# **PUBLISHED BY THE GLOBAL BUSINESS AND TECHNOLOGY ASSOCIATION**

**ISBN: 1-932917-04-7**

The materials published in this Readings Book may be reproduced for instructional and noncommercial use. Any use for commercial purposes must have the prior approval of the president of the Global Business and Technology Association.

All full papers submitted to the Global Business and Technology Association Conferences are subject to a peer reviewing process, using subject specialists selected because of their expert knowledge in the areas.

Global Business and Technology Association (GBATA) is publishing partner with EBSCO Publishing. This allows researchers from throughout the world to access articles from the Readings Book.

Printed in the United States of America, 2008.

# FORWARD

The purpose of the conference is to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations of new challenges in global business and technology: strategies, policies and issues.

All full papers submitted to the Global Business and Technology Association Conferences are subject to a peer reviewing process, using subject specialists selected because of their expert knowledge in the areas.

Academicians, practitioners, and public policy makers at all levels throughout the world submitted original papers for conference presentation and for publication in this Readings Book. All competitive papers were refereed (subject to a peer review). The result of these efforts produced 471 empirical, conceptual and methodological papers involving all functional areas of business education with a special focus on international aspects. Of the 237 papers accepted for presentation at the conference, 145 papers are published in this Readings Book.

# ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the Tenth Annual International Conference of the Global Business and Technology Association (GBATA). The GBATA extends its many thanks to the financial sponsors of this conference: Vaal University of Technology, Gauteng, South Africa; Polytechnic Institute of Leiria, Portugal; Tshwane University of Technology, Pretoria, South Africa; Brno University of Technology, Brno, Czech Republic; State University of New York at Old Westbury, USA; Dowling College, New York, USA; State University of Management, Moscow, Russia; and IBM East Europe/Asia Ltd., Moscow, Russia.

A successful conference could not be possible without the special cooperation and care of the program committee members. Furthermore, many thanks go to the reviewers for reviewing the many papers that were submitted to this conference.

The last but not the least important acknowledgement goes to all these who submitted their work to be considered for presentation at the conference. Also, special thanks to the session chairs and discussants for taking the extra time to make this conference a success.

Nejdet Delener, Ph.D.  
President, Global Business and Technology Association

# **THE ECONOMIC MENACE OF DIABETES IN THE 21<sup>ST</sup> CENTURY**

**Parul Acharya, Elizabeth Milmine, Eric Lewis, Sneha Patel, Shonta Chambers, Renee Hotchkiss and Gerald Ledlow**  
**Georgia Southern University**

## **ABSTRACT**

*Diabetes is one of the most challenging and demanding public health problems of this millennium affecting both the developed and developing economies of the world. The health care expenditures spent on diabetes poses considerable economic burden for the patients. In this paper, cost of six countries on diabetes was compared. The proportion of Gross Domestic Product spent on healthcare and percentage of total healthcare expenditures spent on treatment of diabetes were investigated. Various studies conducted on per capita and health care expenditures attributable to diabetes were analyzed. The social factors that affect diabetes care were also examined. Finally, a cost-benefit analysis model was utilized to create cost estimates for assessing economic burden of diabetes. Result shows all countries spent almost 50% of their per capita health care expenditures on diabetes and the high income group people had lower costs of diabetes as compared to middle income and low income groups.*

## **INTRODUCTION**

Diabetes is a major worldwide public health problem and one of the leading causes of death in both developed and developing nations of the world. There is substantial evidence that it is an epidemic in numerous developed and newly industrialized economies of the world. It is estimated that around 194 million people worldwide (5.1%) in adult population have diabetes and the diabetic population will increase to 333 million (6.3%) by 2025 (International Diabetes Federation, 2003). Predicted increase in the prevalence of diabetes worldwide emphasizes the fact that economically productive age groups within society will be particularly affected (Tuncell, Bradley, Nerenz, Williams, Pladevall & Lafata, 2005). Various studies provide evidence that diabetes affects employers and society not only by reducing employment but also by contributing to work loss and health related work limitations for those who remain employed (Bjork, 2001). This leads to an increase in the total health care expenditures spent on diabetes. In 2007, the world has spent an estimated \$215-375 billion for diabetes care and its complications. This figure will rise to \$234- 411 billion in the next 20 years. Diabetes is growing fastest in low- and middle-income countries. Hence, the developing countries will face the spiraling costs in the near future (Diabetes Atlas, 2003).

By taking all these facts into consideration, the primary objective of this paper was to make a comparison with respect to direct and indirect cost involved in the treatment of diabetes in five developed and one developing economy. Six countries with a high prevalence of diabetes were selected. These include the United States of America (USA), Canada, United Kingdom (UK), Germany, Australia (developed) and India (developing). Data on the medical, health care and per capita expenditures in the treatment of diabetes was collected. Percentage of GDP spent on health care and total health care expenditure spent on diabetes treatment was calculated and compared. Information about the social factors that affect diabetes care was compiled. All this data assisted in the development of conclusions about the social and economic factors affecting diabetes treatment in these countries that could be extrapolated and applied on a worldwide basis. Finally, an economic model adopted from the World Diabetes Foundation was utilized to calculate the health care costs of diabetes among the various income groups (low, middle, and high) in the selected countries.

# LITERATURE REVIEW

The economic consequences related to diabetes can be calculated in two ways: direct costs and indirect costs. Direct cost is calculated based on the number of physician visits, home nursing visits, medicines used and transportation costs. The indirect costs represent the total loss to society due to morbidity and premature mortality; the loss is calculated on the basis of sick-leave days, employment situation, income, family home care and transportation costs. These costs are generally borne by the patients and their families (Bjork, 2001).

Diabetes affects all people in society. According to the International Diabetes Federation (IDF, 2006) more than 80% of expenditures for medical care for diabetes are made in the world's economically richest countries. Less than 20% of expenditures are made in the middle- and low-income countries, where 80% of people with diabetes will live in the future. The proportion of the world's healthcare budget being spent on diabetes care will range from 7% to 13% in 2025 (IDF, 2003). United States is home to about 8% of the world's population living with diabetes and spends more than 50% of all global expenditure for diabetes care. Europe accounts for another quarter of spending on diabetes care. The remaining industrialized countries, such as Australia and Japan, account for a significant portion of the remaining expenses. In industrialized countries, about 25% of medical expenditures for diabetes is spent in treating elevated blood sugar; 25% is used for treating long-term complications, largely cardiovascular disease, and 50% is consumed by additional general medical care that is associated with diabetes (IDF, 2006).

The World Health Organization (WHO) estimates (between 2005 and 2015) that diabetes, heart disease and stroke together will cost about \$555.7 billion in China, \$303.2 billion in the Russian Federation; \$336.6 billion in India; \$49.2 billion in Brazil and \$2.5 billion even in a very poor country like Tanzania over the next 10 years. Diabetes is costly even before it is diagnosed. This is true in both developed and developing countries. In the world's poorest countries, not enough is spent to provide even the least expensive life-saving diabetes drugs. If nothing changes, the disparity in spending for diabetes care between the industrialized countries and the rest of the world will only increase (IDF, 2006). A study was conducted a review of the cost of diabetes complications in Australia, Canada, France, Germany, Italy and Spain in 2005. These cost data could be utilized to create models of diabetes that may accurately simulate the cumulative costs associated with diabetes and its complications (Ray, William, Secnik, Oglesby, Cordony, Gordoys, Davey & Palmer, 2005).

Among all the industrialized nations of the world, United States of America (USA) has the highest health care expenditures. According to the Organization for Economic Development (OECD) health data (2007), USA spends 15.3% of its GDP on health care in 2005 and ranks far ahead of other OECD countries in terms of total health spending per capita. In 2005, the total health care expenditure amounted to \$2.02 trillion (Borger, Smith, Truffer, Keehan, Sisko, Poisal, & Clemens, 2006). The American Diabetes Association published a report on the economic costs of diabetes in 2007. The total estimated cost of diabetes in 2007 was \$174 billion, including \$116 billion in excess of medical expenditures and \$58 billion in reduced national productivity. The actual burden of diabetes is likely to exceed the \$174 billion estimation. In 2007, per capita annual costs of health care for people with diabetes were \$11,744 a year, out of which \$6,649 (57%) was attributed to diabetes. One out of every five health care dollars is spent caring for someone with diagnosed diabetes while one in ten health care dollars is attributed to diabetes (Dall, Mann, Zhang, Martin, Chen & Hogan, 2008).

When compared to US, diabetes is also a major public health problem in Canada in terms of economic, clinical and humanistic outcomes. As the prevalence and severity of diabetes increase with age, the ageing population will increase the economic burden of diabetes to the society. The total health care costs were projected to increase from \$7 billion in 2000 to \$6.48 billion in 2005. The per capita average total cost for incident and prevalent cases of diabetes was \$3877 and \$3715 respectively. The health care costs of diabetes will increase by 75% between 2000 and 2015 (Ohinmaa, Jacobs, Simpson & Johnson, 2004). The Institute of Health Economics at Edmonton, Canada conducted a study on health care costs and mortality for Canadian urban and rural patients with diabetes. Total per capita costs were \$5422 for large urban, \$5448 for small urban, and \$5229 for rural dwellers (Pohar, Majumdar & Johnson, 2007).

Similar studies on health care costs attributable to diabetes were conducted in Europe. The first one was the Cost of Diabetes in Europe-Type II (CODE-2), which provided a comprehensive and practical insight into the direct costs of Type II diabetes across eight European countries including UK and Germany. The total direct medical cost was estimated at \$28.7 billion a year (1999 values). The estimated yearly cost per patient was \$2805 a year (Jonsson, 2002). The second study was conducted in UK. The Type II Diabetes Accounting for Major Resources Demand in Society (TARDIS), examined the direct and indirect costs of Type II diabetes in UK. The results were similar to the CODE-2 study (Williams, 2005). The UK Prospective Diabetes Study provided estimates of the immediate and long-term healthcare costs associated with seven diabetes complications (Clarke, Gray, Legood, Briggs & Holman, 2003). The net annual excess cost attributable to Type II diabetes was approximately \$1.01 billion 2000 (Bagust, Hopkinsont, Maslove & Currie, 2002). Five per cent of the National Health Service (NHS) budget is currently spent on treating diabetes and its complications such as Cardio-Vascular Disease (CVD) which is equivalent to \$2.38 billion a year. These costs are expected to increase by more than 25 per cent in the next 20-30 years (Diabetes Heartache, 2007). In the coming years, diabetes is going to inflict a serious clinical and financial challenge on the NHS (Bagust, Hopkinsont, Maslove & Currie, 2002).

The Cost of Diabetes Mellitus (CoDiM) was the third study that provided comprehensive estimate of costs associated with diabetes care in Germany in 2001. Direct costs of diabetic patients accounted for 14.2% of the total health care costs. Annual direct and indirect costs per diabetic patient were \$5,912 and \$5,639 respectively. The direct cost of diabetes was estimated to be \$34,400 million. Analysis of cost components revealed that high costs associated with the care of the diabetic patients could be largely attributed to inpatient care and overall medication costs (Koster, Ferber, Ihle & Schubert, 2006). A study conducted in 2005 revealed that the total cost of diabetes from a societal perspective was calculated at \$4.83 billion (Stock, Redaelli, Wendland, Civello & Lauterbach, 2005).

The Australian Diabetes study, performed in Australia in 2003, was the first large scale primary study to comprehensively describe costs related to diabetes treatment. The average annual cost per person with Type II diabetes was \$3912 of which \$3109 was from direct costs and \$25 was indirect costs. Government subsidies from pensions accounted for \$4044. Adding these costs raises the total of all costs for a person with Type II diabetes to \$7957 per year. The Direct health care costs for people with both microvascular and macrovascular complications were \$5292 (Colagiuri, Colagiuri, Conway, Grainger & Davey, 2003). The Fremantle Diabetes Study predicted that the financial burden of treating Type II diabetes could quadruple by 2051 unless more is done to prevent Type II diabetes and its complications (Davis, Knuiman, Hendrie & Davis, 2006). A study conducted in Australia concluded that majority of the excess costs were due to increased frequency of disease requiring hospitalization rather than intensity of treatment. People with diabetes cost on an average \$793 annually or 38% more than those who do not have diabetes. The majority of the excess costs are due to increased frequency of disease requiring hospitalization rather than intensity of treatment (Clarke, Kelman & Colagiuri, 2006).

Diabetes is a serious public health problem which poses a major clinical, economic and public burden in India. Health resources in India and other developing countries are very limited with only 5% of the GDP (\$23 per capita) being spent on health care. The estimated direct costs and indirect cost of diabetes in India were \$95 and \$283 per individual per annum respectively. The estimated total costs of diabetes in India were \$442 per person per annum (Bjork, Kapur, Sylvest, Kumar, Nair & Kelkar, 2005). The Cost of Diabetes in India (CODI) study revealed that many socio-economic factors like poverty, access to health resources, lack of health education and unemployment exacerbate the problem of limited health care in India (Kapur, Bjork, Nair, Kelkar & Ramachandran, 2004). A study conducted in Southern India concluded that uneducated, unemployed people, especially those living in semi urban or rural areas, who cannot afford or do not have access to even bare minimum health care facilities, are likely to be diagnosed late of diabetes related complications (Rayappa, Raju, Kapur, Bjork, Sylvest & Kumar, 1999). According to WHO, 80% of the people in developing countries like India pay directly for some or all of their own medicine. For a low-income Indian family with an adult with diabetes, as much as 25% of family income maybe devoted to diabetes care (IDF, 2006).

## METHODOLOGY

This study examined and compared the cost of treating diabetes in the USA, UK, Canada, Australia, Germany, and India. The total health care expenditures on diabetes, obtained from the IDF (2005) website, were updated from 2003 to 2005 U.S. dollars using the market basket projection as the inflation factor (Zaretsky, 2002). This involved an inflation factor of 1.071. The total health care expenditures as % of GDP and the per capita health care costs were taken from the Organization from Economic Cooperation (OECD) website (OECD Health Data 2007). The proportion (percentage) of health care expenditures spent on diabetes was calculated by dividing the total health care expenditures spent on diabetes by the total health expenditures. The total health care expenditures and per capita diabetes costs were taken from various journal articles, reports and fact sheets that have conducted studies on the costs of diabetes.

This study utilized the World Diabetes Federation's (WDF, 2002) economic model of diabetes in order to generate estimates for the total cost of treating diabetes as well as the cost per individual resource groups. The model employs a cost-benefit method that consists of five parameters: Total population; Overall prevalence of diabetes; Percentage of patients who are diagnosed / receiving treatment; Percentage of those in each of three resource consumption groups or income groups – low, medium, high; and Average annual cost of treatment for each resource consumption group. The model computes cost estimates in United States (U.S.) dollars based on 2005 exchange rate for the six countries. The model can be manipulated by adjusting the percentage of persons receiving treatment in different resource groups and / or the average annual treatment cost for each resource group. These manipulations facilitate an assessment of economic burden of diabetes in each country and in each income group. It also assists in making comparisons of diabetes costs per person per year for a particular income group among the various countries.

There was lack of adequate and appropriate data regarding the percentage of people falling into various income groups and the average annual costs of treatment in each of the income groups- low, middle and high. Therefore, some approximations were done to use the model. The total (direct and indirect) annual cost of diabetes for a particular country was taken. The census data contains information on the various income groups in a particular country. These income groups were then categorized into low, middle and high- income groups. The census data was utilized to calculate the percentage of population in each income group. The percentage was multiplied by the total population to obtain the total number of people in each income group. The total cost of diabetes for the entire country was divided by total number of people in each income group to estimate the cost per person per year (in thousands) for a particular income group.

All these values were then inserted into the model to get the cost estimates for not only the entire country but also for the various income groups. Comprehensive estimates of the costs would not only help in framing efficient and effective public health policies but also assist in formulating high-quality clinical and medical practices which can reduce the avoidable burden of diabetes and its complications around the world.

## **RESULTS AND DISCUSSION**

Table 1 provides the data for healthcare expenditure involved with diabetes care in 2005. The USA has the highest total health care expenditure followed by Germany, Canada, UK, Australia and India. The total cost of diabetes in the selected countries was \$151.7 billion in 2005. This represents 5.4% of the total health care costs in these six countries. When the per capita health care and per capita diabetes costs were compared, then it was observed that more than 50% of the per capita health care costs were devoted to the treatment of diabetes and its complications in these countries. The per capita cost spent on diabetes was highest for US (\$6401) followed by Canada (\$3326), Germany (\$3287), Australia (\$3128), UK (\$2724) and India (\$417). USA spent 15.3% of its GDP on health care, out of which 5.7% was spent on diabetes. Similarly, Australia spent 8.8 % of its GDP on health care, out of which 7.3 % was spent on diabetes. The per capita cost of diabetes was highest in US followed by Canada, Germany, Australia, United Kingdom and India. However, if the percentage of health care expenses spent on diabetes was compared, it was seen that Australia spent 11.8% of its total health care expenditures in the treatment of diabetes. Australia was followed by USA (5.77%), Canada (4.3%), India (3.9%), Germany (3.6%) and UK (2.6%). It can be concluded that the prevalence of diabetes is increasing in these nations at a phenomenal rate. This is especially true for countries like India, where rapid urbanization and industrialization has already contributed to a substantial rise in diabetes.

Developing countries accounted for 84% of global population, 90% of the global disease burden, 20% of global GDP but only 12% of global health spending (World Bank, 2008). It could be observed that there is a wide difference between health care spending of USA and India. India is now the Diabetes Capital of the world but it spends only \$1.3 billion on diabetes care as compared to \$116.7 billion in the USA. Similar trends could be seen when the per capita diabetes costs were compared. India spent only \$417 per person on diabetes treatment as compared to \$6401 for USA, \$3326 for Canada, \$3287 for Germany and \$3128 for Australia in 2005. India has the highest number of diabetics in the world and is ahead of China and USA (which are in second and third place respectively) (Mohan, Madan, Jha, Deepa, Pradeepa, 2004). This means that in the near future the per capita costs of diabetes would increase and would consume a greater proportion of the country's total health care expenditure.

**Table 1: Health Care Expenditure in the Six Countries in 2005**

| Country   | Total Health Expenditures (billion \$) | Total HC as % of GDP | % of HC spent on diabetes | Total HC Expenditure on diabetes (USD) | Per capita HC costs (USD) | Per capita HC costs on diabetes (USD) |
|-----------|--|----------------------|---------------------------|--|---------------------------|---------------------------------------|
| USA       | 2020                                   | 15.3                 | 5.7                       | 116.7                                  | 8833                      | 6401                                  |
| Canada    | 142                                    | 9.8                  | 4.3                       | 6.1                                    | 4590                      | 3326                                  |
| UK        | 186.4                                  | 8.3                  | 2.6                       | 4.8                                    | 3759                      | 2724                                  |
| Germany   | 324.4                                  | 10.7                 | 3.6                       | 11.8                                   | 4536                      | 3287                                  |
| India     | 33.6                                   | 5.0                  | 3.9                       | 1.3                                    | 645.8                     | 417                                   |
| Australia | 140.3                                  | 8.8                  | 7.3                       | 10.3                                   | 4121                      | 3128                                  |
| Total     | 2846.7                                 | 57.9                 | 27.5                      | 151.7                                  | 26484                     | 19283                                 |

Therefore, diabetes would be one of the major concerns for the public health departments in the developing economies. The government has to prioritize the limited medical and health resources in the treatment of diabetes and its complications. Therefore, it is very essential and crucial to make comprehensive estimates of the costs so that pragmatic and effective decisions can be made.

## Economic Model

The cost estimates of USA, Canada, UK, Germany, India and Australia were calculated with the help of the economic model found on the World Diabetes Foundation website. Table 2 presents the total cost of diabetes in each of the income groups - Low Income Group (LIG), Middle Income Group (MIG), High Income Group (HIG). It can be seen from the table that USA (\$83.2 billion) has the highest expenditure for diabetes followed by India (\$23 billion), Canada (\$4.39 billion), Germany (\$3.06 billion), Australia (1.53 billion) and UK (\$1.3 billion). In USA, Canada and India the LIG spends more on diabetes treatment and care than the MIG and HIG. Poverty, illiteracy, ignorance to health care education, inadequate access to hospitals, lack of health insurance and poor health consciousness among the LIG people are the socio-economic factors responsible for the high cost of diabetes in this group. In India, free health care facilities are available for the economically backward classes, but due to the low level of education and occupational problems, the facilities are not always used (Ramachandran, Snehalatha, Vijay & King, 2002). In developing countries people living with diabetes bear the

brunt of the medical costs out of their own pocket because many countries lack an adequate healthcare infrastructure and have limited health care and medical resources. Those who need expensive care for diabetes-related complications are often the people who are poor and cannot afford the treatment costs. In the poorest countries, people with diabetes and their families bear almost the entire cost of whatever medical care they can afford.

**Table 2: Total Costs of Diabetes by Income Group**

| Country   | Total Expenditure (billion \$) | LIG (Billion \$) | MIG (Billion \$) | HIG (Billion \$) |
|-----------|--------------------------------|------------------|------------------|------------------|
| USA       | 83.23                          | 33.3             | 41.6             | 8.32             |
| Canada    | 4.39                           | 2.4              | 1.64             | 0.35             |
| UK        | 1.3                            | 0.58             | 0.65             | 0.02             |
| Germany   | 3.0                            | 0.39             | 1.62             | 0.99             |
| India     | 23.0                           | 10.8             | 9.2              | 2.3              |
| Australia | 1.53                           | 0.54             | 0.65             | 0.34             |

In developed countries like Germany and Australia the proportion of people living in the MIG (almost 50%) is high as compared to the LIG. The income inequality is less in these countries as compared to USA, Canada and India. The European countries (UK and Germany) and Australia has universal health insurance and, hence, people have access to health care. But in countries like USA (developed country) and India (developing country), such insurance schemes are not available. A developed economy like USA, which on one hand, has the highest expenditures on health care in the world; on the other hand, has the third largest population of diabetics in the world. This is because a portion of American population does not have health insurance.

If comparison is made between the HIG, MIG and LIG, then it can be inferred that, on an average, the HIG spends less as compared to the MIG and LIG on diabetes in all the countries. Various studies have indicated that those on a higher socioeconomic status according to income or education level have a lower prevalence of diabetes and, therefore, have less health care expenditures on diabetes care and treatment (Diabetes and Socioeconomic Factors in South Australia, 2003; Ramachandran, Snehalatha & Viswanathan, 2002; Rabi, Edwards, Svenson, Sargious, Norton, Larsen & Ghali, 2007; Rabi, Edwards, Southern, Svenson, Sargious, Norton, Larsen & Ghali, 2006). Therefore, in order to make a social and economic impact on the burden of diabetes, resources need to be efficiently and effectively allocated to offset costs in other areas so that the individual and the family do not have to face the financial burden of diabetes.

Figure 1, 2, 3, 4, 5 and 6 depicts the total cost of diabetes in USA, Canada, Germany, UK, India and Australia by utilizing the economic model.

## CONCLUSION AND FUTURE WORK

The burden of diabetes is imposed on all sectors of the society in the form of higher insurance premiums paid by employers and employees, reduced earnings through productivity loss and deterioration in overall quality of life for people with diabetes (Diabetes Heartache, 2007). Action taken early in the course of diabetes is more beneficial in terms of quality of life and is more cost effective, especially if it can prevent hospitalization. Complications have a substantial impact on the costs of Type II diabetes. Prevention of diabetic complications will not only benefit patients, but potentially reduce overall health care expenditure (Dall, Mann, Zhang, Martin,

Chen & Hogan, 2008). Proper management requires investment in awareness, education and better care. This seems to be the trend among the international health policy makers with the WHO and IDF in the forefront (IDF, 2001). It can be concluded that intervention should be made from the beginning so that the exorbitant costs of treating complication of diabetes could be minimized. This would lead to increased health status and quality of life among the population, which at the end of the day will optimize the usage of resources in the national health care budgets. Effective prevention measures needs to be introduced so that the expenditures devoted to the treatment of diabetes and its complications would not dominate the health economies of many countries by the end of the first quarter of the current century.

**Figure 5: India**

**Figure 6: Australia**

One of the areas in which research needs to be done is on the healthcare expenses spent on diabetes by the different income groups (high, middle and low- income groups) in various industrialized and non-industrialized countries. The prevalence of Type II diabetes varies with socio- economic status within a population. Low income individuals with diabetes are particularly at high risk for poor health status due to lack of health insurance. Socio-economic status and its constituent elements are accepted as being determinants of health. There is considerable evidence to show that poverty is associated with shorter life expectancies and increased mortality, particularly cardiovascular mortality. Patterns of socio-economic disadvantage are related to patterns of diabetic complications which are, in turn, further related to indicators of access to care. Barriers to quality diabetes care should be identified and removed. The economic burden of diabetes and its complications will only be ameliorated by policies of substantial income redistribution.

Research also needs to be conducted on the expenditure of diabetes care in developing countries. India is a developing economy and it lacks comprehensive and up-to-date information on health care systems. Data on the documentation of medical details, especially the cost of treatment is also limited. Studies done on the cost of diabetes in developed countries is not updated frequently. There is a dearth of information about the direct and indirect costs of diabetes in the South-East Asian Region (China and Japan), Middle-East Asia and South America. These regions would be the hub of diabetic population in the next decade. Therefore, studies need to be conducted on the health care expenditures attributable to diabetes. Exhaustive, in-depth and current economic data on the costs of diabetes is required for pragmatic policy decisions. The resource allocation needs to be optimized for effectively evaluating approaches to disease management. This would help curbing the rise of the diabetes pandemic.

# COMPLEXITY OF PRIVATIZATION IN KOSOVO-SERBIA

**Slobodan Acimovic, University of Belgrade**  
**Jelena Acimovic**  
**Ministry for Kosovo and Metohia of the Republic of Serbia**

## ABSTRACT

*Political, economic, social and other aspects of life in Kosovo have been rather complicated. A special challenge for the UNMIK administration – in charge for governing Kosovo's politics and economy – is the act of unilateral declaration of independence by the provisional authorities in Pristina, and a fervent opposition to such an illegal act by Serbia and the majority of members of the United Nations. Apart from diplomatic-political issues, the issues related to economy and the privatization conducted in the previous nine years have been the focal point of interest in Kosovo. This paper briefly presents disputable points in legal aspects of privatization, identifies the scope and structure of the privatized companies, analyses applied models and generally outlines effects of the implemented privatization.*

## INTRODUCTION

The Resolution 1244 (10 June 1999) of the United Nations Security Council (UNSC) put a stop to the NATO's war operations in Serbia and international security presence (KFOR) was deployed in Kosovo and Metohija. At the same time, UNMIK, as an international civil presence, was also deployed under UN auspices, and took over further administration of Kosovo, irrespective of the fact that the province was a territorial part of the sovereign Republic of Serbia. In the meantime, great efforts have been put into resolving the dispute on the final status of Kosovo, but activities conducted in the last couple of years have advanced that process. A special challenge for UNMIK administration – in charge for governing Kosovo's politics and economy – is the act of unilateral declaration of independence by the provisional authorities in Pristina, and fervent opposition by Serbia and the majority of members of the United Nations to such an illegal act in violation of the Resolution 1244.

Parallel to the political process, UNMIK administration and the provisional institutions of self-government (PISG) in Kosovo have organized economy on the part of Serbian territory, thereby excluding the Government of the Republic of Serbia from exercising any economic influence. UNMIK manages privatization of enterprises in Kosovo within the realm of its Fourth Pillar (economy development and reconstruction) which is under auspices of the European Union (EU). The privatization process is undertaken on the grounds of regulations promulgated by the UN Special Representative of the Secretary-General (SRSG). The main supervisor of that process is the Kosovo Trust Agency (KTA). The KTA is an independent body within the scope of UNMIK's competence, with the main goal to manage the property of socially-owned and public enterprises and to take measures which are necessary for preserving or increasing the value of that property.

The above mentioned results in the KTA selling shares of the newly-established subsidiary companies ("new enterprises") which consist only of assets of socially-owned enterprises (SOE). The KTA executes privatization process by methods of spin-off and voluntary liquidation. The revenue of the sold enterprises is kept on a KTA's special account – the KTA is its only administrator. The biggest part (80%) of the earned revenue is assigned for paying off the creditors and owners, while 20% of the is assigned for compensating employees of SOEs, which

possess a verifiable legal interest, pursuant to the lists created by competent body of workers' representatives and subsequently confirmed by the KTA. The main goal of this paper is to analyze and present all aspects of a complex privatization process in Kosovo, with the special emphasis on the following:

- Legal framework analysis of the privatization in Kosovo, implemented by UNMIK administration without any kind of coordination either with the Serbian Government or with the Privatization Agency of the Republic of Serbia;
- Analysis of volume and structure of property of the already privatized enterprises, that is either owned by the Republic of Serbia or falls into the category of socially-owned;
- Analysis of the privatization concept in Kosovo, based on case studies of achieved sale prices for each particular enterprise, in comparison to achieved prices for similar enterprises in Serbia and the region;
- Total privatization-generated income and its distribution, especially from the perspective of relations with foreign creditor clubs (Paris club, EBRD, London club etc), bearing in mind the fact that the Republic of Serbia regularly conducts payments to the foreign creditors for the debts of Kosovo-based enterprises, in spite of the fact that she has no returns from the enterprises privatized in Kosovo;
- Economic effects of UNMIK-operated privatization on economy, employment and standard of living of the people of Kosovo.

## **ANALYSIS OF LEGALITY OF THE PRIVATIZATION**

### **Legality and legitimacy of the UNMIK-managed privatization in Kosovo**

Within its EU-led Pillar IV (economic development and reconstruction), UNMIK conducts privatization of enterprises in Kosovo. The process is legally based on the following regulations of the SRSG: 1) Regulation 2003/13 On the Transformation of the Right of Use to Socially-Owned Immovable Property – amended by the Regulation 2004/45 (introduced a change to the right to use SOEs' assets rented by new subsidiary companies, with the possibility to sell/transfer the property), and 2) Regulation 2002/12 On the Establishment of the Kosovo Trust Agency – amended by the Regulation 2005/18 (KTA manages SOEs and other forms of property which are registered and located in Kosovo, while having the right to create subsidiary companies to the SOEs and sell their stock shares).

The very KTA mandate is based on the following legal documents: 1) the mentioned Regulation 2002/12 on the establishment of the KTA, 2) Regulation 2002/13 On the Establishment of a Special Chamber of the Supreme Court of Kosovo on Kosovo Trust Agency Related Matters. The KTA's internal legal documents further develop certain issues regarding the Regulation 2002/13, primarily: 1) KTA's Rulebook, 2) Rules of Tender for the spin-off privatization (so-called "round closure" comprising only sales of the SOE's assets – it should be noted here that a new enterprise is formed within the existing SOE, which operates only with assets of the SOE, while liabilities remain with the old SOE which is to be liquidated. The sale-generated resources are preserved in a special fund under KTA's control – they are to be used for paying off creditors, owners and employees.) and 3) Rulebook on Board of Directors etc.

The above mentioned legal documents of UNMIK and KTA have, arguably, provided legality to privatization in Kosovo. However, privatization experiences of East-European countries in the last 20 years point to a fairly clear principle that there is no successfully undertaken privatization (as the most important process in transformation of the countries' economies from socialist to market-oriented) if, at the same time, there is no satisfaction of the rights of all stakeholders (former owners, current owners, employees, state etc.). The process of privatization in Kosovo fully infringes the rights of current owners, disputes the rights of employees, while the rights of former owners (whose property was nationalized 50-60 years ago) are made obscure. Furthermore, the rights of the Republic of Serbia (on which territorial part the privatization has been conducted) have been treated as illegitimate.

As a corollary, one may estimate that privatization in Kosovo has a highly problematic legal ground and insufficient legitimacy. Primarily, there is a general issue of competence, i.e. mandate of UNMIK to undertake the privatization. More precisely, the issue rises of whether UNMIK, as a temporally-limited international civil presence in Kosovo (according to the Resolution 1244), has the right and legitimacy to sell the property of existing owners on the territory of the Republic of Serbia. Related to that, it should be noticed that the KTA has

never (not by any formal or factual means) taken into consideration existing laws of the Republic of Serbia in respect of privatization. Moreover, the KTA has not even contacted competent Serbian institutions – most notably, the Privatization Agency of the Republic of Serbia, which undertakes privatization of public and socially-owned property in Serbia pursuant to extant Privatization Act (enacted in 2001 and amended in 2004). Establishing any cooperation between the KTA and the Privatization Agency would provide legitimacy to the privatization process in Kosovo for the very fact that, despite the unilateral declaration of independence and the recognition by more than 30 countries, Kosovo is formally a part of Serbia (pursuant to the mentioned Resolution, as reaffirmed in March 2008 by the UN Secretary-General, Ban Ki-Moon, in his annual report to the UNSC).

The fragile legitimacy of Kosovo's privatization is further shaken by certain concrete problems related to legality which the authors of the text identified either within existing privatization-related legal framework or within the pending privatization practice in Kosovo:

- One may pose a question of UNMIK's competence (legitimacy) for revisions of companies' transformations undertaken in the course of 1990ies in Kosovo by virtue of then existing laws of the Republic of Serbia, applicable to Kosovo;
- The KTA's criteria pursuant to which it determines whether an enterprise falls in the category of socially-owned are vague, inexplicit and, as such, convenient for bringing arbitrary and potentially disputable decisions;
- The future of factories, subsidiaries and other forms of dependent enterprises, whose owners are enterprises from other parts of the Republic of Serbia, is also very ambiguous – the issue has so far been “resolved” by their separation and sale. Existing relations between the enterprises whose founding centers are outside Kosovo (in Serbia or other republics of the former Yugoslavia) and their property in Kosovo thereby cease. Even when indisputably proven, ownership on these parts of enterprises does not mean that the owner will manage to keep the property or in any other way benefit from it – the KTA regulations indeed provided the right to compensation, but without stipulating the criteria for determining the actual amount of compensation;
- There is no reasonable explanation for this *de facto* expropriation of property and its subsequent transfer to buyers who originate from a very defined national/political milieu;
- The rights of creditors and, in general, the issue of liabilities of the privatized companies are imprecisely determined. There is a notion of liquidation procedure, but not the rules of such procedure – only the minutes/records of the KTA's Board of Directors may reveal that liquidation in Kosovo is conducted by PISG. Furthermore, there is no right to appeal (for owners and creditors) related to decisions of a separate court (Special Chamber of the Supreme Court of Kosovo) established to resolve, as the first judicial instance, disputes/actions stemming from this privatization process;
- There is absolutely no notion of possible remedies in relation to rights of owners of the property nationalized from 1945 on the territory of the former Yugoslavia;
- The criteria for realization of employees' rights are equally vaguely determined;
- There are no indications that checks are conducted as to the origin of the future owners' capital.

From the whole corpus of legal remarks in respect of privatization in Kosovo, it can be concluded that the most important problem is discrimination of owners of the enterprises which undergo the privatization process. The most obvious example for this conclusion is the fact that this privatization is based on selling the land owned by the Republic of Serbia – the land that is, by Serbian laws, considered as the property that cannot be sold, but only rented.

## **A short survey of Serbian property privatized in Kosovo and accompanying obligations of the Republic of Serbia toward foreign creditors**

What is the object of privatization in Kosovo– who owns the property? This may be the key question that can, in legal terms, deny legitimacy of the undertaken privatization. In other words: can anyone – under the presumption of inviolability and full protection of ownership (private and/or public), as the basic right extant in the countries of the Western democracy – perform privatization without previous consent of that entity? This particular scenario has been enforced in Kosovo, in respect to property owned by Serbian enterprises and citizens and the very Republic of Serbia.

The fate of Serbian public and private property in Kosovo has been uncertain for almost nine years. Since 1999, Serbia has neither succeeded in returning a single object nor uses any of the resources in that part of its territory. The available data gathered by the authors of this research are mostly unsorted and incomplete, as they are based on the state of the property and capital in the late 1990ies, while there is no adequate estimate of its present state and actual worth – therefore, a reserve is warranted when taking the data into consideration. However, competent Serbian institutions have unofficially provided estimates regarding the worth of the property of the Republic of Serbia privatized or in other ways alienated in Kosovo, revealing the matter of tens of billions of Euros worth.

The biggest research problem in creating this paper was the lack of access to data related to worth, structure and territorial allocation of the property. A certain number of direct sources were used with the purpose of viewing the scope and structure of Serbian property privatized and to-be privatized in Kosovo. The available data were originating mostly from the state sources (direct data from the institutions of centralized property management). The data on the property value of SOEs based in Kosovo with majority of business activities in the province (whose owner-companies were situated in central Serbia) remain unavailable. There are no unified records for the latter category of data, except the accounting values from the year 1998 which, at present, may not be relevant. Furthermore, the records on the property of public enterprises (Serbian Rail, Serbian ElectroPower Company, Serbian Oil Industry etc.) whose property is partly located in Kosovo could only be presented in their obsolete book-value. This is hardly relevant, if taking into consideration that all public enterprises in Serbia have conducted capital re-evaluation (with exception of the property in Kosovo) which enhanced their book value several times.

The Property Directorate of the Republic of Serbia is the principal state institution which maintains records on all property of the Republic of Serbia. This institution has at its disposal the following record on immovable property in Kosovo, categorized by the property's types, quantities and value:

**Table 1: Layout of the scope and structure of property of the Republic of Serbia in Kosovo**

| Type of Realty          | Size                           | Reviewed Book Value in EUR |
|-------------------------|--------------------------------|----------------------------|
| Land – agricultural     | 15,376 ha 84a 83m <sup>2</sup> | 48,456,223                 |
| Land – forest           | 5,707 ha 38a 40m <sup>2</sup>  | 15,796,045                 |
| Land – building         | 3,424 ha 28a 96m <sup>2</sup>  | 188,745,832                |
| Official buildings      | 1,240,992m <sup>2</sup>        | 214,762,260                |
| Business buildings      | 145,202m <sup>2</sup>          | 23,465,114                 |
| Housing buildings       | 24,688m <sup>2</sup>           | 4,899,454                  |
| Residential objects     | /                              | /                          |
| Special purpose objects | 3,973m <sup>2</sup>            | 840,219                    |
| Other civil objects     | 753,915m <sup>2</sup>          | 127,264,175                |
|                         | <b>TOTAL</b>                   | <b>624,229,322 €</b>       |

Source: Property Directorate of the Republic of Serbia, data dated 23.10.2003 (exchange rate: 1 EUR = 66.6119 RSD)

It is presumed that, in order to determine the real/“fair” value of the gross state resources, it is necessary to previously perform evaluation of the property pursuant to the International Accounting Standards. For that reason, the above stated values should be taken into consideration with caution. The following table presents a layout of enterprises dominated by state and/or socially-owned capital seated in Kosovo:

**Table 2: Structure of enterprises in Kosovo under jurisdiction of the Republic of Serbia**

| Size of Enterprise | Number of Enterprises | Number of Employees | Ownership Type |
|--------------------|-----------------------|---------------------|----------------|
| Small              | 345                   | 11,571              | Social         |
| Middle             | 118                   | 18,248              | Mixed          |
| Big                | 46                    | 47,916              | State          |
| <b>Total</b>       | <b>509</b>            | <b>77,735</b>       |                |

Source: Development Fund of the Republic of Serbia, 1998, [www.fondzarazvoj.sr.gov.yu](http://www.fondzarazvoj.sr.gov.yu)

According to official data on submitted final balance sheets, provided by the National Bank of Serbia, there were 837 business enterprises (including parts of those enterprises located in Kosovo with management centers in the Central Serbia) active in Kosovo, whose capital comprised state, social and private capital:

**Table 3: Structure of capital of the Republic of Serbia in Kosovo**

| Type of Capital  | Number of Enterprises   |
|--|---|
| State-owned enterprises  | 39  |
| Privately-owned enterprises<br>(stock companies and limited liability companies) | 309<br>(45 of those are enterprises with ownership already transformed pursuant to Serbian laws till 1999, whereby they had become mixed-ownership enterprises) |
| Socially-owned enterprises   | 489   |
| <b>Total</b>   | <b>837</b>  |

Source: National Bank of Serbia, 1999 balance sheets, www.nbs.yu

According to the ownership structure, all 837 enterprises on the territory of Kosovo had the following structure of capital share (state institutions, public enterprises, social and/or mixed enterprises conducting business outside Kosovo, private subjects etc) in the overall capital:

**Table 4: Shares of various types of capital in enterprises in Kosovo**

| Different shares in capital of enterprises in Kosovo   | %   |
|--|-----|
| State capital of the Republic of Serbia  | 30% |
| Development Fund of the Republic of Serbia   | 15% |
| Enterprises with head offices in Serbia outside Kosovo (social, privatized, public)  | 10% |
| Enterprises with head offices in former republics of former Yugoslavia (social, privatized, public)  | 5%  |
| Socially-owned capital and a smaller portion of private capital of individuals based on ownership right obtained through ownership transformations performed pursuant to extant laws of the Republic of Serbia | 40% |

Source: National Bank of Serbia, www.nbs.yu

The Republic of Serbia has been a warrantor of many contracts concluded between legal entities from the territory of Kosovo and those of foreign origin, on the grounds of which Serbian citizens became debtors (for taken credits or foreign product supplies), and she has also taken over all debts toward foreign creditors in the aftermath of the political changes in the year 2000 (hence, during UNMIK's mandate). In other words, Serbia became the debtor toward foreign creditors, while the final beneficiaries of the credit (or other obligations) became the debtors of the state that had taken over payment of the debt in her name but for the interest of the mentioned legal entities. Allocated foreign debts of the state refer to local, identified debts and they were taken over by the Government of Serbia. On the grounds of the data available to the Ministry of Finance of the Republic of Serbia and the National Bank of Serbia, total amount of Kosovo's debts toward foreign creditors on 30.04.2006 equaled \$1.235 billions:

**Table 5: Total debt of Kosovo toward foreign creditors**

| Foreign Creditor  | Currency   | Kosovo's Debt<br>(after writing off<br>51%+15%) | Paid Due<br>Obligations<br>(principal and<br>interest) from 2002<br>till 30.04.2006 | Total Debt                 |
|---|------------|---|---|----------------------------|
| Paris Club  | USD        | 368,901,788.00                                  | 36,123,949.76   |                            |
| International financial<br>organizations (EBRD, ECB,<br>EC) | USD        | 536,160,189.30                                  | 120,622,329.65  |                            |

| 1 USD = 0.80 EUR  | EUR        | 848,120,914.55                                  | 134,632,338.19  | <b>€ 982,753,252.74</b>    |

Source: Ministry of Finance of the Republic of Serbia and the National Bank of Serbia, dated 30.04.2006, www.nbs.yu, www.mfin.sr.gov.yu

From the total amount of foreign debt of Kosovo, as a part of the Republic of Serbia, 93.8% is allocated to 109 business entities (enterprises took over 87.95% of the allocated debts, while 12.05% are referred to banks). All the debts are regularly paid through determined installments by the Republic of Serbia, i.e. all Serbian citizens, irrespective of the fact that the state practically has had no engagement both in the privatization process and the process of fiscal management in Kosovo (the state does not have any incomes, while it regularly pays expenses).

Apart from the direct take over of the obligations toward foreign creditors and the direct outstanding debts for public incomes, the Republic of Serbia also possesses indirect ownership-related rights and outstanding claims stemming from established business relations of the state financial institutions (funds and agencies) which independently gained such ownership and creditor rights toward legal entities from the territory of Kosovo (Development Fund of the Republic of Serbia, Deposit Insurance Agency of the Republic of Serbia, pension-invalid, social and health funds of the Republic of Serbia). The Development Fund of the Republic of Serbia alone possesses registered owner shares in 155 Kosovo's enterprises and long-term and/or short-term investments amounting to total EUR 140 million.

From this short survey, it can be concluded that Serbia is the direct (public enterprises, banks) or indirect (SOEs) owner of business enterprises in Kosovo, while she is simultaneously the main creditor for paying off Kosovo's debt created by the subject business enterprises. This fact will most certainly be an issue of legal proceedings before international courts, especially under the new circumstances of illegal declaration of Kosovo's independence. Under the presumption of due application of international law, the Republic of Serbia should be entitled to a certain compensation for the uncontested privatization of her property.

## **EVALUATION OF THE PRIVATIZATION MODEL AND THE OBTAINED INCOME AMOUNT**

The Regulation 2003/13 On the Transformation of the Right of Use to Socially-Owned Immovable Property, promulgated by the SRSg, served as a legal ground for commencement of privatization in Kosovo. This Regulation defined a privatization model whereby the newly established subordinate enterprise obtains the right to lease the property transferred from the socially-owned enterprise for the period of 99 years, instead of the standard right to use. The rent/lease comprises the possibility to transfer the property to other persons – therefore, it has all characteristics of the ownership right. The KTA, as a provisional administrative body in Kosovo (in accordance with Article 10 of the Resolution 1244), practically performs permanent transfer of ownership – the 99-year long rent amounts to deprivation of possessions, whereby the real owner (the Republic of Serbia, Serbian public enterprises, private owners on the grounds of previous privatization models applied in Serbia, and all persons with ownership rights pursuant to the Serbian Privatization Act) decides neither on commencement nor on cessation of the rent relation, while the lessee is authorized to alienate the property. It is obvious that this approach violates one of the basic legal rules that no one can give what one does not have (*Nemo dat quod non habet*).

The KTA performs sales of shares of the newly established subsidiaries ("new enterprises") to which it transferred assets of the socially-owned enterprises. The privatization methods used are spin-off and voluntary liquidation. The spin-off method can be regular (the criterion for choosing the buyer is only the highest offered price) and special (the choice of buyer is determined on the basis of the offered price and social and investment programmes). Spin-off method is undertaken in two steps: 1) founding of a subsidiary ("new enterprise" as a stock-company or limited liability company) to which all or part of the assets of the socially-owned enterprise are transferred together with a part of liabilities estimated by the KTA, and 2) sales of all or a part of the shares of the newly established enterprise. In all KTA's privatization-related documents there is no notion of a precise method for determination of the initial sales price, which makes the issue disputable and susceptible to abuses. Voluntary liquidation (by virtue of the UNMIK's Regulation 2001/6 On Business Organizations) enables prompt market exit for the enterprises that apparently do not have chances for survival. The KTA can initiate this procedure when it considers that it is in the interest of preserving the remaining value of the extinct enterprises, or in the interest of their eventual owners or creditors. This method is mostly conducted outside the court, pursuant to the liquidation procedural steps provided in the mentioned Regulation 2001/6. In this case also, the liquidation incomes are placed at disposal of the KTA. The biggest part (80% of the shares sale income) is intended for compensating creditors and owners, while 20% of the resources are intended for compensating

employees who have the right to payoff according to the lists created by the employees' representative body and subsequently confirmed by the KTA.

The privatization process in Kosovo has so far been conducted through 30 tenders. These tenders comprised 356 socially-owned enterprises, out of which 440 new companies came into existence through application of the available privatization methods, with assets transferred to them and liabilities left on the original enterprise. 314 enterprises were privatized by means of the regular spin-off method, while only the special method was used for only 16 enterprises. This implies that there have been 330 contracts on privatization signed so far. According to the KTA data, 7984 potential investors have been registered in the privatization process in Kosovo. The total recorded privatization income amounts to EUR 352,651,978.66. Names and titles of buyers used to be partly published on the KTA's web-site, but the practice was later abandoned – in recent privatization waves, only the actual buyer's code is published.

From the expert point of view, what is the most important question regarding the chosen method and the achieved scope of privatization in Kosovo? Above all, the privatization lacks many phases that naturally precede the very sales. The most important among them is a due evaluation of capital and/or property of an enterprise scheduled for privatization. Had this procedural step been used, it would have been clearly visible which enterprise owned the capital and was capable to be privatized as a whole, and which did not possess capital and needed to undergo the spin-off or some other method of privatization (e.g. bankruptcy-triggered privatization). Lack of previously conducted evaluation of capital and property in the privatization process is a gross procedural omission which has not been reported in any of the privatization processes conducted in Eastern-European countries. In this respect, it should be emphasized that there is a serious lack of methodology relevant for determination of the starting price for any subject enterprise, which is a completely novel case in processes of privatization of socially-owned capital.

Related to the above-mentioned issue, the following question arises: is it possible that each of the privatized enterprises in Kosovo lacked capital (bearing in mind that the spin-off method is, in principle, applicable only in such cases)? In its core, the spin-off method represents some sort of sale of the enterprise on liquidation ground. However, there cannot be placed an equation mark between the two methods, as there had been no prior estimate on liquidation i.e. income-related capital value conducted in the course of this privatization process. Experiences from transition countries (Bennett et al, 2004) and Serbian experiences (see Cerovic, 2006) support the fact that the sale on liquidation grounds is used only for privatization of the enterprises incapable for income generation. It is not hard to assume that certain enterprises in Kosovo could have been privatized by using the method of income-generating power, i.e. by engaging into prior evaluation of future investments in the capital of the enterprise upon its privatization. Consequently, the achieved individual incomes and, especially, the overall privatization incomes in Kosovo cannot be marked as satisfactory.

Reviewing enterprise privatization on individual tenders and the price achieved for any of them cannot serve the purpose of clearly concluding whether the enterprise was sold at a lower or higher value than the real one. It is difficult to make even a crude comparison of the privatization prices reached in Kosovo and those for similar enterprises in Serbia or other countries in the region. The ground for comparison could be the difference between the estimated and the value achieved on the tender, but due to the fact that there were no such estimates in Kosovo, hardly any conclusion can be derived in this respect. The sale of "Pecka pivara" (The Brewery of Pec) can serve as an example of economically inadequate model of privatization in Kosovo and a very low tender price achieved. The brewery was sold for three times lesser price than the real one, bearing in mind the capacity and dominant role of the brewery in the Kosovo's market. According to the data provided by the Solvency Centre of the National Bank of Serbia, "Pecka pivara", the erstwhile very successful enterprise in possession of a good beer brand was sold as a "new enterprise" – "Pecko pivo, stock company", for EUR 11,130,000 to the buyer with highly dubious capital origins. Comparison of this sale with privatization of other breweries in the Western Balkan region raises the issue of the choice of an adequate model and transparency of the tender procedure, especially from the point of obtained incomes. The privatization of breweries in Serbia brought excellent privatization incomes to the state and private shareholders. For example, Belgian "Inbev" paid for the Serbian "Apatinska pivara" (the Brewery of Apatin) EUR 300 million, while "Carlsberg" paid for the "Celarevo" brewery EUR 100 million. Similarly, "Niksicka pivara" (the Brewery of Niksic) in Montenegro was sold for almost 15 times higher amount than "Pecka pivara", despite the fact that it is a brewery of relatively similar

quality of the basic product, that conducts business on a relatively similar market (the size of the Montenegrin and Kosovo's market is territorially similar, but the size of population in Kosovo makes its market four times bigger than that of Montenegro).

On the grounds of the above said regarding inappropriate choice of the privatization model and the omission of certain common phases in the privatization process, a question logically arises in terms of whether the spin-off was useful from the point of, on one hand, legal neglect of relevant facts and/or, on the other hand, a peculiar haste in implementing the privatization methods (before unilateral declaration of Kosovo's independence). This question certainly falls out of the domain of economic analytics, but belongs to the realm of political decisions of UNMIK who has led the controversial process.

## **ARE THERE EFFECTS OF THE PRIVATIZATION IN KOSOVO?**

The amount of the privatization-generated incomes in Kosovo is the lowest in the region – both in its absolute and, especially, relative value (*per capita* privatization income in Kosovo is cca EUR 175). Somebody might assert that the general political situation in Kosovo and around the territory has negatively influenced new investment possibilities, and that this was the sole factor resulting in low privatization incomes, devoid of any external disturbing influences. However, it is a matter of common sense (for both the international administration in Kosovo and the population of Kosovo irrespective of ethnic origin) that the economy of Kosovo collapsed and that a very small number of people gained enormous wealth to the detriment of the majority population (this is a phenomenon of all the countries in the region, but Kosovo has been the most drastic case). The unemployment rate is extremely high, the production level extremely low, the basic economic activity is retail trading (with the overwhelming grey economy), regular (internal) budget incomes are marginal, while (Serbian) public enterprises (erstwhile economic giants, i.e. in production of electric power) either do not work or conduct business with significantly reduced capacity. Despite all this, the public does not have access to trustworthy data on the reality of Kosovo's economy. PISG has so far announced only very disputable surveys which emphasize that “the first effects of the privatization in Kosovo are now available” (see statement of the Privatization Agency of Kosovo, Mr. Ahmet Shala, dated 13.12.2007. available at [www.B92.net](http://www.B92.net)). On the grounds of a single survey conducted in the last six months, one can thereby allegedly “conclude that the real employment, based on the survey of 55 enterprises, grew for 24 percent”.

Positive results of the privatization in Kosovo practically do not exist. If there are any effects, then it can be said that they fall into the category of the worst among all from privatizations conducted in the countries of Eastern-Europe in the last 15-20 years. A simple insight into the situation in Kosovo displays the reality that the people of Kosovo live very bad and practically survive on the budget of UN(MIK), EU or the resources of the Republic of Serbia who is economically engaged in the areas of Kosovo populated by Serbs and other non-Albanian communities (Roma, Gorani, Bosniacs). The resources gained from privatization have not yet been invested into development of Kosovo's economy. Practically, the basic expected privatization result in transition countries should be not only the mere change of the property owner, but also initiation of economic development – primarily through attracting foreign investments. Therefore, apart from immensely controversial legitimacy and legality, the privatization in Kosovo deserves a negative mark in the field of boosting economic development.

It can be concluded with certainty that the main reason for the failure of the KTA-conducted privatization to attract bigger number of foreign investors (only 30% of the income in the current privatization process are foreign investments – majority of them being investments of ethnic Albanians with foreign citizenships) lies in high credit risk of investing into politically and legally unstable environment with, additionally, a small and limited market. Lack of attractiveness of enterprises in Kosovo for foreign investors enables fairly easy purchases by a small number of ethnic Albanians with concentrated capital – it does not, however, benefit all citizens of Kosovo, as the low-price sales imply lower budgetary income and, consequently, lower shares for the future economic development. Economic result of this privatization is double negative – in majority of cases, the privatized enterprises did not initiate production, while the resources generated through sales are blocked on a KTA-managed account. AT this point, it is legitimate to ask what the real motive for the haste to start and

finalize the privatization of enterprises in Kosovo is, if the alleged main arguments for its initiation before the settlement of the Kosovo status were of purely economic nature.

# **MUSEUM MARKETING -A CASE STUDY FROM TURKEY-**

**Ozlem Kacar Akman and Ozgur Kokalan**  
**Istanbul Bilgi University, Turkey**

## **ABSTRACT**

*As globalization spreads all over the world, there will be more intense competition among different types of service businesses. As a result of this challenge, many organizations have lost their market shares in the local market; therefore these organizations tend to enter into different sectors. Many service businesses that are not considered as an enterprise have started to be seen as a niche market. Museum marketing is one of these areas which become popular in recent years. Turkey, as one of the emerging countries, follows this global trend, with granting more importance on museums and art galleries. In Turkey, there are many private and public museums but most of them do not give importance on marketing activities because they are seen as cultural tools, but not marketable products. In such a profitable sector, the main question is “Which marketing channels are appropriate for Turkish museum marketing and how can institutions use these channels in an effective way?” Therefore, the aim of this study is to reveal how the institutions utilize marketing tools in the management of museums.*

## **INTRODUCTION**

Museums are not-for profit organizations that aim to educate people. But, like many other organizations, they need marketing to set their objectives, implement strategic plans and promote their products and services to the public. To constitute the appropriate marketing plan that fits the organization, every marketing tool in the museum itself should be considered as a whole. Marketing strategy should support the organization’s culture, values, mission, goals and objectives. Before composing marketing strategy, internal and external environment should be analyzed carefully. Through this analysis; core marketing strategy, which is compatible with the target market, and marketing mix is designed for the museum. Marketing mix is the set of tools that organizations need to plan carefully while presenting to their target market. The main tools in the marketing mix are product, price, place and promotion. Museums provide services to public, so they provide intangible products. For museums, price is the entrance fee or price of the services. Place covers the location of museum, transportation to there and promotion covers the tools such as public relations, sponsorships or advertising of products.

## **MUSEUM MARKETING**

Marketing is vital for every business and organization to live and survive. Although, most art organizations are nonprofit institutions, they are not nonmarket institutions (Rentschler, 1998, p.83). During the past decades, most art organizations have gradually become aware of marketing as a management tool.

The museum has been constructed as a symbol in Western society since the Renaissance. This symbol is both complex and multi-layered, acting as a sign for domination and liberation, learning and leisure. As sites for exposition, through their collections, displays and buildings, museums mediate many of society’s basic values (Hooper-Greenhill, 2001, p.2). There are several explanations about the term “museum.” According to Murray

(1904); a museum is a collection of the monuments of antiquity, or of other objects interesting to the scholar and the man of science, arranged and displayed in accordance with scientific method (McLean, 1997, p.9). In a more recent definition, Museum Association defines museum as “an institution which collects, documents, preserves and interprets material evidence and associated information for the public benefit.” Also according to the international museum community, museums are “not-for-profit making and permanent institutions in the service of society” (McLean, 1997, p.10). Traditionally the prime function of museums has been to gather, preserve and study objects. Today managing museums entails also understanding the need to attract visitors (Gilmore and Rentschler, 2002, p.745). Therefore, museums need marketing to increase their roles in people’s lives, and to increase the number of visitors to museums.

As Rentschler (1999) indicates, museum marketing has been conceptualized in three main periods (Rentschler, 2002, p.8). The first period is the foundation period that lies between the years 1975 and 1983. In this period, main issues were educating visitors, raising staff awareness of the benefits of visitor studies and occasionally, the economic impact of the arts on community. Museums became more democratized in the professionalization period (1988-1993). Ames (1989) implies that these changes forced the recognition of the applicability of marketing to non-profit arts organizations and marketing departments were added to museums (Rentschler, 1998, p.85). After 1994, marketing in museums has passed to an entrepreneurial period. In some places, this period (1995- ) is considered as discovery period. According to Radbourne (1997), collaborative marketing models and a new view of visitors are evident, which diversify revenue sources by obtaining new audiences, products, venues and multi-art experiences (Gilmore and Rentschler, 2002, p.746). Since 1980s, there has been increasing pressure on museums to widen their appeal in order to attract more diverse and larger audience. According to Hooper-Greenhill (1996), some reasons can be stated as reduction in museums’ budgets, implementation of performance measures based on customer satisfaction management and consequence of the contract culture (Goulding, 2000, p.261).

Like most services, the museum “service product” is delivered in a physical environment or site, land and building, shape, lighting, means of directing or orientating the visitor, and methods of stimulating interest and involvement (Goulding, 2000, p.261). According to Gilmore and Rentschler (2002, p.749), the important service dimensions for museum marketing are:

- Education: Education of the public on nature and scope of collection is central to museum service product. Core collection and special exhibitions have a great effect upon the choice of visitors and increase the number of visits to the museum.
- Accessibility: People concern easiness of physical facilities, availability of museum services and offerings for different markets. Museum should give different services to different groups according to their interests.
- Communication: Interaction between museum and visitors is an important aspect of marketing strategy. Guidance and interaction between museum’s staff and visitors are important contributors to the visitor. The other item, interpretation, helps visitors to understand and appreciate the tangible aspects of the service. Also the effectiveness of communicating historical information, the essential product, relies on the ability to construct images, convey information and engage the visitor, through either social exchange or more traditional textual and visual methods.

Although there is a physical product (the collection) in museums, what is really being marketed with the display of the collection is an intangible product (McLean, 1997, p.105). As a result, service dimension is taken into consideration carefully. The collection, its conservation, exhibition should be considered as the core product, whereas the other products or services that complement or facilitate consumption of the core product are augmented products (McLean, 1997, p.107). Museums may offer different kinds of product mix. As an example, specific product mix of a museum consists of permanent and temporary exhibitions, special events, educational resources, school visits, and souvenir.

Museums provide services, so it is hard to determine cost of the service produced. Although museums have some fixed costs like staff salaries and monthly payments, the value of the service should also be evaluated carefully. Pricing strategies affect people’s decision making process among the leisure activities. However, for the visitors

monetary price is not the only cost. Also beside this, museum location (place costs) or physical characteristics (sensory cost) can create some other costs for people (McLean, 1997, p.157). Pricing strategies should be related with the overall organization profile. Marketing objectives should be carefully evaluated in deciding price objectives. In addition, product life cycle and portfolio affect the pricing policy. According to the product portfolio, pricing decisions can be made. Differential pricing can be applied for different target groups like students, children, and groups. Variable prices can be implemented such as admission charges or discounts for different groups (McLean, 1997, pp.161-162). In determining pricing strategies, perceived value is a vital point for museums. The value of a museum is established by its visitors and users.

For museums, place is where a play or exhibition is staged and visual art or craft items are offered for sale. Choosing right place is an essential point that should be considered, because this has an impact on target group. There are some factors, related with the place tool that affects audience decision-making process such as distance, accessibility, public transport access, availability of parking or the costs of accessing the 'place' (e.g. parking fees, public transport ticket) Except in such special circumstances, a museum should be readily accessible by private, in some cases public transportation (Goodman, 2003, p.92). Transportation is an important tool and affects audiences. Choosing an appropriate place is important to increase the visits and it is a good advantage for the competition. In addition, museum or galleries should provide parking places or there should be convenience places nearby. To ease transportation, some museums offer shuttle bus services. As an example, National Air and Space Museum in Washington offers some accessibility options for people; there is a map on internet that shows how to reach the museum, metro rail, also bus services from metro rail, shuttle bus services between different two museums, also metro rail and buses can use from the international airports. Availability of the place also includes opening hours, seasonality of the art organizations. Visiting days and open hours of museum should be clearly identified for the target audience group. Distribution channels and the characteristics of the place should be combined with organization's strategies and other marketing mix tools.

Promotion is another vital marketing tool to attract audiences and it is used in building relationships with other critical markets, especially employees, funders, and sponsors (McLean, 1997, p.138). For developing an effective promotional activity, then first step should be identifying target audience, potential buyers, visitors, current users, deciders, or influencers; individual, groups, particular public, or general public. This is a critical tool to decide what to say, where to say it, and to whom to say it (Kotler, 2003, p.566). Organizations use promotional mix as a part of their marketing strategy. To reach the target audience, museums implement these tools. Messages can be originated from outside the museum such as word of mouth and media editorial. Advertisements can be useful for galleries and museums. Especially through brochures, radio, TV, and printed ads, organizations can effectively reach their target. After museums or galleries define their target market, then they can develop advertising strategy. Also many non-profit service organizations are recognizing the importance of using direct marketing in their efforts to reach wider audiences, build revenue and foster long-term relationships (Arnold and Tapp, 2003, p.141). Through mails or catalogs, an interaction can be developed between target audience group and the organization. Today, rather than be constrained by the physical bounds of objects they house, galleries and museums have moved some portions of their efforts to the internet. (Taylor and Ryan, 1995, pp. 80-88) Through internet and web sites, people can learn about museum or gallery, find information and the most important part is that they can see a part of a collection from there.

## **RESEARCH DESIGN**

### **Purpose**

The purpose of our study is to investigate how the institutions utilize marketing tools in the management of museums. The study also aims to determine the expectations of people from a museum. As a result of the research, it is also possible to understand people's satisfaction level, reasons to visit and frequency of visit to develop appropriate marketing plan for museums.

### **Methodology**

The study consists of two parts; qualitative and quantitative. The qualitative research was conducted through depth-interviews with both private and public museums in Istanbul. In the quantitative part, a survey has been conducted for data collection. The developed questionnaire is composed of three parts. The first part contains questions that aim to determine awareness level of museums in Istanbul. The second part of the questionnaire contains questions that aim to understand the expectations of respondents from museums. The third part contains questions that aim to understand the reasons of why people are not willingness to visit to museums.

## **Sampling**

In the qualitative part, the interviews were conducted with the managers and specialist in museums. In the quantitative part, survey conducted with a group of students in Istanbul. Convenience sampling was used in the selection of the respondents.

## **Data Analysis**

Descriptive analysis has been conducted in this research. Frequency, mean, mode, median, t-test and ANOVA test have been used.

As a result of the reliability and validity tests, Alpha values of the questions are determined between 0.850 – 0.930. These values indicate that the developed questionnaire is reliable. The data were processed through SPSS 13.0 for Windows.

## **Limitations of Research**

Both qualitative and quantitative researches were conducted in Istanbul. Therefore, results only reflect the outcomes in Istanbul, not in all of Turkey. Beside, our sample consists of a small group of students; in a further research sample size may be widened.

## **Findings**

The study, in which 8 museum managers and 95 audiences participated, yielded the following results:

Our sample indicates that 30 respondents did not visit any museum within the last 12 months. More than % 60 of respondents visited the museums between 1 and 3 times in the last 12 months. Only % 4 of the respondents visited to museums at least 4 times. More than 50 % of the respondents preferred to visit to museums with his/her friends. % 27 of respondents preferred to visit to there with his/ her family.

The findings of the study support the fact that the most widely used source for taking information about museum is internet. It was also seen that however reference groups and brochures prepared by museums are very significant sources for taking information about museums, media channels are not preferred too much.

Our sample indicates that the most known museum in Istanbul is Topkapı Museum which is a public one. Private museums - Sabancı Museum, Istanbul Modern and Koc Museum- rank after the Topkapı Museum. It is very interesting that however there are new established museums in Istanbul, the awareness level of these private museums are more than all public museums except for Topkapı Museum. The reason behind this situation may be explained through the effective usage of marketing tools by the management of private museums.

The second part of the questionnaire consists of questions that aim to understand the expectations of respondents from museums. The questions in this part were developed based on marketing mix; product/services, place, price and promotion.

Our sample indicates that “the type of collection”, “staff’s behavior and knowledge”, “presentation style of collection”, “degree of given information about collection”, “variety of collection”, “cleanliness of museum”, “collection specialty and newness”, “availability of educational resources”, and “museum interior design” are so important factors for audiences.

**Table 1: The Importance of Museum Services**

|        |         | Collection | Staff knowledge | Staff behavior | Collection variety |
|--------|---------|------------|-----------------|----------------|--------------------|
| N      | Valid   | 95         | 95              | 95             | 95                 |
|        | Missing | 0          | 0               | 0              | 0                  |
| Mean   |         | 3,71       | 3,49            | 3,66           | 4,25               |
| Median |         | 4,00       | 4,00            | 4,00           | 4,00               |
| Mode   |         | 4          | 4               | 4              | 4                  |

|        |         | Awareness of collection | Education programs | Awareness of museum | Cleanliness of museum |
|--------|---------|-------------------------|--------------------|---------------------|-----------------------|
| N      | Valid   | 95                      | 95                 | 95                  | 95                    |
|        | Missing | 0                       | 0                  | 0                   | 0                     |
| Mean   |         | 4,40                    | 3,09               | 3,33                | 3,89                  |
| Median |         | 4,00                    | 3,00               | 3,00                | 4,00                  |
| Mode   |         | 4                       | 3                  | 3                   | 4                     |

Especially, for audiences, the types of collection and collection specialty are seen as the primary indicators to visit to a museum. In interviews, it is seen that almost all public museums have their own fixed collection, and it is also noticed that in the short run, none of public museums have a plan to accept new collection in their own bodies. Because of this reason, it is seen that most of the audiences visit this kind of museums only one time during their lives. However, private museums always open their gates to the new collections.

The other important tool in marketing is price. For profit organization, pricing strategy is one of the most important strategies to survive in the global competition. But for non- profit organizations, pricing strategy is less important than the others, because they are established for developing a nation’s general welfare.

Both all private and public museums in Turkey are nonprofit organizations. In the interviews, it is seen that both private and public museums’ ticket prices are set in a minimum level. All of them provide free entrance for students, soldiers and old people. Some private museums offer free days/hours for everybody. Main private museums in Turkey are established by very reputable businesses and universities. Having a museum provides these institutions to have a chance to add values to their company names and images. So, they never aim to earn money from ticket price. But they try to earn money through souvenir shops or cafeteria for covering some of museum expenses.

**Table 2: The importance of ticket price**

|        |         | M-ticket |
|--------|---------|----------|
| N      | Valid   | 95       |
|        | Missing | 0        |
| Mean   |         | 3,62     |
| Median |         | 4,00     |
| Mode   |         | 4        |

The findings of the study show that ticket price is one of the important indicators to visit to a museum. In the interviews, public museum managers indicated that many people do not visit to museums because of their ticket prices and most of people believe that museum ticket price is so high.

The other important strategy in marketing is placing strategy. This study shows that factors such as “location of a museum”, “ease of transportation”, “security of location of museum” are considered as the important ones that affect people’s visiting decision to a museum.

In the interviews, the private museums’ managers said that to find a proper location for establishing a museum is very hard in Istanbul. Today, it is almost impossible to open a museum in the city center because of the location cost. Consequently, they search for the proper location close to the city center. Some of the private museums solve this problem with using regular shuttles between the city center and museum. In contrast to the private museums, for public museums, the location of the museum or availability of transportation is not considered by the management. Almost all public museums exist in the major historical areas of Istanbul. The power of this situation provides them an opportunity to attract people to the museum.

**Table 3: The importance of museum location**

|        |         | Location | Transportation | Safety of place |
|--------|---------|----------|----------------|-----------------|
| N      | Valid   | 95       | 95             | 95              |
|        | Missing | 0        | 0              | 0               |
| Mean   |         | 3,84     | 3,72           | 3,85            |
| Median |         | 4,00     | 4,00           | 4,00            |
| Mode   |         | 4        | 4              | 4               |

The last marketing strategy is the promotion of products. It is seen that while all private museums have their own promotion department in their bodies, all promotional activities in the public museums are done by the ministry of culture. It is also seen that private museums use almost all elements in the promotion mix. Web pages should be heavily used by museums, because people prefer to take information from internet and web pages. Awareness of the museum is an important factor while deciding to visit a museum and to create awareness, museums should give more importance on promotion tools.

**Table 4: The importance of museum promotion**

|        |         | Advise for visiting | Web page of museum | Awareness of museum |
|--------|---------|---------------------|--------------------|---------------------|
| N      | Valid   | 95                  | 95                 | 95                  |
|        | Missing | 0                   | 0                  | 0                   |
| Mean   |         | 4,51                | 4,09               | 4,33                |
| Median |         | 4,00                | 4,00               | 4,00                |
| Mode   |         | 4                   | 4                  | 4                   |

Our sample indicates that 30 respondents out of 95 did not visit to a museum in the last 12 months. In the third part, it is aimed to understand the reasons of why people are not willingness to visit to museums. As a result of, it is seen that the main reasons of why people do not visit to museums are ordered as “lack of new collection”, “lack of knowledge about museums”, “limited collection variety”, and “high entrance fee”. These results clearly show that marketing tools, especially product, price and promotion are not used effectively by museums in Istanbul. In the interviews, almost all museum managers said that the main reason of people’s unwillingness depends on their personal attitude. They said that most of the people in Turkey are not interested in visiting museums as a consequence of lack of education about museums. So this problem should firstly solved by governmental policy in stead of marketing tools.

**Table 5: The reasons of why people are willingness to visit to a museum**

|        |         | No new collection | No renovate | No staff knowledge | Don’t like visiting | No time to visit |

## CONCLUSION

In Turkey, there are many private and public museums but most of public museums do not give importance on marketing activities because they are seen as cultural tools, but not marketable products. But like many other organizations, museums also need marketing strategies. In Turkey, it is seen that marketing strategies are only applied by private museums. Therefore, the awareness level of private museums is higher than the almost all public museums. The research results show that collection is the most important factor that affects people participation to the museum. Private museums renovate themselves through new collections or exhibitions. They offer many different services for the visitors. They care about people needs and demands. In most of the private museums, there are souvenir and gift shops and restaurants where people meet with their friends or have a nice time with their parents. Museums should be a part of society's cultural development. This should be promoted through education programs by schools and educational institutions. Meanwhile, visiting museums should be supported through marketing activities. They should especially care about promotion activities. Activities such as advertising or public relations should be heavily used by museums to promote the collections.

# **SATISFACTION WITH HEALTH CARE SERVICES EXPERIENCE: JAPANESE PATIENTS**

**Eleuch Amira**  
**Osaka University of Economics, Japan**

## **ABSTRACT**

*This study aims to assess patient satisfaction with health care service experience and points the most meaningful service features that form his overall judgment. Through a non linear approach, we relied on the scatter model to detect the effect of service attributes on Japanese patients satisfaction and intentional behavior. The study highlighted the necessity to adopt evolution that enhance technical quality and medical practices in Japanese health care settings.*

## **INTRODUCTION**

Interest toward health care service quality and patient satisfaction has been remarkable. One emergent question on which care services contributors are trying to answer is: how to satisfy patients, provide service quality and maximize profit under limited resources in a competitive environment ?In many countries, health care organizations are under colliding pressures : law emphasizing patients rights to a good care interfere with policies of cutting costs and insurance systems'pressures and Japan is not an exception. Hence, our interest toward the Japanese patients relations with health care providers. In this paper, we adopt a marketing perspective through which we try to assess the determinants of Japanese patient satisfaction. As the Japanese context is scarcely investigated (in contrast with USA and Europe), our work aims to enrich the current knowledge on health care service quality and patient satisfaction and to unveil some characteristics of health care practices in Japan. Further unlike the majority of patient satisfaction studies that presume that satisfaction is a linear compensatory process (O'Connor and Shewshuk, 2003), we will base our work on a non linear approach. In addition, far from presuming that patients are not interested in the pure medical procedures neither able to judge its appropriateness, we will frame our study by a theoretical model that considers both functional and technical quality. By doing so, we aim to go deeper in investigating patients' reactions and behaviors in order to better assess their needs.

## **BACKGROUND**

### **Considering technical and functional quality**

Satisfaction is a valuable consumer's feedback that drives the service improvement. It provides essential information about the care delivery process characterized by technical and functional features (Zineldine, 2006). Technical quality refers to the performance of core services while functional quality refers to the manner in which the core service is provided (Donabedian, 1988, Gronroos, 1984). Experience of service is formed by the joint and interrelated effects of the technical and process quality dimensions (Orava and Tuominen, 2002; Brady et al, 2006). Though some researches in health care literature disregarded the importance of technical quality since it was believed that customers would not be able to discern technical aspects of the service, works by Zifko Baliga and Krampf (1997), Frazer Winsted (2000) and Beattie et al (2002) could prove the positive effect of doctors and nurses perceived skills on patient satisfaction. The patient is able to infer an evaluation of his cure procedure through the skills shown by the doctor and nurses when

dealing with him (Trumble et al, 2006). Further, the patient's ability to understand disease's description and treatment procedures is developed due to scientific knowledge accessibility easiness. To this respect, it seems unfair to neglect the effect of technical quality on the patient satisfaction. Furthermore, more holistic comprehension of the service experience judgment implies consideration of all the features on which patients may key in to evaluate the provided service. Our framework will be then based on the Nordic approach of service features where both technical and functional aspects are equally evoked (Gronroos, 2001) when the service is subject to customer's evaluation.

**H1<sup>a</sup>: patient satisfaction depends on functional and technical quality of health care service**

**H1<sup>b</sup>: patient intentional behavior is influenced by functional and technical attributes.**

## **Compensatory/non compensatory process**

In an attempt to simplify the comprehension of patient reaction to health care service experience, researchers have depicted satisfaction antecedents (service attributes) and consequences (intentional behaviors) in linear models. Many works dealt with "satisfaction with this and with that" (O'Connor and Shewchuk, 2003, p.22) considering that patients mathematically average their reactions to the different health care service attributes to come out with a level of satisfaction with their experience. However, psychological theory comes to weaken and contrast the linearity presumption's validity stipulating that in reality, satisfaction does not follow a linear judgment processing (Cronin, 2003). In the same vein, marketing researches posit that some attitudes have a strong impact on consumer behavior whereas some other attitudes do not influence a person's action at all (Van Doorn et al, 2007). Our facts' interpretation is nor linear neither objective. Human subjectivity and selection shape evaluation (Einhorn, 1971). Persons may be inductive; they just select one element and base the overall evaluation on it (Kardes et al, 2004). Evaluation process is often not additive (Brannick and Brannick, 1989), and then positively evaluated attributes cannot compensate for the negatively perceived ones. As consequence, just one miss performance can lead to an overall dissatisfaction (Cronin, 2003, Brady et al, 2006). The use of non additive models to approximate processes underlying evaluation, can lead to greater accuracy in quantification of cognitive processes of decision making and evaluative judgment (Einhorn, 1971; Cronin, 2003; O'Connor and Shewchuk, 2003). Thus, non linear models are likely to come closer to describe and predict judgment process (Brannick and Brannick, 1989). Among several non linear models, Ganzach and Czapczkes (1995) concluded that the non linear scatter model is the best to fit the data. The scatter model is developed by Brannick and Brannick in 1989. It has the strength to indicate whether the evaluation is following a compensatory/non compensatory process and/or the nature of attributes' addition (conjunctive/disjunctive).

Patient satisfaction is a reaction to health care attributes (Zineldine, 2006; Powers and Dawn Bendall, 2004). Information concerning these attributes can be integrated in two possible ways: compensatory and non compensatory. In compensatory model, the patient adds linearly his experience's appraisals. The low value attributed to one feature can be compensated by a high value accorded to another attribute. In non compensatory model, one or some attributes perception may overcome all the other attributes and hence patient ends with an overall positive or negative evaluation with reference to one or few attributes (Otani and Harris, 2004). Two types of configurable rules govern the non compensatory performance evaluation: disjunctive and conjunctive rules (Ganzach, 1995). In the disjunctive model the rating is fundamentally based on positively evaluated attributes. In the conjunctive model, negatively appraised attributes have more impact on devaluing the overall rating (Brannick and Brannick, 1989). If people are risk averse and they avoid making mistakes, negative attributes are often highly prevailing and then conjunctive model are more likely to depict evaluation process (Otani and Harris, 2004). As medical care service consumption seems to be a risky experience where patient is highly involved and mistakes should be avoided at maximum, **we can hence envision that patients will rely on a conjunctive process when assessing their medical care experience and deciding to reuse and recommend the service.**

**H2<sup>a</sup>: Patient satisfaction is inferred according to a conjunctive process**

**H2<sup>b</sup>: Patient intentional behavior is decided relying on a conjunctive process**

## **Health care services in Japan**

In a macro level, Japan appears to have an excellent health care system as services are mostly available to all people in relatively cheap prices. However, recently, discussion has arisen about poor micro economic efficiency (Ogata, 2001). Likewise, the rare researches conducted in Japan about health care quality and patient satisfaction revealed the existence of many problems that affect the relationship provider/ patient and jeopardize the patient health (Ovretveit, 2001; Kurata et al, 1994, Yutaka, 2002). Furthermore, the researches' scarcity attests for a reluctance to adopt a marketing perspective in Japanese health care organization due to a tendency of cutting cost while maximizing profit. Because of the per fee payment system and the services prices fixed by the government, the majority of Japanese health care settings are offering "standard services" which lack specialization and deprive the medical institution to have competitive advantages. In addition, medical and administrative tasks are overlapped as the physicians are in the same time managers of the setting (Levin et al, 1987). Medical care services are becoming high volume services where the absence of restriction on frequency and duration of consultation appears to be responsible for the high number of visit and the short consultation time. Quality seems to be sacrificed by Japanese doctors as they pursue quantity to maintain their incomes. Doctors try to see the maximum number of patients without caring about "how" they see patients neither about "what" they do to patients. In this sense, Onda et al (2004) remarked that the ability to communicate with patient showing him enough interest to hear his story and complaints is not at yet Japanese doctor's skills. Consequently, and not surprisingly, Japanese out patients evaluate pharmacists as best among physicians and nurses based on the performance of medical consultation and the ability to explain instructions and treatment (Onda et al, 2004). Hence, our interest is focused on the Japanese consumers of medical services and their satisfaction with health care service experience. Through such focus, we try to enrich existing knowledge and to detect potential problems that could affect patient experience of health care services and then illuminate some enhancement ways.

## METHODOLOGY

### Research questionnaire and sample

We carried an empirical investigation among Japanese patients to test the validity of our hypothesis. We took into consideration both of the medical service's facets: the functional and the technical quality (Gronroos, 2001). The functional features are depicted by 21 items extracted from the SERVQUAL instrument (Parasuraman *et al.*, 1988). Explicit aspects of clinical quality include provider's qualification using the proper diagnostic equipment and the selection, timing and sequencing of the medical diagnosis and treatment (Li and Collier, 2000). To depict the technical quality, we used sentences like "the doctor service (explanation, listening, ability and knowledge...) was good", "diagnostic was performed according to the explanation given by the patient" and "treatment was appropriate" so any patient would be able to understand. We asked participants to recall their last visit to the doctor and to answer questions. Overall satisfaction was assessed by a single item asking respondents how they felt after consuming the medical service. Intentional behaviors were captured by two questions asking patients about plans to return to the same provider as well as their intention to recommend it to families and friends. For all propositions, a five-point Likert-type scale was used to capture answers ranging from 1 (totally disagree) to 5 (totally agree). A pilot study was carried out with 12 outpatients experiencing services within the last three months. Respondents suggested the addition of item traducing the existence of recommendation to be examined by the doctor. The question from the type "are you introduced by someone?" exists in the questionnaire to be filled by any Japanese patient when he/she goes to a medical setting. Moreover, some respondents admitted the fact that some "famous" doctors require "gifts" to see the patients. Hence we added the item "you needed a recommendation or offered gifts to be admitted". The self-administrated questionnaire was then distributed to 200 outpatients visiting medical institutions operating in Kansai area, west Japan. All respondents were aged more than 18 years old and were direct consumers of medical services. Offering almost similar medical consultations and treatments, institutions were different in terms of appearance and material innovation. Staff (receptionists, nurses and physicians) working in these clinics were all Japanese. One hundred and fifty nine questionnaires (79 males and 80 females) were available for statistical use – a 79% response rate. Respondents' average age was 43.8 years (sd =12.7). 84% were university-level educated.

## Data analysis

Cronbach alphas for quality and intentional behaviors scales were, respectively, 0.89 and 0.84 (>0.7). The scale's reliability condition, therefore, is satisfied (Nunnally, 1987). To assess the service attributes structure we proceed by EFA using principal component analysis with Varimax rotation. Validity of the found structure was verified through a CFA. CFA confirmed the existence of three main constructs. The relationships quality attributes/ satisfaction and quality attributes/ intentional behavior were estimated using the Scatter model developed by Brannick and Brannick (1989):

$$Y = a + b_1X_1 + b_2X_2 + \dots + b_nX_n + [B_{k+1} \sqrt{\sum_{i=1}^n (X_i - \bar{X})^2}]$$

Where Y is the overall satisfaction or intentional behavior, a is an intercept,  $X_i$  is the  $i$ th attribute evaluation,  $\bar{X}$  is the average of attribute evaluations in one profile,  $b_i$  are coefficients,  $B_{k+1}$  is a coefficient to estimate and that indicates whether consumer are more influenced by negative values or positive values when evaluating the service. The Scatter model includes two parts: the first one is a linear additive model, and the second part is a sum of the negative or positive values that may occur when evaluating each attribute according to the judge expectation. If the estimated relation was linear then the scatter term's coefficient will be insignificant and we rejoin the traditional linear model. However if it was really non linear, the coefficient will be significant and subject to a positive or negative value. The signal is of great utility. Negative one indicates that the consumer evaluation is more influenced by negative alternatives than by positive ones. Positive one means that the consumer evaluation is more influenced by the positive alternatives more than by the negative ones.

## RESULTS AND DISCUSSION

### Health services attributes structure

The EFA revealed three main factors which explain 55.63% of the total variance. The CFA results in good fit indexes (RMR=0.024, GFI=0.961, CFI=0.985 and RMSEA=0.063). The confirmed structure depicts three factors named respectively "staff behavior when delivering the service", "technical quality" and "physical appearance". The first factor groups three items "the service was quickly performed" "The staff are willing to help patients" and "the staff behavior transmit trust and confidence to patient". This factor traduces the functional features of the service. The second factor is formed by three items "the doctor service (explanation, listening, ability and knowledge, etc) was good", "diagnostic was performed according to the explanation given by the patient" and "treatment was appropriate". Those items depict the medical service technical facet. The third factor draws the service tangible dimension. The two items "the setting was visually attractive and beautifully decorated", and "medical staff in the setting have neat appearance" are related to this factor. The features categorization seems to fit the quality structure presented by Gronroos (2001). The functional quality is not enough to draw the patient assessment of medical service experience and it seems necessary to refer to the technical attribute in order to understand better how patients perceive the provided service.

### Overall satisfaction judgment

To be introduced in the scatter model, the composite index (CI) was computed for each attribute (independent variable) as the arithmetic mean of all items measuring that attribute.

The scatter model estimation results show that only the staff behavior and the technical quality are statistically significant and positively related to the overall satisfaction. Japanese patients' satisfaction depends on technical quality and staff behavior.  $H1^a$  was confirmed as patients keyed in on both functional and technical features to evaluate their health care service experiences. The non significance of the scatter term indicates that Japanese patients are following a compensatory judgment process while assessing their satisfaction with medical service experience. Hence  $H2^a$  is infirmed. Technical quality weight seems to be more important

(coefficient 0.67) than staff behavior weight (0.23). Our results diverge with Otani and al (2003) finding that American patients depict a non compensatory satisfaction process where the nurse care benefits from the greatest importance. The contradiction seems to be understandable as American and Japanese have many cultural dissimilarities as well as totally different health care systems. In fact Japanese health care settings present standard procedures of admission and discharge. Yet, the words pronounced by working staff seem to be routine and repeated by everyone everywhere. Such routine does not lay much in satisfaction judgment and patients focus on more human and interactive relationship characterized by the staff willingness to help and serve him quickly while transmitting him confidence and trust. Furthermore, the excessive mechanized diagnostic and treatment prescription has deepened patients' needs to skillful doctors. Interactive service process where physician is able to carefully listen to the patient explanation and "friendly" communicate with him in order to prescribe the appropriate treatment seems to be a necessary ingredient to satisfy Japanese patients. Nonetheless, important majority of Japanese physicians working under the duty to allocate equal time for every patient (Kurata et al, 1994), often rely on the result of mechanical diagnostic and prescribe drugs to the patient without even touching him.

## **Intentional behavior**

Composite index for the two items depicting intentional behavior was computed. The results of analysis predicting intentional behavior indicate that the technical quality attribute ( $p < 0.00$ ) and the setting appearance attribute ( $p < 0.05$ ) are significant and positively related to the intentional behavior.  $H1^b$  is confirmed. However, the insignificance of the scatter term traduces the linearity of the causal relationship between health care service attributes and intentional behavior. These results depict the compensatory process by which the patient forms his experience evaluative judgment and his decision to reuse and recommend the provider.  $H2^b$  is infirmed. While deciding about whether to return to the same provider and recommend it to family and friends, Japanese patients focus on the core of their service experience first (coefficient: 0.61) and the setting and personnel appearance second (coefficient: 0.2). "Was the treatment good enough to cure the disease?" "Was the doctor able to perform good diagnostic and explanation so the patient could understand the situation?" "Was the setting clean and properly organized?" "Did nurses have neat appearance?" seem to be questions on which the answers affect patient decision to reuse and recommend the service.

The weight accorded to technical quality when evaluating the medical service and deciding about future behavior illustrates the evolution of Japanese society generally and the patient/provider relationship especially. Due to the Japanese Confucian culture considering physicians in the top of hierarchy as skillful and qualified people, Japanese patients have been long time classified in the bottom of hierarchy as they are presumed to lack scientific knowledge and power. Japanese health care traditional approach gives short shift to patient rights and emphasizes doctors' authority (Westmore, 2006). However, it seems that such power asymmetry assumption should not be the rule anymore as patients are becoming more aware about their rights (Ogata, 2001). The evolution of Japanese society and the adoption of many liberal and individualist norms (Gjerde and Onishi, 2000) encouraged patients to develop a critical view toward their cure and care services. Lack of communication with doctors, shortage of skillful physicians, inappropriate staff behavior and setting appearance may lead the patient to experience dissatisfaction and infer mistrust of practicing doctors and their medical-care technology especially with the frequent reporting of medical errors (Yutaka, 2002). As still no serious measures are taken to listen to patients' complaints, dissatisfied patients often react by experiencing new providers as the insurance system allows access to any provider at the same price. Further, dissatisfied patients are reluctant to recommend the provider fearing from "losing face" inside their group (Triandis, 2004). It merits noting that such fragile relationship that links patients to their health care service provider is likely leading them to point the setting's closeness to home or work as a first motivation beyond the provider's choice (50.9% of patients in our sample).

## **IMPLICATIONS**

Taking into account both technical and functional facets of the medical service while using the scatter model, this work relied on a reliable framework able to better depict the patient reaction to health care service experience. Researchers in health care service marketing are invited to rely more on such models in order to

have better grasp of patient reaction and predict his future behavior. Equally, the technical facet should figure among the attributes believed to affect patient satisfaction and intentional behavior. Researchers should invest more on defining and measuring this dimension. Results show how Japanese culture characteristics and medical practices specificities could provide better explanation to the Japanese patients' reactions. Researchers in health care service ought to use cultural context as a foothold to understand results and predict phenomena. Our findings indicate that Japanese patients overall satisfaction judgment and decision about intentional behavior are result of linear compensatory process. Managers who are in the same time the physicians in Japanese health care settings should pay more attention to the "how" and the "what" of the service through developing a customer orientation among the different employees. As service technical quality seems by far largely to affect patient satisfaction and intentional behavior, providers should try to adopt medical practices which enhance functional specialization rather than underdeveloped standardization (Yutaka, 2002). Physicians ought to develop communication, diagnostic and treatment skills in order to obtain better service output. Further, it seems that more than pronouncing routine words and adopting mechanic courteous manner, staff should be able to demonstrate their willingness to help patient, transmit him trust and confidence, and perform the service quickly. Patients seem to be exhausted from the long waiting time (88.7% of patients in our study admit waiting long time to see the doctor) and the busyness of staff to accomplish routine tasks. Incentive to the medical providers should be more enhanced to encourage the effective use of appointment system in order to save patient's time and better organize staff's work. Further, a well managed space with beautiful decoration and nurses having neat appearance could be also a key to attract more customers and then to maximize profit. Indeed such evolvement could not be accomplished without a real political willingness to change the current situation and to be more opened on Japanese society needs. Japanese health care system should encourage a medical education which emphasizes clinical training in the different medical treatments and incites knowledge diversification even if many Japanese private doctors may oppose such system to hide their shortcomings. Nonetheless, as a rule, Japanese doctors receive hands-on training only in their specialty and then they are often unable to understand exactly the whole health situation of patients. Such rule should be changed in order to improve medical training, renew medical education and employment systems. Revising the health care practices and lows as well as the excessive cutting cost policy, and finding a solution to increase number of doctors and medical staff are challenges to surmount in order to enhance health care service system.

## **CONCLUSION**

Relying on a non linear approach to assess how patients cognitively process their health care experience, this paper explores a scarcely investigated context in medical services literature which is Japan. Furthermore, the study was designed with respect to the theoretical frame work that considers both functional and technical quality to assess patient judgment of health care experience. Though results could illuminate more the understanding of patient reaction to health care experience generally and within the Japanese context specifically, this study seems to be limited by the relatively small sample. Because Japanese patients and health care settings are reluctant to answer the questionnaire and cooperate with the research due to their unfamiliarity with such kind of studies, future researches should rely on the help of official organization such as health ministry to run larger investigation. Broadly, our study could demonstrate the obligation for Japanese health care services policy and delivery to evolve and take in account the patient effective need. Satisfied loyal patients are an asset for the providers to maintain their viability. The evolution seems to be necessary for all the system (medical education and practices) before an unsolvable "breakdown" of the Japanese medical services.

# **PASSENGERS' IMPORTANCE AND SATISFACTION LEVEL OF LOW COST AIRLINES: A CASE STUDY PEGASUS AIRLINES**

**Özlem Atalık, Emin Özel**  
**Anadolu University, Turkey**

## **ABSTRACT**

*The airline industry has been described as "highly dynamic" and "intense competitive". Attaining high level of consumer satisfaction is thus mandatory for company in the airline industry in order to survive, maintain or increase market share. To this end, management needs adequate measure of consumer satisfaction with services rendered by airlines.*

*Today, low cost airlines are very important in airline industry. So many academic papers have recently been published on low cost airlines. However, there is a fat lot search concerning low cost passenger's importance and satisfaction level of low cost airlines. In other words, little is known which factors are important factors and the satisfaction level of them. In this study, the importance and satisfaction levels of the low cost airlines passengers have been tried to be determined. For this purpose, the importance and satisfaction levels for passengers of low cost airline are measured involving on twelve factors. The study is based on responses from 100 passengers who flew on Pegasus Airlines. Empirical data was collected at Sabiha Gökçen International Airport in İstanbul, Turkey. SPSS 10.0 (Statistics Pack for Social Sciences) was used in the analysis.*

## **INTRODUCTION**

Customers are the lifeblood of any organization and customer satisfaction is the key to continued organizational survival (Berry, 1987). Customer satisfaction is becoming an increasingly salient topic in many firms and in academic research. One main rationale behind this interest is that customer satisfaction is believed to be associated with fruitful customer behaviour from the firm's point of view (Söderlund, 1998).

However airline is one of the world's largest service industries. In highly competitive airlines market, customer satisfaction is a key driver of performance, making its measurement and management crucial. Providing high quality service and ensuring customer satisfaction are widely recognized as important factors leading to the success of the airline industries.

## **DEFINITION OF CUSTOMER SATISFACTION**

The word satisfaction first appeared in English during the thirteenth century. The word satisfaction itself is derived from the Latin satis (meaning enough) and the Latin ending -faction (from the Latin facere-to do/ make). Early usage centred on satisfaction being some sort of release from wrong doing. Later citings of the word emphasise satisfaction as a "release from uncertainty" (The Oxford Library of Words and Phrases, 1993). Modern usage of the word has tended to be much broader, and satisfaction is clearly related to other words such as satisfactory (adequate), satisfy (make pleased or contented) and satiation (enough) (Parker- Mathews, 2001).

Customer satisfaction has been considered one of the most important constructs, and one of the main goals in marketing (Erevelles and Leavitt, 1992).

Kotler defines customer satisfaction as follows: *Satisfaction is a person's feelings of pleasure or disappointment resulting from comparing a product's perceived performance (or outcome) in relation to his or her expectations* (Kotler, 1997).

According to other definition satisfaction is defined as a post consumption evaluation that the chosen alternative is consistent with prior beliefs and expectations (with respect to it). Dissatisfaction, of course, is the outcome when this confirmation does not take place. (Laws, 2005)

Customer satisfaction has become one of the key issues for companies in their efforts to improve quality in the competitive marketplace. It can be seen as either a goal of or a measurement tool in the development of construction quality. Customer satisfaction is considered to affect customer retention and, therefore, profitability and competitiveness (Anderson and Sullivan 1993). According to Jones and Sasser (1995), complete customer satisfaction is the key to securing customer loyalty and generating superior long-term financial performance. It is also apparent that high customer satisfaction leads to the strengthening of the relationship between a customer and a company, and this deep sense of collaboration has been found to be profitable (Kärnä, 2004)

Satisfaction is particularly important in relation to organizations that deliver services, rather than goods. Customer satisfaction with goods frequently focuses on the product itself: does it work, doing what it is supposed to do? In the service field this is not the case. Since the “product” is intangible, satisfaction is a perception about performance, rather than the utilization of an object (Berry, 1987)

In recent years, a growing number of studies have focused on customer satisfaction in the service industry (Cadotte and Turgeon, 1998; Barsky and Labagh, 1992; Almanza *et al.*, 1994; Gundersen *et al.*, 1996; Qu and Li, 1997). Swan and Combs (1976) were among the first to argue that satisfaction is associated with performance that fulfills (equal to or above) expectations, while dissatisfaction occurs when performance falls below expectations. The common reason for studying customer satisfaction is the profitability that is generally believed to be brought by customer satisfaction (Barsky and Labagh, 1992; Gundersen *et al.*, 1996; Lam *et al.*, 1996). The key benefits brought by customer satisfaction are repeat purchases, favorable word-of-mouth publicity, reduced customers' price elasticity, and increased loyalty (Fornell, 1992). Customer satisfaction is a result of comparison of the service performance with expectation (Barsky, 1992; Hill, 1986; Oliver, 1980). This cognitive comparison between pre-use expectations and post-use perception has been shown to be a predictor of satisfaction in some situations (Oliver, 1980). Customer satisfaction is therefore defined as post-purchase evaluative judgment concerning a specific product or service (Fornell, 1992; Gundersen *et al.*, 1996) (Vincent C.S., 2000).

As customer needs and expectations are changing all the time, this will lead to a situation whereby customers keep setting ever higher standards, and therefore to achieve perfection is impossible (Farson, 1997). Knowing the needs of the customer makes it easier to anticipate the ideal set of products and services. A major flaw for all the companies has proved to be their inability to understand other ways that customers can be satisfied (Rothschild, 1984).

Implementing customer satisfaction philosophy means identifying customers, then identifying their needs and expectations and finally, measuring their perceptions (Stenberg, 1997).

Companies must periodically measure customer satisfaction in order to learn how satisfied its customers are. Torbica and Stroh (2001) argue that, in construction, the extent of customer satisfaction is only known late in the project when most of the customer's money has already been spent. When companies know which attributes of a service or product affect customer satisfaction, their challenge is to modify their current offering in a way that would lead to maximum customer satisfaction (Kärnä, 2004). A customer satisfaction study should begin by asking about the factors affecting customer satisfaction, how important those factors are for the whole, and the level of customer satisfaction (Järvelin *et al.*, 1992; Koskela, 2002).

## LOW-COST AIRLINES

According to the Statistics and Forecast (STATFOR) Service of Eurocontrol there is no single best definition of a low-cost carrier (Groote, 2008). It is generally accepted that a low-cost carrier or low cost airline (also known as a no-frills or discount carrier/airline) is an airline that offers low fares in exchange for eliminating many traditional passenger services. (<http://en.wikipedia.org/>, 2008)

Today low-cost carriers pose a serious threat to traditional "full service" airlines, since the high cost structure of full-service carriers prevents them from competing effectively on price - the most important factor among most consumers when selecting a carrier. From 2001 to 2003, when the aviation industry was rocked by terrorism, war and SARS, the large majority of traditional airlines suffered heavy losses while low-cost carriers generally stayed profitable.

What's the secret behind the success of these airline companies?

The "low-cost carrier" business design is defined by three key elements: (Mercer Management Consulting, 2002)

- **Simple product:** catering on demand for extra payment, planes with narrow seating (but bigger capacity) and only a single class; there is no seat assignment, they don't offer frequent-flyer program's, ticketless travel
- **Positioning:** Non-business passengers especially leisure traffic, and budget priced, short-haul point-to-point traffic with high frequencies, making an aggressive marketing; using secondary airports (e.g. regional airports), a strong competition with all transport carriers
- **Low operating costs:** low wages, low air fees, low costs for maintenance, reduced employment (with much lower rates of number of passengers per employer), cockpit training and standby crews due to homogeneous fleet, high resource productivity, short ground waits due to simple boarding processes, no air freight, no hub services, short cleaning times, high percentage of online sales (Internet).

Briefly, the core characteristics common to the majority of low cost airlines are: high aircraft utilization, internet booking, use of secondary airports, minimum cabin crew, lower wage scales, lower rates of unionisation among employees, one class of seating thus allowing more seats per aircraft than traditional airlines (who offer alternative seat pitches for different classes of travel), short 'on the ground' turn around times, no cargo carried to slow down turn around times, a simple fare structure and pricing strategy, e-ticketing, no seat allocation, passengers having to pay for food and drink, simple or no frequent-flyer program, flexible working terms and conditions for employees relative to traditional airlines, point to point services and no connections offered (Doganis, 2001). Combined these factors have enabled airlines to reduce their costs and offer lower fares relative to prices traditionally charged for a route. (Francis, Humphreys, Ison, Aicken, 2006; Oliveira, 2008)

The entry of low-cost carriers providing basic air transport service with no frills and lower fares has considerably transformed competition in the airline industry. Notwithstanding a phenomenon of partially or fully liberalized airline markets dating back to the US deregulation process of the seventies, it was only recently that this low-cost revolution (Doganis, 2001) has resulted in the formation of a well recognized and distinct business strategy and a sustainable market niche. (Oliveira, 2008)

Starting out in 1971 as a small carrier in Texas with only three jets, Southwest Airlines is credited with giving birth to the low-cost-carrier phenomenon. Its founding mission was to fly passengers to short-haul destinations, on time and for the lowest fare possible. Nearly 36 years later, countless carriers have copied the philosophy. (Kerensky, 2007)

Today, it operates 2,800 daily flights to 60 airports in 59 cities across the United States, and registers yearly almost 70 million passengers. According to data gathered in 2003, Southwest Airlines is currently one of the largest domestic airline companies of the USA and it is even world's third biggest just after American Airlines and Delta Air Lines. Around 30 percent of all flights in the USA are realised by low-cost carriers (De Groote, 2008).

Europe's history of low-cost airlines is much younger, but those airline companies are for sure trendsetters of the 1990s. The expansion of low-cost carriers in Europe coincided with the final deregulation of the market during the 1990s. Genuine low-cost operations began in Great Britain in the 1990s with the Irish company Ryanair (founded in 1985), which was patterned on American Southwest Airlines. The European market is without any doubt characterized by the expansion of the existing low-cost airlines (e.g. Ryanair, easyJet), new upstarts (e.g. Wizzair, first flight on 19 May 2004), takeovers (e.g. easyJet) and bankruptcies with market exits (e.g. AB Airlines, Air Polonia) (De Groote, 2008).

Global flight information company OAG released a 2006 report identifying 40 low-cost carriers in Europe alone. It also revealed that Ryanair, a low-cost heavyweight based in Ireland, was carrying more passengers per month than British Airways. And the number of passengers interested in booking with low-cost names is on the rise. According to OAG's Quarterly Airline Traffic Statistics The low-cost sector accounted for 16 per cent, or 416,000, of the 2.6 million flights scheduled for July 2007 (Kerensky, 2007).

## PEGASUS AIRLINES

Pegasus Airlines was established on 1 December 1989 and started operations on 15 April 1990. Pegasus Airlines is one of the biggest companies in Turkey with a passenger capacity of more than 4 million passengers per year. Pegasus Airlines is an airline based in Istanbul, Turkey. It operates holiday charter flights to Turkish resorts from around 100 destinations in 17 countries, scheduled services to 17 domestic destinations and 13 destinations in Europe and on demand charters and ACMI leases. Its main base is Atatürk International Airport, Istanbul, with a hub at Antalya Airport. The Pegasus Airlines fleet consists of the following aircraft (at June 2007): 2 Boeing 737-400, 3 Boeing 737-500 and 12 Boeing 737-800.

The airline has also ordered 12 Boeing 737s (6 firm orders for 737-800, and 6 options for either of 737-700, 800 or 900 ER). Pegasus Airlines average fleet age is 6.9 years (at July 2006). Pegasus Airlines is Turkey's only private airline whose wide networks of domestic flights depart from Istanbul Sabiha Gökçen International Airport. (<http://www.pegasusairlines.com>, 2008)

## RESEARCH METHODOLOGY

**Objective of the Study:** In this study, the importance and satisfaction levels of the low cost airlines passengers have been tried to be determined.

**Limitations of the Research:** The research is limited by the questionnaire answered between the 26- 30 of April, 2007 by 100 passengers. Data were collected from passengers departing from Sabiha Gökçen Airport.

The international terminal of the Sabiha Gökçen Airport was chosen as the main data-collection point which has one of the second largest international terminals and the low cost airport in Turkey. All the same Sabiha Gökçen Airport is located at the crossroads of Europe and Asia. All scheduled domestic flights of Pegasus

Airlines depart from Istanbul Sabiha Gökçen International Airport, which is the newest addition to Turkey's airports. (<http://www.sgairport.com/>, 2008)

**Research Method:** Face-to-face interview is used for the research.

**Research Medium:** The research medium consists of 100 passengers. For sampling purposes, 100 was randomly selected from the passengers between 26- 30 of April and included in the questionnaire analysis.

**Collection of the Research Data:** A pilot work has been done with 16 passengers to learn about how good the questions in the questionnaire form serve for the objective of the research. According to answers to those questions, some modifications have been done in the questions. 100 usable questionnaires were gained in the research and Microsoft Office Excel and SPSS 10.0 (Statistics Pack for Social Sciences) were used in the analysis.

## Findings

**Table 1. The level of importance of low cost airlines by passengers**

| The level of importance of low cost airlines by passengers | Means       |
|--|-------------|
| Convenience of schedules                                   | <b>1.23</b> |
| On time performance  | <b>1.20</b> |
| Safety   | <b>1.14</b> |
| Types of airlines  | 2.35        |
| Price  | <b>1.61</b> |
| Comfort  | 1.82        |
| Food and drinks  | 2.25        |
| Personnel behavior   | 1.48        |
| Airline images   | 1.88        |
| Baggage services   | 1.65        |
| Recommendations of travel agent                            | 2.58        |
| Cabin services   | 1.78        |
| n=   | 100         |

1= Exactly important 2= Important 3= Neutral 4 =Not important 5 =Exactly not important

When the level of importance of low cost airlines by passengers was analyzed; it has seen that a big part of the factors has been determined as “exactly important” for the factors. However the factors such as safety, on time performance, convenience of schedules have come into prominence much more in proportion to the others. It is found that the types of airlines, food and drinks, recommendations of travel agent factors have been considered “not exactly important” factors by the passenger.

**Table 2.The Level of Satisfaction of the Pegasus Airlines perceived by the passengers**

| The level of Satisfaction of the Pegasus Airlines perceived by the passengers | Means       |
|---|-------------|
| Convenience of schedules  | <b>1.76</b> |
| On time performance   | <b>1.89</b> |
| Safety  | <b>1.64</b> |
| Types of airlines   | 2.38        |
| Price   | <b>2.15</b> |
| Comfort   | 2.33        |
| Food and drinks   | 2.67        |
| Personnel behavior  | 2.09        |
| Airline images  | 2.34        |
| Baggage services  | 2.10        |
| Recommendations of travel agent   | 2.61        |
| Cabin services  | 2.06        |

|    |     |
|----|-----|
| n= | 100 |
|----|-----|

1=Exactly satisfying 2=Satisfying 3=Neutral 4=Not satisfying 5 =Exactly not satisfying

When the level of satisfaction of the Pegasus Airlines perceived by passenger convenience of schedules, on time performance and safety has been determined as “exactly satisfying” for the passengers. However the factors such as price, types of airlines, price, comfort, food and drinks, personnel behavior, airline images, baggage services, cabin services recommendations of travel agent have been considered “satisfying” factors by the passenger instead of exactly satisfying.

**Table 3. Comparison of the Importance and Perceived Satisfaction Levels for the passengers on the Pegasus Airlines**

| <b>Comparison of the Importance and Perceived Satisfaction Levels for the passengers on the Pegasus Airlines</b> | <b>Means</b> | <b>Means</b> |
|--|--------------|--------------|
| Convenience of schedules   | <b>1.23</b>  | <b>1.76</b>  |
| On time performance  | <b>1.20</b>  | <b>1.89</b>  |
| Safety   | <b>1.14</b>  | <b>1.64</b>  |
| Types of airlines  | 2.35         | 2.38         |
| Price  | <b>1.61</b>  | <b>2.15</b>  |
| Comfort  | 1.82         | 2.33         |
| Food and drinks  | 2.25         | 2.67         |
| Personnel behavior   | 1.48         | 2.09         |
| Airline images   | 1.88         | 2.30         |
| Baggage services   | 1.65         | 2.10         |
| Recommendations of travel agent  | 2.58         | 2.61         |
| Cabin services   | 1.78         | 2.06         |
| n=   | 100          | 100          |

1=Exactly important 5= Exactly not important

1= Exactly satisfying

5=

Exactly not satisfying

When the comparison of the importance and perceived satisfaction levels for the passengers on the Pegasus airlines are examined, it is seen that there is not very important differences between the importance and satisfaction levels.

As can be seen in the table, convenience of schedules, on time performance and safety “exactly important” and perceived by passengers “exactly satisfying”.

When the factor price, comfort, personnel behavior, airline images, baggage services, cabin services as “exactly important” by passengers and these factors perceived “satisfying” instead of “exactly satisfying”.

It is found that the types of airlines, food and drinks, recommendations of travel agent factors have been considered “important” and these factors perceived by the passenger as “satisfying”.

## CONCLUDING REMARKS

The general aim of the research, the importance and satisfaction levels of the low cost airlines passengers have been tried to be determined and realized as limited with 100 passengers of Pegasus Airlines.

It is possible to summarize the findings as in the following;

- The safety, on time performance, convenience of schedules can be mentioned among the most important factors for the passenger low cost airlines. However the factors such as comfort, airline images, baggage services, cabin services and personnel behaviors’ have come into prominence much more in proportion to the others in terms of the importance attached.

- It is found thought that the types of airlines, food/drinks, recommendations of travel agent factors have been considered “not exactly important” factors by the passenger. This is expected result. Because of passengers only want to fly point to point.
- When the level of importance of low cost airlines by passengers is analyzed, price is not important as much as on time performance, convenience of schedules. It’s very interesting.
- When the comparison of the importance and perceived satisfaction levels for the passengers on the Pegasus Airlines are examined, it is seen that there is not very important differences between the importance and satisfaction levels. According the results, convenience of schedules, on time performance and safety “exactly important” and perceived by passengers “exactly satisfying”. Nonetheless price, comfort, personnel behavior, airline images, baggage services, cabin services as “exactly important” by passengers and these factors perceived “satisfying” instead of “exactly satisfying” and types of airlines, food and drinks, recommendations of travel agent factors have been considered “important” and these factors perceived by the passenger as “satisfying”.

# **THE ROLE OF AN IDENTIFICATION TECHNOLOGY ON FIRM PERFORMANCE: A CONCEPTUAL MODEL PROPOSAL**

**Susana Garrido Azevedo and João Ferreira**  
**University of Beira Interior, Portugal**

## **ABSTRACT**

*Customers are more demanding in terms of responsiveness, level of service, quality of products and costs. But many times firms only could reach these goals if they invest in new technologies. The new technology that has received considerable attention from academics and practitioners is the Radio Frequency Identification (RFID) technology. In this context, this paper aims to highlight the potentials associated with the utilization of the RFID technology in logistics field and its contribution to the performance of firms. That is, it wants to emphasize the importance of this technology to firms perform the logistics activities faster, with more quality, cheaper and with more responsiveness.*

## **INTRODUCTION**

The Radio Frequency Identification (RFID) is the generic name attributed to the technologies that use the waves radio (Jones et al., 2005) for the automatic identification of objects, positions or persons through electromagnet answers and at a considerable distances (So and Liu, 2006). It allows that firms produce, warehouse and deliver a high quantity of data quickly (Bange, 2006). RFID is an emerging technology intended to complement or replace traditional barcode technology to identify, track, and trace items automatically. RFID is claimed to add intelligence to and to minimize human intervention in the item identification process by using electronic tags. The tags are significantly different from printed barcodes in their capacity to hold data, the range at which the tags can be read, and the absence of line-of-sight constraints (Meyerson, 2007).

This conceptual paper aims to highlight the potentials associated with the utilization of the RFID technology in logistics field. That is, it wants to emphasize the importance of this technology to firms perform the logistics activities faster, with more quality, cheaper and with more responsiveness. The paper is structured as follows. We start with the characterization of the RFID System in terms of the elements that constitute it (readers, tags, software and security programs). The following section focus on the main advantages and disadvantages associated with the use of the RFID technology. Next, a literature review about the performance measurement systems in logistics is presented with a special highlight on the leading criteria in the selection of performance measures. A conceptual model to evaluate the impact of the RFID on firms' performance is proposed and some conclusions are drawn.

## **THE RFID SYSTEM**

A RFID system is composed by several elements: readers, tags, software and security programs for the readers (Atkinson, 2004). Instead of visible light used in ordinary bar code labels, these tags use radio waves to communicate with the readers. The readers generate signs that are able, by one hand to supply energy to the tag in order to generate data and, on the other hand, to send a sign of interrogation. To produce radio waves tags require some source of energy to power its electronics. Active tags use a tiny battery, a microchip, and a tiny antenna built into them. The operating frequency of radio waves employed also varies. Low-frequency RFID tags

operate at 125 to 134 kHz, for US and international use. High-frequency systems use 13.56 MHz. Frequencies of 866 to 960 MHz are used in UHF (ultra-high-frequency) systems, while microwave systems operate at 2.4 to 5.8 GHz (Dipert, 2004). The key component of an RFID system is the tag itself. Tags come in a large variety of forms and functional characteristics. One useful way of classifying tags is to divide them into active and passive classes. Active tags whose read/write range is longer and passive tags with shorter range. However, passive tags are much cheaper than the active tags and are therefore more widely used. The active tags have more possibilities and bigger flexibility than the passive ones. This is because, they have their own internal power source which is used to power the integrated circuits and broadcast the signal to the reader

To distinguish tag types from each other, Electronic Product Code (EPC) Global has established five tag classes to indicate capabilities a tag can perform (Meyerson, 2007). For instance, Class 0 tags are factory programmable. The EPC number is encoded onto those tags during manufacture and can be read by a reader. Class 1 tags can be programmed by the retailer and supplier. They are manufactured without the EPC number which can be encoded onto the tag later in the field (i.e., by retailer and supplier). The Class 3 tags have the Class 2 capabilities plus a power source to provide increased range or advanced functionality. The Class 4 tags have the Class 3 capabilities plus active communication and the ability to communicate with other active tags. The Class 5 tags have the Class 4 capabilities plus the ability to communicate with passive tags as well.

Antennas also come in a diverse range of form and technical factors. They are used in both the tags and the reader. The size could vary from under a square centimeter to several square meters. Technically speaking, UHF reader antennas can be classified as circular-polarized or linear-polarized antenna. The former emit and receive radio waves from all directions, while the later work best in one particular direction. Therefore circular-polarized antennas are less sensitive to transmit Readers could come in four types: handheld, vehicle-mount, post-mount, and hybrid (Meyerson, 2007). The first three are dedicated to reading of the tags, active or passive. The fourth type has the active/passive mode allowing it to switch from the passive to active mode and vice versa. Both handheld and hybrid readers are more expensive than the vehicle-mount and post-mount. Next generation readers are expected to have less power consumption and fewer voltage requirements. Passive RFID readers create a radio frequency field when they are turned on. When a reader detects passive tags, it activates them. These tags draw their power from the radio frequency field; they do not require battery power. Because they have no battery, the passive tags are smaller and lighter in weight than active tags. Some are as light or even lighter than the bar-coded labels (Meyerson, 2007). When the active tags with power come into the reader's field, the reader switches to the read mode and interrogates the tag. However, the operating range of a linear-polarized antenna is more than that of a circular-polarized antenna (Intermec, 2004). When a tag communicates with an antenna, the radio frequency portion of the circuit between the tag and the antenna is called the air interface. This radio communication takes place under a certain set of rules called air interface protocol. Propriety protocols may cause interoperability problems with equipment from different vendors. Readers read or interrogate the tags. In reading, the signal is sent out continually by the (active) tag whereas in interrogation, the reader sends a signal to the tag and listens. To read passive tags, the reader sends radio waves to them, which energize them and start broadcasting their data. The reader reads all the tags within its read range in a quick succession. This automatic process reduces read times. In a field test, Marks & Spencer, UK, tagged 3.5 million bins with RFID tags. While it used to take 17.4 minutes to read 25 trays with bar codes, on 36 dollies, RFID reduced that to just three minutes. This result was in an 83% reduction in reading time for each tagged dolly (Wilding and Delgado, 2004). Software is the glue that integrates an RFID system

Again it depends upon the industry context, but usually a front end component manages the readers and the antennas and a middleware component routes this information to servers that run the backbone database applications. For example, in a manufacturing context, the enterprise software will need to be made aware of RFID at various levels depending on how far downstream into manufacturing and out into the supply chain RFID is implemented. The middleware technologies could be categorized into three levels: (i) software applications which solve connectivity problems and monitoring in specific vertical industries; (ii) application managers that connect disparate applications within an enterprise; and (iii) device brokers that connect applications to devices like shop-floor machines and RFID readers (RAGMS, 2004).

The enormous advantages associated with this technology, has justified its large application in several functional areas: manufacturing, transportation, distribution, information systems, store operations, and sales (Meyerson, 2007). We can find the RFID technology in different contexts namely in: i) anti-terrorism initiatives (Albright, 2005); ii) electronic keys; iii) warehouses (Meyerson, 2007); iv) centers of distribution (Borck, 2006);

v) points of sales and; v) security applications in the transport (Kevan, 2004), demotic (Kelly and Scott, 2005); vi) e-business; vii) Supply Chain Execution Applications; E-business (Meyerson, 2007).

## **ADVANTAGES AND DISADVANTAGES OF THE RFID TECHNOLOGY**

There is a high investment in the development and improvement of the RFID systems because of the important advantages that firms can reach with it when compared with bar code tags where the reading must be done by a visual contact using optical readers. In this context, one of the advantages pointed out to the utilization of the tags is its power of reading. The tags can be read independently of the environment conditions. They can be read in aggressive environments such as fire, ice, ink, noise and different temperatures (Knill, 2002). This system presents also a high, rigorous and simultaneous capacity of reading (So and Liu, 2006), what could become an important source of competitive advantage in the logistics field. This characteristic, contribute to increase the efficiency of the transport in terms of loads and unloads of cargo once the warehouse operators do not have to use optical reader for collect data about the products that are loaded or discharged in the vehicles. Moreover, this technology allows collecting information of objects in movement (Bange, 2006; Knill, 2002).

The application of the RFID technology can brings also some advantages to the warehousing activity. The collection of the information put in each tag, allows the automatic and rigorous replacement of the stocks' levels (Atkinson, 2004; Kelly and Scott, 2005), a easier identification of the places where products are stored in the warehouses (Kelly and Scott, 2005; Kinsella and Elliot, 2005) and a quicker collect of data (Sullivan, 2004; So and Liu, 2006) without any kind of visual contact with the products (Borck, 2006). Knowing that on average, and in case of bar codes, the warehouse operators read the bar code labels around 25 times, it is comprehensible the high productivity than can be achieved when in its substitution smart labels are used with all the processes' automation that it could involve (Kinsella and Elliot, 2005). In terms of economics, security and marketing, the RFID technology can bring also some advantages. Economically we assist a decrease on stock levels due to a higher control of it and also a better productivity (Witt, 2004; Sullivan, 2004). Thanks to the application of this system, the firms in general and the retailers in particular can reach, by one hand, a decrease on stockouts, a better control of procurement and a development on cross-selling in a more efficient way (Kinsella and Elliot, 2005). The RFID technology makes also possible a better control of the packaging conditions from upstream to downstream of the supply chain (Kevan, 2004; So and Liu, 2006). This last question is related with the rastreability which is imposed by the European regulations to the products agro-food. In the case of retailers, the tags allow them to do a more efficient management of stocks levels (Borck, 2006) since becomes much easier and quicker the identification of the products and also the control of products' life-cycle. The permanent control of the products putted in the shelves of the stores allows the development of specific marketing decisions to each product (Atkinson, 2004; Kelly and Scott, 2005). Under a widened viewpoint, the RFID permits a better visibility of all the supply chain, necessary for a better management of it (Witt, 2004). Among organizations, a supply network characterized by rich information exchange, which can be enabled by RFID, increases the feasibility of implementing alliances of firms that exchange information to coordinate production and distribution, outsource functions and services, and partner with suppliers and intermediaries (Lee *et al.*, 1997; Straub *et al.*, 2004). In cases in which the RFID System adopts a more open and integrated configuration, allowing that the information flows through all partners of the same chain, a lot of bottlenecks of information reading can be avoid.

In the activity of transport, this technology can be used to identify a specific product or to monitor the temperature of the products during the transport. More, the RFID makes possible to verify also if the temperature or humidity of the products was broken during the transport chain (Kevan, 2004). In this way, it is possible to have access to all conditions under which the products were submitted during the transport and also to use security mechanisms (Kinsella and Elliot, 2005). As it can be seen, the new application of the RFID technology in a business and logistics context can bring a lot of advantages for the firms in terms of optimization and of efficiency. However, some problems have also been identified by the firms. Despite of the enormous advantages attributed to the RFID technology, some disadvantages are also pointed out. In this context, the main disadvantage attributed to the use of this technology is its cost. It involves a big investment (Borck, 2006) and the return of this investment is only recuperated in a long time (Kinsella and Elliot, 2005). If a short Return-on-Investment (ROI) was verified it could promote the use of this technology because according to Trunick and Williams (2005) this type of technologies presents a great level of obsolescence and innovation. Furthermore, the

cost of each smart label is higher than the bar code one which lead firms with millions of SKUs to think about it. The level of security provided by the RFID represents another disadvantage. From the point of view of Atkinson (2004) is relatively easy to have access to the information that flows in a RFID systems in a warehouse or in a center of distribution center of a competitor. It is only necessary to use a radio telescope in a relatively near distance. This can explain the fear of the firms to adhere to the RFID technology. The complexity of this technology, the lack of know-how and standardization are some obstacles referred by firms for not use the RFID technology (Albright, 2005). Once analysed the main characteristics, advantages and disadvantages of the RFID technology in a logistics context, we will focus on the impact of this technology to the performance of firms. So, a literature review about the performance measurement system is presented and a set of performance measures is proposed to be used to evaluate the impact of the RFID on a logistics context.

## **PERFORMANCE MEASUREMENT SYSTEM (PMS) IN LOGISTICS**

The reasons which have lead firms to invest in a logistics performance measurement system are the following: (i) obtaining a holistic view of the logistics process; (ii) accompanying the development of logistics activities along time (TRILOG, 1999); (iii) a better understanding of what is happening; (iv) the possibility of influencing behaviours; (v) obtaining competitive results (Fawcett and Cooper, 1998); (vi) understanding firms' unique competences (Clinton, *et al.*, 1996); (vii) a better allocation and control of resources (Bowersox and Closs, 1996); (viii) identification of inefficiencies and sources of costs; (ix) improvement of customer service; (x) development of added-value services for which the customers would be willing to pay a premium price; and (xi) improvement of processes (Keebler, *et al.*, 1999). Two theoretical perspectives of approaching logistics performance measurement systems are referred in the literature: (i) functional perspective (Mentzer and Konrad, 1991; Pohlen and LaLonde, 1994; Davis and Drumm, 1997); and (ii) processual perspective (Carvalho, 1995; Bowersox and Closs, 1996; Keebler, *et al.*, 1999). The main difference between these two perspectives is related to the incidence of PMS. According to the functional perspective, logistics PMS should fall upon a determined function or activity, considering this as an isolated entity. However, this perspective has raised some criticism, mainly from followers of the processual approach, under the argument that efficiency and effectiveness of a determined action does not allow measuring the performance of all the process, obtaining in this case only a biased performance measurement (Keebler, *et al.*, 1999). In contrast, the processual perspective defends that PMS should fall on the whole process. When choosing the performance measures, firms must decide between general performance measures, which are of financial-accounting nature (sales, profit, return on investments), and measures directly related to the logistics process, in other words, operational ones (White, 1996).

Several authors defend that, independently of the function or the business area, measures of operational nature should be used (Kaplan and Norton, 1992; Gerwin, 2005; Cassab and Maclachlan, 2006). This is because, on one hand firms, more than ever, highlight competences and qualifications (not measured by aggregated measures of financial-accounting nature), and on the other hand, because the connection between operational improvements and financial success is, most of the time, tenuous and uncertain. Barker (1995) also argues that financial measures, being short term control mechanisms, become, most of the time, inadequate in the analysis of long term improvements. Apart from these limitations, Ghalayini and Noble (1996) point out some disadvantages associated with financial-accounting measures such as: (i) a lack of flexibility; (ii) high cost; (iii) inadequacy to the new competitive environment; (iv) more probability of quickly becoming out-of-date; and (v) the difficulty of quantifying improvements in monetary terms. Thus, it is reasonable to conclude that measures of operational nature should prevail in a logistics' PMS. In this context, it is important to analyse the criteria to choose the performance measures that should be used to evaluate the impact of the technology RFID used in logistics activities over the performance of the firms.

### **Leading Criteria in the Selection of Performance Measures**

Performance can be considered in a context where one intends to measure the firms' capability in reaching certain targets or objectives, previously defined. Being so, targets and objectives should be previously established and measures and indicators that allow a better performance measurement of the firm should be chosen. In this circumstance, some targets or objectives appear as leading factors in the selection of performance

measures. Kellen (1992) defends the connection between the strategic planning of the firm and the measurement system, in order to guarantee suitability of the logistics processes and specific objectives of the firm.

In the literature it is frequently argued that performance measures should be derived from strategy; that is, they should be used to reinforce the importance of certain strategic variables (Fombrun and Wally, 1989; Zahra, 1993; Chandler and Hanks, 1994). Even though this does not always appear to happen in reality (Neely *et al.*, 1999), the link between performance measurement and strategy has been extensively explored in the business strategy literature (Mintzberg, 1978). Another factor that is pointed out by some authors (NEVEM-workgroup, 1989; Van Amstel and D'Hert, 1996; Bowersox and Closs, 1996) is the logistics objectives.

The NEVEM-workgroup (1989) also points out the role of production organization in determining the selection of performance measures. Other criterion used in the selection process is the one related with the logistics priorities. For Fawcett and Smith (1995) the main logistics priorities in the logistics PMS are the following: (i) order fulfilment; (i) quality of customer service; (iii) flexibility and responsiveness; (iv) service innovation; and (v) cost. Wheelwright (1978) defends that firms can only follow the performance of logistics practices, if they have implemented a PMS which reflects the firms' competitive priorities. These competitive priorities are: cost, service/quality, productivity, and time. Fitzgerald *et al.* (1991) have a different point of view. They suggest that there are two basic types of performance measures in any organization those related with results (competitiveness, financial performance), and those that focus on the determinants of the results (quality, flexibility, resource utilization and innovation). This suggests that it should be possible to build a performance measurement framework around the concepts of results and determinants.

In sum, there is a great variety of proposed solutions in what refers to the factors that should be considered when selecting performance measures. For a faster and easier analysis, we present them in the table 1.

**Table 1: Leading criteria in the selection of performance measures**

| Factors                          | Performance Measures   | Authors   |
|----------------------------------|--|---|
| Key success factors              | Delivery fulfilment; Customer service; Order lead times; Responsiveness level  | Cavaco and Themido (2000)                                   |
| Strategy                         | Availability and reliability of the customer service; Acceptable costs for the level of foreseen service; Investment and financial control; Productivity and                         | Carvalho <i>et al.</i> , (2001)<br>Kellen (1992)            |
| Logistics objectives             | Delivery lead time; Trust deliveries; Flexibility; Stock level   | Van Amstel and D'Hert (1996)<br>Bowersox and Closs (1996)   |
| Organizational way of production | Delivery lead time   | NEVEM-workgroup (1989)                                      |
| Logistics priorities             | Fast and reliable deliveries; Customer service quality; Flexibility; Responsiveness; Service innovation; Cost  | Fawcett and Smith (1995)                                    |
| Competitive priorities of firms  | Cost; Service/quality; Productivity; Time; Leanness  | Carvalho <i>et al.</i> , (2001)<br>Fernie and Sparks (2004) |
| Results/determinants of results  | Measures related with results: competitiveness, financial performance; Measures related with determinants of the results: quality, flexibility, resource utilization and innovation. | Fitzgerald <i>et al.</i> (1991)                             |

**Source:** Elaboration of the authors

As can be seen in table 1, there are many criteria that could be used to choose the best performance measures. It is up to firms choose the ones that best fit its reality and interests.

## A CONCEPTUAL MODEL PROPOSAL

Given the variety of proposed measures, the most important is to respond to the question: which measures to adopt in practice? To assist in responding to this question, Keebler *et al.* (1999) adopt a processual perspective and propose a set of measures considered basic and fundamental, independently of the firm and the logistics

strategy followed (low cost, product innovation, leader in customer service). Those measures are: time, cost, and quality.

Adopting a very similar position, Christopher (1998) considers time, cost and quality as three key performance measures which should form part of any logistics PMS. This is because these measures contribute more than proportionally to the success or failure of a firm. Leong *et al.* (1990) claim that it is widely accepted that the key dimensions of manufacturing's performance, can be defined in terms of quality, delivery speed, delivery reliability, price (cost), and flexibility. They are in fact, the expression of the following philosophy with regarding performance: "Better, Quicker and Cheaper". In other words: superior quality of service, evermore shorter times and lower costs.

Being so, the performance measures proposed in this paper to analyse the impact of the RFID technology on performance of firms are: costs, quality, time and flexibility. These four measures are also the ones proposed by Keebler, *et al.* (1999). Christopher (1998) defends that the time, the cost and the quality, are three key performance measures that should be present in any logistics' performance measurement system. By using these four measures which reflects the new competitive priority of firms (responsiveness) it can be evaluated the contribution of the technology RFID to enhance the firms' responsiveness to a lot of environment changes. After a literature review about, not only the operational and technical aspects related with the RFID technology but also the performance measurement system in a logistics context, a conceptual model is proposed which try to reflect the main relationships that exist between the use of this technology and the performance of firms. That is, the conceptual model tries to illustrate how the use of the RFID technology may influence the logistics performance of the firms. As previously seen, and according to some authors (Atkinson, 2004; Kelly e Scott, 2005), the utilization of the RFID technology in warehousing allows an automatic reposition and rigorosness of the stocks management (Kelly and Scott, 2005; Atkinson, 2004), a easier location of products inside the warehouses (Kelly and Scott, 2005; Kinsella and Elliot, 2005) and, a better efficiency in the collect of data (Sullivan, 2004; So and Liu, 2006). That is, using this technology in warehousing the performance of firms could be improved in terms of time, customer service and costs. Being so, the following propositions are drawn:

P01: The use of RFID in warehousing activity (WH) has a positive impact on Time (TM)

P02: The use of RFID in warehousing activity (WH) has a positive impact on quality (QL)

P03: The use of RFID in warehousing activity (WH) has a positive impact on cost (CT)

As regards the picking activity, and according to Trunick and Williams (2005), the use of the RFID technology leads to a better pick-and-pack sequence while provides a full list of the content of each order while this moves for delivery. Being so, it can be considered that the RFID contributes, by one hand, to improve the quality of the performance of this activity and by other hand, to minimize its time of execution, what can be translated by the following propositions:

P11: The use of RFID in picking activity (PK) has a positive impact on Quality (QL)

P12: The use of RFID in picking activity (PK) has a positive impact on Time (TM)

In what concerns the use of the RFID technology in the transport and according to Kevan (2004) this contributes for increase the quantity and quality of the information that flows along the transport' chain allowing to reach a better rastreability of the products. So, it can be said that the RFID contributes to increase de firms' performance in terms of quality. This relationship can be drawn by the following proposition:

P21: The use of RFID in transport activity (TP) has a positive impact on Quality (QL)

In this context, and having in mind the relationships found in the literature, a conceptual model is proposed (Figure 1). This model aims to highlight the influence of the RFID technology on logistics in terms of costs, time and quality of firms, that is, it intends to explain how the RFID contributes to enhance the responsiveness of firms.

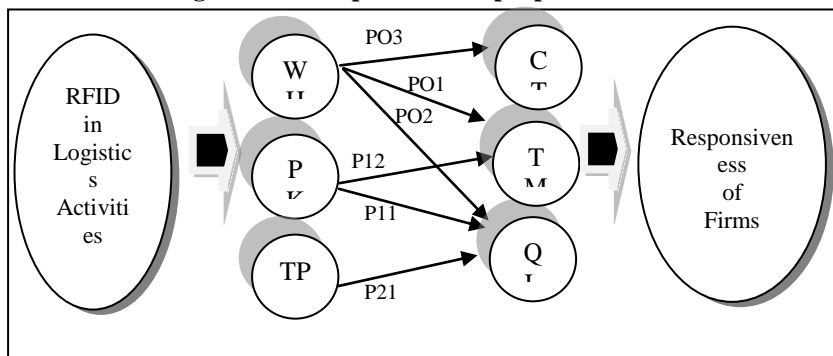

## CONCLUSIONS

In the business context the smart labels have reached many adepts by the huge potentials that it presents for firms considered individually or integrated in a supply chain. The drive toward adopting RFID is being further enhanced by mandates from large retailers such as Wal-Mart and Target, and the Department of Defense of many countries, who require all suppliers to implement this technology within the next few years.

The RFID technology has received considerable attention from academics and practitioners because of its potentialities and diverse fields of utilization in organizations such as: manufacturing, transportation, distribution, information systems, store operations, sales. The increase use of the RFID has been justified by the advantages

associated with its use. Through the RFID we may assist a decrease on the stock levels, a better productivity, a decrease on stockouts, a more efficient cross-selling, a better visibility and rastreability along the supply chains, more efficient logistics activities. The adoption of this kind technology allows a quicker flow of information, an improvement in the quality of the information that crosses the different types of logistics activities and a better synchronization of the information among the supply chain' members. However some disadvantages are also pointed out. The one that is most referred is its cost. Apart from this, questions of security, the complexity of it and a lack of know how are also identify.

**Figure 1: Conceptual model proposed**

To evaluate the true advantages associated with the RFID technology is important to measure its impact on performance. Adopting a processual perspective a set of measures must be considered, independently of the firm and the logistics strategy followed. A set of measures proposed are: time, cost, quality and flexibility. In the literature some relationships are identified between the use of the RFID in some logistics activities and the performance of firms. Being so, the use of the RFID to support the development of the warehousing activity seems to have an impact on time, quality and time. The use of it in the picking activity has an impact on quality and time and an impact on quality when it is used as an identification technology in the transport activity.

Business leaders are facing several critical considerations with regard to RFID. They have already identified its advantages but also a set of disadvantages are pointed out. It is up to managers evaluate the use of the RFID technology inside the logistics through the implementation of a performance measurement system that allows them to measure its impact on the responsiveness of firms. The RFID opportunities outlined here are a starting point. Supply chain leaders must seek out creative ways to use RFID to improve efficiency of the logistics activities while distancing their firms from the competition.

This paper is a first attend to alert managers and academics to the RFID technology. Future studies should therefore be developed taking into consideration the conceptual model proposed and build up a survey to test its validity in a cross-functional and national reality.

# PROSPECTS OF INSURANCE MARKET DEVELOPMENT IN SERBIA

**Mladenka Balaban**  
**University of „Braca Karic“, Belgrade**

## ABSTRACT

*The subject of this work are insurance companies, as the important institutional investor, with a special retrospective view of their place and a role at the financial market in Serbia. A successful development of insurance companies depends on the degree of development of the financial market, as well as on the ability to make a decision regarding the structure of its investment portfolio, in the best way. Besides the usual risk of property and personal insurance, the insurance companies in Serbia faced also the risk of investing free pecuniary funds, in the previous period. A new Law on Insurance has introduced new rules for the functioning of insurance companies in Serbia, but also confused instructions, which are bad for investment decisions of insurance companies, as well as for the development of the financial market in Serbia.*

## INTRODUCTION

From the macroeconomic point of view, a degree of insurance development is defined as the degree of participation of insurance premium in the gross domestic product. It represents one of the most important indicators for monitoring the achieved level of insurance development. That indicator is exactly proportional to the achieved levels of economic development. We shall demonstrate by comparable data, that the insurance sector in Serbia is undeveloped, and that regarding a degree of development, it is considerably below the average of the countries-members of the European Union. The indicators of insurance market development speak in support of that, i.e. the ratio between total premium and gross domestic product, as well as the total premium per capita.

One of the most important indicators of a degree of insurance development in the regional countries, is the insurance structure, i.e. the participation of life and non-life insurance in the total insurance portfolio. If, based on those indicators, we compare Serbia and EU, we can see where is the place of Serbia. The participation of the premium in the gross domestic product in Serbia, in 2005 was 2,0% (1,6% in 2004 year), and therefore Serbia was at the 58<sup>th</sup> place in the world (according to the Swiss Re data). In Slovenia, in the same year, that indicator was 5,7%, in Croatia 3,2%, and in 25 countries-members of the EU it was even 8,4%. The greatest percentage of the premium participation in the gross domestic product, in the year 2005, had Taiwan, and there follow the South African Republic and the Great Britain.

|   |                |      |          |       |       |          |       |

Source: www.swissre.com, Sigma No 5/2006

Serbia was ranked at 63<sup>rd</sup> place in the world, regarding the premium per capita in 2005 year, of 65 dollars or 55 euros (in 2004, 52 dollars, more exactly 38 euros). Switzerland with 5.558 dollars per capita, was ranked at the 1<sup>st</sup> place. According to the total premium of 480 millions of dollars, realized in insurance, Serbia was ranked at the 67<sup>th</sup> place in the world, in 2005.

The following data which show that participation of Slovenia in the total portfolio of the regional insurance market amounts to 49,44%, of Croatia 30,70%, B&H 5,12%, Macedonia 2,46%, and Serbia 12,28%, demonstrate the degree of insurance market development in Serbia.

The insurance market development, measured by the insurance premium growth, indicates the ascending tendency. Based on the data from the Federal Bureau of Statistics, the total insurance premium, (although a part of the premium for the pension insurance was transferred into pension funds) in 2006 year, in relation to the premium in 2005 year, increased by 10,5%, and that with the rise of retail prices of 6,6%, denotes a real growth of the total insurance premium.

Source: www.nbs.yu/Department for Insurance Company/ Department for Bank/  
Financial reports for 2004, 2005,2006

In the total financial sector, according to the size of the balance sum, the insurance companies participated with only 5,5%, in 2004 year, i.e. with 4.3% in 2006 year, while the participation of the banks was dominant with 90,5%, in 2004 year, i.e. 90,4%, in 2006 year.

According to the amount of invested capital, the banks also dominated with 85% in 2004, i.e. with 89.8% in 2006, while the insurance sector participated with only 13,5% in 2004 year i.e. 8.6% in 2006 year. It can be observed that the banks dominate at our financial market, while the insurance companies, as financial institutions, occupy a very small part of the market.

## **PORTFOLIO STRUCTURE OF INSURANCE COMPANIES IN THE REPUBLIC OF SERBIA**

The portfolio structure of insurance companies in Serbia was not adequate in the previous period, taking into consideration that only 3% of the total insurance premium pertained to life insurance, and 97% to other insurances. When the Law on Insurance was passed in 2004 year, it had a considerable effect on the change of the portfolio of insurance companies, and the following data demonstrate that.

According to the data of the Insurance Companies Association in Serbia for 2006, the insurance companies realized total insurance premium in the amount of 38,3 billion dinars (485 million euros, more exactly 639 million dollars), that represent 10,5% of increase in relation to the previous year, when it amounted to 34,7 billion dinars (406 million euros, more exactly 480 million dollars). The participation of non-life insurance amounted to 89,4% in the premium structure, in 2006, while the participation of life insurance increased from 7,4% in 2004 year to 10,6% in 2006 year, owing to the realized high increase of the life insurance premium of almost 23% in relation to the previous year, with the increase of non-life insurance premium of 9,2%. The reasons for such structure lie in passing the Law on Insurance, which succeeded to «regulate» the insurance market, to improve life standard, and to arrange the financial market.

In the structure of the total portfolio of non-life insurance, over 80% was realized in only five types of insurance and they are: accident insurance, motor vehicle insurance, insurance of property from fire and other dangers, other property insurances, as well as the liability insurance for using motor vehicles. The property insurances, which had the greatest share previously, due to the fall of 1% in 2006 year, in comparison to the previous year, reduced their share to 29,5% and gave up the leading share to the motor third party liability insurance, which made 32,3%. After the property insurances, there followed, motor vehicle insurances – Casco of 12,8%, which together with the increase of a share in the premium, recorded the increase of the premium itself of 14%, in relation to 2005 year.

Although it is little represented, there is a considerable annual increase of the premium in the group of non-life insurances in 2006, of the voluntary health insurance (55%), where one can identify the increase of share from 2,3% in 2005 year to 3,3% in 2006 year. Bearing in mind, that in the economically developed countries, there is marked tendency of transferring the gravity of health insurance to the insurance companies, and the fact that the existing system of mandatory health insurance is characterized by substantial weaknesses, it is realistic to expect a faster development of that type of insurance at our market. The premium of voluntary pension insurance marked reduced participation in 2006, due to the withdrawal of the premium into the sector of voluntary pension funds.

According to the data of the Insurance Companies Association in Serbia, the scope of insurance business operations, measured by the balance sum of the insurance companies, that performed insurance and reinsurance business, increased by 21%, more exactly from 46,4 billion dinars to 56,1 billion dinars, in 2006, in comparison to 2005 year.

## PARTICIPATION OF INSURANCE COMPANIES AT THE FINANCIAL MARKET IN THE REPUBLIC OF SERBIA

Insurance companies represent one of the biggest institutional investors at the financial markets, which substantially determine and provide current liquidity and diversification of the financial risks at the market. The indicators of the insurance market development speak in support of that, i.e. the ration between total premium and the gross domestic product, as well as the total premium per capita.

The insurance companies in the USA are significant actors at the financial market, and it is the same case in the countries of the European Union. Since the bankassurance is developed at the enviable level, the banks and insurance companies establish consortiums and take over the mentioned loans together. The long-term securities dominate in the structure of the portfolio of insurance companies in the USA and the EU.

**Table 3 – Investment structure of insurance company in development country**

| Investment structure of insurance companies in developed countries |     |                |         |        |
|--|-----|----------------|---------|--------|
|  | SAD | United Kingdom | Germany | France |
| Real Estate  | 10% | 8%             | 7%      | 7%     |
| Equity Stocks  | 5%  | 38%            | 32%     | 27%    |
| Bonds  | 75% | 42%            | 58%     | 53%    |
| Other Investments  | 10% | 12%            | 3%      | 3%     |

Source: [www.financialservicesfacts.org](http://www.financialservicesfacts.org)

The insurance companies in the USA invest most often in the municipal and state bonds, while the situation in the EU countries, where the long-term securities also dominate, is somewhat different. In the EU countries, there are mostly investments in the shares i.e. mostly in the portfolio shares of the big corporations. One of the important types of investments is the security of transnational's companies. The leasing operations of the insurers are also widespread, whereby they successfully compete with the specialized companies. One of the prerequisites for the approval of mortgage credits is the conclusion of the insurance contract. However, the fall of profitability from such operations, the increase of risk of mortgage credits, the low liquidity, and the long-term character of those assets, have reduced their share in the investment structure. Based on that comparative analysis, the first hypothesis has been confirmed. The countries, where there is a high degree of development of the financial market and the insurance market, have a diversified investment portfolio which brings revenues, but also the assets necessary to cover the losses in insurance business, and as such they have a considerable influence by creating their portfolio.

The insurance sector in Serbia is undeveloped, and regarding a degree of development, it is considerably below the average of the countries-members of the European Union and the USA. The insurance companies are not a significant participant at the financial market with their share of 1,2% in 2006 year, while the banks dominate with 94%. Totally observed, for all insurance companies in Serbia, the technical reserves of non-life insurances in 2006 year, were mostly covered by depositing with the banks – 28%, by the job shares –17% and by the state securities – 14%. In the covering structure of technical reserves for life insurances, there are mostly investments in the securities - 57%, and then follows depositing with the banks - 16%. **The presence of the insurance companies at the financial market, in Serbia is not sufficiently significant.**

**Table 4- Development of Serbian insurance company in financial market**

| Investment structure of Serbian insurance companies for years 2005 and 2006 |       |      |               |      |                |      |                  |      |                            |      |

Source: [www.belex.co.yu](http://www.belex.co.yu)

The biggest part of the insurance companies investments in Serbia, was directed at the short-term securities - 42% in 2004 year, and in 2005 year - 54%. One of the worse investment structures was the investment structure of the insurance company "Dunav", because 72% of investments referred to real estates, and only 1% was invested in the long-term securities. The reason for such investment was that the insurance co. "Dunav" had mostly the premiums for motor vehicles in its premium structure. In contrast to "Dunav" insurance company, Wiener Stadtische had the best investment structure, because life insurance was the most represented in the insurance structure, and therefore the investments at the financial market were directed at the long-term securities - 61% in 2004 year, i.e. 56% in 2005 year. The situation is somewhat better in the investment structure of DDOR Novi Sad, which improved its investment structure by 38% in 2005, investment in shares by 53% in 2006 year. Observing portfolios of the biggest insurance companies in Serbia, one can conclude that such investment structure is not adequate, since by keeping free funds in bank deposits, smaller revenue is achieved than it would have been realized if it had been invested at the financial market, especially in the long-term securities. Investment decisions of managers in the insurance companies were based on hedging, and one part of investment was directed at the financial market, but only in order to maintain liquidity, while the second part of investments referred to real estates and keeping of deposits with the banks. Investment in real estates in the previous period, were only a burden with regard to the maintenance costs and none revenue for the insurance companies.

It can be concluded that the national insurance companies invest at the money market, in the most expensive and the least transparent segment. The reason for that is that the capacities of the insurance companies are still at the low level in relation to the highly developed countries. The life insurance makes only 5% of the total insurance portfolio, and that is one of the reasons why the participation of the insurance companies at the financial market is modest. In comparison to the insurance companies at the highly developed markets, which realize their profit by investing at the capital market, the insurance companies in Serbia realize their profit exclusively from business operations. Undevelopment and instability of the financial market cause that a share of insurance sector in the general scope of investment in the country is insignificant.

The adoption of the Law on insurance in 2004, according to which the supervision over insurance was entrusted to the National Bank of Serbia, was the basis to initiate big changes at the Serbian insurance market. Defining the criteria for the investment of insurance funds, first of all the technical reserves, and the criteria for the evaluation of balance sheet items, as well as the permanent control of business operations of the companies, has caused important changes in relation to the previous condition. Measured by the participation of types of assets, which may be characterized by complicated chargeability and overrated presentation in the financial reports, it can be concluded that the quality of assets of the companies in 2005 year and especially in 2006 was improved. Namely, the values of those indicators in 2005 and 2006 years at the level of all companies which dealt predominantly with non-life insurances, amounted to 61,53% and 42,96%, respectively. Increase of total assets of the companies and reduction of value of a part of assets that may be characterized by complicated chargeability, influenced the change of values of those indicators.

The first controls carried out by the National Bank of Serbia, when the supervision over the companies was undertaken in 2004, demonstrated that the previous situation was characterized by the absence of the security of

investments incomplete business books, as well as, unsettled obligations towards policyholders by some companies. A share of non-material investments, real estates, investments in securities which are not for market trading and claims (as a form of assets that may be characterized by complicated chargeability, as well as overrated presentation in financial reports) in total assets of the companies which dealt predominantly with non-life insurances, amounted to even 75,68% in 2004 year. Relatively high participation of those types of assets in the total assets of the companies, indicated problems in clearing up obligations of those companies.

The growth of living standard and the growth of the GDP are certainly a good sign that the insurance sector will start to develop in the forthcoming period, at a faster rate. In addition, the current participation of the insurance premium in GDP in Serbia, which is estimated at less than 2%, is the indicator of the potential of this market in its intention to nearly achieve the level of the European Union countries.

In the forthcoming period, we expect the entrance of the world leaders to the insurance market in Serbia. Assicurazioni Generali, Uniq, Wiener Städtische or Grawe have already appeared at our market, whether by taking over the Serbian companies, as it has been the case with Generali, which has taken over Delta or Uniq, which has taken over Zepter, or by opening their own affiliates, as it has been done by Wiener and Grawe. Besides them, big insurance companies, which used to have a prominent role at the market in Serbia at the time of former Yugoslavia, like Zavarovalnica Triglav and Croatia insurance, have returned to our market by taking over the companies Kopaonik and Millennium insurance. Besides the insurance company Allianz, other companies like VHV Group, Eureka, KBC, AXA, have shown great interest to start business activities in Serbia. In future, we can expect that the insurance premium structure will get better in favor of the life insurance and that the arrival of those insurance companies will improve the quality of services and competitiveness at the insurance market in Serbia.

After the arrival of foreign insurance companies and docapitalization carried out according to the legal regulations, the value of capital has increased by 5%. That should have positive influence on the financial market in terms of investment in the long-term securities i.e. shares. The portfolio of Wiener Stadische that consists of 56% of long-term securities (tables T26 page 177) demonstrates that. After the arrival of new foreign insurance companies, the increase of the total insurance premium by 25% is expected, that would raise the financial assets by 10%, and thereby improve the investment portfolio of the insurance companies at the financial market in Serbia. We believe that the process of internalization of the insurance market in Serbia, will lead to a greater involvement of the insurance companies in diversification of risks at the financial market.

Based on that, we expect rapid development of that sector from 2008 year, and bearing in mind what effects the insurance development carries with itself, the economic development of Serbia is before us.

## CONCLUSION

That what has been positive in the insurance sector in the last year, is as follows: the increase of the total insurance premium, the increase of the number of employed in insurance business; the improvement of the premium structure in favor of life insurance; increase of technical reserves; sale network quality improvement.

In order to provide normal investment environment, consolidation of the capital market is necessary, since otherwise every investment in that type of securities, exposes investor to a risk. The functions of an institutional investor, and thereby of insurance companies, at the securities market are directed towards the resolution of the problem of budget deficit, which is negative. The insurance companies, through the development of life insurances, should mobilize available savings and direct it in productive investments, that will increase the level of economic activity, i.e. in shares and bonds of companies. Investments in state bonds are useful, but they should not be the only investment of the insurance companies. The insurance companies should invest assets in real estates also, because there is a noticeable price rise of real estates nowadays. Besides that, it is necessary to provide an adequate flow and validity of information from the financial market in order to make proper decisions. The status of an institutional investor requires not only qualified personnel, but also operative procedures for making decisions about investment, the ability to make reports about its business, as well as the efficient internal supervision.

I believe that the insurance market in Serbia is developing and that it has enormous potential, first of all for the life insurance development. Further reforms of the insurance sector in Serbia, should facilitate the financially reliable and stable insurance market, where the interests of the insured and insurance beneficiaries would be protected, and the quality of insurance business activity would be raised at a higher level and adjusted to the European Union standards. Attention should be paid especially to certain parts of the Law on Insurance, which restrict investment activity of the insurance companies. It is necessary to correct the existing Law on Insurance, as soon as possible, and to stimulate the development of insurance, in order to enable the development and the growth of the insurance market. The author ends this paper by pointing out that the participation of the insurance companies at the financial market in Serbia is not sufficiently significant, but also raises a new question about the influence, of the process of globalization of the insurance market, at the increased presence of foreign insurance companies at the market of the Republic of Serbia.

# **WORLDWIDE WINE SYSTEMS: COMPARING YARRA VALLEY AND DOC CONEGLIANO VALDOBBIADENE COMPANIES ORGANIZATIONAL AND SUPPLY STRUCTURE**

**Luigino Barisan**  
**University of Padova, Italy**

## **ABSTRACT**

*This paper compares two global wine models, though their organizational and supply structures. These are the wine systems of companies in the Yarra Valley of Australia (southern hemisphere) and in Conegliano Valdobbiadene Denomination of checked origins (D.O.C.) area of Italy (northern hemisphere). These are related to the evolution of the market in recent years (2006-2007). This paper, which represents a first investigation on a research project with future development, applies a comparative analysis of region, organizational structure and supplies in the wine sectors of both 'New World' and 'Old World'. An international study is utilized that will highlight major differences and analogies in the organizational structure and market strategy among the two worldwide wine systems of companies.*

## **INTRODUCTION**

In Italy, the grapevine and wine-making culture was mainly performed by the Latin and Etruscan populations and new impulse and prestige then resulted from the Greek colonies contributing to vine-growing (Pini, 1988).

In the north-eastern region of Italy, viticulture and oenology began with the *Paleoveneti* (Venetian people) around the 10<sup>th</sup> century BC. The tradition continued with the Romans, and grew prosperous around the time of the Edict of Rotary (643 AD) and the St. Benedict's Monachism which maintained the viticulture of the time (Calò et al., 1996). Centuries later, it spread to the Enlightenment with the establishment of the Agriculture Academies (XVII Century). In this period, the Republic of Venice established numerous Agricultural Academies. The Academy of Agricultural Aspirants was founded in Conegliano (near Treviso) in 1769. This was the embryonic nucleus for the future expansion of the schools of specialization in Viticulture and Oenology in the area. The newly founded Viticulture School of Conegliano would be named 'Little Venice, a forerunner in its kind (1876). The Oenology School of Conegliano established under the patronage of Antonio Carpenè and Giovanni Battista Cerletti had among its lecturers international high-level personalities who contributed to putting modern science into viticulture and oenology. In the 1990s, the University of Padua entered in partnership with the Conegliano Oenology School and widened the academic curriculum.

In this experimental, formative and research context, the value of one of the more appreciated Italian sparkling wines, the *Prosecco*, started to acquire prestige, in particular after the second half of the XIX Century. During this period, the first cultural characterization of Prosecco occurred thanks to Conte Marco Giulio Balbi Valier. In fact, Conte Balbi Valier writes: "Approximately one quarter, 380, of the above mentioned areas that had undergone census could not be quantified with precision and were thus considered as all vineyard onto which I planted Prosecco Vines that were safer and more fruitful than any other quality and that produced an extremely

selected white wine, full of grace and strength” (Balbi Valier, 1868). Then, the *Prosecco* wine began to be produced by adopting the French *Charmat* method, and soon became a true enology pearl in the so-called area of ‘Little Venice’. The creation of the *Prosecco* sparkling wine would not become a reality without the intuition and genius of the Professor Antonio Carpené (1838-1902). Antonio Carpené learned how to ‘improve’ the local *Prosecco* wine believing in the possibility of producing a sparkling wine (with re-fermentation in big tanks). In 1924, the first Bottled Prosecco wine ‘Colli Trevigiani’ was made by sparkling house Carpenè & Malvolti. The new *Prosecco* wine eventually was embraced with pride and enthusiasm by the local community. The way in which the *Prosecco* wine was improved was by creating progressive stratification of the vineyards and the variety of wine (XIX Century), and by the incorporation of the so-called Denomination of Checked Origin (D.O.C.) of the Conegliano Valdobbiadene (1969) area. This was further improved through the special marketing of the *Prosecco* brand in more meaningful ways starting from the 1980s.

The sparkling Prosecco D.O.C. wine is so renowned that it is included amongst the most rated and celebrated successful wines produced in Italy.

In Australia, the history of the Australian wine making industry began in 1788 when Capitan Arthur Philip conducted the First Fleet into Sydney Cove to establish a penal colony (Spawton, 2006).

In Australia, the state of Victoria has 3000 growers across 21 wine regions. There are more than 850 Wineries and 650 Cellar Doors. In Victoria State, the Yarra Valley area was the first wine growing district with a long history. In 1838 the Ryrie Brothers introduced the first vineyard at Yering Station and in 1843 the first product of the Yarra Valley was created, fruit of the passion and creativity of James Dardel. The courage and initiative of these workers gave the wine-growing industry a strong boost in that area towards the end of the XIX century. The local wine industry was flourishing and tourism was experiencing the first signs of success. The growth of the wine-growing industry registered a slowdown during the 20’s but reimplantation of the vineyards began again in the late 1960’s and by the early 1990’s.

In this environmental, social and economic context which characterises peculiarities which are difficult to encounter in other wine-growing areas around the world, important wineries originated in the Yarra Valley in the seventies, amongst which the French Champagne house Moët & Chandon established their brand Domaine Chandon, at Coldstream (1986).

The Yarra Valley area is now recognised as one of Australia’s foremost premium, and internationally renowned wine region, so much that the most important Australian brands, which are also internationally acclaimed, have production plant and an agency in that region (for examples: Fosters, BRL Hardy, De Bortoli Wines, Casella Wines, etc).

## GLOBAL WINE MODELS

On a worldwide scale, change within the wine market could be interpreted through a dualistic model that could be seen in two opposite ways – ‘Old World’ countries versus ‘New World’ countries. However, this interpretative differentiation between ‘Old’ and ‘New’ perspectives of worldwide competitiveness appears to be out-of-focus, due in large to complex economic processes occurring within the wine sector which has seen wine producers distancing themselves from the logic of cut theory – which focuses on broad geographical scale modeling. Rather, it appears that worldwide wine areas should be understood at the firm level group, allowing research to measure with a greater accuracy the worldwide market as well as local markets.

This paper aims to compare two global wine areas in two countries, Italy and Australia, both countries with a significant specialization in both organizational structure and wine supplies. Italy, together with France, is traditionally the country which is the world leader in wine making (example, ‘Old World’ countries). Australia had demonstrated the most growth in competitive performance between the Countries of the New World, right or wrong, the paradigm of new models of competition in the wine market (Pomarici, 2005). The similarities (as well as the differences) between these two wine systems countries have been detailed elsewhere (Pomarici, 2005).

Using statistics regarding wine organizational structure and organizational supply conducted in Italy and Australia, the paper demonstrates how it is possible to identify different approaches to market. In this initial assessment, differences and analogy in size structure and performance organization are examined from aggregate results in companies located in the Yarra Valley in comparison with D.O.C. Conegliano Valdobbiadene companies.

Understanding differences in approach to organization and strategy structure, inside two different territorial systems, is important for evaluating as differentiate vision of companies on worldwide wine markets. This can be organized with a different strategic vision to respond in a diversified way, and in the best possible way to varying target demands that originate from worldwide consumers.

This paper will pursue this comparison between the two wine global models by examining two related themes:

1. A comparative analysis of organizational structure (area of grapes, ampelographic platform, vineyards yield, total tonnes crushed, value of winegrapes, number of wineries, legal structure, etc.).
2. A comparative analysis of wine supply and export structures (wine production, domestic market, export market by continent, estimated wine value to the local economy, etc.).

## **COMPARATIVE ANALYSIS OF THE ORGANIZATIONAL STRUCTURE**

The Australian vine-growing systems does not foresee mechanisms for checking production potential (example: planting rights, etc) and geographic origin that characterise the European Denomination of Origin. Nonetheless, the Geographical Indications (GI's) have been introduced into the Australian vine-growing industry since 1933 thanks to the Australian Wine & Brandy Corporation. In essence, in the Australian GI's, the regulations allow greater freedom for entrepreneurial initiative: the delimitation of the vineyard region or sub-region is substantially topographic, that is, it represents an indication of the origin; there is no reference to a specific vineyard or cultivation techniques; there is no reference to specific oenological practices; the checks are performed on the final product that is destined for exportation; in some cases, the marking of the geographic references is registered.

From an initial evaluation of the profile of the organizational structure of the Yarra Valley region (Table 1), a few considerations can be drawn. Today, the Yarra Valley region is composed of vineyards that extend over a surface area of 3,800 hectares (with altitudes ranging from 50m to 400m above sea level), approximately equal to 2% of the total surface area of the vineyards in Australia.

The composition of the ampelography platform is multi variety, attributable to 64% to the red bead variety and 36% to the white bead variety. Amongst the red variety, which are the most commonly cultivated in the Yarra Valley, the Pinot Noir and the Cabernet Sauvignon are amongst the varieties that ensure a prime product of excellence for those wines that are particularly appreciated by the market. Amongst the whites, the area destined for the cultivation of the Chardonnay and Sauvignon Blanc stands out the most, from which wines of particular prestige as well as emerging wines are obtained, for both sparkling wines as well as a variety of still wines.

The quantity of the prime material produced and that is destined for the production of wine is 19,000 tonnes. The yield per hectare, equal to approximately 5 tonnes /hectare, if compared to the Australian average, is considerably lower (-50%). Normally, in fact, the bunches of grapes are thinned in order to ensure a final product that is of high quality and to obtain wines that are complex and intense to the sense.

The average price of the grapes is of 1.060 € /tonne, so as to markedly affect the provisioning cost of the raw material.

**Table 1: The Yarra Valley Region (Australia) - organizational structure**

|                             | General situation  | Year - 2007   |
|-----------------------------|--------------------|---|
| Area of grapes              | (hectares)         | 3.800   |
| Ampelographic platform      | (composition)      | Multi-variety<br>(red & white grapes)   |
| Total tonnes crushed        | (tonnes )          | 19.000  |
| Vineyards yield             | (tonnes/hectares ) | 5,0   |
| Average value of winegrapes | (€ /tonne)         | 1.060   |

Source: Yarra Valley Wine-Growers Association, 2007.

The 186 operators that compose the wine producing industry report heavy investment in human capital within the region. The 85 wineries present have considerably contributed, by the added value gained by bottling the product, to the affirmations in terms of quality and quantity of the Australia brand in the national markets but above all, in the international markets. The legal structure of the companies involved are those of small companies (77% of the companies crush less than 10 tonnes). The Yarra Valley region, which is also flourishing tourism venue, includes various Public Listed Companies of both national and international importance (example, Foster's, Moët & Chandon, De Bortoli Wines, Casella Wines, etc).

The Italian wine-growing systems currently considers the control mechanisms of product potential (example, plant rights, etc), the market (example, distillation, etc) and of the geographic origin that characterises the European Denomination of Origin. The Denomination of Origin (DO) were introduced into the Italian wine-growing industry with the D.P.R. 12<sup>th</sup> July 1963 no. 930. With the successive Law no. 164 in 1992, the principles of the geographical origin of the wine are recalled and that are founded on the criteria determined by the production discipline, that is: delimit the production area; variety and cultivation norms of the vineyards; norms related to the oenological practices; natural minimum alcoholic value of the grape; yield per hectare; organoleptic checks.

Since then, the D.O.C. Conegliano Valdobbiadene 'wine district system' has evolved considerably. Today it comprises 4.830 hectares of vineyard (Table 2), with altitudes ranging from 50m to 500m above sea level, approximately equal to 0,6% of the total surface area of the vineyards in Italy, almost exclusively cultivated for Prosecco (the other minor vineyards cultivated are for the Bianchetta, Perera and Verdiso variety).

The quantity of the prime material produced and that is destined for the production of Prosecco D.O.C. wine is approximately 61,000 tonnes, with an average hectare yield of around 13 tonnes per hectare.

The average market value of Prosecco D.O.C. grapes has reached 1.400 € /tonne. Approximately 2,800 wine-growers are responsible for the quality of the prime material.

Within this context, 460 wineries, 153 of which are sparkling wine manufacturers that have entered gradually introducing their creative experience and cooperating in the construction of the national enological identity and diffusion of the made in Italy around the world. In the Conegliano Valdobbiadene D.O.C. region, with reference to the legal structure, there are apparent analogies: on one hand amongst the single proprietorship companies and the Australian companies, similar to the sole trader; on the other, amongst the Società per Azioni (S.p.A.) and the Australian companies, similar to the Publicly Listed Company. In addition, there are several enterprises supplying the industry sector with wine-making and wine-processing equipment and technology.

## COMPARATIVE ANALYSIS OF WINE SUPPLY AND EXPORT STRUCTURES

In terms of an examination of the commercial flows conducted on the aggregate of the companies of the Yarra Valley, a production of 13,3 million litres is registered and 15% of the total yield produced in 2006 was exported (Table 3).

**Table 3: The Yarra Valley Region (Australia) - wine supply and export structures**

|                      | General situation | Year - 2006   |
|----------------------|-------------------|---|
| Australian market    | (million litres)  | 11,3  |
| Australian channels  | (typologies)      | Cellar Door; Hotel & Restaurant & Catering;<br>Retail & Warehouse; Agents/<br>Distributors; Independents; E-commerce/<br>Mail Order |
| Exported wine        | (million litres)  | 2,0   |
| Exported wine:       | (%)               | 15,0  |
| - Oceania            | (%)               | 3,6   |
| - Europe             | (%)               | 38,4  |
| - Asia & Africa      | (%)               | 15,9  |
| - Americas           | (%)               | 42,1  |
| Estimated wine value | (million €)       | 160   |

Source: Yarra Valley Wine-Growers Association, 2007.

Comparing the commercial channels present in Australia with the Italian ones, a particular segmentation is apparent: direct selling occurs through Cellar Doors, the Ho.Re.Ca channel is composed of Hotels & Restaurants & Catering; large distribution includes Retail & Warehouse; the wholesale channel includes Agents and Distributors, amongst the other channels there are the independents and an ever more important part of the production is sold through E-Commerce and Mail Order channels.

As far as exporting is concerned, the leading role is held by America (United States and Canada) and European (driven by the United Kingdom), which count for 42.1% and 38.4% respectively of the sales abroad, whilst the Asian, African (15.9%) and Oceania (3.6%) markets cover a significant role in terms of exportation.

An estimate as to the value in terms of locale economy for the entire wine production of the Yarra Valley results to 160 million Euro.

An overview of the 2006 production of Prosecco can be obtained by analysing the data supplied by the D.O.C. Conegliano Valdobbiadene Consortium (Table 4). The prospectus highlights production of 25,3 million litres of *Prosecco* of which 30,1 million are of sparkling wine (translating into 81.5% of the total production). In this sphere, it is significant that the production of the *Superiore di Cartizze* sparkling wine, alone amounts to 0.9 million litres.

The production of fizzy (*frizzante*) wines counts for 6,4 millions litres, while 0,4 are the litres of so-called *tranquillo* (non-sparkling) wine. From the database of the Consortium, the litres exported in 2006 were 11,6 million, of which 8,6 million were of sparkling wine. In so far as the export data is concerned, the leading export market is Europe (78,4%) in which Germany receives (34.4%) of the wine litres, followed by Americas (16,5%) and the Asia & Africa (4,0%). In the Southern Hemisphere market, sales to Oceania amount to 1.1% of the total sales abroad.

It is estimated that the total consumption of Prosecco wine in relation to the entire production is of 330 million Euro.

**Table 4: D.O.C. Conegliano Valdobbiadene (Italy) - wine supply and export structures**

|                      | General situation | Year - 2006   |
|----------------------|-------------------|---|
| Italian market       | (million litres)  | 25,3  |
| Italian channels     | (typologies)      | Direct Selling; Ho. Re.Ca.; Large Distribution; Wholesale channel; Other channels |
| Exported wine        | (million litres)  | 11,6  |
| Exported wine:       | (%)               | 31,4  |
| - Oceania            | (%)               | 1,1   |
| - Europe             | (%)               | 78,4  |
| - Asia & Africa      | (%)               | 4,0   |
| - Americas           | (%)               | 16,5  |
| Estimated wine value | (million €)       | 330   |

Source: Consortium of Guardianship of the D.O.C. Conegliano Valdobbiadene, 2007.

Some of the elements that outline the success achieved by the Wine District of Conegliano Valdobbiadene can be explained by analysing the available data, for the evolution in the production of D.O.C. wine commercialized in bottle (Table 5) over the last decade. Along with a meaningful increase of the total production in the typologies fizzy (*frizzante*) and sparkling wines (+68.0%) and its export capacity (+87.6%), we notice the positive trends of the production of the D.O.C. sparkling wine (+87.5%) and of the exports of the main product of the local territory (+182.3%).

**Table 5: D.O.C. Conegliano Valdobbiadene: elements of evolution of the market of the Prosecco wine (1997-2006)**

|   | Year 2006 | Growth % 1997/2006 | Growth % 2005/2006 |
|---|-----------|--------------------|--------------------|
| Sparkling wine manufactures (million bottles) | 153       | +11,1              | =                  |
| Total production (million bottles)            | 49,2      | +68,0              | +11,3              |
| Total sparkling production (million bottles)  | 40,2      | +87,5              | +12,3              |

|  |      |        |       |
|--|------|--------|-------|
| Total 'frizzante' production (million bottles)       | 8,5  | n.a.   | +9,0  |
| Sparkling production (% on total bottled production) | 82,0 | +8,5   | +0,9  |
| Total export (million bottles)                       | 15,5 | +87,6  | +10,7 |
| Sparkling export (million bottles)                   | 11,5 | +182,3 | +10,6 |

## CONCLUSION

This paper is the first assessment of a research project started by the University of Padova (Italy) in cooperation with the Swinburne University of Technology in Melbourne (Australia).

These two countries are amongst the main wine producers and exporters in the world and represent a leading model worldwide for the role they have as far as production structure and wine offers as well as demands.

The two national wine producing systems are characterized by some specific features and analogies that are to be found on an areal scale. Both the D.O.C. Conegliano Valdobbiadene and the Yarra Valley Region are characterized by historical peculiarities, uniqueness and beauty of the environment (tourist areas), cultural heritage and by details and analogies that extend up to the aspects of the production and market system.

From a historical point of view one can detect some analogies regarding the development and evolution of the tools used in vine growing (i.e. role of the Ryrie Brothers and of the Count Balbi Valier), oenology (for instance the role of Antonio Carpenè and of James Dardel) marketing (i.e. the role of the brands), starting from the XVII century and going further on today; some differences (i.e. role played by the Consorzio di Tutela Conegliano Valdobbiadene in the European Area and of the Yarra Valley Wine-Growers Association in Australia).

By examining the organisation one can see on the one side, the Australian territory, characterized by a multiple varieties ampelographic platform, based in particular on a berried variety (ex. Pinot noir, Cabernet Sauvignon, etc), with some white varieties which are appreciated and currently emerging such as Chardonnay and Sauvignon blanc; the drastic limit of the yield per hectare (5 tons per hectare), to obtain varied wines above all of particular value and complex as far as sensory; on the other side the Italian territory which focus on the Prosecco variety and on the production of sparkling wines, spumanti D.O.C., a higher overall yield, supported by a high value of the raw material. The two areas have something in common as far as a production in the large production manufacture based on small and medium size companies and something in common regarding the company's governance (for ex. between the Sole Traders, the Publicly Listed Companies and the Limited Liability Companies).

From a close examination of the supply structure and of the exports we can see: from one side the group of the Yarra Valley producers who avail themselves in the marketing of their wine range, first of all of the domestic market, where the distribution is mainly the property of two main distribution networks (Woolwhorts, Coles), in the export they privilege the Americas (ex. United States, others) and Europe (ex. U.K., others), and they reserve a considerable quantity of their production towards the Asian countries (China, Japan, Hong Kong, others), while the producers of the D.O.C. Conegliano Valdobbiadene are keen towards the European market mainly (ex. Germany, Switzerland and Austria), and after that North America (United States and Canada).

These two wine systems are characterized by quite different oenological features, expressions and interpretations which on the other hand enable them to satisfy 360° to the requirements of the wine consumer.

The wines of the Yarra Valley express in their organoleptic profiles, a sensory complexity (i.e. from barrels, variety or blends, ferments, aged, etc) instilled by both the Oenologists and by the climate and the Australian environment. The wines of the D.O.C. Conegliano Valdobbiadene, in their organoleptic profiles, on

the other hand show a sensory simplicity (i.e. the taste is unoaked, elegant, young and fresh, etc), the expression of the traditions and of the local wine culture.

## **ABSTRACT**

*The combat against poverty and social inclusion are appellants themes when analyze the public policies implemented in latin america in the last decade. In brazil, the “real plan”, implemented in 1994, achieved stability to the economy, eliminating the inflationary inertia of salaries and prices. The elimination of the inflationary rate was a relief to the social and business brazilian pyramid basis, however wasn't enough to contain the population impoverishment process. This article present the main public policies of credit access, implemented in the last 10 years in brazil, as a way of social inclusion and combat against poverty, with the federal government as inducer and more important actor.*

## **INTRODUCTION**

The combat against poverty and social inclusion are appellants themes when analyze the public policies implemented in Latin America in the last decade. In Brazil, the “Real Plan”, implemented in the government of the President Itamar Franco, in 1994, achieved stability to the economy, eliminating the inflationary inertia of salaries and prices.

The elimination of the inflationary rate was a relief to the social and business Brazilian pyramid basis, however wasn't enough to contain the population impoverishment process, as direct consequence of the productive and distributive reestructuration caused by globalization, through the unemployment and informality increase of the small business.

From 1995 and during the eight years of the president Fernando Henrique Cardoso government (1995-2002), in function of this scenery, the federal government took over the paper of inductor and formulator of a train of public policies turned to the minimization of this situation. Among them, the credit access, not as an isolated politician, but inside a context of integrated and sustainable local development occupied a complete important function.

The policy makers of this period understood that the productive credit was the best way of maintenance of the work places and income generation to the familiar unit and then, in a second moment, through the income multiplicator effect their benefits expanded for all the collectivity.

As a result of this action line, we have from 1996 the creation of the Popular Productive Credit Program (PCPP) and the Institutional Development Program (PDI) from the National Bank of Economic and Social Development (BNDES) with the purpose of foment and create solid basis to the microfinance industry expansion inside the country; the arrangement of a legal mark to the sector and the creation, in the Solidary Community Council scope, of a discussion group about the microcredit expansion in Brazil.

From 2003, with the political break caused by the election of Luiz Inácio Lula da Silva to president (2003-2006), the new team of policy makers decided for the maintenance of the economical policy of the previous government, but, the concept of credit access was modified with the bankarization of the lower classes of the population.

As a result of this new vision were reserved 2% of the compulsory over the deposits in cash to the microcredit and the creation of simplified accounts by Brazil Bank and Federal Savings Bank.

This article presents the main public policies of credit access, implemented in the last 10 years in Brazil, as a way of social inclusion and combat against poverty, with the federal government as inducer and more important actor.

## **THE MONETARY STABILIZATION AND THE BASIS TO THE INCREASE OF THE CREDIT OFFER IN BRAZIL**

For more than a decade, the Brazilian economy cohabited with high inflation rates that, coordinated with the low economic raise, verified from 1981, carried a strong contraction in the investment rate. From 1980 to 1994, the average inflation rate, measured for the IGPM (General Index of Market Prices) of Getulio Vargas Foundation was 725,47 %. In the same period, the average rate of economic and investment raising, measured in percentage terms of the Growth Domestic Product (GDP), were respectively 2,29% and 20,50%.

Obtaining this scenery as a bottom cloth, besides the utilization of the inflation as a tool of economic policies, supporting the government to regulate ex-post of the public accounts (index incomes), the productive sector was suffocated. A vicious circle was formed, making that the Brazilian economic period of the history, in special in the 80's, was known as the lost decade, characterized for: low economic raising, high inflation, power deterioration of population purchasing and credit scarcity, where the financial system stood back more and more of his basic function of credit provider to investment and consume and concentrate in the maintenance of the public debt.

Between 1986 and 1991, five heterodoxies tried of inflation combat failed – Cruzado Plan (1986), Bresser Plan (1987), Summer Plan (1989), Collor Plan I (1990) and Collor Plan II (1991). These plans, had as a common characteristic, the prices freezing, which carried to an immediate inflation fall, with the posterior acceleration of the prices rates growing, leading to a hyperinflationary route (Giambiagi and Moreira, 1999, p.22).

The increasing retake was linked to the success of a new stabilization program, but turbulences in the policy scenery postponed his implementation. The impeachment process of the president Fernando Collor de Mello, started in 1992, 29 September, finished with his renounce, in 29 December and the take over of the command by the vice president, Itamar Franco.

Bypassed the policy crisis and, with a new policy makers team, the path was free to the elaboration of a new stabilization program. The Real Plan, was pre announced in 1993 December and implemented in three stages: fiscal regulate of emergence (federal budget approbation characterized by the *ex ante* equilibrium, creation of the Emergence Social Fund, that unlinked 20% of the Union expenses between 1994 and 1995 and increased the flexibility of the budget execution); the elimination of the inflation inertia, through the salaries and prices conversion, in an account unity, named Real Unity of Value (URV), which value in cruzeiros reais (currency) was daily adjusted with basis in the average variation of three inflation indexes and, the monetary reform, through the transformation of the URV in a new currency, in 1994 July. The inflation monthly rate, in June, was of 45,21% and, in the next month fall down to 4,33%, keeping the falling tendency in the next months.

The Real Plan implementation ended eliminating the retroactive indexation, without need to freeze prices and salaries to contain the inflation. Besides, the exchange appreciation coordinating with the commercial opening allowed that tradable prices were rigidly contained, giving effectivity to a currency anchor in the inflation control. As a result of this process, succeeded a drastic inflation falling, without happen a serious recession (Giambiagi and Moreira, 1999, p.23).

The resulting of this process was the beginning of a new virtuous circle of the Brazilian economy, with low inflation rates, relative increase of the investment rate and a moderated economic increase (see table 1). The maintenance of this policy, in the following years, was possible with the election of the Minister of Finance to Republic President, Fernando Henrique Cardoso, in 1994 October.

In his two orders, 1995-1998 and 1999-2002, his policy makers team looked for the construction of a institutional and legal structure to support one of the main positives points of the Real Plan, the inclusion of millions of Brazilian people in the consume market.

## EXERTS ABOUT MICROFINANCES, MICROCREDIT AND THE SOCIAL AND BUSINESS “PYRAMIDS”

Fulfilling the paper of formulator and inductor of determined public politician, the agent (State), must define correctly the components variable of the analytic model to be implemented.

This idea of access to credit as a public policy overpass all the National Finance System (SFN), where “consider as financial institution, to the effects of the legislation in force, the private and public juridical people, who has as main or accessory activity the collection, the intermediation or the application of the own or others resources, in national or foreign currency, and the custody of value of the others propriety” (Article 17 of the Law 4.695/64, in Fortuna, 2001, p. 17). From this ample spectrum of entities, this analyze will unroll over those whose action is conducted to the social and business pyramid basis.

The social pyramid definition (economic), uses the concept of consume classes, with basis in the familiar person/unit annual income per capita, extrapolated from the power acquisitive equity in the United States of America (Prahalad and Stuart, 2002, p.18). In the pyramid top, we find the class 1, where are between 75 and 100 millions of consumers, with the annual income per capita over US\$ 20.000,00, the richest of the world (high and middle class of the developed countries and the high class of the development countries). In the classes 2 and 3, with income per capita between US\$ 20.000,00 and US\$ 1.500,00, we find the poor consumers of the developed countries and the middle class of the developing countries, in an universe of 1 billion and 750 millions of people. In the pyramid basis, the class 4, with 4 billion of people, and annual per capita income under US\$ 1.500,00; from these, about 1 billion live under the poverty line, (per capita income under US\$ 1,00 by day). In Brazil, about 50 million of people fits in this class, according to the National Research for Sample in Home (PNAD), of 1999.

To characterize the business pyramid, we will use Brazilian parameters. From the universal categorization by charge- micro, small, medium and big enterprise, added to the standard of the new Statute of the Micro and Small Enterprise (Law 9.841/99) and his actualization by the Edict 5.028/04, that classifies the enterprises according to the annual gross income, beyond the concept of occupied people, used by the Brazilian Institute of Geography and Statistics (IBGE) in the raises of the social economic researches and censuses, annuals and monthlies. According to Sebrae (2004), this concept encloses not only the employees, but encloses, also, the owners of the companies, as a way of arrange information about the expressive number of micro business unities that don't employ workers, but work as an important factor of income generation to their owners. So we have:

- Micro Enterprises: annual gross income under US\$ 144.585,00 (utilizing a conversion value of US\$ 1,00 = R\$ 3,00) and/or industrials establishments with until 19 occupied people and, in the trade and in the services loan with until 9 occupied people.

- Small Enterprises: annual gross income over US\$ 144.585,00 and equal or under US\$ 711.044,00 and/or industrials establishments with 20 to 99 occupied people and, in the trade and the service loan among 10 to 49 occupied people.

The small business (micro and small enterprises – MPE) represent, according to IBGE, more than 3,8 millions of establishments, consuming 44% of the employed workers and generating about 20 % of the Growth Domestic Product (GDP).

After define the variables determinates of our model, the credit, determinate variable, must be defined. According to Aurélio Buarque de Holanda Ferreira (1999, p.575) the word credit comes from the latin *creditum* and, means in *lato* sense, security that something is true; trust; good reputation; consideration and in the economic sense the merchandise allow, service or money amount, to future payment or the opportunities of raise loans.

Focusing the social and business pyramid basis, the credit access may be used as a toll of social inclusion in two ways: guided to the consume and/or destined to the production.

Microfinances are, according to Parente (2002, p.11), a new field and in accelerated development, that combine mechanisms of market, strategic support of the State and communitarians initiatives with the objective of structure the sustainable financial services to the clientele of low income, to people, families or enterprises (formals or informals). In Brazil, the most visible and developed part of this complex group of tools in income generation and combat against poverty is the microcredit; besides this we can detach other products, as: popular saving; domicile credit; safes; emergence credit and the popular credit card.

Is important to stand out that the products created by the microfinance sector aren't just a reproduction of those offered by the traditional finance system (commercial banks and financiers); they belong to a philosophy where the credit is seen as a right, because the access to credit lead the person and the productive unit to development.

This reality - microfinance - is present and consolidated in a good part of the Latin America countries in operation, of legislation more comprehensive and flexible. In Brazil, besides it's more recent, the legislation in force just allows one modality of microfinance: the microcredit.

Microcredit is a low value loan, to the informal, micro and small enterprises, without access to the traditional financial system, main because they can't offer real guarantees. Is a productive credit (finances rotation capital and fix investment) and is allowed by an assisted methodology, where the credit agent (institution employee) interacts with the taker before, during and after the credit award (Adapted from Barone, Dantas, Lima and Rezende, 2002, p.14).

## **POVERTY AND LOCAL DEVELOPMENT**

After this melting pot of variables, becomes necessary to evidence the scenery, which they figure. A public police of credit access, whose tools provides from micro finance, and in special from microcredit, focused in the social and business pyramid basis has as basilar poles the combat against poverty and social inclusion inside of a local development strategy.

With the monetary stabilization success in 1994, the combat against the poverty became the main question to the different segments of the brazilian society. The importance that the theme is taking over reveals the understanding that the poverty persistence reflect and synthesize the more critical face of several national problems, between the crescent informalization of the work market, the difference between people and the regional unbalances (adapted from Rocha, 2003, p.174).

One country with continentals dimensions, Brazil posses 5.656 city councils, those are the mater cells of the federation, from these, according to IBGE, only 6% has more than 50 thousand habitants and, just 95 cities, between them, the state capitals, has more than 150 thousand habitants. With social, police and economic differences, any public police of inclusion that reach to be efficient, permanent and effective must, at the same time, has an universal comprehension and be focused in the small federative unit, the city council, following the old maxim of *"think globally and act locally"*.

From the economy study, more particularly the macroeconomy, part of the person income available is spenden in the goods consume and necessary services to the subsistence and a part is saved to the future consume ( $Y = C + S$ ). In the class 4 of consume (social pyramid) or in the business pyramid basis (informal enterprise, micro enterprise and the small enterprise), where the productive activities are to subsistence or simple accumulate, the microcredit, that is a productive credit, works as a lever, increasing the available income of the person/ familiar unit that is spenden in the consume. The multiplier income effect, generated by this process, when amplified, in a small city council district, in the own city council and then successively, generate in aggregated macroeconomic terms, national income increasing and by consequence the economic increase with inclusion, portion wished by all policy makers. By the other side, the credit to the consume can generate either similar effects to the collectivity because, stimulated, by the demand side, determinate part of the population consume and/or increase their consume of goods and services basket and, this offer must to fit, producing more, generating more jobs and, consequently, in aggregated terms, more income will be available in the economy.

For that reason, the importance of the concept comprehension that poverty and social exclusion can't be faced only with economic and compensatory polices raising, but, with innovative investment programs in human and social capital (Franco, 2002, p. 37).

## **THE SOLIDARY COMMUNITY, HIS ROUND AND THE PUBLIC POLICE OF CREDIT ACCESS**

One of the thoughts that were marked during the campaign and the beginning of the first ordering of the President Fernando Henrique Cardoso (1995-98) was "Brazil isn't a poor country, but an unfair country". Over

this tonic and, through a presidential decree, the Solidary Community was created in 1995 January and, in parallel, the “famous” Brazilian Legion of Assistance (LBA) was extinguished.

An agenda of social development was constructed to the country, according to Cardoso, Franco, Oliveira and Lobo (2002, p.05), new concepts placing old structures, singular proposals of singular action replacing old and surpassed assistances models. In this process, also was chopped beside the idea that the social development is unique task of the State. Partnerships with the civil society and privet initiative were used to potential the State action in several fronts.

In the breast of these transformations, in 1996 June, arise the Police Interlocution Rounds of the Community Solidary Council, incentived, according to Cardoso, Franco, Oliveira and Lobo (2002, p.13), by the conviction that was essential the construction of new dialogue channels between society and government.

Were, a long of six years, realized fifteen rounds about key-themes of a social development agenda to Brazil, but, from these, three (Alternatives of Occupation and Income, Legal Mark in The Third Sector and Microcredit Expansion in Brazil) contributed to the induction, formulation and implementation, directly or indirectly, of public politician of access to credit as a way to combat poverty and social inclusion.

The microcredit in Brazil is not recent, its origins reassemble in the end of the 50's, when Dom Helder Câmara, in Rio de Janeiro, created a “ loan wallet” that objective was assist the social excluded to start a productive activity. This wallet was the embryo of the Providence Bank, an answer of the Catholic Church against the miserable reality of a fraction of the carioca population, searching collaborate and participate actively in the effort of help and human promotion of the social excluded.

In the 70's, more specifically in 1973, in the municipal district of Recife and Salvador, by initiative and with technical assistance of the Accion Internacional, in the age called AITEC, and with the participation of business entities and local banks, was created the Northeast Union of Assistance to Small Organizations, knew as UNO Program, a NGO specialized in microcredit and capability to workers of low income in the informal sector (Barone, Dantas, Lima and Rezende, 2002, p.21).

In the 80's, two experiences, of regional importance, appeared in the country: the Woman Bank (Association to the Woman Development), founded in 1984 by the initiative of the Executive Woman Council of the Commercial Association of Rio de Janeiro and, the Rede CEAPE, from the Supporting Center to the Small Enterprises Ana Terra, at Rio Grande do Sul, in 1987.

Belonged to the civil society initiatives to the introduction of the microcredit in Brazil, however, the high inflation growth in the 80 's and in the beginning of the 90's practically made impractical the appearing and the development of a meaningful quantity of experiences. In the middle of the 90's, happened a fundamental change in the macroeconomic environment of the country – the prices stability – reached from the Real Plan implementation.

The elimination of the inflationary inertia and the monetary reform created a favorable environment to the few institution that operated microcredit. Crossing an annual inflation rate over 1.000% to 15%, and with a low sloping that confirmed in the follow years (see Table 1), these institutions could adapt their expectatives so far refers to the interests rate, that is, with a favorable economic conjuncture, started to operate with pre fixed rates, contributing of a meaningful way to the expansion of the credit wallets.

This “incentive”, additioned to the other structuring actions promoted by the federal, state and local governments, made that the number of operators entities surpassed 200, in 2004 (according to the research in process realized by the authors).

Between the structuring actions promoted in the federal government, is proper to detach the creation, in 1996, of the Social Development Area of the National Bank of Social and Economic Development – BNDES that, in syntonization with the Community Solidary Council, published the Popular Productive Credit Program (PCPP), with the objective of divulge, in a consistent and consequent way, the concept of microcredit and promote the formation of a wide institutional network able to take credit to the microentrepreneurs, formal and informal (Kwitko, Burtet and Weihert, 1999, p.11). Through this and the Institutional Development Program (PDI), fruit of an accord of technical cooperation not reimbursable with the Interamerican Bank of Development (BID), the bank passed to arrange of a special credit line to lever the wallets of the institutions in operation (funding) and, invested in the market infra-structure and in the strength of the institutional capability, through the development of qualifying manuals in analysis methodologies, award and accompany of microcredit, to credit agents; manuals to managers (techniques of microfinance management, marketing, microfinances regulation and information systems); a manual to the companies of auditors; institutional classifying systems (rating); support to the development of manager information systems, systems of credit punctuation (credit-scoring), as the strength

institutional actions: governability, regionalization, institutional transformation, development of new products, among other things.

In parallel to these actions, in the breast of the Solidary Community, through of his council, were promoted Police Interlocution Rounds that would influence over way the public policies of credit access. In the fifty round, that treated of the theme Alternatives of Income and Occupation, realized in 1997 august, the microcredit was indicated as an important strategy of the income and work policies and, was created a work group, with representatives of the Central Bank of Brazil (BCB), BNDES, Finance Ministry, among others, to present proposals to their incentive and regulation.

With two meetings, in 1997 august and 1998 may, the Interlocution Police Round about the Legal Mark in the Third Sector, incorporated, according to Ferrarezi and Rezende (2000, p.13), the necessity of construction a new legal structure, that recognize the public character in a complex, vast and still informal, the organizations of the civil society and, at the same time make easy the cooperation between these organizations and the State. From these two rounds, start to be projected a legal structure that makes easy the operations of microcredit institutions of the civil society.

With the monetary stabilization and incentivized by one of the main themes of the national and global agenda of the beginning of the 90's – social development, the microcredit institutions multiplied in the country, through the organized social society (NGO) and the local and state public initiatives (municipals and state funds), knew as people bank. This expansion appeared with a legal problem. The credit concession, with rates over 12% per year, according to the Brazilian legislation in vigor (legal norms about *usura*, usually knew as "Usura Low": articles 13, 14 and 15 from Decree nº 22.626/33; article 4º of the law nº 1.521/51; article 7º, V, of the Law nº 8.137/90), could only be done by entities that belonged to the National Finance System (SFN).

Besides of not making part of the National Finance System, the biggest part of these institutions charged and charge interests rates that guarantee their sustainability in a long time (between 3 and 4% per month), covering their costs and operational expenses and still generate superávit to be reinvested in their operations.

This legal problem was solved only, in 1999, with the promulgation of the Low nº 9.790 and by the Provisory Measure nº 1.965-11, from February 2000 (reedited successively), both fruits of the two Police Interlocution Rounds already named.

The Low 9.790/99, knew like "The Third Sector Low", created a new qualification to the juridical people of privet right without profits intention: organizations of the civil society of public interest (OSCIP), represented, according to Ferrarezi and Rezende (2000, p.13), one step on the direction to the legal mark reformation that regulates the relationship between State and civil society in Brazil. According to this Low, the entities that has by purpose the microcredit concession will not be liable to the "Usura Low", if they qualify their selves as OSCIP; after regulated by the Provisory Measure nº 1.965-11/00.

In 1997 November, the Northeast Bank (development bank federal public, that has his area of actuation in all the northeast region of the country and at the Minas Gerais and Espírito Santo north), marked by the social development agenda of the federal government, created a microcredit program, the CrediAmigo that, working with a methodology of solidary groups and, offering concomitantly the credit concession, the manager capability to the takers, became the biggest microcredit program of the country and one of the biggest, in terms of number of clients and total amount of the operations, of Latin America.

In the second part of the 90's, the Brazilian microcredit sector was composed by, in principle, only by the NGO, after, incorporated to the locals and state government experiences, and the CrediAmigo from the Northeast Bank. The participation of the privet initiative in the sector was through donations to the formation of own capital (equity) or loan capital (funding) to the civil society organizations that's performed in this sector.

The sustainability of a public intervention, in any area, depends on the capability articulation of strategic partnerships and, in the case of a public policy of access to credit, its not different. The dynamic equilibrium could only be ensured with the entrance of a new player, the privet initiative. Once more, proper to the Solidary Community Council create basis, through the Fifth Policy Interlocution Round – Alternatives of Income and Occupation, to this fact happens. As a result of the work group initiated in 1997, the National Monetary Council (CMN) edited, in 1999 August, the Resolution 2.627, considered the legal mark of the privet initiative in the microcredit sector (after improved by the Resolution 2.874/01). This Resolution arrange about the constitution and the operation of the Microentrepreneurs Credit Society (SCM), juridical people of privet right, with lucrative purpose, that exclusive social objective is the concession of providing capital to physic people, with sight to make practical professional business of professional commercial or industrial nature of small size, as like juridical people classified as microenterprises.

The expectation around this new actor was too big, in the measure that ensured the contributions to the equilibrium in all the proportions of the sector practicability (economic, financial, institutional and social). This, less the number of institutions (the legal structure still not attracted the quantity of investors purposed), and more by the business character, join marketing expertise and aggressivity to the microcredit operations. This knowledge of finances come from the fact that the Microentrepreneurs Credit Society (SCM) are being constituted by people originated of the financial system, in special for owners of the business of mercantile foment (factorings).

With the objective of carry financial services to the city councils population not attended by the National Finance System (1.627), the federal government, through the Communication Ministry, in October 2000, edited the decree nº 588, instituting the financial postal special service, denominated Postal Bank, to be landed by the Brazilian Company of Mail and Telegraphs (ECT). According to the 2º article of this decree, the services relatives to the Postal Bank characterize by the utilization of the network attending of ECT to the lend basics bankarian services, in all the national territory, as bankary institution attending. BRADESCO, the biggest privet bank of the country wined, in August 2001, competition to operationalyze it. The first agency was inaugurated in March 2002 and, their results impressed. In the end of 2003, counted with 3.365 agencies and, the hoped quantity to 2004 is of 5.482 agencies, covering 1.006 city councils and benefiting 9 millions and 900 thousand people.

Still with the development of the fifty Round of Police Interlocution of the Solidary Community Council and, under two basic things about microcredit approved at the Round about Alternatives of Occupation and Income, that “microcredit or popular credit can accomplish a strategic paper in the field of the public police of work and income, seen not as a compensatory police, but as element of a perspective more ample to the integration of popular enterprises or small port in the process of development, inside a not excluding optic and, that the popular credit will just obtain expansion to accomplish the strategic paper if be treated of a distinguished way of the traditional credit” (A Expansão do Microcrédito no Brasil, Documento Final, 2001, p.10), The Microcredit expansion in Brazil was theme of two meetings, in March and October 2001. The objective was construct proposals and consensual measures capable to contribute to over coming the obstacles that obstruct the microcredit raising inside the country, between them the expansion and consolidation of microfinances as a new economic sector; reach the countryside regions with low Development Human Index (IDH) and attract the credit offer in the country. Theirs instruments and results were primaries to the sector as the creation of four technical commissions to purpose actions paths to the sector problems: legal mark, divulgation and institutional strength, capacitation and evaluation. Between their results, detach: the edition of the Resolution nº 2.874, July 2001, that improve the legal mark of the participation of the privet initiative in the sector, through the SCM, flexibility some rules and becoming more attractive to the investors; the creation of the microcredit portal ([www.portaldomicrocredito.org.br](http://www.portaldomicrocredito.org.br)); the elaboration of a little book to the microcredit divulgation in the country; elaboration of the minimum requirements to the programs of capacitation in microcredit and the formulation of a group of financial indicators and the impact evaluation in their concepts.

In the end of the second order of the President Fernando Henrique Cardoso (1999-2002), the last important actor, in the policy social scenery, to adopt a specific police, guided to the microcredit foment in the country was the National Service of Supporting to the Micro and Small Enterprises – SEBRAE.

SEBRAE is an autonomous social service, created in 1990, from the mechanisms Constitution of 1998, that purpose, according to the strategic guiding of 2001/2002, is work in a strategic way, innovator and pragmatic to make with the micro and small enterprises in Brazil have better condition to a sustainable evolution, contributing to the development of the country as a hole. In October 2001 was launched the SEBRAE Program of Supporting to the Microcredit Segment, example that the partnership between public-privet-civil society can be conducted in benefit of a specific sector. According to Barone, Dantas, Lima and Resende (2002, p.26), by acting as second line institution, purpose support to the creation and the strengthening of the microcredit organization, since that these adopted independence principle and self sustainability. Between the supporting models, besides the resources to funding, the program expected the supporting to the institution reestructuration; capability of the human resources; allow of computerize management systems use, among others.

## **THE LUIS INÁCIO LULA DA SILVA GOVERNMENT AND THE NEW VISION OF CREDIT ACCESS**

The election of the metallurgic Luiz Inácio Lula da Silva to Republic President (2003-2005), in the end of 2002, represented a rupture with the policy model in vigor in the country in last 20 years. From 2003, a new policy makers team choose by the maintenance of the economic policy of the previous government, but, the concept of access to credit became to be understood as the bankarization of the lower classes of the population (pyramid social basis).

To the middle and the high class, use a “surpassed” piece of paper (check) to pay a bill is a common routine, but, as affirm Rubin (2004), to a big part of the country population, this trivial act is sophisticated, until original. There is no precise statistics about the number of actives economical Brazilian people without access to the bank services, but calculate something about in the band of 25 millions and 45 million of people.

Include this big mass of people in the National Financial System became the main tonic of the public politics of access to credit of the new government. In the eight years of the previous government, microcredit was understood as a productive credit, capable of gear income. In this government, the concept of microcredit was supported to credit of low value, productive or not, either, as already exposed before, capable of generate income (see item 4). Between the taken measures, detaching the edition, in June 2003, of the “Microcredit Package”, a group of measures that purpose to amplify the offer of financial services to the low-income population. Three were their pillars: the creation of simplified accounts (bankarization); the incentive to the credit offer through the destination of part of the resources of the compulsory collecting about the deposits in cash and the credit cooperatives of free association formation.

The edition of the Resolution nº 3.104, of June 2003, by the CMN, as part of the package tried to became instrumental, through the amplifying of accessible mechanisms of access to low income population to the National Finance System and, consequently, incline the improvement of the condition to the credit obtaining, the achievement of savings and the purchasing of financial products, besides of the bigger convenience to pay bills by the people with low income (Darcy e Soares, 2004, p.22).

In parallel, the Federal Savings Bank and the Brazil Bank (federal public banks), created mechanisms to operate this public policy through the creation of simplified current accounts, moved by a magnet card and, needing to the opening, only, the presentation of the identity card and CPF. The Savings created a simplified account denominated “Caixa Aqui” and, the Brazil Bank, one total assisted, called Popular Bank of Brazil to attend this segment. Over another aspect, this Resolution, allowed too, the creation of the cooperatives of free admission associated that, according to Darcy and Soares (2004, p.22), allow the organization of the population today, with few financial services access, localized far from the big downtowns, to move and apply the resources in their own benefits, stimulating the small rurals and urbans enterprises that generate jobs. Another Resolution of CMN, the nº 3.140, of November of the same year, allowed the credit cooperatives creation to the entrepreneurs entailed to classes entities.

Complementing the package and, implemented through the Provisory Measure 122, of 25 June 2003 (arrangement, after, by the Low 10.735, of 11 September 2003), was comparing to the Monetary National Council “competence to regulate the commercial banks applications, of the multiple banks with commercial wallet, of Federal Savings Bank, as with the credit cooperatives to small entrepreneurs, microentrepreneurs and free admission associated, in microfinances operations destined to the low income population and microentrepreneurs, based in resources originated of the deposits in cash” (Darcy e Soares, 2004, p.40). With basis in this Provisory Measure, the CMN edited the resolution (nº 3.109, June 2003) establishing the application of 2% of the deposits in cash, collected by these institutions to the credit operation the social and business pyramid basis. With this measure, hoped that the disposition and by consequence inject in the market of more than US\$ 350 million in credits of low value, productive or not, through the channels already subsisted, mainly the big retail banks, nationals or foreign.

## CONCLUSION

Although the “incentive” given by the economic stabilization, and of a complex of public polices turned to the credit access, such in the two orders of the Fernando Henrique Cardoso government (1995-1998 and 1999-2002) as in the firsts years of the Luiz Inácio Lula da Silva government (from 2003), so much still must be done in terms of productive credit (microcredit), credit to the consume and bakarization in Brazil.

Its frightening the number of people that live under the poverty line in the country (more than ¼ of the population) and the increasing of the informality in the big urban centers. The small business, urban and rural, formal and informal, suffer an acute scarceness of capital, that generates low productivity and low capital

income, that obstruct the income multiplier effect and, consequently, in macroeconomic terms, the including economic development.

This thesis is corroborated by a research realized by the Labour International Organization (OIT), where the potential demand for credit in Brazil, is estimated in almost 14 millions of entrepreneurs. This number was obtained by crossing information of the National Research by Domicile Samples, of 1999 with the Research about Urban Informal Economy, of 1997, both realized by IBGE (Darcy and Soares, 2004, p.07).

When verified the microcredit offer, the result is discourage, same with the expressive raising of operators entities after -Real, that attends only 1% of the estimated demand by OIT, according to Darcy and Soares (2002, p.07) and, half of this number is responsibility of the Program CrediAmigo from Northeast Bank. In part, this situation explains the option for the bankarization and the increasing of the credit offer through the traditional finance institution (2% of the compulsory over the deposits in cash), as a public policy of the Work Political Organization (PT) government.

Independent of the strategy adopted by the federal government: incentive to productive credit (microcredit) through the organized civil society, privet initiative and government programs (of first and second level, municipal, state and federal); bancarization, through the offer increase of specific products destined to the low income population and the spatial cover increase, specially in the city councils not attended by the Finance System, through Postal Bank and, the stimulus to the credit offer expansion, productive or not (2% of the compulsory over the deposits in cash), the policy makers and the society comprehended, in particular, in the last then years, that the war against poverty won't be wined with paternalist actions, clientele and assistance actions, traditional in the Brazilian society of the XX century but with, universal strategies, relative to the purpose, and focused, in the intervention sense of a specific agent complex, carrying local development and inclusion, through the sustainable increasing of the benefited income.

# COUNTRY TOURIST APPEAL AND COUNTRY IMAGE – THE CASE OF ITALY

**Sara Bassani and Daniele Toninelli**  
**University of Bergamo, Italy**

## ABSTRACT

*Starting from the belief that Italy has a great tourist potentiality, this study intends to measure the appeal of European market, and of Italy in particular, for US residents. Moreover Italy's image is investigated using an unstructured method that considers the nouns/adjectives associated to the country from the respondents. 119 personal interviews were conducted in different US States from July to August 2007. The analysis of the questionnaire confirms the strong position of Italy comparing to the others EU and world States and make it possible to identify interesting differences between people who already visited Italy and nonvisitors.*

## INTRODUCTION

The increase of areas of the world developed for tourism and of the quality of leisure time, a major knowledge of the world thanks to the media and to the increase of educational level and a more efficient transportation networks push the competition among countries. Today's consumers have the means to choose from this much larger variety of destinations. But the destination is made, essentially, of immaterial components. Consequently, destinations mainly compete on their perceived images relative to competitors in the marketplace.

Hence, in order to compete successfully, a destination should create and manage a distinctive and appealing perception, or "image" (Calantone, Di Benetto, Hakam and Bojanic, 1989). As pointed out by Guthrie and Gale (1991), with reference to tourism research, "Images are more important than tangible resources" because "perceptions, rather than reality, are what motivate consumers to act or not act". This is absolutely true, but just with reference to first time visitors. For repeaters visitors, it is truly important the confirm (or the improvement) of their perception otherwise, after the first visit, they never will come back (Lovelock, Wirtz, 2006).

In the tourism research field, a clear definition of image does not exist: "image" is a term difficult to define, it is a tricky concept. There are several definitions (Hunt, 1971; Crompton, 1979; Dichter, 1985; Kotler et al, 1994; etc.) but it is difficult to establish the boundaries of the concept.

In the literature about tourism destinations the importance of this topic is strongly recognized by the growing body of research. In particular, it is deeply examined the meaning and the measurement of the image. There are many possible approaches to studying destination image, because this argument has many implications for human behavior. Briefly, a destination (or a product) is perceived both in terms of individual attributes (coming from a "discursive processing" which is characterized by pieces of information on individual features or attributes of the stimuli) and holistic impression (coming from an "imagery processing" which is a sort of mental picturing, although sight is not the only sensory dimension that can be incorporated; imagery can include any or all of the senses).

In table 1 it is proposed a regrouping of 75 works, between 1971 and 2008, focused on this subject. This table is based upon a study of Gallarza, Gil and Calderon (2002) to which we have added the works wrote after the 1999.

**Table 1: Literature review on Tourism Destination Image**

| Topics covered  | Authors *  |
|---|--|
| a. Conceptualization and dimensions                                     | 1,2,4,9,13,15,16,18,19,20,21,22,27,30,31,32,33,34,41,43,45, 46,47,48,49,51,53,55,58,62,63,66,67,70,71,74             |
| b. Destination image formation process (static and dynamic)             | 1,2,6,9,11,13,16,17,20,22,23,27,31,32,33,34,46,48,51,63,68, 70,71,74,75  |
| c. Assessment and measurement of destination image                      | 1,2,3,4,5,7,8,9,10,12,13,14,18,19,22,23,34,25,26,27,28,33,37, 34,40,41,43,47,49,51,54,55,56,62,63,64,67,70, 72,73,75 |
| d. Influence of distance on destination image                           | 1,4,16,19,23,43,46,56  |
| e. Destination image change over time                                   | 1,4,16,19,23,43,46,56,71,72  |
| f. Active and passive role of residents in image study                  | 5,35,36,39,40,42,45,49,52,57,60,61   |
| g. Destination image management policies (positioning, promotion, etc.) | 3,7,9,10,13,14,15,16,19,20,24,25,28,29,30,32,33,34,35,36,37, 39,40,42,46,47,49,50,51,52,53,54,59,61,64,65,69,70,75   |

According to Gunn (1988) everyone has some kind of information stored in memory concerning a destination, even though it may be incomplete. Fakeye and Crompton (1991) speak about a destination image evolving from an organic image, through an induced image, to a complex image. Also in our opinion it is possible to individualize different level of image. The first one is something "given", information stored in memory: it depends on the magnitude and importance of that destination in the history and what the history has left in the country. An image a little bit more complex is made also by the "reputation" of the destination, coming from: the "product country image" (related to famous national products); the exposure to newspapers reports, magazine articles, TV reports, and other nontourism specific information; organization of mega sport or cultural events or the presence of famous sport men/women or teams, singers, etc. The third level implies, first of all, the active information search, but also any type of destination's specific information (documentary film, word-of-mouth, etc.). Finally, upon visiting a destination, a tourist will develop a more complex image resulting from actual contact with the area.

### Different kind of images

## AIMS OF THE STUDY AND METHODOLOGY

### Study's objectives

The empirical part of the study had mainly three objectives. First of all, the study moved from the belief that Italy has a great tourist appeal on US residents. The second objective of the study was to assess the image of Italy given by US residents (and verify if this is different for visitors and nonvisitors). The last objective referred to the importance given, in the related literature, to the benefits coming from organizing mega sport events (Preuss, 2004; Van Den Berg et al, 2002; Watt, 1998). In particular, we wanted to verify the awareness level concerning the country and the city in which the last Winter Olympic Games were hosted. How many knows where the last Winter Olympic Games were held? And, is there a statistically significant difference among who knows and who doesn't know it with reference to the desire to visit Italy?

### Methodology

The techniques commonly used in more general image measurement researches are based on two basic approaches: structured and unstructured. The first requires the use of a standardized instrument, usually a set of semantic differential or Likert scales that incorporates various common image attributes. A product (or, in our case, a destination) is rated by respondent on each of the attributes included in the measure and an "image profile" is derived from these ratings (Ferber, 1974). This method allows the researcher to compare several products (or destinations) across each of the attributes included as scale items. On the other hand, scale items are not designed to measure the unique characteristics of the product. Rather, they force the respondent to rate the product on more general, common traits.

The second approach is based on unstructured methodologies. These methods use free form descriptions to measure image (Boivin, 1986). In this way, respondent is allowed to more freely describe his / her impressions of a product (destination). Therefore, unstructured methodologies are more conducive to measuring the holistic components of product image and also to capturing unique features.

In the major destination image studies researchers have used structured methodologies (Echtner, Brent Richie, 2003), preferring instruments like semantic differential or Likert scales. Therefore, the majority of destination image measurement studies have focused on the common, attribute-based component of destination image and have not addressed the more holistic and unique components.

In our study we decided to use both the approaches. In particular, we used an open question in order to collect the impression about Italy (nouns and adjectives associated to it) and a Likert scale for evaluating the opinions of respondents (only who has already visited Italy) on several attributes.

### The questionnaire

For the data collection we used a questionnaire structured in six main parts; the questionnaire begins with a short introduction that wants to briefly introduce the topic of the survey and the objectives of the study (the developing of the structure of the questionnaire and of the items was made according with principles contained mainly in: Schuman and Presser, 1981; Wright and Anderson, 1983; Bayley, 1995; Corbetta, 2003).

The goal of the first part of the questionnaire, placed after the introduction, is to collect data to gain an exhaustive description (through the major significant variables) of the sample involved in the survey.

With the second part of the questionnaire we wanted to collect information about the process of planning and the vacation preferences of the respondent. The questions in this part are mainly closed items.

In the third part the questionnaire wants to capture the potential relevance of an event (in particular a sport event) to characterize and make stronger the image of a State and to attract the preferences of a potential visitor; the questions are particularly focused on the 2006 Winter Olympic Games (Italy, Turin).

The fourth part of the questionnaire, developed principally with open questions, asks the respondent to specify which States in the world (first) and in Europe (secondly) she/he wants to visit. This part wants to evaluate and compare the potential of attraction of the different States and in our opinion this could be considered a measure of the strength of their images. Moreover, the respondents can do a list of 1 to 5 States he/she wants to visit, giving the first place to the favorite countries, the second one to a State less important, and so on.

The fifth part of the questionnaire wants to collect data about the previous experiences of the respondent, as a tourist in the European countries. This part was developed to obtain a measure of the actual strength of the European States as tourist attraction because (differently from the questions seen above) we consider experiences effectively made by the respondents, and not only an attraction on a "potential" level. The respondents can indicate from 1 to 9 of European countries that he/she has already visited.

The last part of the questionnaire wants to study, in particular, the case of Italy and its image. To all the respondents is asked to indicate from 1 to 5 things or adjectives that he/she associates to Italy. This part is finalized to get a profile of Italy and the holistic components of Italy's image using the unstructured methodology (mentioned before) proposed by Boivin (1996). Considering the different kind of potential respondents, the last part of the questionnaire is divided in two different sections. The first is finalized to collect information from respondents that never visited Italy. The second section, reserved to respondents who visited Italy in the past, collects information about the tourist experience's satisfaction. The section asks to respondents if he/she likes Italy (actual image) and wants to study which aspect is more relevant to grow on his/her satisfaction using an evaluation scale (Delvecchio, 1995; De Vellis, 1991; Giampaglia, 1990; Marbach, 1997; Stevens, 1991; Thurston & Chave, 1974).

The questionnaire was developed in a way that the respondent can follow a logical itinerary through the different questions and to be as short as possible, even if collecting all the relevant information about the topic is the main goal; due to this reason were provided a series of jumps and textual links that allow the respondent to skip the part of the questionnaire in which he/she is not interested or involved.

## **The data collection and the sample**

To carry out this research 119 residents in the U.S.A. were interviewed by means of the questionnaire described above. The sample selection was systematic and not based on a sampling list. The selection of respondents was, mainly, at Manchester Airport (New Hampshire) and at Boston South Station. These two places were chosen to try to intercept, using only two main locations, people coming from as much wide as possible range of US States. The data were collected between July to August 2007.

Considering the way of selection of the sample, the description of its characteristics is very important due to the way of selection.

The sample is composed by 51,7% male and 48,3% female. The majority of respondents comes from New Hampshire (23,5%), Massachusset (16,8%) and Maine (9,2%) and from city with less than 10,000 habitants (27,7%) or with a number of habitants between 10,000 to 50,000 (26,9%) or with more than 500,000 (20,2%). The sample age has the following distribution: the principal part of the people interviewed were young (13,4% under 20, 37% between 21 to 35 years old) while 23,5% are people from 36 to 50 years old, 18,5% between 51 to 65 and 7,6% over 65 years old. The 22,7% of the respondents lives alone, while the 59,7% lives with parents or has an own family. The principal job of respondents involved in the survey is "student" or "working student" (28,6%) and employee (9,2%).

## **RESULTS**

### **The countries appeal**

The analysis of the fourth part of the questionnaire can make it possible a comparison of the potential appeal of all the countries in the world. The question # 7 of questionnaire asked: “*Write the name of the first five countries that you would like to visit (1 = the favorite one)*”. As a result of this item were elaborated two different rankings. In the first one (that we called “counter”) the countries are ordered by the number of the citations: this could be considered a measure of the relevance of the country in relation with the tourists knowledge and background. In the second one (called “score”) the number of citations is weighted with the place assigned (from 1 to 5, in decreasing order of importance) given to each country by every respondents. This second list, based on the score, gives an idea not only about how much frequently a State was pointed out, but takes in account also the relevance that respondents give to each country, that is the strength of the desire to visit the country considered. In the table 2 is possible to find the percentage associated both to the counter and to the score, to get an immediate idea of the difference between the two kinds of evaluation of the country’s relevance.

**Table 2: World’s countries appeal**  
(ordered by score’s ranking)

| # by score | # by count |           | % of tot. count | % of tot. score |
|------------|------------|-----------|-----------------|-----------------|
| 1          | 1          | Italy     | 9,0%            | 11,1%           |
| 2          | 2          | Australia | 6,8%            | 8,4%            |
| 3          | 4          | England   | 6,0%            | 6,2%            |
| 4          | 5          | Spain     | 5,6%            | 6,2%            |
| 5          | 3          | France    | 6,2%            | 6,0%            |
| 6          | 7          | Ireland   | 4,8%            | 4,7%            |
| 7          | 6          | Germany   | 5,2%            | 4,3%            |
| 8          | 8          | Japan     | 3,8%            | 3,6%            |
| 9          | 9          | Brazil    | 3,6%            | 3,5%            |
| 10         | 11         | China     | 2,8%            | 2,9%            |

**Table 3: European Union’s countries appeal**  
(ordered by score’s ranking)

| # by score | # by count |             | % of tot. count | % of tot. score |
|------------|------------|-------------|-----------------|-----------------|
| 1          | 1          | Italy       | 14,8%           | 17,2%           |
| 2          | 2          | France      | 12,6%           | 13,6%           |
| 3          | 3          | England     | 11,5%           | 11,4%           |
| 4          | 4          | Spain       | 10,4%           | 10,3%           |
| 5          | 5          | Germany     | 9,5%            | 8,6%            |
| 6          | 6          | Ireland     | 5,3%            | 5,0%            |
| 7          | 8          | Switzerland | 5,0%            | 4,9%            |
| 8          | 7          | Greece      | 5,0%            | 4,4%            |
| 9          | 11         | Scotland    | 2,5%            | 3,3%            |
| 10         | 9          | Holland     | 3,4%            | 3,1%            |

*Counter* = number of citations; *score* = number of citations weighted with country’s relevance.

In the top-ten list considering all the countries of the world there are 6 States of the European Union (Italy, England, Spain, France, Ireland, Germany) and 4 extra-EU States (Australia, Japan, Brasil, China). Italy results the major cited country with a percentage of 9% of all the citations. It is also the country that the sample wants to visit more, that is the most “desired” and attractive one (11,1% of the global score). This means that the importance that the sample gives to Italy is higher than the Italy’s weight in term of number of citations (there is a difference of +2,2 percentage points). An analogue consideration can be made about Australia but on a lower level (+1,6 percentage points) while the opposite happens, for example, to Germany (-0,9 p.p.). We have to underline also the strong difference between the percentage obtained by Italy if we make a comparison with the second country in the lists, Australia (+2,2 p.p. for the counter and + 2,7 p.p considering the score), and with the second EU country, England (respectively +3 p.p. and + 4,9 p.p.). Also considering England and Scotland together (count’s total percentage: 8,2%; score’s total percentage: 8,8%), Italy remains the world’s country that our US residents sample wish to visit most.

If we consider only the EU context, we can see analogue results in the table 3. The exact formulation of the open question in the questionnaire was: “*Which European States would you like to visit? (1 to 5 names; the first is the favorite one)*”. In table 3 are presented two different rankings similar to the ones seen in table 2: the percentage of country’s total number of citations and the percentages of counter weighted with the importance given to each country by respondent (% of total score).

As a confirmation of the data showed in the previous table 2, Italy is considered the country where the majority of the respondents wants to spend their vacancies (14,8% of the total citations); and, if we consider the place in the list attributed by respondents, Italy is even more important (17,2% of total score, +2,4 percentage points). The distance between Italy and the second country in the ranking list is of +2,2 p.p. (considering the counter) and of +3,6 p.p. considering the score. And, if we consider together England and Scotland (counter percentage: 14%; score percentage: 14,7%) Italy registers again more citations (respectively + 0,8 p.p. and +2,5 p.p.).

If the data showed before are useful to understand which is the impact of European States (and Italy in particular) in the word context, there is another question we proposed to the sample ( “*Which European states did you already visited?*”) to evaluate effectively where in Europe the U.S. respondents spend their vacancies more. The results are in table 4, where one can see the total number of citations (and the percentage on the total number of citations) of the first 10 European countries visited from the sample.

**Table 4: European countries visited**  
(ordered by counter’s ranking)

| #  |             | Counter | % of tot. counter |
|----|-------------|---------|-------------------|
| 1  | France      | 29      | 14,9%             |
| 2  | Italy       | 25      | 12,8%             |
| 3  | Germany     | 24      | 12,3%             |
| 4  | England     | 22      | 11,3%             |
| 5  | Spain       | 10      | 5,1%              |
| 6  | Switzerland | 9       | 4,6%              |
| 7  | Ireland     | 8       | 4,1%              |
| 8  | Holland     | 7       | 3,6%              |
| 9  | Poland      | 7       | 3,6%              |
| 10 | Austria     | 5       | 2,6%              |

*Counter* = number of citations. (multiple responses allowed).

The results showed in table 4 are quite different from the idea given from table 2 and table 3. France is the European country visited most (14,9% of all the citations registered by all the UE countries) and it has a percentage of +2,1 percentage points higher than the second States, Italy (12,8%). Moreover there are two new States that are frequently visited (Poland and Austria), even more than Greece and Scotland (who were in table 3). This results, particularly considering the Italian evaluation, seems to underline that Italy has the highest potential of attraction on the U.S. tourists, but when one U.S. tourist go to Europe, he/she chooses France more frequently as the final destination for his/her vacations.

## The image of Italy

The totality of qualitative responses concerning the nouns and adjectives associated to Italy was content analysed in order to find most frequently used meaningful words describing perceived image elements. We did the analysis dividing the US residents who already visited Italy and the nonvisitors. In order to summarize the great number of nouns/adjectives (each respondent could write 5 words maximum) we grouped them in thematic areas. The results are listed in table 5. In the first column (“visitors”) the underlined words are the ones which, in the category, have been cited more often (the frequencies are in the second column). In the column “nonvisitors” the first number refers to the frequency associated to the same words used by “visitors” (reported in the first column), while the second number refers to words not mentioned by visitors.

The main results underlined by the analysis (see table 5) are the following.

- The food, is really appreciated, both by visitors and by nonvisitors. The respondents praise the quality of the food in general, omitting, usually, to name which one in particular. In addition to food, also the wine received is great appreciated.
- The main attractions of Italy seem to be the landscape (judged beautiful and scenic by about the 40% of the visitors against the 20% of nonvisitors) and the artistic and cultural heritage.

**Table 5: Nouns/adjectives attributed to Italy**

|  | Visitors | Nonvisitors |
|--|----------|-------------|
| <b>Culinary aspects</b><br>( <u>great food</u> , pizza, pasta, <u>wine</u> ) | 25       | 55 + 5      |

|   |    |  |
|---|----|--|
| <b>Artistic and cultural richness</b><br>(music, art, culture, literature, ...)                 | 16 | 21 + 2 (museums)                                 |
| <b>Quality of landscape</b><br>(beautiful, scenic, ...)   | 14 | 14 + 1 (wonderful cities)                        |
| <b>Italian Life Style</b><br>(peaceful, friendly, crazy, cool, exciting)                        | 12 | 3 + 5 (picturesque, fun)                         |
| <b>Typical aspects of Italy</b><br>(architecture, small villages, lakes, Mediterranean lush...) | 11 | 7 + 15 (gondola, soccer, scooters, ...)          |
| <b>History – historic heritage</b><br>(historic site, colosseum, ...)                           | 10 | 13 + 3 (roman ruins, ancestor)                   |
| <b>Religion</b><br>(holy, religious)  | 2  | 3 + 10 (Pope, Vatican)                           |
| <b>Shopping [Italian products]</b><br>(leather good, clothing, boats)                           | 3  | 0 + 4 (jewelry, shoes, shopping, farm machinery) |
| <b>Negative aspects</b><br>(crime, dirty, unpleasant Rome, Smog, expensive)                     | 5  | 0 + 4 (mafia, fascists, Corleone)                |
| <b>Weather</b><br>(weather, warm, hot)  | 3  | 3 + 1 (sun)                                      |
| <b>Cities</b><br>(Rome, Florence)   | 2  | 17 (Rome, Venice, Sicily, Torino, Pompei)        |
| <b>Sentimental matter</b>   | 0  | 7 (pretty women, romantic)                       |

Total visitors: 33 units; total non-visitors: 76 units

- Who visited Italy recognises as typical elements of the country something different from the nonvisitors. For example, the latter ones named different times the word “gondola”, while no one of the visitors named it. We could call this an unfilled expectation, or we can just say that who visited Italy remember aspects of the territory more widespread (gondola is a typical vessel in Venice only).
- The visitors went home with the feeling to have been in a country with a life style particularly extrovert (they use terms like “crazy”, “cool”, “exciting”) other than friendly (more than it is considered to be by the nonvisitors).
- Little importance is given to the shopping goods (clothes, shoes, ...) contrary to our expectations (Italian fashion products are particularly appreciated abroad).
- Religious aspects tend to be forget after visit Italy (or they are considered less important than other attributes), while the nonvisitors strongly associate Italy with them (with the Pope and the Vatican in particular).
- The few negative aspects mentioned by the two categories differ from each other. The ones mentioned by nonvisitors are the ones associated, in a stereotype way or historically, to Italy: mafia and fascism.
- Nonvisitors have mentioned much more cities (Rome in particular) comparing to visitors.

## The impact of mega sport event

The questionnaire wants to evaluate the impact of mega sport events on the image of a country. We focused on Italy and, in particular, on the Winter Olympic Games that took place in Turin in 2006. Only 35,3% of the sample answer to the question about the country, 28,6% to the question about the city. We presume that the other respondents didn't know where Winter Olympic Games were held.

If we consider only the people who answered to the question, the 61,9% (21,9% of all the sample) gave the right answer about the State (Italy) and 52,9% (15,1% of all the sample) gave the right answer about the city that hosted the game (Turin).

To understand if the knowledge about the Winter Olympic Games is a strength point for the image of Italy, we used the chi-squared statistic test to verify the null hypothesis of the independence between the Winter Olympic Games State variable and the questions that asked which country the respondent wish to visit. At the usual levels of statistical significance ( $\alpha = 0.001, 0.01, 0.05$ ) the null hypothesis of independence cannot be

refused. This means that, in the case of Italy, the Winter Olympic Games are not statistically relevant in determining or less orienting the potential tourist's point of view and desires.

## CONCLUSIONS

The version used for this survey is the first release of the questionnaire; and this was the occasion to definitely test the questionnaire itself. In our plans it will be strongly developed in the future not only to get more data from respondents from the US and to make more deepening, but also to implement the survey in different contexts: in fact we're planning to extend the survey to Canada and to other European States, in a close future.

Another objective we proposed ourselves in developing this research is to collect data not only about the Italian image in a world and in an Europe context, but also to collect detailed information about others States that would allow to make a comparison of the evaluation of the States' image from the tourist point of view. This could be very useful for local or National government to plan interventions and improve the tourist appeal of their countries.

Despite this all, interesting considerations can be obtained by the analysis of these firsts 119 questionnaires.

First of all, we have to confirm that Italy still has a great tourist appeal, at least for US residents (for them, it is the most desirable country in the world and the "top of mind" country). Nonetheless, there is a good part of Americans that have already visited Italy (30% of respondents) and they have been satisfied about the tourist experience. The "profile" of country emerging from the judges given by the visitors is really positive (beautiful landscape with great food, extrovert life style and a lot to visit). Moreover, on a more general level, analysis shows clearly the high attraction of the European Union countries: the only extra-EU country that seems to be really competitive with the most cited EU countries is Australia (# 2 after Italy in rankings shown above: see table 2).

Of course, to have a good image is not enough in order to be chosen or chosen again as tourist destination. The tourists, in fact, will compare the image of one destination with all the others' ones. So, if a country picks up the greatest number of preferences, concerning the desire to be visited by the tourists, we can conclude that the country has big appeal. But we cannot conclude that the specific country will be the one with the greatest number of visitors because this depends upon different other aspects (such as the distance, the price, the cost of life, the availability of international connection, the weather conditions, the presence of relatives, etc.). We want to deepen these aspects in further researches.

Other interesting findings of our research concern the little recall of aspects related to Italian fashion business, style and design, and just the few references to negative aspects such as crime, mafia and fascism.

With reference to the role of mega sport events, we can only conclude that to have hosted the last Winter Olympic Games didn't give to Italy too much more notoriety (only 21,9% of the sample knew where the Games were organized and there is not statistically significant difference in the desire to visit Italy comparing with the ones that didn't know where the Games were hosted).

Several additional directions for further researches can be suggested. Firstly, creating a competitive position in the marketplace implies examining not only the strengths and weaknesses of the tourist destination under analysis, but also those relative to the competitors. By applying the same study to a wider group of tourist destinations it will be possible to identify the images of destination that tourists have compared with the main competitors. The results of this comparison are extremely useful in order to develop a successful strategy concerning the tourist destination's positioning in the target markets.

Another direction for further researches, that we're still planning (as told above), is to extend the study not only to analyze the image of other States, but also to study the Italy's image of the residents in countries different from the US.

# **RISK MANAGEMENT IN AIRLINES: FINANCIAL RISKS AT TURKISH AIRLINES**

**Ünal Battal**  
**Anadolu University, Turkey**

## **ABSTRACT**

*Air transportation industry has a significant place for developed and/or developing economies. Changes in rules of economic activities as well as progresses in international economic relations, rapid change in competitive conditions, and technological innovations affect airlines' performance. Operational risk that naturally exists in aviation has also being discussed as means by institutional, financial, and strategic. This study contains 4 sections. Risk management in airlines is explained at the first section. Current situation of Turkish Airlines in Airline Industry is exposed at the second section. At the third section results from interview are evaluated and explored financial risks at Turkish Airlines. At the final section, current situation is examined and some propositions are constitute for Turkish Airlines financial risk management practices.*

## **RISK MANAGEMENT IN AIRLINES**

### **Introduction**

Airlines in today's environment of economic uncertainty are doing everything possible to reduce costs and conserve cash. While this is understandable, a broader view may be necessary to reduce the risk of failure in both the short and long term. Some of the risk faced by airlines stems from a flawed and complex industry structure, which becomes more obvious when times are difficult. For example, ownership restrictions have prevented airlines from consolidating, which could mitigate local and regional economic risk. Also, the airline business model is capital, labor, and technology intensive, increasing the complexity of the risk management challenge. Much of this risk, however, could be identified and managed. There are effective strategies, adopted by other sectors, which can help identify and managed risk. The alternative is volatility of earnings, and therefore, of share prices. In general, the financial markets do not trust airlines' earnings consistency and, therefore, heavily discount the sector's stock. Airline price-to-earnings ratios are generally half or a third of the market average, a fact often lamented by airline CEO's. (Zea, 1998)

### **Risk Management**

Aviation encompasses a full spectrum of risk factors. International airline is exposed both to general entrepreneurial risks and to industry-specific risks. Key areas of exposure are capacity and utilization risks, strategy-related risks, political risks, operational risks, procurement risks, labor agreement risks, It risks plus financial and treasury management risks. Steering with circumspection between opportunities and business risks is integral to corporate management. (<http://konzern.lufthansa.com/>)

The primary risks facing the industry fall into four categories hazard, strategic, financial, and operational (Exhibit 1). Airlines have tended to see risk management in terms of hazards, such as the need to protect physical assets. Significant and growing attention has also been given to safety and security issues. Elsewhere there has been some experimentation with hedging financial risks, such as foreign currency exchange rates, interest rates, and fuel prices. These approaches have been successful to an extent, but Entrepreneurial and Industry –Specific Risk Prioritization to Airline 316 more aggressive techniques and a wider perspective would

greatly increase the benefits. One new concept that can address this opportunity is ERM, a process of systematically identifying all critical risks, quantifying their impacts, and developing and implementing integrated risk management solutions. Those solutions need to be total aligning people, processes and technology to maximize enterprise value. Some tenets of this approach include the concepts that (O'Toole 2002): Not all risks are material - it depends on their potential impact on the value of the enterprise. Individual risks and their impacts should be evaluated on a portfolio basis to understand and appreciate correlations among risks. Risk management is an ongoing process, not a one-time event.

Exhibit 1 Airline Risk Factors

Source: Airline Business April 2002

The Airline Risk Management Survey 2005 was launched last autumn with the aim of gaining a better understanding of the issues and trends within airline risk management and to establish some industry benchmarks against which airlines can measure and monitor their own performance. For research breaking new ground among the airlines, the response rate was positive [degrees] 51 airlines took part, accounting for 41% of the world's top 200 airlines by total revenue. The study shows that risk management has a high profile within airline businesses: not only do two thirds of airlines have a company-wide risk management strategy, which, on average looks just over three years into the future, overall responsibility for risk is taken at boardroom level in 75% of airlines, with the chief executive's office making the decision whether to avoid, retain or transfer risk in 45% of airlines. (Airline Business, 2006) Mercer Management Consulting recently analyzed aviation industry risks for the 10-year period from April 1991 to April 2001. The primary risk facing the industry fall into four categories: hazard, strategic, financial and operational. Overall, failure to manage the entire spectrum of risks resulted in the evaporation of \$46 billion in shareholder value during this time period. Interestingly, hazard events, including safety, liability, and war, were the least likely to result in value loss. Strategic and financial risks were much more prevalent, accounting for nearly %75 of value loss events during the period (Exhibit 2).

Exhibit 2 Risk Events Precipitating Stock Drops, 1991-2001

Source: Mercer analysis

## Key Risks for Airlines

Strategic risks are defined by business design choices and how these interact with various external factors. A challenge from a new form of competition shifts in customer preference and industry consolidation are all strategic risks. Many of these challenges may be mitigated through traditional responses, such as creating a culture focused on the customer, developing a rigorous strategic planning process, or maintaining an independent board of directors. But many risks can be lessened in the first place through the selection of the business design itself. For example, Southwest has designed a business that attracts customers in good times and in bad because it is simple operationally and, therefore, cost effective. It is also not subject to the tremendous reliability problems that bedevil network airlines. Other Southwest business design choices further lower risk exposure. For example, use of secondary airports insulates Southwest from direct competitive pressure while improving turnaround speed. Low debt levels make the company less vulnerable to interest rate fluctuations. And profit sharing and a fun culture reduce the chance of labor difficulties. (Zea, 2002)

Financial risks involve the management of capital and cash, including exogenous factors that affect the variability and predictability of revenue and cash flow (e.g., general economic conditions or foreign exchange rates). Beyond of hazard risks, techniques to mitigate financial risks are the most advanced, primarily because there is a large third-party market dedicated to the effort, including banks, credit specialists, derivative markets and others. Financial solutions may include the design and placement of financial transactions, including, for example, structured finance, derivatives, insurance, contingent financing and debt equity offerings. Other, new approaches could push thinking even further in this area. (Zea, 2002)

Operational risks arise from the more tactical aspects of running the business day-to-day, such as crew scheduling, accounting and information systems, and e-commerce activities. Many airlines have processes in place to mitigate the most obvious operational risks such as business interruption, but fail to address more subtle risks. For example, little effort has been put into working with the government to shape industry regulation or solve capacity issues, yet airlines have spent tens of millions of dollars fighting inquiries and lawsuits, all the while incurring system delays. Operational risks can be mitigated through organizational solutions, for example, process redesign, organization structural changes, improved communication, contingency planning, performance measurement and reward systems, and capital allocation and pricing. Most managers would think of mitigating risks such as these as just part of “doing their job.” The challenge is great, however, and involves looking at risks holistically, as well as evaluating each potential response through the lens of impact on shareholder value. Then strategies can be defined to mitigate risk wherever it resides. (Zea, 2002)

## Risk Mitigation

Lufthansa’s diversification into non-flying businesses was designed to reduce strategic risk and the volatility of their earnings base originating from the passenger airline business. The program began in 1994 after three years of losses, with four companies being created: Lufthansa Technik, Lufthansa Cargo, Lufthansa Service, and Lufthansa Systems. Revenue growth has been highest in the service-related divisions, and passenger airline revenues now account for only 56 percent of the total, down from 70 percent in 1995. While Lufthansa is still reliant on the air transport sector, it is in a better position to reduce earnings volatility than its competitors,

despite the fact that not all of the divisions have been successful. Swissair pursued a similar strategy but, unfortunately, also attempted to diversify geographically within Europe by investing in weak, second-tier airlines. Not surprisingly, the only value left in the company after the recent liquidity crisis was in the services businesses. (Zea, 1998) Some airlines have contained strategic risk through aggressive cash management. Most airlines accelerate spending during periods of high growth to acquire new aircraft, upgrade products and services, and maintain labor peace. Airlines with the highest multiples, however, conserve cash during the boom times and invest in the trough. For example, during the Asian financial crisis, Singapore Airlines initiated hundreds of millions of dollars worth of upgrades to their onboard product, further entrenching their leadership position during the later economic upturn. Low-cost airline Ryanair recently placed an order for 100 Boeing 737s with 50 options, during a time when most airlines are deferring orders and mothballing aircraft. They were able to negotiate a low unit price, and are poised to further exploit the current weakness of Europe's network airlines.

Hedging is a common way to manage the financial risk of input price changes, and no airline input is more volatile than fuel. Airline executives often comment that hedging is not a core competency, and that as long as competitors are not hedged, it will be a level playing field. Unfortunately, when fuel prices rise dramatically, airlines cannot pass all of the cost on to their customers. As shown in Exhibit 3, Mercer analyzed the effect of year 2000 hedging strategies among major airlines. While many airlines were able to maintain profits in the face of price increases, more aggressive strategies could have been used to further improve results. If such tools are not further leveraged, earnings will continue to be vulnerable, and shareholders will suffer value loss during volatile periods of supply.

Exhibit 3 Operating Income Effect of Fuel Hedging

An example of a new technique for financial risk management involves guarantees for credit card transactions. This product, developed by MMC Enterprise Risk, allows an airline to access otherwise unavailable cash (e.g., credit card escrow funds). Normally, the bank processing a weakened airline's credit card transactions will put all of the funds into an escrow account, to be released as customers use their tickets. This protects the bank against refund requirements should the airline cease operations. In the new arrangement, shown in Exhibit 4, a guarantor "insures" the refunds to the bank, which then releases the cash in the escrow account. The risk analysis carried out by the guarantor focuses on the likelihood that the airline will fail to discharge its obligations rather than simply its risk of default. Insurance capacity can typically provide a flexible risk mitigation avenue, without exposing the insurer to undue risk of losses. This arrangement offers the airline access to additional funds at a lower than average cost of borrowing, at a time when traditional funding lines are strained due to the industry's weakened financial state.

Exhibit 4 Financial Risk Management: Credit Card Guarantees

Of the 45 risk events analyzed by Mercer, nearly two-thirds could have been avoided using the types of approaches discussed above. Ten could have been mitigated through traditional means such as insurance or financial derivatives. Fourteen events could have been mitigated by more consistent and in-depth customer analysis, combined with scenario planning and game theory exercises. Finally, eight events could have been

mitigated through improved merger integration planning and improved execution. Given the many new tools available, it is time for airlines to move to the next level of sophistication in Enterprise Risk Management. The impact of one-time value-destroying events and related earnings volatility would be reduced, and shareholder value dramatically improved. As James Lam, former Chief Risk Officer of Fidelity Investments and CE has said, “leaders recognize that over the long-term, the only alternative to risk management is crisis management.”

## FINANCIAL RISKS AT TURKISH AIRLINES

### Current Status of Turkish Airlines

Air transportation is a fast growing sector of the Turkey economy. For these reasons airlines and their good governances are vital important for Turkey as a part of air transportation system. The future of Turkey air transportation is crucial to the Turkey’s economic develop and growth. According to IATA report, Turkey will be one of the fastest growing civil aviation markets in the world between 2005 and 2009. Poland, China, Czech Republic, Qatar and Turkey will be fastest growing civil aviation markets in passenger and cargo areas. An approximate of 8.9% growth in passenger numbers is estimated for Turkey for the next 5 years. Turkish Airlines (THY), founded in the year 1933, was the only airlines company operating in Turkey for a very long time. It may have considered itself the sovereign of Turkish skies as it did not have any domestic competition. Today air travel has improved both in the aircraft used and their safety, in addition to the ground services provided. THY was reorganized in 1956 as a mixed corporation and in 1990 the airline’s shares were transferred to the Prime Ministry Public Participation administration in the form of a privatization venture. THY, remains the national flag carrier. THY was the only national airline providing air transport for a very long time. The performance of its administration had much to do with the revenues of the company. Sometimes it showed great profits but sometimes its revenues did not meet spending. However with competition in the market, a Turkish airline has improved its standards and since the deregulation of Turkey’s airline industry in 1982, the private sector has steadily increased its share in the international market. (<http://downloads.uktradeinvest.gov.uk>)

In Jan-Mar 2008, THY capacity on domestic routes increased by 9,4%, traffic increased by 9,7%, load factor decreased by 0.2pt to 71,4%. On international routes; capacity increased by 10%, traffic increased by 16,5%, while load factor increased by 3.4pt to 70,2%. Total capacity increased by 9,9% while traffic increased by 15,1%. Load factor was 70% (+3.2pt). ([http://www.thy.com/en-INT/corporate/investor\\_relations/](http://www.thy.com/en-INT/corporate/investor_relations/))

Exhibit 5 Passenger Traffic and Market Shares

During the year 2007, THY carried 19,6 million passengers, flies to 69 countries, 138 cities and 140points, fleet of 102 aircraft and seat capacity of 17,594. THY generated 90% of revenues from passenger traffic and 10% from scheduled cargo traffic. They have regular services to 107 international destinations and serve 31domestic airports. They are members of Star Alliance on April 1st. 2008. Out of 59 aircraft, 43 of them joined the fleet as of 2008. As of 2008 average age of the fleet will be around 6 yrs. Total of 2.7 billion dollars financing were completed for the aircraft delivered in 2005,2006, 2007 as well as 19 aircraft in 2008, at Libor and Euribor without Treasury’s Guarantee. At the end of 2008, annual lease expenses will be approximately around \$545 million; of which 77% Financial leases and 23% Operational Leases. ([http://www.thy.com/en-INT/corporate/investor\\_relations/](http://www.thy.com/en-INT/corporate/investor_relations/))

Revenue breakdown has been relatively constant over the years, passengers accounting for around 80%. Turkish Airlines benefits from the large Turkish population living in Europe, creating a steady revenue stream. Revenue has positive correlation with growth in GNP in Turkey.

## Financial Risks at Turkish Airlines

**(a) Financial risk management objectives:** A formally specified risk management model and its active application are not available within the THY. Currency risk, interest rate risk and liquidity risk are some important risks of the THY. THY management manages the risks through its decisions and applications. Even a formally specified risk management model is not available, corporate risk management model has been aimed and the related activities are being performed. THY is subject to the financial risks related to the changes in the exchange rate and interest rate due to its operations. Distribution of expenses and incomes based the types of exchange rates and distribution of debts based on the types of exchange rates and fixed and variable interest rates are managed by the company management. THY's income is diversified among the major currencies. Due to its currency basket THY is very flexible on fx position. Although USD income is lower then USD expenses, THY is able to cover its USD expenses from Euro income due to strong Euro against USD. Same concept on USD/Euro is applicable to cover Turkish Lira expenses Diversified revenue & expense base and agility in pricing currency. (Turkish Airlines Inc.)

Exhibit 8 Distribution of Incomes and Expenses

**b) Foreign currency risk management:** There is a natural balance in the foreign currency risk between the THY's incomes and expenses. This balance is tried to be kept through taking into consideration the future forecasts and market conditions. Foreign currency sensitivity: THY is primarily subject to US Dollar and EUR foreign currency risk. The table below demonstrates that the sensitivity of the THY against the 10 % change in US Dollar and Euro exchange rates. Negative amount demonstrates the decrease effect of the 10 % increase in the value of US Dollar and EUR against YTL in the net profit for the year. If US Dollar and Euro is devaluated against YTL by 10 %, the amounts are the same as the figures in the table below and its effect in the income statement will be reverse. In the impairment calculation of aircrafts, motors, and simulators, US Dollar prices are used. Accordingly, the impairment provided by the THY for the tangible assets decreases when the US Dollar is evaluated against YTL, and increases when the US Dollar is devaluated against YTL. In this context, when the US Dollar is evaluated by 10 % against YTL, due to the decrease in the impairment provided for aircrafts, motors, and simulators, there would be an increase in the net profit for the year amounted 185.532.444 YTL other than the effects in the table above. If US Dollar is devaluated by 10 % against YTL, these amounts remain constant but the effect in the income statement will be reverse.

Exhibit 9 Foreign Currency Sensitivity

|                         | US Dollar effect (i)        |                             | Euro effect (ii)            |                             |
|-------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|
|                         | 1 January-30 September 2007 | 1 January-30 September 2006 | 1 January-30 September 2007 | 1 January-30 September 2006 |
| Income statement effect | (66.399.990)                | (98.045.510)                | (24.877.859)                | (14.210.043)                |

Source: Turkish Airlines Inc.

**(c) Interest rate risk management:** THY's liabilities are on fixed and variable interest rates. When the interest situations of the existing debts are being considered it is seen that the variable interests compose the majority. In recent years, a partial balance between the debts with fixed interest and the debts with variable interest is tried to be provided through increasing the weight of the debts with fixed interest provided that the financing of the aircraft is favorable. Because the THY's debts with variable interest rate are dependent to Libor and Euribor, dependency to local risks is low. THY's financial liabilities are showed below. (Turkish Airlines)

**Short-term portion of long-term financial borrowing at 31.12.2007 is as follows:**

| Maturity   | Interest Rate | Original Amount      | Interest Accruals  | YTL       |
|------------|---------------|----------------------|--------------------|-----------|
| 15.08.2009 | Libor + 1,25% | 2.959.707 US Dollars | 247.266 US Dollars | 3.735.162 |

**Long-term bank borrowing at 31.12.2007 is as follows:**

| Maturity   | Interest Rate | Original Amount       | Interest Accruals | YTL        |
|------------|---------------|-----------------------|-------------------|------------|
| 15.08.2009 | Libor + 1,25% | 22.937.732 US Dollars | -                 | 26.715.577 |

**Finance lease obligations at 31.12. 2007 are as follows: (YTL)**

|                                   |                      |                           |                      |
|-----------------------------------|----------------------|---------------------------|----------------------|
| Less than 1 year                  | 298.808.141          | Represented by:           |                      |
| Between 1-4 years                 | 797.170.667          | Short-term liabilities    | 225.183.209          |
| Over 4 years                      | <u>1.137.792.480</u> | Long-term liabilities     | <u>1.569.126.885</u> |
|                                   | 2.233.771.288        |                           | 1.794.310.094        |
| Less: Future interest expense     | <u>(439.461.194)</u> | Interest Range:           |                      |
| Principal value of future rentals |                      | Floating rate obligations | 1.123.591.167        |
| shown in the balance sheets       | 1.794.310.094        | Fixed rate obligations    | 670.718.927          |

**The future lease rental payments under operating leases at 31 December 2007 are as follows: (YTL)**

|                          |                    |
|--------------------------|--------------------|
| Not later than one year: | 130.984.676        |
| Between 1 - 4 years:     | 374.178.949        |
| Over 4 years:            | <u>522.289.995</u> |
|                          | 1.027.453.620      |

THY Management calculates the effects that are arisen from the fluctuation in the Libor and Euribor rates by 0,5 % that are the interest rates of the THY's variable interest rates and reports them to the top management. When there is an increase by 0,5 % in Libor and Euribor interest rates and the other variables remain to be constant: The amount of the THY's interest expense for the twelve months period increases by 4.616.168 YTL. When the Libor and Euribor interest rates decrease by 0,5 %, twelve months interest expense decrease as the same amount. THY signed interest swap contracts in order to change its financial leasing debts from fixed interest rate to floating interest rate. Also THY signed exchange contracts in order to change financial leasing debts from Euro to US dollar.

**(d) Credit risk management:** THY's credit risk is basically related to its receivables. Because there are so many customers, the THY's credit risk is dispersed and there is not important credit risk concentration. Additionally, THY manages the risk through obtaining guarantees for its receivables.

**(e) Liquidity management:** THY manages liquidity risk by maintaining adequate reserves, banking facilities and reserve borrowing facilities by continuously monitoring forecast and actual cash flows and matching the maturity profiles of financial assets and liabilities.

**(f) Capital risk management:** THY manages its capital to ensure that entities in the Group will be able to continue as a going concern while maximizing its profit and market value through the optimization of the debt and equity balance. The capital structure of the THY consists of debt, which includes the borrowings and equity comprising issued capital, reserves and retained earnings. The top management of the THY assesses the cost of capital and the risks associated with each class of capital. At the time of these analyses, top management assesses the risks associatible with each class of capital and gives the ones that are dependent to Board of Directors to the assessment of Board of Directors. As the results of the assessments of top management and Board of Directors,

the Group provides the optimization of the capital diversification through obtaining new debts, repayment of the existing debts and/or capital increase. This is overall strategy of the Group.

## CONCLUSION

THY, that carries the Turkish flag, by making the decision to expand its fleet, bought 61 new airplanes, in this way THY made an attack on carrying its identity upper levels in the Civil Aviation Sector, that is developing seriously in least years. 41 airplanes financing has completed and the airplanes has delivered to THY. 18 airplanes financing has been decided. For that reason, approximately 2,7 billion dollars financing has provided. While provide the airplanes financing, guaranty of treasure isn't taken and the lowest interest rate credit accepted on libor(-). On finance of the airplanes, THY makes decisions by researching all alternatives as ECA, American Eximbank Guaranteed Financial leasing, Operational leasing, Japanese Operating Lease(JOL) and Securitization. This decision depend on evaluation criterions such as lowest cost offer come from the financial establishment, keep in aircraft at the end of leasing, tax advantages of offer and scrap value risk of the airplanes. The risks and the advantages of ownership concern the lessee in financial leasing but in operational leasing it concerns lessor.

Today, the risk of interest of companies has two sources: the sensitiveness of assets to the interests and the sensitiveness of debts to the interests. If the companies want to protect themselves on natural ways from the risk of interests, the firms which would has the positive correlation with the changes of interest should prefer the floating interest debt and negative correlation with the changes of interests should prefer the fixed interest debt. On the other hand, distribution of foreign money on the revenues and the expenses are care about. If the cost is low, a part of financing can be done on Euro beside dominant money US Dollar in aircraft market. Thus, THY provide positive contribution with the matching distribution of revenues and expenses in their future cash flows,

On financial leases, to guaranty these leases there are some comprehensive works with the US Eximbank and ECA's that is in Europe. In this way, the guarantied credits, that is gotten from these works, let THY can use low cost financing methods. Beside these financing methods, especially in 2007 also JOL that is a financial leasing method has first time used on aircraft financing. This method supplied the possibility of low interest to THY like in US Eximbank and ECA financing. The reason of this low interest is implement to finance policy with zero interest of Japanese Central Bank for encouraging consumption.

In additional, French Tax Shielded Financial Leasing system which one of first in international market and taking advantage of tax agreement between Turkey and France. This method was used financing Airbus aircraft in 2006 which guarantied by ECA. THY's this aircraft financing got reward of the year by "Janes Transport Magazine". Also its aircraft financing US Eximbank guarantied Boeing aircrafts which will be delivered in 2008 by the mentioned French Taxing Shielded Financial Leasing method. These leasing companies share taxing advantage which French laws provides with THY. So Turkish Airlines gets lower cost financing from libor and Euribor like the ECA/US Eximbank guarantied financial leasing and JOL.

The processes about formation Enterprise Risk Management strategy also comprise financial, strategic, risks which will give many advantage to THY in transition process to Basel II criterions, is going to complete very soon. With formation of ERM it's planning to identify risk appetite, risk strategy and create risk transparency to create a strong risk organization, to inculcate sharing risk culture and effective risk processes. It is clear that any kind of changing in this sector is effecting and will effect air transportation directly. If we say economy is a chain and every sector is its ring, so every sector has to keep its ring strong.

# **MEMORIES OF THE PAST, CONSUMPTION AND CONSUMER BEHAVIOR: EXPLORING THE ORIGINS AND LIMITS OF THE NOSTALGIC TREND THROUGH LIFE STORIES IN BRAZIL.**

**João Renato de Souza Coelho Benazzi**  
**Brazilian School of Public and Business Administration, Brazil**

## **ABSTRACT**

*The main objective of this exploratory study was to deepen the understanding of some aspects of the nostalgic appeal and its influences in the attitudes, behaviors and consuming intentions of consumers. To achieve that purpose a field study was conducted, investigating the different reactions, feelings, memories, reasons and other conditioning factors in the life histories of two men when questioned on the influence of nostalgia in their consumer behaviors. Data were collected through in depth interviews and were analyzed with an interpretative approach. The ambivalent results point out the relevance of past recollections and the effect of nostalgia in consumers' attitudes, in situations where nostalgic effect can play as either positive or negative stimulus and that consumer decisions such as buying, rejecting, discarding or collecting products can be strongly influenced by the nostalgic appeal.*

## **INTRODUCTION**

The nostalgic appeal of products has already been the object of research interest of many researchers (HOLBROOK, 1993; HOLBROOK e SCHINDLER, 1994; among others). Specifically in the Brazilian context Bonn and Motta (1999), Benazzi (2000), Benazzi and Motta (2001), Benazzi, Assayag and Gomes (2004), among others, have already focused research efforts on the theme. Brown, Kozinets and Sherry (2003), for instance, argue that it is an important factor in the revival of once famous trademarks and for the success of the retro style. Nostalgia has also been object of recent studies related to the industries of tourism, entertainment and sports (HASHAMOVA, 2004; FAIRLEY and GAMMON, 2005; PELEGGI, 2005) and in marketing studies centered in food preferences (BREWIS and JACK, 2005).

This work aims to deepen the understanding of nostalgic appeal influences in attitudes and preferences of Brazilian consumers. To meet that objective, this study investigated the mode of operation of the nostalgic appeal through in depth and exhaustive analysis of life-story narratives of two consumers who live in the city of Rio de Janeiro (Brazil). One of the interviewed was self-identified as non-nostalgic and the other was self-identified as nostalgic. The results are consolidated in this article, composed of this introduction and other five sections. The second and third sections discuss the concept of nostalgia and its limits, its contextualization for marketing and consumption studies and presents studies already made on nostalgia worldwide and in the Brazilian market context. The fourth section focuses on the methodological choice made and informs on the process of the field search. The following section presents, discusses and interprets the results and in the last section conclusions are presented.

## **NOSTALGIA – THE CONCEPT**

According to Holbrook (1993) nostalgia has been studied in subjects such as history, psychology, sociology, anthropology, environmental psychology and other social sciences approaches. Usually, nostalgia

refers to longing for the past, for yesterday or a desire to revive activities that took place a long time ago (HOLBROOK 1993). Davis (1979, p18), for instance, interprets nostalgia simply as “a positive evocation of a past experience”, involving a negative feeling towards the present or the future, seen in the idea that “things used to be better ... than they are today”. Holbrook e Schindler (2003, p 107) define nostalgia as “preferences (positive attitude or affection) for objects (people, places or things) that were more common (popular, in fashion or of more intense circulation) when one was younger (in the early adulthood, teenager period, childhood or even before birth)”.

Nostalgia can be seen as an intense emotion and can also be considered a kind of feeling that alters and modifies individual experiences. Nostalgia, thus, involves past memories, but can also be connected to fantasies of a remote time or space during which the individual did not go through any direct living experience (SCHINDLER and HOLBROOK, 2003). Anyway, the memories of what one lived in the past, directly or mediated through someone else's report, may not reflect the reality of that past, but even be distorted, producing a more positive image than reality. Therefore, the nostalgic appeal may ignore negative aspects of past and keep only good memories. Though it is not always plausible to assume that the object of nostalgic appeal was more common in the past, the association with the past creates a net of connections with the individual that does not occur with other objects. These connections or associations produce the nostalgic appeal. Nostalgia does not necessarily imply in preference for a determined object, but essentially in a feeling that may result in preferences (HAVLENA and HOLAK, 1991). Thus, nostalgia appears more frequently linking positive feelings – such as joy, happiness and pleasure – with others, such as affection, love and sentimentalism.

According to Havlena and Holak (1991) the concept of nostalgia, in the field of consumer behavior, means “a bitter-sweet longing for Home”. Nostalgia is seen as an emotional state in which the person longs for an idealized view of a past period. This longing for yesterday (Davis, 1979) is expressed by the individual attempt of recreating some aspects of that specific past in the present, either through the reproduction of past activities or through the collection of symbolic representations in memory.

## CONSUMPTION AND NOSTALGIA

Firat and Venkatesh (1995) point out that consumption –the everyday choices that one makes when engaged in shopping processes – gained new meanings when confronted with the new organization of contemporary social life. What we consume explains who we are. Belk (1988) highlights that the self perceptions that consumers actively build and modify are strongly affected by the objects they buy and keep. This perspective will guide the specific approach and development of this study as it will focus on the relationships built between consumers, and acquired products and services and specific interactions in their consuming processes.

According to Giddens (2002) our life styles are revealed through our daily consuming choices. Nowadays, the role of tradition as behavior modeling has been far diminished. Its conventional function – to determine values and, thus, behaviors – is more and more performed by different figures of authority that contemporary social life produces. Such figures work as basis for behaviors of wider layers affluent populations , more and more submitted to market a great variety of market information stimuli. Those figures of authority can be either movie stars, sport idols, intellectuals and celebrities, each one in his/her field of action and influence. It is important to notice that those figures of authority do not need to be in present focus in order to exert influence: they can also be from the past. Giddens' (2002) authority models – present or past – may be a clarifying element in the web of relations between identity perceptions and consuming choice influences, as those figures can be catalysers of behavior, role that, previously, was sociologically played by tradition.

Nostalgia has already been defined as preference or positive attitude towards people places or objects that were frequent, popular or fashionable until the early adult life of an individual (HOLBROOK, 1993). In fact, the period to which Holbrook refers, covers the beginning of adulthood, adolescence, childhood and even the pre-birth period, discarding the need of personal experience in the nostalgic tendency. This appeal to nostalgia would be especially relevant in adults over 30 years old, especially because of the association of positive past events and presently offered goods. Products also evoke memories and trademarks that are successful in linking their images to reminiscences and memories of past may have their sales dramatically affected, especially in items related to the consumer's childhood or adolescence. When buying an item, the consumer would be bringing his memories back to life, re-living, through memories, the times to which the product would be associated (SOLOMON, 1996). For Holbrook (1993) the approaches about the role of nostalgia influence in the consumers' behavior intend to study the importance of two distinct phenomena. The first one relates the degrees of nostalgia to changes that

happened in a lifetime, associated, thus, to the consumer's age: the older ones would be more inclined to be influenced by nostalgic appeals. The second one intended to test the degrees of nostalgic proneness in people of same age rank, trying to prove the influence of psychographic and general characteristics of life style in nostalgic proneness.

The same author has made two studies in the USA about consumers taste in films that show that women were more nostalgic than men, but with non-significant results. Such results also failed to find any relationship between age and nostalgic tendency or even between nostalgia and other demographic variables studied (HOLBROOK and SCHINDLER, 1989; HOLBROOK and SCHINDLER, 1994). In a research about consumer's favorite movie actors or actresses of different time periods, Holbrook e Schindler (1994) assessed the question of nostalgic tendency based on the concept of *attitude toward the past* - ATP. As in the study of Holbrook (1993), a scale of 20 assertions that measured their nostalgia proneness was used.

A study performed in Brazil, whose aim was connected to the detection and measurement of cohort effect in the movies, also verified the nostalgic tendency of the respondents and used 10 of those assertions to measure the nostalgic tendency. The results indicated a probable greater nostalgic tendency in women than in men, but with a non-significant difference in the confidence interval of 95%. The same study also failed to find a relationship between nostalgic tendency and age (BONN and MOTTA 1999).

Based on the studies of Holbrook (1993), Holbrook and Schindler (1994) and Bonn and Motta (1999), Benazzi and Motta (2001), using a sample of over 400 respondents, formulated and tested four propositions on relations between nostalgic tendency and other factors that could help in characterizing and segmenting market targets: the relation between variations in nostalgic tendency and variables such as gender, age, cohort effect and income levels of respondents. The results confirmed a greater nostalgic tendency among women rather than men with a meaningful difference in the confidence interval of 95%. The research found no direct or inverse relationship between nostalgic tendency and age, though nostalgic proneness was higher among respondents of less than 25-year old and among respondents older than 70. But results indicated relation between nostalgic tendency and economic income – lower income levels were associated to greater nostalgic tendency. Finally, no relation between nostalgia and cohort age groups was found.

Reisenwitz, Iver and Cutler (2006) studied the differential receptivity of magazine ads with and without nostalgic appeal. They focused on gender, age and trademark image variables and discovered that the ads with nostalgic appeals exerted influence on the respondents for all the studied variables. Benazzi, Assayag and Gomes (2004) have studied, in the Brazilian context, the influences of nostalgic appeal in the attitudes and consuming intentions of men and women. The field study checked the different male and female reactions when confronted with ads published in national magazines from 1930 to 2004. The results suggest that for most of the respondents, the ad with nostalgic appeal was seen as non attractive. Nevertheless, though women have higher degrees of positive attitude for nostalgic-appealed ads than men, this was more important for men than for women, as women would tend to have more neutral opinions about the subject.

An alternative tendency has been the increasing of interest in a more distant past, as reflected in the success of books and magazines that deal with themes or tell stories that happened in the 19<sup>th</sup> century and in the beginning of the 20<sup>th</sup>. The contrast between the evocation of nostalgia of recent past and the extraction of feelings for a more distant past is also present. Whereas the interest in 1800 and the beginning of 1900 may reflect the longing for a golden age, this is not true for the real nostalgia found in memories of individual experiences. Despite that, the feelings of calm, security and happiness that can be evoked by those messages are similar to those evoked by truly nostalgic messages to assure the classification of those magazines and books as a stimulus on nostalgic basis. This approach, that uses a wider definition of nostalgia, seems more appropriate in the context of the consumer behavior (Havlena e Holak, 1991). Csikszentmihalyi and Rochberg-Halton (1981), studying "special" or "sacred" objects, showed that women are more prone than men or children to collect objects as a source of memories. While men tend to mention action objects (such as sports equipments, TV and vehicles), women mention contemplation objects (such as pictures, art objects, plates and textile articles). Though not examined by the authors, we can expect similar differences between the genders in the kind of stimuli that evoke nostalgic feelings.

However, the perspective of most of those studies prioritizes the quantification of nostalgic tendency (HOLBROOK, 1993; HOLBROOK E SCHINDLER, 1994; BONN E MOTTA, 1999; BENAZZI E MOTTA; 2001) instead of deepening the understanding of its mechanism of action and its influence factors. Such perspective, though partially carried out by Holbrook and Schindler (2003) lacks more attention in the Brazilian academic context. This study sought to address this gap.

## RESEARCH METHOD

The field study investigated the factors related to consumption that were influenced by the nostalgic appeal. Factors that influenced the process were identified, specifically those related to the life stories of the respondents that could bring light on the reasons and causes of different effects of nostalgic tendency in behaviors and attitudes. In order to collect those data, semi-structured in depth interviews - characterized by the high control over content and low control over structure - were performed. This research design intended to uncover regularity in various discourses and infer meaning from the presented text, justifying thus this kind of data collection (TESCH, 1990). Semi-structured interviews are flexible instruments because they make possible redirecting the interview whenever its focus is lost or even to solve ambiguities. The interviews stimulated the development of narratives about aspects related to feelings and perceptions associated to appeals and influences that past memories may have exerted or still exert on the consuming behavior of those interviewed. They explored exhaustively, in the life stories of the respondents, the causes for the various impacts and valorization of nostalgic appeal in consumption. The questions were asked, however, in a very careful way, generally trying to make them indirect or in the 3<sup>rd</sup> person.

The information obtained was submitted to content analysis. The central aim, clearly of qualitative and interpretive perspective, intended to capture perceptions, opinions and evaluations of respondents regarding the possible reasons for the positive or negative preferences towards consumption decision processes, products and other factors of influence. One of the main aspects focused was the reason offered by the respondents for their behaviors and attitudes. The research concerned about classification is, fundamentally, based on interviews and employ, as analysis tool, the verbal expressions contained in the participant narratives. The illustrative expressions of each interview were selected as quotes and are preliminarily classified, based in their similarity. The groups of quotes are organized and re-organized, each group's attributes are explicated and the meaning of each group is consolidated in a definitive category. The result is a list or map of qualitatively different ways in which people undertake, define, distinguish and understand the aspects of reality that are the object of the research. It is a process of analysis that involves a sequence of actions, comprising the decontextualization, the classification (or codification) and the contextualization of data (TESCH, 1990).

During the phases of interview and analysis of document originated by the data transcription, it is necessary to have in mind that we are dealing with what the interviewers revealed about their self-images, the people they are related to and aspects of their daily consumption. In many contexts one can expect that such images do not correspond to the respondents real opinion (ALVESSON, 2003). Such opinions may be selected or even deformed due to a variety of influences, from the expectations regarding the interviewer's reaction, a positive public image to be built or even the defense of public faces, images and roles played by the interviewed. It proved vital to interpret the interviews from a critical perspective in order to identify those possible counterfeits and point them out among the data collected. In addition, Goffman (1976) argues that, among the various processes of social interaction in everyday communication, the individual play social roles and defend faces dynamically. Such perspective contributes to deepen and to limit the analysis made as the consumption processes will be understood as social processes that only make sense when interpreted inside their specific cultural context. The selected perspective, thus, will deal with consumption as an essentially symbolic process that can be object of interpretative analysis.

## RESULTS AND ANALYSIS

The selection of subjects was based on accessibility and judgment. The two respondents of the interview processes had opposite characteristics when it comes to nostalgic tendency: one is very much influenced by the nostalgic appeal of products and services and the other, very little influenced by them. Both were selected after an introductory and informal interview when the aim of the study was explained, and the issue of nostalgic appeal extensively debated. The objective of such debate was twofold: at first the respondents could understand, at first, the very concept of nostalgia and, subsequently, identify the level of influence of such appeals in his own consumption attitudes and behaviors. It was only after this very first contact (whose aim was just to select the respondents) that the first interview for collecting data was effectively scheduled. The sample was composed by two respondents, what makes of this study a case study in which specific cases of consumers are deeply explored

and, whenever relevant, the attitudes in each case are compared (YIN, 2005). The first subject, self-identified as very little nostalgic (S1), is 41 years in 2008, does not have any children, was born in the city of Niterói in the state of Rio de Janeiro, Brazil and has moved to the city of Rio de Janeiro (RJ) when he was 18 years old. He receives approximately US\$1.900,00 per month (typically middle-class income) and has a homo-affective relationship for over 6 years; has concluded high school and works in a small retail organization. The second subject, self-identified as very much nostalgic (S2), is 45 years old in 2008, no children, was born and lives in Rio de Janeiro. He has a graduation degree, a formal and relatively stable job in a large Brazilian organization and eventual insertion as free lancer professional. His monthly income reaches nearly US\$ 4.500,00 and has been divorced for eight years maintaining at present a homo-affective relationship for the last seven years.

The fact that both respondents maintain homo-affective relationships was not a pre-determined criterion of sample selection but proved useful as it helped to reduce the variability of answers. Such aspect certainly marks the life style of both respondents in a similar way and, thus, help in highlighting the different positions each manifested towards their reactions and opinions concerning nostalgic proneness. Similarly the respondents have around the same age. Four interviews were performed with each respondent performing the total length of eight hours of conversation with each respondent. In the interviews, they were stimulated to tell events about the past, memories and short stories about consuming situations and, more specifically, about the meaning of objects, services and reasons evoked in such situations. The analysis of the narratives focused on the identification of their discourse content and the reasons – especially those of affective and symbolic content – for the actions and feelings evoked.

The childhood, adolescence and early adulthood of the non-nostalgic subject (S1) were marked by unpleasant memories. Such negative aspects concerned three specific factors: being the only child, the income level of his parents was much lower than his present income level and questions related to his sexuality. The fact of being the only child brings back memories of loneliness, playing alone and having few friends in childhood. Though he has friends in the neighborhood, he claimed to feel few opportunities to share uneasiness, fears and opinions with friends of same age. His parents' income level made consumption quite limited and created feelings of insecurity. It also forced the respondent's parents to spend long time periods at work – more remarkably his mother, strengthening the feeling and memories of solitude in this phase of life. Because he grew up in a conservative environment, the expression of his sexuality was conflictive and produced unpleasant memories concerning his social acceptance. He claims that this situation had only ceased to be a source of suffering when, at the beginning of his adult life, he started to work and left his parents' house. The memories of freedom and self-esteem, thus, have their origin in a relatively recent phase of life. The respondent says that such circumstances – that nowadays dominate the symbolic images he build and keeps about his past – are the dominant facts about his past. Those features are possibly the reason of his low affection for nostalgic appeals: the past is a source of unpleasant memories.

S1 says that his life is much better now, that he is much happier in the present than in the past. His income level is increasing, the satisfaction with his life and with himself is in constant progress. Those statements make him conclude that his past is not a source of good memories. Therefore, he tends to characterize the nostalgic appeal as something highly negative. For instance, he despises the retro style and he does not like clothes inspired in the decades of 60, 70 and 80. He does not have collection of objects, except for one: watches of famous brands. He started this collection six years ago when he got the first one from his present companion. The symbolic content of this collection is strongly marked by affective behavior – as the collection is stimulated by his companion – and a sign of status and increased income – as they are expensive watches, available only to those that can buy luxury superfluous consumption objects.

When asked about affective attitudes towards objects of his past, S1 pointed out two kinds of objects that remind him of his parents, both deceased. From the father, he keeps two handkerchiefs that he takes with him daily – for nine years, since his father died – in the bag that he takes to work. They are just like some old bills of old money that the father kept and that the interviewed keeps at home. From the mother – dead two years ago – he keeps a ribbon from his baptism, of great affective meaning. The interviewed brings, in his arm, the name of his mother tattooed, as homage paid to her memory and devoted love. He also kept some tickets of shows and parties he took part and that were, in a way or another, important. But those are all events of his adult life – and not adolescence – a period of time and life when he was already independent from his parents and lived at his own. But such objects, kept either as gifts or as symbols or memories of the beloved ones, are a manifestation of his ambivalent attitude towards nostalgia. It is contradictory that someone self-designated as

little nostalgic keeps objects specifically because they are highly symbolic and emotion-intensive on memories of his past.

S1 also declares not keeping clothes for long. He says that gets quickly tired of his garments and usually gives away clothes still well-preserved when notices that he does not want to wear them anymore. He appreciates fashion news and informs that does not buy more things due to exclusively to financial limitations. He manifests strong desire to return to Europe, experience he had, for the first time, in 2007. In general, foreign countries seduce him due to the news and unexpected habits, sceneries and cultures. He is open to the new, to the future and willing to consume products with such symbolism. The stimulus to consume is positive when associated to such imaginary.

On the other hand the nostalgic subject's (S2) childhood is marked by pleasant memories whereas in the adolescence predominate feelings linked to suffering. The beginning of his adult life is not characterized by any remarkable kind of memories, alternating moments of happiness and sadness. The positive aspects of his childhood are marked by family memories. This subject has two sisters and mentioned occasions in which past events influenced present choices. It was impressive the emphasis given to food habits and lifestyle preferences associated to that period of life. For instance, he mentioned many typical dishes from the countryside of São Paulo state, in Brazil where he used to spend long vacation times with the sisters and cousins in his childhood. The dishes mentioned varied from fruit (jaboticabas - a local fruit - and mango) to manioc-powder biscuits and coconut caramels to other candies and a stew chicken made by an old beloved aunt. The subject affirms that he has a strong preference for those dishes and always associates them to his childhood memories, feelings that, when eating them, recover pleasant feelings evoked by that period of his life.

His favorite hobbies and activities for leisure time are also influence from that same period of life. Going to the beach, alone or with friends, is a habit he keeps and mentions as a result of his happy childhood memories. Riding bikes or horses are other leisure activities that, though not present in everyday life, also have positive associations to happy moments of childhood. Some tourist destinations in south of the state of Minas Gerais, in Brazil and at the seashore of Rio de Janeiro are linked to that period of life with pleasant memories. From the same time come the reminders of objects collected that still have symbolic value. He says that used to collect key rings and still keeps the collection, though does not dedicate himself to the activity anymore. Likewise, he claimed that keeps many childhood toys as souvenirs of that stage of life: toy cars, a miniature motordrome and a miniature apache fortress, his favorite toys. In addition, he informs that has already bought those kind of toys for his nephews, connecting such behavior to those sepecific past memories.

From early youth also came associations with vacation trips to places in Brazil and abroad. He specifically mentioned trips to Florida (USA), Brasília and Goiás ( both in Brazil) and to the seashore of Espírito Santo state (also in Brazil). But also among those trips, taken with sisters and parents, came negative memories: such destinations are strongly associated to unpleasant moments. He also said that has no intention to travel to those places again, partially due to such memories. From that stage of life also come associations similar to those of the non-nostalgic subject: feelings of loneliness, associated to his first memories about his sexuality. He also mentioned, as well as the other subject, few opportunities to share uneasiness, fears and opinions with others of his age, though he had a wide circle of friends and relatives. For the nostalgic subject, the parents' income level seems to play an indirect role in his nostalgic tendency: their financial situation – both successful professionals – was from average to high income level and this condition provided the chance to have various pleasant and eventually expensive activities during his childhood and adolescence. Differently from the non-nostalgic subject, he mentioned having neither relevant negative memories concerning his family's consumption level during childhood nor insecurity memories associated to the family's income during his childhood and youth.

As the non-nostalgic subject, he also mentioned the conservative social environment in which he grew up as source of unpleasant memories regarding the expression of his sexuality, conflicts and insecurities about his social acceptance in a wider sense. For the nostalgic subject, the memories about freedom and self-esteem are linked to moments of childhood vacation, to trips at the early adult life without the family during graduation. They are, thus, also recent in his life, but not as meaningful as for the non-nostalgic subject. The nostalgic subject claims that the circumstances narrated about his childhood seem very important to explain the symbolic images that he has built and keeps about his past. Such features are possibly the cause of his affection for nostalgic appeals. Differently from the non-nostalgic subject, the past tends to be a source of pleasant and unpleasant memories. Specifically in this case, there were fewer unpleasant souvenirs, possibly corroborating Schindler and Hoolbrook (2003) when they argue that the filter of time tends to mitigate bad memories, selectively keeping the good ones.

The nostalgic subject, as the non-nostalgic one, also informs that his life seems much better nowadays, that he feels happier in the present than in the past. But he does not see his trajectory of life as a constantly improving process. On the contrary, sees highs and lows. Therefore, understands that, in his past, there is room for memories to be re-lived in the present and that consuming products with nostalgic appeal is a way to reach that intention. The nostalgic subject also pointed out a wide variety of objects with affective meaning associated. Furniture, photos of events and situations, souvenirs from trips, scents, clothes and food are in that category. He remarkably mentioned occasions when traveled and bought objects just because they were associated to the other past trips, which supports the assumption that the nostalgic appeal can be relevant in tourism (FAIRLEY and GAMMON, 2005). That specific connotation was the origin of buying behaviour of perfumes, photographs and even the LCD monitor of his computer. Those objects were linked to stories of pleasant moments even if quite recent. All of them had a specific short story that provided them with symbolic meaning, beyond their specific utilitarian features (CSIKSZENTMIHALYI e ROCHBERG-HALTON, 1981). When asked if any item connected him to his parents, he informed that both were still alive and that he has a pocket clock that belonged to one of his grandfathers' and that he has pictures of five generations of relatives in his living room. But such pictures and the clock do not seem to evoke nostalgic feelings: their meanings were linked to a feeling of belonging to the family and had no other associated memories.

Regarding everyday consumption habits influenced by past memories, the nostalgic subject informed he had great emotional difficulty in discharging even ordinary objects linked to memories of the past. He claims to dress in traditional style and admits being a little resistant to fashion changes, though he may eventually appreciate novelties. Such ambiguity may be, simultaneously, effect and result of his memories whereas the ambivalence may be a consequence of the development of nostalgic tendency and appeal (HOLBROOK E SCHINDLER, 2003).

Just like the non-nostalgic subject, the nostalgic respondent also claims to be open to novelties, to the future and willing to consume products with such symbolism. Again, the stimulus to consumption is positive when associated to such imaginary. But, for the nostalgic subject, past can be a supplementary source of associations, subjectivity and symbolic value for marketing processes.

## CONCLUSIONS

The understanding of the changeable motives of consumer behavior can help offer products and services that better fit demands and expectations of consumers. The purpose of this study was to understand more deeply aspects of this complex behavior, emphasizing the effect of nostalgia on the attitudes and preferences of clients. The nostalgic tendency, defined as an appreciation, preference or positive attitude towards people, places or objects that were frequent, popular or fashion in the past has become a relevant variable in market segmentation, able to characterize and differentiate Brazilian populational groups. More specifically this study deepened the debate on the way the nostalgic appeal operates through an exhaustive investigation of two consumers' life story narratives, being one self-identified as non-nostalgic and the other self-identified as nostalgic.

The results confirm that nostalgic appeals have an important role for service and product consuming in tourism, food and toys in Brazil and indicate that the positive or negative attitude towards events and memories of childhood may play a central role in the width and intensity of nostalgic tendency. For nostalgic consumers, the appeal to memories of other phases of life and the association of brands and products with the past may be an important differential in the processes of purchasing as well as an important stimulus to build positive image associations. Nevertheless, for non-nostalgic consumers, such effect can be an obstacle for selling and a negative image association. The results suggest, though ambiguously, that even nostalgic consumers respond positively to image association with the future, progress and updating.

Finally, we emphasize that symbolic aspects of products – and not just its usefulness – are a relevant part in sense making and in intensifying market value. More specifically, old objects, not associated to past memories, have no nostalgic stimulus. Such results reinforce the necessity of deepening the understanding of subjective aspects of consumer's complex behavior as a way to produce relevant and rigorous knowledge in marketing in Brazil.

# COMPARATIVE ANALYSIS OF EUROPEAN BOARD OF DIRECTORS

**Cristina Bettinelli, University of Bergamo, Italy**  
**Lal Chugh, University of Massachusetts- Boston**

## ABSTRACT

*We conduct a comparative analysis of corporate governance laws with respect to boards of directors and directors' duties in six European countries (Spain, Italy, France, Germany, Austria and Portugal). The analysis focuses on corporate governance and directors' duties for companies limited by shares. The article focuses on three major objectives: 1) to compare different laws that could improve the board's strategic role and protect the shareholders' rights, 2) to measure with an index the extent to which legislation intervenes in the composition of boards of directors for each country, 3) to point out some divergences and convergences among the European countries analyzed.*

## INTRODUCTION

Corporate governance law has an impact on corporate behavior, in particular on the protection of shareholders' rights and on the strategic decision-making process. Variability in the political and social environment can profoundly affect which firm structures and which governance provisions survive and flourish. Using this as a starting point, we conduct a comparative analysis of corporate governance laws with respect to boards of directors and directors' duties in six European countries (Spain, Italy, France, Germany, Austria and Portugal). The analysis focuses on corporate governance and directors' duties for companies limited by shares. The methodology is based on the conventional approach to evaluating a law which consists of examining its contents from a qualitative point of view. We have three major objectives: to compare different laws that could improve the board's strategic role and protect all the shareholders' rights, to measure with an index the extent to which legislation intervenes in the composition of boards of directors for each country, and lastly, to point out some divergences and convergences among the European countries analyzed.

## LITERATURE REVIEW

According to the literature, corporate governance "becomes a key consideration (and often a binding constraint) in countries with sound economic policies and with regulations which provide adequate protection of property rights" (Rueda-Sabater, 2000). Moreover, in these times of globalization, many continental European countries have transformed their corporate laws and financial market regulations. The literature suggests that, even if national corporate laws are different, there are different forces that can contribute to corporate governance convergence (Jeffers, 2005). Two of these are very important in the European Union: the free circulation of capital and the introduction of the Euro as a common currency as well as the constitution of a unique European market that leads to a bigger competitive environment. Through this restructuring process, firms have developed a new culture that transcends specific national characteristics. As a consequence of the integration, Jeffers explains that different elements that directly affect corporate governance can be cited. He mentions the establishment of common prudential rules (that is, rules designed to limit risk taking by investors), the usage of international norms of accounting, and, in Europe, the aim to harmonize fiscal policy and corporate laws. Inside Europe, as mentioned above, a process of convergence in the various systems has started. Nonetheless there are

different opinions about the future of European Corporate Governance Law. Cernat (2004), for example, remarks that in Europe the diversity of national corporate governance models and the presence of different EU decision-making procedures do not guarantee a successful future convergence into a unique corporate governance model for the EU. On the other hand, it must be noted that, in the last few years, a number of rules by the European Court of Justice (ECJ) have made cross-border mobility in incorporation in the European Union easier. Becht *et al* (2006) have analyzed how deregulation and the costs of regulation have affected the location decisions of firms. They found that incorporation costs, especially those due to minimum capital requirements and delays in incorporation, have significant influences on firms' location decisions. Their results confirm that when a firm has to choose between different legal systems, the price is relevant and that cross-border incorporation has encouraged regulatory competition between EU member states to offer low-cost corporate law. Moreover, Khanna *et al* (2006) have analysed cross-sectional data and tested the hypothesis that similarity in corporate governance between two countries is correlated with economic integration between those countries. The authors conclude that globalization may have encouraged the adoption of some common corporate governance standards but that there is little evidence that these standards have been implemented. Furthermore, Black (2001) found that a firm's corporate governance behavior can have a vast effect on its market value in a country. These results are confirmed by recent literature which shows empirical evidence of a positive relation between the quality of corporate governance and the firm-specific valuation (Beiner et.al. (2006). What we wanted to explore is the convergence of the corporate governance law in European countries and we decided to do so by a comparative law analysis. In the literature, some authors focus on comparative law and corporate governance (Barca & Becht, 2001; Kraakman *et al*, 2004). For example, Albert-Roulhac & Breen (2005) examined the key aspects of the structure and composition of boards in Europe by considering a sample of companies from different European countries. They interviewed these companies and defined the corporate governance ratings by country) according to the response obtained. We believe that although the Roulhac and Breen study is one of the most important works on this topic, it seems that the influence that the law has on the corporate governance characteristics of the companies in the sample has been neglected. For this reason, we decided to analyze the corporate governance laws in six different countries; the results of the analysis will help understand some aspects of corporate governance behavior in Europe.

## THE SAMPLE

This paper focuses on law provisions for Spain, Germany, France, Italy, Austria and Portugal. We decided to consider these countries because of their geographic location (all are in continental Europe, each bordering at least one of the others) and the similarity in their GDP per capita in 2006. Moreover, the countries selected all belong to the Romanistic-German legal system (Visegrádi, 2001) which formed the first legal family in the world. More specifically, France, Italy, Spain and Portugal belong to the *Romanistic* legal system (the first subgroup of the Romanistic-German group). In the past, Italy, Spain and Portugal have been also greatly influenced by the German and the Swiss codes, which makes them representatives of an intermediary type. Germany and Austria belong to the *Germanic legal family*, which is the second legal grouping of the Romanistic-German system. This article will consider the law requirements for boards of directors and some indicators of shareholders' rights in companies limited by shares. By companies limited by shares, we mean those in which each shareholder pays debts up to the amount of the shares they have bought if it fails; legally speaking, such companies have a legal personality, limited liability and transferable shares. We considered the legal provisions of these types of companies for each country. Table 1 shows the acronyms and names used for in each of the analyzed countries. It shows also which corporate governance model can be applied. The countries in which only one model it is applicable are Spain, Germany and Austria.

**Table1: Board Structures**

|         |                          |                                      |
|---------|--------------------------|--------------------------------------|
| SPAIN   | SA (Sociedad anónima)    | Unitary                              |
| GERMANY | AG (Aktiengesellschaft)  | Two-tiered                           |
| FRANCE  | SA (Société Anonyme)     | Unitary or Two-tiered                |
| ITALY   | SPA (Società per Azioni) | Traditional or Unitary or Two-tiered |
| AUSTRIA | AG (Aktiengesellschaft)  | Two-tiered                           |

## METHODOLOGY

Each country has been analyzed from a legal point of view. In particular, we have considered some aspects that we believe to be of primary importance in describing the typical features of the boards of directors. Firstly, we measured with an index (*legal rules index*) the extent to which legislation intervenes in the composition of boards of directors for each country, secondly, we compared all the different laws and finally we pointed out some divergences and convergences among the European countries analyzed. In order to build the legal rules index, we explored nine different aspects of the composition of the boards and two aspects of the shareholders' rights that are regulated by the law. We verified whether the country's laws refer to employees' representation in the board, the number of directors, directors' age restrictions, non-executives or independent figures, the prohibition of appointment of the chairman as CEO of the same company, directors' terms of appointment and directors' ownership. With respect to shareholders, we considered as a good indicator the possibility of shareholders calling a meeting or proposing a specific resolution for a meeting and the percentage of shares required in order to do so. Moreover, we explored the shareholders' inspection rights. In other words, we examined the extent to which shareholders had access to directors' service contracts. With the aim of building the legal rules index, we gave a value to each of the ten aspects analyzed: one point when the topic considered as regulated by the law and zero points when it was not regulated; in specific cases, the points given were 1.5 (i.e. high law intervention) and 0.5 (i.e. low law intervention).

## RESULTS AND COMMENTS

### The law requirements country by country.

*Employees' representation* is mandatory -when certain conditions regarding the number of employees are met- on the supervisory boards of Germany, Austria and France (for France, if the unitary system is implemented, the employees' representation is required on the board). In Italy, Spain and Portugal this type of representation is not required. According to Fauver & Fuerst (2006), such representation on boards offers precious first-hand operational knowledge for board decision-making. The authors found that labor representation helps monitor and reduces agency costs; the governance effectiveness obtained through the requirement of employee representation is high and there is good co-ordination between all the company's parties in the firm. On this topic, we espouse Roe's (2003) point of view according to whom both the strengths and weaknesses of employee representation are important for facilitating corporate governance arrangements. For this reason the cases in which the law requires the presence of employees on the board of directors could be considered as rules that improve corporate governance.

Regarding *the minimum or maximum number of members on the board*, each country's laws refer to this but different rules are applied. From a theoretical point of view, the experts affirm that, in general, boards with a small number of members are more desirable because in large groups individual responsibility tends to dissolve (Neubauer and Lank, 1998). The board members' liability is indeed connected with the size of the board. Additionally, many authors claim that excessively large boards can be ineffective in terms of teamwork and communication. Larger boards can lead to difficulties in the co-ordination of board meetings and may inhibit the full participation of each member. On the other hand, boards should be big enough to offer adequate resources to govern. Indeed, the board of directors has to be seen as a team in which persons with different skills, experiences and backgrounds meet together to deal with complex problems (Corbetta & Minichilli, 2006). Moreover, board size is affected by the number of committees (if the company needs to have different committees the board size can be bigger), the workload for the board and the ownership structure. For the abovementioned reasons concerning board size, we suggest that the optimal size is impossible to identify as it depends on a company's characteristics and goals. There is no consensus in the literature on the relationship between board size and performance in the case of general samples. The lack of consensus about the relationship between board size and performance can be attributed to the fact that too many variables interact in determining the performance of a company and it is necessary to consider the complexity of each of them.

On the subject of *age restrictions*, Lorsch *et al* (1992) contend that board effectiveness could be improved if each board established a mandatory retirement age for independent directors. We believe that *all* members of the board should retire at a certain age, which is up to each board to determine. Unfortunately, few boards set retirement ages and, amid the analysed countries, only the French law prescribes retirement ages (unless otherwise specified in the company articles, no more than 1/3 of the board of directors and of the supervisory board can consist of directors of over seventy years of age while the chairman of the board of directors, the general manager and the members of the management board must not be over sixty-five years of age). Having a director's age limitation is one of the criteria generally used by corporate governance and board rating systems (Van den Berghe & Levrau, 2004). Indeed, the presence of an age limit improves the corporate governance effectiveness because it helps guarantee a proper turnover on the board.

With regard to *independent directors*, we considered board composition (obligation to include non-executive or independent members), the recognition of non-executive or independent figures within the board, and the definition of independence. Relating to the last two points, for the most part in the countries analyzed, both the recognition of non-executive or independent members and the definition of independence is provided (either by the law or by the codes). Nonetheless, in France and in Portugal, this definition does not exist or there is no consensus on it. In the literature the effect of outsider-dominated boards on performance is controversial. Greater representation of outside directors on the board results in a negative impact on firm performance (Agrawal & Knoeber, 1996; Coles *et al.*, 2001). Some authors found a negative relationship between a higher proportion of independent directors and performance or firm value (Rosenstein & Wyatt 1990; Baysinger & Butler, 1985; Wagner *et al.* 1998). Other scholars affirm that there is virtually no relationship between board composition and firm performance (Dalton *et al.*, 1998; Hermalin and Weisbach, 2003). We believe that inconclusiveness of these results' is due to the fact that finding the right mix of independent and non-independent directors is a very complex issue. On the one hand, the inclusion of insiders in the board may be useful because they have access to information relevant in assessing both strategic and managerial performance. On the other hand, independent directors can bring external skills and competencies to the company and have an important role to play, chiefly in those fields where conflicts of interest may arise (i.e. financial control, nomination and remuneration). As Van den Berghe and Levrau (2004) assert, almost all rating systems pay attention to *board independence*. To conclude, the proper balance inside the board may depend on the company's characteristics (company structure, size, age etc.) and needs: the board of directors should pursue a balance between executive directors, shareholders' representatives and outside independent directors.

The *prohibition of appointment of the chairman as CEO* of the same company is another issue that we have taken into account. Other than Austria, France and Germany, the law does not forbid appointing the chairman as CEO. Austrian and German laws instead explicitly require the strict separation of the roles of the management board and supervisory board in these two countries the only model that can be implemented is the two-tiered one. In France the position of chairman is separated from the position of general manager in principle but the board can decide to give the two functions to the same person. The separation of the roles of CEO and chairman reduces the power of the CEO and the potential for management to dominate the board. It has to be recognized, however, that when the CEO also serves as the chairman, his or her role-duality provides unified firm leadership, builds trust and stimulates the motivation to perform (Muth and Donaldson, 1998).

With regard to law requirements for *terms of appointment*, all the countries other than Portugal (where no limits are defined) fix some terms of appointment. We consider this as an element that improves the quality of corporate governance. The importance of establishing the length of a term is stressed by many authors. The precise length of a director's term depends on a number of unique factors that are not only connected with the company's characteristics but also with the individual business' characteristics. In one sense, fixed terms of service have to be long enough to allow the sharing of knowledge among all members and to provide a long-term perspective on the running of the company. In another sense, they have to be short enough to permit the board to be effective and ready to adapt to new scenarios. The fact that the law prescribes some terms of appointment is enfeebled by the possibility, allowed for by the same law, of re-electing the same director.

*The role of directors as owners* is another point that we analyzed. We wanted to investigate whether the law allows for directors to be owners or not. We found that in every country directors are allowed but not required to own shares in the company. The only case in which directors and members of the supervisory board have to own at least one share in the company is France. This information shows that ownership by directors is not considered as a danger for the company. In fact, in the literature it is recognized that having owners as

directors can positively affect performance. For example, Bhagat *et al* found that the greater the value of an outside director equity ownership, the better the company's overall performance.

## The legal rules index.

The legal rules index is a numerical construct that we created to measure law intervention on the features of boards of directors. The higher the value of this index, the deeper the law intervention is. As shown in tables 1 and 2, we gave one or zero points to each analyzed aspect of boards of directors (employees' representation, number of directors, and so forth) country by country. The attribution of points depended on the depth of the law intervention. When particular situations required a different consideration, we gave 0.5 or 1.5 points. This happened when we had to assess the number of directors' regulation, we gave 0.5 points when the law has a low intervention and 1.5 when the intervention is high. We added up all the figures and we found, for each country, the value of the legal rules index. Spain's index is 5.5, Italy 4.5, France 6.5, Germany 7.5, Austria 7.5, and Portugal 0.5. These results demonstrate that, in spite of the European Union, the impact of law intervention on board's aspects is still different in each of these European countries. Moreover, Germany and Austria, from the Germanic legal family, have laws that more minutely prescribe what the characteristics of the board have to be. While Italy and Spain have indices that are more similar, this concurs with the fact that they belong to the Romanistic legal region. France is in an intermediate position. The peculiar result is Portugal's index. It is the lowest and very different from all the other countries. Company law in Portugal does not contain many definite rules about the characteristics of boards of directors and this is reflected in a low legal rules index.

## The rights of shareholders.

The protection of shareholders' rights is a huge and complex issue. It is not the aim of this article to define and measure the level of shareholders' rights in Europe. Our aim is to focus on some precise topics and try to understand whether there is a convergence among some European countries. What we would like to emphasize in this paper are two aspects that we consider to be, in a broad sense, indicative of shareholders' rights recognized by the law. These aspects are the capacity to call a meeting or propose a specific resolution for a meeting and the shareholders' right of inspection. If shareholders want to call a meeting or propose a specific resolution for the meeting, they generally have to hold a minimum percentage of the company's share capital, which is equal to 5% in Spain, France, Germany, Austria and Portugal, while it is 10% in Italy (unless otherwise stipulated in the company's articles). The rules from this point of view are largely similar. With regard to shareholders' inspection rights, they are not entitled to access documents about service contracts between the company and directors in Spain, Italy, Germany and Austria, while they are entitled in France and Portugal where it seems that more attention is given to these rights. Country by country, the similarity in the law is higher on the topic of shareholders' rights.

## Conclusions.

We have defined some features of boards of directors and we have considered how they are regulated. Moreover, this paper has revealed some divergences and convergences among six European countries. It has been shown that boards' characteristics vary and that these differences are probably connected to the legal families to which every country belongs to. There are more similarities on the two indicators of shareholders' rights. On these aspects and on what makes a good board of directors, there is not always homogeneous theoretical support. This aspect and the fact that some cultural and historical differences remain strong can explain the law divergences that we found. More research has to be done on this topic, and it would be interesting to extend the analysis to all the members of the European Union.

**Table 2: Countries Comparison**

|  | SPAIN | S | ITALY | I | FRANCE   | F | GERMANY  | G | AUSTRIA   | A | PORTUGAL | P |
|--|-------|---|-------|---|--|---|--|---|---|---|----------|---|

# CHANGING ORGANIZATIONAL MODELS OF CORPORATE GOVERNANCE : AN EMPIRICAL CASE-STUDY OF ITALIAN CORPORATIONS

**Cristina Bettinelli, University of Bergamo**  
**Lal Chugh, University of Massachusetts- Boston, USA**

## ABSTRACT

*The existent literature ascribes a company's dynamism to some specific company characteristics. In 2003, a deep company law reform in Italy introduced the possibility to modify radically their corporate governance organization. Starting from this event we have collected a dataset composed of more than 35,000 joint-stock corporations incorporated in Italy. We defined an innovative company as one that decided to change the traditional corporate governance model in favour of a new one. Our aim was to investigate the relationship between these innovative companies and some of their specific characteristics. Surprisingly, no statistically significant relationships emerged.*

## INTRODUCTION

The existent literature tends to ascribe a company's dynamism to some specific company characteristics (see for example: Zajac et.al. 1991 and Sørensen & Stuart 2000). In 2003, a deep company law reform in Italy gave to Italian companies the opportunity to modify radically their corporate governance organization. To the traditional corporate governance model, two further models have been added, so a company can choose from three different frameworks (the traditional, the one-tier and the two-tier models). Using this event as a point of departure, we have collected a dataset composed of 35,000 joint-stock corporations incorporated in Italy. The dataset is provided by the Italian Chamber of Commerce. Which is a public entity that has access to the Enterprises Register. It was drawn out on April 2007 and it considers a sample composed of all the existing and operatives Italian Joint-Stock Corporations which are, accordingly to the Enterprises Register, 35,590. Of these enterprises we analyzed the adopted Corporate Governance Model (Traditional, Monistic and Dualistic), the Age, the Activity, the Value of Production and the geographic position (location). We have defined an innovative company as one that has decided to abandon the traditional corporate governance model in favor of a new one. We have then investigated the relationship between these innovative companies and some of their specific characteristics (age, sector, total sales, and location). In particular we were interested in understanding if empirically exists a relationship between structural inertia and some organization's characteristics such as age, size and sector. This general question derived from the literature review and in particular from the consideration of a seminal paper of Hannan & Freeman (1984). The authors deeply studied the concept of structural inertia and developed some assumptions and theorems. We wanted to apply these theoretic assumptions to the corporate governance field. In particular we were interested in understanding whether exists or not an empirical relationship between corporate governance structural inertia and some organization's characteristics such as age, size, location and sector. From the descriptive statistics emerged that a very small percentage of the companies analyzed could be defined as "innovative" (0,65% of 35,590). We then had to resort to a peculiar methodology that is the Re-Logit function which has been created in order to solve Rare Events Logistic Regressions (King & Zeng, 2000). We made use of the R software. By considering this dataset we can assert that for size and sector there isn't any statistically significant relationship with structural inertia while for age the weakness of the results makes it impossible to draw any conclusions.

## LITERATURE REVIEW

Organizational behaviour studies consider organizational models and structures as the core element. An interesting aspect in this field regards organizational changes and structural inertia. As Freeman & Boeker (1984:79) affirm, an organizational form is “a set of stable routines for accomplishing organizational action”, this definition is based on the assumption that structural features of organizations change slowly and so, organizations have typically the characteristic of being structurally inert.

Organizational change has been explained by different theories, two main streams can be considered: the theories that define it as the adaptive response of existing individual to prior changes and theories which assume that when organizational change occurs a *selective* replacement of the old failed forms by the new forms takes place. In the first group can be included contingency theory (Woodward 1965, Lawrence & Lorsh 1967), resource dependence theory (Pfeffer & Salancik 1978) Burt (1983), institutional theory (Meyer & Rowan 1977, DiMaggio & Powell (1991, 1993), and transaction cost economies theories (Williamson 1975, 1985). The second group embraces organizational ecology theorists such as (Hannan & Freeman (1984, 1997, 1989) and also evolutionary economics theorists such as (Nelson & Winter 1983). In particular, Hannan & Freeman assert that structural inertia is the outcome of an ecological evolutionary process. Conceptual ideas and new theories have been shaped during the last decade (see for example, Schwarz & Shulman 2007, Wischnevsky 2004, , Hannan; Pólos and Carroll 2004). Nevertheless, the aim of this article is to focus on the concept of structural inertia and to verify whether it is related to the existence of particular company characteristics. For this reason, we consider the Hannan & Freeman (1984) work and empirically verify their assumptions. In particular our aim is to answer this question: *Does exist empirically a relationship between structural inertia (and conversely, structural dynamism) and some organization's characteristics such as age, size and sector?*

Hannan & Freeman (1984) theoretically assert that inertial forces vary over the life cycle, with organizational size and with complexity. Amid the mentioned authors' assumptions, we found 2 interesting theoretic answers to our question. The first one states that “*Reproducibility of structures increases monotonically with age*”, the second one affirms that “*the level of structural inertia increases with size for each class of organization*” (Hannan & Freeman 1984:157,158). These assumptions have been confirmed in different empirical studies. For example, the relationship between organizational aging and innovation processes has been investigated by Sørensen & Stuart (2000). The authors found that in dynamic environments aging leads to a bigger divergence between organizational competence and contemporary environmental demands. Moreover, Ruef (1997) tested the structural inertia hypothesis on a sample composed of hospitals, interestingly he found that organizational size, age, and service scope affected a hospital's capacity to surmount relative structural inertia. As far as the relationship between structural inertia and organizational size and age, the most adaptable elements of the sample were the ones with a bigger size and an higher organizational age.

Scholars assert that organization's attributes such as size and age are supposed to affect also the organization's legitimacy (i.e. the recognition of an organization by its external environment). The older the organization is, the easier will be to build up strong exchange relationships, enter in a power hierarchy and be legitimate by powerful social actors (Singh et al. 1986).

Furthermore Baker & Cullen (1993) analyzed the effects some organization's characteristics on the administrative reorganization of top-level managers in 200 colleges and universities. They found that age, size and change in size have important influences on administrative reorganization. Large, old, and growing organizations experienced high levels of administrative reorganization not the moderate levels hypothesized. Small, old, and growing organizations, had low levels of reorganization. The authors asserted that the organizations, put in order of decreasing levels of reorganization, follow this order : (1) large, young, and declining, (2) large, young, and growing. (3) large, old, and declining, (4) small, young, and growing, (5) small, old, and declining, and (6) small, young, and declining (Baker & Cullen p1268).

In corporate governance by organizational models we mean the governance structures adopted in order to govern and steer the company. These models are generally defined by the law in a mandatory way. The application of the structural inertia concept to the corporate governance field implies that if the lawmaker changes the corporate governance models range, for example, by adding some new models, then we expect the company to be relatively slow in experimenting these new models. We couldn't find in the literature the application of the concept of structural inertia to corporate governance, for this reason we decided to explore this new field and to do the empirical analysis on the adoption of new corporate governance models by Italian Companies. In particular we specified our general question (Does exist empirically a relationship between structural inertia and some organization's characteristics such as age, size and sector?) with the following: *Does exist empirically a relationship between corporate governance structural inertia and some organization's characteristics such as age, size and sector?*

In the next paragraphs we present the sample, then we explain the methodology and finally the results.

## THE SAMPLE

In 2003, a deep company law reform in Italy gave to Italian companies the opportunity to modify radically their corporate governance organization. To the traditional corporate governance model, two further models have been added, so a company can choose from three different frameworks (the traditional, the one-tier and the two-tier models). Using this event as a point of departure, we have collected a dataset and we have defined an innovative company as one that has decided to abandon the traditional corporate governance model in favour of a new one. The dataset considers the Italian Joint-Stock Corporations (JSCs) and is provided by *Infoimprese*, the Italian Chamber of Commerce office. This office is a public entity which has access to the Enterprises Register. Every time an enterprise decides to change something of its Corporate Governance System, it must communicate this to the Enterprises Register. The dataset was drawn out on April 2007 and it considers a sample composed of all the existing and operative Italian Joint-Stock Corporations which are, accordingly to the Enterprises Register, 35,590. Of these enterprises we have considered the adopted Corporate Governance Model (Traditional, Monistic and Dualistic), the Age, the Activity, the Value of Production and the geographic position (location). With respect to the corporate governance models the legal options are the following.

- The traditional model of governance (inspired by the French tradition) prescribes the implementations of a board of directors and a board of auditors both selected by the shareholders' meeting.
- The two-tiers model (inspired by the German experience) requires the shareholders' meeting to select a board of independent supervisors, and this board of supervisors has to select and remove the members of the board of managers. In addition of the controlling function performed by the board of auditors in the traditional system, the board of supervisors also approves the balance sheet of the corporation and other issues that, in the traditional system, compete to the shareholders' meeting.
- The one-tier model (inspired by the Anglo-Saxon experience) requires the Shareholders meeting to select a board of directors, the board itself must appoint an auditing committee, as well as in the US and English approaches. At least a third of its members must have the same independence requirements of the auditors.

The two-tiers and the one-tier models have been introduced in 2003 with a law reform, before it, companies could apply only the traditional model. So, from this point of view, we define structurally *inert* the companies that did not explore the new models and *dynamic* the companies that implemented one of the new models. The Age is calculated by estimating the difference between the date of inscription on the Enterprises Register (and, if not applicable, the date in which the corporation has started its activity), and the date of extraction of all the data. The activity refers to the ATECO codification, it is the official codification provided by the ISTAT (the Italian Institute of Statistics), this codification is organized in sections, under-sections, divisions, groups and categories. We have re-elaborated the codification to simplify it, in particular we have created some macro-groups that contain all the most important activities codes (see Table 1). The elements that compose the Value of Production are specified in the Appendices.

## METHODOLOGY

The dataset shows that after 4 years from the corporate governance reform in Italy, the 99,35% of all the Italian Joint Stock Corporations (JSCs) are still governed according to the traditional system. At almost the middle of year 2007 (April), Only 154 companies have adopted the one-tier model and only 79 the two-tier. So a very low quantity of JSCs has decided to modify its traditional corporate governance system. The aim of this article is to verify whether there is a relationship between the structural inertia of these companies and their characteristics. By using the R software we built a logistic regression that could help us understand this relationship. In particular we specified that:

$$syst=f(company\ characteristics).$$

Where *syst* is the dependent variable and is a dummy, it equals to 1 when the company is *dynamic* (i.e. adopts one of the new governance models), it equals to 0 when the company is *inert*. Company characteristics is a group of variables that measure the Age, the Sector and the Value of Production (which measure the size of the company). We created different classes for each of these variables, that is we transformed them into polychotomous variables

which equal to one when each of them belongs to a particular class and to zero otherwise.

Since we have a dependent variable with only two levels multiple regression techniques are not suitable, to handle this problem we applied a logistic regression which uses a transformation called *logit* that forces the prediction equation to predict values between 0 and 1. A logistic regression equation calculates the natural log of the odds for a subject being in one category or another. In addition, the regression coefficients in a logistic regression equation can be used to estimate odds ratios for each of the independent variables. Our aim is to see if age, size and sector can be used to predict if the company is dynamic or inert. The peculiarity of this database consists in having an huge quantity number of traditional companies but a very small amount of innovative companies. In other words, the adoption of a new corporate governance model is a “rare event”, indeed we have binary dependent variables with hundreds of times fewer ones than zeros. The problem is that popular statistical procedures, such as logistic regression, can sharply underestimate the probability of rare events. Moreover commonly used data collection strategies are grossly inefficient for rare events data. The solution of this problem has been provided by King & Zeng (2000), the authors provided mathematics proofs to solve with appropriate corrections the rare events question. King & Zeng provided also a software that implements the corrections developed. Technically we have chosen the software called R, and the statistical program “Zelig” the corrections for the “rare events bias” have been applied by writing in the logistic regression the value of *tau*, a vector to specify the ratio between the 233 dynamic companies and the 35,357 inert companies. We also added the statement “bias.correct” which is a logical value of TRUE (default) or FALSE indicating whether the intercept should be corrected for finite sample (rare events) bias. The statement utilized is the following:

*Zelig (formula = SYST ~ company characteristics, model = "relogit", data = finch, tau = 233/35357, bias.correct = TRUE).*

We made different attempts by changing the combinations of variables comprised in the company characteristics.

## RESULTS AND COMMENTS

In table 1 we show how Italian companies are grouped in different sectors, in the grouping process we focused our attention on the macro-groups that we believe could be more significant for the topic of this research. The sector n.1 contains, with the classical primary sector, also the groups that weren't essential for this research (i.e. non industrial activities). This sample is characterized by a high presence of Manufacturing companies, Trade Companies and Real Estate and Services companies.

Table 2 contains the sample's company size. There is a high quantity of companies with a value of production comprised between 1 million Euros and 15 millions Euros. This means that the sample is composed of a large amount of small and medium size companies, the number of enterprises that could be defined as very big (i.e. value of production higher then €100.000.000,00) is low and this is true also for the big companies. These characteristics can be explained by looking at the Table 3, which represents the companies' age. Each of the age class has a width of 20 years in most cases the companies are younger than 40 years, almost half of the sample is composed of companies younger than 20 years.

**Table 1: Distribution of Companies by Sectors**

| Sector |   | n         |
|--------|---|-----------|
| 1      | Agriculture, hunting, forestry, fishing plus other non industrial activities            | 1,715.00  |
| 2      | Manufacturing industry  | 12,571.00 |
| 3      | Production and distribution of energy, gas and water                                    | 485.00    |
| 4      | Buildings industry  | 2,538.00  |
| 5      | Retail trade and wholesale trade, repairing of personal goods                           | 5,463.00  |
| 6      | Hotels and restaurants  | 534.00    |
| 7      | Transportations, logistics and communications   | 1,333.00  |
| 8      | Financial activities  | 2,238.00  |
| 9      | Real Estate, rental activities, computer science, research and services for enterprises | 8,162.00  |
|        |   | 35,039.00 |

**Table 2: Distribution of Companies by Size**  
(in Euros)

| size classes |               |               | n         |
|--------------|---------------|---------------|-----------|
| 1            | €-            | 99,999.00     | 1,560.00  |
| 2            | 100,000.00    | 499,999.00    | 2,803.00  |
| 3            | 500,000.00    | 999,999.00    | 1,852.00  |
| 4            | 1,000,000.00  | 4,999,999.00  | 6,815.00  |
| 5            | 5,000,000.00  | 9,999,999.00  | 5,456.00  |
| 6            | 10,000,000.00 | 14,999,999.00 | 3,190.00  |
| 7            | 15,000,000.00 | 19,999,999.00 | 1,939.00  |
| 8            | 20,000,000.00 | 29,999,999.00 | 2,173.00  |
| 9            | 30,000,000.00 | 49,999,999.00 | 1,756.00  |
| 10           | 50,000,000.00 | more          | 2,260.00  |
|              |               |               | 29,804.00 |

**Table 3 :Distribution of Companies by Age**

| age classes |    |      | n         |
|-------------|----|------|-----------|
| 1           | 0  | 19   | 16,515.00 |
| 2           | 20 | 39   | 14,118.00 |
| 3           | 40 | 59   | 3,717.00  |
| 4           | 60 | More | 1,240.00  |
|             |    |      | 35,590.00 |

Table 4 represents a summary of the most important independent variables (age, size, sector) the mean Italian joint stock corporation is 23,6 years old and has a value of production comprised between 5 and 10 millions Euros. The amount of missing values is low for *sector* while is unfortunately pretty high for *size* (16,00%). We have no missing values for age. In the regression the statistical software eliminated all the observations with a missing data. The results of the logistic regression are shown in the Appendices. In order to avoid technical problems due to perfect collinearity we included the first element of each variable group (i.e. AGE1, VP1, Att<sub>a</sub>) in the intercept estimation. We have chosen to do this with the first element because it facilitates the output interpretation. The number of statistical significant variables that could help explain the adoption of a new organizational model is too low. Only one variable (AGE2) seems to be significant. We made different attempts by considering diverse combinations of variables (age, size, sector and location) and the results did not change. The statistical significance of AGE2 could mean that companies younger than 40 years are more dynamic. Nonetheless we believe that having only one variable with a significant p-value is not sufficient to draw conclusions on the presence of any relationships between structural inertia and company characteristics. The interpretation is complicated by the fact that the majority of the companies belong to the same class that results to be significant (AGE2). As a conclusion we wanted to understand whether an empirical relationship between structural inertia (and conversely, structural dynamism) and some organization's characteristics such as age, size and sector exists or not. By considering this dataset we can answer that for size and sector there isn't any statistically significant relationship while for age the weakness of the results makes it impossible to draw any conclusions. A possible explanation of these results is that typically there is a period of time during which existing rules and structures are being taken apart and new ones are being implemented to replace them. Three complementary points have to be acknowledged, first, structural inertia depends on both external and internal forces, second, to argue that inertial forces characterize organizations doesn't mean that organizations never change, it means instead that organizations tend to be relatively slow in responding to external changes. Lastly, the duration of the response-period is not known. Since the Law reform took place in 2003, the Joint Stock Corporations have had 4 years to change their systems, it is possible that these systems are still too new for the Italian companies. An open question is whether that period of time was enough for the operators to assess the new models and understand if they could improve the corporate governance effectiveness and fit the real needs of the Italian environment. It would be interesting to monitor the adoption of these new models in the future and to see how do Italian companies behave.

**Table 4:Descriptive statistics**

# **LITTLEPAW® SKATEBOARDS CASE STUDY**

**Larry W. Boone, Geno Chou and Chi Ho Cheng**  
**St. John's University, USA**

## **ABSTRACT**

*This is a case study appropriate for introductory business courses. It describes the entrepreneurial efforts of a recent business school graduate, Geno Chou, to establish and grow his lifestyle venture involving the popular sport of skateboarding. Issues of start-up strategy, management, marketing, operations, and international expansion are included in the case.*

## **INTRODUCTION**

Founded in 2002, LittlePaw® Skateboards is the fulfillment of Geno Chou's ambition to participate in the skateboarding sport he loves. "After realizing that my chances to become a professional skateboarder were slim to none, I decided to get into the business end of the sport, designing and selling skateboards as well as sponsoring young riders who are looking to make their mark on the sport. Through this venture I am aiming to make a living and do something I enjoy each and every single day."

While holding down a 50-hour-a-week full-time job, Geno, 27, puts an extra 30-plus hours into his sole proprietorship. Currently, Geno has 7 young riders on his team and, through a U.S.-based distribution network that reaches 9 countries, he has grown his fledgling business to the 500 unit sales mark in 2006. However, he wonders how far he can grow this venture, whether he should attempt to concentrate on the agent side of the business - and if he will ever be able to make LittlePaw® his full-time endeavor.

## **THE FOUNDER**

Geno Chou is a 2003 graduate of St. John's University's Peter J. Tobin College of Business, where he majored in management with a concentration in integrated marketing. In 1988 Geno and his family emigrated from Taiwan to Queens, New York, where, as a child, he easily adapted to the city's fast-paced, hard-driving culture. This is where he first encountered skateboarding. However, he did not truly develop his love for the sport until his high school years. Geno caught the skateboarding "bug" after many years of participating in mainstream sports such as basketball and handball. Rather than the controlled environment of team sports with coaches, he was attracted by the individualized freedom and action of skateboarding.

Throughout much of his adolescence Geno involved himself in community events related to skateboarding and spent a considerable portion of his discretionary income on new decks and equipment. One particular incident exemplifies Geno's passion for the sport. In early 2000, Geno got the news that New York City was considering the construction of a new skate park. He drafted a petition in favor of selecting a site in Flushing, easily accessible to him and many other skaters, and collected 800 signatures from local residents. In addition to presenting the petition, he lobbied the board members as hard as he could. Though the outcome was not favorable, Geno knew that he had identified a cause that energized him. It was just a small indicator of what was to come.

## THE INDUSTRY AND MARKET

The skateboarding industry has demonstrated tremendous growth over the past decade. Since the mid-1990's, exposure on TV's sports networks has helped commercialize the sport by bringing it into millions of households. Emergence of several professional skateboarding personalities helped to swell the ranks of U.S. skateboarders to more than 11 million. The board sports industry (consisting of skateboarding, snowboarding, and surfing) is estimated to generate \$11 billion in annual sales.

Among skateboarders there are two major segments – core and non-core. Non-core markets include buyers who are attracted primarily by the designs on the decks. Core markets also care about designs, but their interest extends to the particular size of decks that best suits their skating performance.

## BUSINESS MODEL AND OPERATIONS

Geno envisions LittlePaw® Skateboards becoming a well-recognized brand in the skateboarding industry. Primarily, his satisfaction is derived from working with young, developing skaters, helping them improve their techniques and engendering in them a love for the sport. His general approach has been to identify talented young skaters at local and regional competitions as well as amateur skaters who have not yet reached the competitive level. Geno talks to the skater's parents, seeking their permission to add the skater to his team. He provides each skater with his branded skateboards, apparel, and such. In addition to providing equipment, LittlePaw® covers some of the skaters' travel expenses and entrance fees at various competitions.

Geno runs all aspects of the day-to-day business - from developing deck designs to marketing to team management. Throughout the year, he travels numerous times with his team riders while co-paying their expenses with their parents. In return, Geno and LittlePaw® Skateboards gain exposure through his riders' involvement in competitions. LittlePaw®'s brand image is strengthened and sales of his skateboards are promoted.

The firm generates revenue through sale of its decks. Currently, there are 7 different size decks (see Exhibit A) with 3 different series of designs (see Exhibit B). The 3 different design series are intended to target the core and non-core markets. Geno works hand-in-hand with a designer to develop different series. As shown, there are three different series of designs: "Year of Monkey Series"; "The M Series"; and the "Team Logo." Geno was born in the Year of the Monkey; the "M Series" is similar to the "Year of Monkey Series," but less edgy; and the "Team Logo" contains different LittlePaw® font designs on the decks.

Each series takes between three to six months to produce. During the design process, Geno and his designer create many drafts before it is ready for production. Geno's experience with his market influences the designs. He knows what will appeal to customer groups. He designed "Team Logo Series" specifically to target the core markets, while the "Year of Monkey Series" and "The M Series" target both the core and non-core markets.

LittlePaw® Skateboards will customize designs to satisfy specific market needs. The firm will also produce different sizes if there is sufficient demand. Retailers are enamored with LittlePaw®'s flexibility. Geno is able to customize different designs on different size decks, helping to meet the needs of various customer groups.

Industry-wide, retail prices for a typical deck range from \$45-55 based on brand value. Of course, endorsements by pro athletes add significantly to perceived value. Brands, such as LittlePaw®, generally mark up the cost of their decks 30-35% when selling to distributors, and distributors mark up another 35% or so.

Geno's business objectives are to provide the best-value products for his customers and to support the development of the next generation of talented skateboarders. Therefore, he seeks to provide high quality products to every skateboarder who purchases one of his decks. Geno says, "I want all customers to be purchasing the same high quality of LittlePaw® decks each and every time they are in a skate shop." To achieve

this, Geno is committed to work with the best manufacturers to produce his decks. Products are made to Geno's specifications, and materials used for production are also of the highest quality. He is unwilling to lower his cost of production by outsourcing to countries like China, because so far Geno has found their quality to be inferior to the products he can produce in the U.S. Geno accepts a lower profit margin on each deck rather than compromise his standards. According to Geno, "Skateboarding is a lifestyle business, you have to believe in what you are doing. You have to be passionate and committed, or no skaters will believe in you or support you."

Geno's manufacturer is located in North Carolina, where quality raw material is plentiful. "You can't make a great deck without great wood," Geno says. After his products are made, they are tested by Geno and his team riders. Then they are transferred to the distributor a few miles away in the same city. Geno's distributor, Eastern Skateboard Supply, is the largest on the East Coast, and sells products to retailers nationwide. They are "America's Only True One-Stop Wholesale Shop" as they cater to more than two thousands retailers across the U.S., mostly on the East Coast. The close association between manufacturer and distributor supports a cost-effective operation, minimizing transportation costs and preserving more profit margin for LittlePaw®.

Currently, LittlePaw® Skateboards are marketed to both distributors and retailers. Unlike many larger competitors, Geno is willing to take custom orders from smaller retailers. Further, to simplify the retailer's ordering and billing tasks, Geno will introduce his buyers to Eastern Skateboard Supply.

## **ADVERTISING AND BRAND BUILDING**

In his attempts to build brand recognition Geno employs multiple advertising strategies. However, the cost effective use of very limited funds is always a key consideration. Over the last five years, Geno has carefully planned his advertising and marketing strategies. He has used some print ads (see Exhibit C). However, in this market there are many magazines for potential advertisements, each targeting very specific types of skateboarders.

LittlePaw® Skateboards also gains exposure at competitions. At these events each skater's sponsor is mentioned as a promoter courtesy. Thus, by sponsoring his team riders at competitions, Geno earns numerous plugs for the LittlePaw® brand. Moreover, Geno judges at competitions where his team riders do not participate, and he is announced along with the company name when he is introduced. For more information about the team riders, events and contests, *LittlePawSkateboards.com* can be consulted.

Geno attends various domestic and international tradeshows. He distributes business cards and brochures to retailers who may have interest in carrying his products. Typically, tradeshows charge \$15-30 per square foot for booths, which start at 10 X 10. Through his experience, Geno has found that any booth smaller than 10 X 20 at a major show is fairly ineffective. Large brands occupy 40 X 40 booths and may have 10+ salespersons on the floor to meet potential customers. Major trade show dates tend to be January and September, serving summer season and "back-to-school" retail orders. Regional shows pop up throughout the year. With his budget restricting him to 10 X 10 booths, Geno has found regional shows to be of relatively equal value to the major shows.

## **INTERNATIONAL MARKET EXPANSION**

International markets represent 20% of LittlePaw® Skateboards' current sales and play an integral part in their future expansion plans. LittlePaw® decks are now sold in Taiwan, France, Germany, Canada, England, Sweden, Italy, and Australia (see Exhibit D). Also, Geno has an international rider, Kyle Ke, on his team. Kyle is from Taiwan. They met in a skate park where Geno clearly remembers Kyle jumping over his head from a ramp. After securing permission from Kyle's parents, Geno added this young Taiwanese "aspiring actor" to his team of talented riders. (See Exhibit E for some more information about a few of the current team riders.)

LittlePaw® Skateboards are distributed internationally in two ways - the same ways Geno distributes to his U.S. retailers. He personally contacts retailers at international tradeshows. Plus, Geno sells his decks to an international distributor who sells to retailers in many nations and helps to build brand recognition for LittlePaw® in those countries.

LittlePaw® Skateboards' exposure to the international market is still relatively new, and Geno has been working diligently to improve his presence worldwide. Moreover, Geno understands that there are different purchasing patterns between the international markets and the U.S. market. By keeping his hand in both, LittlePaw® will be protecting itself from economic downturns in any single area.

## **STARTUP HURDLES TO OVERCOME**

Success never comes easily, and in the last five years Geno has encountered his share of challenges while guiding LittlePaw® Skateboards' operations. Like many entrepreneurs, Geno bootstrapped his way through early growth stages. All financing came from his personal savings. There were no corporate sponsorships to rely on. Fortunately, due to well-chosen advertising strategies and the exposure his team riders received at competitions, sales of skateboards increased sufficiently to allow LittlePaw® to reach its breakeven point recently.

Since LittlePaw® Skateboards' inception, it is common for Geno to work 80-hour weeks. While having to fulfill his responsibilities at his day job, Geno has struggled at times to keep his firm on track. Typical of his dedication to his riders, Geno saves all of his vacation and sick days so he can travel with his team to events, contests, and demos.

Financing for LittlePaw® Skateboards has been challenging, but the operational side of the business has been equally daunting. Geno had to change his early product lines after he realized there was a flaw in his early product conception. His initial strategy involved targeting both the "kids" market (with smaller-sized, "mini" skateboards) and the standard market (with standard-sized skateboards). However, the "mini" skateboards didn't sell well, due mainly to the fact that the target market was very small. When scaling up his products, Geno not only had to redesign his decks, he also had to redesign the graphics for the decks.

In early production stages Geno drew his graphics by hand and had the scanned image printed on the final product. The resolution was good, but not excellent. Therefore, he decided to hire a graphics designer to illustrate the graphics on a computer. Computer-generated designs produced the quality he was seeking and permitted the dimensional flexibility to fit designs to decks perfectly. This operational adjustment coincided with development of the "Year of Monkey Series," which took shape as the first major line of LittlePaw® Skateboards.

Lack of commercialization and professional endorsements initially posed a problem for establishing LittlePaw® Skateboards' brand image. Demand was low, yet Geno wanted to offer different designs and different deck sizes. Consequently, production runs were quite small – much to the displeasure of manufacturers who did not want to reconfigure their equipment so frequently. This greatly hampered Geno's buying power. He couldn't obtain his early stock at favorable prices. However, five years of hard work have eliminated the small order quantity dilemma.

## Exhibit D: International Sales Distribution

### Exhibit E: Sponsored Athletes

#### MICHAEL MOROCH

Michael always knew how to pump up the vert ramp without stressing out and looking graceful at the same time. He was a natural on the transition, working each wall smoothly, effortlessly and going higher on airs each time that he skated. By summer 2003, he “rolled in” on the 13+’ “Titanic” ramp at Woodward Camp, PA catching at least a 5 foot backside air 1<sup>st</sup> try. He was just 9 years old then.

#### JARROD GRAMMEL

Jarrold Grammel was seen skating and spinning a “540 McTwist” (a 540 body rotation and using the front arm by grabbing the board in between the front and back foot position) at a Wilmington, Delaware skate park in late 2003. His ability to try difficult tricks at a young age was unmatched; as well as his fluid style. In spring 2004, he was asked to be on LittlePaw® Skateboards. At the young age of 10 years old, Jarrod showed quite of bit of determination but was very humble in his abilities.

# **CROSS SECTOR AND CROSS ORGANIZATIONAL COORDINATION FOR LOCAL SUSTAINABLE DEVELOPMENT: A STUDY IN ARAÇUAÍ, MINAS GERAIS, BRAZIL**

**Ana Cristina Valente Borges**  
**Fundação Getúlio Vargas, Brazil**

**Carolina Rolim**  
**Universidade de São Paulo, Brazil**

**Osmar Pancera**  
**Universidade Federal do Pará, Brazil**

## **ABSTRACT**

*This paper aims to discuss local development under the prospect of coordinated intervention of multiple organizations, considering different thematic areas of action, sectors and origin regions; different methodologies of work and different social technologies. Search to identify determinants, facilitators, and restrictive factors of cross sector and cross organizational coordination processes for a common purpose structuring results on a conceptual map. The field research was conducted at a region of State of Minas Gerais, Brazil, where a group of 13 organizations fitting the above profile, joined up to work facilitating the environment for local development. 54 citizens were interviewed using the semi structured inquiry methodology.*

## **INTRODUCTION**

There are several challenges and obstacles that permeate the actions of local development initiative in which civil society carried out involving multiple social institutions, who argue different themes, accumulate different paths of development and various activities, and are distinct from sectors of society. The historical background, social vision, fields of interest, understanding of the priority, the construction of thought, methodology of work and action of each of the organizations and each of the different sectors are different and often divergent.

What are the factors that determine, facilitate and then restrict the construction of alliances and partnerships aimed cross organizational coordinated actions for local development? To what extent a number of organizations from different regions of Brazil, from more different backgrounds and areas of expertise, can join in for a same question in a single territory, working towards the development of a municipality and its rural communities?

The object of this work is to examine the extent to which the action of 13 organizations from regions and different areas of expertise, are helping to change and strengthen the local scene, in the municipality of Araçuaí, Minas Gerais, Brazil. The result of the work is the structure and dynamics of the factors that determine,

restrict, or facilitate the coordinated action of different organizations that propose to the implementation of joint activities, flagged in a conceptual map, and the perception of respondents about the impact of actions implemented Program for Sustainable Araçuaí, are the main references practice guidelines of this study. In the next section we will present the methodology used for the lifting of information and concepts that made possible such work.

## **METHODOLOGY**

The survey was conducted in two stages: the first documentary and literature and, second, field interviews. The systematization of the data collected was made with the construction of conceptual map held in four stages: i) the definition of the question of search, ii) identification of sources of reference for research and its implementation, iii) the processing of data with the identification and selection of key concepts for structuring the map and definition of groups of affinity of concepts and data iv) structuring of the relationship as between the concepts.

The methodology used is limited in data collection, with regard to search the field. The interview by itself is limited, because the respondents may feel inhibited, which undertakes, in some aspect, the collection of information. On the treatment of data, there is a risk of confusion when trying to extract trends, intentions capture, acknowledging the important aspects and essential to the objective of the proposed work here. With regard to construction of a conceptual map limiting factor is the many possibilities of cross between the words selected for the final work.

## **REFERENTIAL THEORETICAL**

### **Development and local development**

The lines of study involved in development can be divided into two parts: those that consider only economic factors that process, and those who defend the existence of multiple dimensions to this theme: cultural, social, environmental, scientific, political and economic. Bresser Pereira said that the development is a process of transforming economic, political and social, through which the standard of living of the population tends to become automatic and autonomous, is a process in which the overall structures economic, political and social, suffer continuous and profound changes, with no sense to talk about economic development only or just political, social or just (2003, p.31). Ramos (1996) in his essay on sociological reduction already believes that the development is the ability of a place, be it a country, a state or a municipality, to develop a project for the existence of its territory and its population.

In Latin America, the evolution of the approach - theoretical and practical - given to the development passes by two historic moments before reaching the local development: country development and regional development. The first, comprehensive territorial in nature, focused on the nation, includes the period marked by centralizing policies and practices aimed at bringing the country to modernity. The second is that which deals with regional development, reduction movement of the concept of development, when applied to the territorial dimension, since their practices are directed to regions rather than the nation and that, in Brazil, includes the period of 60 years to beginning of the 90, in the twentieth century of operations.

The concept of local development enters the staff of theoretical and practical discussions in the 90, a period marked by structural changes in the economic policies of developing countries, characterized in general by opening up markets and the consolidation of democratic public management. Search to develop models and initiatives intended to undertake the development and characteristics from the vocation of the area or the territory. Abromovay (1999) considers the territory as the environment in which it runs a political project of territorial development. In concept, is rapidly incorporating the concept of citizen participation, imbued with aspects such as construction of alliances and partnerships and work in networks. While Albagli (1999) points out that the place is the complementarity of three dimensions: location, culture and social interaction, a lot of space where people live, have their daily practice, where the changes occur and reproduction of social relations, the

physical construction and material life in society, Schommer and Fischer (2001) include the diversity of the merits of the actors involved and advocate the importance of relations between ordinary agents of the State, market or civil society, under local and potential virtues of action a network in interdependence. They believe that these relationships occur within a movement of recovery of the site as an area of confluence of global powers and local area and how to (re) configuration of organizations and (re) building institutions for integrated development. To Brose (2000), the ability of developing a town becomes increasingly dependent on the set of local, natural, economic, social, cultural, political, complementary or systemic, built or rebuilt during the process of interaction between the actors which includes trust and morality. Tenório (2007) highlights the gap that process, compared to the other, is clear in encouraging the participation of local people in the structuring of the proposed development, not more centralized, not more bodies imposed by political-administrative superiors. He stresses the six main characteristics of this new model of planning: i) the leading role assumed by localities in economic development, ii) the relationship interdisciplinary aspects are considered in the analysis of development, iii) external aspects to the site again to matter, are reference for planning and design of projects, iv) sets up technological innovation and learning; v) show is not commercial relations existing in the locality; vi) the formation and accumulation of social capital are considered essential for success in this new model.

## **Alliances, partnerships and network**

The concepts of alliances, partnerships, and the performance of networks represent different stages in terms of relationships between institutions. While Spink (2001) point the convergence of concepts, noting that both the alliances and coalitions as they relate to the process to regroup, come in the same enterprise to achieve a common goal, Lins (2001) the difference in the following terms: the partnership is a specific action that involves planning and development of ideas among organizations that have similarity of objectives and ability to share ideas, setting up a relationship of reciprocity and complementary, and the optimization of resources and expertise, the basis justifying the relationship; already the alliances assume that even before establishing any link to a joint action, there is the sharing of beliefs and values between the institutions, and alliances especially useful for the confrontation of complex social issues, which require continuous and sustained action. Marinho (2007) says that an alliance is in the process of collaboration between a larger number, but stable of partners aimed at developing a project or specific program of action, around goals and objectives agreed and requires a strong link between the actors Depending on which cooperation can become lasting or permanent. Already the partnership, to the author, it is a bilateral pact to cooperate on the development of a specific project. It occurs when a pair of actors provides a practical working around common goals and objectives. The duration of the partnership can vary depending on the nature of the project developed, but it generally has specified period. Meirelles, a survey conducted in 2005, adds that the alliances and partnerships, especially those of cross sector nature, can be seen in three dimensions: as instruments contributing to the effectiveness of corporate social responsibility and to the sustainability of the organizations civil society; as cross sector strategies for social development, symbolizing the reduction of accountability in the public sector, given the enormous social challenges, and as a emblem of the renegotiation of a new social pact.

The processes of alliances and partnerships then indicate the existence of common interests, ideas, shared goals and projects, the search for a new logic of action presumes that understanding, consensus, communication, articulation of interests, the quality of relationships built; addition to learning mutual, democratic and continuous. For Giannecchini (2003), the implementation of integrated and coordinated actions, with different purposes, but complementary, is a basic condition for development. For authors such as Ekuni (2002), perceives itself to convergent trend of a society that works together. Partnerships, strategic alliances, cross sector and networks called the collective identity of the activities of different sectors, regardless of how we are organized, there are emerging social structures around the collective good. It is important to emphasize that the actions implemented under the sign of the logic of alliances and partnerships are marked by complexity. It is not difficult to understand why: places in the same table organizations that even share similar values and beliefs and converging, have administrative structures, management styles and different ripening of managerial processes. The meeting is a balance of power between different organizations is a challenge that requires the parties' flexibility and openness to try new processes and adapt to new. If the administration of relations between organizations in the same industry already calls to a scenario of such peculiarities, that between organizations from different sectors tends to heighten them.

The work involves a network that identified a different dynamic in relations guided by the logic of alliances and partnerships. This rationale is based on different principles: the horizontal and decentralization reflected in the lack of hierarchy; density, qualified by the number of connections that can be identified in the network, its plasticity, denoted the possibility to grow from any of the connections that integrate ; Transitivity expressed in the potential for access to another node of the network that each represents, the free flow of information, the ongoing reorganization of its own elements of the system, the self-organization. Another feature of the network, which distinguishes it from concepts of alliances and partnerships, is its temporality: the network appears when it is driven, with specific goals to meet. Frijof Capra (2002) in their studies on the living systems reference to the theory of systems and identifies the pattern of network as being common to all forms of life. For him, where there is life, there is network. Social networks are, first of all, communications networks involving the symbolic language, the cultural limits and also the relations of power. Communication and power are the subject of studies of Habermas (1987) with respect to the structure of social relations that argues that the social structures are defined by a set of rules and the resources available. He explains that there are two types of rules and two types of resources: there are rules as to the interpretative schemes, or semantic rules, standards, rules or moral, and in the resources exists both materials such as authority. Also discussing how the social system by the manner in which restrict the actions of individuals, or is linked to relations of power and those related to issues of communication and significance, given that individuals give a specific meaning to their environment and act in according to the meaning given. The author relates the process of the three dimensions proposed by Capra in his analysis: the subject (caused by instrumental action in the world), shape (resulting from the strategic action related to human relationships), and meaning (resulting from the communicative action whose purpose is the understanding of things).

## **Coordination and Inter role of the parties**

According Alarcon et al. (2006), inter-institutional coordination is an ideal way to add targeted efforts to achieve strategic objectives and common. For them, multidimensional social problems require the participation of multiple actors and complex issues such as welfare, can not be addressed only with public policies, require the coordination of wills, resources and actions cross, vertical and longitudinal. In the same vein, Van de Ven (1980) discusses the relations between institutions as a result of the emergence of social and economic problems that go beyond the capacity of action of a single organization. To the author networks between institutions can be defined as a model of interrelation between a group of organizations that are organized as a social system to achieve both goals of personal interest and collective goals or solve common problems specific to a particular population. It requires the existence of administrative arrangements established to define the role of the relationship between the members of the system; by case, the flow of activities and is related to decisions and the frequency of both resources and the information that flows between its members.

Bose, Dutra and Schoenmaker (2003) note that the links established between the institutions are strongly guided the values and beliefs of each partner and without the explicit definition and understanding of what it is up to each actor perform the simple agreement between the parties is not sufficient to ensure the success of joint performance and efficiency of inter-institutional coordination. Schommer (2000) highlights characteristics identified in cross sector partnerships between institutions and well-delivered: clear and common goals based on mutual benefit, a group or organization that plays a leading role of intermediary between the partners; clear understanding of different functions and capabilities of partners, technical knowledge of procedures and decision-making, conflict resolution and evaluation; open and transparent communication. He also emphasized the importance of a strategy to organize the common ideal and the involvement and genuine and clear responsibilities distributed among the partners. Valley record the chart prepared by Austin (2005) which depicts the spectrum of motivational cross sector collaboration. From the analysis of vectors and variables, the author concludes that, regardless of motivational point of departure, where the cross sector collaboration continue to meet the interests of all partners, their motivations for joint collaborative action probably will evolve over time.

## **Conceptual Maps**

Conceptual Maps are tools that allow graphic represent and organize knowledge, as of terms and expressions, enabling establish relations between these terms and conditions contributing to the systematization of knowledge in a given field. Novak (2006) indicates the main characteristics of a conceptual map: the concepts are organized from diagrams, in a hierarchical structure from the wider concept than the more specific, and between these concepts are established relationships, illustrated by lines that connect a concept the other, explaining the limitations of the relationship between them. The author identifies the link between the concepts as the area of creativity in the production of knowledge and highlights the applicability of the model in search of answers to questions investigative and considers that "Conceptual maps are displayed not only powerful tools for capturing, archiving and represent the knowledge of individuals but also to create new knowledge." (P. 13)

Figure 1: Spectrum of motivational cross sector collaboration

Successful collaborations influence motivations: (1) Even if mix of original motivations remains constant (50%-50% in example), intensity may increase.(2) Even if intensity of original motivation remains constant, it may become more blended: **2a** Generating a value-oriented and emotional connection in the ultra-pragmatic actor **2b** Generating a utilitarian connection in the purely-altruistic and idealist actor

Source: Austin, 2005.

Cañas, in his work of 2005, presents the tools of conceptual map as a basis for knowledge management to integrate the visualization of information with graphical representation of knowledge that allows you to express your knowledge of how easily understandable to any other and adds further that the conceptual maps have proved to be an efficient and effective tool to organize, represent and communicate knowledge.

## REFERENTIAL PRACTICAL

### The Program Sustainable Araçuaí

Araçuaí Sustainable is a local development program, initiated in 2005, implemented in the city of Araçuaí, semi-arid mining, aims to turn this municipality of Vale do Jequitinhonha in a place viable and sustainable, with cultural resources, social, education, housing and income, which reduce the rate of migration to other urban centers.

You can say that the Program Araçuaí Sustainable arose from maturity and the relations of trust, built in the course of four years, by a group of social leaders supported by a foreign foundation that promotes sustainable development in Latin America and operates in Brazil since 1999. The initiative is founded on three basic premises: the logic space (the space where they express the results), the relevance of social technologies (applied with systemic) and work together (the groups, the teams, alliances).

The dynamics in Araçuaí has been thus built on the integration of social technologies in seven outbreaks of work as priorities for the sustainability of the municipality, in view of the group: food security and water, housing, energy, labor, education and culture. The conceptual logic of the Program is based on a mandala who moved and guides the work of the group. On the core, the common goal of the group that is the social transformation. That goal has been translated into four main lines of action independent and complementary: economic satisfaction, community empowerment, human values and cultural and environmental commitment, that the fundamental objective of long-term project, which is creating opportunities and quality of life that reduce the need the migration of the population in search of work and financial resources, and ideas materialized in "My Place is Here" and "Taking Care of Next Generations." From that perspective outcome the seven outbreaks priority of work defined by the group and cited above. In the external dimension, are the organizations participants of the program.

The area of focus and expertise that each of the 13 members of the program brings to the group include popular education, permaculture, generating income, redemption cultural, management and planning of projects, promoting the construction of alliances and partnerships cross organizational, agriculture, bio-fuels and recycling.

It is considered that, overall, the construction of the Program Araçuaí Sustainable follows the following milestones: a) formation of the group of leaders of the Representation AVINA northern Brazil in 2001, b) institutional strengthening of each of the organizations, from projects and initiatives funded by the foundation, c) contacts between organizations, recorded in the annual meetings held in events and training aimed at improving the institutional organization of each in the period 2001-2005, d) the group's annual meeting, held in Araçuaí in December 2005, saddle the desire of collaboration between organizations and) meeting of conceptual construction and planning held in July 2006, in the Serra do Cipó, in Minas Gerais. f) first joint activities in Araçuaí g) selection of the path of the water project, designed by the group and presented the program of financing environmental damage, in January 2007, strengthens the financial base of the initiative, accelerating the implementation of various initiatives.

## **Perception of interviewees**

Two issues are highlighted among those raised in the search. The factors that facilitate, reserve and support a coordinated initiative between multiple organizations, in view of these, and the contribution of local development program, the vision of both organizations as a group of local citizens who act as agents of mobilization.

For the organizations, the success of the initiative is based on the existence of a structured organization and with initiatives recognized in the host city to act as facilitator, planning, methodology, tools, equipment capable of mobilizing local people, besides a good articulator political, as factors that can not misses a speech based on the characteristics of Araçuaí Sustainable.

In the analysis of interviews conducted notes that the impact of the program for local development is perceived by respondents from organizations of participants in environmental dimensions, social and cultural. They were cited: i) the actions of education, by nature cross-dimensional, that is inherent in them, ii) incorporating environmental aspects to the staff of educators: iii) the echo of the program in the region, which already affects neighboring counties to Araçuaí iv) to promote initiatives to generate income, the ownership and use of information technologies, dissemination of agricultural production techniques; v) Araçuaí placing at the forefront of a new model of action and intervention for social transformation, to meet economic, cultural values and human than the environmental approach; vi) the natural dissemination of knowledge among the population, through the publication of social technologies in the program and, vii) the definition of planning with clear targets which together aim to sustainable local development.

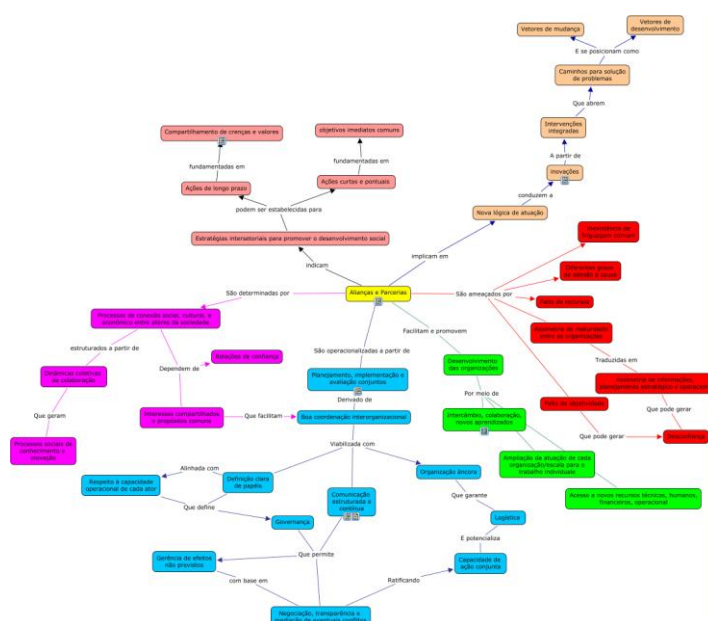

Citizens who contribute on condition of local agents interviewed shared the vision above and specifically emphasize aspects linked to new knowledge about the use of water, care for the rivers and the

environment, plus the new techniques of food production based on the concept of permaculture. One aspect that is new in the speech that group is the construction of the capital, or the qualification and development of relations of trust between the residents.

## The key terms and structure of the conceptual map

From the theoretical and practical environment were selected key expressions for the construction of the proposed conceptual map. After selection, trying to combine the words and expressions listed in groups of affinity that could define or describe the construction of alliances and partnerships on the way to answer to guide the work. There were seven groups of affinity indicate that: i) what determines alliances and partnerships, ii) what they indicate or imply, iii) in what they depend on: iv) from which they can be operational; v) which facilitates its construction; vi) that the threat or restricts its construction; vii) the leading. These seven groups are the seven core structuring of the conceptual map prepared as exemplified in the figure below:

Figure 2: conceptual map of alliances and partnerships for social development.

## FINAL CONSIDERATIONS

The work reported here is proposed to discuss the development site from the intervention of coordinated initiatives of many organizations, considering that these are originated from different regions of Brazil and engage in different areas of expertise. The conceptual map structured as a result of this work sought to answer the question "What are the factors that determine, facilitate and restrict the construction of alliances and partnerships aimed at cross organizational coordinated actions for local development?"

The mission of social transformation that permeates the initiative Araçuaí Sustainable is one of the most relevant to the development of sustainability of small municipalities. Create conditions to increase the opportunities for citizens to build a dignified life and reduce the levels of poverty and deprivation identified in the environment is a key factor for promoting equity and, from a long-term, the structuring of a sustainable city, which does not oblige its citizens to seek, in other cities, minimum conditions for survival.

The logic proposed by Araçuaí sustainable impact in breaking with current models of management and coordination of initiatives aimed at social welfare, postures and organizational approach of the problems common to territorial spaces, whereas the inter-relationship of initiatives have greater potential to point solutions that implementation of initiatives isolated from each other.

It is important to emphasize that Araçuaí Sustainable is an experimental initiative and that the procedures and results to be established, due to the nature of the changes it proposes to launch the council, have their measurements in the largest possible space of time. Learning from a project like this is an exercise which requires openness to new concepts: the identification and understanding of new social values, new institutional pipelines, new tools and mechanisms that arise and to consolidate as the proposed model is built. The systemic view of the challenges faced by the municipality of Araçuaí, and the conceptual basis that moved the program, are differential of this initiative.

# ON SAFARI IN BOTSWANA: DESCRIBING THE PRODUCT

Nerine Bresler  
University of Johannesburg

## ABSTRACT

*The purpose of this paper is to elicit the motivations or push factors of self-drive visitors to game parks in northern Botswana, in order to describe the product. A survey was conducted and visitors' experiences observed. The most important motivations were escape, nature, adventure and mega-fauna. It is suggested that promotion material should not only emphasize specific species (the Big 5) but also include camp-life, creating an image of relaxation away from daily routine, as well as overland safaris. The unique attributes of the destination should be used to differentiate it and provide the benefits visitors are seeking, thereby ensuring repeat visits.*

## INTRODUCTION

Wildlife-viewing tourism contributes to the Gross Domestic Product of many southern African countries. Fringe areas of the Okavango Delta in northern Botswana offer great wildlife-viewing opportunities, and is one of the most visited tourist destinations in Botswana. (Mladenov, Gardner, Flores, Mbaiwa, Mmopelwa & Strzepek, 2007:409). Tourists are generally transported to safari camps by small plane or four-wheel drive vehicles from Maun International Airport to Moremi Wildlife Reserve and from Kasane to the Chobe National Park. Often visitors are self-driven to public campsites or part of an overland tour. The number of visitors to the Okavango Delta is estimated at 80 700 for 2001-2002 and their average annual tourist spending on safaris in the Delta calculated at US\$90.5 million (Mladenov, et. al., 2007:414).

Reynolds and Braithwaite (2001:258, 260) define wildlife tourism as “the experience of wildlife by tourist, and an area of overlap between nature-based tourism, ecotourism, consumptive use of wildlife, rural tourism, and human relations with animals”. Since there is a wide range of possible experiences and wildlife human interactions it is suggested that these be examined in order to ascertain their attraction to tourists and their effect on wildlife (Cf. Björk, 2000; Bulbeck, 2005; Newsome, Dowling & Moore, 2005). This overlap or coalescence in markets and concepts is confirmed by Buckley (2000:438) who uses the term Neat tourism; that is nature, eco- and adventure tourism, to describe the sector where nature and adventure are the product's primary attraction. Buckley (2000:439,442) argues that a combination of social factors has led to sudden and rapid growth to a sector, at least the size of a quarter of the total tourism industry in developed countries such as the United States of America (USA) and Australia, and more in developing countries, with most occurring in and around national parks. Bulbeck (2005; xix-xxii) elucidates a number of such social factors to list but a few; our emotional response to animals bend us towards respectful stewardship; we are neither completely separate from nor completely merged with the world around us; we escape our ordinary existence and work demands to a space where time is our own; our search for meaning operates through a search for the authentic and the primitive in the construction of the *other* where *self* stands for civilization, rationality, individualism while the *other* stands for naturalness, emotion and connection, the quest is to fill the emptiness of the self with the other.

Consumer behaviour of tourists has shifted away from mass tourism towards experiences perceived to be more individualistic and enhancing and Diamantis (1998: 516) ascertained that ecotourists in the United Kingdom (UK) tend to be a highly involved group who see their holidays more as pleasure and important to them. They magnified the values of excitement and sense of accomplishment and selected this type of holiday to experience different lifestyles, explore an undisturbed area with the purpose of being educated, and seek to attain

value for money for their holidays. To understand visitors to nature-based destinations, enhance their experiences and facilitate promotion, it is necessary to ascertain their state of mind in terms of Moscardo's (1996: 383) "mindful/mindless model of visitor behaviour" (Ladkin, 2000:212-213). In the case of mindful visitation, the tourist learns more, satisfaction is high and the consequence is greater understanding. Wildlife tourism seems to generally lack important information on the user in terms of expectation, motivation and satisfaction, especially for African destinations to market and manage the quality of the experience. However, Beh and Bruyere (2007:1468-1469) identified eight motivational factors and three distinct segments of visitors to three Kenyan national reserves. The motivations in order of importance are; general viewing, nature, culture, mega-fauna, adventure, escape, learning and personal growth. The three segments are escapists, learners and spiritualists. Bresler (2007:175) also asserts that wildlife-viewing at South African (SA) game lodges offer visitors memorable and differentiated experiences with authenticity, intensity, uniqueness, and popular species which have publicity status.

Two frameworks can be used to categorise the experience of wildlife-viewing on safari. The one; "Experience and trade-off" suggested by Reynolds and Braithwaite (2001:273) and the other; "Nature of animal encounter and conservation orientation" used by Bulbeck (2005:11). Reynolds and Braithwaite constructed a matrix with two dimensions; richness/intensity of experience and effect on wildlife, then plotted a range of possible experiences and wildlife/human interactions on the matrix, and drew three diagonal lines across the framework to delineate four broad categories that attempt to capture the trade-offs between the impact and the quality of experience. Wildlife-viewing on safari does not appear on the matrix, and even though this paper focuses on one dimension only, namely the human side of the wildlife encounter, a suggestion will be made for categorising it. Bulbeck ranked animal encounter sites firstly in terms of the nature of the animal encounter (from authentic to staged) and secondly the conservation orientation plus major activities of the animal encounter site (from ecotouristic orientation to education of visitors).

Tourism marketing is image marketing and must be looked upon from the demand side, especially in the case of wildlife-viewing that is expensive and the risk of unsatisfied visitors is substantial owing to the diverse range of experiences (Björk, 2002:199). It is thus essential that the product is marketed correctly in terms of motives (Bergery & Eckersley, 2007:2-3). When promises are made they create mental pictures and expectations partly on what marketers tell them and these need to be kept. It is therefore necessary to elicit the motivations of visitors to nature parks that are rich in wildlife and require specialised vehicles for access, in order to describe the product for differentiation purposes

## **THE PURPOSE OF THE STUDY**

The purpose of this paper is to elicit the motivations or push factors of self-drive visitors to two game parks in northern Botswana, in order to describe the core product in terms of motives or the benefits tourists seek. To contextualise expectations, it is necessary to observe visitor's experiences and to profile them; in other words, to find out more about the consumer behaviour of the wildlife tourists. The findings may assist destination managers in positioning wildlife safaris, and promote an appropriate image (Ibrahim & Gill, 2005:183).

## **RESEARCH METHOD AND PROFILE OF VISITORS**

It is an exploratory, descriptive and multi-method study, which is predominantly qualitative in nature. In addition to secondary sources, namely a literature study and content analysis of various documents, primary data was collected. The methods used were participant observation, and interviews with groups and individuals at campsites. A structured questionnaire with closed and open-ended questions was used for the survey.

The universe was all self-drive safari visitors camping in the Moremi Wildlife Reserve and the Chobe National Park in northern Botswana during the first two weeks in April 2006. The researcher interviewed them whilst at their camps; mostly Savuti and Ihaha. It was a convenience, judgemental sample. Those who were willing to be interviewed formed 17 informal discussion groups consisting mostly of two to four persons; two groups consisted of six persons. Four interviews were also held with individuals. Respondents represented the group with whom they camped and travelled; the sample therefore consisted of 93 persons, and the composition is reflected in table 1. Collectively these travellers spent 843 nights over a period of fourteen days in this area.

**Table 1: Composition of the sample of tourists on safari in northern Botswana**

| Country of origin | No. | %   | Province in S Africa | No. | %   | Language  | No. | %   | Age group | Gender Male/fem | Total | %   |
|-------------------|-----|-----|----------------------|-----|-----|-----------|-----|-----|-----------|-----------------|-------|-----|
| S Africa          | 70  | 75  | Gauteng              | 65  | 95  | Afrikaans | 68  | 73  | Children  | 5 8             | 13    | 14  |
| Germany           | 12  | 13  | WCape                | 3   | 3   | English   | 13  | 14  | Students  | 1 2             | 3     | 3   |
| USA               | 11  | 12  | Limpopo              | 2   | 2   | German    | 12  | 13  | 25 to 40  | 11 12           | 23    | 25  |
|                   |     |     |                      |     |     |           |     |     | 41 to 54  | 19. 12          | 31    | 33  |
|                   |     |     |                      |     |     |           |     |     | 55+ older | 12. 11          | 23    | 25  |
| Total             | 93  | 100 |                      | 70  | 100 |           | 93  | 100 |           | 48 45           | 93    | 100 |

Three quarters (75%) of the tourists came from the neighbouring state SA, and almost all (95%) from the most densely populated province of Gauteng. All the tourists from SA were Afrikaans with the exception of two who preferred English. The interviews were thus conducted mostly (73%) in Afrikaans. A group of eleven tourists were Americans (teaching at the international school in Johannesburg) and two groups consisted of Germans. Three had been working in SA for four years and brought along three visitors. The only tourists who came from overseas specifically for this safari were three couples from Germany accompanied by a tour operator. All tourists were from the white population group. None could be found from other groups. Respondents travelled in groups with family and friends. The sample thus included all age groups with more mature adults (33% was between 41 and 54 years of age) and an almost equal split between males (48 or 51.6%) and females (45 or 48.4%). There were few children all of school going age, the exception was one baby that was not included in any analysis. Three students accompanied their parents.

To ascertain if the sample selection was not biased, it was compared with the register of visitors through the Sedudu entrance gate, from 1-13 April. The origin of these visitors (230) was; SA (145 or 63%), Europe (23 or 10%), North America (22 or 9%), UK (7 or 3%), New Zealand and Australia (2 or 1%), Botswana (permanent residents 14 plus others living there 17 = 13%). Although dominated by South Africans (63%) it comprised of more international visitors. This can be attributed to its proximity to Kasane, a major town in the area with an airport, a number of game lodges on the Chobe River, and the availability of safari tour operators and overland vehicles for hire.

## FINDINGS

### Safari Groups in Northern Botswana

The safari groups ranged in size from three to 23 persons and were family and friends, or friends of friends. There were two very small groups of three, considering the survival skills required and vulnerability in case of emergency, and two very large ones of 22 and 23 tourists, considering the logistics, and only one overland tour operator group of seven persons including the guide. One very small and one very large group's profile will be elaborated upon. The one group of three consisted of a self employed financial adviser of 58 years of age from Centurion, Gauteng, who had been in Botswana 15 times before he got married, his wife of 38 and their son of eight. Formerly he had been a conservationist. Since their marriage they have been camping in Botswana 12 times. The father explained they had food supplies for two weeks, and 200 liters of fuel in addition to a tank of 80 liters, in case they got stuck. They had a mishap in the past, and for three days had no contact with anybody.

The largest group consisted of a family with two school going daughters and grandparents. The males were self employed manufacturers of mechanical equipment, and the daughter in law was a science teacher. They brought a young couple along who came to test their newly acquired Land Rover and tried to get away one weekend a month. This acquaintance was a self employed estate agent and his partner a project manager. The rest of this team was an electrical engineer lecturer cum dairy farmer, his pharmacist wife and their student son who had an affair with one of the two student girls from another family with whom they regularly went camping. There was also a specialist (otorhinolaryngologist), his wife and colleague, an audiologist, her husband who was

a mechanical engineer and their two school going sons, as well as a cousin who was a retired language lecturer with his marketing lecturer wife. The specialist was invited by his colleague.

In addition to the demographics reported above the sampled population held a variety of professional positions, ranging from an IT software developer, land surveyor, zoologist, horticulturist, registered big game hunter, forester, public relations officer, automobile and clothing marketer, bank marketing manager, bookkeeper, administrative assistant/accountant, builder, dairy and game farmer, social worker, policeman and housewife. Their qualifications thus ranged from a school leaver certificate (the majority of these were from SA and self employed), to a diploma and higher diploma for teachers, technicians and some engineers. Others had a professional four year degree, masters or doctoral qualification. An above average proportion was self-employed and educationally qualified, and were all financially secure; earning above average incomes to be able to afford the required vehicles and equipment. The findings confirm what is reported by Herbig and O'Hara (1997:232) that ecotourists are wealthier, better educated, more mature; between the ages of 35 and 54, more environmentally focused in comparison to other types of tourists, and are likely to pay more for this privilege.

## **The Attraction of Going on Safari to a National Park in Northern Botswana**

On the questions why respondents decided to come to Botswana, why nowhere else, and what was the greatest attraction, they said what made it unique was the abundance of wildlife in a genuine unspoilt wilderness/jungle, yet accessible. Some of the comments were: "it is part of Africa, here is no fences, no camp gates, very few campsites, it is not commercialized, no management intervention, more freedom, you can drive off the roads, not regulated like in the Kruger National Park (KNP), it is less travelled, here is less people, it is not overcrowded, it is very quiet, the isolation, and this is not available in SA".

The dire need for solitude, to experience magic moments, was other important push factors. This was strongly associated with being privileged to be there. In addition, a feeling of spirituality was evident. One group said this was the last "genuine churches". Many used the words adventure and unknown. One American stated; "I wanted to drive with this nice vehicle through the mud before I leave SA". This was their ideal holiday. Respondents enjoyed overlanding, and driving through the sand and mud with a 4x4. The vehicles were status symbols and a motivator to go on safari. A sense of self esteem, of superiority, was also evident with comments like: "ordinary guys go to the KNP, because I can afford to, not everyone can, I have the right vehicle, I am sufficiently confident and secure to cope with damaging this vehicle" (Ek is mans genoeg om die motor op te neuk). The fact that it was safer than Mozambique and Zimbabwe was also mentioned as decision criteria.

## **Decision Making and Planning a Safari to Northern Botswana**

The decision to go on safari was generally suggested by a male family member who had a safari experience and wanted to share the nostalgia of a previous trip to the area with his family. It was subsequently supported by the children and agreed to by the wife who wanted to see what she heard. In not one case was the initiator a female. The husband and wife alternatively selected the eventual destination. The seed to go away on holiday may be planted during a social gathering where work related stress was discussed or, whilst viewing photos or a video of a previous trip. On average, serious planning commenced about three to four months before the actual trip. As one respondent explained; "the sequence is: friends socialize, they agree that they need to get away, they agree it should be somewhere in the bush as this is their kind of holiday, and then they decide where it will be". Peer pressure definitely played a role. A person or family may have wanted to go to Namibia or Mozambique, but were persuaded by friends to rather join them on a trip to Botswana.

The planning process evolved over a period of eight months to a year. Respondents all read relevant travel magazines and specific destinations evoked their interest. Once the bug had bitten them they got excited or itchy and consulted catalogues or the internet. One member testified that he kept a file of clippings from *Getaway*, *Weg* and other outdoor magazines of places he wanted to see, for planning purposes. A leader started making arrangements and organized regular meetings as the itinerary planning progressed. Medical insurance and preventative measures with respect to contracting malaria, was part of it. Subsequently other friends may be invited or convinced to join, to replace those who had withdrawn. For the late comers it was a spur of the moment decision. There were subgroups within larger groups that planned their own menu, food acquisitions

and sharing of camp equipment; who takes what. Not everyone would take a two-way radio, a spade or saw, a kinetic rope or set of mats to use under the wheels of a stuck vehicle. This was also a time to enthusiast newcomers, to build camaraderie and initiate them to what lies ahead, and ensure that they would be sufficiently prepared not to be a burden or contribute to the risk. Visitors going on safari did not go uninformed into a territory. They knew what they were doing and were not such daredevils that they would try to conquer a complete unknown territory. They read about the destination, asked people who had been there and made a list of what was required, especially in terms of an emergency medical kit. One said the only thing he did not know was that the fridge at home was switched off!

## **Other Holiday Destinations Frequented**

All the SA respondents had criss-crossed their own country, from around the corner of their homes to far away places like the KNP, Sabi-Sabi, Zululand, the Drakensberg, Graaff-Reinet, Klein Karoo, Knysna, Cape Town, Durban and the Kalahari. A few responses are quoted on the question; where have you been on holiday before?; “where haven’t we been?, everywhere, anywhere, from fishing in the Vaaldam to Thabazimbi, every inch between Johannesburg and Botswana, from east to west, from south to north in SA, and overseas”. Most respondents have been to the neighbouring states of SA namely Namibia, Botswana, Mozambique, Zambia and Angola, in this order of frequency. They have also been overseas to the most popular and less travelled destinations; places like London, Rome, Venice, Austria and Australia, to Vietnam, Maldives, Mauritius and Iceland. On average respondents went overseas once in five years. Visiting family and friends, in whatever country or continent they resided, were high up on the priority list. Respondents generally enjoyed the full depth and breadth of the available tourist products and alternated self-reliant wilderness and hiking holidays with self-service resort experiences, five star luxury resorts and hotel based city tours.

## **General Holiday Behaviour**

All the respondents went on holiday for about ten to 14 days at least once a year, and took a few short breaks in between. Some of the pensioners even went away for as long as three months a year; especially in winter. They were thus well travelled. The duration of this safari was ten to 14 days, with one group who stayed for nine days and one for 16. To take a shorter trip was not worth their while, considering that the travel time to SA and back would take at least four days. All, but 15 of the 93 visitors had been to Botswana before. Four previous visits seemed to be the average. Visitors reported to have been in Botswana anything from two to 10 years ago. Three had been in Botswana over 15 times. One worked in Botswana, one was a travel operator and another purchased souvenirs for a curio shop in SA. Persons from SA on safari are thus most likely recurring visitors.

Not a single respondent travelled only to the camp or park they were interviewed at. The majority also stayed at other camps, and included a brief visit to the Victoria Falls in Zambia. Many overnight in a lodge to be pampered for a day or two. Some of the international visitors planned to go to either Namibia, Mozambique, or to Zululand and the Cape in SA afterwards. A safari is thus a touring expedition and not a short break away.

## **Push and Pull Factors to Holiday Destinations**

The reasons most frequently given for going away on holiday were; to get away from everyday routine, to relax, for a balance, to broaden experiences and learn more, and to be with family and friends, in this order. Examples of responses are: “we need to get away from the rat race, at home we only work, I work seven days a week for long hours, we cannot always look after others, we are tired and want to switch off, we need to relax, to cope with the stress of living in town, in SA we feel oppressed, to see different places, to have different experiences, we like scouting, we want to be in nature, it is important for a balance, we want to get away from push button conveniences, we want a change from home so that we can appreciate it when we get back, we want to see everything fresh again; from a new perspective, we want to be alone with our children and parents, we like to spend time with family and friends”. Respondents described themselves as venturesome, the wondering type, responsible and caring, not reckless.

On the question; what is your ideal holiday? it would seem as if places far away from everyday life and other people, (not Margate) where you have time to look after yourself and not your keys, time to think and meditate, with neither telephone nor television, were most attracting. Outdoor life was the dream world for respondents, especially if they could see animals in their own environment and hear the sounds they made at night. One said; "I wish I can put the stars here in a bottle and sell it". Even though, water, the sea, beautiful beaches and white sands as well as mountains were mentioned as ideal holiday destinations, nature escapes in the bush had more pulling power in terms of frequency of visits, because it was not perceived to be as busy as at the sea. They liked places that were different, or held the promise of a different experience, such as surprising behaviour of wild animals. One retired couple said they desired to see as much as possible before they die and another group that they wanted to see the world. The pulling power of overseas visits was to feel part of the European first world, to make mistakes and to conclude transactions in foreign currency. When overseas, respondents wanted to learn more about different cultures. The ideal was a balance between luxuries and roughing it. Respondents desired comforts and were willing to take these along if necessary. Females also liked to be totally pampered in five star luxury, and made sure they were occasionally getting it. In their hearts respondents were explorers who did not like to stay at one place, they preferred touring. Value for money and the time spent to get to a destination were important decision factors too.

Taylor and Prieaux (2008:78, 80, 84) found similar psychological motivations or push factors for the experiences of four wheel drive (4WD) trips namely; socializing with like minded people, personal discovery, getting away from it all and from the city, facing challenges and developing and maintaining friendships. 4WD tourists clustered in the same age group, 45-65, the median length of long trips taken were also 12 days and multiple-vehicle trips was a motivation in its own right. Both represent the same contradiction whereby the wilderness is desired for its solitude but at the same time a catalyst for enjoying the company of friends.

## **Knowledge about Nature**

Visitors were asked to describe and rate their knowledge about nature. This varied from as little as three out of ten for international tourists to ten out of ten for some tourists from SA, meaning that they knew almost all the animals, birds and trees of the area, but not all the other plants. This is not surprising given that the respondents included a former conservationist, a zoologist, a horticulturist, a registered big game hunter, a forester, a couple that was dairy farmers and four couples owning game farms in SA; and their friends had often been guests there. These people could identify grass types, knew the nutritional value of plants and could diagnose the veldt conditions. Tourists were very knowledgeable; their average rating was seven. The most frequently given rating were eight, which can also be ascribed to the fact that all the SA respondents had a variety of reference books on fauna and flora, especially on wild animals, birds and trees. The three outdoor educational magazines read mostly were *Weg*, *Getaway*, and the *National Geographic* in that order. Respondents also watched the National Geographic television (TV) channel and 50/50, an educational nature TV programme in SA.

## **What Tourists do Whilst on Safari in Northern Botswana**

Tourists remain busy whilst on safari. When touring to a destination they pack up and travel daily, but remain stationed at one campsite for two to three days once they arrived. To set up a camp, pitch a tent, inflate a mattress, make a bed and find your bearings takes time and coordination if you are part of a group. A leader needs to plan the logistics in a democratic non intrusive manner, and individuals must be mindful to take cognisance of the needs of others. Whilst stationed at a camp tourists split into smaller groups for more independent camp life and freedom to view the wild animals around the camp when and for how long they wanted to. Normally this was done twice a day for two hours or longer at a time. Whilst on such drives visitors may have a picnic at what they believed to be a safe spot, and once they knew the area, they ventured out on their own. When at the campsite tourists made coffee or tea, drank cold beer or wine with ice cubes, prepared meals, had a barbeque (braai), took a shower, washed their clothes, dishes or vehicles. They shared their latest experiences and photos with friends. Males filled water tanks, refilled petrol tanks or adjusted the pressure of tires. They attended to these camp chores as if it was a pleasure. Sometimes they shared knowledge, gave advice, assisted a friend with a problem, demonstrated a unique gadget or boasted about the performance or capacity of their vehicle's engine. They also told stories, played games and asked riddles. Although groups

socialized for hours on end till late at night around a fire, individuals occasionally desired some privacy and relaxed with a nature book or took a nap. It was not uncommon to retract with no questions asked by anybody.

The food people prepared on this safari was exquisite; as if they were entertaining. They ate prawns, T-bones steaks, hamburgers and chicken, had sausage rolls and meat balls (frikadelle). There was no shortage of fried sausages (boerewors), kebabs (sosaties) or lamb chops. They baked pot-bread, made stews (afval and potjiekos), served with a variety of vegetables and even salads. Snacks such as biltong and dried wors, Easter eggs, chocolates, biscuits, rusks and fruit were in abundance. Delicatessens were often shared. When close to a town, such as Maun or Kasane, tourists stocked up with fuel, ice and other luxuries and necessities. They then had a cold beer or meal. Many participated in a guided cruise down the Chobe River from the Chobe Safari Lodge to view the abundance of wildlife on its banks. The lodge accommodation and boats were filled to capacity. Respondents spotted animals such as crocodiles, hippopotamuses, buffalos, lots of elephants, giraffes, and kudus, snakebirds, fish eagles and jacanas, from the boat. When three elephants swam through the river as many as 12 boats of different sizes descended upon this spectacle, as operators and tried to come as close as possible to the elephants swimming, for tourists to take close-up photos.

## **What Will Tourists on Safari in Northern Botswana Tell Their Friends?**

On the question what will you tell your friends upon return? respondents were in unison that they will show their videos, photos and CDs to their friends, share the experience, make them jealous and try and invite them to come along next time. Words such as: “amazing, fantastic, a feast, very peaceful, really different, a truly African experience, and it stimulates your imagination”, were used to describe their emotions. One said “you cannot tell somebody, this must be experienced firsthand” and another; “there are really no fences, the animals walk on both sides of the park entrance, even in the streets of Kasane!”, “you hear the animals breaking the leaves around your tent at night”. The fact that it stirred deeper emotions needs to be mentioned. One respondent said he would share the feeling of vulnerability; he felt completely powerless. That so many people were Afrikaans will also be told. The young boys would share the experience of baboons that urinated on their tent which was pitched under the baboon’s tree, and making a lot of noise from above whilst shaking the branches to scare the intruders. The young girls would tell friends about the tiny mouse they found in front of their tent and the frog underneath the canvass in front of it.

Some advice will also be shared, such as “make sure you take a trip in a mokoro (dugout canoe), you cannot do this without a guide, go with a group of people who know, planning is very important, you must be self-reliant, your equipment needs to be reliable, you must be cautious, you cannot do this without knowing what to expect, take your own port-a-potty along, if you need help or something it will take you a full day trip to get it, do not expect to find any *MacDonalds* or *Steers* and there is no place for a laptop”. Respondents were asked to categorize the type of experience as either special interest tourism, nature based tourism, adventure tourism or wildlife tourism, but they could not come to a conclusive decision. Nature based plus adventure tourism was suggested by most. One respondent suggested a category “back to the basics”.

## **Discussion and Management Implications**

Tourists on safari are mindful visitors. The product can be categorised as authentic and ecotouristic. The effect on wildlife is minimal and the experience is one of high enthrallment. Visitors are escapists since general viewing, nature, escape, adventure and mega-fauna were more important motivators than personal growth, learning and interacting with a unique culture. Their profile is also similar; escapists are mainly European (85%). It is suggested that promotion material not only emphasize specific species (the Big 5) but also include camp-life at a novel place, expansive scenery, vista points creating an image of relaxation away from daily routine, 4WD safaris with some challenging driving excitement. Designated vehicle stops could be established at scenic points under special trees, blending into the landscape, offering a more varied experience. The unique attributes of the destination that attract tourists to the area would then be used to differentiate it in their minds and provide the benefits they are seeking, thereby ensuring sustainable use of the resource.

# STRATEGIC ALIGNMENT AND MANAGEMENT OF FACULTY PROGRAMME OFFERING TO STATE HIGHER EDUCATION REGULATION: A FACULTY CASE STUDY AT THE UNIVERSITY OF JOHANNESBURG

**Amanda Breytenbach and Geoff A Goldman**  
**University of Johannesburg, South Africa**

## ABSTRACT

*Higher education state governance fulfils an important function in providing policies and procedures, which in turn provides guidance and strategic vision to higher education in South Africa. The reformed South African higher education policies have to guide, rebuild the nation and drive transformation that is necessary in a post-apartheid society. However reformation and transformation of regulations require change and restructuring in order to ensure alignment within the entire system. At the University of Johannesburg, the Faculty of Art, Design and Architecture (FADA) is positioned in a newly restructured educational landscape and merged institution. This paper aims to determine the challenges and expectations presented in reformed state regulation that should be considered in the strategic management of faculty programme offerings in order to ensure strategic alignment to state regulation. The study employed a qualitative research approach in order to observe and document the perspective of the academics in FADA. Using documentary and policy analysis and interviews with academics within FADA, the study revealed that an increasing move towards a management paradigm is evident in the restructured higher education environment, which necessitates the introduction of strategic management in higher education.*

## INTRODUCTION TO THE STUDY

Higher Education regulation in South Africa (SA) has been under the spotlight of reconstruction, transformation and re-curriculation since 1994. The post-apartheid political ideologies were required to restructure and reform the education environment in SA. Past Minister of Education, Kader Asmal identified in the foreword of the National Plan for Higher Education (NPHE) that: “*The victory over the apartheid state in 1994 set policy makers in all spheres of public life the mammoth task of overhauling the social, economic and cultural institutions of South Africa to bring them in line with the imperatives of a new democratic order.*” (SA, 2001: Foreword).

The time period from 1994 to 2007 gave rise to a number of education acts, policies and discussion documents, which aimed to reform and transform a diverse and fragmented pre-1994 higher education environment. This study focuses on reformed state regulation, in order to determine strategic direction and guidance for strategic management of programme offering as well as the challenges and the expectations that are presented through alignment with the regulations. It is compulsory for public higher education to be aligned to state regulation. However in order to be aligned to state requirements the faculty must understand the focus of state regulation, which begs the following, central research question:

**How does the change in the institutional environment and change in Higher Education Qualification Framework affect the academic staff and the programme offering of the Faculty of Art, Design and Architecture?**

Against this backdrop, the aim of the study can be purported as follows:

**To determine the challenges and expectations presented by reformed higher education state regulations that should be considered in the strategic management of faculty programme offering in order to ensure strategic alignment to state regulation.**

## **REGULATION AND REFORM IN SOUTH AFRICAN HIGHER EDUCATION**

### **Post-apartheid regulation for a New South Africa**

The first five years of the New SA, was land marked by the emphasis placed on the introduction of new policies and legislation. The vision for the transformation of the higher education system was communicated in 1997 with the publication of the Education White Paper 3: A Programme for the Transformation of Higher Education (SA, 1997a). Asmal (SA, 2001: Foreword) describes the focus of the vision as follows: “*Central to this vision was the establishment of a single, national co-ordinated system, which would meet the learning needs of our citizens and the reconstruction and development of our society and economy.*”

The Education White Paper (SA, 1997a) identifies that the separate and parallel qualification structures for universities, technikons and colleges have prevented student transfer between these institutional types. Technikon qualifications did not articulate with university programmes and did not provide a coherent pathway and mobility between qualifications for students. The Education White Paper (SA, 1997a) therefore proposed a single qualification framework for higher education. The White Paper (SA, 1997a) further motivates that it is the role of higher education to provide education and training to develop skill and innovation that are necessary for national economical development and successful participation in a competitive world economy.

The Education White Paper (SA, 1997a) provided a policy framework with goals, values and principles for the higher education system. The White Paper was immediately followed by the Higher Education Act 101 of 1997 (SA, 1997b) which established a legal basis for a single national system. The White Paper and Higher Education Act were followed by the NPHE (SA, 2001) which provided a strategic framework for the re-engineering of a higher education system. The NPHE included the strategic objectives that were developed according to the higher education goals as identified in the Education White Paper.

In July 2004 the Ministry of Education presented the first draft Higher Education Qualification Framework (HEQF), the long awaited Framework was finally published by the Education Minister Naledi Pandor on 5 October 2007 and the implementation date is 1 January 2009. (SA, 2007) The HEQF addresses the need for a single qualification framework for higher education as identified in the Higher Education White Paper (SA, 1997a). It is identified that the impact of this policy on the Higher Education sector is widely expected to be significant and opinions about its ‘fitness for purpose’ range from skeptical to cautiously optimistic. (Education Web, 2007). However, the Department of Education (DoE) and Council of Higher Education (CHE) indicated that new programmes and qualifications to be offered in 2009 should be aligned as closely as possible with the HEQF. (DOE *et al*, 2008)

### **Academic freedom and institutional autonomy**

A concern that is noted by various authors’ is that the increase in the number of state education policies indicated an increase in state authority in South Africa. (Waghid *et al*, 2005; Hall, 2006). Hall (2006:374) notes that: “*The defining trend in university governance in South Africa, expressed through legislation and amendments to the Higher Education Act, has been increasing state control.*”

The concern around the increase in state control is also evident in a response document submitted by the previous Mangosuthu Technikon (S.a.). This Technikon expressed the opinion that political interference in higher education is often a symptom of a much larger fear. The Technikon argues that the Ministry of Education and related constituencies are reacting fearfully to change, and seek to impose more rigid controls on institutions and processes.

The concerns regarding academic freedom and institutional autonomy received much attention in 2007 in SA. In a paper presented by Jackson (1997:121) he reflects on the academic regulation environment in the United Kingdom. He states that regulation is an emotive, threatening and potentially divisive concept when used

in academic communities. He explains that the academic communities hold high values for the concept of academic freedom and institutional autonomy, and the academic community is often reluctant to engage with the concept in order to avoid the notion that autonomous institutions lose control over the way in which they conduct their internal affairs.

The national debate around institutional autonomy and state governance is not new. *“What is new; however, are the effects of international reform ideologies that fundamentally challenge the notion of institutional self-steering in higher education.”* (Cloete *et al*, 2002:8). They refer to the work of a Norwegian political scientist, Johan Olsen, who made interesting contributions to the policy debate on the modernisation of higher education. Olsen (as cited in Cloete *et al*, 2002) claims that the traditional pact between society and higher education has become problematic. A number of examples are provided to explain this problematic situation such as; the accusations of insufficient quality, effectiveness and efficiency, and the complaints about the lack of intellectual capacity. The result of the deterioration of the relationship is the re-interpretation of the relationship between society and higher education. The traditional emphasis on academic freedom and self-steering of academics is replaced with an interpretation that higher education is a service-company with society as its marketplace. (Cloete *et al*, 2002).

## **Increased focus on strategic management**

The challenge for higher education leadership challenge is to reconfigure institutions to become more competitive and market orientated. Cloete *et al*, (2002:162) indicates that *“This requires the vigorous adaptation of corporate management principles and techniques to the higher education setting.”* The focus on managerial leadership in SA Higher Education institutions includes the need for strategic vision and planning within a new changing and competitive environment.

The leadership challenges for strategic managers are to position the institution in such a way as actions become more strategic. (Cloete *et al*, 2002). The strategic manager will also have to indicate to the academics that managing the institution on sound management principles will not threaten the traditional values of academic freedom and that such management is necessary.

## **THE INSTITUTIONAL CONTEXT OF THE CASE STUDY**

The University of Johannesburg (UJ) is a comprehensive institution, and is the result of a merger between the former Technikon Witwatersrand (TWR) and the Rand Afrikaans University (RAU) that took place in January 2005. The Faculty of Art, Design and Architecture (FADA) formed part of the former TWR and offer programmes that are referred to as technikon type programmes. FADA is the smallest faculty in the university. UJ's statistics indicates that FADA enrolment headcount contributes 2% of the total UJ headcount. From 2005 to 2007 the average student enrolment was 854. In 2008 FADA has indicated a growth of 15%. The faculty nearest in student size to FADA is that of Law Faculty with a headcount enrolment of 1431 in 2008.

FADA consist of eight Departments which all currently offer three year National Diplomas (N Dip) and fourth year Bachelor of Technology (B Tech) qualifications. The Master Technologiae (M Tech) is offered by six departments. FADA is currently only offering previous technikon-type qualifications. However the faculty has indicated in 2007 that the introduction and conversion to identified degrees programmes will take place from January 2009. The programmes that are offered by the faculty have to compete within a small and highly competitive regional and national higher education environment. Regional competitors, who are mostly private providers, offer similar design programmes to those presented by FADA. In 2003 private providers started to convert their qualification types from diploma to degree programmes.

## **RESEARCH DESIGN AND METHODOLOGY**

The nature of the research question suggests an exploratory study, which, as Mouton (1996) argues, attempts to gather new data and “facts” and to establish whether there are interesting or novel patterns in the data. For the fact that qualitative methods are generally used for exploratory research – in particular when the research activities attempt to identify, describe and generate explanations for phenomena (Crabtree & Miller, 1992) as is the case in this study, a qualitative design was chosen. Moreover, the choice of a qualitative design is

generally considered appropriate when little previous research has been conducted in the subject domain (Mouton, 1996). The qualitative design was effected through a *case study* approach, which allows investigation of phenomena as “bounded systems” (Henning, Van Rensburg & Smit, 2004). Any social entity can be demarcated by parameters that enable exposure of its distinctive dynamics. Data is solicited from within the parameters of the bounded system or case. In this study the focus is on the changing institutional environment and proposed changes in programme offering within FADA, which can be viewed as a bounded system with clear parameters and a specific and unique dynamic.

The ontological platform for the study is indicated by the study’s point of departure namely the impact of a changing educational environment on people. The study investigates the experience of employees and thus works at the level of individual feelings, beliefs, views, and understandings of this changing environment. The latter are of course personally and socially constructed and fit an *interpretive* research paradigm. In this regard Neuman (2003) argues that researchers operating from within an interpretative paradigm strive to systematically analyse socially meaningful actions. This they do through direct observation, in order to understand how people create and maintain their social worlds. From an epistemological perspective it follows that first hand accounts (e.g. verbatim narratives) of how the change in state regulation was experienced, and obtained directly from those who experienced it, will be most suited as a vehicle of knowledge.

Methodologically this poses significant demands in terms of the nature and quality of information required, which are not easily met with traditional (positivist) survey-approaches and which are criticised for generating impoverished data. As a consequence data-gathering methodologies employed in qualitative research rely on predominantly unstructured or semi-structured, open-ended techniques which will extract data of the required levels of richness and redundancy. The degree to which observations or measures are consistent or stable i.e. are reliable (Rosenthal & Rosnow, 1991, p. 628), is a function of scientific rigour which commences substantially before actual data-gathering but includes inter alia the conceptualisation of the research, preparation of the research context (e.g. managers) and cultivating receptivity for the research, maintaining the anonymity of respondents, establishing rapport with respondents, and ensuring consistent interviewing through the use of a single interviewer and a consistent format and procedure of interviewing across respondents and organisations (cf. Mouton, 1996). This was indeed the case in this study where the researchers secured faculty support some time before commencing with the research.

The *research population* for the study comprised all full time academic personnel in the employ of FADA at UJ, which includes academics and faculty managers. As with most qualitative studies, non-probability sampling was employed in this study – in particular as representativity in terms of the population, is not a consideration. However, as strategic management is firstly, a function that is associated with management, it was therefore important to include faculty managers within the research population.

In all then, nine academics and nine faculty managers were selected on a judgemental basis for the collection of primary data through the usage of semi-structured interviews. The nine managers are; the eight Heads of Departments as well as the Dean. In addition nine senior academics were identified, which must have occupied a senior academic position for at least five years. Preference was given to academic staff that were previously in FADA management positions. This research group represented 41% of the full time academic staff within FADA.

Coding and identification of patterns and themes as presented by Miles and Huberman (1994:55-69) were used as guide to formulate a content reduction process for this study. The coding process searched for relationships in the content and find any emphases or gaps in the gathered information. The scope of this paper, as directed by the research question, focuses on the primary themes (or categories) that emerged from open coding.

## **PRESENTATION OF THE RESEARCH FINDINGS**

Richardson (as cited in Taylor and Bogdan, 1989:168) identifies that researchers do not merely report research findings, but they transform their field notes, documents, interview transcripts, and other data into a form of narrative text. Taylor and Bogdan (1989: 168) encourage researchers that engage with qualitative research to experiment with new forms of writing qualitative research researchers, and to increase their sensitivity when conducting and producing the narrative product. This research study will however attempt to maintain an objective reflection of the research findings.

The narrative production of the research findings aim to present a thick or rich description as suggested by Miles and Huberman (1994) and, Taylor and Bogdan (1989). This rich description should aim to reveal the

complexities within the context in which it is nested. Taylor and Bogdan (1989: 174) further suggest that illustrative quotations and descriptions should be included to convey a deep understanding of what the context and the people involved are like, and to provide support for the researcher's interpretations. These authors state that quotes and descriptions help readers to understand how the researcher has reached conclusions and interpretations.

In contrast to quantitative research, qualitative research focuses on findings, not results and on rich descriptions rather than graphs, tables and frequencies of events. The research findings as presented in this study have been grouped under headings that represent the main themes and patterns identified in the text of the transcribed interviews.

## **THE RESEARCH FINDINGS**

### **The reformed higher education system as experienced by the subjects**

The reformed higher education system is described as being extremely rigid with an increase in constraints. The majority of subjects mentioned that there is an increase in bureaucracy, which relates to the increase in the number of higher education policies and procedures. A subject stated that: *"The expectations are far more bureaucratic. It seems to be tied up with many more rules and regulations and restrictions and this is very inhibiting for art education. It actually gets in the way and they do not enhance the performance of the educator."* Another subject observed that: *"It has become much more bureaucratic and is much more driven by policy and procedure."*

The changes within the reformed higher education system require of academics to approach, present and deliver education in a new, different and transformed manner. This observation is presented by a subject who stated that: *"The fairly massive sets of paperwork also reflect the paradigm shift in the minds of staff and the workshops and programmes that they have to attend in order to familiarize themselves with the concept and the processes that are associated with the paperwork."*

### **Reflections on change in Higher Education state regulation**

Four main occurrences that resulted in major changes in higher education governance since 1994 are recalled by a number of the respondents. These aspects are:

- The merger of the higher education landscape
- Introduction of Outcomes Based Education
- Change in the government's approach to higher education
- Introduction of new higher education policies

The occurrences presented above were not presented in any order of importance or preference during the interviews. However the first point, the merger, was mentioned or referred to by all the respondents. It is also noted that the change that took place in higher education post-1994 are perceived as interrelated events, as one person stated: *"The government's approach to tertiary education has changed. The mergers took place, and everything that flows from that."* Another subject presents the change as follows: *"Huge change, dramatic change has taken place since 1994 within the rationalizing of higher education, refocusing of targets and initiatives. The biggest one is the rationalizing of the higher education landscape from 36 to 21 institutions. That impacts on where we are now."*

### **Expectations and challenges presented by state regulation.**

The respondents presented a wide variety of expectations and challenges that are presented by higher education state regulation. The expectations addressed by most of the subjects are the need to address and include transformation, equity and accessibility in higher education. One person summarised these expectations as follows: *"Transformation, redress, addresses, equity, those are the main issues."*

However the expectations and challenges presented by the state in higher education policies are described as being idealistic and unrealistic. A subject commented that: *"There are so many expectations. Many of them are quite unrealistic"*. Another subject raised the following concern: *"Policies bring change and*

*one should not forget about the culture that you want to create in this new merged environment. The biggest concern for me is that there are huge contradictions in these policies”.*

## **The subjects’ knowledge of higher education state policies**

During the interviews a number of subjects indicated that they were not familiar with the state policies and one respondent clearly indicated: *“I can not answer this question”*. General statements were made during the interviews in relation to the policies; such as: *“All of them [policies] impacts in us”*. The majority of the subjects had a vague and unclear understanding of higher education policies. One respondent identified that: *“I am not familiar with the particulars of every document. I leave it to my manager to study the documents and implement them”*.

The respondents that are familiar with titles of state policies and to a lesser degree the content of the higher education state policies, identified a wide variety of state policies as drivers of change in post-apartheid higher education state regulation. In total these subjects refer to six different policies and one framework.

## **Alignment of the faculty regulation to state regulation**

The subjects had divergent opinions regarding the current alignment of the FADA to higher education state regulations. Their opinions ranged from a very convincing; *“O ja, I think it is very aligned”* to a doubtful; *“I do not think so”* and finally; *“I have no idea. I know that there is an intention to be aligned”*. The subjects that consider the faculty to be aligned base their opinion on the fact that the faculty forms part of an institution that is forced to be aligned to state regulation. This opinion is expressed as follows: *“We have been forced to be aligned to the policies”*.

## **The benefits and challenges for the merged institution**

The merger presented both benefits and disadvantages for the subjects that form part of FADA. The main benefits that were identified by the subjects are that the facilities and the educational environment have improved. The institution has increased in size and is currently the third largest higher education institution in SA. This is perceived as a benefit since larger university offers a broader range of programmes and access to a broader range of modules within other faculties. A number of subjects identified an increase in status that was experienced by changing from a technikon to a university. This observation is expressed by a subject as follows: *“South Africans are snobs. Give them the choice from a degree from a technikon or a degree from a university, South Africans will generally choose the university degree.”*

However the transformation from a technikon to that of a university context also raised concerns and is perceived as a challenge. This shift is identified as follow: *“How possible is it for people to suddenly go into a new head set, in term of understanding what academics are all about as laid down by the expectations of a university which is a highly academic institution which we are now part of ?”* A further challenge presented by a number of respondents relates to the amount of change that the faculty will have to address. One subject observed that: *“Qualifications have to be upgraded and we have to rethink the way in which we conduct our business.”* The change is further expressed as follows: *“We are expected to change dramatically in our whole approach towards education”*.

## **Proposals to restructure and rearticulate faculty programme offering**

A number of subjects describe the faculty’s current position within the comprehensive institution as an opportunity to align with the degree stream as presented in the HEQF. The current position will enable the faculty to restructure the diploma to degree programmes. The opportunity is identified as follows *“We have an opportunity to realign our programmes into a single qualification framework or standardized qualification, which is also internationally aligned.”* The proposed conversion from diplomas to degrees is seen as the preferred and best option for the faculty.

However the following concern is expressed by a subject: *“One has to be strategic about what one wants to emphasize.”* The increase in degree entrance requirements will also impact on the intake of previously disadvantaged students. This concern is expressed as follows by a subject: *“The selection requirements are*

*shifting. It means that the previously disadvantage students will be eliminated in the process. How are we going to cater for the learners who do not make the cut off point?"*

## **Challenges and expectations in relation to programme offering**

The research subjects from FADA identified a wide variety of challenges and expectations that have to be addressed by the faculty in order to restructure. One subject summarised the challenges as follows: *"The challenges start to kick in at various levels. It poses a challenge to staff qualifications. It poses a challenge to the curriculum, the academic architecture and content of the curriculum. It poses challenges to the student profile. It poses a challenge to the support structures in the faculty. It poses a challenge in the way that we envision ourselves and how we are going to portray ourselves outside and inside the institution. It is a whole reconfiguration of the faculty"*. This description presented an overview of the challenges and expectations that were presented by the remaining subjects.

The challenges that relate to staff qualifications were identified by most of the subjects. The majority of staff have Technician qualifications, and although a number of staff have increased their qualifications to a Masters level, it is required that they increase their qualifications further to even Doctoral levels. This requirement is motivated as follows: *"People will have to improve their qualifications. The Department of Education indicates that we have to have a certain level of qualification in order to offer a qualification at certain levels."*

## **Perceptions relating to strategic management within higher education**

An aspect identified by a large number of the subjects is that the focus in education has moved towards including business strategies and business models in educational operations. This aspect is presented as follows by one person: *"Education has become much more of a business. The faculty is now operating as a business."* Another subject stated that: *"There has been a move from aligning academic institutions to corporate models."*

The majority of the subjects observed that the notion of strategic management has increased in higher education since 1994. The shift to a management paradigm was described as follows: *"There is an increasingly new move to a management paradigm which was quite foreign to the institutional environment, quite difficult in that people did not really think in those terms. Resistance, because it seems to be something that was against the ethos of what an academic institution was all about."* The description was supported by another subject who observed that: *"I think there has been a move from academic management to strategic management."* A research subject considers strategic management as an important component of large institutions. This subject stated that: *"It has become such a big thing now, that management becomes even more important, especially strategic management. The bigger the institution is the bigger the demand is for good strategic management."*

Strategic management is not only a function that is associated with university executive management or faculty management, but it is required of all academics to include strategic thinking in their programme planning and projections. A subject commented as follows: *"In the faculty there is much more thinking about where we are going and why we are doing specific things."* This observation was repeated by another subject who stated that: *"The new management has themselves made statements that strategic management will be part of the highest levels down to management at the various different levels below."*

## **Faculty experience and training in relation to strategic management**

The focus on strategic management within the institution has placed a demand on academics and faculty managers to identify strategic directions and present strategic plans to the faculty and its departments. It became evident during the interviews that strategic projections and presentation are delivered in most cases, by subjects who have very little or no experience or training in strategic management. More than 50% of the subjects that were interviewed have experience or training in management but a very small group within the faculty has strategic management experience or training. The training that was received in strategic management was mostly through short courses or workshops.

A number of subjects expressed the opinion that strategic management should be a function of the head of department and the dean. This opinion was expressed by one subject as follows: *"If I understand where the institution is going, they are going to drive it [strategic management] down and they will look at the department*

*as a unit. If you look at the department as a unit then certainly the person who stands at the head of that unit should have the capacity to think strategically at that level.”*

The majority of the subjects agreed that it would be important for faculty managers to receive training in strategic management in order to fulfil the requirements that are associated with this form of management. The following observation was presented by a subject: *“Now with the strategic shift in our responsibilities you need a strategic background. I often think people that are recruited now as head of departments are very different to before.”*

## CONCLUSIONS

The limitations that were experienced in this study resulted from the ambiguous interpretations of state regulation and the extremely slow development that is made over a number of years. The following example explains this point; the first draft HEQF was published in 2004, the second draft in 2006 and the final publication in October 2007. Each draft was followed by a wide range of interpretations and debates that took place within the various higher education institutions. The slow progress further impact on the literature study in that there is a reluctance to engage in matters that are not finally approved and purely postulations. Breytenbach (2007) identified in a study relating to implementation of the White Paper knowledge economy expectations that, after ten years of publication the majority of academics interviewed for the study, were not familiar with the key terminology and expectations presented within the White Paper.

It was determined in the study that the Higher Education state regulations have been completely transformed and reformed by the post-apartheid government. However, the change in state regulation raises serious concerns with some authors, in that the increase in the number of state education policies indicated an increase in state authority in South Africa. This has resulted in an apprehension among higher education institutions, who maintain the right to academic freedom and the ability to practice institutional autonomy.

It was required of higher education to institute rapid change through the introduction of a vast number of reformed state policies and procedures. The literature review indicated that expectations to change resulted in a situation where the capacity and ability for managerial evolvement became crucial. The literature review identified that a paradigm shift took place within higher education which is referred to as the managerial phase. The paradigm shift indicates a move from collegial academic self-rule to academic managerialism.

Strategic leadership and management are required to inform and implement strategic changes which would aim to position the institution, the faculties and the programmes offerings. The study indicated that academic staff are often reluctant to engage in the planning and implementation of institutional strategic plans, but wish to only focus on teaching and research. During the interviews a number of respondents considered it the responsibility of their managers to study and implement state and institutional policies.

The research respondents identified that the increase in the number of higher education policies has resulted in an increase of bureaucracy within higher education. The reformed higher education system is described as being rigid with an increase in constraints. The subjects claimed a substantial increase in the administrative workload, which impact on teaching contact time and interaction with students. The subjects also identified that the changes within the reformed higher education system require academics to approach, present and deliver education in a new, different and transformed manner which require a complete paradigm shift for staff.

The faculty is required to rethink and revisit their entire programme offering. Traditionally the faculty has presented vocationally orientated programmes; the intention is to restructure to an academic focus, which will require a different student profile. The research subjects from FADA identified a wide variety of challenges and expectations that have to be addressed by the faculty in order to restructure. Challenges that relate to staff qualifications were identified by most of the subjects.

## RECOMMENDATIONS

**Ensure that the faculty management team is experienced and trained in strategic management**

The literature review identified a transition from a collegial academic self-rule to academic managerialism environment. In order for faculty management to have the strategic ability to align the state and institutional vision and objectives, it is recommended to provide relevant strategic management training to managers.

## **Include of a market orientated approach in the strategic planning**

Cloete *et al* (2002) identify that international reform thinking suggests that universities should be steered by market forces and not by governmental or state mechanisms. It is suggested in the literature that the leadership challenge is to reconfigure institutions to become more competitive and market orientated. It is recommended that faculty management should include strategic vision and planning within a new changing and competitive environment. International trends suggest that higher education is a service-company with society as its marketplace.

## **Avoiding a top-down strategic management approach**

Le Roux (2004:8) suggested that the old model of strategic corporate management where a new strategy is decided on in the boardroom, and then executed through the organisation hierarchy, is outdated in a rapid changing business environment. This study recommends that FADA should avoid a strategic management structure that is top-down in which decision making resides with faculty management, and excludes concerns and expectations of the academic staff. The faculty should ensure that everyone in the faculty must be included in a strategic information feedback loop that can provide results to those that have to make or change strategic decisions.

## **Reduce the negative impact of change within state regulation**

The majority of the respondents indicated that the increase in the number of higher education policies has introduced a high level of bureaucracy within higher education. This results in an increase in administrative workload, and impact on the teaching contact time and individual interaction with students. The literature review identified that this type of bureaucratic dilemma has the potential to block activity and stifle ingenuity. It is recommended that faculty management should place greater emphasis on the expected direction presented within state regulations. This would enable lecturers to use national policies as a guide to facilitate effective and efficient behavioural responses rather than perpetuating a bureaucratic paper-producing machine.

## **Ensuring continuous staff development**

Le Grange (2005) indicates that higher education should commit itself to staff development and training which could ensure that continuous growth and development takes place within a true learning environment. The study recommends that the faculty should identify training needs that are relevant to; programme offering; state regulation requirements; strategic planning and development.

## **Address the challenges that are presented to the academics staff**

Le Grange (2005: 6-10) identify the following challenges for lecturers in higher education that relate to the implementation of new national policies. It is recommended that these challenges should be addressed:

- New structure necessitated a call for new curricula.
- Higher education has an important role to play in the reconstruction and development of society and the economy, and lecturers have to ensure that these aspects are addressed in the curriculum.
- The transformation of the higher education environment does not only affect teaching systems but also necessitates to the introduction of new practices.

## **ABSTRACT**

*Over the last decade or so, a large number of multinational companies (MNCs) have established an India center to co-ordinate and control their operations in the country. This paper describes the roles played by human resource (HR) function in these India centers. The results highlight how the India center's HR function provides a range of services both to the units of MNCs operating in India in general and at times to other parts of the world. The India centers' HR function is typically responsible for developing and implementing HR policies and practices, and is a key instrument for organizational learning about HR.*

## **INTRODUCTION**

Effective management of human resources (HRs) in foreign firms operating in emerging markets constitutes a major challenge and can be decisively beneficial to the success of investments in these markets. Multinational companies (MNCs) establish country/region specific centres to create and transfer knowledge in order to co-ordinate and control their different operations. This article describes the roles played by the HR function in India centres in the same regard and highlight how the centre's HR function provides a range of services both to the units of MNCs operating in India in general and at times to other parts of the world. The India centres' HR function is not only responsible for developing and implementing HR policies and practices, but it is a key instrument for knowledge creation and organisational learning about HR. This paper is structured as following. In this introduction we discuss the key debates in IHRM, especially regarding the management of HRs in overseas subsidiaries of MNCs. Next we present information regarding the methods adopted to conduct this investigation. This is followed by the key research findings and implications.

With the growth of emerging markets and increased levels of internationalisation and globalisation of business, both academics and practitioners have shown an increased interest in the topic of international HRM (see Schuler et al., 2002). However, majority of the existing research in the field has been conducted mainly in developed nations of Western Europe or North America. So far less work has been done on the management of human resources involving emerging markets (one exception being the proliferation of interest on studies relating to China). However, there is a strong scarcity of information regarding the nature of HRM in MNCs operating in India. This paper makes an attempt to fill this significant gap.

Broadly speaking, MNCs have the option to choose from ethnocentric, polycentric, geocentric and regiocentric approaches to structure their international HRM systems (Perlmutter, 1969). While making a choice from these, an MNC is faced with a paradox: on the one hand it needs to develop control and co-ordination mechanisms consistent with effective and efficient global operations; on the other, it needs to be responsive to national/local interests which may impede world-wide activities (Jain et al., 1998; Prahalad and Doz, 1987).

In this regard, many large MNCs, after starting from small beginnings now have multiple operations in India. For example, today, the majority of GE's businesses world-wide have a presence in India, either through a joint

venture, a wholly-owned subsidiary, a strategic alliance or a business development and customer support presence. Similarly, many other foreign firms (such as Hughes Software, Siemens, Motorola, Excel Services, Avon Beauty Products and Honda) have established their representative offices in India, just after it liberalized its economy and opened it for international business. The challenge for MNCs like GE is to manage an increasingly complex network of affiliates scattered around the country. In this regard, many MNCs have established an India corporate centre (also called 'India headquarters' or 'India centre') to control and co-ordinate their various units in India. In most of such firms, the India centre includes a HR department with an HR manager for the country.

Establishing an HR department within India rather than somewhere else in the region is critical for a successful HR strategy. This is mainly due to significant differences in the socio-cultural, political, economic, legal systems and labour markets (both internal and external) of India and its regional neighbours (Budhwar, 2001; Budhwar and Singh, 2007). This creates a complex and unique challenge for the HR professionals of foreign firms operating in India. Therefore, it is sensible that the HR managers that are responsible for Indian operations should be based in India. In this paper we highlight the role played by the HR function in the India centres in order to co-ordinate and control their operations. In particular we report on: 1) how foreign firms staff their India centre HR department; 2) the services provided by the India centre HR department; 3) dynamics related to the application of global corporate HR policies in India; and 4) how the India centre HR department promotes learning across the firm's operations.

## RESEARCH APPROACH

We conducted 55 in-depth interviews during late 2002 and early 2003 with one top HR specialist in as many foreign firms operating in India. Access to the companies was gained from the researchers' previous research and with snowballing techniques that utilised contacts of contacts. Apart from core HR functions (such as what and how of recruitment and selection, training, appraisals, compensation, retention), a number of other key themes such as the nature of organisational structure, relationship between India units and headquarters and different learning experiences related to key HR functions were examined in the research. On average, each interview lasted for 90 minutes. The interviews were tape-recorded, transcribed and later content analyzed. The views presented of interviews in this paper are those of a minimum of forty percent of the interviewees. The majority of the research firms (67.7 percent) established their operation(s) in India after 1990. Other demographic details of the sample firms and respondents are provided in table 1.

| Table 1: Sample Profile of Foreign Firms Operating in India |   |              |
|---|---|--------------|
| Parent nationality  | Categories                                      | No. of Units |
|   | US  | 24           |
|   | European  | 15           |
|   | Asian   | 14           |
|   | Others  | 2            |
| Foreign ownership of the firm                               | <50%  | 27.7%        |
|   | 50-95%  | 12.3%        |
|   | >95%  | 60%          |
| Location in India   | Delhi and around (90%)                          |              |
|   | Other locations (5% each in Mumbai and Chennai) |              |
| Total No. of employees                                      | <100  | 6.2%         |
|   | 100<500   | 30.7%        |
|   | 500<1000  | 32.3%        |
|   | 1000 -  | 30.8%        |
|   |   |              |
| Industry  | Name  | %            |
|   | Transport and industrial equipment              | 3.1          |
|   | Chemical and pharmaceuticals                    | 13.8         |
|   | Wood, pulp and paper                            | 4.6          |
|   | Electrical equipment                            | 9.2          |
|   | Automobiles                                     | 10.8         |
|   |   |              |

|  |   |      |
|--|---|------|
|  | Food, tobacco and textile                 | 12.3 |
|  | Metal, rubber, stone, glass and leather   | 3.1  |
|  | Others (services, IT, telecommunications) | 43.1 |

## **FINDINGS AND IMPLICATIONS**

### **Staffing of the HR Department**

Most of the sample firms recruit their top HR manager to head their India centres from within India. The HR manager is either recruited from the Indian partner in the joint venture (31 percent), from an Indian company (40 percent), or from another Indian unit of the MNC (25 percent). The most commonly used job designations of the interviewees are HR manager, general manager and HR director. The sample managers have an average work experience of 12.4 years and have worked in MNCs and some managers (around 10 percent) are non-resident Indians who were working in some other affiliate of the MNC outside India. Such a background ensures that the HR manager is extremely familiar with the MNC's HR policies and practices and in many cases, in other Asia/Pacific regional centres.

There are a number of advantages of recruiting an Indian as the HR manager in India centre. As HRM is context-specific, hence a local HR manager has a better understanding of the local social, cultural, political and legal environment; can be recruited for a relatively small compensation package in comparison to an expatriate; knows the ways of working around the local system; can easily become part of relevant networks (not only related to HRM but also related to customers, suppliers, and distributors); and can easily be moved between different units of the MNC. If necessary, then the HR manager is given required training both in and outside India. The HR manager on average is given a training of 13 days per year.

At the moment, MNCs are not experiencing any serious problem in finding relevant human resources to staff their HR departments. This is primarily due to the existence of a large number of management institutes in general and a few related to HRM/HRD in particular in India which are producing a large number of management graduates (also see Yadapadithaya, 2000). As a result, MNCs operating in India are able to get human resources with a similar kind of academic knowledge like in their own home country. However, working in a MNC is a new experience for majority of employees. Considering the unique ways of doing things in MNCs (mainly related to their global standardised HRM practices), the HR department in India centre has to work very hard to change the established mind-set of new employees (who have not previously worked in a MNC) as per their own liking. Hence, a strong emphasis is laid on training, orientation and related programs. Sixty percent of the sample firms give up to 10 days of formal training to new employees.

### **Services Provided by HR Department**

The HR department of MNCs in their India centres is providing a comprehensive set of services such as recruitment, training and development, performance appraisals, compensation packages, retention efforts and various means to co-ordinate activities between HQs and their Indian operations. By having a centralised HR service provider has many benefits. First, a comprehensive set of services can be provided. Second, the required company specific HR tools can be developed. For example, companies like GE, Escotel (a joint venture between an Indian and a Hong Kong based firm) and Techumseh (a Brazilian manufacturing MNC) are using the concept of '6 sigma initiative' and '6 sigma training' for their own unique requirements to enhance their quality. Third, at times it is not easy to develop company-specific training tool-kit if there is no India centre HR department. Companies such as Hughes Software Systems and RSMI (a global IT services company providing 'Geographic Information Systems and Spatial Solutions', and application software services to clients world-wide) are good examples in this regard. Both these US based firms actively contribute in the development of company-specific tool-kits to train their HR staff in India centre. Apart from usual HR functional skills, a lot of emphasis is laid on different technical skills related to both software and IT – 'technical skills for non-technical people'. As the majority of the products and services of such firms are produced in India and then exported to other parts of the world (at times even to their HQs), therefore, it becomes more convenient to have an India centre with an HR department for the development of company-specific tool-kits.

Most operational units are headed by a manager who regularly interacts with and follows instructions from the HR department of the India centre. To ensure that the staff in the HR department of India centre is well equipped

with relevant skills and capabilities, the HR personnel are provided both internal and external and on-the-job and off-the-job training in a variety of areas. These vary from functional, behavioural (such as interpersonal, communication, coaching, mentoring, employee relations, interviewing), operational, and technical (such as by help of HR tool-kits, finance for non-finance people, about '6 Sigma' and ISO 9000-3). Mostly, the training to HR personnel at the India centre is provided within India; however, a few organizations such as Hyundai, GE, Honda, Motorola, New Holland Tractors and HSBC send selected people overseas for training. For example, Honda sends top HR managers to Japan mainly to inculcate the "Honda way of working" and Honda philosophy, Motorola sends people to its "Motorola University" in the US for training purposes.

## **HR Policy – Parent Versus Indian Operations**

Established MNCs are known to have a global set of HR policies. Also a tension exists between the MNC headquarters and their overseas operations (such as joint ventures, affiliates or wholly-owned firms) for a globally standardized approach to HRM and the need to make adjustments to local conditions (see for example, Beechler and Yang, 1994; Prahalad, 1976). The India centre HR department also experiences such tension at times. When the Indian operations of the MNCs were initiated, in the majority of the cases there was some sort of agreement concerning HRM policies and practices between the MNC and Indian units prior to the start-up. In such circumstances, on the one hand, the HR department has the responsibility to implement the agreed goals, core values and philosophies in India. On the other hand, it needs to make adjustments to some HR policies to suit the local Indian environment. Many sample firms have been successful in adopting the MNC's global HR policies related to recruitment, employee development, performance appraisals and compensation of local employees, to a great extent with some local adjustments.

## **Staffing**

Most MNCs are able to use global recruitment and selection policies with minor local adjustments. All the MNCs adopt a formal, structured and systematic approach to recruit new employees. Interestingly, this is not so in the case of majority of Indian national companies (especially in the private sector) which adopt an informal and unstructured approach to recruitment function (Sparrow and Budhwar, 1997). Nevertheless, sector based differences are quite strong. For example, research evidence from the business process outsourcing (BPO) sector (Budhwar et al., 2006) clearly highlight the existence of formal and structured HRM systems. As indicated above, a number of methods are adopted by MNCs to find new recruits. They include consultants, employee referrals, via net, campus interviews, and through advertisements. When it comes to adopting different criteria and methods to select new candidates, the global HR policies of the MNC are seriously considered. MNCs adopt different criteria during the selection process. It generally starts with job specification, by defining the profile of person(s) required, the kind of competencies one should have and finally matching the needs of the person with the company. A strong emphasis is given to the attitude of the person, along with different skills, educational qualifications and the institute from which the candidate has graduated.

The majority of HR managers have some kind of bad experiences with their recruitment programs, for example, with advertising of jobs in the newspapers or magazines. It results in too many applications with little potential. Another problem faced by HR managers is acquiring a new employee, after a formal job offer is made. At times, after getting the appointment letter, the candidates do not take up the job and use it to get a job in their preferred organisation. Further, at times the same candidate's profile comes to an organisation from two or three consultants. In such cases, it becomes a difficulty for the HR manager to figure out if there are different candidates or there is a single candidate. Moreover, many MNCs (which are not famous) are unable to get an early date for campus interviews. As a result, they end up with below average students. HR managers also report the need for new tests to suit the Indian context. For example, a Hong Kong based telecommunication firm has developed tests for customer sensitivity, service orientation and test around their core values.

HRM in India is known to be strongly influenced by social relations, political affiliation, informal networks, one's caste and religion (see Saini and Budhwar, 2007; Sparrow and Budhwar, 1997). However, it seems that such influence is almost non-existent in the case companies. And if it is there, then MNCs are using this to their advantage. For example, Honda cars, Avon Beauty Products, Grand Hyatt and many other firms use employee referrals with great success by mixing them with structured and formal approaches.

## Human Resource Development

Like the recruitment function, training and development programs are also clearly structured, formal in nature and most of the times linked to the performance system of the MNC (this is another strong deviation from local firms). The training programs used in India are to a great extent a reflection of the global training set-up of the MNCs. For example, companies like Max New York Life Insurance, Honda, Motorola, GE, Siemens, Hyundai and Hughes Software Systems have established their own 'management training centres' in India, where the courses offered are similar to those offered in other parts of the world in their affiliates or HQs. Apart from in-house training facilities, the help of external training consultants is also taken. A variety of area-specific training programs are provided by MNCs in their India centres. These include both soft (such as behavioural, supervisory, management, leadership, communication, ethics, culture, team building) and hard skills (such as operational, technical, quality). Training programs also cover most functional areas such as marketing, organizing, accounting, business strategy, human resource management, and production. Apart from these, most MNCs have also established induction and orientation programs for up to four weeks. These form part of the global training programs. The majority of the MNCs do not have any serious problem in adopting such training programs in the Indian context, but they do make amendments to them to suit the local context.

All the MNCs practise some kind of on-the-job training. It varies from a few days to a few weeks. Both internal and external experts are used in this regard and it is formal in nature. Most of the firms also adopt some sort of 'shadowing system' or 'overlap system' while providing on-the-job training. Moreover, all the MNCs formally analyze their training and development needs. It is generally conducted once or twice per year (at times on a quarterly basis) when the performance appraisal is carried out. This is mainly an outcome of the emerging training needs, which are either identified during the performance appraisal process or by the section heads or immediate supervisors through formal formats and regular discussions.

Despite the systematic and formal approach to employee development, the HR managers report some problems with the training programs. First, trainers, especially internal, find it difficult to train a higher status employee. India is known to be a high power distance country (see Hofstede, 1991). This aggravates both learning and communication problems between different levels of employees. Second, during the induction and orientation programs, due to less inter departmental co-operation (i.e., when new recruits are sent to different departments for orientation, they are not given the required attention), some MNCs find it hard to achieve the required training results. Third, at times, some companies do not have a sufficient training budget. Fourth, HR managers also report the scarcity of training experts in some specific areas (such as quality control and new management interventions). Lastly, a more serious problem is regarding the older employees, who do not have a proper university education and often hesitate to adopt new technologies and modern approaches to management.

To a great extent then, the structured, formal and thorough approach (consisting of both internal and external experts and venues), along with on-the-job coaching is proving to be useful in providing a successful training program for the MNCs operating in India. As the competition is increasing, with a strong emphasis on performance, it is expected that MNCs will be able to correct the above identified problems. Performance related pay and bonus (which is already practised in many MNCs operating in India) will further help in this regard.

## Performance Management System

A formal and structured approach to performance appraisal system is common in most MNCs under study. To a great extent, the majority of firms have introduced a periodic appraisal or assessment system, generally developed in their HQs, which form part of their global policies concerning performance appraisal in India. The majority of firms have a yearly-based appraisal system. Some firms like Hyundai, Carrier Aircon limited have it on a six monthly basis and some even on a quarterly basis tied to the yearly cycle (such as Glaxo SmithKline Beecham). All the firms have a structured format and a clear set of parameters for appraisals. In many cases the appraisal starts with a self appraisal, in which the individual writes about oneself and then s/he is appraised by the immediate supervisor. However, the general trend is that the immediate supervisor appraises the employee and gives their report to the person. They then read it and have to counter sign before it is submitted to the section head. If required, then adjustments are made by involving the section head. At times, the section head also appraises his section employees. A number of issues related to future movement, cross function movement, training needs identification, key performance areas and possible targets are analysed.

Most MNCs have an individual based performance appraisal system, though some (like Whirlpool and RSMI) also go for a group based system. Almost all the firms use some kind of rating scales, grading or ranking system and set targets for appraisals. For senior managers many firms are using techniques such as the 360 degrees. In over sixty percent of the research firms, performance appraisal is primarily determined by an objective measure of individual performance (such as sales). The above discussed appraisal system, which is quite comprehensive, has some drawbacks. However, the majority of HR managers are convinced that this is the way forward and believe that over a short period of time either employees have accepted it as a fact of life or are quickly getting used to it. Most organisations also use the appraisal system to identify their training needs. Still, there is scope for improvement in the existing system. For example, in the present system there is relatively less participation of individual employees regarding their goal setting (though few companies claim they are doing it). This reflects the hierarchical nature of Indian society. Perhaps, a more participative approach could be beneficial (as experienced by some Japanese firms operating in India).

## **Compensation, Promotion and Retention**

By far the most different amongst the global HR policies are the compensation of local employees in the Indian units. The main reasons in this regard are the low labour costs and the availability of large number of skilled human resources in India. To a great extent, the recent success of BPO and contact centres is based on these factors (see Budhwar et al., 2006). Still in comparison to Indian national companies the compensation packages of MNCs are far more attractive (see Venkata Ratnam, 1998). Firms like Escotel, JCB, Motorola, Honda Scooters, Whirlpool, GE and many others set up their compensation packages on the basis of market trends by conducting regular surveys and by bench marking their packages against the best payers. Many MNCs adopt a grading system to compensate their employees. Others, on top of it also practise performance related compensation – a mixture of company and individual based performance. Almost all the firms pay a bonus to their employees. A variety of bonuses are paid in MNCs operating in India, such as based on individual, group and organization's performance or a mixture of these. Many times firms pay up to twenty four percent of basic salary as an annual bonus.

Despite competitive compensation packages provided by the MNCs, most firms experience managerial turnover. However, at the moment, due to the recessionary conditions this is not a serious problem. It also varies according to the nature of firm. For example software and IT related firms report an attrition rate of up to nineteen percent. The main reasons identified in this regard are moving to better jobs, moving abroad, family reasons or for higher studies. Firms adopt a number of measures to retain employees such as salary surveys to stay as one of the best pay masters in the market, culture building exercises, exit surveys, counselling and career development. Some of the software and IT based companies have been recently more successful in retaining their employees. Possible mechanisms adopted by them include the 'fast track programs' where the potential performers get moved on to a fast track which means that you may jump levels, get higher responsibilities than many others. Another is the 'hot-skills program', where people with skills which are very much in demand in the market get paid better than others. The list of these skills gets published every year people can acquire those skills and move into that segment. Firms adopting such programs have found them useful. Other firms experiencing employee turnover problem should seriously consider them.

## **Globalisation versus Localisation**

To a great extent, many global HR practices can be adopted in Indian units with minor adjustments. Perhaps the key reason for this is the awareness of Indian employees about the way of doing things in different parts of the world (due to their management education system). Still, the importance given to social networks can be a big hindrance in further reducing the gap. The key task for the HR department of India centre is to identify and mould such social issues on the one hand and the preference of the headquarters on the other to develop an appropriate HR policy for India. For example, three Korean manufacturing firms examined during this research, during the initial years brought a large number of expatriates to inculcate their philosophy into their Indian operations. A strong emphasis was on the adoption of their manufacturing technology. In that regard, a number of Indian employees were and are still sent to Korea. However, over a period of time, the number of both the

Koreans expatriates working in India and Indians going to Korea has been significantly reduced. Now there are enough trained people to carry out the 'Korean way of working' in India.

Further, India is a large country with massive regional differences – cultural, economic and political. Accordingly, the employment conditions (such as for the availability of labour, cost of living, state taxes, etc) vary significantly. For example, it is costly to set-up a plant in one of the metropolitan cities in comparison to less populated and less costly areas. Hence, it is not sensible for MNCs to establish strict nation-wide policies such as for compensation and various benefits (such as housing and travel). On the other hand, if a particular MNC such as GE has many units in India spread over different geographical locations, then it might be useful to have India wide policies such as career development by moving personnel to different regional offices. It will not only help to integrate the various units with the India centre but will also help to share and possibly convince local joint venture partners to resolve HR related issues and refine their HR practices. There are then many opportunities for MNCs to learn from and teach to local partners in India. For example, at times, few corporate policies (such as related to training and development) are being created in the India centres (especially in IT and software related firms under study) and then transferred to other affiliates of a particular firm.

## **Learning and Sharing of Knowledge**

A number of established HR related networks exist in India. Almost all the HR managers of India centres are in one way or other affiliated to these. These networks form the part of many forums (such as Delhi, Bombay chapters of HRD network), professional bodies, national and regional HRD network, local and national management association (such as All India Management Association), confederation of Indian industries (CII), Indian Society for Training and Development. Such bodies organise a number of conferences, seminars and workshops. Information related to different HR trends such as compensation, recruitment practices, retrenchment, work environment, new developments in the area, staff welfare, competition, etc are shared during such meetings.

These meetings are held at regular intervals such as bi-monthly, monthly, quarterly, bi-annually or annually. The main outcome of such meetings and networks is to help HR managers to update themselves regarding developments in the field and share difficulties faced by them and at times are able to get useful solutions for the same. They also help them to develop an understanding about the latest trends in HR policies and practices (such as compensation benefits, market leaders – best payers, recruiters, etc.). This information is regularly shared with regional and world HQs of MNCs and accordingly modifications in HR policies for India and at times other regional units are made. All the above discussed points then helps HR centre to develop and transfer effective HR practices across MNC affiliates in India; transfer learning about effective and relevant HR policies and practices to their own company from both national and international firms; forward clear message to their corporate HQs regarding what will be an effective HR practice in the Indian context and possibly in similar developing countries around the world. With the existence of such a useful set-up of relevant networks, there is plenty to learn for the MNCs.

## **THE FUTURE OF HRM IN FOREIGN FIRMS OPERATING IN INDIA**

As more and more MNCs are lined up to enter India and as national firms are modifying their HRM systems in order to compete with foreign firms, the management of human resources has become crucial. However, due to the absence of reliable information, foreign firms find it challenging to successfully manage their human resources in the Indian context. An attempt has been made in this research to fill this gap. Despite of some significant limitations (such as only one level of managers was interviewed, the study has a small sample size and no expatriates were questioned), the study provides useful information regarding the type of HRM system suitable for foreign firms operating in the Indian context.

The India centres are proving very useful for not only implementing core HR systems but also in the creation and transfer of knowledge and integrating the various units (both within India and at times in the region). They play a crucial role in the transfer of core HR philosophy and organizational culture from headquarters to Indian affiliates. The study provides clear evidence regarding the successful implementation of many global standardised HR policies and practices and the successful adoption of a formal, rationalised and structured

approach to HRM in the Indian context (which to a great extent is opposite to what is adopted in the majority of Indian national firms). The adoption of the 'polycentric approach' to HRM is proving to be successful. However, to stay successful in the long run it is advised that HR managers of foreign firms should try to sort-out the problems (faced by the HR function) highlighted by our analysis and also give more consideration to the local context. For example, our results reveal that in comparison to national firms, MNCs under-score on informality, employee loyalty and importance given to the Indian context (such as importance of job security and career development – issues which are important in the Indian context).

# SUBMITTING VEHICLE CLAIMS FOR AUDITING

**André M. Caldeira and Helberte B. Oliveira, PUC/RJ, Brasil**  
**Walter Gassenferth and Maria Augusta Soares Machado,**  
**Faculdades IBMEC/RJ, Brasil**

## ABSTRACT

*Nowadays, fraud is a major enemy of insurance companies. For the total of R\$ 28 billion in claims, an estimated R\$ 7 billions must be fraud. Since the claims represent 59.9% of the premiums paid by the companies, frauds represent 15.0% of them. Therefore, great caution is to be taken in order to detect the frauds and not to pay for these claims. One of the most important detection tools is the audit. But because it is an expensive service, it is not possible to audit all claims. On the basis of this caution, the goal of this work is to test some strategies of how to select claims to be audited. The strategies used become more complex, from the first to the fifth, starting with simple thoughts for the first three strategies, and the utilization of logistic models and neural network to estimate the probability of a fraud detection on the fourth and fifth strategies, respectively.*

## INTRODUCTION

An insurance contract involves a bilateral agreement between the insurance company and the beneficiary in which the company covers the risk. The policy holder's attitude regarding a claim is not always honest. Insurance companies have been more and more concerned with insurance frauds, since the claim represents a high cost that corrodes the company's profit margin.

Some theoretical studies on insurance frauds consider some audit patterns to control the frauds [1], [2]; however, the cost of these audits may render such action unfeasible. This action assumes that the company can obtain some information on the claim through auditing, but at a cost. It implicitly suggests that the auditing process always distinguishes a fraudulent claim from an honest one. The main discussion involves the preparation of a contract that minimizes the insurance company's cost by including the full payment of the claim plus the audit cost. Normally, the models that have this structure use the overall amount of the insurance to decide on applying monitoring techniques [1], [3]. In some other works, deterministic audits are compared with random audits [4], or the insurance company is supposed to accept an audit strategy.

Models have been designed to detect frauds; reference [5] used multiple linear regression models to select indicators of different types of fraud. Reference [6] utilizes fuzzy techniques to classify the claims. Reference [7] proposes a self-organizable neural network to create groups of claims by characteristics; whereas [8], [9], [10] suggest discrete choice models to estimate the likelihood of a fraud existing in the claim as based upon the knowledge of the data base on the portfolio of the insurant's behavior.

This paper aims at creating strategies to support the decision of paying for the insurance or forward it to auditing (including such procedures as investigation, inquiry etc.). The strategies will rely on simple thoughts and models that will estimate the probability of a fraud to be detected after auditing a certain claim. After estimating such probability, the multiplication of it by the value of the claim is an estimate of the savings produced should it be sent for audit to check for fraud.

It is important to emphasize that the fraud variable is a non-observable variable [11]; that is, the source of information used is the base of audited claims, with possible cases of undetected frauds. Another selection bias is the non-assurance that the audit result will reflect the reality, and in some cases of fraud it might not be detected, even after the audit. Therefore, the focus of this study becomes estimating the likelihood of detecting a fraud after the audit and, by this, selecting the claims that should be forwarded for auditing.

Such likelihood shall be estimated by a logistic model and by a Neural Network Model. After such estimate, the strategies of forwarding to audit will be tested in order to verify the best technique to be used by the companies. Such decision shall take into account the claim value and the audit cost.

## **FRAUDS IN INSURANCES**

The main role of insurance is to reestablish the financial balance caused by a physical, material or moral damage. By contracting insurance you protect your assets, since you will rely on the insurance company's support to pay for repairs or to replace your asset [12].

This financial balance provided for by the insurance companies protects their users and reflects a constant quest, on the part of the insurance companies, for a better relationship between both parties entering into the insurance contract.

On the other hand, one of the biggest obstacles to this relationship is fraud. It hinders the progress of insurance industry and penalizes not only the operators, but also the insureds [13]. A fraud can be understood as any deliberate, deceiving act committed against or by the insurance company, broker, service provider or the policy holder with a purpose of obtaining a non-guaranteed financial gain. The fraud occurs during the process of contracting and use of the insurance [14].

So, it can be defined as an exogenous factor that has been causing a rise in the price of insurance. The defrauders have taken advantage of gaps in the internal investigation systems of the companies to implement schemes that have become more and more elaborate and brought about damages to these companies for many years. The frauds can be committed by gangs or by the ordinary citizen; in the latter case the fraud is committed by reason of financial necessity or a tempting opportunity. The main insurance branches affected by the frauds are as follows: Cars, transportation, fire, health, personal accidents, life, civil responsibility, tourism.

A study ordered by the National Federation of Private Insurance and Capitalization Companies (FENASEG) assessed the economic impact of frauds in the insurance sector to be an estimated R\$7 billion out of a total of claim amounting to R\$28 billion in 2004. Such cost will only be reduced with a reduction in claims, thus causing the companies to reduce the price of insurance and broaden their market share.

There are cases of fraud in life, assets, health and travel insurance. However, the most common ones are those involving automobile insurance. Here there is a range of possibilities in which the defrauder can act, from the issuance of the policy to the occurrence of the claim. There is a false perception on the part of the population that this type of fraud is acceptable. The most common types of frauds in car insurance are as follows: Simulated robbery of vehicles and objects; aggravation of a claim in order to obtain total loss or a compensation for previous damages; contracting responsibility for third party claims; request of an overinvoiced receipt or in duplicate in order to get reimbursement of whole amounts; overpriced budget in workshops for self-benefit; connivance on the part of the broker to simulate a claim; connivance on the part of the preliminary surveyor for not reporting the damages on the vehicle. The good consumers end up being the main victims of this fraudulent system, for the value paid for their insurance is directly influenced by the increase in the prices.

The fraud is to date one the main challenges of the insurance market. It is necessary that more efficient measures and efforts be taken by the institutions in order to get this picture to improve [15]. Through such information, the companies are able to realize the best equipment acquisition and maintenance (or any other service) possibilities at a lower cost.

However, in many cases, surveying such information involves the collection of data throughout the company's several areas. This ends up bringing about a long delay or incomplete information (in the case of short terms). Even with all the information on hand, there still has to be a detailed comparative analysis of the information for a decision to be made.

In this context, the Maintenance Logistics Cost Simulator is a system that aims at simulating the maintenance costs of equipment, also taking into account its components, for a better logistic planning.

the Maintenance Logistics Cost Simulator will use both historical information and information from the equipment market used in the Company. Based upon the aspects informed above, this tool will help in the decision-making processes for the maintenance or purchase of equipment.

## **MODELS FOR PROBABILITY ESTIMATION**

### **The Logistic Model**

Regression models play an important role in many applications by providing prediction and classification rules and are used as an analytical data tool in order to understand the interactive behavior of different variables [16]. In the dichotomized case, the depending variable indicates the occurrence or not of a certain event. By defining the  $Y_i$  variable as the  $i$ -th individual in the sample to assume one of the two possible results, 0 or 1,  $Y_i$  has a Bin ( $n_i, p_i$ ) distribution, being  $p_i$  the likelihood of success.

$Y_i$  can be represented through a linear model

$$Y_{ij} = \beta'_j X_i + u_{ij} \quad (1)$$

Where  $X_i$  is a vector of observed characteristics to the  $i$ -th individual,  $\beta_j$  is a vector of unknown parameters to be estimates, and  $u_{ij}$  is the error associated with the  $i$ -th individual, whereas  $u_{ij}$  can be estimated by a discrete model. The type of model depends on the suppositions made on the distribution of  $u_{ij}$ .

The expected proportions  $p_i$  can be modeled as follows:

$$\eta_i = \log \left( \frac{p_i}{1 - p_i} \right) = \beta_0 + \beta_1 X_{1i} + \dots + \beta_q X_{qi} \quad (2)$$

By assuming  $\eta_i$  and performing some operations in the equation above, the probabilities can be represented

$$\text{like: } p_i = \frac{e^{\eta_i}}{1 + e^{\eta_i}} \quad (3)$$

Therefore, the output of the logistic regression is the likelihood of an 'i' individual to belong to the class assuming value 1. Such result is well used in classification problems and will be used in Strategy 4 as an estimate of the likelihood of a fraud to be detected if  $i$ -th claim is submitted for auditing.

## Neural Network Model

The neural networks are non-linear models that were developed on the basis of how the human brain works. These models have neurons (functions) that receive stimuli and spread them on to other neurons until the last layer is reached, the propagation of which is the model's response. There are several neural network structures; the one represented below was used in the fifth strategy tested and uses multiple layer perceptrons.

Multiple layer perceptrons consist of neural network trained in a supervised way through the error backpropagation algorithm. This algorithm is based on the rule of learning by error correction. Figure 1 shows the architectural graph of a multiple-layer perceptron with two hidden layers and one output layer.

### Translation:

Camada de entrada = Input layer  
 Primeira camada oculta = First hidden layer  
 Segunda camada oculta = Second hidden layer  
 Camada de saída = output layer  
 Sinal de saída (resposta) = Output signal

**Figure 1: Architectural graph of a multiple-layer perceptron with two hidden layers.**

This network can be used both in regression and classification problems. The use of it as a classifier must be employed with care when it is intended to estimate the probability of pertinence in a given class. According to the passage below from Simon Haykin's book, such utilization is possible, but a logistic function must be used in the output neuron and there must be a training set that is large enough.

"One multiple-layer perceptron classifier (using the logistic function as non-linearity) indeed approximates the subsequent class probabilities, since the size of the training set is large enough and the learning process does not get stuck to a local minimum" [17].

## CASE STUDY

The case study refers to data from 418 claims of a Brazilian company that were audited with an aim at detecting frauds in third party claims. For the study, an audit cost of R\$2.000,00 was adopted.

At a first moment, the data base was divided into two parts, one part of 40 cases separated for the study (20 fraud-detected claims and 20 with no frauds detected) and the 378 remaining cases were used to estimate the parameters for the models. Five audit forwarding strategies will be assessed within the data for the test, namely: Strategy 1: Not to audit any case. Strategy 2: To audit all the cases with a claim higher than the audit cost. Strategy 3: To use the probability prior in order to estimate the expectation of savings should the claim be audited. If such expectation is higher than the cost of the audit, the claim will be audited. Strategy 4: Utilizes the same logic as Strategy 3; however, the probability will be estimated by a logistic regression model. Strategy 5: Utilizes the same logic as Strategies 3 and 4; however, the probability will be estimated by a neural network.

## Strategy 1

No cases, the result is R\$ 0, since there was no cost with auditing and no claim to be paid for.

## Strategy 2

Upon auditing all the claim cases, higher than R\$ 2.000,00, of the test base an overall expenditure of R\$34.000,00 was spent to audit 17 claims. Overall, 7 frauds were detected and the savings amounted to R\$112.571,41. Therefore, the final output of Strategy 2 is savings of R\$78.571,41.

## Strategy 3

The fraud probability prior (25% as calculated on the basis of the FENASEG estimate) must be used in actual data, but for testing this strategy the percentage of utilization of 25% was not fair, since the test sample is balanced; that is, the number of fraudulent and non-fraudulent claims is the same. Therefore, the probability used for the calculation of the expectation of savings was 50%.

The auditing of the 14 cases selected generated a cost of R\$28.000,00 and savings of R\$109.003,81 due to non-payment of claims in which frauds were detected. The final outcome of this strategy was R\$81.003,81.

## Selection of Variables for Strategies 4 and 5

Strategies 4 and 5 used models to estimate the probabilities of a fraud to be detected after the audit of the claim. For that, some characteristics were used with the intent of modeling this probability from the explanatory variables. The variables to be tested can be seen in Table I.

**Table 1: Variables to be Tested.**

| Variable | Description   |
|----------|---|
| X1       | Nr. of installments of the insurance contract         |
| X2       | Adjustment factor for the vehicle value               |
| X3       | Value of premium paid / market value                  |
| X4       | Driver's age  |
| X5       | Quantity of claims / quantity of policies             |
| X6       | Age of the vehicle                                    |
| D1       | Partial loss claim                                    |
| D2       | Total loss claim                                      |
| D3       | Claim involving a third party                         |
| D4       | Total loss coverage contracted                        |
| D5       | Robbery coverage contracted                           |
| D6       | Third party coverage contracted                       |
| D7       | Personal accident coverage contracted                 |
| D8       | State of the claim different from Traffic Dept. State |
| D9       | 00:00 < claim time < 06:00                            |
| D10      | Policy holder's sex                                   |
| D11      | Claim informed between 1 and 60 days                  |
| D12      | Claim occurred within the first 60 days of policy     |
| D13      | Suspicious words: ex.: obstacles, light post...       |

The variables of Table I were normalized and went through two variable selection algorithms. The SIE method (Table II) described in [18] selected six variables. One other method used was the LSE () described in [19]. By using a cutting point at 80% of accumulated significance, this method selected nine variables, out of which five coincided with the SIE method. Following this selection of variables, specialists were consulted in order to verify the need to force any variable into the model that is deemed indispensable. The specialist pointed only the D12 variable.

**Table 2: Sie Method.**

| Simplification | Significance | Accumulated Significance |
|----------------|--------------|--------------------------|
| X3             | 66.17%       | 66.17%                   |
| X4             | 5.69%        | 71.86%                   |
| D3             | 5.43%        | 77.29%                   |
| X6             | 4.27%        | 81.56%                   |
| X1             | 4.12%        | 85.68%                   |
| D4             | 3.97%        | 89.65%                   |

**Table 3: LSE Method.**

| Variable | Significance | Accumulated Significance |
|----------|--------------|--------------------------|
| D1       | 14.8%        | 14.8%                    |
| X6       | 13.3%        | 28.0%                    |
| X1       | 11.8%        | 39.8%                    |
| D13      | 11.1%        | 50.8%                    |
| X5       | 10.3%        | 61.1%                    |
| X4       | 8.1%         | 69.2%                    |
| D3       | 5.1%         | 74.3%                    |
| D5       | 4.8%         | 79.0%                    |
| D4       | 4.1%         | 83.1%                    |
| X2       | 3.2%         | 86.3%                    |
| D6       | 2.9%         | 89.2%                    |
| D2       | 2.5%         | 91.7%                    |
| D11      | 2.3%         | 94.0%                    |

| D10      | 0.1%         | 100.0%                   |

## Strategy 4

Strategy 4 makes use of a logistic regression model to estimate the probabilities of fraud so it can assess whether or not it is necessary to conduct an audit of a certain claim.

On the test base, the results were 75.0% of correct classification and one Mean Square Error (MSE) of 0.199, thus pretty close to the value of the base used for the estimate (MSE=0.198). The values presented by the MSE in other sets of variables were very close to the values presented in this set. For this MSE value, a 66.7% correct classification percentage was obtained on the estimate basis.

Strategy 4 selected 12 claims for audit, out of which 6 were detected for frauds. The overall cost of the audits was R\$24 thousand, whereas non-payment for fraudulent claims resulted in savings of R\$109.003,81. Therefore, the final result of Strategy 4 is R\$85.003,81.

## Strategy 5

Strategy 5 uses a neural network to estimate the probability of a fraud to be detected after an audit. For this end, the neural network must have an output neuron with a sigmoid function [17]. Now, the number of neurons in the hidden layer and their functions may vary. In order to select the best network topology, the estimate data were divided into two groups: the first one having 70% of the overall data was used to estimate the parameters; the remaining 20% were used for validation (having in mind that 10% were separated for tests). At a first moment, the number of neurons in the hidden layer was tested, having a variation between 3 and 9. The results (Table V), after a cross validation with 100 combinations of fitting set and validation, show superiority of mean correct classification, and a lower Mean Square Errors (MSE) for the network with 5 neurons in the hidden layer.

**Table 4: Result of the Cross Validation for Performance (100 combinations).**

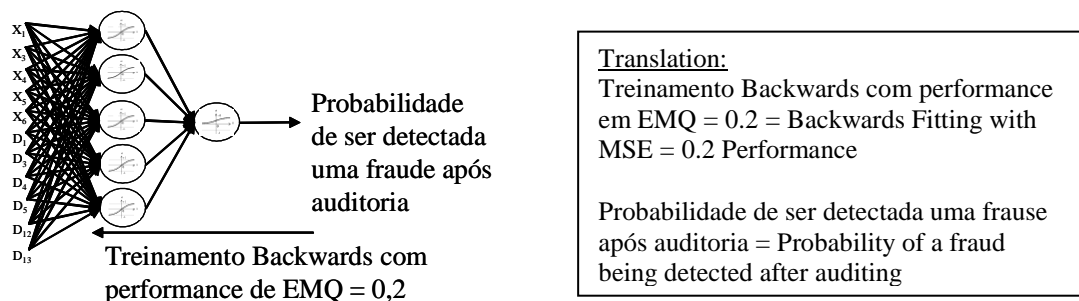

| Statistics  | Number of Neurons in the Hidden Layer |       |       |       |       |       |       |
|-------------|---------------------------------------|-------|-------|-------|-------|-------|-------|
|             | 3                                     | 4     | 5     | 6     | 7     | 8     | 9     |
| Mean of MSE | 0.227                                 | 0.228 | 0.221 | 0.225 | 0.220 | 0.223 | 0.225 |
| MSE Minimum | 0.167                                 | 0.189 | 0.183 | 0.168 | 0.175 | 0.167 | 0.163 |
| Mean Hit    | 65.4%                                 | 65.0% | 66.0% | 65.1% | 65.8% | 65.5% | 65.1% |
| Maximum Hit | 76.5%                                 | 74.1% | 75.3% | 75.3% | 75.3% | 78.8% | 76.5% |

After selecting the number of neurons, the definition of a criterion to choose the moment of stop of the fitting is required so as to avoid overfitting. For this end, some performances (measured by the MSE) were tested in the training by using a cross validation similar to the previous one. The results (TABLE IV) of this test show superiority when the network is fitted with a MSE of 0.20.

**Table 5: Result of the Cross Validation for the Number of Neurons (100 combinations).**

| Statistics  | Performance (MSE) in the Training |       |       |       |       |       |       |
|-------------|-----------------------------------|-------|-------|-------|-------|-------|-------|
|             | 0.17                              | 0.18  | 0.19  | 0.2   | 0.21  | 0.22  | 0.23  |
| Mean of MSE | 0.234                             | 0.222 | 0.221 | 0.221 | 0.224 | 0.226 | 0.235 |
| MSE Minimum | 0.180                             | 0.162 | 0.171 | 0.174 | 0.164 | 0.167 | 0.191 |
| Mean Hit    | 65.4%                             | 65.9% | 65.9% | 66.5% | 66.2% | 64.8% | 62.7% |
| Maximum Hit | 74.1%                             | 75.3% | 76.5% | 77.6% | 77.6% | 78.8% | 75.3% |

After these results, the network topology has been well defined by using the eleven variables selected. This topology can be summarized by Figure 2.

**Figure 2: Topology of the neural network**

The set of tests was used for the purpose of strategy comparison; however, before calculation the strategy results, the network performance will be analyzed. As for the estimate of probabilities, the mean square error (MSE) on the test basis was 0.18, whereas 75% of cases were classified correctly. The results to Strategy 5 were obtained through the estimated network probabilities. In this strategy, 11 claims are selected for audit, out of which 7 were detected for fraud. The overall cost of the audits was R\$22 thousand, whereas non-payment for fraudulent claims resulted in savings of R\$112.571,41. Therefore, the final result of Strategy 5 is R\$90.571,41.

## CONCLUSIONS

As it could be seen in this work, the intelligent techniques can help companies save capital by selecting the claims that should be audited. As the complexity of the selecting intelligent algorithm increased, the results were get better; however, in terms of classification, the models showed positive results, though not so good. The models had a correct classification percentage of 75%. The MSE are not so good either; they are relatively high for a probability estimate. When the logistic model was used, the MSE in the test basis was 0.2, a result that, upon taking the square root, represents an absolute mean error of 44.6%. The neural network had a little better result, with an absolute mean error of 42.3%. Therefore, the probability of a fraud being detected after the audit is not so predictable. Other models can be used such as the TOBIT [11], which is an alternative for those cases where the response variable is not observable, but similar results to the logistic one are likely to exist. Other explanatory variables should be analyzed in order to improve the performance of predictions. The result of the comparison of strategies (Table VI) somehow was a little predictable; as the strategies become more complex, in a more robust manner, they get more efficient. Therefore, Strategy 1 has the worst result, since it is not inhibiting the fraud. Strategy 2 has better results, since fights fraud, even in a non-structured way. The other strategies are different from the previous ones, since they input the selection, in an intelligent manner, of the cases to be audited. While Strategy 3 uses the simplest method to estimate the probability of fraud (the probability prior), Strategies 4 and 5 make use of both statistical and computing intelligence to estimate them.

**Table 6: Ranking of Strategies.**

| Ranking | Strategy   | Result        |
|---------|------------|---------------|
| 1       | Strategy 5 | R\$ 90.571,41 |
| 2       | Strategy 4 | R\$85.003,81  |
| 3       | Strategy 3 | R\$81.003,81  |
| 4       | Strategy 2 | R\$78.571,41  |
| 5       | Strategy 1 | R\$ —         |

To select the claims, which must be sent for audit is an extremely difficult task, especially due to the high audit cost. However, such difficulty is to be faced. One of the most effective devices to date is the denunciation by phone to the insurance companies; but only a small share of frauds is denounced; once again, what really matters is the selection decision of fraud-suspected cases, which must be audited. There are cheaper mechanisms to detect frauds, though less effective. This paper used only the audit and an instrument.

# **FIVE THOUSAND YEARS OF ORGANIZATION CHANGE: THE IMPACT OF PROCUREMENT**

**Guy Callender**  
**Curtin University of Technology, Australia**

## **ABSTRACT**

*Organization change is often thought of as a contemporary issue. However, areas of the management discipline have developed and changed over time, one of the lesser known being procurement, which can be defined as "the art and science of buying and supply". Over the past twenty years this discipline has attracted international interest because of its growing importance as organizations increasingly outsource. Its management status has consequently changed in many organizations – in government as well as business. This paper sets out a brief international history of the discipline with the aim of uncovering elements that have implications for current management practice. The management advantages of adopting the progressive features of this former clerical function conclude the paper.*

## **INTRODUCTION**

Procurement is an old profession, yet it has attracted little attention from historians and not nearly as much as another profession with the same name and with which it is sometimes confused! Because procurement is a cross-disciplinary activity, the choices to be made exploring its past are very diverse. Is procurement aligned to the growth of trade, the emergence of large organizations, to the growth of bureaucracy or to globalization? This voyage of historical exploration is influenced by which part of the overall procurement picture one starts from.

As a starting point, it has been assumed that the development of procurement began with the emergence of sophisticated societies and their demand for trade perhaps 5000 years ago. There is little doubt that the need for some types of procurement policies and practices can be linked to the ensuing growth of organizations and their bureaucratic rules. These rules could also be linked to the need for standardized procedures and documents, the separation of owners and managers in private sector businesses and the requirement for transparency of public sector decisions and operations.

Due to the diversity of activities associated with procurement broadly defined as 'the science of buying and supply' for the purpose of this paper - what follows could be called a 'disjointed history'. It is organized around several themes from the ancient history of China, Greece, Rome and the Middle East; selected incidents from medieval Sweden, Britain, and France; the impact of the Industrial Revolution on procurement; and some reflections on procurement's development during the late-twentieth century. The narrative attempts to recognize some of the institutions which have shaped and nurtured the practices and traditions of procurement, as well as suggesting some surprising links between the procurement practices of times long gone and what we would call 'best practice' today. For example, the evolution of the contract under Greek, Roman and Anglo-Saxon Law shows a respect for trust, ethical behavior, obligation, relationship management, not to forget terms and conditions. Many of these elements are often thought to be products of the twentieth century!

## **PROCUREMENT IN THE "ANCIENT WORLD"**

There is strong evidence of active trade between China and what were then the city-states of the region we now call Greece nearly 3000 years ago, according to the Chinese scholar Shen (1998). As the centuries passed the

Silk Road from Asia to Europe provided an important transfer point for products and ideas from China and other Eastern cultures and the emerging societies in Europe (Blainey, 2004). Most had quite sophisticated social networks and this trade was probably linked to the emergence of work specialization in Greek societies as agriculture developed into cultivation and animal husbandry. Blainey (2004) suggests that possibly ten percent of the people in this region lived in villages and towns and performed non-agricultural tasks that were assisted by local as well as long distance trade and contracting.

Similarly, more self-sufficient societies also emerged around this time in Egypt and Mesopotamia where the growth of large cities, often of substantial construction, was associated with more sophisticated organizations and societies. As Roberts (1983: 73) notes:

*Their brick technology was advanced enough by the end of the Sumerian period to make possible very large buildings with columns and terraces ... by 3000BC the wheel was being used from transport. Another invention of the Sumerians was glass, and specialized craftsmen were casting in bronze... This example of innovation ... raises further questions: where did the raw materials come from? There is no metal in southern Mesopotamia... Clearly, a widespread network of contacts abroad is in the background, above all with the Levant and Syria, huge distances away, but also with Iran and Bahrain, down the Persian Gulf. Before 2000BC Mesopotamia was obtaining goods – though possibly indirectly – from the Indus Valley [now the site of modern Pakistan]. Together with the evidence of documentation ... it makes an impression of a dimly emerging international trading system already creating important patterns of interdependence.*

Numbering systems, so essential for contracting, finance and risk assessment emerged and were eventually dominated by the decimal system in use to this day. While the machinery of trade and contracting in ancient civilizations is not well recorded, the picture changed with the emergence of Rome. Moving forward some 2000 years, we find that Livy (15BC), whose writings have long challenged students of Latin, recorded that following the success of the Roman armies in Spain in the summer of 215BC, the army ran short of food, clothing and pay (though probably not wine). The Roman Senate sought to relieve the soldiers' position by sea, but found that the traders, who had the ships to do the job, also had risk management policies in place. The limited number of suppliers who came forward negotiated exemption from military service, "while employed in that public business, the second that their shipments should be made at the state's risk against attacks of the enemy or storms. On obtaining both their requests, they entered into the contracts, and the affairs of the state were conducted with private funds" (Livy, 15BC: 224).

The Romans created some sophisticated aspects of contracts that we still observe in some ways today. Maine (1861: 261) tells the story:

*At the earlier dawn of jurisprudence, the term in use for a Contract was ... nexum, and the parties to the contract were said to be nexi ... The notion that persons under a contractual engagement are connected together by a strong bond or chain, continued to the last to influence the Roman jurisprudence of Contract; and flowing thence it has mixed itself with modern ideas.*

One of the challenges created by the notion of a contract was that, even in Roman times, the issues of contract management and finalization were a difficulty. Maine (1861) records that a sale of goods contract, where the money and the goods were swapped by the parties at the time of the deal, was readily accommodated. But what happened when the delivery of either the goods or the payment was delayed? Maine (1861: 267) says that in these circumstances "the *nexum* was artificially prolonged to give time to the debtor". Thus the term *nexum* which had originally meant a conveyance (transfer) came to be a 'contract' but with some important essentials: agreement (a 'pact' or 'convention') plus an *Obligation*.

But wait, there is more to this. Roman contracts, according to Maine (1861:270), eventually came in four versions: "the Verbal, the Literal, the Real and the Consensual" each with its own formalities to be completed before the legal obligations were enforceable. The Verbal was a form of spoken agreement, the Literal was a form of written agreement, the Real Contract created legal duties between the parties (enshrining the sense of obligation between the parties), while Consensual Contracts comprised four types:

- *Mandatum* - a 'commission' or 'agency'
- *Societas* - a 'partnership'

- *Emtio Venditio* - a 'sale'
- *Locatio Conductio* - a 'letting' or 'hiring'.

The way these rules translated into a contemporary system of contracting was very complex, but the evidence suggests that most of the contractual styles we observe today, and some of the legal difficulties courts have had to adjudicate over the years, existed in the Roman Empire, if not before.

## SOME DEVELOPMENTS IN MEDIEVAL EUROPE

Just as early civilizations established trade relations with private suppliers, the monarchs of Europe would have also needed such undertakings. For example, after his conquest of the Anglo-Saxons in 1066, William the Conqueror ordered the creation of the Domesday Book to provide a systematized record of ownership. As Plucknett (1956: 12) notes, the Domesday Book, or 'the record' created centralized authority for the monarch. "The land was described county by county, village by village, the owners and their subtenants were listed and their holdings valued, even the farm stock was recorded, with a view to settling clearly the rights of the Crown and the taxable resources of the country". This complex task enabled the wealth of the nobility to be measured and for a tax system to be created. This form of supplier measurement was resented at the time but it established a basis for orderly procurement of funds and services by the Crown, both taxes and service.

Gustavus Vasa, King of Sweden, provides us with a terminal example of sixteenth century buyer-supplier relations with his oft-quoted statement (Gadde & Hakansson, 1993:1):

*By virtue of the grace invested in my royal office, I have decreed unto you to forge one thousand suits of armor and ten thousand arrowheads.*

*You have failed to obey this command!*

*At the peril of having your heads fall to the axe, to the amusement of the inhabitants of Stockholm, in the city square one holiday eve at my discretion, I once again command you to comply with my wishes.*

In France, Marshall Vauban (1633-1707) was a military engineer and a remarkable designer and builder of fortifications for the French monarchy. Vauban's contribution emerged from his insistence on qualification of suppliers whose selection was thus not just left to price. The following comments were sent by Vauban (1685:1) to his Minister (obviously in an age when public servants were permitted to provide frank and fearless advice):

*There remains several remnants of the works of the last years that are not finished and will never be finished, simply because, your Eminence, of the confusion caused by the frequent cuts which are made to these works. Breaking of contracts, failures to honor verbal agreements and new adjudications, only serve to attract those firms which do not know which way to turn, rogues and ignoramuses, and to make those with the knowledge and capability of directing firms, beat hasty retreats. I would add that they delay and inflate considerably the cost of these works, which are the worst since these cuts and the cheapness sought are imaginary. For the contractor is ruined, and like a drowning man who clutches at anything, he clutches at anything he can as a contractor. He does not pay the merchants who supply the materials, pays badly his employees, cheats on those he can, has only the worst, and since he is cheaper than the others, uses the poorest materials, quibbles about everything and is always crying for mercy from this one and that one. That is enough, your Eminence, to show you the folly of this way; leave it and in the name of God, go back to plain dealing; pay the price for the works and do not deny an honest salary to a constructor who fulfils his duties; that will always be the best deal you can find*

Again in France, Bernstein (1996:3) has reported on the birth of probability theory, so valuable for the assessment of risk, in the following way:

*In 1654 ... the Chevalier de Méré, a French nobleman with a taste for both gambling and mathematics, challenged the famed French mathematician, Blaise Pascal to solve a puzzle. The question was how to divide the stakes of an unfinished game of chess between two players when one of them is ahead. The puzzle had confounded mathematicians since it was posed some two hundred years earlier by the monk Luca Paccioli [inventor of double entry bookkeeping]. ... Pascal turned for help to Pierre de Fermat, a lawyer who was also a brilliant mathematician. The outcome of their intellectual collaboration was intellectual dynamite... that led to the discovery of the theory of probability, the mathematical heart of the concept of risk.*

*Their solution to Paccioli's puzzle meant that people could for the first time make decisions and forecast the future with the help of numbers*

Britain has been a rich, though not the only, source of historical procurement artifacts, having made good use of some of the most important aspects of procurement including negotiation and bargaining, strategic alliances, competitive pricing and supplier management. From around 1500, the so-called Mercantilist era, which lasted about 150 years, was centered upon the accumulation of gold, the development of shipping (to help develop the British Navy) and a firm focus on the rise of Britain as a nation-state. Economic development was based on a national commercial perspective, supported by parliament.

This became associated with colonial power in the hands of both government and the development of major corporations such as the East India Company and the Hudson Bay Trading Company. These companies were given monopoly power by Parliament at the expense of individual traders. It is an interesting aside that the power of the East India Company grew so great that British governments of the late-eighteenth century struggled for economic authority over the Company. For example, there is evidence that the British Government had to gain the Company's approval to create a settlement in New South Wales. However, the Mercantilism economic approach, with its focus on the accumulation of wealth through international competitive advantage, gave way to the combined influences of the increasing power of the middle classes in the Parliament and new economic ideals such as those espoused by Adam Smith.

Without being able to foresee the emergence of the Industrial Revolution of the eighteenth century, at least in Britain, the political and economic framework of industrial development was sown in the name of establishing national economic supremacy. Trade was seen to be important and as parliamentary democracy emerged, merchants and other members of the lower classes were granted a voice in the House of Commons. Thus, at the start of the Industrial Revolution, Britain had strong domestic markets, the potential of export markets and Parliamentary support for commerce. Indeed, the spirit of commerce was a driving force. Further, the notion of the Contract had developed to the point that, as Maine would report, it contained elements of obligation, ethical behavior as well as the foundations of a legal relationship:

*... a signification by the promising party of his (sic) intention to do the acts or to observe the forebearances which he promises to do or to observe. Secondly, a signification by the promisee that he (sic) expects the promising party will fulfill the proffered promise.*

Adam Smith documented the market-managed elements of procurement (1776: 406-7) and suggested that:

*... manufacturers could not afford to retail their own goods as cheap as a vigilant and active shopkeeper, whose sole business was to buy them wholesale, and retail them again. The greater part of farmers could still less afford to retail their own corn, to supply the inhabitants of a town, at perhaps four or five hundred miles distance from the greater part of them as a vigilant and active corn merchant, whose sole business is to purchase the corn wholesale, to collect it into a great magazine, and to retail it again.*

Status has also been a problem for purchasing practitioners. As long ago as 1915, Twyford (p. 11) noted that while organizations ignored the importance of purchasing at their peril, there was also "too great a tendency to belittle purchasing and treat it in a negligent and offhand manner". However, the issue of status is gradually diminishing as an issue as enhancements to the function, activities and responsibilities of procurement professionals take hold. Business policy has also changed, particularly in relation to outsourcing; a poorly explored process which is widely practiced in public and private sectors.

## **THE RISE AND RISE OF PROCUREMENT**

Until the technological developments of the past 20 years, conventional ideology regarded procurement as the practice-based administrative process of buying the goods and services required to satisfy the functional needs of managers. Rules, regulations, procedures and protocols were typical of the process. Procurement staff stood as financial and operating sentinels between the managers and their material requirements, centralising the supply

task and creating management control over expenditure. Procurement was both a powerful and sometimes hated position with its virtual monopoly over acquisition.

Some researchers suggest that the modern evolution of procurement is characterized by the principal business and government requirements of the time. For example, Monczka, Trent and Handfield (2002) suggest that the evolution of procurement can be traced through a number of stages: emergence around the mid-nineteenth century (in their view), through a period of recognition before World War II, rapid increase in sophistication in procurement during that War, followed by a period of quiet gestation. However, in the last 35 years, the profession has moved into a period of major reform in materials management and faced the challenges of globalization, technological change and the emergence of supply chain management.

An aside about Defense procurement is worth recording here. As Weidenbaum (1998) reports, defense "procures products that are not yet designed or for which production experience is lacking and at prices for which there is little precedent." But that is not all the story: defense procurement often generates extraordinary levels of contract variation.

During World War II, the Douglas Aircraft Company (Douglas) was contracted by the US military to produce the A-26, a twin-engined light-bomber produced. This aircraft represented a significant advance in aircraft design and technology for the period and its development and construction was painful for all parties, not the least US General Henry 'Hap' Arnold who is reported to have made the following observations:

*'We cannot have more A-26s although we have plenty of fuselages, but not enough wings. We could have more wings if we had more spars, but we cannot build more spars due to difficult output of machinery. We might be able to build more wings if we were able to get more machinery, but whether we will be able to get more machinery I was unable to determine, and nobody could give me the answer. One thing is certain: I want the A-26 for use in this war and not for the next war. If something drastic is not done, we cannot hope to replace the B-25s, B-26s and A-20s with the A-26.'* Although the [A26] Invader looked pretty much the same throughout its production life, the aircraft was beset by hundreds of changes; as many as 35 a day ....

Those who have experienced the problems associated with product development and delivery problems, would readily identify with Arnold!

And to conclude this history, it is time to jump forward to the last 30 years of this story. By the late 1980s, the demands on procurement processes were shifting and, with it, traditional ideology and methods began to change. Procurement began to be mentioned in terms of a new concept called the *supply chain* (Oliver & Webber, 1982; Kuglin, 1999) and the importance of procurement was also recognized by Michael Porter's notion of the *value chain* (Porter, 1990). These changes were almost imperceptible until the capacity of computer technology became linked with the revolution in procurement processes.

Then quite suddenly, a routine clerical process operated by "unglamorous individuals" (Stewart, 1994) and designed to control the purchasing policies adopted by an organization began to be seen as having different potential. As part of the supply chain, procurement practitioners began to be seen as initiators within the procurement process. Coupled with developing concepts such as total quality management, customer service, supplier performance management and just-in-time inventory management, imaginative supply managers saw the opportunity to begin to manage their supply chains through the procurement process. So, rather than assuming their segmented role of days gone by, procurement practitioners began to view the entire extended enterprise and to, therefore, strategize with other key business functions to meet organizational objectives and to add value to the acquisition process.

## PROCUREMENT AS A CHANGE AGENT

The definition of procurement and the development of a uniform code of practice (and body of knowledge) remains a fundamental weakness of the notion of procurement. Traditional definitions emphasize the transactional or process focus of this function. For example, van Waele (2002, p. 10) suggests procurement means "all the activities required in order to get the product from the supplier to its final destination", and which:

*... encompasses the purchasing function, stores, traffic and transportation, incoming inspection, and quality control and assurance ... also salvage and environmental issues.*

However, Porter (1985, p. 41) defined procurement as "the function of purchasing inputs used in the firm's value chain, not the purchased inputs themselves ..." while Gadde and Hakansson (1993, p. 13) took a quite different view, describing procurement as an activity that "comprises a company's behavior in relation to its suppliers". Oakland (1991) widened the definition of procurement by including services, a critical change in definition that is, arguably, one of the fundamental reasons for the rise (and rise) of procurement – enormous growth in contracting for services. Oakland (1991, pp. 94-95) defined the goals of procurement as ensuring the "correct equipment, materials, supplies and services in the right quantity, of the right quality, from the right origin, at the right time and cost ... also ... providing information on any new products ... and services."

The emphasis on services is significant. It reflects one of the most significant forces driving the increasing sophistication of procurement decision making: outsourcing or contracting out. Historically, it was reflected in a complete change in the outlook of many manufacturers, as demonstrated by the comments of Sloan (1941, pp. 93-94):

*The Dodge brothers had started to make Dodge cars only a year or so before. In the trade world we believed they had changed from parts manufacturers into automotive makers because they believed their biggest customers contemplated making parts previously bought from Dodge. The same uncertainties that troubled makers of parts were valid worries of those who bought our parts. Suppose Buick or Willys-Overland or Ford suddenly got the idea it might be cut off from an important source of supply? Lack of one tiny part might hold up their assembly line. That fear was the nightmare of the business.*

Today the story is reversed: many organizations, especially those in high-cost economies, seek to outsource or contract out as many of their activities as possible. So the previous affinity with in-sourcing expressed by Sloan (1941) seems to have lost favor since the 1980s, to be replaced by outsourcing. As Ronan (2005, p. 7) notes, "outsourcing involves the sourcing goods and services previously produced internal within the sourcing organizations from external suppliers ... the term 'outsourcing' is most commonly used in relation to the switching of the supply of product or service activities to external suppliers".

While it is difficult to select one reason for the growing popularity of outsourcing, the rise of global sourcing, though well established in the history discussed earlier, has become more powerful as organizations seek to achieve their lowest cost goals. Could the influence of Peters and Waterman (1983) be greater than expected? Similarly, what has been the cumulative impact of the drive for small government, reduced taxation and more streamlined public and private sectors (Osborne and Gaebler, 1993) have also played a role? The popularity of Just-in-Time models of inventory management was undoubtedly driven by a need to liberate working capital from the potential waste caused by overstocking.

Significantly, outsourcing or contracting out creates involuntary organization change. Manufacturing and support staff are usually be redeployed to new tasks or retrenched. The specifications for outsourced goods or services have to be developed and managed to ensure that the contractual relationships ensure the quality and regularity of supply. The chain of command within the sourcing organization is exchanged for the legal contract. But it is clear that that is not sufficient. Some organizations attempt to create relationship structures with their suppliers to improve the reliability of their contracts and to gain additional benefit from the outcomes. Each of these seemingly incidental issues, adds to the scale of organizational change.

The definitions from Porter (1985), Oakland (1991), Gadde and Hakansson (1993) and van Waele (2002) typify the changing emphasis in the definition of procurement over the past decade and reflect the diversity of its origins (Goubeau, 1963; Zenz, 1994). The focus of these activities moves away from transaction processing, traditionally associated with procurement, towards a focus upon behavioral, interpersonal and strategic roles. This is epitomized by the Burt and Doyle model of strategic procurement (1993, pp. 28-29) which suggests that procurement involves a range of responsibilities including:

*... the identification of threats and opportunities in the firm's supply environment ... manufacturing and outsourcing decisions ... the development of supply base and strategic alliance plans and active participation in the corporate ... planning process ... through several links of the supply system from the supplier's supplier at one end to environmental disposal and recycling strategies at the other ... also ... how the firm interfaces with its present and potential suppliers.*

It is the behavioral area that is most testing for organizations in the case of procurement. Some of the analytical tools used by practitioners inherently create organizational change. The activity of conducting a "spend analysis" enables an organization to examine the precise nature of its expenditure. This is not an aggregation of funds flows within an organization's accounts or a re-examination of the profit and loss. It is a deconstruction of the expenditure accounts to show the exact products and services purchased across all sectors of an organization. This activity may use the standard Chart of Accounts as its basis but it amalgamates expenditure in each category to provide a statement of "Who Bought What?" This information can be used by executives to better manage expenditure patterns. It should be also used by procurement managers to negotiate better contracts for particular items of expense, to suggest alternative sources of supply, to focus on managing the aggregate impact of all types of expenditure.

## THE MANAGEMENT ROLE OF PROCUREMENT

Often seen in the past as a pedestrian, ill-developed function of government and business organizations, procurement practitioners are increasingly responsible for supervising the basis on which large amounts of expenditure is undertaken. Some aspects of supply management, such as outsourcing, more sophisticated contracts management, the use of e-commerce and partnering strategic alliances, have received growing academic attention as awareness of the financial and operating impact of the profession has developed.

The emerging versions of procurement will demand a strategic focus, a customer service focus, a capacity to interpret financial, political, legal, operational and other supply chain risks, and the capacity to operate as a senior executive. The purchase requisition of yesterday has not entirely disappeared but in the minority of organizations that have harnessed a version of e-commerce or e-business, electronic ordering will free the procurement professional to focus on the strategic issues and work to solve some of the challenges for procurement that are evident from this paper.

The function demonstrates an often unannounced type of organizational change which nevertheless can have a substantial impact on buying behavior across an organization, providing management with a new set of analytical tools to understand the spending patterns across their organization.

For management, development of the science of procurement can be harnessed more effectively to manage organization-wide expenditure, to better understand the nature of cost, and to make global sourcing decisions. Internally, contemporary procurement practices can enable management to make intra-organizational changes that help to align organizational strategy with acquisition strategies that support innovation and enhance the eternal problem of maintaining adequate management control.

# A CALL DETAIL ANALYSIS - GETTING INSIGHT INTO CUSTOMER BEHAVIOR

**Dragana Camilovic**  
**BK Faculty of Management, Serbia**

## ABSTRACT

*No other business has better information about the behavior of its customers than telecommunications. Since the main product of the telecommunications company is the call, its customers create hundreds of thousands transactions per day. Call detail record is an important marketing data that service provider can analyze to improve customer relationships. These records can be used in conjunction with demographic data in order to get better and more valuable results. All the data can be put together and stored in an OLAP (Online Analytical Processing) cube. As it will be presented in this paper, an OLAP system can help the telecommunications company to get better insight into its customers' behavior and improve its marketing campaigns and pricing strategies.*

## INTRODUCTION

After years of being a monopoly market, the telecommunications market is now highly competitive. A monopoly does not change much, but competitive markets change a lot. Customers are able to switch providers easily, because there are many of them available. This is why many telecommunications companies use call detail analysis to achieve competitive advantage. By understanding customers' characteristics and behavior, it is possible to successfully tailor services that meet customers' needs.

There is no doubt that telecommunications companies have to be focused on their customers. The good news is that customer behavior is in the customer data and patterns of calls. The telecommunications industry has advantage over other sectors because it has a voluminous amount of customer data. Telecommunications companies collect various demographic data (such as name, address, age and gender information) and store call detail records. Call detail records usually include information about originating and terminating phone numbers, the date and time of the call and its duration (Weiss, 2005).

Demographic and call detail data analysis can provide a significant insight into customers and improve campaign management and pricing strategies, as it is displayed in Figure 1.

**Figure 1: Demographic and call detail data analysis**

To create a better environment for managing customer relationships, companies need to look at a new approach called CRM (customer relationship management). Customer understanding through data analysis is referred to as analytical CRM (Srivastava, Wang, Lim and Hwang, 2002). This topic is discussed in the following section.

## ANALYTICAL CRM

CRM is defined as a set of activities that a business performs to identify, qualify, acquire, develop and retain loyal and profitable customers by delivering the right product or service, to the right customer, through the right channel, at the right time and the right cost (Galbreath and Rogers, 1999). The right product or service means that only a product or a service that meets customers' needs should be considered. The right customer means that not all the customers are alike, so the company's interactions with customers need to move toward segmented marketing campaigns that target individual preferences (Sumathi and Sivanandam, 2006). There are a number of mediums available, so the company should choose the right one (that is what the right channel means). The right time is a result of the fact that there are continuous interactions with customers (Sumathi and Sivanandam, 2006). The goal of every company is to reduce costs. However, as the success of the company grows, so does customer inertia. The company often loses the desire to please its customers and focuses more on how it can reduce costs rather than on delivering meaningful and differentiated experiences (Strativity Group, 2007). This opens the door for its customers to be tempted by competitive offers, so the right cost component should be carefully considered.

Meta Group classifies CRM into three different types:

- Operational CRM, which is concerned with automation of business processes involving front-office customer contact points (Payne, 2005). The benefit of operational CRM is to personalize the relationships with the customer and to broaden the company's response to the customer's needs (Xu and Walton, 2005).
- Analytical CRM, which is in charge of the analysis of the information previously collected by the CRM system or from other sources, in order to establish customer segmentation and identify their potential to reinforce the relationships. (Bibiano, Mayol and Pastor, 2007). According to Smith (2006), analysis of customer data is a key part of CRM. A good analysis enables the company to get insight into its customer preferences and behavior. Analytical CRM systems include tools that can process the unmixed volume of customer data to support the provision of strategic customer information (Xu and Walton, 2005), such as data mining and OLAP tools.
- Collaborative CRM includes the use of collaborative services and infrastructure in order to enable interaction between a company and its channels (Payne, 2005).

This paper is focused on analytical CRM applications in telecommunications, especially those that use an OLAP tool. Armed with an OLAP system, a company can obtain better understanding of the needs of individual customers.

The telecommunications industry, as mentioned earlier, has advantage over other sectors because it has a vast amount of customer data. However, existing operational systems are application-oriented and they support day-to-day operations (Inmon, 2005). This means that the operational data is primarily highly detailed current-value data (Han and Kamber, 2001), and the time horizon normal for operational systems is often very short.

The fact that operational environment has current-value data is even bigger problem than the time horizon. If a customer e.g. changes the address, the new address simply replaces the exiting one. The time of the change is usually not recorded in the system. Nevertheless, capturing changes is relevant to CRM analysis.

Another problem that telecommunications companies have to face is the customer data integration. Customer data is often spread redundantly in separate applications, so the key is to create a single, comprehensive view of the customer across the company (Levine, 2002).

There is the unique solution to all of these problems – the customer-centric data warehouse. A central data repository provides the platform for OLAP and data mining.

An OLAP cube can provide multiple and dynamic views of data. Furthermore, many data mining functions, such as classification, prediction and clustering can be integrated with OLAP operations (Han and Kamber, 2001). Armed with an OLAP system, every organization can get a significant insight into customers. Extracting patterns from customer and usage data and their visual representation is a great help for understanding customer behavior.

The next section demonstrates the insight gain from data exploration of call detail and customer demographic data maintained by a mobile phone carrier that declined to be identified. The project is altered so that no company is recognizable.

## **CALLING PATTERNS RECOGNITION - A CASE STUDY**

Understanding customer behavior is the key for implementing a successful CRM strategy. Telecommunications companies have to learn from experiences and notice customers' needs and preferences. Gathering intelligence from the information captured, is becoming a critical success factor to remain competitive (Bain, Benkovich, Dewson, Ferguson, Graves, Joubert, Lee, Scott, Skoglund, Turley and Youness, 2001).

The project presented in this section demonstrates the value of analyzing the great amount of call detail records and some demographic customer data. Call detail data is aggregated for three-month period. The project consists of several activities, grouped in four phases: defining the problem to be solved, assembling and preparing the data, building the OLAP cube, interpreting the results and results application. In the first phase business objectives and requirements need to be defined. The main business objective is to identify calling patterns in order to understand the behavior of individual customers. It is wise to make a list of interesting questions. The list can include several important marketing questions, but for the purpose of this case study, the three that the author finds the most interesting are selected. Those are the following:

- What could the data tell us about patterns of telephone calls during the day and during the week?
- Is there any difference in mobile phone usage between men and women?
- Is there any difference in mobile phone usage between different age groups?

In the second phase, the data needed for the purpose of the analysis (by the OLAP tool) should be collected and transformed. The data is accessed from the call detail data mart. Since the data was preprocessed before entering into the data mart, no further transformation is necessary. The data mart contains true archival detail data at the lowest granular level (the more detail data there is, the lower the level of granularity), since atomic data provides maximum flexibility. Call detail analysis provides a level of granularity that surveys or some other devices are unable to deliver (Strouse, 2004).

In the third phase, the OLAP cube should be built. The cube has to include all necessary dimensions and measures. Measures are numeric data needed for analysis purposes (e.g. the total number of calls, the cumulative duration of calls etc.). Some measures are more interesting when combined and these are called calculated measures (or calculated members). E.g., the average call duration is interesting for the purpose of calling patterns recognition. It is calculated by dividing the cumulative duration of calls by the total number of calls (made during the three-month period). A data cube allows data to be viewed in multiple dimensions (e.g. customer gender, customer age group, day of the week, hour of the day). After being processed, the cube is ready to be used. The results should be interpreted and applied. Results can be presented visually, which enables improved comprehension. Visualization can help answer the questions asked.

The study first examines the question: What could the data tell us about patterns of telephone calls during the day and during the week? The histogram in Figure 2 shows the pattern of calls made throughout the day during the week. There is an alternative way to visualize the same pattern as shown in Figure 3.

Figure 2 shows that the total number of calls (made during the three-month period) has an interesting peak through middle of the day, at about 11:00 A.M. (an hour later on Sundays). Calls are low in the early morning and they are increasing during working hours, reaching the maximum value at about 11 A.M. and declining afterwards. Calls are quite low in the evening. Figure 2 also shows that the total number of calls has two peaks

on Sundays - at midday and at about 5:00 P.M. Both Figure 2 and Figure 3 show that the total number of calls is lower on weekends. It seems that the calling pattern is quite the same throughout the week (a peak is almost at the same time all week long). An interesting thing to be noticed is that people like to make telephone calls on Wednesdays and Fridays. Both Figure 2 and Figure 3 depict this pattern.

**Figure 2: Total number of calls histogram by day of the week and by hour of the day**

**Figure 3: Total number of calls by day of the week and by hour of the day**

Figure 4 shows that the number of calls made between 0:00 A.M. and 6:00 A.M. is higher on weekends than on the other days of the week, but it is also quite high on Mondays, too. However, since this number is generally low comparing to the rest of the day, patterns of night calls are not so interesting to marketers.

Figure 5 shows the average duration of calls in seconds throughout the day during the week. It seems that people generally like to talk longer in the evening. Even though the total number of calls is high during working hours, those calls are significantly shorter than e.g. calls made after 9:00 P.M. The longest calls are late evening calls.

**Figure 4: Total number of calls made between 0 A.M. and 6 A.M. by day of the week and by hour of the day**

**Figure 5: Average duration of calls (expressed in seconds) by day of the week and by hour of the day**

Two more questions need to be answered: Is there any difference in mobile phone usage between men and women? And what about different age groups? Figure 6 shows the mobile phone number ownership by gender. Evidentially, there are more male than female subscribers. Only 25% of all subscribers are women.

**Figure 6: Phone number ownership by gender**

Since there are more male customers than female customers, the total number of calls made by men is expected to be higher than the total number of calls made by women (as it is displayed in Figure 7). However, both genders have similar calling behaviors: calls are increasing in the morning, reaching the peak through middle of the day, and declining in the afternoon. The total number of calls is low in the evening, no matter the gender.

**Figure 7: Total number of calls by gender and by hour of the day**

Figure 8 depicts phone number ownership by age group. The figure shows that less than 1% of mobile phone numbers are owned by customers younger than 20. There is a low percentage of older adults' phone number ownership as well. The difference in phone number ownership of different age groups is significant, and this information can be valuable to marketers.

**Figure 8: Phone number ownership by age group**

The mobile phone usage by different age group is seen in Figure 9. Customers in the 30 to 39 and the 40 to 49 age group are heavy mobile phone users. This is also the case with two other age groups: age 20 to 29 and age 50 to 59. Mobile phone usage is very low among users younger than 20 and older than 60.

Since the total number of calls is, the cumulative number of calls made during the three-month period, the more customers in certain age group there are, the higher the total number of calls (although the high frequency of calls, obviously, results in the high total number of calls as well).

Figure 10 shows the average duration of calls in seconds throughout the day by age group. Even though there is less than 1% of mobile phone numbers owned by customers older than 80 (see Figure 8), those subscribers generally make longer calls. This could be interesting information for the company in order to provide its older customers with optimal service and rate plans.

**Figure 9: Total number of calls by hour of the day across different age groups**

**Figure 10: Average duration of calls (expressed in seconds) by hour of the day across different age groups**

Result interpretation is followed by its application. This is the last phase in the process of analyzing the data. OLAP analyses are more than simple data analyses - they enable understanding of a business environment, so that relevant questions can be answered by deploying appropriate tools on the properly selected data (Sumathi and Sivanandam, 2006). The key is to incorporate the patterns discovered into the business. The patterns noticed can be used in development of appropriate marketing campaigns and pricing strategies. For example, customers should be motivated to make more phone calls on weekends or in the evening (a better rate for evening and weekend calls would be a good idea). Some special price plans could be offered to school children and senior citizen, since the mobile phone usage is very low among them. Since the “seniors” tend to talk longer, it would be wise to offer them low cost call rate. Women should be targeted by a special campaign, as well. Special offer on Mother’s day, for example, could be a good idea.

The case study presented in this paper gives just an insight into customers and business. Nevertheless, there is a hope that business people will realize the great possibilities that OLAP has to offer.

## CONCLUSION

Telecommunications deregulation led to a highly competitive environment, and this placed increasing dependence on understanding customers. Today, most telecommunications companies collect and refine massive amounts of data, and call detail analysis is one of the hottest areas of exploration in the telecommunications industry. To increase the value of current information resources, OLAP tools can be used. CRM benefits greatly from OLAP as it helps in the understanding of customer behavior.

In this particular case study involving the improvement of marketing campaigns and pricing strategies, OLAP has been applied with much success. The OLAP cube helped a lot in giving answers to some important marketing questions. It seems that OLAP can be a very effective means of helping telecommunications companies to better understand their customers and to redefine and reinforce customer relationships. In today's competitive business landscape the customer is a king, and the soon one realizes it, the better.

**P. Braun, France**

## ABSTRACT

*The recent and significant development of public research valuation structures raises the question of the precise role of marketing's intervening moment as well as its exact role within the chain of innovation.*

*The goal of this paper is to present a new marketing approach exclusively dedicated to the problems associated with the valuation of technological projects at the heart of public universities or laboratories when said projects are in their upstream phase; in other words, still in a gestation period on-site at a laboratory.*

*This approach is based on the concept of modal marketing and strives to define the future of the technological project, meaning choosing its optimal market-entry mode between its association with existing businesses, sale of the technology, and autonomous development of start-up style.*

## INTRODUCTION

Several authors have examined the role of marketing within the generic context of technological innovation. For Mohr (2004), a technological innovation project is characterized by a triple uncertainty: technological, competitive and market, and where the role of marketing would be to identify a potential market in an unstable environment which can alter the competitive landscape at any given time. Other authors (Schilling and Thérin, 2006; Fernandez-Walch and Romon, 2006) argue that a major function of marketing would be to value a product or service resulting from innovation after having researched different possible applications born out of a single technology. These works all commonly situate marketing's essential action as being in the implementation phase of a technological project, when for example it concerns defining the main coupled functions/applications, or determine the outline of economic potential presented by the project, or lastly quantify the number of foreseeable buyers. But the downstream introduction of marketing reflection, so as to evaluate the best mode of innovation-produced valuation, is not generally evoked, whereas two levels of accompaniment must be differentiated according to the maturity of the project.

In the upstream phase, when uncertainty is at its peak and the project is in its initial phase, the accompanying function of innovative projects is in particular carried out by swarm units at the heart of companies themselves, or by research valuation cells inside universities or public research laboratories. Farther downstream, when the risk probability becomes foreseeable and the project is in its execution phase, the accompaniment is carried out by the company's breeding-ground, and/or by incubators for example within Business or Engineering schools or a university which make it possible for the creator to access resources and shared methods in order to facilitate the strategic development of the project (studies, business plan elaboration, researching capital) as well as operationally putting it into place (creation of prototypes, applying for patents, logistical support).

For this reason, marketing's mission within the specific setting of the valuation of technological innovations in their initial highly uncertain phase, and developed within the heart of public research laboratories still remained to be precisely defined.

The goal of this article is to present a marketing approach dedicated to the issues of the valuation of technological projects during their upstream phase, inside public laboratories and universities in France. The

authors have been able to (within the context of their activities supporting projects of different valuation structures in public research) develop a specific marketing approach devoted to the valuation of technologically disruptive projects in their beginning phase, during which there exists an all-encompassing incertitude about the project's usefulness. This approach, henceforth called modal marketing for the valuation of technological projects, is successfully implemented today not only within research valuation university structures (French member-universities of the Curie network), but also at the heart of incubators inside ivy-league engineering schools, like Télécom Paris.

Based on the marketing modal concept, this approach aims to allow laboratories and universities to define the best market-entry method for technologically strong innovative projects amongst their association with existing companies, sales of the technology, or autonomous development such as start-ups.

## **EXISTING COMPANIES FACING RESEARCH ON DISRUPTIVE INNOVATIONS**

The publication of Christensen's work (1997) renewed the debate about the market's role in the formulation of a response to technological innovations by introducing the concept of disruption, or disruptive innovation. Up until then, the majority of studies (Henderson and Clark, 1990; Tushman and Anderson, 1986) identified the destruction of internal competencies generated by innovations as a major hindrance to the introduction of new generations of technologies (at the heart of existing large-scale companies). Christensen redirects this analysis and points out the (negative) role of top-level management within these companies. This management style would focus its attention and resource allocation on existing clients and on sure profitability, rather than allotting the resources to disruptive innovations destined for hypothetical new buyers, i.e. unsure profitability (Henderson, 2006). However, several subsequent studies present this absence of large existing companies' significant involvement in the development of technological disruptions as a rational approach from the shareholders' point of view.

Adner (2002), Adner and Zemsky (2005) and Danneels (2002, 2004) show that important changes in demand structure are present behind the disruption phenomenon and that the established routines at the heart of big companies already present on the market make it difficult for them to perceive and subsequently act on this evolution of demand. Moreover, Christensen and Raynor (2003, p.55) follow by modifying their initial position and indicate *"...Because disruptive strategies are predicated upon competitors doing what is in their best and most urgent interest: satisfying their most important customers and investing where profits are most attractive"*. This change reinforces the idea that directors of large-scale companies who don't seek out disruptive innovations are in fact acting in the best interest of their company.

Treacy (2004) goes even farther and suggests that disruptive innovation should be a last resort growth strategy because innovation generates risk and as a result managers must first consider the possibilities for increasing profitability without innovating, meaning by minimizing the taken risk. For example, securing existing loyal clientele or improving new customer targeting and recruitment can significantly increase company profits. Large-scale companies are very conscious of this situation and Silberzahn (2006) highlights that companies established on recognized markets handle with risk situations whereas for example start-ups introduce disruptive projects that must face an uncertain position in the "Knightian" sense of the term. Knight (1921) differentiates risk, a future whose possible distributive states are known, from uncertainty, a future whose distributive states are not only unknown but are impossible to know. This uncertainty is due to the nature of the phenomenon itself; faced with such a situation it becomes impossible to define objectives and different possible market studies will only be able to elaborate on the extrapolations from the present onward. Thus it becomes more rational for an already installed company to transform this uncertainty, which is linked to radical innovation, into risk probability.

One of the methods to reach this position consists of entrusting radical innovation development to specialists in risk management, with this occurring just before the quantification of possible markets. Furthermore, integrating this innovation should only occur when the probability of success for said innovation becomes an acceptable risk, in other words once its market has already begun to emerge. For Markides (2006) the logical consequence of this analysis is that rather than using up resources for the development of disruptive innovations within their core, existing companies should focus themselves on the creation, backing, and support of a network of small

feeder firms, meaning entrepreneurial projects which are external to these existing companies and which seek to create new niche markets.

Established companies can act as venture capitalists for these small feeder firms, or can develop strategic alliances with them or provide capital participation to them. As such, when the time comes to consolidate the market, these already existing companies can create a new mass market by drawing on the platform of disruptive technology that these feeder firms have provided. Having neither the resources nor capital, nor the power nor distribution needed to permit their creation to change market scale, these feeder firms should in principle be happy to form an alliance with a big company.

This approach has an even bigger sense when you create a distinction of disruptive innovation depending on its nature. In his original formulation, Christensen (1997) concentrates first on technological innovation and studies the way in which new technologies come to impose themselves onto existing technologies. With time, he broadened the idea of this concept of technological innovation to also include new products and new business models, encompassing for example (Christensen and Raynor, 2003) discount supermarkets, budget airlines, and low-cost mass-produced products like motorcycles or photocopiers. Along the same lines, Treacy (2004), in his seminal article, distinguishes product innovation, meaning what the company actually produces, from economic-model innovation, meaning the way in which the company puts the product on the market. Markides (2006) reworks and broadens this distinction and differentiates “*business-model innovations*” from “*radical new-to-the-world product innovations*”. These two types of innovations present several differences: the markets created are of different kinds, and what’s at stake for existing companies is radically different, as are all the implications for managers. For Markides, business-model innovation is the invention of a business model fundamentally different in an existing market, such as Amazon, EasyJet or Dell. To be innovative, this new model must expand the existing market either by attracting new consumers or by increasing current consumer consumption. Conversely, radical product innovation creates disruption both for consumers since it introduces products which profoundly alter habits and behaviors, and for producers, because it undermines the skills upon which already market-present players have built their success.

For this reason, these innovations rarely stem from demand, but most often from supply, devised according to the development of new technologies (Markides and Geroski, 2005). Numerous works (Klepper and Simons, 2000; Utterback, 1994) show that supply-born markets share four characteristics which are: (a) the presence of a significant number of new entrants, (b) a very large variety of products and maximum innovation rate, (c) subsequent emergence of a dominant design which marks the start of market growth, (d) the major role of the length of time before the market becomes structured. One of the consequences of this situation is that the pioneers who created these new markets are rarely the ones who then evolve them into mass markets. This is due to the fact that evolution such as this calls for very significant investments to make the most of economies of scale, to progress on the learning curve, to develop strong brands, or to control distribution circuits (Markides, 2006). Subsequent entrants possess the resources to enlarge the market by changing the competition bases via distancing themselves from the only technical performance put forward by the pioneers. This is in order to make the market evolve towards other attributes like quality and accessible price, by producing a product whose performance without being the best *technically* possible, is sufficient for consumers and costs less than the market price.

Because of these characteristics, companies already in place on markets must rather concentrate themselves on what they are good at, in other words the consolidation and transformation of these emerging markets into mass markets. These companies shouldn’t themselves try to create disruptive product innovations, but leave the job of creating these new markets to small businesses or start-ups who have the attitude, skills and talent to pull it off (Markides and Geroski, 2005). If we consider it from the point of view established by Markides and Geroski (2005) and Henderson (2006) then it is rational for the companies already present on the markets to focus themselves on existing markets, and take the necessary measures so that highly innovative projects are first developed by these smaller up-and-coming businesses who focus on the market placement of the technological innovations that they themselves generate.

This development requires assistance and backing which can come from private parties such as the large-scale companies themselves using swarm procedures or venture-capitalists. This support can also come from public parties such as university research valuation cells or para-public parties as with the incubators. Therefore, various structures have ad hoc been developing over the course of recent years in several countries in order to accompany highly innovative projects which companies don’t know how to, don’t want to or don’t have any desire to accept responsibility for within their core.

This development of accompanying units upstream of the disruptive innovation, under the influence and with the aid of public power, raises the question of marketing's precise role and that of its intervening moment during the innovative chain. When the technological project is in its gestation period, it is necessary to define what will be its possible future.

## MODAL MARKETING

Valuation structures need to be capable of continuously arbitrating between the different projects they control, in order to define the pertinent valuation strategy to adopt. This could mean for example to define if a patent has to be taken out, if a prototype needs to be financed, if contacts with companies need to be implemented, or if a project must first be valued.

Within the aforementioned logic, we can consider that the fundamental major goal of marketing technological projects in their initial phase is to value this technological innovation by defining its market-entry mode. This entrance onto the market can be executed following three modes which are: (a) Internal Development, (b) Alliances (c) Sale of the Technology.

Modal is a logic term that is used to introduce propositions containing conditions or restrictions. This is particularly the case with a proposition in which – unlike categorical propositions – the terms of a problem relate to the resolution of a preceding statement. The modal dimension is therefore particularly appropriate to qualify a method devoted to highly innovative technical projects, because it is they who are characterized by a permanent and successive sequence of inputs -- either favorable or restrictive for the project's entry into the market. The modal character of the model allows for the integration of the permanent uncertainty generated by the environment and by the project itself, at the heart of a process which makes the completion of technical projects conditional, unpredictable, and non-determinist. The term modal refers to the necessarily reiterated dimension which characterizes the analysis of rapidly changing environments in order to integrate permanent environmental modifications through a permanent retrofit.

The modal approach is a marketing method specific to technological projects, based on the separation of three stages in the technology's development and one which takes into account the interdependent liaisons necessary for the success of these projects.

Modal marketing is directed towards the definition of the most appropriate valuation mode according to the measured appeal of the project, of validating its feasibility, and of its permanence. The modal approach breaks down the initial phase of the innovation process into three steps, which are: detecting innovative projects (Stage D), selecting the most attractive projects (Stage S), and valuating priority projects (Stage V). A matrix analysis of multicriteria allows for the establishment of scores, permitting qualification of these parameters. Pre-established veto thresholds avoid having evaluations that are too weak on criteria considered as critical being counterbalanced by too favorable evaluations on criteria viewed as being less essential to the project's success.

The model includes permanent retroalimination which allows for the integration of environmental modifications, the emergence of new competitive technologies, or the impact of disruptive technologies being put into place on the market.

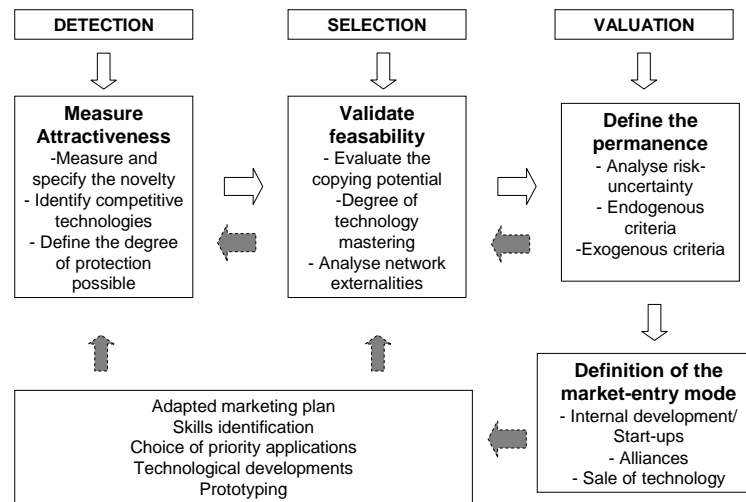

Figure 1 presents the general model that is implemented.

Once the matrix position is established by weighting attractivity and feasibility indicators, an additional permanence indicator permits evaluating the nature of the durability and sustainability of the competitive advantage linked to the studied technological innovation.

The sum of the scores obtained from each indicator defines an innovation level referred to as "AFP" (Attractivity, Feasability, Permanence), which can effectively be compared to the database drawn from previous or current evaluations (as would be the case for the creation of a comparative evaluation between projects simultaneously present in the valuation cell established for other innovative projects in their initial phase. Within each scoring phase, retroalimination occurs thus enriching or altering the matrix score.

Once a project's level of AFP innovation is established, modal analysis integrates the impact of the time factor on the deadlines of the project's culmination along with the means necessary to put the innovation on the market. Time-to-market is a pertinent indicator of the autonomy of an innovative project and one which is integral to its value evaluation because the resource requirements – financial, in particular – that are necessary for innovation development and market entry are subjugate to the time separating the project from its completion. Time-to-market directly influences the estimation of resources necessary for the development of a project from its uncertain phase until its risk phase, and as a consequence has a direct influence the technological project's valuation mode.

**Figure 1: Modal marketing's general model for technological projects**

Time-to-market will be evaluated by responses given to several questions such as: How much time will the project take? Is it a good strategy to be a pioneer of this technology? If the project is delayed, what kind of impact will that have on the value of the project? How much will the project cost? What is the potential variation of said costs?

A hybrid matrix integrating the AFP innovation level and the time-to-market can then be devised, either for a particular innovative project or for a portfolio of projects. The AFP evaluation combined with the foreseeable deadlines for market-entry therefore allow for a determination of an adequate valuation mode for a technological project, such as this one presented in Figure 2.

Four different valuation options can be differentiated according to the innovation level and the time allotted to reach market-entry.

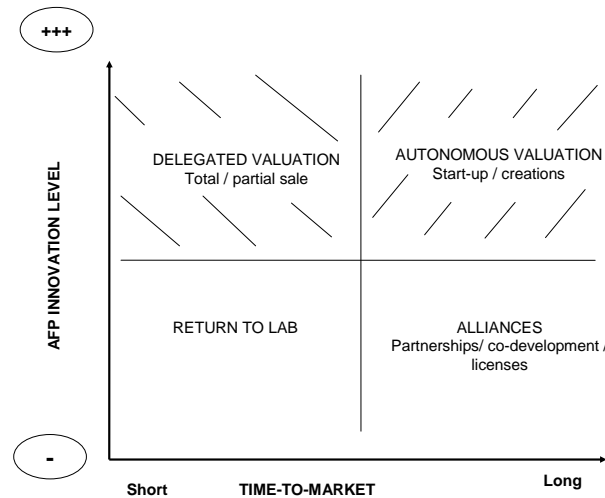

- The first valuation mode is that of the selling the technology, which permits getting the necessary resources (for example: capital, sales and marketing structure, distribution network access) for a project's rapid market entry. This should be the preferred mode when necessary, for example to participate in setting the standards for an emerging market, or when other technologies can structurally alter the foreseeable market set-up.
- In the second possible mode, innovation is highly differentiating and can take its time to penetrate the market, for example if applying for a patent. The preferential valuation mode is that of autonomous valuation which allows the project's carrier to increase the value of said project, perhaps through a subsequent sale to a large-scale group already installed on the market. This valuation mode is, strictly speaking, start-ups and incubation projects. It assumes the carrier's capacity to find funding to develop the innovation up to its entry into the market, which could be a long ways away.
- The third mode, "Stay in lab" assumes that the innovation is still in its developing phase and needs to be worked on, with a goal for eventual valuation.
- The fourth mode, alliance covers different market-entry options. The strategic aim is to enrich the innovation before putting it on the market. For example, this can be by initiating co-development so as to insure more technological added-value in the development phase and to eventually morph into start-up mode.

Therefore modal marketing introduces a marketing vision from the technological project's upstream phase and simultaneously integrates the environmental and competitive modifications into the innovation's development; the objective being to evaluate the perspectives and methods required to ensure the project's development and completion. The modal approach, founded on the definition and use of specific criteria for each of the three indicators – Attractivity, Feasibility and Permanence – equally facilitates the comparison and selection of projects according to the internal priorities of public valuation structures, and to the relative value created.

The AFP innovation level and the amount of time needed to enter the market can naturally be very different depending on the domains involved. For example, biotechnologies require a longer time for market entry due to

numerous clinical tests than do innovations coming from information technology. The modal approach, because it is situated at the start of the market entry, can be utilized for the majority of highly innovative projects.

**Figure 2 : Selection of market-entry method of innovative technological projects**

## CONCLUSION

Numerous recent works suggest that large companies already present on existing markets generally do not have any interest in taking on directly at their core the development of disruptive technological innovations, and that the most rational approach for them is to maximize their profitability by minimizing their environmental level of uncertainty. This maximization has a short and medium-term effect of playing on levers such as new client recruitment, the increase of quantities consumed by existing clients, and a rise in customer loyalty. From medium to long-term, this maximization can be generated by the capacity of these large-scale companies to massively expand emerging markets created by disruptive innovations, initially developed by small structures focused on this creation. This model raises the question of an evaluation for these innovations, particularly in their initial phase, when the uncertainty which accompanies them is not yet able to be acknowledged as a quantifiable risk. This question is particularly important for public and parapublic research valuation structures which are forced to arbitrate between different projects that they control, accompany or finance. This is in order to define the pertinent valuation strategy to be adopted, and to determine which disruptive projects must be valued in priority.

We have presented a new approach, called modal marketing. Modal marketing is founded on the use of multicriteria matrixes which, by a reiterative process, allow for the integration of the extremely progressive environmental nature of highly innovative technological projects in order to determine the market-entry mode of innovative projects. This modal method allows for an evaluation first in the absolute and then in a relative manner (between projects) of the possible valuation level of a innovative project, including the time-to-market dimension – meaning the necessary financial means to get the developed technology up and running.

It is currently applied in the context of French public research laboratories as well as in private evaluation activities for disruptive technological projects.

## ABSTRACT

*Music industry is facing ever growing challenge when customers can now download what they want and pay for it online. Traditionally, music was purchased at stores and/or through mail orders. Since e-Commerce started, download music has become an online trend that has surfaced in the recent decade and is increasingly becoming very popular. This has many consequences, many impacts on the music industry and its related affiliates such as stores that sell it. Thus, studying the interaction between the medium of music and its consumers is necessary, and greatly needed to better understand and fulfill the needs on both sides.*

*The following study that has been conducted helps create a better understanding of just what consumers want in terms of accessing music. Valuable data was collected from subjects on several aspects of preference on accessing music. The research results reveal that more consumers prefer downloading music online today as opposed to purchasing it at store locations due to convenience.*

## INTRODUCTION

Online retail sales in 2007 reached \$175 billion, a 21% increase over \$144.6 billion in U.S. in 2006 [Forrester Research, 2008], as the global Internet users reached 1.3 billion by the end of 2007 [internet world stats, 2007]. The emergence of shopping on the Internet has a big threat to the traditional retail businesses where the customers needed to go to the stores to complete the transactions. When the deliveries of goods and services can be made on online, it presents ever bigger challenges to the traditional retailers, offers convenient shopping for customers. Purchasing and downloading music online for the past twelve years has overwhelmingly challenged record companies and private stores that sell albums. For example, Tower Records, the largest music store chain, closed all its retail stores in the U.S. on December 22, 2006, after a failed attempt to emerge from bankruptcy, witnessed the shifting trend in the industry [wikipedia, Tower Records]. Many websites flourished by having customers pay to download music such as iTunes, after Napster was forced to stop free music sharing [Guardian Unlimited, 2003]. New technologies and gadgets, combined with the high speed internet access, it is now easier than ever to create your own "album" of music with all the songs being of your own preference.

Many consumers have switched from purchasing music disks at stores to simply downloading the same music online [Beal, 2004]. As the shift in the medium of purchasing music has taken place, the new generation is more prone to using the internet to obtain their music. In theory, if a customer is able to download his/her favorite music from the Internet at a lower or substantially lower price with reasonably good quality, that customer would not need to go to purchase the CD at a local music store.

This study intends to examine the various factors that affect the customer's choice between purchasing music through the different methods of downloading from the Internet and visiting stores, in order to provide

some insights about music shopping behavior for record companies and music retail stores, and how they could improve their performance.

## REVIEW OF LITERATURE

In the recent years, music industry has experienced a great pressures, as overall music sales decreases. In 2007, the total volume sales dropped by 15%, even the downloads increased more than 50%. [Holton, 2008].

Figure 1 illustrates the global downward sales trend in music industry as a whole in dollar terms [Verna, 2007].

**Figure 1: Global recorded music sales trend**

Source: Paul Verna, Recorded Music: Digital Falls Short, *eMarket*, November 2007.  
[http://www.emarketer.com/Reports/All/Emarketer\\_2000472.aspx?src=report\\_head\\_info\\_sitesearch](http://www.emarketer.com/Reports/All/Emarketer_2000472.aspx?src=report_head_info_sitesearch)

As part of its response to such a drop in global music sales, the music industry is calling on Internet service providers to take more responsibility for illegal file sharing by either disconnecting those who repeatedly upload music or preventing illegal tracks from being downloaded. Many ISPs have so far proved reluctant to take any action, but the music industry is hoping this could change following a move by French President Nicolas Sarkozy to block Web access to those frequently downloading music or films illegally [Holton, 2008]. The closure of Napster's free music sharing in 2001 was a result of legal battle between music industry and a website music sharing.

Due to the convenience of downloading music from websites, more people are able to get the music they desire at the click of a mouse rather than going to the store to buy a CD with limited songs. Table 1 illustrates the growth of music downloads from 2003 to 2007 in the U.S, while the sales of album dropped by a double digits, the download share of total album unit sales was only about 10% [Palenchar, 2008].

**Table 1: growth of music downloads from 2003 to 2007 in the U.S.**

|  | 2003  | 2006  | 2007  | % change 2006-2007 |
|--|-------|-------|-------|--------------------|
| Single tracks downloaded*                | 353.0 | 581.9 | 844.2 | 45%                |
| Full albums downloaded                   | 16.2  | 32.6  | 50.0  | 54%                |
| Total album sales**                      | 618.9 | 588.2 | 500.5 | -15%               |
| Overall album sales***                   | 654.1 | 646.4 | 584.9 | -9.5%              |
| Download share of total album unit sales | 2.6%  | 5.5%  | 10%   |                    |

\*\* Includes CDs, LPs, digital albums, but not track-equivalent digital albums, where 10 individual tracks equal one album

\*\*\* Includes all albums and track-equivalent albums Sources: U.S. market by Nielsen SoundScan (www.nielsensoundscan.com), International Federation of the Phonographic Industry (www.ifpi.org) © TWICE 2008

Apple Computer captures the #1 music retailer position in the USA. The news was announced recently in an email that was sent out to a few Apple employees. A few months ago Apple breezed past Best Buy to secure the number #2 spot. The same report estimates that one million consumers dropped out of the CD buyer market in 2007, a flight led by younger consumers. In fact, 48 percent of U.S. teens did not purchase a single CD in 2007, compared to 38 percent in 2006. [Tribble, 2008]. Professor Strumpf comments on iTunes stores sold three billion songs in 2007, claiming that there was surprisingly little evidence to support the claim that file sharing had significantly hurt record sales in the present downturn. Instead several other factors are suggested: (1) industry has failed to find genres that capture the interests of consumers; (2) much of the reduction in sales is the direct result of industry cost-cutting, as the major record labels have cut large numbers of staff and severed ties with many artists; (3) recorded music has had trouble competing against other products that vie for consumers' entertainment spending; (4) the rise of paid digital downloads are made popular by iTunes [[http://blogs.allofmp3.ru/music\\_news/category/market-statistics/](http://blogs.allofmp3.ru/music_news/category/market-statistics/)].

Digital downloading has changed the way people purchase their music and videos looking at the statistics more people are opting for this service. The continued growth in legal download sites is encouraging, yet the industry struggles to improve the value of each digital customer. Apple has continued to improve iTunes making it even more attractive for its users. Not only do you have the option to purchase a variety of music and videos. Apple recently added movie rentals to iTunes including an attractive weekly 99 cent rental. iTunes has also improved the compatibility with Apple TV. It will be interesting to see whether Apple holds onto the #1 spot. With so many baby boomers and gen-Xers entering the market, there are certainly opportunities to sell more digital albums, promote older catalog titles, or create bundles that will raise revenues. In the near term that's going to be the best means available to narrow the gap on dwindling CD revenues.

Why are customers shifting from buying music in the traditional stores to downloading online? What lessons can music industry learn from the recent buying shift online vs offline? These are the focal questions this research attempted to answer.

## METHODOLOGY

With the focal questions in mind, this research studied the views of consumers with regards to how they obtained their music in the past and the present. A survey was developed to investigate the pros and cons in the consumer preferences on products and their quality, price and promotion, deliveries, together with other features available using different shopping methods. The following variables were based on literature reviews.

### Variable Selection

The following variable selections affect how and where consumers make their purchase decisions.

1. *product quality, purchased music is of good quality*
2. *variety of selection: present customers with large selections of music*

3. *freedom of choices: enable customer to buy only what they want and need*
4. *attractive price: offer attractive prices*
5. *easiness of purchases: enable customers least efforts to buy music*
6. *security and safety: transactions (including trips to store) are secure and safe.*
7. *privacy: private information is kept confidential*
8. *cost of obtaining is kept low*
9. *enable customers to make their own album*
10. *buying those songs I do not want to listen is a waste*
11. *can obtain free music legally*
12. *enable customers to learn what are popular, try, and know the feedback of others*

## Sampling, hypothesis, and test of hypothesis

The hypothesis for this research is to find if there is a significant increase of online downloading music purchase versus actually buying music in retail music stores based on present consumers.

### The hypothesis for this study states:

- H: There is no significant difference in methods of consumer music purchase decision online and offline.

Alternatively, there is significant difference in methods of consumer music purchase decision online and offline.

Due to the nature of this empirical study, the questionnaires were distributed in a shopping mall in a metropolitan area. The respondents were asked to evaluate the selected variables in a five point Likert scale, with 5=strong agree, 4=agree, 3=neutral, 2-disagree, and 1=strongly disagree. Since the data collected are of ordinal scaling, the Mann-Whitney nonparametric statistic test was used to test the hypothesis. The Mann-Whitney U test, often referred to as the rank sum test, was applied to test the null hypothesis. If the null hypothesis that the two samples were drawn from the same population were true, the totals of the ranks (or equivalently, the mean ranks) of the two samples would be expected to be about the same. The null should be rejected if the significance level is less than or equal to 5% in any one criterion.

## RESULTS

Two hundred fifty questionnaires were distributed, with one hundred eighteen returned usable questionnaires, which represent 47.2 percent of the total. Table 2 presents the general information of the respondents.

Table 3 presents Mann-Whitney nonparametric statistic test results. The test results show the significant differences exist in eight of twelve variables. Therefore, the null hypothesis is rejected. In other words, shopping music online and offline presents significant differences. These greater differences can be seen particularly on these variables as the significance level is zero:

2. *variety of selection: present customers with large selections of music*
5. *easiness of purchases: enable customers least efforts to buy music*
6. *security and safety: transactions (including trips to store) are secure and safe.*
7. *privacy: private information is kept confidential*
8. *cost of obtaining is kept low*

**Table 2: General information of the respondents**

| <i>Variables</i>  | breakdowns | %     |
|---|------------|-------|
| <i>Age</i>  | <18        | 14.00 |
|   | 19-35      | 69.00 |
|   | 36-55      | 11.00 |
|   | >55        | 6.00  |
| <i>Income</i>   | <30k       | 26.00 |
|   | 30-50k     | 30.00 |
|   | 50-75k     | 35.00 |
|   | >75k       | 9.00  |
| <i>Own cd players</i>   | Yes        | 66.00 |
|   | No         | 34.00 |
| <i>Own mp3player</i>  | Yes        | 65.00 |
|   | No         | 35.00 |
| <i>Methods of purchase music</i>                                | download   | 30.00 |
|   | in stores  | 22.00 |
|   | both       | 48.00 |
| <i>If your answered "both" in previous question, % download</i> | <20%       | 22.00 |
|   | 20-50%     | 30.00 |
|   | >50%       | 48.00 |
| <i>You purchase music online in the form of</i>                 | albums     | 18.00 |
|   | songs      | 21.00 |
|   | both       | 61.00 |
| <i>How often store purchase last month</i>                      | >5         | 10.00 |
|   | 3-5        | 29.00 |
|   | 1-2        | 56.00 |
|   | none       | 5.00  |
| <i>How often downloads last month</i>                           | >5         | 40.00 |
|   | 3-4        | 18.00 |
|   | 1-2        | 42.00 |

A few other variables show the significance levels between 1-3%:

1. *product quality, purchased music is of good quality*
3. *freedom of choices: enable customer to buy only what they want and need*
9. *enable customers to make their own album*

## MANAGERIAL IMPLICATIONS

The rejection of the null hypothesis presents that the music industry trend favors online purchases from the consumers' perspectives, while offline purchases are still an important vehicle for consumers purchase decision. This finding is important and suggests that the music industry will preliminary be focusing on the internet for heavier demands for the years to come.

The music industry is definitely going through a major transition in terms of the medium it is conveyed in. Just as vinyl records, cassettes, and CD's have slowly declined, there will soon be no need for consumers to be stepping foot in a store location to purchase music.

**Table 3: Mann-Whitney test results**

|   | Mann-Whitney U | Z     | Sig. |
|---|----------------|-------|------|
| <i>1. product quality, purchased music is of good quality</i>                               | 5805           | -2.28 | 0.02 |
| <i>2. variety of selection: present customers with large selections of music</i>            | 4929           | -4.03 | 0.00 |
| <i>3. freedom of choices: enable customer to buy only what they want and need</i>           | 5565           | -2.68 | 0.01 |
| <i>4. attractive price: offer attractive prices</i>   | 5970           | -1.85 | 0.06 |
| <i>5. easiness of purchases: enable customers least efforts to buy music</i>                | 5048           | -3.67 | 0.00 |
| <i>6. security and safety: transactions (including trips to store) are secure and safe.</i> | 4088           | -5.63 | 0.00 |
| <i>7. privacy: private information is kept confidential</i>                                 | 4679           | -4.47 | 0.00 |
| <i>8. cost of obtaining is kept low</i>   | 4282           | -5.25 | 0.00 |
| <i>9. enable customers to make their own album</i>  | 5884           | -2.16 | 0.03 |
| <i>10. buying those songs I do not want to listen is a waste</i>                            | 6136           | -1.61 | 0.11 |
| <i>11. can obtain free music legally</i>  | 6301           | -1.30 | 0.19 |
| <i>12. enable customers to learn what are popular, try, and know the feedback of others</i> | 6268           | -1.45 | 0.15 |

Through our findings, music downloading became more popular in recent years. The online retail stores such as iTunes, Napster, Rhapsody, Amazon etc. can increase their sales in many ways. They need to emphasize to the consumers that they will not receive any type of computer viruses and that they are a trustable site to shop from. Once a consumer receives positive online shopping experience they will be more likely to shop with them again. Internet sales can be increased by having sales, deals, and more discounts to attract consumers. Deals such as buy 2 or more songs, get 1 free, have online coupons (25% or 50%, etc.), and instead of having songs for 99 cents they can sell songs for 75 cents or less. Once consumers know of these special offers, they will feel more likely to purchase more songs online than going to the music stores and buying a tangible CD.

The recorded music industry is declining overall because of the inability of digital sales to grow enough to offset the decline in tangible sales. A trend that plays a role in this decline is the fact that many people today are listening to individual songs, rather than to an entire album, just as the original research presented earlier in this paper suggested as well. Revenue may come from individual songs, and that it is much harder to get revenue from entire albums and therefore making it harder to sell CD's. This is also supported because more people preferred just downloading one song off an album. It is very convenient for people to just put all the songs of their preference into one single device and play them whenever and wherever they want. At the same time, the traditional music stores may need to further enhance their online stores for their lost time and revenues.

As revealed in this study and many other studies, music industry is matured where only a limited growth in U.S. and many Western countries. However, in the emerging market, i.e. India and China, the demand for music remains strong. The problems in those countries are illegal downloading, and mass produced pirated cds sold in those markets that can never be translated to sales. So for the music industry as a whole, protecting intellectual property is an important task and the industry has to seek the supports from the law enforcement from the local government authorities, so far only limited results were produced.

In addition, the industry needs to further promote digital downloading, since it can reduce the cost of delivering music. This will be a cost side game, rather than focusing on the revenue.

## **LIMITATIONS OF THIS RESEARCH**

Due to the limited sample size and the rapid change in the music retail industry, this research has many limitations that can lead to future research projects.

We have found more issues and problems after we finished the research, i.e. how consumers switch from going to physical stores for their music need to digital downloading. The music retail industry is currently divided into two focuses: stores vs web. What are the fundamental differences in their strategic approaches? How do these strategies work? Are there any of these strategies eventually prevailing? These are the questions need to be answered in the future research.

## APPENDIX

The Mann-Whitney procedure is used to test whether two independent samples have been drawn from populations having the same mean. Hence, the rank sum test may be viewed as a substitute for the parametric t test or the corresponding large-sample normal curve test for the difference between two means. If any difference between the two population distributions is due only to the difference in location of the two distributions, then the Mann-Whitney test is equivalent to testing whether or not the two population means are equal. This is similar to the two independent sample t-test, where we must assume that the two population variances are equal.

The Mann-Whitney test is based on the notion that if the two independent random samples have been drawn from the same population, then the average of the sample ranks  $r(x_i)$  and  $r(y_i)$  should be approximately equal. If the average of the  $r(x_i)$  is much greater or smaller than the average of the  $r(y_i)$ , then this indicates that the two samples likely came from different populations. In order to carry out the test, the Mann-Whitney statistic  $U$  is calculated. This test statistic depends only on the number of items in the samples and the total of the ranks in one of the samples. It is defined as follows:

$$U = n_1 n_2 + \frac{n_1(n_1 + 1)}{2} - R_1$$

The statistic  $U$  provides a measurement of the difference between the ranked observations of the two samples and yields evidence about the difference between the two population distributions. Very large or very small  $U$

values constitute evidence of the separation of the ordered observations of the two samples. Under the null hypothesis stated earlier, it can be shown that the sampling distribution of U has a mean equal to

$$\mu_U = \frac{n_1 n_2}{2}$$

and a standard deviation of

$$\sigma_U = \frac{n_1 n_2 (n_1 + n_2 + 1)}{12}$$

Furthermore, it can be shown that the sampling distribution approaches normality very rapidly and may be considered approximately normal when both  $n_1$  and  $n_2$  are in excess of about ten (Hamburg, 1977, p. 530).

# UNDERSTANDING TAIWANESE BUSINESS LEADERSHIP STYLES

Lee Shiu Chen and Railton Hill  
Swinburne University of Technology, Victoria Australia

## ABSTRACT

*Asian economies have grown rapidly. Enterprises run by Chinese in Taiwan, Hong Kong, other South East Asian countries and in the People's Republic of China have become increasingly prosperous. This phenomenon has attracted attention from researchers in business leadership. Due to changes in the Chinese society of Taiwan, large business enterprises also have changed. They no longer function in the traditional family style. It is argued that a "hybrid" style of business leadership is emerging in modern Taiwan as well. Chinese leadership has been influenced by Confucian culture, and Daoism – the study of rules, moral philosophy, and ethics - with an emphasis on the relationship between individuals and the group. This paper explores this leadership style, proposing a research agenda concerning the nature of an hypothesized "hybrid" Chinese leadership style or styles in contemporary Taiwan.*

## INTRODUCTION

Many Asian economies have grown rapidly. Enterprises run by Chinese in Taiwan, Hong Kong, South East Asia, and in the People's Republic of China have become increasingly prosperous. With the end of martial law in Taiwan in 1987, Taiwan experienced major political and economic reforms. The changes gone through in the Chinese society of Taiwan resulted in a move toward democracy (Sheng and Chang 2004), and large business enterprises appear to have changed as well. Although the overall organization has not completely changed towards the western style, they no longer function in the traditional family style. Zheng and Lin (1998) called the result a "hybrid" style of business organization. The structures of many organizations have changed from family-owned to public trading corporations (Wong 1993). This phenomenon has encouraged a number of researchers to study the changes in organizational structures and leadership behavior (Smith and Wang 1996).

The purpose of this study is to explore the nature of emerging Chinese leadership styles, and how they affect the relationship with subordinates, particularly in Taiwan. Researchers point out that a distinctive *paternalistic* leadership style is the typical leadership style in Chinese business organizations. Leaders act as father figures, and possess clear and powerful authority. They are usually related to the business owner. Therefore, "guanxi" (the interpersonal relations between leaders and followers) play a very important role in Chinese leadership. Is this style of leadership really evident within Chinese, and specifically in Taiwanese, business organizations?

## Literature on Leadership

Such is the importance ascribed to 'leadership' in business, an enormous amount of research has addressed the phenomena over a long period. (Fleishman et al., 1991), yielding literally dozens of schemes attempting to define, describe and theorize concerning the nature and dimensions of leadership. We have settled on a *definition* of leadership as 'a process whereby an individual influences a group of individuals to achieve a common goal' (Northouse 1997 p2). Early research focused on special *traits or characteristics* of individuals (Bass 1990). Other approaches address *acts or behaviour* which perform to achieve group goals (Blake, R.R. and ;McCanse 1991). A significant literature focuses on the dimension of *power* within the relationships of leaders and

followers (French and Raven 1959), and more recently on leadership as an *instrument of goal achievement for group members* (Fiedler and Chemers 1984). Indeed, recent research has a focus on the *transformation* of followers through vision setting, role modeling and individualized attention (Northouse, 1997, p3).

## Differences between the cultures of West and East

Adler (1997) stated that within Eastern and Western cultures, different leadership styles have formed. In Western leadership there is a kind of equality between leaders and followers. Within Chinese business organizations, there is a clear hierarchy and set of role expectations between leaders and followers, from the outset (Tsai 2002). Therefore, Western leadership theories are not necessarily suitable for an understanding of business leadership in the East. Chen et al. point out that the main culture value differences between East and West are: 1. individualism versus collectivism. 2. power distance. 3. influence of the Confucian work dynamic.

Chinese leadership is influenced by Confucian culture (see below), Daoism – which emphasises rules, moral philosophy, and ethics - and the example of three thousand years of autocratic rule by Chinese emperors. Chinese leadership emphasises the relationship between individuals and the group, and their interaction. Chinese thinking is largely concerned with stable and harmonious relationships. Chinese leadership philosophy is based on traditional cultural norms and a family concept that is termed *collectivist*. Collectivist culture is also called “high-context”, in that leaders are concerned about their followers’ feelings. Communication between leader and followers has an indirect but succinct style which enables everyone to maintain “face”. In Chinese organizations there is much use made of *inspiration* and *consultation*. Chinese believe that a good leader-follower relationship is built on warm-heartedness. Inspiration and consultation will improve work effectiveness (Chen 2005) It is a reward-oriented strategy (Wu 2004). Chinese thought pays great attention to understanding the whole picture, combining separate parts, elements, or substances into a whole (Yang 1981).

Western organization is characterised by *individualism*, an emphasis on the individual person. People look after themselves and their immediate family including parents and children. The focus is on competition and ambition. The culture is “low-context”, and characterised by the use of a direct, equal and exact personal communication style (Wu 2004). Western thinking emphasises an analytic style which resolves complicated sections into different elements, which are then researched in depth (Yang 1981). Within western organizations use may also be made of menace, ultimatum and the like. In a punishment-oriented strategy (Wu 2004). This is argued to be very different from the collectivist ethos of the East.

Eastern culture maintains clear power distance. Followers accept the work from leaders, and whatever decision the leader makes, they follow and do not complain. According to Eylon and Au (1999) if leaders ask followers’ opinions or ask them to make decisions, followers will not trust their leader and will feel their leader has no ability to lead the group. The followers get used to obeying and being faithful to leaders or to the whole organization. Huang (1988) points out those family business owners always adopt an authoritarian style of leadership. Followers respect authority. Even if they have a different opinion, they will never argue, but will accommodate their leader (Cheng 2004). In western culture the distance between leaders and followers is usually smaller. Followers believe that an unfair situation should not arise in the organization, and that leaders and followers should stand equal, have the same rights, and participate relatively equally in decision making. Followers want leaders to play a supporting role (Brockner et al 2000).

Confucian thought emphasises that superiors should be concerned about the juniors, and juniors should have respect for and be faithful to their superiors. This results in:

1. a difference in seniority, gender, role, and position (this concept being similar to that of power distance)
2. a focus on harmony and cooperation with each other.
3. a belief that you do not force other persons to do things that you do not want to do.

## Leadership Style(s) in People’s Republic of China and Taiwan

Silin (1976) studied Taiwanese leadership in a privately owned enterprise. He found distinctive Eastern styles of leadership. The view of participative leadership was quite different from that of America and Japan. Silin found differences between the Eastern and Western standards of *morality* and *authority*. Redding (1990) studied the structure of Chinese family enterprise and its management style, in Hong Kong, Singapore, Taiwan, and Indonesia. He found Chinese business culture had a distinctive style he called “Chinese capitalism.” Patriarchy is one of the most important elements of this style. Yet he proposed the style of leadership was based on “benevolence”, and pointed out that Chinese societies have a strong legacy of *personalism* – a reliance on interpersonal bonding as the basis of transaction.

Westwood (1997) investigated South East Asian Chinese owned enterprises, developing a *headship* concept. A father is thought to possess both benevolence and authority, and the ‘headship’ role is the combination of discipline with a fatherly benevolence. Westwood (1997) stated that his *patriarchal (headship)* style is likely to occur where 1) structure is centralized, and 2) there is not a high level of complication in systems and procedures. The style will feature a general relationship context emphasising harmonious relationships, moral leadership, and personalism, where the leader allows personal opinion to be included in decision-making. In summary, Chinese leadership is generally termed “paternalistic”. Because this is based on elements of Chinese culture, such a style is thought to be effective in Chinese organizations. (Cheng, Huang and Chou 2002; Wu, Hsu, Cheng 2002; Cheng, Hsieh and Chou 2002). Farh and Cheng (2000) state that this type of leadership is more suitable than others for Chinese family business organizations. Chinese leaders tend to control information, passing it to an in-group only. The style is said to suit leadership in simple environments where there is no requirement to use a lot of modern technology.

According to Brockner et al. (2000), research in Taiwanese leadership is quite rare. Redding and Wang (1986) point out that in Chinese business organizations, the leadership style is “directive and authoritarian” (p278). Chinese followers are said to be more comfortable with this type of leadership than other styles, because an authoritarian leader is considerate towards followers (Bond and Hwang 1986). Traditionally, Taiwanese leaders tend to use an autocratic leadership style, controlling the information, refusing followers participation in meetings, only giving them limited information, and instructing them to do what he or she wants them to do, all with the purpose of preserving the leader’s position, power and control of the business (Wu 2006). The style emphasises a leader’s prestige, individual authority and control of followers via autocratic behaviour, belittling of followers’ ability, rectification of image saving “face” and admonishment. Followers respond with obedience, submission, reverence, and shame. Although leaders use an authoritarian style of leadership, they still want to keep good relationships with their followers. Therefore, they do favours for them, look after followers individually, and defend followers’ reputations. Followers feel grateful and seek ways to return kindness. (Zheng 1995a, 1995c)

Wren (2005) stated that the paternal model was a continuance of male-dominated culture. This focuses on the *leader’s* needs. Workers, just like children at home, need parents’ guidance, direction, and a father’s wisdom. Leaders do all important thinking, make important decisions, control all information, and command all of the activities as fathers normally do at home in traditional Chinese cultures. Children (followers) only do what father (leaders) order; if any problem occurs, leaders take the responsibility. Laub (2003), states that although autocratic or paternalistic leadership can cause damage and have the opposite of the desired effect, this type of leadership will remain firmly rooted, influencing organizations strongly. Anderson (2005) states that although a paternalistic leadership style has negative aspects, it also has very positive points. For example:

- Contrary to argument that followers, like children, are always being passive, doing what the leader (adult) says, and never growing up, there is another view, that one day children will become adult, in response to the challenge of being someone else’s parent.
- In regard to the treatment of the children, the positive viewpoint argues that parents treat every child according to their interests, personalities, skills, and abilities.

Paternalism comes from the Latin “pater.” The leader acts like a father at home, and treats followers as children, and acts for the good of others, as parents do for their children. This is an hierarchical pattern. A father makes decisions on everything for everyone in the family. Also, Weber stated that the critical subject is “domination”. He divided this domination into three standard models: “legal domination”, “traditional domination”, and “charismatic domination”. Under “patriarchalism” (headship), every single human being’s lifestyle is to a great

extent influenced by the related social whole. The patriarchal authority controls this relationship. This leadership style has gradually been discarded by Chinese in Western countries, but is still popular among Chinese family enterprises (Hamilton 1990). In terms of Blake and Mouton's managerial grid, Chinese paternalistic leadership style fits as types 1.9 mixed with 9.1. The leader-follower relationship is just like the parent-child relationship at home. The reward comes from the 1.9 types, and punishment comes from 9.1.

According to Farh and Zheng (1998c) the Chinese family enterprise paternalistic style has the three important elements of authoritarianism, benevolence and morality. Regarding the last of these, *morality*, leaders in this context have to display a higher level of personal integrity and self-cultivation, personal virtues, self-discipline and unselfishness, and must treat staff equally without discrimination. As noted, paternalism manifests in a context characterized by centralization, low formalization, harmony building and personalism. Chinese patriarchal leadership style combined strict and impartial discipline and authority, with a father's kindness, honesty, and moral integrity expressed in a personalistic atmosphere (Farh and Cheng 2000). The relationship between leaders and followers is complementary (Pye 1981). According to Zheng (1995), in a patriarchal (headship) style, leaders did not treat every follower equally. They divide followers into *insiders* (in group members) and *outsiders* (out group members). Leader's behaviour towards insiders is to "do favours", treating them differently to the outsiders. Depending on "guanxi" (relationship), "loyalty", and "ability", people are put into different categories.

**Table 1: Paternalistic leadership style summary:**

| Authoritarianism:  | Benevolence:   | Morality:   |
|--|--|---|
| <b>Leaders:</b> <ul style="list-style-type: none"> <li>• have absolute authority</li> <li>• do not tolerate any challenge</li> <li>• control followers</li> <li>• not willing to empower</li> <li>• control information</li> <li>• control communication</li> <li>• ignore followers' opinions</li> <li>• defend leader's dignity</li> <li>• show leader's self confidence</li> <li>• request high effort</li> <li>• rebuke poor effort</li> <li>• provide guidance</li> </ul> | <b>Leaders:</b> <ul style="list-style-type: none"> <li>• have long term care for followers' holistic individual or familial welfare or well being.</li> <li>• treat followers as a family member</li> <li>• ensure the work</li> <li>• help in crisis</li> <li>• encourage and uphold</li> <li>• show consideration</li> </ul> | <b>Leaders have to</b> <ul style="list-style-type: none"> <li>• better personal integrity</li> <li>• self cultivate</li> <li>• have better personal virtues</li> <li>• perform with self discipline</li> <li>• demonstrate unselfishness</li> <li>• treat equally without discrimination</li> </ul> |

## Towards a 'Hybrid' Taiwanese Leadership Style?

Taiwan is a small island country, surrounded by sea. After 20 years of democracy, Taiwan has become freer not only in politics and business, but also in education. Increasingly parents sent their children overseas for study. Because of the influence of Western education and cultures on the young generation, their thinking has tended to become much more westernised. Society in Taiwan has begun to change, older generations thinking about handing over the businesses that they built to the next generation. However, they do not give their businesses to the young people with a free hand to run them, for as parents they frequently try to maintain an influence over the running of the business. Business leadership styles in Taiwan would be expected to be changing from the traditional paternalistic leadership style to a more democratic (participative) leadership one. However the body of research on Taiwanese leadership theory and leadership style is still very small.

Drawing then on the broader body of leadership research, and placing alongside the characterisation of Chinese/Taiwanese leadership styles discussed above, we propose a research agenda designed to assess empirically 1) the nature of Chinese/Taiwanese leadership 2) any detectable difference in the business leadership evident amongst Chinese businesses in the Taiwanese context.

Further, we propose the development of measurement instruments specifically designed to assess 'Chinese' elements of leadership style. We note that possibly to an even greater extent than in the west, Chinese business leadership positions will tend to be 'assigned', rather 'emergent' (Northouse 1997 p5). This fact, and the 'authoritarian', 'paternal' or 'headship' styles of leadership described above seem to lend themselves towards measurement with instruments which focus on leadership *behaviours* and their *context*, rather than the assessment of specific (possibly innate) personal *traits* of business leaders.

We propose the use instruments incorporating elements of tools such as the Leadership (managerial) Grid (Blake and McCanse 1991) - which measures spatially against dimensions of concern for *people* and concern for *results* - the Situational Leadership II model (Blanchard, Zigarmi and Zigarmi 1995) - which measures *supportive* and *directive* behaviours - and Least Preferred Co-worker (LPC) Scale as developed by Fiedler and Chemers (1984). The latter enables close scrutiny of leader - member relations, within different types of task and position contingencies, and hence seems well adapted for the 'collectivist' Chinese cultural context. Another tool which could be incorporated is the Path - Goal Leadership Questionnaire (Indvik, cited in Fulk and Wendler (1982). This provides data on how leaders motivate subordinates to accomplish designated goals, drawing on knowledge concerning worker beliefs (specifically 'expectancy theory', which examines work beliefs regarding the capabilities, likely outcomes and payoffs/rewards). Again, the notion of reward and punishment seems germane to authoritarian/ paternalist/ headship styles of leadership. Given the connotation of masculinity often associated with Chinese leadership style, we propose testing of any gender linkages to leadership style by incorporation of equal numbers of males and females within the research design developed.

## Research Questions and Proposed Research Design

We propose the following research questions for research.

1. Can key elements of a distinctively Chinese leadership style - in terms of behaviours, contexts, contingencies, leader-member relations and worker expectancies and beliefs - be measured?
2. Will such measurements allowing comparisons to western styles of leadership,
3. Will such measurements allowing comparisons between various sub categories of Chinese style, such as may be found in Taiwan and amongst other Chinese communities? Is there a 'hybrid' Taiwanese leadership style?
4. If the existence of traditional and hybrid 'Taiwanese' leadership styles can be demonstrated, are there empirically demonstrable *gender differences* in the prevalence of such leadership styles?
5. If such differences can be established, are they age related, in terms of the ages of leaders and followers?

Once the above questions are answered, it may be possible to move forward to consideration of issues of the effectiveness of Chinese or hybrid styles of business leadership.

In order to answer these questions, the following design will be used:

- 1). Initial qualitative *exploratory research*. Interviews will be carried out with 25 female business leaders in each of the two countries examined (PRC and Taiwan) from a wide range of ages (25-60), and with 25 male business leaders from the same age groups.
- 2). Empirical *Survey based study*: In order to clarify distinctive characteristics of eastern leadership quantitatively, a survey instrument regarding leadership will be developed and administered to appropriate and substantial sample groups in Taiwan and China. The survey instruments will utilize scales as discussed above.
- 3). Case Studies: in order to further identify and analyze eastern leadership styles, detailed case studies will be conducted within individual businesses within Taiwanese and other Chinese contexts.

Thus, we propose methodological triangulation (Oppermannt 2000), via a combination of quantitative, qualitative and case study research methods. The findings should be of much practical value in understanding the nature of Chinese and Taiwanese leadership, and in subsequent comparisons.

# **GAINING SUSTAINABLE MOMENTUM IN MARKETING TECHNOLOGICAL INNOVATIONS: INSIGHTS FROM A NETWORK APPROACH TO STRATEGY**

**Hsin-hui Chou and Judy Zolkiewski**  
**The University of Manchester, UK**

## **ABSTRACT**

*A firm's sustained competitive advantages are often derived from its inter-organizational relationships (e.g. Baraldi et al. 2007). For those technology-based companies who need to cope with constantly changing conditions, technological prowess as well as a firm-level strategic thinking may not be able to guarantee the success and provide sustainable momentum in marketing technological innovations. By using the insights from a network approach to strategy, we suggest that a firm should be equipped with four types of strategic ability to gain sustainable momentum from marketing a technological innovation: network orienting, network building, network enhancing, and network mobilizing.*

## **INTRODUCTION**

A successful technological innovation must be able to make the products or services based on it spread from the early market to the mainstream market (Easingwood and Harrington 2002; Moore 1991), generating fresh impetus to boost the firm's growth. In technology-intensive industries where the phenomena of technological uncertainty, market uncertainty, and competitive volatility prevail (Mohr et al. 2004), technological prowess no longer guarantees success in the markets. Moreover, in a "no business is an island" environment, a firm's competitive advantages and long-term sustainability are not only determined by its internal capability but its networking competence with other organizations (Håkansson and Snehota 1989). By building a linkage between Moore's (1991) *Crossing the Chasm* and Christensen's (1997) *Innovator's Dilemma*, the study aims to elaborate on how a technology-based firm can achieve sustainable momentum using the perspective of network strategy (or interaction approach to strategy).

## **MARKETING TECHNOLOGICAL INNOVATION**

Moore's (1991) influential work *Crossing the Chasm* mainly addresses three fundamental parts: the early market and the mainstream market separated by a chasm, the valley of death (see Figure 1). In his work, the first wave of momentum in commercializing technological innovation hinges on the firm's selection of the initial market segment and its strategy to appeal to this group of adopters. However, the strategy that achieves the initial success in the early market may fail to attract the adopters from the mainstream market and cause the innovation (or products based on it) to become stuck in the chasm due to the critical differences of needs between early market customers and mainstream market customers.

**Figure 1. Technology adoption curve (adapted from Moore 1991)**

In order to sustain the momentum, the firm has to adjust its strategy, including the construction of the whole product in particular, to surmount the chasm and facilitate the penetration of the mainstream markets. Here, the development of the whole product refers to the efforts of a firm to combine complementary resources (e.g. the combination of software and hardware products) to create a safer atmosphere of innovation adoption. In addition, the existence of a chasm has been validated by Goldenberg et al.'s (2002) empirical data from the consumer electronics industry, showing that between one-third and one-half of their cases encountered a saddle, a slump in sales after initial peak.

Built on Moore's work, Easingwood and Harrington (2002) prescribe a four-step procedure for managers to launch (marketing to early market customers) and re-launch (marketing to mainstream customers) a technological innovation: marketing preparation, targeting, positioning, and execution. Following these principles high-tech firms are able to accumulate momentum from the launching stage to the re-launching stage, shorten the chasm period, and propel a technological innovation to its potential (see Figure 1).

Furthermore, in Slater and Mohr's (2006) work which can be viewed as an extension of Moore's work, the technology adoption curve is combined with Christensen's (1997) *Innovator's Dilemma*, suggesting that technology-based firms should develop contradictory skill sets to be successful across a range of innovations. From his research in the hard disk drive industry, Christensen (1997) argues that the incumbent firm who has successfully brought the technological innovation to the mainstream market may be disrupted by the new entrant who introduces a different set of performance and price attributes relative to the existing technology, if the incumbent firm is inattentive to the emergence of this invading technology or reluctant to take responsive actions.

Although Moore (1991) and Easingwood and Harrington (2002) stress the importance of utilizing partnering to cross the chasm and penetrate the mainstream market, a great deal of attention in their work and others (e.g. Slater and Mohr 2006) is placed on the firm-level strategies and competences. In a business environment in which each company (or actor) has an embedded context with its connection with other actors (Halinen and Törnroos 1998), the firm-level strategic thinking provides a limited explanation of momentum accumulation from one technological innovation to another. Thus, the rest of the paper aims to use the insights of network (or interaction) approach to strategy to expand our understanding of gaining sustainable momentum on the basis of Moore's (1991) and Christensen's (1997) work.

## **INSIGHTS FROM THE NETWORK APPROACH TO STRATEGY**

The network approach emphasizes that it is the interplay between actor bonds, resource ties and activity links that makes a business environment come into being (Håkansson and Snehota 1995). The results of interaction

embed a firm in a web of exchange relationships and create a unique network position, influencing and being influenced by other actors (Johanson and Mattsson 1992). Thus, a firm's performance is determined by its interaction with other organizations; and such network phenomena have not only a strategic significance but also a relevance to the firm's long-term sustainability (Baraldi et al. 2007).

In order to have its momentum sustained, a firm must be able to manage its relationships, that is, to integrate, build, and reconfigure its internal and external resources and competences through interaction with others (Eisenhardt and Martin 2000), especially in the face of a highly dynamic technology-intensive environment. Based on the insights from the network approach to strategy, we propose four types of strategic ability for the company to build a firm stand in the early market, cross the chasm, achieve success in the mainstream market and bridge technological discontinuities accordingly, generating the sustainable momentum (see Figure 2).

**Figure 2. Four types of strategic ability**

## Early-market strategy: Network orienting

The adopters in the early market, consist of two groups and are termed by Moore (1991) as technology enthusiasts and visionaries, appreciate a product based on the technological breakthrough instead of improvement. Their endorsement is crucial to the survival of the product. However, their opinions can guide a firm in diverse market directions and in a highly risky environment. To build the initial momentum in the early market, we propose a *network orienting ability*. This ability focuses on a firm's efforts in seeking for inter-organizational commitments on the investment of the technology as well as in getting access to new complementary resources, so as to reduce the risks, create core capabilities from a cosmopolitan learning (Kash and Rycroft 2002), develop the best possible technology (Mohr et al. 2004), and cultivate a winner image (Easingwood and Harrington 2002).

Nokia's entrance into the market of mobile payment services (Dittrich and Duysters 2007) can be a good example of network orienting strategy. By utilizing joint R&D agreements with Nordea Bank and Visa International, whom it did not collaborate with before, Nokia explored this new market with a new software development, that is, a pioneering pilot to test and verify mobile payment services based on dual-chip technology. This strategy is characterized by relatively weak ties, low commitments and opportunistic behaviors (Dittrich and Duysters 2007). Although it is a period of trial and error (Kash and Rycroft 2002), this allows the company to better develop its core competence and understand its network position to facilitate future network building.

## Crossing-the-chasm strategy: Network building

The fundamental difference in needs and wants between early market customers and mainstream market customers may cause a product based on this technological innovation to be stuck in the chasm if a technology-

based firm doesn't adjust its strategy that is successful in the early market (Moore 1991). To sustain the momentum, the priority for the firm is to minimize the time in the chasm by transforming the product into a "whole product" that aims to be the best solution possible (Mohr et al. 2004). This strategy can be complemented by *network building ability* in which we take into account Ford and Saren's (2001) technology bundles and Ritter (2004) and his colleagues' identification of four types of firms and organizations in a value net. These two concepts are explained in the following.

After going through a cosmopolitan learning and exploration process in the early market, the firm needs to define its core competence (either product technology or process technology or marketing technology; that is, one of technology bundles suggested by Ford and Saren (2001)) and combine this with complementary technologies performed by other business actors to build a whole product. The latter requires the firm to develop its relationship portfolio which may consist of suppliers, competitors, customers, and complementors (the four types of firms). Take the relationships with competitors for example, it concerns a firm's ability to co-develop, co-invest, or co-promote with competitors for a product or technology standard which is decisive to the success in the mainstream market (Easingwood and Harrington 2002). Thus, as Ford et al. indicate (1998), "...technological resources are only valuable if they are important to other companies and when they are combined with the technologies of those other companies (p. 227)".

Matsushita's triumph in the videocassette recorder (VCR) standard competition and Microsoft's dominance in the operating system for personal computers (PCs) just illustrate the importance of network building strategy (Wonglimpiyarat 2005). In addition to the development of their core competences, both Matsushita and Microsoft were good at combining external complementary resources to construct the whole products and increase their market acceptance. For Matsushita, its utilization of channel partners and the efforts in extending recording capacity to encourage film studios to release films on VHS format could account for its win-out of VCR standard battle and the later prevalence in the mainstream market. As for Microsoft, although it faced the challenges from IBM's OS/2 and Apple's MacOS, its strategy of low-cost licensing of its Windows via OEM agreements with hardware manufacturers, the strategy of product bundling to include software applications and the collaboration with Intel's microprocessor (known as Wintel machines) allowed it to establish a solid basis in the mainstream market.

## **Mainstream-market strategy: Network enhancing**

When a network is built, the firm embeds itself in a deep relational structure and obtains a unique position, producing and delivering values (Halinen and Törnroos 1998). In addition to be able to surmount the chasm with a whole product, the fundamental choices of business partners allow the firm to establish a beachhead (or a kingpin) in the mainstream market (Easingwood and Harrington 2002; Moore 1991). To deeply penetrate the mainstream market (or generate the bowling-alley effect termed by Moore (1991)), we suggest that the firm should strengthen its cooperation and collaboration with partners; here, we term this as their *network enhancing ability*.

In the mainstream market where a technological trajectory is well established and market segments are well defined, network enhancing ability concentrates on broadening and strengthening the knowledge of established technology and exploiting complementary resources within the business network (Dittrich and Duysters 2007; Kash and Rycroft 2002). Along the technological trajectory the company may participate in a range of value systems (or business nets), such as vertical nets or horizontal nets, and even enter into a renewal net by enhancing and adjusting its core capabilities (Möller and Rajala 2007). Thus, the firm's utilization of network enhancing ability is the source of sustained momentum while it is penetrating the mainstream market.

Intel's success with respect to microprocessors for PCs can exemplify the application of network enhancing strategy in the mainstream market. A key factor of its success hinges on its cooperation and collaboration with network members (including software providers, hardware manufacturers, and channel partners) to continuously release derivative products around the whole product to fill the technological gaps without holes in the mainstream market (Tabrizi and Walleigh 1997), enabling its momentum to be sustained. The network enhancing strategy stresses the firm's ability to exploit network aggregated resources to pursue business net

efficiency and maximize the market coverage, meeting the diverse needs of mainstream market customers, e.g. low-end and high-end segments (Dittrich and Duysters 2007; Kash and Rycroft 2002; Möller and Rajala 2007).

## **Bridging-technological-discontinuity strategy: Network mobilizing**

The works by Christensen (1997) and Slater and Mohr (2006) have shown that a firm who rests on its laurels in the mainstream market and ignores the emergence of new technology may easily lose its momentum and suffer from the invasion of a new entrant who embraces a new technological paradigm. Moreover, Suárez and Utterback (1995) indicate that investing in a new technology (e.g. T2 in Figure 2) is a pivotal event that gives fresh impetus to a firm's growth. Actively bridging technological discontinuities (e.g. from T1 to T2), thus, could help the firm avoid innovator's dilemma and produce long-term sustainability.

The accumulation of adaptations (the efforts to eliminate the mismatches in interaction (Halinen 1997)) enables an actor, who embeds itself in interconnected relationships, to function better (e.g. achieving operational efficiency) in the mainstream market; however, it also produces constraints on the firm's interaction with others (Håkansson 1989). Besides, making a transition to a new technological paradigm or trajectory may make a firm's existing investments obsolete (Afuah 2000; Slater and Mohr 2006) and require it to expand, explore or eliminate its core capabilities that could result in its entrance into a new business net (Kash and Rycroft 2002; Möller and Rajala 2007). Here we suggest that a *network mobilizing ability* can help bridge technological discontinuities successfully. This ability stresses how a firm balances its network positions in serving both existing and new business nets by mobilizing the resources and actors. The concept of mobilization comprises Lundgren's (1992) network integrative mobilization and network changing mobilization in which the former refers to the process of extending and expanding the existing activity cycles while the latter refers to the process of establishing new activity cycles or breaking old ones.

Although Toshiba's withdrawal of HD DVD business in early 2008 puts an end to its format war with the rival format Blu-ray disc which was championed by Sony (Moses 2008), this case at least highlights an important issue concerning sustainable momentum. Technological discontinuity necessitates new investment and consequently investments in existing technology may become redundant. This is especially important for firms whose business operations rely on existing DVD technological dependences, such as the manufacturers of optical recording media. In order to successfully make the transition to the next generation of DVD, these manufacturers need to overcome these obstacles, including differences in product design (e.g. laser tracking requirements) and incompatible production systems (Weiss 2007), which result in major changes in the existing actors-resources-activities structured network. Consequently, these firms may formulate their strategies accordingly, e.g. integrative mobilisation or changing mobilization (Lundgren 1992), by reviewing their portfolio of relationships and network positional resources (Baraldi et al. 2007).

## **MANAGERIAL IMPLICATIONS**

In this paper we address a firm's pursuit of sustainable momentum in technology-intensive industry by drawing on an interactive and network perspective of strategy and propose four types of strategic ability in accordance with the development of technological trajectories. To apply these four abilities in the practical settings, we find three crucial inter-connected managerial issues: organizational interfacing, network adaptation and the balancing of network positions.

First of all, a firm's relationships in the business environment is the source of competitive advantages (Håkansson and Snehota 1989), but it is also the result of its functional departments' interaction with other actors', such as R&D, sales and marketing, and procurement. That is, building a sound organizational interface (e.g. R&D-marketing or R&D-production) can help develop the firm's core competence and identify the needs of complementary resources for the whole product establishment (Moore 1991), technology bundle (Ford and Saren 2001) and network member selection (Ritter et al. 2004). Moreover, in the face of the emergence of technological discontinuity, a good interfacing mechanism is able to remove organizational friction (Håkansson and Waluszewski 2002), reach common grounds (e.g. the willingness to sacrifice some of exiting investments) and identify new initiatives (either product or process) required for bridging the discontinuity (Lundgren 1995).

Secondly, in order to enhance the function of an established network (e.g. network efficiency (Möller and Rajala 2007)) while penetrating the mainstream market, the firm will increase its commitments with its counterparts, develop collective goals and fine-tune the inter-firm interfaces accordingly (e.g. Firm A's QA with Firm B's Production), including the development of routines and procedures and elimination of mismatches (Halinen 1997). Through this adaptation process an actors-resources-activities structured network is reinforced (Håkansson 1989). Last, but not least, a firm's resource mobilization following its bridging of technological discontinuity provides the firm with multi-positions, serving both the existing business net and newly developed nets. In terms of balancing multi-positions, the firm has to take into account when to adopt the new technology, how to maintain the competitive advantages of the existing net, and how to adjust the portfolio of relationships. For the first question, a good organizational interface could generate useful information (e.g. readiness of technical development) for decision making. For the last two, examining the impact of technological change on the firm's co-opetitors' (e.g. suppliers and complementors) performance and capabilities (Afuah 2000) could help adjust the firm's resource deployment and portfolio of relationships, such as phasing out of the product or developing alternative suppliers for the cost-down of the product in the existing net.

## CONCLUSIONS

No business actor can have all the resources that are required in developing and commercializing a technological innovation, that is, no firm can escape from interacting with others. Moreover, Baraldi et al. (2007) stress that strategies emerge from interactions, showing that firm-level strategies may not be able to cope with rapidly changing conditions in technology-intensive industries. This paper expands the strategic thinking of marketing technological innovations from the firm-level to the network-level by incorporating the insights from the network approach to strategy into the works by Moore (1991) and Christensen (1997) and proposes four types of strategic ability for technology-based firms to pursue the long-term sustainability. However, the most challenging task for a technology-based firm would be learning and using the network mobilizing ability. This ability involves a firm's elimination and/or exploration of capabilities which may in turn result in radical changes in its relationship portfolio. Our understanding of when an actor decides to bridge technological discontinuities, how it uses this network mobilizing ability, and what accompanying impact on its relationships is quite limited. It would be fruitful if more efforts, both theoretical and empirical, are devoted to this area.

# KNOWLEDGE TRANSFER THROUGH NETWORKS: THE CASE OF TURKISH SMALL AND MEDIUM SIZED ENTERPRISE (SMES) DEVELOPMENT AND SURVIVAL.

**Dababrata Narayan Chowdhury and Lynne Butel**  
**University of Plymouth, UK**

## ABSTRACT

*This research paper proposes a Knowledge Transfer and Networking approach to the development of SMEs in Turkey. The modern world is frequently referred to as a world of knowledge. The study examines the knowledge transfer process of SMEs business networks in the Turkish Textile Industry. The problem firms face is how to manage knowledge to gain efficiency and competitive advantage forced modern companies to think about Knowledge Transfer and its applications. However, many Turkish SMEs seem to be unaware of the importance of managing this process. This research reviews and develops a **FirstAid model and Pipe- Line(P-L) Model** for SMEs in Turkey in order to implement or better the existing knowledge transfer procedures. This also helps one understand the level to which the process of knowledge transfer is entertained in SMEs to survive.*

## INTRODUCTION

To understand how the Knowledge Transfer (KT) and Networking operates in the Turkish Textile industry, will give insight into the competitiveness of SMEs. Knowledge Transfer Networking(KTN) has been defined by Seufert, Von Krogh, and Bach (1999), as “signifying a number of people, resources and relationships among them, who are assembled in order to accumulate and use knowledge primarily by means of knowledge creation and transfer processes, for the purpose of creating value.” In order to survive and grow, there are many methods that firms can use. Firstly, networking can be an end in itself according to Gilmore et al (2001) and has proven a successful tool for smaller firms. In order for firms to appreciate the importance of networking and to consciously and successfully implement the networking concept through planning, they need to overcome the regular problem of lack of networks expertise. The difference between the success and failure of small firms can be the availability of and access to the relevant information and support services that have become increasingly common (Summon 1997). The business support infrastructure such as IT, government support and support by private organization that we see today are of great value to struggling SMEs (Sparrow 1999) and the benefits of this form of knowledge transfer are perhaps not emphasized enough. Knowledge transfer is, therefore, a critical factor in improving the growth prospects of many smaller businesses via networks. An understanding of the development and implementation of SMEs` Knowledge transfer is also crucial given the importance of innovation to the improvement of Network processes within organisations. The development and introduction of networking activities are directly related to changes in Knowledge Transfer practices such as management style, the flow of information and training. In the following sections, the relevant literature is reviewed to identify the gaps with respect to knowledge transfer and network in Turkish Textile Industry.

## THE CHARACTERISTICS OF KNOWLEDGE

One of the most used and consistent definitions for “Knowledge” is proposed by Davenport and Prusak: Knowledge is a flux mix of framed experiences, values, contextual information, and expert insights that provides a framework for evaluating and incorporating new experiences and information. Knowledge has some specific

characteristics. Firstly, knowledge is hardly measurable. Secondly, knowledge can be transferred from one person to another person, but the original owner of the knowledge will not lose the knowledge. Because of this knowledge is called a non-rivalry good. Thirdly, knowledge is cumulative, for example, if one wishes to absorb new knowledge one should at least have already an adequate base of knowledge (Kerste et al, 2002). The most simplistic approach to defining the characteristics of knowledge was proposed by Polanyi (1966) and later reiterated by others such as Nonaka and Takeuchi (1995) who made the distinctions between explicit and tacit knowledge. Explicit knowledge is knowledge that is easily codified and shared; an example of this is product specifications. In contrast, tacit knowledge is personal, rooted in values and routines and is difficult to share, for example, presentation skills (Polanyi, 1966). Both Szulanski (1996) and Simonin (1999) highlight the fact that the tacit content in knowledge can make it harder to understand and requires more social interaction before those involved have a similar understanding. These authors see this knowledge as knowledge with impact, because it is the transfer of these tacit elements and that give knowledge its unique nature and strategic value. For example, the knowledge management literature highlights the need to recognise the tacit elements in knowledge so that it can be managed by using sufficient social interaction to ensure its transfer (Nonaka & Takeuchi 1995; Simonin, 1999).

## Understanding Knowledge Transfer

Transfer of knowledge includes two actions: one is transmission which means sending knowledge to potential receiver and another is absorption meaning that knowledge must be incorporated either by a person or a group. As such, Davenport and Prusak have expressed this concept as “*Transfer = Transmission + Absorption*”. (Davenport & Prusak, 1998). Nonaka and Takeuchi (1995) describe knowledge creation as a spiralling process that starts with the individual and then moves across the organisation in a never-ending process of knowledge transfer (Nonaka & Takeuchi, 1995). This highlights the value that needs to be placed on understanding knowledge transfer in SMEs. Transfer of knowledge from one set of individuals to another has been a key area of interest for knowledge management and knowledge transfer researchers. The terms, knowledge transfer (Gupta & Govindarajan, 2000a), knowledge flows (Gupta & Govindarajan, 2000a), and knowledge distribution (Huber, 1991) appear to be used interchangeably in the literature to describe the process of knowledge transfer. The literature identifies that knowledge transfer is a dynamic process between the individual or group and the organisation's knowledge stocks. Alavi(2000) highlights the importance of knowledge transfer by suggesting that for superior performance of a social entity, knowledge generation and its successful transfer needs to take place. Cross, Parker, Prusak, and Borgatti (2004, p. 62) also posit the value of knowledge sharing in today's economy, "where collaboration and innovation are increasingly central to organizational effectiveness." Knowledge transfer can be defined as a “Knowledge systematic approach that obtains, organise, restructures, warehouse or memorise, deployment and distribute knowledge to points of action where it will be used for sharing and adopting best practices” (Wiig, 1997). Therefore this highlights the importance that need to be placed on understanding SMEs networks for knowledge transfer which are explained in brief in the following section.

## SME Networks

In a successful knowledge transfer, the experience of one network actor affects another (Argote and Ingram, 2000). While individuals ultimately have to perform the transfer of knowledge, this article focuses on knowledge transfer between business units, extending the work of previous authors at this level of analysis (Hansen, 2002, Tsai, 2001). SME networks have been classified as ‘personal’, ‘support’ and ‘industrial’ with emphasis being given to the sets of dyadic relationships that comprise the network (Shaw & Conway, 2000: 367). Industrial networks are the exchange relationships involving customers and suppliers forming part of SMEs value adding processes. These three types of networks are central to the existence of many SMEs (Martin, 2000). In practice an SME's personal, support and, even sometimes, industrial networks may overlap significantly. Interest in personal networks has been stimulated by attempts to understand how involvement in these networks can help create, develop and grow small firms (Shaw & Conway 2000: 370). Personal contact networks, it has been found, help generate social support for the owner, extend strategic competencies in terms of identifying opportunities and threats, and can supplement internal resources to resolve major operational problems. Owners can save significant time and money by accessing information, advice and resources through their personal

networks. Social networks help build relationships that can give the small firm access to new markets, technology, finance and political protection (Doukas & Kalantaridis, 2000). After a thorough analysis of existing literature on Knowledge Transfer and Knowledge Networks, this research paper came to a conclusion where there is a wide gap in between the communication systems in SMEs and would like to propose a model below to bring down the communication gap to offer a better Knowledge Transfer process.

## First Aid Model

The Network First-Aid model is a new concept this research would like to propose. The below diagram shows that any department within the organization should start by listening to each other, understand, trust and collaborate with each other in the network.

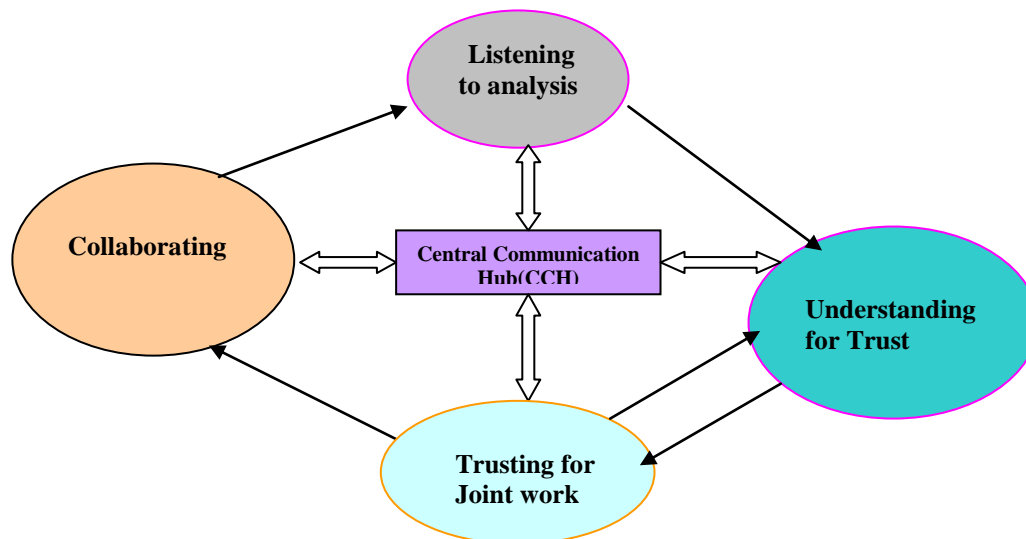

Diagram 1: Network First Aid Model for SMEs.

In any form of knowledge transfer business network, listening, trusting and collaborating are the main elements to connect each other to businesses that are geographically separated. The Listening section of the above diagram shows that any conversation in the network is gathered and passed on to the understanding section. Understanding the gathered knowledge is trusted and then collaborated with the entire organization to share the knowledge. Network **First Aid** forms a central communication hub which helps the entire knowledge transfer process within the organization. Central communication hub could be a set of expertise, group of IT experts or a computer that receives and forwards the information to other sections. It is a reserved knowledge that constitutes experienced knowledge transfer professionals and could be contacted for any sort of procedural help that may be required by other sections. The Central communication hub may be able to develop SME training presentations, design and develop various awareness materials, maintenance of existence database systems and develop a web strategy for collecting and storing information related to knowledge transfer procedures. Knowledge transfer becomes incomplete if the information being shared is not trusted and the entire process is complete only when the information is trusted once it is clearly understood. In practice, for example, when two firms are aimed a particular task and only one firm end up with its product then there is a loss in the final product. So, both firms needs appropriate communication and this is where Network First Aid box plays its important role. Similarly, collaboration, trust and understanding elements will contact the Network First Aid with the help of IT for any sort of help that they might need to ensure that the final product is completed in a stipulated amount of time.

Scott (2000) argues that the method is best suited for network analysis, where some players act as key information distributors within a network and others act as bridges between networks. For example, if an organization receives advice from a network partner, the organization should be prepared to help them in the future. Partners who are willing to pass on skills to each other will establish the network as a centre of excellence or expertise and facilitate future collaborations. A well established network will thrive if its participants play an active role in keeping the network topical and relevant (Dwyer, 2000). On the other hand, Central Communication Hub (CCH) create reliance for others by having the option to deny, make known, and modify information and influence other external Networks . CCH also creates more attention among beneficial partners

in its network. In support of this argument, Podolny (1994) finds that, especially in situations characterized by high uncertainty, organizations rely on structural position as a tangible basis for discriminating among potential transaction opportunities, while centrality creates resource dependencies for others, their independent access to other units makes Central units less dependent on others (Brass and Burkhardt, 1993). In addition to increasing a central units control over information flow, centrality also increases structural autonomy; that is, the degree to which a unit is free to pursue its own goals (Floyd and Wooldridge, 1999). A centrally located unit that directs, concentrates, and legitimates information received by others enjoys the advantage of having its interests represented in a positive light, at the right time, and in the right places. From a learning perspective, network centrality increases a central units knowledge of its interfirm network power distribution and the accuracy of its assessment of the political landscape (Burt, 2000). This, in turn enables the unit to better control and exploit worthwhile opportunities for knowledge transfer. At the same time, centrality also reflects the total experience of the focal unit in cooperating with other external units. Therefore, the more central a unit is the stronger the units collaborative experience in how to extract value from these relationships (Gulati et al., 2002). In support of the above arguments, Powell et al. (1996) empirically demonstrate that a central position in interfirm learning networks for biotechnology start-ups is related to their rapid subsequent growth. The individual benefits of a unit's centrality in the interfirm network therefore positively impact its ability to acquire knowledge from its alliance partners (Jorge et al. 2007). Therefore the first aid model may be play as bridges between networks in SMEs.

## SMEs PIPE-LINE(P-L) MODEL

After explaining Network First Aid Model for SMEs, we have come up with another new model for start-up business in Turkey. Which are basically gives the general concept of starting new business for real success .Starting a new business is exciting, but it is full of challenge and competition in Turkey. A businessman can see the opportunities ahead but it need to so many things to do, it is very important to know all knowledge about where to start and stop. Here is the SMEs *Pipeline* model explained to knowledge transfer system to get successful business. This model firstly gives the direction of SMEs development of knowledge transfer via *Pipeline* for starting a new business for survival, which is explained below.

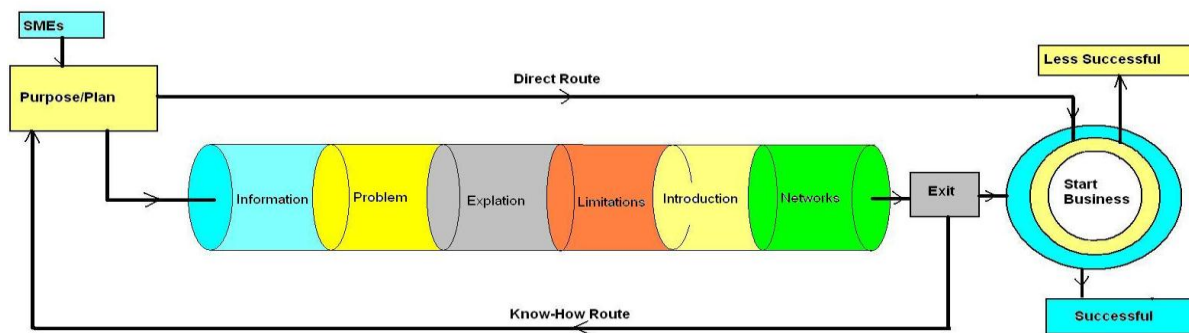

Figure 1: Knowledge Transfer via Pipe-Line (P-L) for SMEs

## Pipeline Definition

**Pipeline:** a sequence of one or more shell commands separated by a pipe symbol ( | ). The standard output of each command is sent as standard input to the next command. Each command is run as a separate process, but the shell waits for the whole series to finish before issuing a new prompt. ([www.eos.ncsu.edu/guide/glossary.html](http://www.eos.ncsu.edu/guide/glossary.html))

**Pipeline:** Pipeline is a sequence of block explanation shell which supply the information to get the decision for starting the plan ( researcher definition).

In this above model SMEs have two choice to do the business, the first one is Know-How route which is explained in the model. According to the *pipeline* process plan is the most important thing which starts first, after getting the plan ,SME have to generate all kind of information which might be tangible or intangible. After having all information, they need to know about the problem. In this problem section they will face two types of problems such as known problems-which are easily to get solution and the second type is the unknown problem

which occurs throughout the process. Therefore these sorts of problems should be given enough explanation by the research and development department, until getting full explanation it is hard to get the limitation of the business process. In limitation should give the boundaries of business implementation, after that SMEs need to introduce the plan to the network people, then the *pipeline* model give the SMEs enough knowledge to exit for doing business or re-thinking the plan or purpose again and again until SMEs would not take the decision to start the business. Using this model will give the SMEs to share knowledge transfer to get success. The second route is direct route where SMEs do not use any knowledge or sharing any kind of *pipeline* which is short route to start business, therefore it takes heavy risk to do business. Start the business with direct route it shows less successful in SMEs overall in Turkey.

## The explanation of pipeline

“P” as purpose which indicates whole business plan, target, objective or aim of the market. “I” as information which indicate whole business resource and market competitiveness. “P” as problem, which indicate three questions as give below.

a) What is going on? b).What is in hand? c).What is out of hand?

“E” as explanation, which indicates set of all possible problem solution, pay attention to the solution, and clear problem identification.

“L” as limitation, which indicates the boundaries of upper and lower case and also explains the upper and lower support. “I” as introduction indicate business name and frame, location, HR, R&D etc. “N” as networks, which indicate the business size and gender, business culture, partners and parent company closeness. “E” as exit which indicate not to leave, but rethinking or start.

## METHOD OF RESEARCH

The entire process of collecting and processing the data is schematically represented as shown in diagram 3.

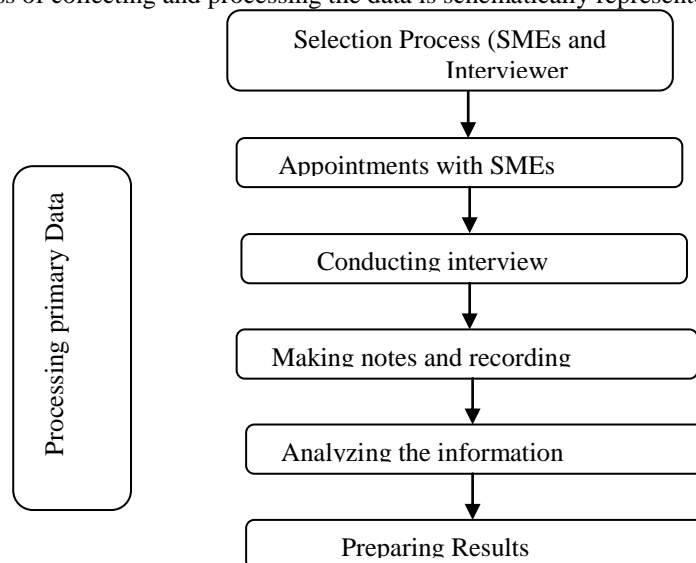

Diagram 2: Interview Process

Primary data is believed to be used to explore a specific research objective, which will be gathered using interview techniques. According to the nature of the topic, we decided to use semi-structured interviews which facilitated a better understanding to gather data on Knowledge Transfer practices within the Turkish Textile SMEs under research. An interview is a survey method designed to collect extensive information from each respondent. It is an ordinary conversation, with one individual at a time that has been extended and formalized in order to collect data. Keeping in mind the purpose, the research method was to interview the managers, owners/founders and CEO in order gather as much information as possible. Moreover, the interviews are expected to provide information that reflects the opinion of both their customers and employees in SMEs. The process of interviewing implies not only asking questions but also a systematic recording and documenting of responses. All the interview questions were originally written in English and then translated into Turkish

language. An appropriately designed semi-structured questionnaire was more likely to encourage the interviewees to express their points of view accurately. After finishing each interview, the taped interviews were uploaded in the computer and also stored in CDs for the safety of the collected data. Twenty interviewers had a copy of the recorded interview to clarify any confusion by referring to the record whenever needed. The entire interviews of respondents were noted down. The draft of each interview was made in order to select the information that is interest of this paper. Finally, the corrected version of primary data of each interview was processed and framed in the paper. The interviews were conducted in Company's offices. Most interviews lasted between 30 to 60 minutes.

**Table 1. Summary of the responses to Key Issues**

| <b>Question asked</b>   | <b>Number of respondents</b>      |                                  |                                    |                     |
|---|-----------------------------------|----------------------------------|------------------------------------|---------------------|
| What are the advantages of doing business in Turkey?  | Easy to communicate: 6            | Turkey's Geography: 13           | No Answer: 1                       |                     |
| <b>What type of information/resources do you share with other SMEs?</b>                       | <b>IT and Management: 14</b>      | <b>Management Skills: 3</b>      | <b>Marketing Strategies: 2</b>     | <b>No Answer: 1</b> |
| What are the most important obstacles in Knowledge Transfer (Idea Sharing) to SMEs in Turkey? | <b>Trust: 17</b>                  | IT support: 2                    | Lack of KT Awareness: 1            |                     |
| <b>Why do you think Knowledge Transfer (Sharing Ideas) in SMEs is important?</b>              | <b>Share ideas: 15</b>            | <b>Improve business ideas: 3</b> | <b>Get closer to other SMEs: 2</b> |                     |
| What kind of IT resource you use for KT?  | Internet: 18                      | Existing Knowledge: 1            | Company Database: 1                |                     |
| <b>Why do you use private and public knowledge in your company to develop any product?</b>    | <b>Develop business skills: 2</b> | <b>Improve Trust: 3</b>          | <b>Collaboration: 15</b>           |                     |

Focusing on the textile industry in Turkish SMEs the research was capable to explain the theoretically driven assumption and to show the relation between the concepts of Knowledge Transfer and SMEs network. Twenty SMEs responded to this survey and majority of the responders are in the higher position in the company and aged between 24 and 48. They have good business ideas but not many were familiar with modern technology. However, they were happy to implement and hire expertise when they are in need. Some of them were not happy with business because they are still using old technology which makes it difficult to cope up with the market demands. From the above survey results, we have decided to describe the following three key 'knowledge sharing' factors: (1) *having strong trust* (2) *believe in collaboration*

## **Factor 1: Having strong Trust**

In particular, trust as a control mechanism is based on the belief in the other partner's reliability in terms of fulfillment of obligation in an exchange (Appleyard, 1996). Trust allows both parties to assume that each will take actions that are predictable and mutually acceptable (Uzzi, 1997). Trust also affects the depth and richness of exchange relations, particularly with respect to the exchange of information (Lee and Al-Hawamdeh, 2002.) This process of exchange innately hinges on trust as crucial for the provider to take initial action based on a belief that the receiver will respond in like kind at some future point (Coleman, 1988). Szulanski (1996) explain that both applied and scholarly research have made it clear that relationships are critical for knowledge creation and sharing and that ineffective relationships can block knowledge transfer. This factor was considered one of the most critical for the success of the SMEs in the process of knowledge transfer. In Turkish SMEs

knowledge sharing by being the first ones to do so, and by setting the ground rules to establish the trust that gave other members the confidence to share their knowledge. One of the respondents indicated that Trust is the most important aspect for SMEs in order to share information/resources with others. Other respondents explained that business with other SMEs is impossible without Trust. However, we lose our profit margin because of sharing business skills with others where trust is not considered important. Some of the respondents formed the equation **trust = risk**. Textile industry in Turkey is very competitive industry and every SME wants profit without sharing the information. We can conclude that if a firm X want to get involved with firm Y, they need to trust each other in order to achieve a common profit. Therefore it is clear that the issue of trust arose during the discussion of collaboration.

## **Factor 2: Believe in Collaboration**

Collaboration of Networks is established for collective benefits and is most successful and effective where there is give and take by participants and members. This involves sharing organizational experiences through dialogue and interaction with other partners, as well as learning from theirs. For instance, the organization could attend debates and discussion groups to contribute their ideas and experiences or offer to speak at a conference. Other related research efforts have analyzed communities of practice (Wenger, 1998), actor-networks and networks of strong and weak ties (Granovetter, 1973). In his proposition, Granovetter explains that regular flow of information depends on the presence of multiple short paths between persons, as opposed to a local bridge does not represent a likely path of information flow, though it represents a possible path of such an information flow. Participants agreed they needed to believe in collaboration in order to share knowledge. One respondent said that collaboration has to be delivered on time similar to exchanging trust and get access to the resources/information. Few mentioned that collaboration is a big asset of knowledge sharing. Large SME are thinking twice before they shake hands with smaller SMEs. This forms a gap in the understanding that directly affects effective knowledge transfer. SMEs owned by family members and friends find it easy to collaborate no matter the size of the SME and SMEs in the same area/groups collaborate with each other with ease.

## **DISCUSSION**

The results of this study have implications for the research and practice of business engaged in knowledge Transfer. Three of those implications are now considered. First, there is a need to conduct a survey of SMEs in Turkey to find out the detail their approach to KT. This survey would increase the validity of the factors we have identified in this study offering us a better understanding of KT in Turkish SMEs. Second, one of the key factors identified in this study is the role of the SMEs Trust development. Finally, we believe the results from this study could be used as a key element of SMEs knowledge transfer in Turkey. For example, an inventory of factors influencing knowledge transfer could be used as an instrument for examining where the SMEs stand in relation to deploying knowledge transfer process in their business development and survival.

## **CONCLUSION**

Knowledge is an important asset and is vital for enhancing capability and competitiveness of Textile firms. Without any mechanism to deploy that knowledge, Turkish firms may not cope with changes and challenges in the dynamic business environment in today's world. New technologies find and increasing demand and quickly introduced into the market in order to meet global needs. While in many developed countries new technologies have to replace the previous ones step by step, Turkey, an emerging market, implements state-of-the-art systems from the beginning. Effective Knowledge Transfer implementation helps SMEs with free flow of information, ideas and resources. But, this often may not be easy as there might be a communication gap between various entities in or between Turkish SMEs. The main challenge faced by most businesses is to manage the flow of information among different entities. Firms may not be able to handle complex knowledge transfer procedures with the changes and challenges in the dynamic business environment. Therefore, SMEs need a clear understanding on what to be shared, when to should be shared or accessed and with whom the resources has to be shared. Therefore this study has made an attempt to identify and examine several important development factors such as *First Aid Model* in order to reduce the communication gap with the help of Trust and Collaboration in knowledge transfer process in Turkish Textile firms. Turkish SMEs will be able to achieve a

desired level of participation in Knowledge Transfer process with the help of the startup SMEs **PipeLine(P-L) model**. Turkish firms have to find a favourable position in their external network of cooperating organizations and also manage the internal relationships between their business units so that they complement and support each others. This is challenging managerial cooperation assignment which offers a set of opportunities that are reaching of a link of organization Networks. However, firms that are able to shape the arrangement of their external and internal relationships in a manner not easily imitated or substituted might gain competitive advantages for survival. For these reasons, research into the nature of knowledge Transfer environment is important and constructive and should be conducted on a continuing basis.

# **THE ROLE OF SISTER CITY RELATIONSHIPS IN THE ENHANCEMENT OF TRADE: LATROBE CITY (AUSTRALIA) AND TAIZHOU (CHINA)**

**Mona Chung**

**Deakin University, Australia**

**Bruno Mascitelli**

**Swinburne University of Technology, Australia**

## **ABSTRACT**

*Traditionally the role of Sister City relationships has been a political and cultural one involving local governments across the world. Over the decades this role has been questioned in both its efficacy as well as its focus. Hundreds of Sister City relationships have developed and in Australia very few can be said to have produced long term and worthwhile outcomes. New interpretations of the functionality of Sister City relationships in Australia (and elsewhere) has resulted and has shifted towards an inclusion of a consideration of the commercial utility of such relationships and not solely cultural (O'Toole 2001). Today especially with current strong trade relations with China, new models are sought to provide sustainability and long term prospects to such relations. This paper examines the possibility of special sister city relations between Australian and Chinese cities using their sister city links. Specifically an examination in this paper is undertaken of the City of Latrobe and Taizhou as a case study of interest which provides sustainable trade potential between two strong small medium enterprise (SME) economies.*

## **INTRODUCTION**

The aim of this paper was to underscore the role of existing sister city relationships and how they can be vehicles for sustainable trade vital for the life of SMEs in both localities – Latrobe City and Taizhou. This conceptual paper explores the potential of the economic focus for Sister City relationships to acquire greater importance and impact. Sister cities are defined in different ways across different countries. They are referred to as Sister Cities, twin cities, friendship cities, *partnerstadt* (in Germany) and *Gemellaggio* (in Italy). On the whole however there is little confusion about what they actually do. There are some 20,000 towns and cities across the worlds which have a relationship of one description across borders. The figure continues to grow by the day. Moreover they have very different roles in different parts of the world. The approach towards sister cities in Australia is very much different from that in Asia. Moreover in some parts of the world like Germany and Europe they have been instrumental assisting peaceful relations and collaboration before and after the end of the Cold War. Formally rival nations, Germany and France have used sister city relationships to pursue peace and establish better relations. Casagrande from the European Council of European Municipalities (CCRE) indicated that “twinings have not only improved relations, they have made them possible” (Weyreter 2003:37).

Researchers in the field of local government and Sister City relationships have highlighted the sheer lack of serious research in this area overall and the lack of studies across these relationships across countries (de Villiers et al, 2006:9). Moreover the small amount of research has emerged mostly from Anglo-Saxon/English speaking countries reflecting the narrow base from which our studies are based. Using a case study approach of two existing cities, Latrobe City in Victoria, Australia and Taizhou in China, which have a Sister City relationship this paper is to explore the extend of this relationship. More importantly both cities are seeking economic sustainable projects to allow their respective SME's to engage in sustainable and long term economic exchange based on their trust established through the Sister City relationship. In order to achieve this, the paper begins with presenting a good understanding of Sister City relationship especially its historical development. It leads further on to the Sister City relationship in Australia.

## WHAT ARE SISTER CITY RELATIONSHIPS?

A Sister City relationship is a broadly-based, officially approved, long-term partnership between two communities in two countries (O'Toole 2001: 403). A Sister City relationship becomes official with a signing ceremony of the top-elected officials of the two local jurisdictions, following approval by the local city councils. Sister City programs are also unique in that they inherently involve the three main sectors in a community: local government, businesses, and a wide variety of citizen volunteers (and civil society or non-profit organizations).

The origins of Sister City, county and state affiliations date back to the immediate aftermath of the Second World War. Two towns, one Ludwigsburg in Germany and Montbeliard, France were in 1950 the first such Sister City arrangements. However the concept was most embodied and driven by the US and developed into a national initiative when President Eisenhower proposed the people-to-people program at a White House conference in 1956. The history of the Sister City relationships as a post-war phenomenon is most comprehensively presented by Cremer et al (2001). However it is important to note that when the Sister City Program began in 1956, it had little or no explicit reference to international trade and economic co-operation as one of the objectives of the relationship and its significance in the globalisation and economic development of both Australia and China.

## THE EVOLVING NATURE OF SISTER CITY RELATIONSHIPS

The nature of Sister Cities and twinning of cities is not one that remains fixed. The concept over the decades has evolved. Different roles have emerged for the Sister Cities as O'Toole (2001) has identified. O'Toole highlighted how the emphasis of Australian sister cities in the recent period has changed from friendship ties to those of exchange of economic development. In part definitions of the relationships have reflected this change of emphasis especially in the last decades of the twentieth century characterised by growing forces of globalisation (de Villiers et al, 2006).

O'Toole has provided for many scholars of Sister City studies a model to interpret and understand the levels of development and maturity of Sister City relationships (2001). He had evidenced the evolutionary nature of the sister cities and provided labels for their respective stages (see below). They are defined in the following way:

1. Associative phase (twinning based on friendship, cultural exchange);
2. Reciprocatative phase (twinning based on educational exchange, people exchange); and
3. Commercial exchange phase (twinning based on economic development).

There is much to be said for this model which highlights the very real way in which Sister Cities have evolved and in which they mirrored the new priorities of governments in the post-war period. Moreover O'Toole explains that the commercial exchange phase is a phase which developed in a later period but, interestingly not at the expense of the Associative and reciprocative phase. It was in effect an additional activity (O'Toole 2001:405). More to the point the additional commercial phase reflected the changed geo-political circumstances in which not only was there the end of the Cold War and an opening up Eastern Europe, but more importantly the Chinese economy underwent significant reforms allowing for global trade relations with the west like never before.

Alongside the O'Toole model is a comprehensive approach of successful benchmarks of successful and less successful Sister City arrangements. De Villiers et al (2006:10) has listed four criteria which have according to their study covering sister relationships in South Africa defined their relative success or otherwise. In an abbreviated version they include:

1. Proper partner selection
2. Marketing of the Sister City to all stakeholders
3. Management quality

#### 4. Well conceived business plan

While the criteria offered by de Villiers has a “motherhood” quality, it also illustrates that Sister City relationships have in the past failed often for more basic reasons than a lack of vision and relevance. The authors in their study concluded that their success factors required further research to ascertain the validity of the above findings (2006).

## SISTER CITIES IN AUSTRALIA

In Australia, the genesis of a Sister City relationship occurred in 1939 when the Shire of Parkes, New South Wales, (NSW) claimed a Sister City affiliation with Coventry in England. A relationship was established between Saddleworth in South Australia and Saddleworth Parish in the United Kingdom in 1941, while one has existed officially between Hunters Hill and Henley-on-Thames since 1950, and one between Bega, NSW, and Lyttleton, Colorado, United States of America, since 1956. Today Australian cities have over 475 Sister City Agreements in place throughout the world and this number increases every year (ASCA 2007).

Over the last decade Sister City relationships have received unfavorable publicity and comment from the media. Sometimes this has flowed over to outright hostility by the media against “money wasting” Sister City relationships by local government. While serious academic research is not influenced by this negativity it has acted as a brake on Sister City development and the fear of only addressing economic development issues. One example of the media attention on the question of Sister City relationships involved the debate over Christchurch in New Zealand. It may well have been any city in the world. Negative media coverage was sparked by the following incident:

“An independent study which shows Christchurch gains little economic benefit from its Sister City relationships has some senior councilors questioning the international links” (Watson 2003).

A similar incident, and again in New Zealand, received the following media coverage:

“A council report [in Palmerston North] to Monday night’s meeting noted that the city needed ‘to be realistic’ about how much money should be spent on international relationships. It could be difficult to justify this spending as the most effective way to achieve council growth targets. Benefits were more likely to be social or cultural” (Mathews 2003).

The evolving nature of the Sister City agreements are in fact influenced by this fear of investment and equally hysterical attitude of the “financial return”. In other media outlets accusations of “junkets” and other critical commentary because in essence the “peace” factor is no longer sufficient to justify this allocation of local government funding and government can no longer live simply on playing a social and political role but must also respond in economic terms. These new political pressures on local government to fend off these criticisms make Sister City relationships very difficult to pursue.

Sister City partnerships have the potential to carry out the widest possible diversity of activities of any international program, including every type of municipal, business, professional, educational and cultural exchange or project. It is common at times for academics to highlight the scarcity of literature on a certain theme or interest of study. Sister City relationships fall into this category also. It suffers not from a lack of journalistic exposure and debate, where it does well (Macnicol 1998; Mathews 2003), but from more rigorous academic and critical scrutiny.

Over the recent period a very few number of scholars have examined international Sister City relationships as a policy instrument to facilitate business relationships between countries with different cultures (Ramasamy and Cremer 1998). As has been demonstrated this includes the ability of local government to play a role in promoting business and being a facilitator between its own jurisdiction and business with other countries. Some have even postulated that this relationship provides a hybrid form of entrepreneurialism “municipal-community entrepreneurship” in which is a valuable facilitator of economic and social vibrancy of cities (Cremer et al, 2001, p. 377).

## GLOBALISATION AND LOCAL GOVERNMENT

There is no doubt that the nature of local government and the role it plays in economic development, sustainability and trade promotion can be more significant than it has traditionally been. As has been acknowledged by O'Toole that for Australia there is no "direct overarching public policy directed at Sister City relationships" (2001: 404). Moreover new interpretations of the functionality of Sister City relationships in Australia have shifted towards an inclusion of a consideration of the commercial utility of such relationships and not solely cultural (O'Toole 2001). Sister City programs inherently involve a unique kind of partnership and involvement of the three main sectors that make for a vibrant, productive community: the local government, business and private voluntary sectors. Sister City programs--perhaps more than any other international program--involve the widest possible diversity of exchanges and projects. Basically, anything that goes on in a community can become--and has, in one city or another--the subject of a Sister City project, including every type of municipal, business, professional, environmental, educational and cultural exchange.

Germany's twinning arrangement, another term for Sister City have been documented as being primarily cultural except "in the case of China (where 16 twinings with Germany had existed even before 1989) inter human aspects were not a priority, but helping to build local Chinese infrastructure, transferring technology and introducing Germany's unrivalled vocational training system in China were. In return Germany was rewarded with a huge new market to sell new technology" (Weyreter 2003, p. 42). Zelinsky (1991, p. 1) claims that Sister City arrangements are not random but based on specific and shared concerns, one of these is clearly economic.

As early as 1990, Zelinsky made the observation that shared economic interests actually account for numerous Sister City relationships within the United States. These included examples such as Pittsburgh with metallurgical centers such as Sheffield in the UK, Houston is twinned with oil rich Baku in ex-Soviet Union Baltimore twinned with ports like Genoa and Rotterdam in the Netherlands (1990). As such the use of Sister Cities was also seen as a trade and economic mechanism of economic enhancement. In closing Zelinsky summarised the economic potential in the following way:

"The right sort of Sister City partnership can only be positive for almost any American town. The immediate reward is cultural enrichment. Later, with luck and ingenuity such cooperation can bring real economic dividends" (Zelinsky 1990, p. 46).

Forth and Howell (2001) have indicated in their paper the manner in which Sister City relationships with China have enhanced trade between China and Australia and have provided ever increasing important "sub-national relationships" between different layer of governments between the two countries. They state:

"Since 1979, an important aspect of this relationship has been the development of 42 Sister City type formal agreements between Australian and Chinese state and local governments" (Forth & Howell 2001).

Experts in trade have been reticent and at times skeptical about Sister City relationships and their impact on trade. Former Australian Trade Minister, Tim Fischer once remarked:

"Where it is properly managed, it [Sister City relationships] would give impetus and support to small and medium sized exporters opening up new markets with new products" (Fischer 2002).

With limited exceptions Fischers words have not been heeded. While the Sister City relationships are assuming, an economic emphasis, they are still distant from being effective instruments for SME sustainable growth. The Latrobe City and Taizhou example provides a successful initial model for this to happen.

## **FUTURE RESEARCH – LATROBE CITY AND TAIZHOU**

The sister relationship between cities in Australia and China co-exist within a framework of strong economic trade between the two countries. The economic importance of China to the world and to Australia is clearly evidenced by rapidly increasing trade figures. Trade between Australian and China has grown from \$A13 billion in 2002 to \$A45 billion or 14 percent of the total trade in 2006 (DFAT 2007). Since 2004 China has been Australia's second largest trading partner and in 2006 it became the largest source of imports reaching \$A25

billion or 15 percent of total Australian imports (DFAT 2007). China has become an essential economic partner for the Australian economy and has altered the pattern of trade

In the period between 1945 and 2005, while world trade growth grew 20-fold, GDP growth only increased by six times. Moreover the ratio of world exports to GDP has more than doubled since 1950. Globalisation is today more than just an activity for large corporations. Global business involves more and more the smaller, medium enterprises (SMEs). While in Australia only 4 percent of all companies actually export, this figure can be increased (Austrade 2007).

For SME's located in Latrobe City in Victoria, 150 kilometres east of Melbourne, China can represent significant opportunities for future growth and sustainable trade. Out of the total 2835 businesses in the Latrobe City, 2632 are small and 161 are medium sized businesses (ABS 2002). Moreover it is an SME base which has transformed itself from a semi-depressed economic state of the 1990s to an actively engaging community. In 2000, Latrobe city established a Sister City relationship with Taizhou city in Jiangsu province China. The relationship was initiated by the Taizhou City in 1998 with a strong economic and trade desire in its earlier visits from Taizhou city. Latrobe city however has been following the long tradition of establishing cultural ties parallel to its exiting Sister City relationship with Takasago Japan. All delegations have been to China for the purpose of cultural exchange with the exception of the one in 2007, a group of local business people took part in this delegation.

Are Sister City relationships effective trade drivers between cities and regions and their external partners such as Latrobe Valle and its Sister City in China, Taizhou? How can SMEs in the Latrobe City area more effectively enter the supply chain of trade between Australia and China? We set to further research on how the Latrobe Sister City arrangement will be able to assist in transforming and strengthening the role of SMEs within the local business community to the benefit other regional centres and nationally.

Building on the strong economic growth of China in the recent years and the increasing important role of China in the world economy, Latrobe City has been actively pursuing a more proactive role in establishing a working relationship with China. In part economic officers within local government are obliged to provide this form of local government marketing and business development. According to Taylor:

"Most local government in Australia now have economic development officers whose role it is to ensure that there are strategies in place to ensure "growth" in the local economy. Even though there is no typology of local "growth" in the local economies and therefore no strategy for local economic development, many localities still assiduously look for 'models' that they can emulate" (Taylor 1997).

Leo Billington, Latrobe City's senior economic development officer, suggested:

"I have learnt a great deal about the importance of the business relationship – what it is based on and how it is built. Having a strong and effective relationship network (guanxi) is one of the single most important factors for business success. There are vast differences compared to what we do here but this is all part of learning and understanding cultural differences" (Billington 2007).

Recent research suggests that cultural barriers are a major impediment for Australian businesses when entering the Chinese market (Chung, 2006). We proposed for a future research to provide a sustainable trade model utilising the Sister City arrangements which would provide the evidence, impetus and sustainable driver strategies to overcome cultural barriers for Latrobe City based SMEs venturing into and consolidating within the Chinese market. This model would then be used by the La Trobe City Economic Development Unit as a way of providing a template for the local business community to grow the economic performance of the SMEs within that area. This research proposal resonates strongly with the City Council's strategy of "supporting existing business investment and facilitating investment opportunities" (Latrobe City, 2007). The model developed and lessons learnt from the La Trobe City-Taizhou experience could then be applied in other regional areas throughout Australia to the benefit of both these regions and the Australian economy as a whole.

Trade between China and Australia has become important and will continue to be so for the foreseeable future. Given the resources trade boom with China, regional Australia has a special case in seeking out trade opportunities not normally provided. What many are seeking are sustainable methods and approaches which will enhance this relationship and provide it a commercial focus alongside the cultural one. Cremer et al, (2001) postulated that this trade oriented Sister City relationship can provide a hybrid form of entrepreneurialism

“municipal-community entrepreneurship” which is a valuable facilitator of economic and social vibrancy of cities (p. 377). The paper examines the tentative approaches made by these two cities to further their relationship in an economic sense using their traditional Sister City relationship as the means for this.

## CONCLUSION

This paper sought to underscore the role of existing Sister City relationships and how they can be vehicles for sustainable trade vital for the life of SMEs in both localities – Latrobe City and Taizhou. Like other Sister City relationships, this particular one also started in traditional cultural fashion and slowly progressed towards a more enduring and economic one. In part this evolution was influenced by the growing globalisation but also by the specific needs of the two business communities in both countries. Moreover the economic officers in both cities were conscious of this necessity and pro-active in their determination to pursue these economic ventures. There is only circumstantial evidence to confirm the validity of these sister cities and more and properly measured tests are needed to establish that Sister City relationships can become effective and successful vehicles for economic transactions and trade in a sustainable fashion. The research case study intended and emerging from this paper seeks to establish the necessity but also the validity of this hypothesis and a model applicable to other Australian cities especially in regional and rural Australia.

# **EVALUATION OF COLLABORATIVE STRATEGIES USED IN THE MANAGEMENT OF ENVIRONMENTAL PARKS IN RIO DE JANEIRO**

**Marcos Cohen and Jorge Ferreira da Silva**  
**Pontifical Catholic University of Rio de Janeiro, Brazil**

## **ABSTRACT**

*This paper exposes the main conclusions of an exploratory research that aimed at analyzing the management of eight environmental parks in the city of Rio de Janeiro. Considering the participative management guidelines proposed by Law 9985 ("NSCU"), the findings revealed that governmental agencies have been making an effort to establish more participative management by means of advisory councils, but the initiatives are still mostly ineffective. The cases have shown different forms of partnership maintained with varied organizations but factors such as bureaucracy, lack of management autonomy and the inadequate use of managing tools are barriers to the expansion of such collaborative strategies.*

## **INTRODUCTION**

Under the inspiration of the 1992 United Nations Conference for Environment and Development, that took place in Rio de Janeiro, Law 9985 was introduced in 2000, creating the National System of Conservation Units (NSCU) and legalizing the management of different types of environmental conservation units in the country in order to improve their protection. Unfortunately, the results of the actions meant to create and manage conservation units are not always as expected. This is due, in great part, to the lack of financial and human resources by the Governments responsible for their administration, to the projects complexity and, according to the opinion of many scholars, to the lack of effective participation of society (Araújo, 2004; Horowitz, 2004). Taking the city of Rio de Janeiro as the main focus of this study, one can verify the existence of great quantity and variety of natural areas and conservation units (PCRJ-SMAC, 2004), specially environmental parks. These are Integral Conservation Units with the basic objective of preserving nature, being allowed just the indirect use of its natural resources, with just few exceptions made by NSCU Law. Thus, extrativism, agriculture and cattleling activities are prohibited in these units (Brazil, 2000, Chapter III, Article 7<sup>th</sup>, 1<sup>st</sup> Paragraph). Each one of the seventeen environmental parks in the city of Rio de Janeiro is managed by a responsible government agency, which delegates part of its functions to a park manager (SMAC, 2006). Nevertheless, it has been evidenced that the majority of the environmental parks in Rio de Janeiro do not have enough financial, human and management resources in order to assure its self sustainability. (PCRJ-SMAC, 2004; TCMRJ, 2005).

NSCU Law identifies five main objectives of an environmental park (Brazil, 2000, Chapter III, Article 1<sup>o</sup>): 1-To preserve natural ecosystems of great environmental relevance and scenic beauty; 2-To make scientific research possible; 3- To develop educational and environment interpretation activities; 4-To develop recreational activities in touch with nature; 5- To develop ecotourism. These objectives, if effectively accomplished, may contribute to the self maintenance of conservation units and the sustainable development of urban communities in its surroundings. One can also identify two main NSCU guidelines that embody the participative management and collaboration, mentioned above (Brazil, 2000, Chapter II, article 5<sup>th</sup>): 1- To ensure effective participation of local population in the creation, implantation and management of Conservation Units. 2- To look for support and cooperation of non-governmental organizations, private institutions and citizens for development of studies,

scientific research, environmental education practice, leisure and ecotourism, maintenance and other conservation units managing activities.

Based on these two collaboration guidelines and in the NSCU objectives an exploratory research has been made with the final goal of identifying how collaborative strategies used by park management are implemented and how they affect management objectives. This paper presents the main research results and conclusions and proposes a conceptual model that seeks to understand the parks sustainable management issue based on the use of collaborative and competitive strategies that would result in lower or higher management effectiveness.

## **THEORETICAL REFERENCES**

### **Urban Environmental Conflicts**

It is fundamental to bring up the eminently conflictuous character of the environmental issues. According to De Mio *et al.* (2004) the environmental conflicts are caused by environmental degradation, by the development option and by the exclusion of some sectors of society. In the new model of sustainable development, the interests that were conflictuous and excludent need to be integrated in order to have the conflict solved. Costa (2004) states that the environmental practice in Brazil has become extremely complex due to its great social heterogeneity. That can be easily verified in the larger cities where problems due to the wealth unfair distribution coexist with those caused by the excessive consumption of the upper classes. Thus, one can verify in large urban centers irregular occupations in environmentally protected areas (hillsides, river and lagoon shores, mangroves). There is also the issue of sewer treatment and the increase of garbage and pollution, this one caused by the ever increasing number of vehicles. The public policies conceived to treat these problems end up affecting the different and complex interests of several social groups. Costa (2004) denounces the logic of money valorization in the urban space: *"It ends up causing the exclusion of great part of the population to basics rights such as housing, which leads consequently to illegal occupation of environmentally protected areas such as conservation units"*. The collaborative strategies can be used as a form of reducing the urban environmental conflicts.

### **Collaborative Strategies for Environmental Issues**

To Presas (2001) the transition to sustainable development requires a new way of thinking based, no longer in the traditional top-down approach, but in a collective learning mechanism, that results from the dialogue among all social actors. In this context, it is necessary to define what collaboration in the social-environmental issues is and also identify the different kinds of collaboration that are being used in this area. Gray (1985) defines collaboration as *"the aggregation of tangible and/or intangible resources by two or more stakeholders in order to solve a group of problems that none of them could solve by themselves"*. Based on Healey (1997) one can affirm that traditional society planning and developing strategies, purely based on economical criteria and without any participation during the planning process are no longer plausible. There is a need of a social-environmental approach, keeping in mind the interests of the social actors involved. Such initiative begins with the identification of those members of society that may lead to local changes and also of new ideas on governance that may unite the social actors and local communities. Her approach recognizes that the active work of social construction does not happen on a neutral field, since power disputes are involved in this process. Healey's "institutionalistic" approach could be used then as ground for a collaborative planning, focusing on community networks that generate intellectual and social wealth. Healey reminds us, however, that such relational and social networks may vary in terms of space and relational reach, becoming frequently the origin of local conflicts. In practical terms, this means that collaborative planning processes are multicultural and must take conflicts on account. Understanding and respecting the need of the parties involved is essential. On that matter, it is necessary to mention the work of Wondolleck e Yaffee (1997) on the collaborative dimension of the ecosystem management and its decision process. They focus their work on the non-conflictuous solutions of disputes regarding threatened areas, trying to identify the factors that facilitate and those that obstruct the collaboration and coordination among the geopolitical borders that divide ecosystems. Nevertheless, Wondolleck e Yaffee (2000) alert to the institutional and structural barriers present in the complex environmental conflicts.

The main barriers are: lack of opportunities and incentive; opposing objectives; lack of policy flexibility; limited resources; lack of mutual trust. Wondolleck e Yaffee (2000) suggest actions to overcome these barriers: to eliminate misunderstandings among partners and stimulate mutual understanding through frequent and even informal contacts; to focus on the individuals instead of the organizations; and to stimulate trust and mutual respect. In this work, the term “collaborative strategies” embodies several types of collaborative arrangements, temporary or not, with several or few participants, formal or informal, including some traditional forms as strategic alliances or networks, such as: Simple Partnerships; Multiple Partnerships; Coordination between government agencies (Wondolleck e Yaffee, 2000); and Participative management of Conservational Units – including the participation of a community that is established around a Conservational Unit through an Advisory Council (Brazil, 2000).

## RESEARCH METHOD

Based on Creswell (2003) and Remenyi *et al.* (1998) an exploratory research was chosen, since the goal was to achieve knowledge about a field of study not very well known in Brazil: collaborative strategies applied to conservation units management. This led to the option of a qualitative approach (Creswell, 2003) and the choice of multiple case studies strategy. Based on the study case protocol proposed by Yin (1994) the use of multiple sources and its triangulation tried to ensure the validity of the studied concepts. The generalization capacity was partially assured by using multiple study cases. In the eight study cases the three spheres of government are represented: the only National Park in the city (Tijuca National Park), the only operational State Park (Pedra Branca State Park) and six City Natural Parks (Chico Mendes, Marapendi, Prainha, Bosque da Barra, Bosque da Freguesia e Dois Irmãos). With an area of 12,500 hectares (48.26 square miles), the State Park of Pedra Branca is considered the world’s largest urban park. During data collection 78 interviews were made with central organ managers, park managers and representatives of several groups of stakeholders (non governmental organizations, companies, teaching and research organization, among others). From all these interviews, 71 were used. Data was also obtained through bibliographical and documental research, besides direct observation in the parks. The data collection phase lasted from November 2005 through December 2006, with a follow-up from January 2007 through March 2007. Data treatment was eminently qualitative, using the content analysis software Atlas 4.2.

## RESEARCH RESULTS

The research results were grouped according to the two collaborative guidelines selected from the NSCU law (Brazil, 2000).

**Guideline 1-** To ensure the effective participation of local population in the creation, implementation and management of Conservation Units.

The process of constitution of the Advisory Councils and how they work in each park has been analyzed as a management instrument that implements NSCU’s first guideline: the parks collaborative strategy of participative management. Advisory Councils are deliberative organs formed by representatives of public agencies and civil society organizations, which help the park manager. There are a series of rules for the formation and working of theses Councils. During the research, only one out of the eight studied parks (Bosque da Freguesia Park) had a working Advisory Council, even though it existed as a pilot initiative. Among the other parks, four of them were in process of forming their Councils and three had not even begun the process. Among the parks that were in process of establishing their Councils during the research period, the Tijuca National Park was undoubtedly the most advanced, having its Council finally established in 2007. However, the most important aspect refers to the methodology used on establishing the Councils. On that matter, the Tijuca National Park calls the attention for using a participative methodology, making the whole process democratic and, above all, inclusive and motivating for all stakeholders involved. On the other hand, the Pedra Branca State Park uses a more centralized and bureaucratic process, despite the whole process of forming the Council has been regulated. The process of forming the Pedra Branca’s Advisory Council has been largely affected by political conflicts between political parties that formed the State Government. Five out of six City Parks did not have rules or procedures for de Councils, what led to conflicts between park managers and stakeholders. Besides, the idea of

an Advisory Council itself does not seem to be well accepted yet among most City Park managers, indicating the need to recycle them about this issue.

**Guideline 2** - To look for support and cooperation of non-governmental organizations (NGOs), private institutions and citizens for development of studies, scientific research, environmental education practice, leisure and ecotourism, maintenance and other conservation units managing activities.

The main evaluation points by objective are listed in Table 1. Three city parks (Chico Mendes, Marapendi, and Prainha) were grouped together due to the great similarities and collaboration among them. Other two City Parks (Bosque da Barra and Bosque da Freguesia) have many common points that justified them together in Table 1.

**Table 1 - Evaluation of Objectives Achievement by Park**

| <b>Park</b>  | <b>Ecosystem Conservation</b>  | <b>Environmental Education</b>   | <b>Recreation and Ecotourism</b>   | <b>Scientific Research</b>   |
|--|--|--|--|--|
| Chico Mendes; Marapendi and Prainha City Parks     | Partially achieved.<br>No Management Plan.<br>Lack of human and financial resources.<br>Informal partnerships to control pollution in Marapendi and Chico Mendes lagoons and fires risks in all parks.<br>Multiple partnerships to create ecological corridor between Chico Mendes and Marapendi.<br>Prainha more isolated from communities. | Fully achieved<br>Centralized strategy at City Environmental Organ.<br>Use of Center of Environmental Education (CEA) of Marapendi and Prainha parks.<br>Centralized partnership with City Education Dept.<br>Budget reduction may jeopardize results. | Recreation objective partially achieved.<br>Partnership between Prainha Park and Atlantis Institute brings companies to the park.<br>Ecotourism poorly exploited. No centralized strategy.<br>No partnerships to maintain trails.  | Poorly achieved.<br>Centralized accord with Iguacu Institute provides undergraduate part-time trainees to do research.<br>Limited quality of research.<br>Loose control over research and its results. |
| Bosque da Barra and Bosque da Freguesia City Parks | Partially achieved.<br>No Management Plan.<br>Lack of human and financial resources.<br>Large areas of park are anthropomorphized.<br>Informal partnerships with local companies bring resources.  | Partially achieved.<br>No CEA at the parks.<br>Bosque da Barra Park manager created partnerships with theater company for environmental Education activities.  | Recreation objective partially achieved.<br>Partnerships between park managers and local companies.<br>High visiting rates.<br>Ecotourism poorly exploited. | Dois Irmãos City Park                              | Partially achieved.<br>No Management Plan<br>Lack of human and financial resources.<br>Centralized partnership recovered large forest area in the park.<br>Park threatened by slams expansion and drug dealers.<br>Tension between poor and rich segments in the surroundings.   | Poorly achieved.<br>Lack of CEA at the park.<br>No partnerships identified.  | Recreation objective partially achieved.<br>Informal partnership between park and local community provide sports and cultural activities. Low visiting level due to difficult access and surroundings problems.<br>Ecotourism poorly exploited. No centralized strategy. | Poorly achieved.<br>Same situation of parks above.   |
| Pedra Branca State Park                            | Poorly achieved.<br>No Management Plan.<br>Strong urban pressure   | Fully achieved.<br>Centralized strategy.<br>Partnership with State   | Ecotourism poorly exploited. No centralized strategy.  | Fully achieved.<br>Centralized strategy.   |

|                      |  |  |   |   |
|----------------------|--|--|---|---|
|                      | threatens park limits. Restoration Programs on course due to international accord. Firemen Partnership reduced fire risks. Poor integration with communities.                                      | Education Dept. "Moving Forest" Program takes information on the park to schools. Visiting Center operating with educational activities. | Park unknown to majority of city population.  | Partnerships with reputed universities. Tight control over researches and results.  |
| Tijuca National Park | Partially achieved. Management Plan under revision Urban expansion and violence are strong threatens. "Water in Conservation Unit" Program is well succeeded partnership with NGO and communities. | Fully achieved. Decentralized strategy creates educational networks within communities and forms multipliers.                            | Recreation fully achieved, with high visiting rates. Ecotourism partially exploited through external agreements and dedicated sector that promotes trekking and maintains trails with the help of Park Fiends' Society. | Partially achieved. Centralized strategy. Partnerships with reputed universities Loose control over researches and results. |

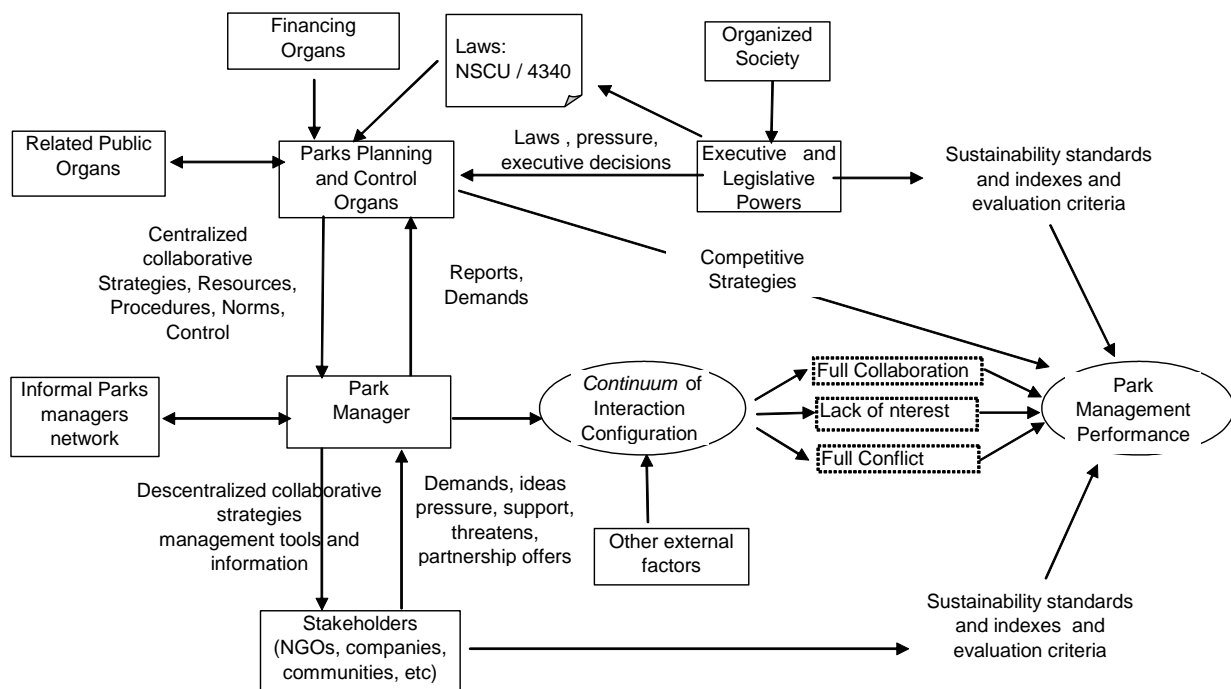

## DISCUSSION AND CONCEPTUAL MODELING

When comparing the eight parks management at a centralized level, it becomes obvious that the Federal sphere, represented by IBAMA Regional Agency, responsible for Tijuca National Park, has reached the highest degree of participative management and collaboration with stakeholders aiming at the five NSCU objectives for parks. The implemented model at that park arises as the one to be followed by other environmental agencies in managing their parks. The State Forest Institute of Rio, responsible for Pedra Branca State Park is quite ahead in the search for agreements and partnerships that may provide it with financial resources in order to manage this park and other thirty six state parks. However, this agency still hesitates within the process of creation of the Advisory Council of Pedra Branca Park, specifically in the development of a democratic process. Anyhow, the challenge is huge due to the enormous proportions of the park and the urban threatens. Finally, at the city level, the Environmental City Department is the most belated of all in the Advisory Council forming process and in the search for new partnerships. The difficulty factor for this agency is the lack of financial e human resources in order to cope with the great number of parks and other environmental units under its responsibility. On the other hand, as the city parks are relatively small and well known among the population, there is a greater chance of forming partnerships with local companies and NGOs. One remarkable example of this potential is the recent "adoption" of a small city park in Rio by a large building company. Also, the concepts of mosaic management and partnerships with NGOs contemplated by the NSCU law could help the city agency in improving the management effectiveness of its parks. A common point to all three spheres of government is the prevalence of political interests strongly affecting those environmental agencies, either in the dispute for budgetary amounts or in the prioritization of conservation actions. These interests change at every new mandate causing a serious problem of management discontinuity.

As a result of the findings, it was possible to devise a model (Figure 1) of the interactions disclosed in the cases studied and a series of theoretical propositions to explain how collaborative strategies are influenced by the different factors and how these strategies can affect the success of park management procedures. This model can be groundwork for future research in order to verify the validity of these principles and to measure the effectiveness of a park management *vis-à-vis* sustainability criteria and standards. As seen in Figure 1, considering a given park as the focus of the model, it is possible to identify that the main stakeholders usually involved form a complex network of interaction and collaboration or conflict. The park manager is the official representative and main contact between the park management and its local stakeholders. He also receives from its central agency human, financial and technical resources as well as strategic and operational orientation, norms and procedures to be followed. On the opposite direction, the park manager passes to its central agency the

stakeholders demands, local partnerships proposals and periodic managerial reports. The Park manager and the central agency should interact with the different stakeholders through management tools such as the Park Management Plan and collaborative strategies such as the Advisory Council, informal or formal partnerships or simple meetings. The result of this permanent interaction is a continuum of configurations such that, on one extreme, there may be a conflict between the park manager and its stakeholders, and, on the other, a wide network of stakeholders integrated to the park management and helping it in planning and managing the park. Among these extremes, it is possible the occurrence of isolated actions or different partnerships between two or more stakeholders, which are structured for specific projects or in a more permanent way. It is also possible to imagine an indifference point in the stakeholders' attitude towards the park. It is plausible to suppose that the greater the number of partners involved, the lower the level of conflict of interests, but, on the other hand, greater operational conflicts generated by different visions will arise. Thus, the model contemplates the possibility of evaluating the management performance of an environmental park based on greater or lower collaboration degree, seeking to capture significant differences among the performances of different emerging strategic configurations. The central thesis on which such model rests is that only through a combination of collaborative strategies, structured in the form of network among the stakeholders, and effective competitive strategies (that promote the park and capture financial resources), a park can arrive to effective and permanent results, measured by a set of sustainability indicators democratically established. It would just not be enough the isolated action of governmental agencies as it is usual in Brazil. The community consciousness and active participation, of non governmental organizations, entrepreneurs and other organizations is fundamental to create the synergies that will make such parks feasible.

**Figure 1 – Proposed Conceptual Model**

The main theoretical propositions related to the conceptual model are presented below:

1. Advisory Councils that operate steadily, with clear rules and skilled members are a success factor for the park management.
2. Advisory Councils that operate partially without clear rules and skilled members tend to generate conflicts among its members.
3. A greater number of stakeholders committed with the park management reduce the risk of conflict.
4. A greater number of stakeholders committed with the park management increase the operational difficulties.
5. A greater number of stakeholders committed with the park management increase the chances of identifying most of the local issues concerning the park.

6. Communication and negotiation skills are fundamental for park managers while dealing with the stakeholders.
7. A greater number of partners in any park project increase the level of operational conflicts due to different visions and interaction difficulties.
8. If two or more parks apply equivalent competitive strategies, those that present a “high level of collaboration” configuration should perform better than those parks that present a “low level of collaboration” or a “conflict level” configuration.
9. The implementation of effective collaborative strategies is necessary but not sufficient for the success of the park management. Effective competitive strategies are also necessary.

## **CONCLUSIONS AND RECOMMENDATIONS**

One of the main conclusions of this research is that the management of environmental parks in the city of Rio de Janeiro is a complex and hard task that imposes enormous challenges to all three spheres of government, each of them with its own characteristics, but affected simultaneously by the same social-economic and environmental problems. Considering the participative managing guidelines proposed by Law 9985 (NSCU), the initiatives are still mostly ineffective. However, in the new environmental context it is mandatory that governors of urban centers implement actions towards sustainable development, which will only be accomplished through adequate urban planning that encompasses the basic social needs of the people, the foment of economic activities and the environment conservation. The urban environmental parks and other units may assume a relevant role both as the “green lung” of the cities and as a source of income, leisure and education. Thus, Environmental Education arises as a fundamental strategy, of competitive and collaborative nature, for parks management. Through it society members become aware of the conservation units existence and of the environmental issue as a whole. As a natural consequence, more people will be eager to help preserve the natural areas of their cities. This is a major point, since it became evident from the eight case studies that the lack of human and financial resources prevail in most governmental agencies in Rio de Janeiro.

The findings revealed that governmental agencies have been making an effort to establish more participative management by means of advisory councils, yet, with the exception of one park – The National Park of Tijuca- these boards had not actually been implemented at the time of this research. The process of organizing and conducting such councils is slow and inefficient and can cause controversies among social players (stakeholders) and the management teams. The diversity of social actors and intervening factors such as lack of funds, economic and political pressures, uncontrollable urban growth and violence can be aggravating issues. The cases have shown different forms of partnership maintained with varied organizations – ranging from informal to complex; involving multiple actors and even different governmental powers. Factors such as bureaucracy, lack of management autonomy and the inadequate use of managing tools can be barriers to the expansion of such collaborative strategies. Again the National Park of Tijuca appears as the successful model to be copied due to its partnership with an environmental NGO that led to the implementation of a series of infrastructural improvements as well as the establishment of a democratic and fully participative advisory council. Considering the operational and financial difficulties faced by all government agencies in managing their environmental parks, a proposal of intergovernmental partnerships arises as an interesting and promising alternative should political disputes among them be overcome. It is also the opinion of the authors that Brazil needs a clearer vision of its conservation units performance and the best way of planning and managing them in a sustainable and democratic way. In this sense it is necessary that environmental agencies and society together establish adequate sustainability indicators. The proposed conceptual model seeks to fulfill the theoretical gaps about collaborative and competitive strategies applied to the management of environmental parks. Finally the research indicated that a wide participative process including different social segments may be the answer to overcome the present barriers to an effective management.

## ABSTRACT

*The objective of this essay is to reinforce the importance of strategic alliances valuation through the theory of real options. Since one of the current most important inhibitors for the decision taking involving the entrance, maintenance, transfer or closing of an alliance is exactly the previous valuation of the future results of that decision, the theory of real options appears as an appropriate and robust tool. Besides, the broadening of studies involving the trade-off between commitment and flexibility may amplify to compare the implications and assumption of the real options to explain ambiguous empirical findings regarding alliances.*

## INTRODUCTION

Strategic alliances have grown vastly during the last decade due to its increasing recognition as an important form by which firms update their capability sets (Eisenhardt and Martin, 2000). Strategic alliances help firms spread risk, increase market power, share resources, and gain organizational learning (Mitchell and Singh, 1992). Alliances also allow organizations to obtain the desired benefits without the added costs of governance (Williamson, 1985).

A real options perspective offers a complementary approach to normative models of investments under uncertainty borrowed from the fields of finance and economics. Where finance theories are based on assumptions of efficient markets and static equilibrium, real option presumes information asymmetries, path-dependent accumulation processes, and uncertainty (Miller, 1998). The assumptions borrowed from the field of finance seldom fit managerial realities, leading to lack of support for hypothesized relationships and to observed inconsistency in managerial application (Dixit, 1992). A reason for such inconsistencies may be the actual imperfection of the markets in which firms compete despite the assumptions in underlying models from finance might suggest (Chatterjee, Lubatkin, and Schulze, 1999). Nonetheless, powerful ideas from finance offer an economic rationale for observed managerial behavior.

The stream that has characterized strategic alliances as real options suggests that when a firm initiates an alliance, it gains access to a growth option for future expansion or for acquiring its alliance partner, while retaining the option to defer completely commitment. Real options theory explains equity alliances commitment (Folta and Leiblein, 1994) among others, but a careful examination of the assumptions underlying real option pricing models in finance and deviations from those assumptions where necessary to allow for market failures, and managerial and organizational realities still misses (Folta and Miller, 2002).

Moreover, real options offer a perspective from which to develop ideas that are relevant to the problems facing decision-makers in established firms. Mc Grath and Nerkar (2004) suggest that decision-makers in practice may deploy a pattern of investment choices that is consistent with real options reasoning, and conclude suggesting that real options concepts might offer a useful perspective for those seeking to develop a theory of investment for the field of strategic management.

This essay calls for the importance of real options theory as an important tool to provide ex ante assessment of strategic alliances future results so that we can motivate the research in that needing area of

objective ways of ex ante assessment.

## REAL OPTION AND STRATEGIC ALLIANCES

In recent research there has been intense interest in understanding how real options might usefully complement net present value-based approaches to investment decisions (Mitchell and Hamilton, 1988; Trigeorgis, 1996; McGrath, 1997).

Kogut (1991), Bowman and Hurry (1993), and Sanchez (1993) were early advocates of resolving the tension between the rationality of finance based models and the observations of behavioral researchers through an options lens. As they point out, real options accommodate the value of flexibility, differing resource allocation horizons, the process of retrospective sense making, and path dependence. A critical issue is whether managers' investment decisions under uncertainty are foresightful or simply based on feedback from past experience.

Real options approach permits decision-makers respond to the value of the right to preserve decision rights in the future in their investment choices. Since real options can explain some of the differences between actual managerial investment behavior and theorized investment behavior, it would be of most use as a theory of investment appropriate to the strategy field, mainly to decisions covering alliances commitment.

A firm that invests in any alliance, being it an equity or nonequity commitment can create a unit of new knowledge. It can secure its claim to commercialize this knowledge and subsequently may elect to proceed to extend the knowledge, commercialize its knowledge, to do nothing with it, or to seek to leverage the knowledge in some other way, for example by sharing it in a further alliance.

Investing in real options can allow firms access to a greater variety of opportunities than would be possible if each investment represented a sole project. Once uncertainty is reduced, an investor can then elect to exercise only those profitable options and allow the remainder to expire. By investing relatively small amounts in learning about several promising technical directions simultaneously, a firm can broaden the range of alternatives it can apprehend, generating conceptual variety with parsimony (McGrath and Nerkar, 2004).

The basic intuition behind the recent interest in the application of real options in business strategy is that if low-outcome draws can be costlessly discarded, then greater variance in the sample, holding the mean constant, increases the expected value of those draws that are adopted (Gavetti and Levinthal, 2000). Since alliances resource commitments before the relationship between these commitments and their potential performance outcomes are fully understood, options are an important mechanism through which firms reduce the strategic risk of making commitments (Chatterjee et al, 1999).

At its core, the real options perspective is like other theories of investment in that it is concerned with identifying the factors that influence the investor's in respect of the point at which to decide about investing or not. What makes the real option perspective distinct is that it seeks to establish this threshold while acknowledging that some investments are not fully reversible. This assumption is critical because if investors cannot fully recover sunk costs, the initial investment decision depends on expectations about uncertain future cash flows (Miller and Shapira, 2004).

Real options analysis provides an important complement to other approaches while departing from neoclassical investment theory. It also takes into account that most investments are at least partially irreversible since they cannot be fully recovered and costlessly redeployed in the event of a negative shock and that managers can adapt and revise their strategies in response to unexpected market developments that cause cash flows to deviate from their original expectations.

Engagements in alliances almost always involve investments that are at least partially sunk, or irreversible, uncertain, in domains distant from partner's core capabilities. Under such conditions, real options models (e.g. Kogut, 1991; Bowman and Hurry, 1993; Arora and Gambardella, 1994; Kim and Kogut 1996, McGrath 1997) help to understand the investments made by firms in exploration of new commitments.

Nevertheless, although strategic decisions under uncertainty appear to conform to some general expectations based on real option theory (e.g., Folta, 1998; Folta and Miller, 2002; Kogut, 1991), there is compelling evidence that managers and organizations are badly equipped to handle real option decisions and often do not explicitly use real option analytical techniques (Busby and Pitts, 1997; Graham and Harvey, 2001; Howell and Hegle, 1997). In other words, despite their biases, managers' alliances decisions may employ real option reasoning imprecisely (Triantis and Borison, 2001). Even when quantitative analyses may not be feasible, qualitative assessments employing real option reasoning can guide investment decisions (Miller and Waller, 2003), which means that managers' investment decisions direction may be correct even if biased.

Elegant solutions based on unrealistic assumptions about managerial rationality and organizational routines can cause unintended problems in practice. Given cognitive and organizational constraints, and environmental complexity, researchers may best serve managers by developing robust heuristics (Miller and Arikan, 2004) rather than complex option pricing models.

## Some works

Strategic management research has long focused on understanding differentials in performance across firms (Helfat, 2000). While innumerable empirical studies have linked alliance to superior performance and many scholars have offered theoretical insights on decision making surrounding alliances within firms, little empirical research integrates theories developed largely in finance, and behavioral theories emerging from organizations research regarding the drivers of decisions to invest in alliances commitments.

Whether option pricing may seem unrealistic, neither the evolutionary or option reasoning approach consistently dominates the other. In the absence of explicit option pricing, we can make no *ex ante* claims about the value added from pursuing investments in strategic alliances. Hence, option reasoning may be justified as a way to manage risk, but it may or may not enhance firm value nor is clearly advisable in every competitive situation.

As far as we can affirm, only one work was motivated by an integration of real options theory with the resource-based view (Vassolo *et al.*, 2004). The results partially confirm a central claim in real options theory that exogenous uncertainty influences whether firms exercise their real options. This is one of the reasons why there has been an increasing interest in understanding how real options may complement the net present value approach to alliances decisions as a tool to reduce the strategic risk of making commitments that firms face in their daily operations.

Chi (2000) has argued that significant resource asymmetries must exist between partners for a real option to have strategic value. Chang (1995) modeled international joint ventures as a platform into international markets, where a platform is represented by an investment that offers expansion opportunities due to path dependency (Kim and Kogut, 1996; Kogut and Kulatilaka, 1994). However, Adner and Levinthal (2004) point out that such path dependency can arise out of endogenous rather exogenous factors.

Researchers have used transaction cost theory to diagnose whether a firm's alliance history reduces or accentuates opportunistic behavior in the context of repeated alliances with the same partner. Network theorists also have studied firms with multiple alliances, but their emphasis has been on the role of social networks as a substitute for hierarchy. Moreover, they have not been concerned with transitional governance decisions.

The value creation by the right of postponing decisions seems to be ideal for those firms considering the engagement in sole or a net of alliances since it allows access to a greater array of opportunities than would be possible if each alliance were assessed solely and only in terms of its net present value. Besides, the cost of an option on an asset is insignificant when compared to the cost of an eventual purchase of the asset, allowing for the exploration of more opportunities with the same resources.

The proponents of the option approach tend to emphasize value creation through the development of strategic and organizational flexibility (Bowman and Hurry, 1993; Sanchez, 1993). However, one of the issues that the transaction cost approach puts its emphasis on is the use of commitment, at the expense of flexibility, to reduce opportunism (McGrath and Nerkar, 2004). When trying to apply these two approaches to the analysis of alliances structuring, therefore, one can easily find them to suggest conflicting solutions.

## Some missing works

Despite the normative work on real option valuation, we know little about how managers actually value real options. A few researchers (Bowman and Hurry, 1993; Kogut and Kulatilaka, 1994; McGrath, 1999) have called for studies on the behavioral aspects of managing real options. Lander and Pinches (1998) indicated that managers have limited understanding of existing option pricing models and the real option pricing problems they face often violate the assumptions of these models. The limited survey evidence we do have shows managers' assessments of real options deviate from nonadditive models (Howell and Jagle, 1997), organizations lack systematic approaches for assessing real options (Busby and Pitts, 1997), and managers apply real option analyses in only a small minority of their capital investment decisions (Graham and Harvey, 2001).

With few exceptions, a characteristic of previous studies in the real option literature is a focus on

isolated options that are independent of other options held in a firm's portfolio. However, interactions between real options are a common phenomenon. In the presence of interactions, the valuation of a portfolio of related options is not straightforward. Failure to consider the effect of interactions on investment decisions would lead to misleading explanations.

Other limitation of this line of research is that it has not emphasized insights from the resource-based view and capability perspectives (Zhou and Peteraf, 2002). Since interactions between alliances are a very common and important phenomenon in alliances (see Madhok, 1997 for R&D alliances), an emphasis on synergistic benefits across real options is needed to fully understand the configuration of a portfolio of strategic alliances.

The development of an option model typically involves the use of advanced mathematics, leaving room for simple approximation methods that entail only some basic tools of quantitative analysis. Although finance research has helped managers frame decisions under uncertainty in option theoretic terms, normative models for pricing options overlook key aspects of the behavioral and organizational contexts in which investment decisions occur (Chi, 2000).

The effort to keep option problems the simplest possible leave the researches unresolved in respect of the valuation of compound options, which is a common type of investment problem managers face when making decisions about alliances. Compound option investments are challenging due to be subject to behavioral phenomena such as myopia (Laverty, 1996; Levinthal and March, 1993; Miller, 2002) and escalation of commitment (Staw, 1981).

We already know that the multistage nature of many real options affects exercise timing, although the nature of these effects is not all that apparent. What we do not know is why we do observe firms making successive investments in uncertain technologies and markets over time if maintaining maximum flexibility adds to the value of compound options. To the extent that uncertainty can be reduced and uncertainty reduction enhances value, managers should accelerate their multistage investments relative to when uncertainty is beyond managerial control. This motivation is distinct from the rationale for exercising simple options discussed earlier.

A further theme that is central to real options but not yet to theories of strategic investment, mainly alliances, is the idea that investments in uncertainty reduction erode in value over time. Future research on the erosion of option value and the expiration of real options should test whether firm adopting real options for investments do let options expire as uncertainty associated with the underlying option is reduced.

The theoretical and empirical works explain why alliances may have real option characteristics, and why such a perspective illuminates the context of strategic alliances. Despite these previous contributions, there remains considerable opportunity for further study. A particular limitation of this literature is that all previous studies focus on a single real option in isolation. McGrath (1997; McGrath and McMillan, 2000; McGrath and Nerkar, 2004) emphasized this concern when she suggested that future studies should consider the cross effect of strategic alliances.

Future research would need to show evidence of applicability to nonequity strategic alliances such as research agreements. The argument that such alliances also represent firm options, and should be considered a legitimate part of a firm's portfolio needs evidence.

It would also be useful to compare the implications and assumption of the real options and the network approaches. Recent studies have used network theory for explaining ambiguous empirical findings regarding alliances, and substantially contributed to the understanding of the configuration of the portfolio of alliances (e.g., Powell et al., 1996). In general, network theory suggests a distinct cooperative element in the behavior of firms while the real option approach transactions as its main element of analysis, which would require to compare and to integrate predictions from these different behavioral traditions.

Factoring portfolio considerations into option valuations presents a major challenge to managers. Because of possible correlations in the prices of their underlying assets, the value an option adds to a portfolio may differ from its value on a stand alone-basis. Trigeorgis (1996) calls this the problem of nonadditivity of option values. Another possible extension is to explicitly consider the effect of the presence of competitors, since multiple options analysis is even more challenging when the firm faces rivalry for the investment opportunity (Kulatilaka and Perotti, 1998).

Finally, researchers should pay more attention to the criticism that academic research on human choice behavior pays surprisingly little attention to the difficulties facing a decision maker whose current model of the world usually has a substantial probability of being misspecified (Cohen and Axelrod, 1984). The real options as well as other literatures to date have tended to focus on individual investment despite the solid knowledge that firms often consider a set of simultaneous and overlapping strategic investments, particularly in searching for new Technologies (Nelson, 1961).

## DISCUSSION

Most related work in strategic management has used real options as a metaphor (Miller and Folta, 2002). This has been an effective way to initiate discussions of real options, but it leaves room for developing models generating refined insights.

The understanding pattern in the literature is that firms have a greater propensity to initiate alliances under high uncertainty. This helps reconcile Williamson's understanding that transaction cost analysis should not be applied without deep concern when investments are exploratory in nature, such as those in uncertain research and development, since significant resource asymmetries must exist between partners for a real option to have strategic value. Also, it is important to point out that alliances may offer expansion opportunities due to path dependency, although one should detect whether such path dependency exists, and whether it arises out of endogenous or exogenous factors.

Real options offer a complementary approach to models of investments under uncertainty and theories of decision making due to the fact that real options presume information asymmetries, path dependence accumulation process, and uncertainty. Real options also reduce the disconnection between finance and managerial realities, created by the actual imperfection of the markets not contemplated by finance models, although this area usually offers economic rationale for managerial decisions.

While the theoretical and empirical works explain why alliances may fit in the real option characteristics, helping to give light to the context of strategic alliances, there remains a considerable green field for further research. Innumerable studies have linked strategies to superior performance, but only little empirical research integrates theories developed in finance with those emerging from strategic researches, mainly in respect of alliances.

Since Kogut (1991) first demonstrated the power of viewing joint ventures as options, the option perspective has become widely recognized as an essential analytical framework for understanding the strategic nature of joint ventures. Although further conceptual and empirical work based on this approach has yielded additional insights into the nature of alliances, there has been limited effort to scrutinize the properties of alliances options through rigorous theoretical modeling.

Recently, Adner and Levinthal (2004) have argued that the literature on real options has overextended the application of this concept. They point out that real options formulations are valid in application only when there is an explicit option or when the source of uncertainty is exogenous. Vassolo *et al* (2004) were able to show that the majority of alliances contains some version of an explicit option clause and that alliances in a technological domain predict further alliances within that domain in the future. Therefore, it is to believe that the dominant form of uncertainty is exogenous, which is appropriate for the continuity of works assessing alliances by means of real options formulations.

Real options explanations for alliance formation and dissolution (e.g., Hurry, Miller, and Bowman, 1992; Kogut, 1991) may be less compelling than applications of real options in contexts that are proprietary, such as internal R&D. For an internal venture, the firm faces an exercise price that is determined by the technical characteristics of the project itself. By contrast, in the context of alliances, implicit buyout options are exercised at prices that result from bargaining processes involving two or more partners (Miller and Folta, 2002). Just as firms may want to move away from alliances in their search to capture option value, strategy researchers may do well to move away from their focus on alliances to test real option propositions.

What remains unclear is to what extent Kogut's findings (1991) still prevail. In other words, if a joint venture contract does not give either partner the right to acquire or divest the venture at an ex ante specified price, it is of no use to endure the ex ante valuation of alliances by means of real options. Those who strongly believe in alliances of any kind as a means of firms' reducing competition and improving performance levels need to believe there is a way out.

# INCREASING SERVICE EXPORTS: A KEY CONTRIBUTOR IN THE GROWTH OF THE GLOBAL KNOWLEDGE ECONOMY

**Max Coulthard**  
**Monash University, Australia**

## ABSTRACT

*In a global knowledge economy both business leaders and government policy makers have identified service exports as key outcomes of innovation based strategies and areas in which to achieve sustainable competitive advantage. This Australia based study of service exporters identified key barriers to success and potential role for government agencies. Key findings included misunderstandings over defining service exports, incorrect classifications of exporters, the need for appropriate and timely planning, challenges in obtaining financial support, need for qualified and appropriate human resources, and the need for government incentives and support aimed at increasing innovation and export orientation amongst service exporters.*

## INTRODUCTION

In a globally competitive marketplace, many organisations are turning to knowledge management and innovation to gain a competitive advantage. The challenge for government regulators is to identify both industries and organisations with best practice entrepreneurial characteristics to become success models that others can emulate. As knowledge and innovation are key components of the service sector, one would expect service exports to be a leading indicator of government innovation policy success. This paper reviews a government sponsored survey of service exporters to help clarify what risks and barriers they may have to overcome to thrive in a global knowledge economy.

Before developing any strategy to encourage service exports it is important to understand the sector and its potential for innovation leading to international demand. In Australia, an industry innovation survey (IBM-Melbourne Institute, 2007) found that within the service sector some industries had achieved rapid innovation increases over the previous 15 years, such as communication services 68.7%, and finance and insurance 87.9%. However, over the same time period, other service industries achieved very few innovative changes, such as property and business services 4.5%, and cultural and recreational services 12.3%. A recent government study (DITR, 2007) helped identify why these innovation discrepancies exist. These researchers identified skill shortage as a leading deterrent to service based industry innovation. It was also found that larger organisations were the most innovative and less likely to suffer from skill shortages. On the other hand much of the service sector outside of communication, finance and insurance was found to be dominated by small business which lacked the capacity to innovate and had difficulty in attracting the most knowledgeable and innovative job seekers.

Governments at all levels are interested in the development of innovation and competitive industry that leads to export growth. According to Smith (p.6, 2006) exporting “enables government policy makers to enlarge foreign exchange reserves, increase employment levels, improve productivity, and promote societal prosperity”. However it could be argued governments encourage exports for a more fundamental reason: to pay their way in a global economy. According to the Australian Department of Foreign Affairs and Trade (DFAT), the 2006-07 balance of trade deficit was AUD \$12 Billion and for the past five years imports have exceeded exports. Although the net trade deficit has been declining each year since it peaked at AUD \$22.6 Billion in 2004-05 the subsequent debt needs to be serviced (DFAT, 2007). Service exports based on knowledge management and

innovation are seen by many governments as a way to fast-track export growth and in Australia service exports have consistently exceeded service imports growing by 5% in 2007 to \$46.2billion (ABS, 2007).

Although a small number of large companies still make the greatest contribution to service export revenues (ABS, 2007), smaller companies, which employ less than 100 people, have the potential to grow and become larger companies of the future. The total number of Australian service exporters in 2006-07 was only 2638, making up only 5.95% of all exporters in Australia. This suggests there a great deal of potential for further expansion service export numbers and value considering this is the largest employment sector in the country. Doubling the number of small and medium exporters could boost Australia's overseas earnings by \$8 billion a year (Callick, 2003). While travel and transportation services dominate the service export sector with 73% of total service exports, the fastest growing area by value between 2005-06 and 2006-07 were computer and information services 23.5% and other business services 21.7% (ABS, 2007). The 10.5% growth by value in the previous year for service exports suggests this sector is not only important, but the rapid increase in the major knowledge sections within this sector highlights the importance of knowledge management and innovation in growing service exports. Past research also suggests government export development policy may need to be targeted at industry level rather than the broad service sector level.

## **LITERATURE REVIEW**

The growth of service exports was covered briefly in the Introduction; a definition, their characteristics, similarities and differences between goods and services exports, challenges they face and the role of government support will be considered in this section. Some of the findings are re-visited in later sections as a result of interviews and the survey conducted for this project.

### **Defining Service Exports**

While service exports are becoming more widely researched a definition of services is still a much-debated issue (Gani and Clemes, 2002). Different authors adopt different definitions, and some authors even change their definition from time to time (Carter, 1984). Although service exports can be understood as service activities that are internationally traded between residents of different countries (Austrade, 1994), the term services covers a heterogeneous range of intangible products and activities that is more difficult to encapsulate within a simple explanation (Department of Economic and Social Affairs, 2002).

Simple definitions of services include "anything that you cannot drop on your foot" (Austrade, 1994) and "generally cannot be held in your hand" (Business Victoria, 2008). In an attempt to gain a better understanding of the concept of services, some authors have divided services into categories (Sacks and Malbon, 1992, Lovelock and Yip, 1996). Current detailed classifications incorporate: transportation, travel, communication, construction, insurance, financial, computer and information, royalties and license fees, other business services, personal cultural and recreational, and government services (Australian Bureau of Statistics, 2007). This method of export service definition is based on the Organization of Economic and Cooperative Development's (OECD) trade in services classification. It is compatible with Australia's Balance of Payments statistics, and is compiled in accordance with the latest international standard determined by the International Monetary Fund (Market Information and Analysis Unit, 2002). This definition appears most appropriate and was used as the base for this survey.

### **The challenges facing exporters**

The literature highlights some common challenges to all exporters. This section reviews these challenges and adds specific issues related to service exporters under the headings of planning, finance, resources and role of government.

#### **Planning**

When moving into a new market a range of planning issues emerges. Many companies make their decision to export without carefully screening markets, conducting research, considering costs, or weighing alternatives. When early export efforts are unsuccessful because of poor planning, the company can be misled into abandoning exporting altogether (Reif et al., 1997).

According to Sacks and Malbon (1992), before exporting there are trade barriers in the host country to consider. These barriers are many and varied and can be divided into three categories: government monopolies, government regulation, and industry regulation. The literature identified that like goods exporters, service exporters find that trade barriers generally prevent them reaching their full potential. For example, in one Australian study undertaken by the Australia Trade Commission (Austrade), more than one quarter of respondents identified trade barriers, especially product standards and certification, and 13% cited intellectual property protection as regulatory constraints on their ability to more successfully deliver their services offshore (Austrade, 1994).

State and Federal service export support agencies, (e.g. refer Business Victoria, 2007; DFAT, 2007; and Harcourt, 2002), highlight the need for businesses to consider some basic issues in setting objectives and making the commitment to export. These export support agencies were found to all emphasise that for international success, potential exporters must have the right product or service. Their literature highlighted that the product or service must satisfy the needs of the end user, and be of high quality. They also suggest that firms must have the management capacity to develop and cope with overseas demand. Price, as well as effective implementation of appropriate technology and training linked with an understanding of how to sell the product or service to non-Australian audiences is also identified as important.

Although Yip (2003) noted that exporting services is easier than goods, Reif et al (1997) stated that the decision to export a service is nonetheless, an equally serious one. Like goods exporters, service exporters must do market research to familiarize themselves with the differences in language, culture, and business practices in target markets (Industry Canada, 2003). Businesses that do not prepare adequately may miss opportunities and fail. A common theme of Australian State and Federal export support agencies is to suggest that the success of export activities often depends on the effort put into understanding the target market. Through such a process a firm will be able to examine the driving force of demand of their service (Harcourt, 2002).

Services need to make globally integrated moves as much as product-based companies. But the key feature of such moves, cross-country coordination, can be both easier and more difficult. Coordination can be easier for those services businesses that reproduce a strong core formula around the world. In such businesses, corporate headquarters play a continuing role in monitoring the strategies of overseas units. However, the prevalence of franchising in services, and its concomitant dispersion of ownership, makes global coordination much harder (Yip, 2003).

Difficulties may arise within some firms regarding the maintenance of a high level of commitment (Industry Canada, 2003). Commitment is important for the flexibility in handling foreign clients. It is a combination of willingness to commit time, effort and follow-ups. However, according to Austrade (1994), young companies with less than five years in business often become exporters by accident, through unsolicited external enquiries, rather than because of a strategic plan to expand internationally. This suggests that the businesses may treat exporting more like a sideline than a commitment.

## **Finance**

Lack of capital has been found to be a major barrier preventing non-exporters from exporting (Patterson, 2004). Service exporters usually face problems in securing finance as financial institutions are usually very conservative in their lending policies for service firms. Financial institutions have not developed a high level of sophistication in dealing with service exporters (Austrade, 1994). This situation is compounded by the difficulty in translating assets to access finance, as assets may not be tangible (Parliament of the Commonwealth of Australia, 1996). Lenders insist on borrowers providing, as security, traditional collateral such as inventory and other fixed assets, which includes plant and equipment (Shuman, 2002). Typically,

service exporters have nothing to pledge as security other than an assignment of the proceeds of a service (Shuman, 2002). This situation occurs because the most valuable asset a service company has is usually the intelligence and competence of its people, which is not shown in the balance sheets. For smaller firms, which make up the bulk of service exporting firms, asset bases are limited and many are ill prepared to provide the financial information required when they seek finance and equity (Austrade, 1994).

Although exporting opens the doors to new customers, increased turnover, and greater profits, there is always the chance, no matter how much confidence a firm has in its customers, that there will be non-payment problems. Unforeseen political, social, legal and commercial factors can prevent payment to Australian exporters. In the experience of the Australian Export Finance and Insurance Corporation (EFIC), a significant number of non-payments occur even though the firm has enjoyed a long-standing trading relationship with an overseas customer. Often, non-payment is a result of circumstances outside that customer's control. A non-payment can be devastating, especially for small-to medium-sized businesses dependent on cash flow (EFIC, 2003).

According to Austrade, apart from the problem of collateral, many firms seeking finance have been identified as being ill - prepared, poorly organised and in some cases not well administered. Lack of collateral, non-compliance with application criteria, and risks were cited as key reasons why finance was refused (Austrade, 1994). Austrade advises that exporters and financiers need to better understand each other's requirements. In particular, financial institutions need to appreciate the real risks involved in providing finance to service enterprises, and to develop ways to better manage this risk (Austrade, 1994).

## **Resources**

As in all businesses, the ability to hire suitable people is a huge challenge. There is a need for the firm to invest in its people, especially for an export business, where the employees must be willing to adapt and cope with an unfamiliar system. According to Kaplan and Rieser (1994), the operation must be supervised directly by quality employees who can maintain high levels of excellence. Fisher and Fisher (1998) added that firms should invest in hiring and developing competent senior export professionals. These authors advise that attracting and retaining good export professionals to deliver excellent services is a major challenge for firms.

According to Austrade (2007), when considering market entry strategies, exporters are often encouraged to replicate a service they have established in Australia. However, it can sometimes mean less control over how the service is delivered. It could leave the service originators open to having their service taken over by local partners, although demonstration of best practice and protection of intellectual property can help reduce this risk.

Similarly, piracy has limited the opportunities for legitimate players in the market. Maintaining pressure to protect intellectual property rights is very important for Australian exporters because of the highly intelligent service component apparent in services export. The extent of this risk is reduced to a limited extent by the Agreement on Trade-Related Aspects of Intellectual Property Rights which helps to promote widespread acceptance of standards and enforcement of regulations (Austrade, 1994).

## **Role of government**

Czinkota (2002) noted that there are three basic reasons for government intervention in exporting – overcoming market barriers abroad; bridging market gaps; and alleviating the trade deficit. Essentially Czinkota (2002) sees the role of government as overcoming macroeconomic issues as well as assisting and facilitating organisations handle more immediate concerns. At the strategic level, Australia is pushing most of its major trading partners to open their markets to service industries by lodging a series of proposals seeking the removal of barriers to trade in services (Davis, 2002). This activity has come about since the World Trade Organization (WTO) introduced the General Agreement on Trade and Services (GATS), which contains fundamental principles including most favoured nation, national treatment, market access and transparency. GATS has helped liberalise international trade in services as it allows organisations to obtain exact information on the regulatory framework of their priority markets. It also gives governments additional opportunities to negotiate the removal or reduction of barriers by targeting restrictions on market access in the financial services, telecommunications, legal services, environmental services and education sectors (Sacks and Malbon, 1992).

Apart from government agencies, Australia has more than 350 associations representing service companies; many are focused on accreditation and maintenance of standards, and have limited resources to assist members in exporting. However, it was noted by Austrade (1994) and confirmed by Coulthard (2003) that the majority of service exporters were unaware of the support schemes, especially those provided by various government agencies.

To assist organisations in Australia, both State and the Federal governments have initiated export support programs through a variety of activities. First, information and advice has been provided via a series of plain English brochures and fact sheets; trade information on the Internet, and a wide range of trade advocacy and outreach activities in both metropolitan and regional Australia. The State and Territory offices of both the Department of Foreign Affairs and Trade and Austrade played a major role in these efforts (DFAT, 2003). Second, government subsidies and incentives have been provided through schemes such as The Export Development Grants Scheme, the Export Facilitation Program and the Export Finance and Insurance Corporation's financial support scheme. Further direct support is given through the organisation of trade missions and fairs, seminars and workshops. All these activities are aimed at increasing exporters' revenue, reducing their tax liability, reducing their production and marketing costs and speeding up the process of government approvals.

## METHODOLOGY

This exploratory study used both qualitative and quantitative methods to ascertain the current situation regarding service exports in the Australian state of Victoria. The study was sponsored by the Department of Innovation, Industry and Regional Development (DIIRD), a Victorian government agency. Following a literature search a questionnaire with a letter of support from DIIRD was sent to approximately 400 businesses. The database for the mail out was derived from a variety of sources, including government agencies, industry associations and local telephone directories. The database search helped identify a broad range of services being exported from Victoria including: education, tourism, engineering consulting, financial services, cultural/applied art, IT software including games, environmental services including water treatment, legal services, medical services, landscaping architecture, nursing, logistics, serviced apartments, insurance. Only 49 (12.25%) questionnaires were returned. Of these 41 were usable and 8 were not completed. A further 25 questionnaires were returned to sender unopened. This disappointing response was analysed via random telephone contacts and it was found that many firms were reluctant to respond due to concerns about why the government was seeking this information. This response highlighted that researchers must weigh up the consequences in overtly highlighting sponsors, in particular government agencies. Time constraints did not allow a follow-up quantitative survey to be undertaken.

Semi-structured interviews were undertaken with 12 randomly selected Victorian organisations involved in service exports. This approach was considered most appropriate for the study because as noted by Lee (1999, p 62) the researcher is free to pursue matters as the situation dictates. The interviews involved two basic groups working in the service exports area - actual exporters of services, and suppliers of support services to those businesses. The former group included IT, law, business consulting, logistics, events management and project management firms; the latter group included industry organisations, government support agencies and private sector consulting firms. These interviews were taped and transcribed for further analysis and identification of common themes.

## RESULTS AND DISCUSSION

Because the questionnaires provided limited responses both in terms of quality and quantity the main focus of this paper is on the qualitative aspects of the research. Some findings from the questionnaire that were noted follow:

**Perceived performance:** When asked how well you believe your service exports had performed against major competitors, seventy four percent of respondents felt their performance was either excellent or above average. When analysed it was found it this positive perception on performance was common no matter whether the

respondent organisations had large or small service export sales levels, or whether they had few or many employees.

**Use of Government Export support services:** The only thing that was clear from the surveys was that seventy percent of service exporters either did not know or had not bothered to use Government export support services whilst the other thirty percent had used these services only once. Though this might suggest a failure by government export agencies to promote their services or an unwillingness of potential users to seek out financial or advisory services from government agencies, no definitive conclusion can be drawn as only ten organisations responded to this question.

The qualitative results were segmented based on the key themes identified in the literature review. Respondent's comments and suggestions were analysed and applied to the following topics: service export planning; financing exports; identifying resource requirements and role of government. Before reporting on these factors a brief comment is made on the problem of defining service exports highlighted by this survey.

The Australian Bureau of Statistics (ABS) definition is based on internationally accepted definitions and allows for direct comparison between countries. Or at least that is the idea. Preliminary investigations into the sub-sectors of services suggest that there is widespread confusion regarding how to categorise a range of businesses. As businesses grow they may diversify their activities. The result of this diversity is they might find their operations defined in one of the "other business" categories to the detriment of statistical accuracy and meaningful cross-nation comparison. Given that most people relate to products more easily than to services, which are invisible, developing a meaningful definition is a challenge. It becomes even more so when narrowing the definition down to service exports. This is because people have different connotations as to the meaning of exports versus other activities and often relate exporting to mean the physical transfer of a product to an overseas destination. At the same time they often dismiss the royalty based income they receive from overseas as something other than exporting. The questionnaire found the majority of businesses did not understand that a service could be exported, and none of the respondent manufacturers involved in exporting acknowledged value-added services or at least did not identify them and their monetary value. Whether value-added services are provided is unclear and further investigation will be required to clarify whether manufacturers are taking the opportunity to differentiate themselves from competitors via the use of complementary services. It was noted that a number of organisations incorrectly classified themselves or were incorrectly classified by others as "other exporters" This may result in a range of problems, including insufficient allocation of resources and support by government agencies, poor opportunity matching by service exporters and agencies, and inaccurate data being used in planning for export growth at both State and Federal levels of government.

## Planning

Developing locally and then expanding globally or going global from the start was a dilemma faced by many organisations. This issue was not clearly answered by respondents though it was acknowledged that some organisations are more likely to gain early access to international markets than others. In summary, it appears most respondents believed it was best to have developed a successful system at home first, knowing what works and meets local customer requirements before looking to the export market for growth.

Consistent with Harcourt's (2002) findings, it was emphasised in most interviews that no matter when the decision was made to export, unless the organisation had the resources (in particular financial and human resources), it may fail to take full advantage of international opportunities because it cannot meet the on-going demands of foreign customers. Respondents also emphasised the need to ensure there were enough resources focused on maintaining and growing the domestic market. These respondents felt it was essential to support international development and provide sufficient surplus capital to cover overseas start-up costs.

The importance of developing and maintaining effective networks to build overseas markets through a variety of strategies was emphasised. For example, build on existing contacts – in-country or in Australia; use of government export development bodies, networks, industry associations, banks, private consultants, trade shows. The importance of personal contact was highlighted, through activities such as attending trade shows, local Chamber of Commerce or network meetings, especially when there were guest speakers.

All respondents involved in advising exporters said the choice of which markets to enter required careful planning and market research. The exporters interviewed felt the level of research and planning depended on the proposed market, their past experience and the value of the project itself. Although exporter respondents agreed that the largest market opportunities may be in developed countries with high GDP/GNP, smaller niche markets in developing countries should not be ignored. Some respondents mentioned they had their greatest successes in developing countries where competition was less and the Australian services on offer were significantly more advanced than those offered by local providers. A note of caution was added – choose markets which are open to trade and have in-country incentives to ensure the host country has some stake in ensuring success.

The issue of who should undertake the market research was raised but responses varied from do it yourself to use Austrade recommended providers. Respondents agreed that this research was not a passive undertaking and no matter who assisted in data collection and analysis, the organisation needed to take a proactive interest and overall responsibility for the planning. This was necessary to ensure strategies were in line with the organisation's growth objectives and all those people involved in developing overseas markets were committed to the process. This finding is consistent with the findings of Reif et al, 1997.

Questions related to the appropriate type of organisational structure for the overseas venture were raised but not really answered. The most common point made was that the structure would depend on what was best for the organisation to achieve its foreign objectives and should take into account its current local operational structure.

## **Finance**

The key issue for all respondents was handling financial transactions, including getting paid. The responses were basically risk-reduction strategies and common to any exporter. They support the findings from the literature review, for example, EFIC (2003). Strategies included: taking out insurance; ensure tight audit clauses are in the contract and it is administered by a local firm; get advances and milestone payments; and/or performance and bid bonds; and hedge for exchange rate variation.

It was noted by most interviewees, and supported by the findings of Austrade (1994), that too often Australian organisations failed to budget correctly for their international expansion. Most suggested that significantly more time would be required in the start-up and on-going phases than planned; the same applied to cost estimations.

## **Resources**

Apart from accessing initial finances respondents identified access to human resources and protection of intellectual property as key resource issues. On a general level, getting access to resources to be competitive was critical to success. Respondents suggested many service exporters were comfortable growing their international business with alliance partners. For example, one respondent involved in large infrastructure projects advised they required a diverse range of skills and therefore for them alliances were common. Though respondents were in favour of growth through alliances, further research is required to identify whether service exporters have a greater attraction to vertical or horizontal alliances, what success level has been achieved and what strategies work best to achieve international success.

Whilst acknowledging there will be competition for experienced staff members a specific issue of public/private competition arose: how do I compete with government enterprises for human resources? There were a number of concerns raised about government involvement in international trade. The main concerns centred on the failure of Australian governments to support local business to the extent provided by foreign governments, such as the Japanese and USA governments, giving their own domestic organisations a priority in bidding for overseas government work. Two respondents suggested that governments should remove themselves from managing major projects and rather than competing for local resources, work with the private sector to win international projects. Other strategies to boost private sector expertise, supported by government involvement,

included encouraging the government to build a bigger pool of experts through, for example, an Ambassadors programme, or secondments, where people are encouraged to go overseas to gain experience.

The challenges of working in different cultures was the main human resources issue in all interviews and was a key point emphasised in the survey. Though many respondents raised the concern of language differences and the need to ensure documents were checked for their English translation by at least two different translators, other issues emerged. The most common one related to negotiations. Concerns were expressed that what was said may be different to what was meant, that face saving was important and respecting local cultural nuances would help the relationship develop. Issues such as working with people in other cultures emerged, particularly regarding the need to ensure Australians selected for overseas postings wanted to go and had a support structure for long-term success. Overall, it was generally felt that to be successful in international markets there was a need to understand that the legal, cultural and financial environments were likely to be different to Australia.

In service organisations intellectual property is a fundamental resource; how to protect intellectual property was a key question. Concerns raised were similar to those relating to goods though there was less concern here as it was felt many services adapted to individual project needs. Getting brands and domain names registered in-country was the most favoured strategy. This of course could be different for a licensor or franchisor where developing a quality image and building brand awareness may be their keys to international success. It was not clear from responses whether this latter point was an issue for the selected sample, however, it does need to be further investigated.

## **Role of government**

While Government influence occurs in all of the above areas respondents generally agreed that it was essential for State and Federal Governments, and their agencies, to work closely together in terms of providing support services. Many respondents appeared uncertain as to what services were available for service exporters. Developing more effective communication approaches outlining support and financial assistance packages available to service exporters appears necessary. Respondents were keen to see greater involvement by the Victorian Government in assisting service exporters. However, the only consistent response as to how this should be undertaken was monetary support. The best role for Government to take regarding assisting service exports requires further research. Suggestions for improving assistance to service exporters, based on these results follow in the next section.

## **CONCLUSION**

In view of the issues faced by the exporters, appropriate government support could be of significant benefit in expanding service exports. Support could be provided to assist service export organisations and their customers through:

- Increasing awareness of their services: Government agencies should more aggressively market their services ensuring they target service exporters with appropriate policies and support mechanisms.
- Reducing paperwork and streamlining the approval process: Dealing with bureaucratic processes appeared to be daunting for service exporters interviewed. Many opportunities to enhance the experience of service exporters were identified; including streamlining current large and complex application forms, reducing the number of applicant interviews, and speeding up the approval process by reducing the number of levels of approval required. Service exporters often cannot wait six to twelve months for government approval and receipt of support funding. They are used to responding to their clients in significantly shorter timeframes.
- Education: Government agencies can utilise their own knowledge and consultant network to develop education services appropriate to service exporters. Issues identified as appropriate included finding appropriate and trustworthy partners in overseas markets, protecting intellectual property and ensuring payment for work undertaken. Advice such as that given on the Victorian Government's website is only useful when potential users can find it or know it exists.

- Networking: Agencies could provide opportunities to match supply and demand. Opportunities include working with industry associations, business angels and business networks.
- Money: Organisations could be reimbursed for appropriate export development costs.
- Risk reduction: Agencies could ensure adequate finance and insurance is available, either directly or indirectly via the private sector.
- Export policies: Policies that encourage and reward new and existing exporters should be developed at both Federal and State level. These policies need to be integrated to overcome potential duplication.

There are several reasons why so little information is known about service exporters. First, it could be due to the fact that agreement has not been reached on a specific definition of services. Second, the difficulties and risks associated with exporting services are not well known. Third, not much is known about how the process of exporting services differs from the process of exporting products. Fourth, little is known about the information needed by service exporters to find overseas markets and deliver services to those markets.

This study highlights the importance of service exports to the global knowledge economy. It also demonstrates that much needs to be done by government agencies if they are to assist current and potential service exporters including the provision of incentives to innovate and export. However, before these policies can be implemented, basic definitions need to be agreed on, data collection improved, cross-country research undertaken and on-going advisory services improved and promoted so awareness of opportunities and support are recognised and accepted in the wider economy. This exploratory study hopefully provides a base for further studies and its limitations in terms of scope and respondents involved need to be recognised when assessing these findings and conclusions drawn.

# THE GROWING LEVEL OF ICT USE DURING INTERNATIONALIZATION

**Gerard Danford**  
**Haaga-Helia University of Applied Sciences, Finland**

## ABSTRACT

*As the geographical boundaries of the corporation expand, complex organizations emerge which need greater information-processing capacity. Since internationalization proceeds step-by-step, success depends on the ability of the corporation to gather the necessary information during the process and effectively utilize that information. Therefore, information-processing plays a crucial role in the internationalization process. The findings of this paper concorporation a strong relationship between the incremental stages of internationalization and growing ICT intensity. Furthermore, taking an information-processing perspective on internationalization uncovered a significant challenge to mainstream internationalization theory. ICTs were found to speed up information intensive processes during internationalization. The impact of that affect is to speed up the process of internationalization.*

## INTRODUCTION

This paper is relevant because in the year 2004 alone, more than 2.5 billion Euros was spent by industries worldwide on information and communications technologies. The rate of investments in such technologies has been growing at twice the rate of the global economy (de la Torre and Moxon, 2001). Furthermore, the study of ICT use during internationalization has received limited attention in the international business literature. Moreover, 'accelerating technological developments are now forcing corporations to internationalize more rapidly than some decades ago' (Johanson and Vahlne, 2003, p. 83). During internationalization corporations need to adopt information-processing mechanisms, which allow them to process vast amounts of information and simultaneously deal with information overload. 'Information systems are a key integrating mechanism. Considering the phenomenal development of information technologies these days, information based integration will be a more important and effective form of integrating various business functions and operations in the coming years. The information-based mode should deserve far greater attention and should be a critical part of mechanisms for global integration' (Kim, Park and Prescott, 2003, p. 340). Furthermore, viewing organizations as systems that need to balance organizational information-processing capacities against information-processing requirements originating from the corporation's organization, strategy and environment supports the internationalization process (Axinn and Matthyssens, 2002).

For the corporation to internationalize, information has to be as broad as possible and relevant. This is because the international environment is highly uncertain, risky and containing excessive information. To determine alternative courses of action and identify opportunities and threats, information must be managed (Liesch and Knight 1999, Kim, et al., 2003). Furthermore, information-processing can help decision-makers make the right decisions. Therefore, increased information-processing can support uncertainty reduction, improve risk mitigation and help management identify opportunities during internationalization. During early stages of internationalization the information-processing capacity of corporations is limited. This explains why corporations tend to first expand into countries, which exhibit limited psychic distance. Slower internationalization is also due to undeveloped information-processing mechanisms. Rapid internationalization

occurs when there is a close fit between psychic distance, knowledge, learning and information-processing capacity.

There is limited research on the use of new information-processing mechanisms, such as ICTs, in the international business literature. Moreover, ICTs have the potential for reducing uncertainty, enhancing the learning process and facilitating the creation, transfer and retention of knowledge during internationalization (Petersen, et al., 2002, Galbraith, 2002, Petersen and Welch, 2002). 'Clearly, there is much empirical and theoretical research to be done in order to get behind the hype and develop a clearer picture and understanding of how the Internet is changing the world of international business – including that of corporations' foreign market expansion' (Petersen, Welch and Liesch, 2002, pg. 219).

## POSITIONING OF RESEARCH

This paper builds on the work of Egelhoff (1991). Egelhoff explored in detail information-processing within the context of the multinational corporation (MNC). However, this paper more deeply explores information-processing during the different stages of internationalization. Furthermore, this paper also builds on the work of Petersen, Welch and Liesch (2002). These authors conceptualized the likely impact, which the Internet might have on corporations' foreign market expansion. In this paper the phenomenon is more thoroughly explored through multiple empirical investigations. 'Because international environments are associated with uncertainty, it follows that internationalization leads to a significant increase in environment-related information-processing requirements. As the relative size of the foreign sector increases product interdependency should increase. Thus, internationalization would require more product-related information-processing capacity. Internationalization's influence on the volume of corporation-related information-processing depends on the market entry mode used. Although pure export-oriented strategies will not greatly increase corporation-related information-processing, internationalizing production often demands a higher level of corporation-related information transfer' (Wolf and Egelhoff, 2001, p. 124).

ICTs have the potential to improve market transactions, reduce search costs and improve response time to new opportunities during internationalization (Petersen et al. 2002). 'There is little doubt that the ICT revolution will indeed transform business processes, customer relationship management, supplier and procurement systems, the structure of industries, and, perhaps, the very nature of corporations...The field of international business is particularly vulnerable to this transformation. The act of crossing borders-whether by products, services, ideas, people or money-is at the core of our field. Such crossing, imply a multitude of processes that are information intensive' (de la Torre, et al., 2001, p. 618-619). However, this paper is exploratory because investigations on the impact of ICTs during internationalization are rare (de la Torre, et al., 2001, Petersen et al., 2002). There has been international ICT research addressing macro structural issues (Leamer and Storper 2001, Zaheer and Manrakhan 2001). The impact of ICTs on transaction costs in international business has also been investigated (Bakos 1997). Furthermore, research employing a combination of theoretical approaches has been completed. Unfortunately, few research efforts have been carried out which explore the organizational impact of ICTs during internationalization. Therefore, 'work on more micro aspects of the impacts of ICTs on International business is certainly needed' (de la Torre, et al., 2001, p. 631). Because of the exploratory nature of this paper, a mixed empirical methodology was employed (quantitative and qualitative). This was done to enrich the researcher's understanding of the phenomenon.

## Conceptual Framework

In this paper internationalization is operationalized through the different stages of internationalization (Figure 1). As a corporation progresses through each dimension the level of internationalization increases. Information-processing is operationalized by investigating a wide range of ICTs. The original theoretical proposition of this paper assumed a relationship between growing ICT intensity (cumulative and internationalization as:  $y = \alpha + \beta x$ ). The intensity (variety) of ICTs employed is the dependent variable (y) and the independent variable (x) is internationalization. The ICT mechanisms selected for this paper included: e-mail, Internet, Intranet, Extranet and EDI (electronic data interchange). ICT intensity was operationalized by using ordinal intervals. Therefore, a combination of mechanisms is used as the indicator of ICT intensity, rather than the use of individual mechanisms. E-mail was found to be the alpha ( $\alpha$ )

Figure 1. Internationalization Dimensions

| <b>Product Dimension</b><br>(product type) | <b>Operational Dimension</b><br>(operation mode) | <b>Market Dimension</b><br>(markets distance) |
|--|--|---|
| Goods                                      | Non-investment marketing activity                | very close                                    |
| Services                                   | Direct investment marketing activity             | Close   |
| Know How                                   | Non-investment operations                        | Medium  |
| Systems                                    | Direct investment operations                     | Distant                                       |

## Information Processing

Galbraith (2002) is credited with conceptualizing and unfolding the vision of the organization as essentially an information-processing entity. He considered organizational diversity to be a result of strategies that organizations employ to cope with environmental uncertainty. He defined uncertainty as ‘the difference between the amount of information required to perform the task and the amount of information already possessed by the organization’. However, Egelhoff (1991) extended Galbraith’s work by developing a multidimensional framework to define information-processing capacities and requirements in international business. He felt that increased organizational information-processing capacity requirements result from the strategic and environmental impact of internationalization. Egelhoff differentiated between logistical and cognitive information-processing. Logistical information-processing is concerned with information-processing capacities and requirements inherent in the corporation strategy and environment. Organizational structures and processes to transfer and access information are the focus of the logistical approach. Vertical information systems and lateral relations are logistical mechanisms, which have the greatest capacity to process information. Vertical systems include computer-based systems and staff groups. Lateral

Mechanisms include: groups, E-coordination, integrators and matrix/line organizations. Based on the definition of ICTs applied in this paper mechanisms would also include: information systems, information technology and virtual-human interfaces such as e-meetings etc. (Galbraith, 2002, 2006). The cognitive perspective is not explored in this paper. Empirical studies verifying Galbraith’s conceptualizations and Egelhoff’s extension have been scarce in the international business domain (Petersen, et al., 2002, Premkumar, Ramamurthy, and Saunders, 2005). The role of information-processing and in particular the use of ICTs during internationalization, however, receives brief treatment (de la Torre, et al., 2001, Petersen, et al., 2002, Kim, et al., 2003). Therefore, conceptual and theoretical research on information-processing during internationalization has outpaced empirical research. ‘It is ironic that there have been almost no studies that examine comprehensively the role of information and knowledge acquisition during the internationalization of the corporation’ (Liesch et al., 1999, p. 384).

However, the internationalization process of corporations has been studied for decades (Johanson and Vahlne 2003). In those seminal studies internationalization was described as an incremental process during which learning plays an important role and psychic distance impacts the efficiency of information flows. Network theory, portfolio theory (Rugman, 1979), knowledge internalization (Nonaka and Takeuchi, 1995), resource based studies (Collis, 1991) and socio-competitiveness studies (Fouad, Mrad 2006) have also addressed information-processing during internationalization to a very limited extent. The presence of significant differences between global and domestic information technology requirements has also been researched (Tractinsky and Jarvenpaa, 1995). The alignment between technology and strategy has been the dominant stream in that research effort. However, ICTs have been the subject of analysis in few international business studies, especially from an internationalization perspective (Egelhoff 1991, de la Torre, et al., 2001, Kim, et al., 2003). By limiting this empirical investigation to ICTs the research neglects to consider other vertical and lateral mechanisms such as liaison roles, teams, and staff groups.

## Internationalization

The internationalization stages model is a process and behavioral phenomena. Experiential knowledge is emphasized in that process during which knowledge is acquired by operating on foreign markets. Additionally, the accumulation of experience is vital to future internationalization. Furthermore, internationalization is corporation specific and involves high risks. Internationalization is also a dynamic and multidimensional process involving buying, selling and different forms of co-operation. Furthermore, internationalization is incremental and involves a deepening commitment to different operating forms and a chain of activities. The internationalization process involves market selection and commitment based on; know how, human resources and technology. However, the process is unpredictable and market knowledge (both objective and experiential) plays a critical role. Therefore, information needs are affected by imperfect access to information and knowledge. This imperfect aspect impacts market selection and operational mode choices. Hence, country, institutional, culture, competitor, market and customer aspects all impact the information needs of the corporation during internationalization.

Furthermore, information-processing during internationalization is a means of knowledge accumulation (Johanson & Vahlne, 2003). The result of knowledge accumulation is the reduction of uncertainty and perceived risk. Because experiential knowledge is costly, difficult to interpret and harder to transfer, utilizing appropriate information-processing mechanisms supports the corporation during the internationalization process. Additionally, ICTs influence the corporation's initiatives, information search processes, and information evaluation. Therefore, 'ignorance, unfamiliarity and uncertainty related to international business activities can be reduced through collecting, interpreting and evaluating information on these matters' (Luostarinen, 1994, Eriksson and Johansson and Majkgard and Sharna 2000).

## **Propositions**

Based on the above discussion the following working propositions were postulated:

WP 1. As corporations develop their level of international business, the need for increased information-processing capacity grows and ICTs are increasingly employed

WP 2. As corporations increase their product offering (sales objects) during internationalization stages, the need for increased information-processing capacity grows and ICTs are increasingly employed.

WP 3. As corporations expand their use of operational modes (export etc.) during internationalization stages, the need for increased information-processing capacity grows and ICTs are increasingly employed.

WP 4. As corporations expand the number of markets served, during internationalization stages, the need for increased information-processing capacity grows and ICTs are increasingly employed.

## **EMPIRICAL DESCRIPTION**

In order to more fully understand the phenomenon in question it was considered necessary to employ mixed-method research. The advantages of the mixed-method approach are numerous. Two empirical investigations were implemented in order to better "understand the mechanisms that cause the outcomes rather than only relying on the statistical significance of correlations between attributes and outcomes" (Christensen, et al., 2003, p. 74). During the empirical phase, the researcher was conscious of the need to be able to make generalizations on the findings even though the work was exploratory. Study 1 used data from a large-scale domestic Finnish survey of ICT usage (Statistics Finland 2001). An Ordinary Least Squares (OLS) regression model was used to study the relationship between the dependent variables (Internet, Intranet etc.) and independent variables (imports and exports). Statistics Finland was able to gather import/export data for participating corporations. The results of the regression analysis suggested that there was a strong probability of a link between involvement in imports, exports and increased ICT usage. There were no assumptions made on the generalization of the findings. Rather, the findings were felt to be indicative of the relationship. A deeper investigation of that relationship was explored in Study 2.

Empirical Study 2 was a telephone survey made with 66 Finnish corporations. The results concorporated a strong and positive relationship between the stages of internationalization (POM) and growing ICT intensity. ICTs were defined as: e-mail, Internet, Intranet, Extranet and EDI. These information-processing mechanisms have been investigated in other international studies (Petersen, et al., 2002, Kim, et al., 2003).

## Results: Study 1

The results from the exploratory regression analysis suggest that an important relationship might exist between early stages of internationalization (imports-exports) and the increased use of ICTs. Most of the variables had strong significance or significance in relation to ICT usage (Figure 3).

Figure 3: Correlation of Imports/Exports and Information-processing Mechanisms Use

| ICTs   | <i>Import/Export</i> | <i>Pr&gt; t </i>         |
|--|----------------------|--------------------------|
| Corporation has www site (4119 observations)   | Import<br>Export     | 0.0154*** 0.1108         |
| Corporation has Intranet (3810 observations)   | Import<br>Export     | <.0001****<br>0.002****  |
| Corporation has Extranet (3810 observations)   | Import<br>Export     | 0.0141*** 0.1360         |
| Corporation has EDI (3681 observations)  | Import<br>Export     | 0.0002****<br><.0001**** |
| <0.01 = strong significance ****<br><0.05 = significance ***<br><0.10 = some significance ** |                      |                          |

The variables measured in this regression analysis represented only early stage activities (imports and exports). However, the regression analysis involved five (e-mail was employed by majority) different ICTs. Descriptive analysis, such as the above, can make some probabilistic statements of association (Christensen, et al., 2003). Nevertheless, one can only assert on average the attributes associated with results. Testing inductive proposition through different sets of data is one way to proceed. However, based on these regression analysis findings one can assume that some relationship exists between early stages of internationalization and ICT usage. These findings imply that internationalization is information-intensive (de la Torre, et al., 2001). However, one should not draw too many conclusions or argue that the results are applicable to the entire population of internationalizing corporations (Petersen et al. 2002). The sample (from 3681 to 4119 corporations) was considered representative of Finnish industry as a whole.

## Results: Study 2

Empirical Study 2 involved interviews with 66 Finnish corporations. The findings were analyzed using SPSS (Statistical Package for the Social Sciences). SPSS is a software package used for conducting statistical analyses, manipulating data, and generating tables and graphs that summarize data. The sample was considered representative in terms of industry variation. Large and medium size corporations represented 81% of the sample. Directors and functional managers represented 64% of respondents. The remainder were corporate communications personnel.

Empirical Study 2 revealed that a strong relationship (supporting WP1) exists between the stage of internationalization (products, operations and markets) and growing ICT intensity. However, know-how sales did not fully match the mainstream sales object pattern observed. One explanation for this could be that know-how corporations do not need certain ICTs because they don't sell physical goods. The findings revealed that as an internationalizing corporation progresses through different sales objects ICT intensity grows (WP2 partially supported). Regarding operational strategy, the findings revealed growing ICT intensity as corporation's progress from inward, outward and then to co-operative stages (WP3 supported). Regarding operational strategy, the findings also revealed growing ICT intensity as corporation's progress from inward, outward and then to co-operative stages (WP3 supported). Finally, there appears to be a trend towards growing ICT intensity as the corporation expands its market coverage. Therefore, WP4 was partially supported. Participants were also asked

to indicate the major benefits gained through the usage of ICTs during internationalization. Increased speed of business processes was considered to be the major benefit.

Furthermore, participants were also asked to elaborate on those benefits. Table 1 summarizes the major benefits gained through the use of ICTs during internationalization. These benefits have been categorized based on the product, operation and market framework (POM). Many of the benefits listed will have a positive impact on more than one POM variable.

Table 1. Major benefits gained during internationalization by employing ICTs

| <b>Product : Sales Object</b> | <b>ICTs: Major Benefits Gained During Internationalization</b>  |
|-------------------------------|---|
| <i>Products</i>               | on-line sales , on-line sales catalogues, electronic trading, more quickly solve problems   |
| <i>Services</i>               | Internet and Extranet based services, faster communication and data flows, easier exchange of files in original form, less paperwork  |
| <i>Systems</i>                | precise information available, easy to use tools, following technical developments, quicker and more direct information sharing, easier to acquire information  |
| <i>know-how</i>               | more effective networking, simplify and speed up communication, improved information quality, global availability of information, more diversified information available, quicker and less costly information availability                              |
| <b>Operations</b>             | <b>ICTs: Major Benefits Gained During Internationalization</b>  |
| <i>In-ward</i>                | easier to find and contact potential suppliers, electronic trading, better supplier information exchange, efficient order processing and invoicing  |
| <i>Out-ward</i>               | more effective communication with distribution channels, customers get better information, lower costs, faster data and information transfers, better customer feedback, improved information sharing with subsidiaries                                 |
| <i>Co-operative</i>           | all files in original form and easily exchanged, deeper interaction with core processes, speed of production increased, accounting systems improved, actions taken more quickly on problems, time saving  |
| <b>Markets</b>                | <b>ICTs: Major Benefits Gained During Internationalization</b>  |
| <i>close</i>                  | finding new customer easier, sales and service on Internet, marketing and sales promotion easier, increase sales  |
| <i>distant</i>                | build awareness, after sales service, quickly respond to customers needs, easier to communicate, improved competitive scanning  |
| <i>very far</i>               | provide more information to own personnel in network, good Extranet for contacts with customers, e-commerce opportunities, improved competitive scanning, better customer feedback, better communication in markets where infrastructure is undeveloped |

## Summary of Theoretical Contribution

This paper has demonstrated that ICT intensity gradually increases as the corporation internationalizes because of environmental changes and resulting changes in corporation strategy, organization and knowledge. These changes contribute to growing uncertainty and complexity. As corporation's progresses through stage dimensions organizational learning occurs, experiential knowledge is accumulated, and procedural knowledge is gained (Johanson et al., 2003). Furthermore, the corporation encounters psychic distance related barriers and lateral rigidity during internationalization. ICTs diminish the negative effects of growing complexity and psychic distance. Moreover, ICTs support increasingly cost effective and efficient transfers of knowledge from one product, operational and market context to another (Petersen, et al., 2002). ICTs can in fact accelerate the internationalization process. 'The Internet holds the potential of reducing the uncertainty associated with doing business in foreign markets. Since the uncertainty about foreign markets (as perceived by corporations' decision-makers) has been considered a major barrier to foreign market expansion, in the hands of international managers the Internet may be an instrument that accelerates foreign market expansion' (Petersen et al. 2002, p. 208).

Moreover, ICTs have a significant impact on internationalization and influence other elements portrayed in each loop of the framework. This paper demonstrated that ICTs accelerate the process of internationalization. The internationalization process was described as corporation specific and incremental. The central role of ICTs in the revised framework highlights the fact that ICTs support the growing need for information throughout the internationalization process, which is due to increasing environmental uncertainty. The cumulative effect of growing ICT intensity during the process of internationalization is the acceleration of that process (Arenius, Sasi and Gabrielsson 2006). This acceleration is a result of the positive role which increased information plays in knowledge accumulation and decision-making. Therefore, in this paper ICTs were found to support the acceleration of foreign market expansion. The circular/reinforcing feedback loop of the framework illuminates the dynamic interplay, which exists between ICTs (along with other information-processing mechanisms) and internationalization.

## MANAGERIAL IMPLICATIONS & FUTURE RESEARCH

There exists a need to reconsider the combined role of information and knowledge during internationalization. 'So far, the empirical data are scarce and anecdotal' (Petersen et al. 2002). Because this paper was exploratory, more research is needed in order to understand the enabling role of ICTs during foreign market entry and expansion. However, one should not view ICTs as the solution to all problems associated with internationalization. The empirical findings revealed that the primary benefit of using ICTs during internationalization was increased 'speed' of processes. It was determined that speed had an impact on a number of processes such as: information flows, money flows, communication flows, information capacity, up-to-date information and data transfer rates. Therefore, processes should be prioritized when considering the positive impact of ICTs. Individual business functions should also be accounted for when identifying the benefits that might be gained by increased ICT intensity. Furthermore, there is a need for more in-depth empirical research examining information-processing needs during the different internationalization stages.

# EXCERPTS FROM DIGITALLY DIVIDED LIVES IN TURKEY

**Elif Dayar, Atılım University, Turkey**

## ABSTRACT

*In this study, lives of Turkish people have been examined through newspaper excerpts and interviews in the book 'Yoksulluk Halleri' by Necmi Erdoğan to see if there still is a digital divide problem in Turkey as of 2006. After grouping the collected data according to different headings of income, age, education, gender, geography, foreign language, and technological skills, the data has been studied from the point of view of four categories: physical, digital, social and human resources. Turkey seems to be well equipped with physical resources yet in the other categories it fares quite poorly.*

## INTRODUCTION

Turkey has been diagnosed with the problem of “digital divide” as early as 1997. (Geray, 2000). Saatçioğlu (2006) claims, Turkey still suffer from “digital divide”. One common point in the diagnostic analysis of both authors is the utilization of quantitative data such as the number of people who have computers or the extent of infrastructure for Internet or other such indicators.

However, it is the opinion of this author that social issues should be tracked via real life stories. The point of concern here is which aspects of their lives should be analyzed. Unfortunately, the literature does not provide an agreed upon definition of the term digital divide and its relation to various aspects of people’s lives. Therefore it is the purpose of this paper to first present the various interpretations of the concept and then apply the most suitable one to the case of Turkey.

The paper starts out with a review of the literature regarding the definition of ‘digital divide’, which is followed by the second section on research question and the methodology. In the third section, ICT usage in Turkey is presented via news excerpts. In the conclusion, a verdict is reached on the issue of digital divide in Turkey.

## What is Digital Divide?

A literature review of the term digital divide reveals a transformation of the term in time. According to Tipton (2002), and Quibria et. al. (2003) the digital divide separates those who are connected from those who are not. Souter (2004) defines the digital divide as “the disparity in ICT diffusion and use between industrial and developing countries”. According to Garcia et. al. (2006) digital divide is not only about access, but also about other characteristics that define the social opportunities of an individual such as gender, education, employment status, IT skills, and among others ability to speak foreign languages. DiMaggio and Hargittai (2001) lay out five dimensions of digital divide as “equipment, autonomy of use, skill, social support, and the purpose technology is employed for”. Robinson et. al.(2003) find the more educated a person is, the higher his/her chances of using the Internet while Chen and Wellman (2003) indicate that there are many divides and that it is a ‘multifaceted’ concept varying both within and between countries.

As presented by the various definitions above, the concept of “digital divide” does not have a strictly agreed upon version. However Warschauer’s (2003) categorical approach to the issue enables one to study the concept in a well structured manner. The categories consist of physical resources, digital resources, human resources, and social resources. Physical resources comprise computers and telecommunications. Digital resources encompass digital material in different languages. Human resources mean literacy and training or education to be able to effectively use the ICT devices, while social resources refer to the computer literate people around who are willing and able to help with ICT problems. This paper uses Warschauer’s approach to the issue of digital divide.

## **THE RESEARCH QUESTION AND THE METHODOLOGY**

Geray (2000), and Saatcioglu (2006) indicate that there is a digital gap in Turkey. However, their diagnosis rests upon the review of statistical figures on ICT use in Turkey and therefore corresponds to the physical resources category in Warschauer’s analysis. The digital, human and social resources are not touched upon in these studies. The aim of this study is to fill in this gap so that a full picture of the ‘Turkish digital divide’ can be taken in terms of Warschauer’s perspective.

A Turkish daily newspaper, *Hürriyet* has been used as one of the sources because the aim was to collect real life information on Turkish people. *Hürriyet* archives have been scanned over the Internet for the year 2006. All the ICT related news excerpts have been collected and filed as per the following dimensions: income, age, gender, education, geography, foreign language, and technological skill. A second source has been Necmi Erdogan’s book titled *Yoksulluk Halleri* (2007). This book describes poverty through the interviews with people living in the slums of Ankara and İstanbul.

## **A NEWS BASED OUTLINE OF ICT USAGE IN TURKEY**

### **Income**

One of the most repeated themes in the use of ICT by the rich is at housing applications. For example Hararlı, (2006) reports that Ajda Pekkan, a celebrity singer, has started to build a ‘smart house’ on her lot at Tarabya, İstanbul. After completion of the building, she will be able to water her plants via a touch on her cell phone. Apart from houses of the high-income earners, students’ lodgings at private universities and private hospital rooms are other places where Internet access and satellite TV can be found. (*Hürriyet*, 3 September, 2006). For the rich, gambling purposes seem to be a preferred use of the Internet. According to a research made by Ankara Chamber of Commerce, the size of the Turkish gambling market is 1 billion dollars. (Özbey, 2006)

On the poor side of the population the use of or access to IT is not even an issue. The words of Necmiye from the book *Yoksulluk Halleri* (2007) reflect the challenges these people need to fight every day. Necmiye:

“I wait from seven to ten in the morning for food to be handed out. Then I bring it home around ten thirty. We have our breakfast from ten thirty to eleven. So our lunch and breakfast is actually the same meal.” (Erdoğan, 2007)

In another case, Erkan and his wife Fitnat who live in the slums of Mamak, Ankara, complain that they do not have water, and admit that they use illicit electricity. When asked to Firnat, whether there is a TV at their home, she answers that they did have one, but it got confiscated. (Erdoğan, 2007)

### **Age**

Among 86 thousand subscribers of VW PoloCup, a virtual Internet game, 54.5% are in their twenties, 25.6% are under 21 years of age. (Yoldaş, 2006). The amount of time some of these teenagers spend on the computer is rather high. Okan Deniz, a 17 year old high school graduate says that he spends at least five hours every day on the computer. (*Hürriyet*, 15 October 2006). The significance of the matter is indicated by a letter

written by the minister of Family and Women, to four other ministries. In the letter, the minister offers partnership in projects dealing with problems such as Internet marriage, Internet crimes and Internet addiction. (Hürriyet, 1 October, 2006).

Despite all the harmful effects, if used positively at the right amount and for the right purpose, computers and Internet can change some young people's lives. Çakmakçı (2006) reports the case of Hüseyin Kaya, 18. The fourth child of his family, Hüseyin has managed to set up a computer system to the English language course he attended, and was offered a scholarship at the City of London College where he eventually became the IT manager.

However, when the lives of poor children in Turkey are taken into consideration, it is highly unlikely that most will ever follow Hüseyin's footsteps. For example, Zeynep, a 12 or 13 year old girl longs for a bicycle, and an "ateri" (misspelled form of 'atari', a computer game brand favored among children) while Emrah, 16, is lucky enough to attend the Society Center at Sincan, Ankara. When asked about what he does at the Society Center, he explains that he comes to the center to play on the computer and to get away from his old friends who are thieves. (Erdoğan, 2007)

In addition to computers and Internet, cellular phones are also a matter of longing for the poor youth. Ayşenur, 18, who lives at Yenidoğan, Ankara describes how 'the rich' pass in front of them slowly to show off their cell phones. (Erdoğan, 2007). As far as youth is concerned, from the above discussion, it can clearly be observed that, IT constitutes a major element in their lives, either as excessively used as in the case of the rich or excessively longed for as in the case of the poor.

However for the old, IT does not seem to carry much significance. In the year 2006, only one article was found in Hürriyet on this issue. Narlidere Nursing Home residents are reported as seniors who chat on the Internet with their children and grandchildren at the Internet café of the nursing home. (Hürriyet, 13 December 2006).

## Gender

According to a research study conducted by MyNet, 68% of the Internet users in Turkey are men. (Hürriyet, 3 March 2006). Even though this statistic hints on a gender wise difference in terms of Internet use, a piece of news that was reported in December 2006 corroborates this diagnostic. The article is about one of the historical *hamams*, (common baths) in Ankara. The manager of the Karacabey Hamamı is reported to say that most of their customers came to a close by car wash, and while waiting for their cars, they chose to get a bath themselves. Upon realizing most had laptops, the bath management launched a wireless Internet connection in the hamam. (Hürriyet, 11 December 2006). As it is not customary for Turkish ladies to go to public baths without preparation like clean underwear, and clothes, this service was introduced for male customers.

In another article Ayşegül Kalem, a clinical psychologist, cites two very similar cases of computer game addiction leading to divorce. In both cases the couples have bachelor's degrees. The husbands are so much into computer games that the minute they step into the apartment they go straight to the computer. In the case of S, she finally resorts to send a short message over the cellular phone to her husband in order to attract his attention. Unfortunately it does not work, and eventually they get divorced. In the case of D., she grows jealous of the computer but cannot divert her husband from it. Their seven year marriage ends with a divorce. (Hürriyet, 19 February 2006).

Aslı Boduroğlu de Munnink is the European, Middle Eastern and African regional director of HP for Internet and Marketing Services. She works from her home-office, managing a staff of 12 people from 7 different countries over the Internet. (Güzelay, 2006). Binnur Akhun who has a master's degree in movie making is not working due to childbirth leave. She has a one year old blog of her own on bread making. (Hürriyet, 17 September 2006). Even though these cases give the idea that some Turkish women have surpassed the world average in terms of Internet use, one article cites a story which is drastically different from the ones mentioned. It is about Fadime Conker who grew up in an environment where it was forbidden to go out for girls, so she could not get any schooling as a kid. However after attending a literacy course as an adult, she continued

her studies and is currently attending the junior year in high school. Her goal is to learn how to use computers and get a driving license. (Hürriyet, 4 November 2006).

The absence of Internet or information technologies in the lives of women apparently is not even an issue in Turkey, as this topic is not covered much by the media.

## Education

All primary and secondary schools in Istanbul have computers, overhead projectors and Internet infrastructure. (Hürriyet, 13 September 2006). For instance Kadıköy Anadolu High School has 3 'technology classrooms' equipped with a notebook, Internet connection and security systems. (Hürriyet, 5 January 2006).

One of the reasons for the provision of hardware to wealthy schools may be the persisting effort of private companies to create market for their products. Intel is reported to set a goal of establishing 350 computer centers by the year 2011. (Hürriyet, 24 June 2006). These are all nice intentions and given the attempt of the Ministry of Education to take Internet to poor schools over the lines of electricity, the picture seems rather rosy. (Hürriyet, 16 June 2006). However, in the presence of power shortages in a number of primary schools in some provinces, such as Adana, talking about Internet connection over lines of electricity presents a contradiction. (Hürriyet, 11 December 2006). In Lalapasa, Edirne, computer laboratories are turned into classrooms to make room in the primary school building for the newly founded vocational school and computers are locked up at a nearby warehouse. (Bayrak, 2006). In Yatağan, Muğla the IT course has been lectured 'theoretically' because computers could not have been set up by the technical personnel. (Yıldırım, 2006).

## Geography

According to the virtual Polo Cup car race statistics, 60 % of the competitors are mainly from the three big cities in Turkey. 37.6 % are from Istanbul, 14 % are from Ankara and 8.8 % are from İzmir. The rest is from all over Turkey. (Yoldaş, 2006). This data indicates a wide gap between the three metropolitan areas and the rest of Turkey. Yet, it is interesting to see a medical doctor who is appointed to Mutki, Bitlis reporting that he had access to Internet at Mutki. (Hürriyet, 8 October 2006). On the other hand, in the Sürügüden village of Muş, the husband of a woman in labor pain is reported to walk for 10 kilometers to call for help as there was no telephone in the village. (Aydın, M., 2006).

## Foreign Language

English as the dominant language of Internet and the IT sector in general is a barrier for most Turkish people. As for the magnitude of those suffering from this problem, Benmayor (2006), reports that out of a total of 50,000 IT people working in the sector, only 13,000 can speak English. Realizing the business opportunity in the need of content in Turkish, some private companies have initiated products to serve this market. Logomotif, one of the leading firms in the educative software market in Turkey, is providing services in Turkish from homework assistance to interactive newspaper and entertaining games. (Hürriyet, 13 September 2006).

## Technological skill

News on techno-savvy people in Turkey can be grouped under two different headings: Hackers and cell-phoners. Aydın Ç. (2006) reports the case of Ali Akgün and his team who have been caught after breaking into 10580 bank accounts. An indicator of the size of cell-phone savvy Turkish people could be the 550 thousand applications to Akbank's new cellular-loan service in a period of only two months. (Hürriyet, 20 February 2006).

After acknowledging the presence of the techno-savvy group in Turkey, the misery of the digitally illiterate ones begs to be pointed out. According to Gürkan Avcı, the president of the Independent Educators Union, school registrations conducted over the Internet are denying access to those parents who do not know how to use the Internet. (Hürriyet, 7 September 2006). While the goal may be the elimination of lines of frustrated parents,

due to digital illiteracy, another group of frustrated parents is generated; those who need to find digitally literate people to help them out.

## CONCLUSION

On the one hand there is Istanbul with all her primary and high schools equipped with computers and infrastructure for Internet, on the other hand, in Sürügüden, Muş, there is not even a single telephone to be used for emergency purposes. In terms of physical resources it seems like there is a large gap, particularly when we compare the east and the west. However, at the very least, there is awareness and there are some initiatives taken to reduce the gap. When we look at the digital resources, we can say with the introduction of homework assistance material in Turkish, children are able to find more material in their native tongue. Yet, given the fact that only 25% of people working in the IT sector can speak English, it would not be wrong to conclude that in terms of digital resources, Turkey still has a long way to go. The case of parents who cannot register their children to school because of IT-illiteracy, and schools that cannot set up computers due to lack of technical knowledge prove that as long as human resources are concerned, Turkey is far from the ideal state. Last but not the least, in terms of social resources, there are some efforts such as the establishment of society centers where poor kids can learn to use computers and access the Internet, but it is rather doubtful that these efforts will be of widespread use particularly because of the absence of a government policy regarding the matter.

In conclusion, this paper confirms the findings of Geray (2000), and Saatçioğlu (2006) that there is a digital divide in Turkey and furthermore underlines the different aspects of the divide as they relate to the digital, human and social areas in life.

# **ABSORPTIVE CAPACITY AND FIRM OPERATIONAL PERFORMANCE: THE MODERATING ROLE OF STRATEGIC PLANNING FORMALITY**

**Zarina Denan and Noraini Ismail**  
**Universiti Teknologi MARA, Malaysia**

## **ABSTRACT**

*The purpose of this study is to evaluate the interrelationship between absorptive capacity and operational performance. The moderating effect of strategic planning formality on the relationship between absorptive capacity and operational performance is also investigated. A 34-item survey questionnaire was developed and 157 manufacturing small and medium enterprises (SMEs) in Malaysia were selected as the samples of this study. Face to face interview was conducted on the owners or managers of the SMEs. The results conclude that: the emphasis of absorptive capacity including knowledge acquisition, knowledge dissemination and knowledge exploitation, is associated with the operational performance. Though, the moderating effect of strategic planning formality on absorptive capacity-operational performance relationship is significant, it does not enhance the relationship.*

## **INTRODUCTION**

A firm's ability to make use of knowledge as a resource strategic has been recognized as a key factor determining firm performance. Zack (1999) has reported that firm such as Buckman Lab, Lincoln Re, Lease Co. and Image Corp have been successful firms because of their implementation of knowledge management activities such as acquiring knowledge from the experts, sharing knowledge from the universities and applying knowledge as part of their strategies. It has been shown that firms' performance will be influenced by knowledge as knowledge provides increasing returns as it is used. The more it is used the more valuable it becomes, creating a self-reinforcing cycle (Zack, 1999).

Knowledge could be the answer to overcome the problems faced by small and medium enterprises (SMEs) throughout the world. SMEs particularly in Malaysia are facing with not only domestic but also global challenges in achieving economies of scale and competing internationally (Saleh & Ndubisi, 2006). They are challenged with problems such as the low level of technological capabilities and limited skilled human capital resources, a low level of technology and ICT penetration, low levels of research and development (R&D), a substantial orientation towards domestic markets, a high level of international competition (for example, from China and India), a high level of bureaucracy in government agencies, and internal sourcing of funds (Saleh & Ndubisi, 2006). Therefore, knowledge could be used as part of strategies in small firms such as SMEs as they tend to have a high mortality rate compared to larger firms (Lau & Lim, 2005).

Knowledge management is the most popular issue in today's business world. In spite of its tremendous importance very few entrepreneurial literatures attempt to investigate the relationship between knowledge process and SMEs performance. In order to fill this gap this paper attempts to empirically investigate the absorptive capacity or knowledge process and its impact on SMEs business performance. This study also will examine the impact of strategic planning formality as moderating factor on the relationship between firms' absorptive capacity and operational performance.

# ABSORPTIVE CAPACITY

It is important not only to large firms to seek capability but manufacturing SMEs in particular need the combination entrepreneurial skill with commercial focus and continued knowledge acquisition and application as key drivers of success (Keogh, Mulvie & Cooper, 2005). They also believed that the SMEs need to pay attention to human capital especially at senior management and employee levels which are extremely important to the growth and development of the SMEs.

Cohen and Levinthal (1990) argued that the distribution of knowledge within the organization and the organization's ability to transfer this knowledge internally are critical to absorptive capacity. They also argued that a firm's stock of prior related knowledge determines the ability of a firm to absorb new knowledge and practices. According to Zahra and George (2002), like any other organizational ability, absorptive capacity should provide a competitive advantage only if barriers to competition prevent its efficient acquisition by competing firms.

Zahra and George (2002) reconceptualized the absorptive capacity as having four dimensions – acquisition, assimilation, transformation, exploitation where the first two dimensions form potential absorptive capacity; the latter two- realized absorptive capacity. They criticized the existing studies for using R&D intensity, number of scientists working in R&D departments, etc as a measure of absorptive capacity because the measures are too simple and do not fully reflect the richness of the construct.

According to Lim and Klobas (2000), km processes are easier to apply in smaller companies because easier to capture tacit knowledge in less formalized environments. There are a few studies (Liao, Welsch, & Stoica, 2003; Wang, Wang & Horng, 2004; Jantunen, 2005) have tested the concept of absorptive capacity as firm capabilities with performance amongst small businesses.

The aim of this paper is to add to the existing literature on absorptive capacity in two important directions: (1) the concept: in terms of the conceptualization and measurement of absorptive capacity, which follow the path of recent contributions (Zahra & George, 2002; Liao et al., 2003; Jantunen, 2005). This paper aims to focus on three dimensions (acquisition, dissemination and exploitation) of absorptive capacity with the assumption that SMEs have simple and less formalized structure; and (2) the development: by introducing strategic planning formality as moderating variable. Thus, it allows us to examine the possible effect of strategic planning process on absorptive capacity-performance relationship that is not often examined in the literature.

# STRATEGIC PLANNING FORMALITY

Sexton and Auken (1982) defined strategy as managerial planning proposed to adjust a small firm to its external environment in a way to achieve sales and profit goals. It is a dynamic process and involves change that does not necessarily translate into expensive programs (Moyer, 1982). Common belief holds that SMEs are simple users of strategic management, likewise they do not make strategy at all (Verreynne, 2004). Sexton and Auken (1982) also described small business planning behavior as unplanned, unpredictable and narrow. On the contrary, Naffziger and Mueller (1999) argued that small firms do plan and have generally indicated that planning has value, depicting that strategic management researchers demonstrate mixed views on strategic planning among SMEs.

The direct impact of strategic planning on performance is well covered within the literature. However, Rogers, Miller and Judge (1999) argued that researchers of planning studies neglected an important moderating variable when examining the direct link between strategic planning processes and performance. Thus, according to them, planning may not be empirically linked to performance without considering the moderating effect of strategy.

There are a few studies (Carpenter, 2002; Matsuno & Mentzer, 2000; Richard, 2000; Youndt, Snell, Dean & Lepak 1996) which have considered the moderating effect of strategy on several different predictor-performance relationships. The abovementioned studies however were more concerned on the strategic content rather than method of planning. According to Lyles, Baird, Orris and Kuratko (1993) formal planning is often associated to the adoption of key steps in the decision process. To date one study carried out by Olson and Bokor (1995) has considered strategic planning formality to be a moderating variable on strategy content-performance relationship. Thus, this study proposes to study strategic planning formality as a moderator which will or will not enhance the relationship between absorptive capacity (knowledge process) with operational performance.

## Interrelationship between absorptive capacity and operational performance

Arora (2002) argued that most research on knowledge management outcomes disregard non-financial performance. A few studies (Carneiro, 2001; Chong and Choi, 2005) claimed that financial indicators alone cannot measure intellectual capital adequately. A study by Prieto and Revilla (2006) supported that learning capability do increase non-financial performance. Therefore, this leads to the first hypothesis:

*H<sub>1</sub> : There is a significant relationship between absorptive capacity and operational performance*

## The moderating effect of strategic planning method

A few empirical studies have investigated the moderating effect of strategy type on the relationship between organizational capabilities and performance. For example, Liao et al., (2003), found that the more proactive the SMEs are, the greater the impact of knowledge acquisition on performance. Hitt, Ireland and Stadter's (1982) study suggested that a firm's grand strategy moderate the relationship of functional areas and company performance. Meanwhile, firm strategy was found to moderate the relationships between both peripheral and core outsourcing intensity and financial and innovation performance in Gilly and Rasheed's (2000) study. Nevertheless, one particular study by Olson and Bokor (1995) revealed that firm's sale growth rate was influenced strategy process (degree of planning formality) and content interaction. Therefore, it is expected that formal planning and absorptive capacity (knowledge process) will have a positive interactive effect on operational performance.

*H<sub>2</sub> : Strategic planning formality moderates the relationship between absorptive capacity and operational performance*

## RESEARCH DESIGN AND METHODOLOGY

### Research Model

This study investigates the interrelationship between absorptive capacity and operational performance. This study also attempts to verify the effects of strategic planning process. Based upon the above literature review, a more detailed research model was developed (Figure 1).

Figure 1: Research Model

### Population

The population of this study includes all manufacturing SMEs in peninsular Malaysia. The population comprises of seven main industries which represent 75 percent of the total establishments of SMEs. About 361 SMEs owners that registered with Small-medium Industry Development Centre (SMIDEC) were contacted. Nevertheless, only 157 respondents agreed to participate within the two month period. Once the owners had been contacted, a personal interview was carried out. All of the questionnaires were usable in the final data analysis.

# QUESTIONNAIRE DEVELOPMENT

The questionnaire was developed using established instruments that are readily available in the literature. As suggested by Sudman and Bradburn (1982), a booklet format questionnaire was used to achieve a good response rate. To determine the potential effectiveness of the research instrument and to ensure that it met the objectives of the study, a pretest and pilot study of the questionnaires was conducted. The pre-test was accomplished by having about 30 SME-owners from the Klang valley to complete and comment on the questionnaire. The questionnaire was revised based on the pre-test. Ambiguous questions were deleted or reworded for clarity. The refined questionnaire was then been prepared in three languages, namely Malay, English and Mandarin.

## Variable measurement model

Absorptive capacity which comprises of three dimensions; knowledge acquisition, knowledge dissemination and knowledge exploitation were measured with five, eight and seven items respectively. The instruments were developed based on Gold, Malhotra & Segars (2001), Akgun, Lynn & Reilly (2002) and Jantunen (2005) work. Operational performance was measured using multidimensional measurements adapted from Porth, Kathuria, & Joshi (1998). There are four dimensions of operational performance which consists of cost (3 items), flexibility (5 items), quality (3 items) and delivery (3 items). Strategic planning formality process was measured with a three-item instrument adapted from Robinson & Pearce (1983).

## RESULTS

### Characteristics of sample firms

The data were gathered over a 2 month period from January – February 2008. A total of 157 SMEs participated in this study. The respondents are as follows; Textiles , apparels and leather (19.6%), Food beverage & tobacco (22.2%), Metal products (15.8%), Publishing, printing and reproducing of recorded media (14.6%), Furniture (8.9%), Rubber & Plastic product (9.5%) and Wood & Wood products (8.2%). Moreover, over 50% of the respondent firms had been operating less than 15 years. More than 50 percent of the respondent firms have formal strategic planning. Almost 50 percent of the owners have a Bachelor degree and above. Finally, more than two thirds of the sampled firms claimed of having systematic way of processing knowledge; acquiring, disseminating and exploiting.

### Hypotheses Testing

**Table 1 : Pearson correlations among absorptive capacity, operational performance, strategic planning formality, strategic decision making process**

|                                   | Absorptive capacity | Strategic planning formality | Strategic decision making process | Operational performance |
|-----------------------------------|---------------------|------------------------------|-----------------------------------|-------------------------|
| Absorptive capacity               | 1.00                |                              |                                   |                         |
| Strategic planning formality      | .320**              | 1.00                         |                                   |                         |
| Strategic decision making process | .437**              | .294**                       | 1.00                              |                         |
| Operational performance           | .281**              | .255**                       | .499**                            | 1.00                    |

**\*\* Correlation is significant at the 0.01 level (2-tailed)**

Table 2 presents the Pearson correlations matrix for absorptive capacity, strategic planning formality, strategic decision making process and operational performance. The results of the correlation analysis indicate that absorptive capacity and both method of strategic planning have significant correlations with operational performance. Therefore, H<sub>1</sub> is supported.

### *The moderating effect of strategic planning formality (H<sub>2</sub>)*

Aiken and West (1991) suggested before the hierarchical regression analysis which testing the moderating effect could be carried out, the strategic planning formality (SPF), and absorptive capacity (ACAP) constructs' measure were mean-centered as to avoid the possibility of multicollinearity. Using variance inflation factor (VIF) to examine multicollinearity levels, this study found the result (VIF < 10) to be below a harmful level (Neter, Kutner, Nachtsheim & Wasserman, 1996). The moderating impact of strategic planning formality (SPF) on the relationship between absorptive capacity (ACAP) and operational performance (OP) was illustrated in Table 3.

**Table 3: Hierarchical Regreression Analysis**

|                                    | DV: Operational Performance (OP) |         |         |
|------------------------------------|----------------------------------|---------|---------|
|                                    | Model 1                          | Model 2 | Model 3 |
| <b>Main effects</b>                |                                  |         |         |
| Absorptive capacity (ACAP)         | .339**                           | .268**  | .267**  |
| Strategic planning formality (SPF) |                                  | .400**  | .257    |
| <b>Interaction</b>                 |                                  |         |         |
| ACAP x SPF                         |                                  |         | -.620** |
| <b>R<sup>2</sup></b>               | .079                             | .110    | .159    |
| <b>R<sup>2</sup> adj</b>           | .073                             | .098    | .143    |
| <b>Δ R<sup>2</sup></b>             | .079                             | .030    | .050    |
| <b>F</b>                           | 13.299                           | 5.273   | 9.083   |

**\*\* p-value < 0.00**

These findings were consistent with what Cohen and Cohen (1983) suggested, that the interaction effects produce a significant increment in R<sup>2</sup> (R<sup>2</sup><sub>1</sub> = .079, R<sup>2</sup><sub>2</sub> = .110, R<sup>2</sup><sub>3</sub> = .159). Based upon the result of hierarchical regression analysis above, H<sub>2</sub> was rejected. In other words, there is a significant association between operational performance and the two-way interaction involving absorptive capacity and strategic planning formality, but it does not enhance operational performance. This is because the results show that the coefficient (β = -.620, p = .003) is significantly negative

## **DISCUSSION**

This study found that the absorptive capacity had a positive effect on operational performance. This result provided evidence to support the hypothesis that better absorptive capacity or knowledge process enhances business performance which supports the study done by Pietro and Revilla (2006). Also, this study revealed that strategic planning process in term of degree of formality has a negative significant effect on the relationship between absorptive capacity and operational performance. This implies that the more formal the strategic planning is the weaker the impact on operational performance. Nevertheless, the result contradicts with the result found in Olson and Bokor's (1995) study whereby the interaction between strategic planning formality and content in terms of degree of innovation enhances the strategic content-non financial performance relationship.

## **CONCLUSION**

Absorptive capacity plays a crucial role in determining the success of organizational performance. This finding is consistent with studies done abroad. However, it has also proven that the relationship between absorptive capacity and operational performance amongst the Malaysian manufacturing SMEs is contingent upon informal strategic planning. This could be true for the Malaysian manufacturing SMEs which function better in less formalized surroundings.

# **A COMPARISON OF IRISH AND INDIAN GROWTH AND THE ROLE OF USA VIA FDI AND OUTSOURCING**

**Zeynep Deniz**  
**İstanbul Bilgi University, Turkey**

## **ABSTRACT**

*This paper aims to investigate and compare the growth patterns of Irish and Indian economy since these both countries have experienced similar growth trends at the beginning of 1990s - 2000. In this study, rather than to include both aspects of economic growth, the factors that are specific to Ireland's economic growth will be distinguished and discussed. Same structure will be applied to the case of India in order to exhibit the similarities and differences of these two different economies. This investigation shows that the role of USA on both countries contributes much to their growth performances.*

## **INTRODUCTION**

Economic growth has many aspects and it depends on many factors. Among them, the utilization of resources, the rate of population growth, the saving rate, the capital accumulation and technological progress have the most significant effects. We can also include other factors such as education, demographic change, expenditure on health, income distribution and the role of geography. Additional to those, there may be other unique factors that affect a country's development and growth.

In this study, first of all, I will present the growth performances of Ireland and India to exhibit the similarities in the same period. Then, I aim to compare the growth paths of European Union (EU) countries to distinguish the place of Ireland among them. The place of Ireland is deemed important because this experience may be a good reference for both EU member countries and the EU candidate countries such as Turkey. In the fourth section, I investigated the pattern of Irish growth. In this section, after having a brief look to the history of Ireland Economy, the role of foreign direct investment and trade, the role of education and technology will be discussed. Fifth section is structured like the fourth section for Indian economy in order to be able to compare these two countries. Sixth section displays the role of USA on Irish and Indian growth. Finally, last section concludes the paper.

## **COMPARISON OF IRISH AND INDIAN ECONOMIC PERFORMANCES**

GDP growth performances of both India and Ireland are impressive on the 1990s. Similar trend also can be observed in GDP per capita terms. However, Ireland's growth performance is superior especially in 1997 and 1999. We can observe this pattern in figure 1 which is constructed for 1993 – 2004.

**Figure 1: GDP Growth, Ireland and India, 1993 - 2004**

Source: World Development Indicators, 2006

## GROWTH PATHS OF EU COUNTRIES AND THE SUCCESS OF IRELAND

The purpose of this section is to compare the growth performance of the 9 EU countries to distinguish the place of Ireland among them. International comparison of growth performance is an intractable task since every country may have different size and unique properties such as geographic location or having natural resources. Being aware of these difficulties, the basic indicator to compare the countries will be the growth rate of gross domestic product (GDP) and the growth rate of GDP per capita.

According to the following figure, all the countries except Ireland and Luxembourg have nearly the same growth paths, however Luxembourg had experienced more fluctuations. For the years between 1994 and 2002, Ireland had experienced a relatively stable growth performance and moreover the growth rates are nearly 4 to 5 percent higher than the average growth rates of other EU countries. In that period, the lowest growth performance is attained by the United Kingdom which is -1,36. We can also observe the similar growth paths of all countries except Luxembourg and Ireland for this period.

**Figure 2: EU 9 Growth Paths 1991 - 2003**

Source: World Development Indicators, 2006

## PATTERN OF IRISH GROWTH

In this section, the growth performance of Ireland will be analyzed in details for the period of 1991 and 2004. After having a brief look to the economic history of Ireland, the main determinants of the growth performance will be explained in subtitles.

In the following figure, it is very clear that Ireland experienced an expansion in the GDP levels beginning from 1994 up to the end of 2000. In fact, the growth rates for 2000 to 2004 are also higher than the average growth rate of EU countries in this period.

### A brief look to the History of Ireland Economy

Ireland's economic performance, after its independence in 1922, had been one of the worst one compared to the most of the European countries. This conclusion can be inferred from the following quotation.

*'It is difficult to avoid the conclusion that Irish economic performance has been the least impressive in Western Europe, perhaps in all Europe, in the twentieth century.'*

One of the most important problems of the Ireland Economy was the declining population and the main reason of the declining population was the emigration from the country because of the great famine and unemployment. After 1950s, while most of the Western European economies recovered from the damage of war and began to grow faster, Ireland economy could not experienced such a trend. Additional to the low employment levels, low labor participation of women was also contributed this stagnation period. After 1960s, the stabilization of the population was attained as a result of the increasing living standards. However, the living standards in the 1960s were still lower than it is in most of the European countries. In 1973 and the early 1980s, two oil shocks had a negative impact on the Irish economy. In 1973, Ireland joined into European Economic Community (EEC). This leads to improvements in the trade performance of Ireland as a result of the implication of the free trade regime. The most significant benefits did occur in the agriculture sector. The implication of the membership to EEC also affected the policy makers in the areas of trade and agriculture sector. In the agriculture sector, Ireland benefited from the transfers as a result of the Common Agriculture Policy (CAP) of the community. According to Matthews (1994), Ireland became a net exporter of farm goods which is about 2 to 6 percent of its GDP. After its membership to EEC, Ireland joined to the Customs Union (CU) with common external barriers and by 1977 it had no internal trading barriers. Under the new free trade regime, Ireland's exports grew rapidly from 38 percent of its GDP in 1973 to 60 percent by 1991. Ireland Joined the European Monetary System (EMU), in 1979. However, it affected negatively from the devaluation of Deutsche Mark, especially on 1983.

## The Role of Foreign Direct Investment and Trade

Beginning from the early 1930s and up to the 1950s, high tariff barriers was an important problem of the Irish economy and as a result of this, foreign ownership of firms was insufficient. Additionally, the 'Control of Manufacturers Act' had also prohibited foreign ownership. In the early 1950s, the government abolished this policy and replaced it with a policy that promotes foreign direct investment (FDI). Another event to promote FDI is the 'zero corporate profit tax' on manufacturing goods that are exported. With the help of these improvements, Ireland had export-oriented FDI in the manufacturing sector. According to the Barry and Bradley (1997), when the ownership of the plants in the manufacturing sectors are considered, it is clear that only 15 % of the local plants are foreign owned. However, they produce 60 % of gross output and engage almost 45 % of manufacturing employment. About 40 % of the foreign plants are US-owned, 16 % are owned by United Kingdom and 15 % are owned by German. According to the statistics, Irish owned plants export on average 35 % of its output, while foreign owned plants export almost 86 % of their output. This percent is 96 % for US owned plants.

Ireland also differs when we consider other leading countries of Europe in attracting foreign direct investment from US in the manufacturing sector. Following table shows US Direct Investment per manufacturing worker in US \$. According to this table, Ireland attracts the significantly higher direct Investment per manufacturing worker for the years 1983, 1992 and 1996.

**Table 1:** US Direct Investment per manufacturing worker in US \$

|                | 1983   | 1992   | 1996   |

## The role of Education and Technology

Walsh and Whelan (1976), using 1972 data estimated human capital earnings function for Ireland and found that returns to education is about 3 % per year. This return is lower than the average of international estimates. However, Reilly (1987), estimated the Mincerian type earnings function on a sample of young workers aged 15 – 24. This study considers some dummy variables for education and found a higher return than the study of Walsh and Whelan (1976). Sexton et. al. (1988) also found higher returns to education for Ireland. Although, the estimations in these papers do not include the same variables, it is clear that there is a substantial increase in the rate of return to education for Ireland after 1980s.

## PATTERN OF INDIAN GROWTH

As explained in the second part, Indian economic growth has a more volatile path compared to Ireland. Following sections attempt to clarify the pattern of Indian growth in a parallel way with the Irish case.

### A brief look to the History of Indian Economy

After the independence of India in 1947, the growth rate was around 3,5 percent and the per capita growth rate was 1,9 percent during the period 1950 to 1970. Sachs (2005), suggested that India's first economic breakthrough came in the late 1960s and early 1970s with the introduction of the Green Revolution into the country. He emphasized the importance of this event as the following;

*“... The resulting rise in food yields freed India from the chokehold of famine. After the Green Revolution, India was able to feed itself even in years when the monsoons failed. The seemingly endless saga of India’s fighting mass starvation came to an abrupt end, well before its market reforms triggered a sustained acceleration in economic growth”*

After this improvement, it will be useful to clarify the main pattern of the Indian growth especially after 1980s since India’s growth has accelerated over the past two decades. Bosworth et al. (2006) constructed a growth accounting model in which they began by looking at growth performance over the relatively long periods 1960 – 1980 versus 1980 – 2004. Their results indicate that the performance of Indian economy changed significantly around 1980. The statistics shows that GDP growth increases from an average of 3,4 % per year during 1960-80 to 5,8 % during 1980 – 2005. Their results suggest that this acceleration mainly concentrated in improvements in the efficiency of factor use. This improvement of total factor productivity depends on the policy regime that is implied around the beginning of 1980. These policy regimes include an ongoing process of liberalization and openness of the economy. However, they noted that, contrasting to the other East Asian Economies, the rate of job growth was modest in the India as a result of the modest rate of growth of both physical and human capital per worker. Beginning from 1993 – 1994, contribution of capital per worker began to increase on average 2,4 percent per annum which is a similar rate for the other East Asian countries.

## **The Role of Foreign Direct Investment and Trade**

Increasing trade volume is another factor that contributes to the Indian growth. We observe an increase in the openness ratio for the India. It was 9,8 % in 1970s and increased to 19,3 % in 1990s. USA is India's largest trading partner and premier export destination. From table 2, we can observe a positive and increasing trade balance as a result of the increasing trend in the exports to USA.

**Table 2:** India - US trade (in US \$ millions)

|                        | 1993  | 1994  | 1995  | 1996  | 1997  | 1998  | 1999  | 2000   |
|------------------------|-------|-------|-------|-------|-------|-------|-------|--------|
| <b>India’s Exports</b> | 4,551 | 5,302 | 5,736 | 6,169 | 7,322 | 8,237 | 9,071 | 10,686 |
| <b>India’s Imports</b> | 2,761 | 2,296 | 3,296 | 3,318 | 3,608 | 3,564 | 3,688 | 3,663  |
| <b>Balance (+)</b>     | 1,790 | 3,005 | 2,440 | 2,851 | 3,715 | 4,673 | 5,383 | 7,023  |

## **The role of Education and Technology**

Both the education and the usage of technology are other common factors that promoted both Indian and Irish economy in the same period. Like in the Ireland’s case, these two factors are interrelated in promoting growth. Singh (2002), summarized this interrelation as follows:

*“Whether growth comes in revenue per employee or number of workers, there are implications for training. Increasing revenue per IT professional requires improvements in managerial and marketing skills, as well as the production of more highly trained IT people. Training more people in IT requires investments to increase the capacity of this component of the higher education sector.”*

There are basic improvements in the education sector of India to meet the skilled- labor need in the country. However, the investments on education need to be continuous. Kochhar (2006), suggests that India needs to improve higher education and remove the barriers to starting new institutions to create a pool of skilled workers who will be essential to enhance the growth.

## **THE ROLE OF USA ON IRISH AND INDIAN GROWTH**

In the table 3, foreign direct investment net inflows and outflows as percentages of GDP are available both for Ireland and India for the years between 1993 - 2004. The data suggests that especially net inflows to Ireland is very significant compared to India. In year 2000, net inflows to Ireland accounts about 28,7 percent of its GDP. One reason of this result may be the lower tax rates that are imposed in Ireland. Hence, different from India, Ireland attracts foreign firms (especially US firms as mentioned before) just because of this lower cooperation tax rates. This conclusion is supported for the case of India by Cravino et al. (2007);

*“In spite of the growing concerns about foreign direct investment being diverted from Latin America to China and India, the best available data show that Latin America has performed relatively well since 1997.”*

As a result, for the India outsourcing is more common than the FDI into this country especially in the relations of USA. According to Sachs (2005), from the point of view of economic reforms, India was internationally competitive and an export boom initially in services such as software engineering, data transcription services, computer graphics, back-office processing and other IT based activities was important factors that generate rapid economic growth. Sachs (2005), also mentioned that IT revolution meant that exports of information by the way of satellite linkups in mid 1990s.

**Table 3: FDI inflow and outflow (% of GDP), Ireland and India, 1993 - 2004**

|             | FDI net inflows | FDI net inflows | FDI, net outflows | FDI, net outflows |
|-------------|-----------------|-----------------|-------------------|-------------------|

Source: World Development Indicators, 2006

We can infer that the IT sector is a common factor that generates growth both for India and Ireland. In order to compare this sector in terms of innovation, table 8 presents the patent applications for both countries. Patent applications are applications filed with a national patent office for exclusive rights for an invention, a product or process that provides a new way of doing something or offers a new technical solution to a problem. When we compare these two countries, despite the size and population advantage of India, we can observe that patent applications in Ireland are significantly greater than that of India. This difference is more obvious by the end of 1990s. We must also note that this difference is much more valid by the applications of non-residents.

According to the discussions in the previous sections, we can infer that for the Ireland the role of USA is more common in the form of FDI. On the other hand, USA contributes to the growth of India by outsourcing from this country in the IT sector. This conclusion is also supported by the patent application numbers for these countries since more patent application can be deemed as improvements in the technology in that country. In table 4, patent applications for both countries are available.

**Table 4: Patent Applications, Ireland and India, 1996 - 2002**

|  | Patent applications | Patent applications | Patent applications | Patent applications |

## CONCLUSION

In this paper we investigated and compared the growth patterns of Irish and Indian economy since these both countries have experienced similar growth trends at the beginning of 1990s - 2000. After exhibiting the Irish and Indian GDP growth pattern on these years, we concentrated on the growth performances of EU countries to distinguish the case of Ireland. We define the factors that are specific to Ireland's economic growth. Same structure is applied to the case of India in order to exhibit the similarities and differences of these two different economies.

Our investigation showed that the role of USA on both countries contributes much to the growth performances of these two countries. However, the role of USA differs. USA affects Ireland economy by foreign direct investment into this country. On the other hand, USA affects the Indian economy by outsourcing from this country especially in the information technology sector.

# **CUSTOMER VALUE STARTS FROM WITHIN: DETERMINANTS OF INTERNAL CUSTOMER SERVICE QUALITY**

**Manilall Dhurup**  
**Vaal University of Technology, South Africa**

## **ABSTRACT**

*Whilst service quality and its antecedents have been widely researched through literature and addressed in scholarly academic platforms; research on internal service quality and the relationship within internal customer satisfaction has not been given the same amount of prominence. An issue raised in literature, is an apparent lack of a conceptual framework that illustrates the understanding of the mechanics of service quality inside an organisation. This paper has sought to contribute further to the knowledge concerning internal service quality by developing an instrument to measure internal service quality within a particular functional unit based on the perceptions of those they serve in an organization. The internal service quality dimensions comprise five dimensions namely, credibility, accessibility/tangibility, preparedness, reliability and competence. The dimensions accessibility and tangibility, reliability and competence exerted the strongest influence on satisfaction.*

## **INTRODUCTION**

Survival in competitive markets much depends on the quality of services provided by internal employees through outstanding customer support to other service units within an organization (Gilbert, 2000). Effective internal supplier-to-internal customer service becomes a pre-requisite to the level of service quality eventually offered to external customers. Internal marketing literature suggests that the way to satisfied customers, is through satisfied employees and that the ability to meet customer requirements is vital, not only between two separate organisations, but also within the same organization (Heskett, Jones, Loveman, Sasser & Schlesinger, 1984). Perhaps the best way to ensure that external customers are satisfied is to establish the idea that every part of the organization contributes to internal customer service quality through its various micro operations that form an interconnecting network of physical and information flows within the macro operation (Pycraft, Singh, Phihlela, Slack, Chambers, Hartland, Harrison & Johnston, 2005). Hence, an internal service chain is developed before the product or service reaches the external customer (Paraskevas, 2001). High level of quality built into the internal service chain will consequently result in high level of quality products and services offered to the external customer.

The purpose of the study was to develop and empirically test an instrument that can be used to measure internal service quality. Within a company, administrators play a pivotal role in ensuring effective service delivery. Hence the current study examines the relationship between administrative staff (internal suppliers of service) with the Research and Development (R&D) employees (internal customers) within a petro-chemical company.

## **INTERNAL MARKETING AND INTERNAL CUSTOMER SERVICE**

The notion of internal customer services must be clearly distinguished from internal marketing (Berry, 1981; Grönroos, 1984). Internal customer service is about how employees from one department serve employees

in another department; while internal marketing is how the organization (mainly through its human resources department) serves its employees (Paraskevas, 2001). Internal customer service is defined as services provided by distinct organisational units or people working in these departments to other units or employees within the organization (Strauss, 1995). Nagel and Cilliers (1990) defined the internal customer as any member of an organization receiving products or services by other members in the organization. Hence, departments must consider themselves as members of a customer chain (Chaston, 1994) within an organization.

Berry (1981) was among the first authors who introduced the concept of internal marketing. The author appropriately encapsulates the internal marketing by viewing employees as internal customers, viewing jobs as internal products that satisfy the needs and wants of these internal customers while addressing the needs of external customers. George and Grönroos (1989) explain that internal marketing takes place when employees display a service-minded and customer-oriented behaviour by an active, marketing-like approach and when marketing-like activities are used internally.

Earlier, Shostack (1987) proposed that internal service levels could be improved through the use of service blueprinting. Service blueprinting entails illustrating the exchange and transactions in flow charts that create value between departments (Voss, Calantone & Keller, 2005) that are not customer visible (Lings, 1999). Departments receive services and goods from other departments within an organization. In this manner, certain departments serve as internal suppliers of goods and services to other departments who act as internal customers. To achieve the highest possible value delivered to the external customer, each department inside an organization must deliver the highest possible value (in the form of outputs) to internal customers (Conduit & Mavondo, 2001). The service delivered internally eventually culminates in the service level delivered to the external customer (Vandermerwe & Gilbert, 2001; Voss et al., 2005; Kang, James & Alexandris, 2002). Thus, the service production process is seen as a network of systems built up by interrelations and interdependence between various sub-processes (George, 1990).

Like external customers, employees engage in numerous service encounters to satisfy the needs they have in the course of carrying out their job responsibilities (Kang et al., 2002). These internal encounters include relationships between customer-contact staff and back-room staff, managers and the customer-contact staff, managers and the back-room staff and for large organizations, between head office and each branch (Lewis & Entwistle, 1990). Hence, the basic premise of internal customer service posits that every department in an organization exists to serve someone, whether it is the external customer or another department (Farmer, Luthans & Sommer, 2001). An organization therefore consists of an independent chain of individuals and functional units, each taking inputs from one another and turning them out into external customer service. Thus if the tasks of the front-line employees and departments are not performed efficiently and effectively, the results can be detrimental to service levels provided to customers, supply chain performance and to the financial-wellbeing of the organization (Voss et al., 2005). George (1990) further reiterates that if poor internal service exists the final service to the customer will be damaged.

## **SERVICE QUALITY**

Service quality on the other hand forms an integral part of service marketing. Service quality is about performing the service dependably and accurately. When a company performs a service carelessly, when it makes avoidable mistakes, when it fails to deliver on alluring promises made to attract customers, it shakes the customer's confidence and undermines its chances of earning a reputation for service excellence (Dhurup, Singh & Surujlal, 2006). From the customer's perspective, the proof of a service is its flawless performance (Berry & Parasuraman, 1991).

SERVQUAL, developed by Parasuraman, Zeithaml and Berry (1985, 1988) is an established framework for the measurement of external service quality. This framework which was widely used across a range of services (Galloway, 1998) was chosen as a framework for this study. These external service quality dimensions have been previously used in the measurement of internal customer service quality (Chasten, 1994, Nagel and Cilliers, 1990, Reynoso and Moores, 1995 and Varey, 1995). The justification for the use of an external model is that the interaction between the company and the external customer is simply one link in a large network of relationships; many of which occur inside an organization (Auty & Long, 1999). The implication is that the principles and techniques for the creation and measurement of external service quality can be transferred to the internal environment.

Whilst the original SERVQUAL instrument has been revised, refined and reformulated (Parasuraman, Zeithaml & Berry, 1991, 1994) its primary content remains unaltered. Zeithaml, et al. (1990) claim, that SERVQUAL, with appropriate adoption, can be used by departments and divisions within a company to ascertain the quality of service they provide to employees in other departments and divisions. Debates surrounding the validity and reliability of the SERVQUAL methodology have been lively for many years. However, relevance relating to the number of dimensions, perceptions and expectations score and questions designed to establish an overall quality perception are still debated (Galloway, 2000).

Unfortunately, of the prevalence of articles which are important in respect of identifying internal service quality dimensions, only a few could be considered as being methodologically useful from a reliability and validity perspective (Kang et al., 2002). Chaston (1994) for example, measured potential gaps in internal service quality by using a modified version of the SERVQUAL instrument. Young and Varble (1997) assessed internal service quality within a purchasing context by applying the original SERVQUAL measures. Edvardsson, Larsson & Setterlind (1997) used the SERVQUAL instrument to explore the relationship between the psychosocial work environment and internal service quality. In fact, Edvardsson et al. (1997:256) noted, that "...our way of measuring internal service quality is inspired by the SERVQUAL instrument", implying that the SERVQUAL instrument guided the development of the measures used. Lings and Brooks (1998) and Frost and Kumar (2000) also propose that the SERVQUAL instrument may be an appropriate tool to measure the quality of service delivered by internal suppliers to their customers. However, the findings of Frost and Kumar (2000) did not concur with the findings of Parasuraman et al. (1985), whose research found reliability as a dimension to have the most significant influence of all the SERVQUAL dimensions on the overall perception of service quality. In summary, the authors were of the view that substantial changes have to be made to the wording of the items to capture internal service quality construct.

## **RESEARCH DESIGN**

### **The Sample Framework and the Measuring Instrument**

The population comprised Technology R&D employees from different departments of a petro-chemical company. A database comprised a total of 519 employees in the Technology R&D departments. The survey method was used to collect data. A sample of 200 was deemed to be adequate to develop and refine the instrument (Finn, Baker, Marshall & Anderson, 1996; Frost & Kumar, 2000; Kang et al., 2002). Respondents were randomly selected and a total of 229 questionnaires were used for analysis. The SERVQUAL items were modified to measure the employees' perceptions of internal service quality. Where necessary, items were reworded to capture internal rather than external service quality. Pre-testing for the study was done with 10 different employees, including the Heads of R&D and Administrative departments, so as to ensure that the wording and the questions were appropriate and related to the study. Changes were made to a draft questionnaire with regard to re-phrasing, sequence, and appropriateness of the internal service quality attributes. The variables on the questionnaire were transformed to into a 6-point Likert scale where "completely fails to meet my expectation" = 1 and "exceeds my expectation" = 6, were used.

## **STATISTICAL ANALYSIS AND DISCUSSION OF RESULTS**

### **Factor Extraction**

The principal components factoring procedure was used and the analysis was constrained *a priori* to five factors in keeping with the number of factors extracted in the SERVQUAL model. Varimax rotation (using Kaiser normalisation) was applied in order to obtain a factor structure. Varimax rotation was also used in order to minimize the number of variables with high loading on a factor, thereby enhancing the interpretability of factors (Malhotra & Birks, 2003). Variable loading of 0.40 and above were retained (Churchill & Iacobucci, 2002). Item reduction and scale purification was then undertaken whereby items with low factor loadings, communalities and low-item-to-total correlations were investigated (Chandon, Leo & Philippe, 1997; Aldlaigan & Buttle, 2002). The iterative process was re-run several times until a clear factor structure emerged. The final

factor structure, eigenvalues, the coefficient alpha values is reported in Table 1. The eigenvalues in respect of the five dimensions ranged from 7.73 to 1.00. Together, these factors accounted for 63% of the variance which according to Malhotra (2004) is satisfactory.

**Table 1: Rotated Factor Loading Matrix**

| ITEM                                     | F1       | F2       | F3       | F4       | F5       |
|--|----------|----------|----------|----------|----------|
| Perform services effectively             | 0.603567 |          |          |          |          |
| Provides feedback to my requests         | 0.722603 |          |          |          |          |
| Consults with me in decision-making      | 0.560962 |          |          |          |          |
| Display honesty                          | 0.658718 |          |          |          |          |
| Accepts fellow colleagues decisions      | 0.667964 |          |          |          |          |
| Courtesy displayed                       | 0.588405 |          |          |          |          |
| Willingness to cooperate                 |          | 0.538225 |          |          |          |
| Provides services consistently           |          | 0.770799 |          |          |          |
| Accessibility of the unit                |          | 0.723117 |          |          |          |
| Appearance of materials and products     |          | 0.619542 |          |          |          |
| Provides advice and guidance             |          |          | 0.677319 |          |          |
| Demonstrates flexibility                 |          |          | 0.727781 |          |          |
| Knowledge and skills to perform services |          |          | 0.647802 |          |          |
| Understands my specific needs            |          |          | 0.491850 |          |          |
| Perform services, right the first time   |          |          |          | 0.783393 |          |
| Provides services at required time       |          |          |          | 0.773750 |          |
| Provide accurate information             |          |          |          | 0.627442 |          |
| Provide information as promised          |          |          |          |          | 0.495402 |
| Handling of confidential information     |          |          |          |          | 0.638318 |
| Understands our problems and constraints |          |          |          |          | 0.788807 |
| Eigenvalue                               | 7.93     | 1.31     | 1.21     | 1.11     | 1.00     |
| % of variance explained                  | 39.66    | 6.59     | 6.07     | 5.57     | 5.03     |
| Cumulative %                             | 39.66    | 46.25    | 52.33    | 57.91    | 62.94    |
| Reliability (Cronbach alpha)             | 0.83     | 0.76     | 0.78     | 0.79     | 0.66     |
| Standardized Cronbach alpha = 0.92       |          |          |          |          |          |

## Factor Interpretation

Factor one, labeled credibility comprised six variables and accounted for 39.66% of the variance. This factor relates, *inter-alia* the credible aspects of efficiency, honesty, feedback and courtesy afforded by the administrative staff to the personnel from the R&D department. Given the intangible nature of services and the inseparability of production and consumption of services, it is difficult for customers to undertake prior evaluation of a service. Thus the trustworthiness and authenticity of the internal supplier of service becomes a crucial determinant in internal service quality evaluation (Malhotra, Ulagado, Agarwal & Baalbaki, 1994).

The second factor, labeled accessibility and tangibility, comprised four variables and accounted for 6.59% of the variance. This factor incorporates issues relating to cooperation, consistency of services, accessibility and the physical appearance of the materials and products provided by the administrative personnel. Since production and consumption of a service is inseparable, a customer's ease of contact with and timely access to the service supplier becomes crucial.

The third factor, preparedness comprised four variables and accounted for 6.07 % of the variance. This factor emphasized that aspects such as guidance, flexibility, demonstrative skills, and understanding internal customers specific needs are high on the agenda in service quality evaluation. The premise of knowing and understanding customer needs serve as the underlying basis behind relationship marketing (Malhotra, et al., 1994).

The fourth factor labeled reliability comprised three variables and accounted for 5.50 % of the variance. The emphasis of this factor is on performing services right the first time, with timely and accurate provision of services and information. This was the only factor that incorporated most of the variables of the reliability dimension in the SERVQUAL scale.

The fifth factor labeled competence comprised three variables and accounted for 5.03 % of the variance. The emphasis on this dimension is on the provision and handling of information and understanding internal customer problems and complaints. This dimension varies significantly from SERVQUAL scale but similar to Lings and Brooks (1998) internal service quality competence dimension.

## Comparison with the SERVQUAL scale

Other studies on internal service quality also reported on dimensions that varied and were not totally in congruence with the SERVQUAL scale (Brooks, Lings, Martina & Botschen, 1999). Whereas the Parasuraman et al. (1988) SERVQUAL model is in part encapsulated in this scale, the types of dimensions lends support to the findings of Carman (1990), Buttle (1996) and Babakus & Boller (1992) that the service quality construct much depends on the service industry under investigation, its service settings and its related service attributes.

The difference between the external and internal service quality dimensions identified as important may also be explained by the standardized nature of the work involved in value adding activities undertaken by the administrative personnel. Interactions involving value adding functions, either as internal supplier or internal customer, will require attention to detail to ensure that the standardized operational nature of the work is not compromised. The main driver for internal service quality appears to be the external customer, who makes demands on the internal customer. Internal customers in turn then make demands on the administrative department within the value chain. This implies that an internal service quality wave-front, driven by the external customer, moves through the organization backward along the value chain and out towards the support functions, in this case the administrative staff (Brooks, Lings, Martina & Botschen, 1999). The ramifications of this mean that attempting to improve service quality by concentrating on customers facing staff only is inappropriate.

## Internal Consistency and Validity

Owing to the multidimensionality of the internal service construct, the internal consistency reliability of the five factor solution was established by computing the coefficient alpha value (Cronbach  $\alpha$ ). The standardized coefficient alpha for the entire scale was 0.92. The results are also reported in table 1. The coefficient alpha values obtained from factors one to five were 0.83; 0.77; 0.78; 0.79 and 0.66 respectively. The internal consistency reliability values for factors one to four were considered adequate *i.e.* above 0.70 (Nunnally, 1978), whereas factor five indicates marginal acceptance. The reliability value for factor five is deemed acceptable as this was an exploratory study (Hair, Anderson, Tatham and Black, 1998). In addition, the high coefficient alpha value reported for the total internal service quality scale (Cronbach  $\alpha$  = 0.92) supported the inclusion of the fifth dimension.

To ensure that the internal service quality scale satisfies content validity, a mixed methodology research process was followed. Content validity was also established by pre-testing the questionnaire. Discriminant validity, in this context, refers to the ability of the research instrument to assess the uni-dimensionality of underlying dimensions. Evidence of reliability and validity confirm the construct validity of the measuring instrument (Bosch, Boshoff & Louw, 2003). In assessing discriminant and construct validity of the research instrument, exploratory factor analysis was conducted. In each step of this procedure, scale purification was undertaken where individual items were removed from the research instrument to improve the discriminant and construct validity until all items demonstrated acceptable levels of discriminant validity (*i.e.* all the items load on a common factor only with no cross-loadings) and construct validity (*i.e.* all the items relating to each dimension have factor loadings of at least 0.40).

## Internal Service Quality and Satisfaction

In examining the relationship between the internal service quality dimensions and satisfaction correlation coefficient (Pearson product-moment) was used to determine the level of association between these two constructs. The range of possible value is from -1.00 for a perfect negative correlation to +1.00 for a perfect positive correlation (Malhotra, 2004). The following rule of thumb proposed by Huck, Cormier and Bounds (1974) were used in examining the level of association between the internal service quality and internal customer satisfaction.

- 0 to + 0.25 (or -0.25) = little or no relationship
- + 0.26 (-0.26) to + 0.60 (or -0.60) indicates a moderate relationship
- above + 0.60 (or -0.60 and above) indicates a strong relationship

The level of association between the internal service quality and internal customer satisfaction is shown in Table 2 below.

**Table 2: Correlations between internal service quality dimensions and overall satisfaction**

| Independent variables         | Pearson value (r) | p-value |
|-------------------------------|-------------------|---------|
| Credibility                   | 0.49              | 0 .05   |
| Accessibility and tangibility | 0.50              | 0 .05   |
| Preparedness                  | 0.47              | 0 .05   |
| Reliability                   | 0.49              | 0 .05   |
| Competence                    | 0.49              | 0 .05   |

The correlations between credibility, accessibility and tangibility, preparedness, reliability and competence are positive and moderate ( $p, < 0.05$ ) indicating that internal service quality is positively correlated to internal customer satisfaction. This means that the higher the level of credibility, accessibility and tangibility, preparedness, reliability and competence displayed by the employees from the administrative department (internal suppliers of service) the higher the level of satisfaction experienced by Research and Development (R&D) employees (internal customers).

Correlation however, only measures a linear relationship and does not necessarily infer a causal relationship between variables. The study proceeded to predict causal relationship between internal service quality and satisfaction with the use of multiple regression analysis. Table 3 reports on the results of the multiple regression analysis computed in order to establish the predictive power of the five internal service quality dimensions on overall service satisfaction. The five internal service quality dimensions were used as the independent variable and overall satisfaction was used as the dependent variable.

**Table 3: Regression analysis between internal service quality dimensions and satisfaction**

| Dependent variable: overall satisfaction  |           |        |           |           |
|---|-----------|--------|-----------|-----------|
| Dimensions (Independent variable)   | B         | BETA   | t         | p-level   |
| Credibility   | -0.108445 | 0.1113 | -0.111353 | 0.168458  |
| Accessibility and tangibility   | -0.172046 | 0.1846 | -0.184656 | 0.012065* |
| Preparedness  | -0.092006 | 0.0958 | -0.095835 | 0.207641  |
| Reliability   | -0.151519 | 0.1710 | -0.171025 | 0.017641* |
| Competence  | -0.169886 | 0.1869 | -0.186963 | 0.008492* |
| R= .60453485    R <sup>2</sup> = .36546239    Adjusted R <sup>2</sup> = .35123509    F=5,223    * p < 0.000 |           |        |           |           |

In terms of the relationship between the individual dimensions and the overall satisfaction rating, the adjusted  $R^2 = 0.35$  suggesting that the internal service quality dimensions explained 35% of the variance in the internal customers' overall satisfaction rating. The dimensions accessibility and tangibility, reliability and competence were statistically significant at  $p < 0.0000$ . Assurance and preparedness showed a moderate relationship with overall service satisfaction. Of the factors, competence of the internal staff showed the strongest association with overall service satisfaction. Aspects such as willingness to cooperate, consistency of service, performing services right the first time, meeting deadlines and the provision of accurate information were effective in influencing customers' overall service satisfaction. Whilst assurance and preparedness showed a moderate relationship between internal service quality and satisfaction, theory supports such relationship which is evident in the basic needs dimension of Kano's quality model (Zhang & von Dran, 2002). Basic quality is the minimum quality of service acceptable to the customer (Shen, Tan & Xie, 2000) and encompasses aspects consumers take for granted. Their presence goes unnoticed, but their absence will generate complaints and dissatisfaction. Customer satisfaction does not rise with a high performance of these services (Tan & Pawitra, 2000) as these services are naturally expected and customers normally do not verbalise or explicitly demand them (Matsler & Hinterhuber, 1998).

# RECOMMENDATIONS, LIMITATIONS AND CONCLUSION

## Recommendations

High levels of internal service quality lead to satisfied internal customers, which leads to high levels of cooperation between client and customer departments (Finn et al., 1996). A valid and reliable measure of internal service quality has been developed which can be used as a tool by administrative managers to improve internal service quality within organizations. Whilst many service quality attributes may influence an employee's perception of internal service quality, the results infer that some attributes have a greater impact on overall perception of internal service quality. An organization should have a checklist of best practices with regard to the dimensions of internal service quality and should monitor whether such practices are implemented. With this knowledge of internal service quality dimensions, service departments can judge how well employees performed on each dimension and managers can identify weaknesses in order to implement corrective actions.

## Managerial implications

This study provides a foundation for internal service quality evaluation that can be used by managers of an administrative department as a feedback mechanism. Measuring a department's performance gives managers a benchmark for tracking the effect of modifying components of the internal service quality delivery system. Tracking results over time is critical because improving internal service quality should be an ongoing process. In addition, internal customer expectations will change as departments react to the changing needs of external customers. Measuring internal customer service quality provides a quantitative baseline for comparing results over extended time periods and enables fact-based decision-making (Forst, 2002).

## Limitations

A limitation to the study was that the research was conducted on one site only. More data can be collected from other administrative departments of other types of companies to refine the measures described herein. Similar measurement development process can be undertaken in service departments within the organization for example, the Human Resources Department. Some universality of items may be possible across other service departments, but each service department may require a set of items tailored to the unique aspects of that service. The use of a single case-based approach to this research prevents generalization of these results to other organizations. The study concentrated on one organization within the service sector and it is possible that there are differences in internal service quality application both between organizations within the same industry sector and organizations in different industry sectors. It is also important to note that while the five dimensions measured were found to be important indicators of internal service quality, there may be other dimensions of internal service quality that may also be important.

## CONCLUSION

If quality services are to be delivered, employees must view themselves as an important link in the value chain. However, if employees endure poor quality of service from their colleagues and the organization as a whole, it is likely that services will suffer. The internal service culture may be difficult to create in large bureaucratic organizations where there are few mechanisms for receiving feedback about services (McDermott & Emerson, 1991). By focusing on internal customer service, providing value, and strategically marketing its service, an internal department can increase its value to the organization and in fact reduce the likelihood that it will become and candidate for outsourcing. Programs focusing on internal customer service can build accountability, improve employees' understanding of how to meet or exceed customer expectations and creates an internal culture that serves as a foundation for Total Quality Management. Future research work to identify other dimensions of internal service quality in different internal service settings is welcomed.

# THE BRANDING OF CELLULAR TELEPHONES TO TERTIARY STUDENTS

**Antonie Drotsky, Ben Janse van Rensburg and Johan de Jager**  
**Tshwane University of Technology, South Africa**

## ABSTRACT

*Cellular phones have spread to every section of the population and have become an all in one integrated communication tool. Companies in the telecommunication industry that are making profits and continue to survive are the ones that move to new markets or develop new products. One of the markets that started to use cellular products and services is the student market. For organisations to be successful, they have to distinguish their product offerings from other organisations' offerings. To do this, marketers develop their products into brands to create a unique position in the minds of consumers. This paper looks at the branding of cellular telephones and what is important to students in acquiring brands. There is also looked at pre-paid vouchers versus contract as subscription method.*

## INTRODUCTION

Cellular phones have spread to every section of the population and are being used by the youth, market traders, taxi drivers, vegetables vendors and many others. The ubiquity of the cell phone handset has revolutionised people's lives and empowered them to participate in national life, especially in the area of business and communication (Mutula, 2002). Since its introduction, a multitude of different cellular phone models with a variety of functions has become available on the market (Minges, Männistö & Kelly, 1999). The cellular phone has become an all in one integrated communication tool and has functions that previously were available only in specialised technological products such as radios, computers and video and digital cameras. The latest models of cellular phones are multimedia communication instruments that can take pictures and do what was only possible on personal computers in the past. Not only the cellular phone has improved, but also the service and packages provided by network operators and service providers (Frieden, 2000; Brodsky, 2001).

Polak and Kliener (2001) emphasise, the companies in the telecommunication industry that are making profits and continue to survive are the ones that move to new markets or develop new products. McCormick (1996) states that service providers and network operators should do four things to achieve success. First, they should determine the customer's real needs and wants and remember that not all customers buy according to price only. Second, they should focus on new services and improving existing services to add value based on customer expectations. In the third place, they should look for niche markets to develop in, and, finally, they should form alliances with other service providers who can provide complementary services.

With the expansion of cellular phones, one of the markets that started to use cellular products and services is the student market. As students represent a sizeable segment of the market, the cellular industry should take note of students' attitudes, behaviour and spending with regard to cellular products. In South Africa, approximately 600 000 students enrol at tertiary institutions annually (UNESCO, 1998). The spread of cellular phones in the larger population is the result of marketing done by the cellular telecommunication industry. For the purpose of this paper cellular telecommunication industry refers to the network operators, service providers and cellular phone manufactures. A wide variety of cellular communication products and services have become available to consumers with the development of cellular telecommunication technology. Therefore, the cellular

telecommunication industry has to ensure that their marketing mix is effective and efficient. This entails their product offering, the services they offer, how they promote, how they distribute, and how they price their products and services in the market.

In this paper branding choices in acquiring cellular phones will be discussed. Secondly student's choices regarding pre-paid vouchers versus contract will be pointed out, where students prefer to acquire pre-paid will be touched on and lastly why student prefer pre-paid vouchers or contract will be discussed.

## Concepts and literature review

Hoffman and Bateson (1997) indicate that the term "product" refers to both goods and services. Strydom, Jooste and Cant. (2000) agree with Hoffman and Bateson (1997) and define a product as "...a tangible good, a service, an idea or, more often, some combination of these that, through the exchange process, satisfies consumer or business needs". Kotler (2003) refers to a product as anything that is offered to the consumer that satisfies a want or need. In the cellular telecommunication industry, the different elements that make up the tripod deliver either products or services, or a combination of products and services. Cellular phone manufacturers, for example, provide a tangible product, namely the cellular phone, whereas network operators provide the service that makes it possible to communicate by constructing and maintaining the network towers.

Network operators provide consumers with a service. A service "is an activity which has some element of intangibility associated with it that involves some interaction with customers or with the property in their possession, and does not result in the transfer of ownership" (Payne, 1993). Kotler (2003) and Zeithaml and Bitner (2003) agree with this definition that implies that the customer does not take ownership of a service. Czinkota and Kotabe (2001) state that a service can be a pure service (the capability to communicate on a cellular phone) or a service that supports goods (after-sale service on cellular phones). The customers cannot see, feel or touch the service they receive from network operators, as it is intangible. To receive the service, they must have a cellular phone. In the cellular telecommunication industry, the different role players thus provide services, products or a combination of the two. For the purpose of this paper, product and service offerings are referred to as "the product offering", which then includes both these elements

For organisations to be successful, they have to distinguish their product offerings from other organisations' offerings. To do this, marketers develop their products into brands to create a unique position in the minds of consumers (Jobber, 2004). Branding is used by the members of the cellular telecommunication industry to increase their success. Thus, branding will be discussed as part of the product offering. To create a distinction in the minds of consumers, organisations make use of the different product elements (Jobber, 2004).

According to Solomon and Stuart (1997), brand can be defined as a name, a term, a symbol, or any other unique element of a product that identifies one firm's products and sets them apart from those of other producers. An example of this in the South African cellular communication industry is the use of a dotted red "C" by one of the network operators. Aaker (1991) points out that branding focuses on a name or symbol of an organisation. Network operators rely heavily on branding as a way to build corporate image, since they sell a service and not a physical product. Palmer (2001) points out that organisations rely on branding as a way to differentiate themselves from their competitors and to build an image and service with a specific identity. Anderson and Heinonen (2002) point out that one way to improve consumers' knowledge of mobile services is to connect them to an existing traditional service brand. Branding is therefore not important only for cellular phone manufacturers, but also for network operators, to assist them in marketing the different products that they deliver to the market.

Nicholas et al. (2003) point out that teenagers yearn for connectivity. Although network operators have identified the potential of the youth market and developed packages aimed specifically at them, such as per-second billing, cheap phones and calls, they focus on the youth in general and not on the tertiary student *per se*. A large second-hand market for cellular phones was also created as people upgraded to new, improved cellular phones and discarded their old ones. The second-hand market for cellular phones and the lowering of in prices have resulted in groups of people that previously did not have access to cellular phones now also obtaining cellular phones (Ryan, 1997). According to Cant and Machado (2005) consumer has access to a variety of

cellular packages that differ in cost and the services that will be received. The two categories of subscription available to consumers is pre-paid vouchers where the consumer buys airtime or talk time, as they require it or contract where consumers usually pay a fixed amount on a monthly basis for airtime. Most contracts include free minutes in non-peak times and a cellular phone in the contract package. Even with the extras that are included in a contract student prefer pre-paid vouchers as method of subscription as determined in this paper and indicated in **Figure 1**. Selian (2004) indicates that young people prefer the pre-paid option since it gives them access to wireless services and it allows them to get extra minutes beyond the basic security plan that their parents might pay. Pre-paid therefore gives students control on how they spend their disposable income.

**Figure 1: Type of Subscription**

Pre-paid is readily available to students and as indicated in **Table 1** students acquire their pre-paid vouchers from different outlets.

**Table 1 Places where pre-paid vouchers are obtained**

| Places                                     | Number* | Percentage of total |
|--|---------|---------------------|
| Supermarket                                | 254     | 71.75               |
| Petrol station                             | 157     | 44.35               |
| Department store                           | 107     | 30.23               |
| Service outlet of network operator         | 130     | 36.72               |
| Street corner shop                         | 103     | 29.09               |
| Automatic teller machine (ATM)             | 89      | 25.14               |
| Someone else acquires my pre-paid vouchers | 77      | 21.75               |
| Vending machine                            | 65      | 18.36               |
| Stationery shop                            | 45      | 12.71               |
| Pharmacy                                   | 22      | 6.21                |
| Call to recharge                           | 15      | 4.24                |
| Internet                                   | 10      | 2.82                |
| Book shop                                  | 9       | 2.54                |
| Music shop                                 | 7       | 1.98                |
| Direct delivery                            | 2       | 0.6                 |

\* Respondents acquire pre-paid vouchers at more than one place (n=354)

**Table 1** indicates that 71.75% (254) of the students obtain or purchase their pre-paid vouchers from supermarkets. A substantial number of students namely 44.35% (157) obtained or purchased prepaid vouchers at petrol stations and 36.72% (130) students used service outlets to obtain pre-paid vouchers. Furthermore, 30.23% (107) students used department stores and 29.09% (103) used street corner shops (29.09%), which are also favoured distribution points. Supermarkets often have special offers on pre-paid vouchers, which could be the

reason for them being favoured by students to obtain pre-paid vouchers. It is interesting to note that service outlets are also favoured, although they are not as widespread as the other outlets.

## RESEARCH METHOD

### Research design

The study was completed in two phases. Firstly a literature study was done on the different aspects that could influence students' acquisition of cellular products and services. Branding as an aspect of the marketing mix were evaluated, as well as existing cellular phones and services and their pricing reviewed by means of the consultation of newspapers, magazines articles and research publications. Secondly primary research was completed to determine student's preference regarding brands and pre-paid or contract. Probability sampling and a self-administering questionnaire were used. The questionnaire was pre-coded and contained multiple and scale questions. In total 17 concise questions that deals with branding and pre-paid vouchers or contract were used in the questionnaire. The phrasing of each part of the questionnaire was closely examined so as to ensure clarity and ease of use. The amendments done after extensive piloting, are considered to have significantly increased the validity of the scale. The items were rated on a seven-point Likert scale from "Strongly agree", 7, to "Strongly disagree", 1.

A descriptive research design was used that uses a set of scientific methods and procedures to collect raw data and create data calculations that describe the existing characteristics of a defined target population or market structure. Descriptive research attempts to obtain a complete and accurate description of the situation and determines the frequency with which something occurs (Hair Bush, & Ortinau, 2000; Strydom, *et al.*, 2000; Churchill, 2001). Students studying at Tshwane University of Technology represented the survey population. The study population is the aggregate of elements from which the sample is actually selected and from this inferences can be made out of about the original population (Kinnear & Taylor, 1996). In the study a multi-stage cluster sampling method was used which consists of two or more steps in the selection of groups from the population that is broken down into sub-groups that are mutually exclusive and collectively exhaustive. There after a random sample of the groups was selected for further sampling (Dillon, Madden, & Firtle, 1994). Full time students at pre-selected faculties of Tshwane University of Technology made up the sample frame. The eleven faculties at Tshwane University of Technology were listed and departments were selected from the faculties where after a simple random sample of students was drawn from each department. 430 questionnaires were distributed and from the distributed questionnaires 422 were received back. Of these 410 were used. 12 questionnaires were rejected due to incompleteness.

### Data analysis

**Table 2:** Student's preference for pre-paid vouchers versus contracts

| Description of variable  | Scale                                   |       |       |      |       |       |       | Mean |
|--|---|-------|-------|------|-------|-------|-------|------|
|  | 7:Strongley agree - 1 Strongly disagree |       |       |      |       |       |       |      |
|  | 7                                       | 6     | 5     | 4    | 3     | 2     | 1     |      |
| V37-Price influences my choice between pre-paid vouchers and contract. | 34.8%                                   | 27.7% | 14.2% | 9.6% | 5.3%  | 3.3%  | 5.1%  | 5.47 |
| V38-I see a contract as expensive.                                     | 38.3%                                   | 20.6% | 12.7% | 5.6% | 8.6%  | 6.9%  | 7.4%  | 5.24 |
| V39-Pre-paid vouchers are more flexible.                               | 43.7%                                   | 28.7% | 11.4% | 5.1% | 4.3%  | 2.0%  | 4.8%  | 5.77 |
| V40-Acquiring pre-paid vouchers is easy.                               | 54.8%                                   | 25.4% | 8.1%  | 4.3% | 3.8%  | 2.3%  | 1.3%  | 6.11 |
| V41-I find getting a contract as being too complicated.                | 22.8%                                   | 21.1% | 12.7% | 8.6% | 11.2% | 10.2% | 13.5% | 4.52 |

|   |       |      |       |              |       |       |       |      |
|---|-------|------|-------|--------------|-------|-------|-------|------|
| V42-Pre-paid vouchers have more service options than contracts. | 12.7% | 9.9% | 16.8% | <b>19.8%</b> | 10.9% | 15.2% | 14.7% | 3.89 |
|---|-------|------|-------|--------------|-------|-------|-------|------|

Frequency for level of agreement and disagreement **table 2:**

- **V37** – Students strongly agree (34.8%) and agree (27.7%) that price influence their choice between pre-paid vouchers and contract. Seeing that a majority of students does not have fulltime employment this will influence their choice and predisposition for pre-paid vouchers.
- **V38** – The majority of students see a contract as being expensive and therefore strongly agree (38.3%), and agree (20.6%) with this statement. Students rely on family and part-time jobs for an income and therefore do not have the financial resources to have contracts and pay fixed monthly fees.
- **V39** – With pre-paid vouchers giving students the option on how much they spend the findings is that pre-paid vouchers are more flexible with student strongly agreeing (43.7%) and agreeing (28.7%) with the statement.
- **V40** – Students clearly see acquiring pre-paid vouchers as being easy with more than half strongly agreeing (54.8%) with this statement. Pre-paid vouchers are available at a multitude of different outlets and with this students will not see it as being a big an obstacle to subscribe to a network operator.
- **V41** – Students indicated by strongly agreeing (22.8%) and agreeing (21.1%) that they find getting a contract as being to complicated. This could be due to the prerequisite such as a pay slip and three month bank statement.
- **V42** – Students indicated that they neither agree nor disagree (19.8%) that pre-paid vouchers have more service options than contract. Service provided by the two subscription options is seen as being the same by students.

**Table 3:** Importance of brand name to students as a determinant in cellular phone acquisition

| Description of variable  | Scale                                   |       |       |      |       |       |       | Mean |
|--|---|-------|-------|------|-------|-------|-------|------|
|  | 7:Strongley agree - 1 Strongly disagree |       |       |      |       |       |       |      |
|  | 7                                       | 6     | 5     | 4    | 3     | 2     | 1     |      |
| V58-The brand name of a cellular phone will influence me when acquiring a cellular phone.                | 40.4%                                   | 31.0% | 10.4% | 5.1% | 3.0%  | 6.6%  | 3.6%  | 5.66 |
| V59-The guarantee will influence the brand name of the cellular phone I acquire.                         | 30.2%                                   | 35.8% | 16.0% | 7.4% | 4.8%  | 4.1%  | 1.8%  | 5.60 |
| V60-The features and functions of the cellular phone will have an influence on the brand name I acquire. | 41.6%                                   | 29.7% | 13.7% | 4.8% | 4.6%  | 4.1%  | 1.5%  | 5.81 |
| V61-Specials on cellular phones will influence my decision to buy a specific brand name.                 | 23.8%                                   | 26.4% | 22.6% | 8.1% | 8.1%  | 5.6%  | 6.3%  | 5.06 |
| V62-Before I buy a cellular phone brand I will consult my friends and family.                            | 14.7%                                   | 18.5% | 16.0% | 8.9% | 8.9%  | 18.5% | 14.5% | 4.08 |
| V63-The services that accompany the brand will influence my decision.                                    | 28.2%                                   | 34.8% | 18.5% | 6.6% | 4.6%  | 3.8%  | 3.6%  | 5.50 |
| V64-If the brand I prefer is not available, I will easily acquire another brand.                         | 6.3%                                    | 18.8% | 17.5% | 5.3% | 13.2% | 20.1% | 18.8% | 3.64 |
| V65-Price is more important than the brand that I acquire.   | 10.7%                                   | 13.2% | 15.0% | 7.1% | 14.0% | 21.8% | 18.3% | 3.61 |

|   |       |       |       |      |       |       |       |      |
|---|-------|-------|-------|------|-------|-------|-------|------|
| V66-Where I acquire a cellular phone is not important to me as long as it is the brand that I prefer. | 19.3% | 17.8% | 16.8% | 7.6% | 11.7% | 13.7% | 13.7% | 4.31 |
| V67-Advertising has an influence on the brand I acquire.  | 24.1% | 28.7% | 21.3% | 9.9% | 7.1%  | 2.8%  | 2.8%  | 5.23 |
| V68-The extras that I receive with the brand will influence my decision to acquire the brand.         | 22.8% | 30.7% | 24.4% | 8.4% | 6.3%  | 2.3%  | 2.3%  | 5.31 |

Frequency for level of agreement and disagreement **table 3:**

- **V58** – A majority of students strongly agree (40.4%) and agree (31.0%) that the brand name of a cellular phone will influence their acquisition of a cellular phone.
- **V59** – The guarantee given is important to students as most strongly agreeing (30.2%) and agreeing (35.8%) that it will influence the brand name of the cellular phone they acquire.
- **V60** – There is a strong indication that features and functions of the cellular phone will have an influence on the brand name students acquire since most strongly agree (41.6%).
- **V61** – Students strongly agree (23.8%), agree (26.4%) and slightly agree (22.6%) that specials on cellular phones will influence their decision to buy a specific brand name.
- **V62** – There is no clear indication that students will consult their friends and family before buying a cellular phone brand.
- **V63** – Services that accompany the brand will influence students decision to acquire it most students strongly agree (28.2%) and agree (34.8%) on this statement.
- **V64** –Students disagree (20.1%) and strongly disagree (18.8%) that if the brand they prefer is not available, they will easily acquire another brand.
- **V65** – On this statement student disagree (21.8%) and strongly disagree (18.3%) that price is more important than the brand that they acquire.
- **V66** – Where students acquire a cellular phone is not important to them as long as it is the brand that they prefer with most students slightly agreeing (16.8%), agreeing (17.8%) and strongly agreeing (19.3%) with this statement.
- **V67** – There is a strong indication that advertising has an influence on the brand students acquire with students slightly agreeing (21.3%), agreeing (28.7%) and strongly agreeing (24.1%) to advertising importance in their decision making.
- **V68** – Students are slightly agreeing (24.4%), agreeing (30.7%) and strongly agreeing (22.8%) that the extras that they receive with the brand will influence their decision to acquire a brand.

## CONCLUSIONS, RECOMMENDATIONS AND LIMITATIONS

Regarding student's preference in pre-paid versus contract they indicated that price will influence their choice between pre-paid vouchers and contract, that they see contract as more expensive, that they see pre-paid vouchers as more flexible and that acquiring pre-paid vouchers is easy. Students of all income groups indicate that they are uncertain whether getting a contract is to complicate. There is also an indication that students don't see pre-paid vouchers as having less service options than contracts. Price of services should be researched more. Since price has an influence in the selection of pre-paid vouchers above contract, network operators could consider creating contract packages than could be controlled by the students themselves. The process of getting a contract could be revised to make contract subscription more available to students. In promoting contracts the different network operators must note the distribution points which students use the most to acquire pre-paid vouchers. These distribution points can be used as a point to promote contracts with students.

Students seem to be brand loyal and prefer specific brand names. The price of the cellular phone is less important than its brand name. Students also indicated that if the brand they wanted were not available, they would not easily acquire another brand, although special offers on cellular phones would influence the brand they acquire. However, students are not certain if they would consult friends and family when making a decision about purchasing a cellular phone. Students indicated that advertising and the extras received would influence the brand they acquire. There was an indication that students are uncertain about the importance of where the

cellular phone would be acquired, as long as it is the brand that they prefer. Cellular phone manufacturers could improve the functions on their cellular phones and should promote new technologies like the new Generation three (G3) phones. Guarantees should be honoured to ensure continued brand loyalty. Specials would influence students' selection of a brand. Therefore, there is still an opportunity for cellular phone manufacturers to persuade students to change brands by creating attractive specials on their brands. In view of cost being an important consideration in purchase decision-making, offering special deals specifically for students could ensure their subscription. There is no clear indication that students would consult friends and family before they make a decision. Therefore, there is an opportunity for in-store selling to influence the buying decision. Given the importance of advertising, advertisements specifically for the student market should be developed. Extras that can be included are hand-free sets, pouches, free downloads, etc., to convince students to buy a specific brand. Cellular phones should also be available at all possible outlets, since students are uncertain about the influence that an outlet would have on their selection of a brand.

Certain limitations can be identified in this paper. Firstly the research was limited to one university of technology. Secondly due to the speed at which technology is changing in the cellular telecommunication industry aspects that was not covered in the questioner might have an influence on the decision making of students such as the availability of television on cellular phones. Lastly a fourth network operator entered the market since the research was done and that can most probably also influence some of the findings.

# EVALUATION OF ENVIRONMENTAL EFFECTS OF AIRPORT OPERATIONS: THE CASE OF TURKEY

**Vildan Durmaz, Mufide Banar, Mustafa Ozen, and Hatice Kucukonal**  
**Anadolu University, Turkey**

## ABSTRACT

*Airport operations have significant effects on environment both directly and indirectly. Some of these effects are so familiar (noise, air quality, water quality etc.), the others are not so easily identified (wildlife, land use etc.). For that reason, all responsible actors should aware and control of these effects for the sustainability of aviation.*

*The purpose of this study, firstly, is to determine the environmental impacts of the airport operations; and then to state the national legislation on environmental impacts of airports; finally to develop a comprehensive policy for the decision makers. In the first part of the study, airport operations and the possible environmental impacts are generally described. In the second part, Turkish legislation and authorities directly related to the airport operations' environmental impacts are determined. In the last part, in order to evaluate the responsibilities of all stakeholders in this field, the data were collected by using semi-structured interview method at the main international airports (Ataturk-İstanbul, Antalya, Adnan Menderes-Izmir and Esenboga-Ankara).*

*Finally, a strategy is proposed to implement the environmental management system among the related actors in an efficient and sustainable manner in Turkey.*

## INTRODUCTION

Aviation is one of the world's fastest growing industries, with a growing demand for aviation services. The global airline markets have shown an average annual passenger traffic growth of 4.8 percent and air cargo growth of 6.3 percent over the past 20 years. This growth was founded on world economic growth of 2.9 percent and further stimulated by liberalization of market regulations in many countries.

Looking ahead over the next 20 years, while the world economy is set to grow at 3.1 percent, the airline passenger traffic is expected to grow 4.9 percent and air cargo 6.1 percent (Boeing, 2006). In the light of the expected growth in air travel, one of the major issues facing the airline industry in the 21st century will be its ability to conciliate capacity expansion at major airports with the negative impact of increased airport operations on surrounding neighborhoods (Nero and Black, 2000). As a multi-disciplinary and unique research in this field in Turkey, this study is believed to contribute to the other developing countries for the requirements and the implementation of environmental management system at airports to achieve the environmental sustainability worldwide.

## ENVIRONMENTAL IMPACTS OF AIRPORT OPERATIONS

The total transport sector accounts for 20–25 percent of the global CO<sub>2</sub> emissions, and in 1992 aviation was responsible for about 13% of CO<sub>2</sub> emissions from all transportation sources. Hence, there is a concern that the predicted continued growth in air transport will increase CO<sub>2</sub> emissions substantially, and counteract any reductions achieved elsewhere, such as aircraft technology improvements yielding quieter engines and fuel efficiencies (Kaszewski and Sheate, 2004).

Global and local environmental pressures upon aviation will continue to mount and have a significant effect upon the future growth of the industry. The ability of cities to play a full part in and achieve maximum social and economic benefit from the global economy will be dependent to a significant extent upon the development of the airports that serve them. An issue that is in direct conflict to this growth is that many airports are at risk of reaching their environmental capacity before they are able to fulfill the demand for air travel due to local planning constraints (Maughan et al., 2001).

Airport operations include the activities related to operation and maintenance of runways, control towers, maintenance facilities, aircraft gates, baggage handling facilities, and airport operations such as passenger and vehicle traffic, ticketing, baggage handling, passenger security, and concessions. The operation of airports can have a variety of impacts on the environment. Airports, like other administrative offices, can generate large quantities of waste paper and consume large amounts of energy from lighting, heating and cooling systems, and computers. Concession shops and food service operations can generate significant quantities of solid waste, such as corrugated cardboard, paperboard, office paper, newspapers, magazines, wooden pallets, aluminum, plastic, and glass containers, as well as leftover food. Grounds keeping and landscaping activities can generate waste pesticides and herbicides. Airport ground traffic congestion can generate significant air emissions (EPA, 1998, 31).

The externalities generated from commercial flights have various impacts on air quality, noise, water quality, fuel consumption and energy, ecology (Morrell and Lu, 2000), erosion, sedimentation, soil compaction, chemical pollution resulting from aircraft maintenance and deicing, aircraft emissions, contaminated runway and grounds runoff, generation of waste construction materials, and litter and other debris from administrative and food service operations (EPA, 1998, 31). Despite the many benefits that the aviation industry brings there are a range of negative environmental impacts, which cannot be ignored and which have been debated with much controversy over recent years (Maughan et al., 2001). Potential environmental impacts resulting from airport operations are identified briefly in Table 1.

**Table 1. Airport operations and environmental impacts**

Airports typically own and manage relatively large areas of land, which can provide good quality wildlife habitats for a wide range of species, including those that receive legal protection and/or are notable for their nature conservation value (AOA, 2006). Airports by their very nature cover large areas of land and create zones which are either hostile to wildlife (paved or built) or an ecological monoculture (such as mown grassland). The more distant areas surrounding airports can, however, often be of considerable ecological value, particularly if the airport is located in a green belt surrounding a major urban conurbation, as is often the case. The ability of an airport to extend its boundaries or even build upon parts of its own land can be restricted by the value of the habitats threatened (Upham et al., 2003).

## NATIONAL ORGANIZATIONS AND LEGISLATION

Turkey is strategically positioned astride Europe and Asia. With a growing population, rapid urbanization, a healthy foreign tourism industry and an active regional commercial base, Turkey has witnessed a need to further develop civil aviation and airport infrastructure in the current decade. Turkey is at the center of regional civil aviation development and has identified the following critical areas for development: renovation and modernization of existing airports; construction of new airport facilities; upgrading of ground and terminal equipment and systems; increasing the establishment of airlines; increasing general/business aviation services; privatization of the national airline/airport management operations; air traffic control improvements; and the upgrading of airport and airline security (CCA Market Overview Turkey 2005 ).

In Turkey, the governmental organizations related to civil aviation and environmental impacts of airports are Ministry of Environment and Forestry, Ministry of Transport, the Directorate General of Civil Aviation, the General Directorate of State Airports Authority. Table 2 shows that the national organizations with legislations related to environmental protection caused by airport operations.

**Table 2. National organizations with related legislation**

## METHODOLOGY

The main research objective is to determine the implementation of environmental management systems at airports for the sustainability of air transportation in Turkey. The method chosen for this study was a survey by means of semi-structured interviews. Semi-structured interviews are conducted with a fairly open framework which allow for focused, conversational, two-way communication. The semi-structured interview was intended to do with the responsible person from environmental impacts of airport operations. Four of the major international airports -Ataturk-İstanbul, Antalya, Adnan Menderes-Izmir and Esenboga-Ankara- in Turkey were chosen due to their high traffic (DHMI). Istanbul is the primary commercial air hub in Turkey. Other major facilities are located in Izmir, Ankara, and Antalya (CCA Market Overview Turkey 2005). However; it is observed that none of the airports has an environmental management department. For that reason, the interview was applied with the manager of Quality Management Department.

## RESULTS AND DISCUSSIONS

As a result of the survey, the findings can be briefly summarized in the following points. Traditionally, all of the airports were established out of the city, but now they are performing almost in the highly populated city center. There has been a significant increase in road traffic (surface access traffic) in recent years within the frame of the increasing aircraft movement and passenger traffic. Road traffic and its environmental impacts have been increased in relation to airports location. Antalya and İstanbul, Atatürk airports have maintenance centers. All the activities in the maintenance centers detrimental effects on environment. The entire airport operator stated that every airport have and will plan their terminal, apron, and runway capacity enlargement. Those construction activities also have environmental impacts.

All of the responders were asked to give the answer to the question of which operations cause what type of environmental impact such as noise, air quality, water quality, waste, energy and land use. As a result of the survey it is found that they are not aware/accept their operations' environmental impacts. So, they did not give the complete answer for the question of their actual protection methods/remedial actions for the possible environmental impacts of their operations. Only two of them stated that they have waste water treatment facilities.

The interesting results of the interviews with airport directors, airport tenants and the governmental organizations on aviation and the environment are as follows:

All responsible actors at airports believe that environmental management system is very significant, in spite of that fact none of them have this application. İstanbul, Atatürk airport operator stated that one of airport tenants (Turkish Airlines Technic) is preparing the documentation necessary for the ISO 14001 Certification. As evident from the findings, it is constanted that there is a tendency to have environmental management system certification (ISO 14001 or EMAS) in the airport sector as in Europe and USA.

In Turkey, not efficient and effective communication among governmental organizations, responsibilities are not delegated, duties and responsibilities are not clearly identified, and requirements of conventions and international organizations' specifications are not completely applied; even if there is some environmental legislation covering airport operations those are not efficiently applied. Moreover, there is no well-organized system to control the environmental impacts of airport operations continually. Airport tenants still do not aware of the importance of environmental management system. Tenants believe that their operations do not cause any environmental impact so, they do not have any systematic protection or precautions.

## CONCLUSION

Climate change is a major issue in the world. Scientists are focus on alternative solutions to eliminate this global problem. Air transportation is one of the sources that cause climate change. So to minimize the environmental impact of airport operations it is essential to be aware of the effects of airport operations on environment. Within the adaptation process for the European Union membership, Republic of Turkey Ministry of Environment and Forestry had renovated laws and regulations relating to prevent environmental pollution with a great success. Unfortunately, lack of coordination among the national authorities (such as Ministry of Environment and Forestry, Ministry of Transport, The Directorate General of Civil Aviation, The General Directorate of State Airports Authority) results in the inefficient application of these laws and regulations.

As it is known, international organizations have various rules and regulations on decreasing airport externalities. As a member of international organizations, Turkish civil aviation authority has only published wildlife hazard and bird control directive for airports and the noise regulation at airports adapted from ICAO publications. As a result of interviews, it cannot be said that these rules are applied as required by international standards. It is evident from this study that the growth of the aviation sector in Turkey is environmentally unsustainable at present and, with increased growth forecast, will be even worse in the future unless the necessary coordination among authorities is provided. It is concluded that, there is a lack of coordination between Turkish authorities (Ministry of Environment and Forestry, Civil Aviation Organizations). The regulations are not well-organized to handle environmental impacts especially related to the airport operations. It is observed that there is a tendency to apply environmental management systems but airport directors need to be forced and encouraged by national and international authorities and legislation.

# ON THE CONVERGENCE OF DECISION-MAKING STYLE TYPOLOGIES

Nikolay Filinov

State University – Higher School of Economics, Moscow, Russia

## ABSTRACT

*The paper investigates the issue of identifying decision-making style of a manager. Different methodologies are available to handle the task, including those of A. Rowe, I. Adizes, A. Karpov, K. Brousseau, M. Driver, G. Hourihan, R. Larsson, D. Kiersey, M. Bates and others. Interestingly, the issue of correspondence of results obtained through application of different methods does not receive appropriate attention. There are few exceptions as in case of MBTI and I. Adizes typology. First, textual analysis of style descriptions is undertaken which leads to formulation of certain hypothesis. It is then complemented by statistical analysis.*

## THE NOTION OF DECISION-MAKING STYLE

The notion of decision-making (DM) style is widely used in managerial literature. Although we can find certain differences in definitions provided by different authors there appears to be a general understanding of DM style as a pattern of manager's behavior in situations where he/she is obliged to make a decision or is doing it voluntarily. For example, "Style of managerial decision-making – it is stable, preferred and what is also important possible for a given manager way of behavior in a problem situation" (A. Karpov, 2003). "Learned, habitual response pattern exhibited by an individual when confronted with decision situation" (Scott, Bruce, 1995).

This involves at least two difficult questions. The first one is differentiating between style of management and style of decision-making. Manager's DM style is not necessarily equivalent to style of management as far as it pertains to only one (although important) side of manager's activity. A good example of an activity, which is clearly complementary to decision-making is provided by the recent publication by (P. Clampitt and M. Williams, 2007) in which a notion of *decision downloading* is being introduced. By decision downloading authors understand the phase of communicating decision to employees. This phase precedes and creates necessary conditions for decision implementation and in turn includes a number of steps, such as planning, announcement, monitoring and responding (to employees' concerns). We will not go into further details as far as it takes us to a much more broad and sophisticated problem of the contents of management functions. Anyway, it appears evident that decision-making is only one of them, and consequently style of management and style of decision-making relate to each other as a part and a whole. Style of decision-making should be regarded as an element of management style in line with such other elements as for example communication style. Moreover, all these are highly dependant and may cause problems if there is insufficient fit among them. In spite of this in numerous publications, notions on decision-making style and management style are used either interchangeably (I. Adizes, 2004), or decision-making style as that of especially important and especially explicit function is regarded as a proxy for style of management (A. Karpov, 2003).

The second question is linked to the distinction between management and leadership. Can DM behavior of a manager and a leader be described in terms of the same set of patterns, or they are substantially different? Rowe et. al. suppose that of the four possible DM styles two (Conceptual and Analytic) pertain to the behavior of a leader, and two others (Directive and Behavioral) pertain to the behavior of a manager. Of course, in reality, every single person demonstrates elements of all four styles. However, in the suggested framework this simply means that everyone demonstrates elements of a manager's and a leader's behavior. (Rowe et. al., 1990).

A different view has been proposed by (K. Brousseau et al., 2006). They also consider four individual styles: Decisive, Hierarchic, Integrative and Flexible, but draw attention to the fact, that "...managers make

decisions differently in public settings, where they know they are being observed, than they do in private settings, where there is no need to explain or justify their process". Accordingly, they call the public mode "leadership style" (of decision-making) and the private mode "thinking style" (of decision-making). For the further discussion, we use the "thinking style" option of this methodology.

However, in both approaches we have styles of manager's DM and styles of leader's DM as separate entities included in more general characteristics of "style of management" or "style of leadership" respectively. These two are entities of a higher order for DM style.

If we want to look at the internal structure of DM style, we also find different approaches. Rowe et. al. consider manager's needs, problem-solving capacities, perceptual and cognitive skills, and leadership qualities as determinants and descriptors of DM style. A.Karpov offers an alternative view by drawing attention to the fact that making management decisions has two facets: individual (reflecting characteristic of the individual in the position of decision-maker) and inter-individual (reflecting the systems of his relations with peers and subordinates involved in decision and affected by it).

Finally, it seems justified to apply general process-like description to decision-making process and thus we obtain the triad inputs-transformation-outputs with their respective characteristics. Based on literature review and attempting to select features directly related to and affecting the DM process we come up with the following (accumulated) list of characteristics. Inputs characteristics include amount and form of information which decision-maker prefers to obtain. Process characteristics include Perceived organizational goal, Priority given to (result vs. process), Time reference (future vs. present), Local/global focus, Basic needs, Dominant criterion for selecting course of action, Attitude towards risk, Tolerance to ambiguity, Nature of preferred decision-making process (structured vs. unstructured), Focus in search for options (optimal option vs. acceptable option), Preference to rely upon logical analysis or practical experience, Speed of decision-making, Employees' involvement in DM process. Output is characterized by how the DM process result – selected option is treated: whether we stick to a single option and insist on its implementation, or alternatively, we regard our choice as a fuzzy indication of a course of action needed to be adapted as circumstances change and new information appears.

Note, that suggested characteristics may be attributed (although in some cases not in a unique way) as reflecting needs-capacities-skills-leadership qualities or, alternatively, individual and inter-individual patterns of behavior in DM situations, using the frameworks mentioned earlier.

## **COMPARISON OF THE FOUR DM STYLE TYPOLOGIES – TEXTUAL ANALYSIS**

Interestingly, the issue of correspondence of different methodologies for defining and determining (assessing) individual's DM style does not have appropriate attention. At the same time, this is an attractive research goal because if we succeed in establishing a kind of correspondence, then we get advantages of double-checking and extended interpretation of results not to mention better theoretical understanding of the construct.

For our analysis, we have selected four DM style typologies. These are: typology suggested by K. Brousseau, M. Driver, G. Hourihan and R. Larsson, Decision Style Inventory (DSI) (A. Rowe, 1990), I. Adizes typology, and 4-temperament model of D. Kiersey and M. Bates based on MBTI methodology (G. Huit, 1992). The reason for such selection was twofold. First, all these typologies are based on structurally similar four styles model and second, in case of the pair "I. Adizes typology – 4-temperament model of D. Kiersey, M. Bates" there is published evidence of strong link between these two (I. Adizes, 2004).

In terms, described earlier, typology suggested by K. Brousseau, M. Driver, G. Hourihan, R. Larsson, and DSI of A. Rowe are DM style typologies in proper sense, while I. Adizes framework is closer to management style typology (although it includes a rather detailed list of DM process features and the author himself calls it sometimes a DM style typology). 4-temperament model of D. Kiersey, M. Bates is personality type scheme and thus has much more fundamental nature.

Based on the descriptions of outlined types proposed by the authors we have compiled tables 1-4 including 16 characteristics for every type. Types are grouped in tables according to their presumptive similarity. In an attempt to implement a conservative approach we intentionally avoided making hypothetical statements and included in our tables only those features that have been explicitly described by the authors.

| 2. Preferred form of information                                 |  |  | Oral   |   |
| <b>Process characteristics</b>                                   |  |  |  |   |
| 3. Perceived organizational goal                                 |  | Functionality  |  |   |
| 4. Priority is given to (result vs. process)                     | Result   | Result   | Result   |   |
| 5. Time reference  |  | Short-term   | Short-term                                       | Short-term  |
| 6. Local/global focus  |  | Local  | Internal to organization                         |   |
| 7. Basic needs   |  | Achievement  | Security and status                              |   |
| 8. Dominant criterion  |  | Effectiveness  | Effectiveness                                    |   |
| 9. Attitude towards risk   |  |  |  | Positive (select high risk occupations)   |
| 10. Tolerance to ambiguity                                       |  | Low  | Low  |   |
| 11. Decision-making process                                      |  | Structured   | Structured                                       |   |
| 12. Focus in search for options                                  | “Satisficing” option   |  | Practical solution                               |   |
| 13. Prefer to rely upon logical analysis or practical experience |  |  | Practical experience                             | Practical experience  |
| 14. Speed of decision-making                                     | High   | High   | High   |   |
| 15. Employees’ involvement in DM process                         |  | “If you need a guarantee that the job is performed properly – do it yourself!” | Low, generally have the drive to dominate others |   |
| <b>Output characteristics</b>                                    |  |  |  |   |
| 16. Adaptability of approach                                     | Select single option. Stick to the plan and move on to the next decision             | Love improvisation   |  | Use iterative approach, definition of problem may change in the process of solving it |

**Table 4. Comparison of FLEXIBLE – INTEGRATOR – BEHAVIORAL – NF styles**

|  | K. R. BROUSSEAU,<br>M. J. DRIVER,<br>G. HOURIHAN,<br>R. LARSSON -<br><b>FLEXIBLE</b> | I. K. ADIZES -<br><b>INTEGRATOR</b> | A. J. ROWE -<br><b>BEHAVIORAL</b>          | D. KIERSEY,<br>M. BATES -<br><b>NF</b> |
|--|--|-------------------------------------|--|--|
| Input characteristics  |  |                                     |  |  |
| 1. Amount of information, needed to make decision                | Limited - just enough data to choose a line of attack                                |                                     | Limited                                    |  |
| 2. Preferred form of information                                 |  |                                     | Oral                                       |  |
| Process characteristics  |  |                                     |  |  |
| 3. Perceived organizational goal                                 |  | Effectiveness in the long term      |  |  |
| 4. Priority is given to (result vs. process)                     |  | Process                             |  |  |
| 5. Time reference  |  | Future                              | Short to medium range                      | Future                                 |
| 6. Local/global focus  |  | Global                              |  |  |
| 7. Basic needs   |  | Acceptance                          | Acceptance                                 | Becoming, self-discovery               |
| 8. Dominant criterion  |  | Consensus among subordinates        |  | Integrity of solutions                 |
| 9. Attitude towards risk   |  |                                     |  |  |
| 10. Tolerance to ambiguity                                       |  |                                     | Low  |  |
| 11. Decision-making process                                      |  | Unstructured                        |  |  |
| 12. Focus in search for options                                  |  | Acceptable option                   |  |  |
| 13. Prefer to rely upon logical analysis or practical experience |  |                                     |  |  |
| 14. Speed of decision-making                                     | High – “make decisions quickly”  | Low                                 |  |  |
| 15. Employees’ involvement in DM process                         | High involvement   |                                     | Receptive to suggestions, enjoy counseling |  |
| Output characteristics   |  |                                     |  |  |
| 16. Adaptability of approach                                     | Quickly change course if need be   |                                     |  |  |

Cells corresponding to features, not specified explicitly in respective methodologies have been left empty.

Given the substantial number of empty cells in tables 1-4 we realize that actually the task we are facing is similar to comparing two partially destroyed text fragments attempting to establish the identity of content. Looking for fit does not necessarily mean looking for same words in types’ descriptions but rather looking if one description of particular feature may be associated, or goes in line with another. For example, “approval and support” as a basic need we consider to be well associated with “praise, recognition and independence” and “consensus among subordinates” as a feature which goes in line with “integrity of solutions”.

Tables 1-4 demonstrate that as suggested by I. Adizes ENTREPRENEUR style appears to correspond to NT temperament of D. Kiersey, M. Bates. Besides this, other correspondences may be established: INTEGRATIVE-ENTREPRENEUR-CONCEPTUAL-NT, FLEXIBLE-INTEGRATOR-BEHAVIORAL-NF, HIERARCHIC-ADMINISTRATOR-ANALYTICAL-SJ, DECISIVE-PRODUCER-DIRECTIVE-SP.

Literature provides additional evidence for the proposed correspondence. K. Brousseau et al. suggest that C-level executives should demonstrate moderately high levels of INTEGRATIVE and HIERARCHIC styles, moderately low level of DECISIVE and moderately low-to-low level of FLEXIBLE. This perfectly corresponds to earlier finding of A. Rowe for 80 senior executives with moderately high (dominant) level of CONCEPTUAL style, slightly higher than average ANALYTIC style, considerably lower than average DIRECTIVE style and avoided BEHAVIORAL style. This is also in line with D. Kiersey results showing much higher proportion of NT-people among managers and entrepreneurs as compared with general US population. I. Adizes attributes PRODUCER and ADMINISTRATOR styles to left-brain thinking while INTEGRATOR and ENTREPRENEUR styles with right-brain thinking which perfectly coincides with the view of A. Rowe with respect to ANALYTICAL styles and CONCEPTUAL and BEHAVIORAL styles accordingly. A. Rowe also refers to an earlier work of A. Zaleznick associating ANALYTICAL style and behavior of a bureaucrat and I. Adizes regards bureaucrat as an extreme manifestation of ADMINISTRATOR style.

The fit between descriptions of style, although impressive in some pairs is nevertheless not perfect even within the considered framework of characteristics. We encounter contradictory statements concerning: speed of decision-making in pair “FLEXIBLE-INTEGRATOR” (“Make decisions quickly” vs. “Low”); employees’ involvement in DM process in pair “HIERARCHIC- ADMINISTRATOR” (“Expect others to contribute – and will readily challenge others’ views, analyses, and decisions” vs. “Favor, but in a highly formal way”); time reference in triad “FLEXIBLE-INTEGRATOR-NF” (“Future” vs. “Short to medium range” vs. “Future”)

Other researches also contribute certain doubt about the proposed fit. I. Adizes discussing ENTREPRENEUR and INTEGRATOR styles indicates that in Japan level of ENTREPRENEUR was historically low at the expense of INTEGRATOR style. Japanese had never been innovators-individualists. They have even to import corporate leaders from abroad! On the other hand, according to A. Rowe results, the score for CONCEPTUAL style for Japanese managers was higher than for their American colleagues.

Consequently, we can in no way state that INTEGRATIVE-ENTREPRENEUR-CONCEPTUAL-NT, FLEXIBLE-INTEGRATOR-BEHAVIORAL-NF, HIERARCHIC-ADMINISTRATOR-ANALYTICAL-SJ, DECISIVE-PRODUCER-DIRECTIVE-SP are fully identical styles. Rather, we can put forward a hypothesis that there is a strong association of the described kind and thus a person, exhibiting, for example, a domination of the INTEGRATIVE style in terms of K. Brousseau, M. Driver, G. Hourihan and R. Larsson should most probably fall into ENTREPRENEUR category in terms of I. Adizes methodology, and a person with NF temperament in terms of D. Kiersey and M. Bates should most probably exhibit domination of BEHAVIORAL style in terms of A. Rowe.

## **COMPARISON OF DM STYLE TYPOLOGIES – STATISTICAL ANALYSIS**

We attempted to apply the logic outlined above to a sample of 64 Russian executives, working on their EMBA. DSI and Decision style Survey Form by P. Nutt and D. Marcic (P. Nutt, 1989) as a proxy for MBTI have been used as measuring tools. It is obvious that the sample size is not sufficient to make ultimate conclusions on the proposed hypothesis – only some preliminary results are available for today. In our mind, it is still worth considering them as well as additional problems that have surfaced in the research process.

As far as only one D. Kiersey and M. Bates temperament is attributed to a person whereas several A. Rowe styles may be found dominant (or back up) we distinguish two situations: the situation in which A. Rowe style “corresponding” to D. Kiersey and M. Bates temperament is avoided (this is an argument against the proposed hypothesis) and the situation, in which this style is either dominant one, or a back-up (this is an argument in favor of the proposed hypothesis). Statistical table for the  $\chi^2$  test follows.

The results are encouraging for the CONCEPTUAL – NT pair, somewhat doubtful for pairs BEHAVIORAL – NF and DECISIVE – SP and fully discouraging (showing the pattern opposite to the suggested one) for the ANALYTICAL – SJ pair. However, most probable reason for this is low numbers of managers with respective temperaments (4 and 7) in the sample. At the same time domination of NT temperament is one of the predicted aspects of the situation. Additional testing on larger samples is required.

**Table 5. Statistics for  $\chi^2$  test**

| Statistics for CONCEPTUAL – NT pair |  |             |
|-------------------------------------|--|-------------|
| Avoid CONCEPTUAL                    | Have CONCEPTUAL as dominant or back up | Temperament |
| 8                                   | 30                                     | NT          |
| 10                                  | 16                                     | Other       |
| P-value=0,032912907                 |  |             |
| Statistics for BEHAVIORAL – NF pair |  |             |
| Avoid BEHAVIORAL                    | Have BEHAVIORAL as dominant or back up | Temperament |

# STRATEGIC E-HR: MATCHING E-BUSINESS VALUE DRIVERS AND HR MANAGEMENT TASKS

**Bjørn-Tore Flåten and Rotem Shneor**  
**University of Agder, Norway**

## ABSTRACT

*The scant e-HR literature has thus far focused on the shift from traditional HR Management to the adoption of e-HR. However, very little attention has been granted into understanding the strategic match between actual HR tasks and e-HR value creation. This paper embeds e-business logic into HR operations management. This is done by conceptualizing a framework for analyzing and evaluating e-HR activities in terms of the fit between e-business value drivers and key HR activities. This effort culminates in suggesting e-HR value creation analysis matrix, based on which five propositions are formulated predicting the relative impact each value driver may have on different HR activities.*

## INTRODUCTION

With more than 1.2 billion Internet users worldwide (Internet World Stats, 2007), and over a 100 Million active domains registered in 2007 (DomainTools, 2007), the Internet is entering people's lives and being incorporated into business' strategies in an unprecedented level. Recognizing the Internet's commercial potential for business, firms have continuously looked into ways of using Internet-based technologies for tailoring more efficient and effective strategies and practices, while attempting to tap into an ever expanding global pool of resources and market opportunities.

Thus far, most of the attention had been focused on changes to commercial conditions, shifts in relationships and roles of sales intermediaries, extending transactional capabilities, and upgrading customer relations and retention. At the same time, very little attention had been given to the use of electronic network-based solutions for human resources management (HRM). The few existing studies either provide initial insights into Internet-based HRM in general (Cairns, 2006; Ensher et al., 2002; Karakanian, 2000; Lengnick-Hall & Moritz, 2003; Panayotopoulou et al., 2007), or focus on specific applications for recruitment (Maurer & Liu, 2007; Singh & Finn, 2003), benefit management (Cambern, 2006), and training (Gascó et al., 2004; Long & Smith, 2004). Still, for the time being, most relevant data on the use of electronic HRM practices are scattered and unscientific (Lengnick-Hall & Moritz, 2003), and a systematic approach to analyze the influence of Internet technology on HRM is in dire need.

The introduction of a new phenomenon titled 'e-HR' has followed the emergence of e-commerce during the 90's, and is usually referring to conducting HRM-related transactions while using the Internet (Lengnick-Hall & Moritz, 2003). Furthermore, Karakanian (2000) views e-HR as the overall HR strategy which shifts from the HR department and is redistributed to other organizational units and trusted business partners, in a way which integrates HR activities with other corporate processes (e.g. finance, supply chain, and customer service).

Our investigation of e-HR contributes to the literature in developing a much needed framework for analyzing how exactly may e-HR affect performance, while conceptually applying e-business value creation frameworks to the main functions and activities of HRM. In this sense, we aspire to uniquely bridge e-business logic with HRM needs. The question of how to attract, motivate and develop workers with critical skills and aptitudes is one of the main concerns of our paper. And specifically we want to address the questions of whether and how can e-based solutions influence firm value creation activities through proper configurations of HRM practices.

In order to pursue these objectives, we first introduce the available literature on e-HR while identifying some gaps and challenges that need to be explored further. In the next section we then present e-business and the logic of value generation that underlies it. In the third section an analytical framework of e-HR adoption and its underlying forces impacting performance is being suggested, resulting in a refined list of three main propositions. And, finally, based on this conceptual development, venues for further research are suggested.

## **HR PRACTICES AND INTERNET TECHNOLOGIES: THE EMERGENCE OF E-HR**

The term 'e-HR' (or online HRM) refers to the use of a wide range of Internet-based applications for conducting HRM-related transactions (Lengnick-Hall & Moritz, 2003). What initially started as a way of making information available for employees and managers through the Internet, has developed into advanced total e-HR solutions, which may include enterprise resource planning (ERP) software, HR service centers, interactive voice response, web applications, voice recognition systems, and manager and employee portals (Lengnick-Hall & Moritz, 2003).

According to main contributions to e-HR literature (Cairns, 2006; Cambern, 2006; Ensher et al., 2002; Karakanian, 2000; Lengnick-Hall & Moritz, 2003), underlying the adoption of e-HR are the following shifts from traditional HR management: first, creating more cost-efficient and time-savvy HR activities. Second, delegating responsibilities to end users for various administrative tasks through employee self-service systems (ESS), such as updating their own profiles, filling evaluation forms, filling employee surveys, tailoring their own benefit schemes (within set borders), process travel expenses refund claims, etc. Third, making more information better available to all authorized parties (e.g. employees, managers, HR service providers, corporate customers, and the public). Fourth, strategically incorporating HR into the firm's operations systems in a way which integrates HR-related activities with other corporate processes (e.g. finance, supply chain, and customer service), and also aligning them with other external partners. Moreover, by doing so, distance between the HR department and its internal customers is reduced. Finally, it is turning the HR function from an administrative division to a strategic partner, moving beyond traditional tasks such as hiring, training, and compensation management into new value generating strategic areas such as knowledge management and the creation of social capital.

When focusing on the HR function within organizations, Lengnick-Hall & Moritz (2003) claim that e-HR has the potential to affect both efficiency and effectiveness. Efficiency emerges in abilities to cut cycle times and costs of processing paperwork, increasing data accuracy, and reducing human resource staff. And effectiveness emerges in the ability of managers and employees to make timely and better educated decisions, through the use of improved HR knowledge management systems and reporting tools, as well as through social capital creation efforts and relationship building.

However, although much praise has been bestowed upon e-HR systems, one should also acknowledge the most frequently mentioned shortcomings associated with the implementation of such systems. One major concern is that of privacy and information security, especially with respect to the sensitive private data (e.g. employee evaluation reports, opinion surveys, and compensation and benefit schemes) being collected and processed as part of HRM activities (Karakanian, 2000; Lengnick-Hall & Moritz, 2003). In addition, health and safety issues such as ergonomic considerations and technology related stressors (e.g. information overload), often associated with more extensive work with computers, should also be monitored and solved by management (Ensher et al., 2002). And other concerns include issues such as potential resistance to the blurring of borders between work-life and home-life, risks of transforming employees into 'information junkies', or refusal of employees to take on the extra-burden of updating HR data and forms on their own (Lengnick-Hall & Moritz, 2003).

Having those concerns in mind, it is increasingly evident that e-HR is being used to different degrees in various organizations. Lengnick-Hall & Moritz (2003) have conceptualized different levels of e-HR adoption by characterizing three forms, namely – information, automation, or transformation. The information form implies that information is published and made more available to employees and managers throughout the organization in a cost-efficient and timely manner, so that costs of printing and distribution of materials, as well as their updating, are significantly reduced through online publication. The automation form introduces two-ways communication solutions, where employees and managers have access to databases and forms, where they can

update information or tailor-make specific reports for decision making. Finally, at the transformation stage, HR functions are liberated from operational focus and are redirected towards a more strategic one, where they become more active in the stewardship of the organization's intellectual capital, developing the organization's social capital, and facilitate the flow of knowledge.

Ensher et al. (2002) identified five main areas in which Internet-technologies influence HR processes: in acquiring HR (recruitment and selection), rewarding HR (performance evaluation, compensation and benefits), developing HR (training and development, career management), protecting HR (health and safety, employee relation, and legal issues), and retaining HR (retention and work-family balance). Moreover, Panayotopoulou et al. (2007) have also suggested that influences are evident in HR planning activities, which may improve thanks to the availability and maintenance of extended and up-to-date employee databases.

Interestingly enough, findings from the Watson Wyatt survey (2002), covering 649 US-based firms of all sizes, challenge the assumption that the faster an organization moves its traditional HR services into an e-HR environment, the more efficient HRM would become and employees would be more satisfied. Their survey shows that better performance is associated with excellent strategic implementation of e-HR, rather than the speed or extent at which it is implemented by the organization.

What excellent strategic implementation of e-HR actually means remains a riddle, and in order to better capture the advantages embedded in e-HR systems' deployment one must understand value creation logic in e-business applications in general. This part of the HR strategic planning has often been neglected in earlier literature, and the following section will serve as the first step towards closing this gap. Following which a model of strategic e-HR implementation, based on various e-value drives may be suggested.

## THE EMERGENCE OF E-BUSINESS MODELS

Returning to basics, 'Internet' simply means a 'network of networks', and is defined as a network of interlinked computers throughout the world operating on a standard protocol which allows data to be transferred between otherwise incompatible machines (Hamill, 1997). Such networks link a wide range of participants (individuals, companies, organizations, governments, education and research institutions, etc.), and supports the transfer of a wide range of data (text, graphics, audio, video, software, etc.).

Weill & Vitale (2001) define e-business as doing business electronically by completing business processes over open networks, while substituting information for physical business process. Therefore, the concept of e-business also involves the supporting functions of commercial transactions, including business intelligence gathering and processing, customer and technical support, connection and relations with suppliers, as well as human resources management and training.

At the micro level, various authors have sought to understand the sources of value creation when employing e-business models at the firm's level of analysis (Amit & Zott, 2001; Barua et al., 2001; Christensen et al., 2002; Doern & Fey, 2006; Shneor, 2004, 2007). However, the most influential framework is Amit & Zott's (2001) value drivers' model, which highlights four interdependent sources of value creation, namely – efficiency, complementarities, lock-in, and novelty. *Efficiency* indicates that value may be created through reduction of information asymmetries between buyers and sellers, greater speed at which information is transferred, reductions of customer search and bargaining costs, availability of wider selection range at lower costs, reduction of various firm operational costs (e.g. distribution, inventory management, marketing, sales, communications, etc.), scale economies, simpler transactions, faster delivery, etc. *Complementarities* indicates that value may be created through the bundling of complimentary products and services (vertically or horizontally), the combination of online and offline assets, the offering of complimentary goods not directly connected to the core transactions, capitalizing on complementarities among activities (e.g. supply chain integration) and technologies, etc. *Lock-in* indicates that value may be created through increasing switching costs for customers and their encouragement to engage in repeated purchases (by means of loyalty programs, virtual communities, familiarity with interface, etc.), positive network externalities with growing customer value the larger the customer base gets, etc. And, finally, *Novelty* indicates that value may be created through innovation in new transaction structures, content, participants, etc. Moreover, Shneor (2004) identified a fifth value driver which may be

located between efficiency and lock-in titled – ‘*Availability*’, indicating that value may be created through greater firm exposure, higher accessibility across boundaries of time and geography, strengthening of brand awareness, expanding market share, etc. And as with previous drivers, this driver is interdependent with the rest.

In the following sections we wish to close the gap between HRM tasks and e-HR value creation by exploring micro-level influences on Internet-enabled HRM, by applying existing e-based frameworks and logics to the HRM context. In this sense, we are trying to analyze value creation through e-HR adoption in a systematic way, which may serve as valuable guideline for excellent strategic e-HR implementation.

## VALUE CREATION IN E-HR

Since implementing e-HR systems can represent a large investment, a persuading case must be made for convincing decision makers that benefits will outweigh the costs (Lengnick-Hall & Moritz, 2003). While it is easy to identify costs associated with e-HR implementation, it remains a great challenge to quantify the intangible benefits to be derived from an e-HR system. Most frequently used indicators include cost reductions, time savings, productivity improvements, return on investment, enhanced employee communications, etc (Lengnick-Hall & Moritz, 2003; Watson Wyatt, 2002).

In a study analyzing e-HR adoption in Greece, Panayotopoulou et al. (2007) defined three categories of benefits of e-HR use, related to strategy, process, and HRM. From a strategic point of view the resulting reduction in operating costs and enhancement of company image emerged as main benefits, while alignment of corporate and personal ranked relatively low. From a process perspective, time management emerged as the greatest benefit both within the category and in general, while minimizing errors and supporting management decision making were recognized as having only a moderate contribution. Finally, from an HRM perspective improved cooperation was identified as a major benefit, employee development as having moderate contribution, and employee satisfaction and qualified employee retention as the least prevalent of results.

Although interesting, such approach treats e-HR as a whole without differentiating between the various impacts on different HR tasks and responsibilities (e.g. recruiting, training, retaining, planning, etc), and still remains locked in a narrow interpretation of value as operational efficiency. Based on this we suggest an alternative more comprehensive approach which examines e-HR value creation in a way which views HR functional responsibilities through an e-prism. For this purpose we suggest a combined matrix analytical framework (see Table 1 below). First, the five value drivers embedded in e-business models, as identified in the literature presented above - efficiencies, complementarities, lock-in, novelty, and availability - are adopted. Second, each of these value drivers is assumed to affect specific HR activities, including the three main HR activities of – recruiting and selection, rewarding and evaluation, and training and development. And the matrix predicts the relative impact each of these value drivers may have on the differing HR activities.

**Table 1: e-HR Value Drivers Analysis Matrix**

|            | <b>Efficiency</b> | <b>Complementarities</b> | <b>Lock-In</b> | <b>Novelty</b> | <b>Availability</b> |
|------------|-------------------|--------------------------|----------------|----------------|---------------------|
| Recruiting | High              | Medium                   | Medium         | Low            | High                |
| Rewarding  | Medium            | Low                      | High           | Medium         | High                |
| Training   | Medium            | High                     | Low            | High           | Medium              |

This combined view of HR activities and e-business value drivers, provides a novel and richer approach easing the understanding of underlying powers that create better HR unit performance when adopting e-HR, and through that contributing to performance of the organization as a whole. Moreover, learning about the relative role of each driver within each HR activity, may serve as valuable guidelines for HR strategic decision making; especially when exploring investment options and mapping needs towards e-HR adoption and extension plans. After all, better planning and strategic deployment of e-HR was found to be the most influential factor predicting successful implementation of e-HR (Watson Wyatt, 2002).

For the time being, the matrix's ability to predict the relative impact each of the value drivers has on the different HR activities is based on a list of propositions, requiring further empirical confirmation. The propositions suggested in detail below, are formulated based on logical development and initial insights collected from the limited available literature on e-HR. This serves as an important first step in a currently ongoing study, through which the authors aspire to both further fine tune these assumptions, and empirically validate them.

## **Recruiting and Selection**

Recruitment is often regarded as the HR process which has been most influenced by the Internet (Ensher et al., 2002). Various market reports and surveys support this claim, and with indications such as 88% of global 500 companies using Internet-based recruiting already in 2001 (CMA Report quoted in: Ensher et al., 2002), and 98% of surveyed UK-based HR professionals doing the same by 2003 (Reed report quoted in: Wigham, 2004), one can conclude that the Internet has indeed revolutionized the recruitment function.

In interviews with HR professionals, Ensher et al. (2002) found three consistent themes concerning the use of Internet in recruiting: first, more companies are using the Internet for posting jobs and receiving resumes, either through the firms' own websites or through postings on Internet-based recruiters' websites. Second, the use of the new technology reduces cost and turnaround time needed for filling positions, also referred to as just-in-time recruitment (Singh & Finn, 2003). And, third, the quality of applicants has not suffered, and instead firms are better able to tap into global talent without being limited to local pools of candidates. Furthermore, when the actual selection process is concerned, these authors found that Internet technologies have profound impact on the capabilities to scan and filter candidates as well. Today, firms can use automatic scanning systems that go through bulks of CVs searching for certain keywords, and short-listing a selected few for further processing. Moreover, new online testing and assessment tools can replace physical solutions that where much more costly and time-consuming, and often required travelling from various locations. And finally, initial interviews may also be conducted online either in a written form, or in a face-to-face Internet-based telephone or video interview.

According to Singh & Finn (2003) this helps to transform the HR function from an owner of recruitment data to a critical knowledge sharing centre, now focused on internal customer service for various intra-organizational stakeholders. This further implies that hierarchies may be flattened and the line managers can contact candidates directly based on their access to recruitment databases, cutting bureaucratic processes, while collaborating with HR officials to avoid legal and other blunders. Moreover, recruitment staff can better coordinate with organizational units across different time and geography zones, through virtual teamwork arrangements, conferencing and social networks.

With all its promises, one must also recognize potential limitations associated with online recruitment. One concern is for discrimination of ethnic minorities who despite the fact that Internet is technically open to all users, still may not have the required access to computers or have the skills to use online recruiting (Hogler et al., 1998; Singh & Finn, 2003). Another concern are cases where HR managers experience an overload of qualified applications, and as a result having trouble keeping up with the speed of recruiting through Internet. Moreover, some concerns have been raised that Internet recruitment may be more suitable for certain jobs and not for others (Singh & Finn, 2003), for example Ensher et al. (2002) found that Internet is not an effective recruiting tool for senior executive positions. And finally, some recognize the challenge in developing effective e-recruiting websites, where recruiters should avoid job opportunity rejections by job-seekers simply because of poorly designed websites or the need to use online application systems, which are too complicated (Maurer & Liu, 2007).

Overall, employing e-HR solutions for recruitment and selection activities helps firms reduce both the costs and time similar processes require through offline platforms to a significant extent. Online job postings are immediately available for candidates to track down at all time, and such exposure is not limited to expensive one time printed media publications. Moreover, availability of information about new job openings, requirements and application procedures, reaches a larger crowd than traditional recruitment intermediaries would like and, therefore, generates more applications for each job opening posted. All of which meaning that

time period from advertisement to application is significantly cut. Selection is also processed faster thanks to smart search agents that scan digital profiles and CVs for keywords, and help filter the larger amount of applications received. Again, further cutting the time required to scan candidates as well. Overall, processes that previously took a few months can now potentially be concluded within days. Therefore, we propose that *efficiency* and *availability* drivers will have a large impact on performance of recruiting and selection activities.

Moreover, the ability to use both online and offline advertising outlets for new job openings, as well as receiving application material through different communications tools, again may help tap into larger pools of potential candidates, and enhance the firm's credibility. Short expensive print ads could serve as invitation for starting online application procedures, through which richer information can be provided to candidates. Once candidate databases exist, the firm can also initiate contact with candidates concerning new openings, as well as invite them to periodically update profiles for future reference. Still, while these benefits are obvious, they may serve as more support drivers rather than being the main performance enhancement tools. Therefore, we propose that *complementarities* and *lock-in* drivers will have a moderate impact on performance of recruiting and selection activities.

Finally, using Internet platforms may help promote job openings on diverse new electronic outlets, using new players such as online recruiters, and through the application of new database management technologies for screening CVs and application materials, collecting and processing candidate information. These effects of novelty will also play a supportive role, rather than revolutionize the process as a whole. Therefore, we propose that after refining *efficiency* and *availability* gains, as well as the other sporting effects, *novelty* in it-self will play a weaker role in recruitment and selection activities.

In summary, we propose that:

***P1:*** *Better performance with respect to recruiting and selection activities is attributed to:*

*(a) A large extent to efficiency and availability effects; (b) a moderate extent to complementarities and lock-in effects; and (c) a small extent to novelty effects.*

## **Rewarding and Evaluation**

According to Cambern (2006) online benefits management systems run from websites where employees access policy information and are able to process forms in integrated HR information system portals, which automatically connect and update billing, payroll, and benefits programs in a timely and cost efficient manner. This is done in a way which is both personalized and tailored to individual employee needs, and at the same time allows for systematical gathering and analysis of information that helps tailor more options and improved offerings, which in turn results in more satisfied and loyal employees. Employees value the ability to access benefits information at any time from different locations, receive personalized information while confidentiality is maintained, and being allowed to take an active role in tailoring their own plans, and not simply accepting whatever is given to them. In addition, beyond a greater ability to retain more satisfied employees, the employers themselves enjoy more up-to-date information about their employees, while reducing costly errors in sensitive data reporting, and facilitating consistent communications across the different locations in which the firm operates.

Ensher et al. (2002) claim that benefit administration has been radically changed with the Internet, in the sense that it became more of a self service operation via the company's Intranet. HR still sets the boundaries and provides explanations about available options, but it is the employees themselves that are going online to complete their profile details and select their preferred options. In this context, their survey also showed a certain preference for performance and skill-development based incentives, which automatically translates into enhanced training and learning needs that the HR department has to answer for. However, this may be biased by culture and institutions typical of the US business environment, which are mostly associated with more calculative HRM practices (As suggested in: Gooderham et al., 2006). Moreover, it appears that the Internet has aided employees in becoming better informed about compensation and benefits options, as well as industry bench marks and statistics that allow them to compare their own position versus other similar employees elsewhere, and as a result, come with specific demands to their managers and HR officials. On the other hand,

although not mentioned in this study, if employees are better informed thanks to the Internet, so is the firm's management, probably also doing a better job at avoiding excessive overpays, thanks the same information available online.

Employees' benefits and rewards are closely related to performance evaluations. Here, Internet technologies have contributed to cost efficient distribution of performance evaluation materials; however, it has contributed less to the actual analysis of the obtained data (Ensher et al., 2002). This is somewhat of a surprising finding, as in principal advanced capabilities of database analysis, manipulation and reporting exist, and the lag seems to remain on the user side rather than the technological one.

Overall, employing e-HR solutions for rewarding and evaluation have enhanced employee awareness, involvement, and responsibilities concerning their own benefit plans configurations, as well as monitoring and sense making from their performance evaluations. Having policy information, company and industry benchmark details, and decision making support tools available online at all times and from different locations for their own evaluation and benefit plan tailoring, all of which empower employees in making better informed decisions, while involving a greater circle of stakeholders (e.g. family). Therefore, we propose that the *lock-in* driver, putting premium on employee own involvement, and the *availability* driver, stressing easy access to information, will have a large impact on performance of rewarding and evaluation activities.

Furthermore, the ability to compare firm offerings to industry benchmarks helps in avoiding excessive payments to employees, as well as strategic positioning above or below industry standards. Also the ability to evaluate employees' needs and analyze their preferences can help firms seek best offers from external suppliers of the various benefit plan components (e.g. insurance firms, health services, leisure services, etc). All of which stressing the openness to new components in benefit offerings and their potential suppliers, as well as the efficiency at which they may be provided and strategically decided upon by the firms. Therefore, suggesting that *efficiency* and *novelty* may both provide a supporting effect on performance levels of rewarding and evaluation activities.

Finally, once a benefit plan had been selected and tailored to individual needs, the whole system's automatic and timely synchronization across various HR and organizational functions, both further supports operational efficiency and adds a complementarities effect across these functions. Hence, we propose that after refining *lock-in* gains, as well as the other supporting effects, *complementarities* in it-self will play a weaker role in rewarding and evaluation activities.

In summary, we propose that:

***P2:*** *Better performance with respect to rewarding and evaluation activities is attributed to:*

*(a) A large extent to lock-in and availability effects; (b) a moderate extent to novelty and efficiency effects; and (c) a small extent to complementarities effects.*

## **Training and HR Development**

The Internet enables the delivery of computer-based training across time and distance, in a manner that allows firms to diversify the learning portfolio, accelerate the pace of learning, and create new opportunities for employees learning (Long & Smith, 2004). Web-based distance learning is one main form of online training which is fairly easy to develop and adapt to changing organizational needs. However, in order for it to be effective, its design must be tailored to answer the organization's strategic needs by being tied to specific business objectives, as well as to strike a balance between collaborative learning and independent learner control (Long & Smith, 2004).

Adopting online training tools leads to cost reductions in a number of expenditure categories, including: direct and indirect costs associated with traveling and being away from work, costs of producing training materials, as well as costs of updating training materials (Ensher et al., 2002). In addition, other cost reductions may also be envisaged, including: costs of training facility rentals, costs associated with course feedbacks' collection and analysis, and costs of evaluating participant's learning.

Keeping all these potential advantages in mind, some concerns about online training exist as well. First, surveys show that online training is characterized by relatively low retention and completion rates, either due to missing social interaction surrounding the learning experience, or because of distractions at home or in a work environment (Ensher et al., 2002). However, some studies, such as Schmeeckle's (2003) analysis of online versus classroom based training showed that online training is as effective an instructional method as classroom training, and more efficient than classroom training. Still, more evidence supporting these findings are necessary, especially when applied to more liberal and business-oriented organizations. For the time being, Long & Smith (2004), suggest that a solution may be found in creating more collaborative learning opportunities, either electronically or in physical classroom sessions which take place parallel or complementary to online sessions.

Finally, some insights into success factors behind the adoption of e-learning solutions in international business organizations are provided in Gascó et al.'s (2004) study on the influence of information technology on training policy in Telefonica, the Spanish telecommunications giant. These factors include flexibility in time management for training, active participation by trainers, establishing control mechanisms to ensure that training occurs, the creation of quality content, the promotion of interactive elements among users (trainers, students, and with each other), the use of standardised and developed technologies, and a gradual implementation process.

Overall, employing e-HR solutions for training and employee development provides innovative ways for setting educational standards across the organization, delivering training sessions across locations and time zones, adapting content to functional, professional and local needs, as well as monitoring individual employee performance and training results in real-time. Moreover, for certain trainings learning interactions in complementary offline and online group study sessions are necessary. And e-learning systems also allow the provision of new and complementary set of study materials using text, graphics, voice, and video tools; which again may be technically adapted to various target audiences. Moreover, the electronic embedding of training solutions in an overall HR system, serves as a complementary tool for employee career development in the sense that employees can monitor their training requirements for moving up the positions' or salary ladder, and take up the necessary training online. Therefore, we propose that *novelty* and *complementarities* effects will have a large impact on performance of training and HR development in an e-HR adopting organization.

Efficiencies may also be gained through cost reductions in traveling across locations, time saved, and benefits paid to employees going on distant location training sessions. However, these cost reductions are to a certain extent offset by needs to hold some training sessions in seminar classes or on-site in certain locations, or increased costs associated with adjusting content (to different languages, different target groups, etc), as well as in needs for costly in-house development of highly specialized trainings that would have otherwise be provided by external suppliers. Still, the flexibility inherent in remote access to online training tools at the time and place of convenience for each employee provides a great benefit valued by employees. Again, this appreciation is also limited, as employees find it hard to detach from work obligations in their normal working site, and as they sense losing an opportunity to acquire certain tacit knowledge, normally developed through human interaction and learning experiences. Therefore, we propose that both *efficiency* and *availability* have positive but only supportive moderate influences on performance related to training activities.

Finally, on the one hand Internet-based training has exhibited low retention and completion rates, and on the other hand has extended the flexibility of completing obligatory training, answered employees needs to further develop their education and skills, while also sometimes allowed them to compare test results with general firm statistics, as part of their career development ambitions and plans; and, off course, doing all of this at the time and speed of their choice. Therefore, we propose that *lock-in* effects will have minor impact on performance of training and development activities.

In summary, we propose that:

***P3: Better performance with respect to training and development activities is attributed to:***

*(a) A large extent to complementarities and novelty effects; (b) a moderate extent to efficiency and availability effects; and (c) a small extent to lock-in effects.*

## CHALLENGES AHEAD

In the previous section a list of propositions concerning the impacts different e-business value drivers might have on e-HR functional performance have been outlined. However, the challenge here remains in actually capturing what we seek to analyze. Hence, for measurement purposes, a list of unique statements representing e-HR manifestations for each of these value drivers is presented in the appendix. Each of these statements can be evaluated perceptually by practitioners, indicating to what extent has the suggested impacts actually occurred in their organization since implementing e-HR. Although the current paper does not attempt to empirically verify these statements as such, it suggests them as possible instruments for capturing these impacts in the authors' ongoing study.

## CONCLUSION

While e-HR is being implemented to vast extents in various organizations around the world, it has still been little explored, providing very few predictions about its influence on organizations, and what actually constitutes its successful deployment within them. In the current paper, existing vague recommendations suggesting excellent strategic e-HR implementation as a key source for its success were refined into a clear set of propositions. The challenge of identifying powers underlying e-HR implementation and influence on the organization has been undertaken; and for this purpose, we have created a unique matrix which evaluates the relative contribution of value drivers associated with e-business modeling logics, and HR functional activities.

In this sense, our main contribution is in enhancing the understanding of e-HR's impact on the HR unit activities and organizational performance, by being the first to suggest a conceptual bridge between HR concerns and e-business logics. However, at this early stage, while our matrix presents an interesting theoretical conceptualization, it still requires empirical validation. Therefore, the current paper is the first in a series of studies undertaken by the authors, which both conceptually develop a strategic e-HR value drivers' analysis framework, and empirically test it in different industries and national settings.

Naturally, such pioneering work paves the way for numerous future research venues. First, scholars are invited to challenge the propositions presented above and contribute to their validation or disproof through empirical analysis. In addition, one may challenge the use of the five value drivers adopted from the e-business literature and replace them with other elements that may underlie value generation and enhancement through e-HR system deployment. Moreover, one may also envisage a study into how e-HR may inhibit value generation and enhancement, as suggested in some of the reverse effects described in earlier sections. And finally, cross-industry and cross-national studies comparing e-HR adoption levels and implementation patterns are in dire need and may prove extremely valuable.

In conclusion, as HR professionals take on the challenge of integrating information technology, network communications, and the human touch, while implementing e-HR systems throughout organizations; the next challenge is in better understanding how to do it right, and how to capture as much value as possible from proper implementation of these tools. The current paper serves as an initial step in this direction.

## APPENDIX

### Value Drivers' Manifestations in e-HR Practices

| HR Function | Value Drivers | HR Dept. Performance                                     |
|-------------|---------------|--|
| Recruitment | Efficiencies  | Decreasing costs of applicant search related advertising |
|             |               | Decreasing costs of intermediary recruitment services    |
|             |               | Decreasing time from application to posting              |

|                  |                   |   |
|------------------|-------------------|---|
|                  |                   | Increasing ability to tap into higher quality candidates  |
|                  |                   | Faster delivery of job application documents  |
|                  |                   | Faster absorption of new employees once chosen  |
|                  | Lock-In           | Proactive invitation of candidates in database to apply for relevant positions  |
|                  |                   | Proactive encouragement of candidates to update their details on their online candidate profiles periodically   |
|                  | Novelty           | New ways for screening CVs and application documents  |
|                  |                   | New outlets for publicizing vacancies (professional social networks, industry databases, online magazines, online recruiters, etc)                                |
|                  |                   | New ways of facilitating new employee absorption  |
|                  | Complementarities | Usage of a combination of online and offline selection procedures (e.g. online CV screening + offline interview)  |
|                  |                   | Usage of applicants' database for recruiting for other positions  |
|                  |                   | Improves absorption process of new employees, logistics, welfare, and IT are notified in advance.   |
|                  | Availability      | Access to a larger pool of candidates   |
|                  |                   | Access to different sources of candidates (countries, organizations, social networks, etc.)   |
| <b>Rewarding</b> | Efficiencies      | Decreasing costs of printing and copying of evaluation materials  |
|                  |                   | Faster distribution and collection of performance evaluation materials to and from managers   |
|                  |                   | Decreasing number of errors in filling evaluation documents   |
|                  |                   | Higher response rate for performance evaluation tasks   |
|                  |                   | Decreasing time necessary for fixing employee benefit plans and their approval by superiors   |
|                  |                   | Timely update of personal updates influencing employee income (marital status, number of dependents, etc.)  |
|                  | Lock-In           | Provide employees with private online reports about own performance, development and standing versus others   |
|                  |                   | Better ability to personalize and tailor benefit plans to individual preferences within set boundaries  |
|                  |                   | Updating employee compensation schemes and benefit plans based on industry standards  |
|                  | Novelty           | Using new ways for distributing evaluation materials  |
|                  |                   | Using new ways for analyzing performance evaluation data  |
|                  |                   | Using new ways to configure employee benefit plans components   |
|                  | Complementarities | Performance evaluation can be conducted based on a combination of online and offline tasks and meetings   |
|                  |                   | Evaluation integrated into overall HR components (benefits and awards update, eligibility to apply to higher positions, etc.)                                     |
|                  |                   | Based on online benefit plan employee self configurations and form processing, related functions are updated automatically (e.g. billing, payments, welfare, etc) |
|                  | Availability      | Greater access to evaluation materials across time and geographical locations   |
|                  |                   | Greater access to information on benefits plans and their boundaries across time and geographical locations   |

|                                 |                   |   |
|---------------------------------|-------------------|---|
|                                 |                   | Increased transparency about benefits plan options and comparison with industry trends  |
| <b>Training/<br/>Developing</b> | Efficiencies      | Decreasing costs of employee travel associated with trainings   |
|                                 |                   | Decreasing costs of renting training facilities   |
|                                 |                   | Decreasing costs of printing, updating and distributing training materials by making them available online                    |
|                                 |                   | Increasing the number of employees being trained in each coordinated session  |
|                                 |                   | Increasing the number of employees being trained in general   |
|                                 | Lock-In           | Increasing ability to personalize timing of training to individual employee schedules   |
|                                 |                   | Increasing ability to personalize paste of training to individual employee preferences  |
|                                 |                   | Increasing ability to personalize content of training to individual employee needs  |
|                                 |                   | Increasing ability to involve training participants in timely feedback concerning training quality, content, and contribution |
|                                 | Novelty           | Using more new ways of conducting training sessions   |
|                                 |                   | Using more new ways of tailoring training sessions to individual employee's needs, schedules, and preferences                 |
|                                 |                   | Using new ways for measuring and evaluating training outcomes   |
|                                 | Complementarities | Training can be conducted based on a combination of online and offline sessions and tasks                                     |
|                                 |                   | Training integrated into overall HR components (benefits and awards update, eligibility to apply to higher positions, etc.)   |
|                                 | Availability      | Increasing ability to conduct training seminars for employees across distant locations  |
|                                 |                   | Increasing flexibility in timing of training across locations and individual preferences and schedules                        |

# **CORPORATE CLIMATE STRATEGY: PROPOSAL FOR A FORMULATION AND ASSESSMENT MODEL BASED ON INTERNATIONAL BENCHMARKS**

**Paulo Gustavo Fuchs  
BNDES -Brazilian Development Bank**

**T. Diana L. van Aduard de Macedo Soares  
Pontifical Catholic University of Rio de Janeiro, Brazil**

## **ABSTRACT**

*A social and economic environment with restrictions on carbon emissions is a reality that has come to stay. In this context, it has become evident that firms should reduce Green House Gas – GHG emissions, not only due to environmental issues or restrictive regulation, but also to gain sustainable competitive advantage. The objective of this article is to propose the outline of a model, based on international benchmarks, for the formulation and assessment of adequate business climate strategies. The development of this model is part of a wider research that seeks to contribute to the strategic management of firms concerned with the growing impact of climate changes. Its importance lies in the urgent need to manage the strategic implications of these changes with a view to assuring firms' competitiveness while attending to all stakeholders.*

## **INTRODUCTION**

The current production paradigm, based mainly on the consumption of fossil fuels, causes significant increases in anthropic emissions of greenhouse gases – GHG - whose high atmospheric concentrations are upsetting the global climate equilibrium.

The concentration of CO<sub>2</sub> in the atmosphere, which remained stable for thousands of years, increased substantially as of the 19th century. There is strong scientific evidence suggesting that the increase in CO<sub>2</sub> in the atmosphere is not due to natural factors, but is caused by human activities. According to various scientific studies, the concentration of CO<sub>2</sub> in the atmosphere will double by the year 2065 in relation to pre-industrial levels. Humanity's impact on the environment, known as the ecological footprint, quantified by multiplying the world's population by the per capita consumption of natural resources, has left a deep mark on the planet.

Climate change is having a drastic effect on business's competitive environment. According to Hoffman (2006), as in all situations of change, there are winners and losers. Three key factors are influencing and accelerating the transformation of the macro-environment: a) regulations that restrict GHG emissions; b) the increase in energy prices; c) the financial community's interest in the matter.

In this context, the pressure on companies to act in harmony with the environment is increasing significantly day-by-day. This pressure is being exercised by various actors such as consumers, suppliers, communities, non-governmental organizations - NGOs, governments and company employees. The great novelty is the appearance of a new group of stakeholders, notably banks and insurance companies. This movement is symptomatic for when "...the financial services industry - which focuses like a laser on return on

investments - starts worrying about the environment, you know something big is happening” (ESTY, WINSTON, 2006, pp.9).

The aim of this article is to propose the outline of a model, based on international benchmarks, for the formulation and assessment of adequate business climate strategies. The development of this model is part of a wider research that seeks to contribute to the strategic management of firms concerned with the growing impact of climate changes. Its importance lies in the urgent need to manage the strategic implications of these changes with a view to assuring firms’ competitiveness while attending to all stakeholders.

## THEORETICAL REFERENCES

### Review of the Literature

Given the recent nature of the theme, the literature on the subject is scarce. This fact, while evidencing the need for a wide-ranging bibliographical review, also presents an opportunity for developing new investigations. Our literature review sought to identify the authors of the most recent studies of climate strategies in environments with carbon restrictions, as well as the methods proposed to address the problems involved. The following authors were found to be particularly relevant: Hoffman (2000, 2006), Esty and Winston (2006), Kolk and Pinkse (2004) and Lash and Wellington (2007).

### Main Definitions

The central concepts of the research at issue in this article are strategy, environmental strategy and climate strategy. Below, we present the definitions adopted for each of these concepts.

For the **concept of strategy** we used Macedo-Soares’ (2000, p. 460) definition inspired in Grant (1998):

“Strategy is a unifying proposition that gives coherence and direction to the actions and decisions of an organization, especially for leveraging and allocating the necessary resources for improving or sustaining its performance, in keeping with its vision and considering the internal and external environmental conditions”.

For the **concept of environmental strategy** we drew on Hoffman’s (2000) definition for this type of strategy as a conduct that is able to make the protection of the environment compatible with the financial and economic growth of the organization, respecting the interests of all the stakeholders involved.

The **concept of climate strategy** is quite recent and has emerged in the context of the growing concern with climate change. Here too, we adopted the definition proposed by Hoffman (2006, p. 3), according to whom climate strategy is defined as “...the set of goals and implementation plans within a corporation that are intended to reduce GHG emissions, produce significant GHG-reduction co-benefits, or that otherwise respond to climate-related changes in markets, public policy, or the physical world.”

### Theoretical References

As mentioned above, few studies have been made of business climate strategy. For this reason it was necessary to undertake a wide-ranging exploratory review of the relevant literature in order to construct the proposed Climate Strategy Model – CSM. The research analyzed pertinent concepts and indicators developed by Hoffman (2000, 2006), Esty and Winston (2006), Kolk and Pinkse (2004) and Lash and Wellington (2007). Some authors, such as Hoffman (2000, 2006) and Esty and Winston (2006), used the same indicators. Kolk and Pinkse (2004) performed their studies with the indicators used in the first survey carried out by the Carbon Disclosure Project – CDP. Lash and Wellington (2007) focused more on the threats and opportunities presented by climate change and their effects on firms’ revenues and costs.

Also several indicators were identified as relevant for our study in the five editions of the field research performed by the Carbon Disclosure Project – CDP, and by the Investor Responsibility Research Center – IRRRC, commissioned by CERES.

Note that CERES ([www.ceres.org](http://www.ceres.org)) is an institution that congregates investors, environmental groups and political organizations interested in issues pertaining to business sustainability and climate change. It also leads the Investor Network on Climate Risk – INCR, a group composed of 50 institutional investors from the USA and Europe who manage assets worth around US\$ 3 trillion.

The Carbon Disclosure Project – CDP ([www.cdproject.net](http://www.cdproject.net)), based in London, is a global initiative involving more than 220 institutional investors with US\$32 trillion under management. Its main objective is to keep these investors informed about how the opportunities and risks associated with climate changes are being dealt with by firms all over the world. It is currently in its fifth edition and has collected information from more than 2100 companies.

## **RESEARCH METHODS**

### **Literature Review Method**

In order to review the literature pertinent to the theme, the research consulted master dissertations and doctoral theses from leading academic institutions, as well as articles published in well-ranked scientific journals and available at specialized international websites (see References).

The research sought to identify the authors of the most recent studies of climate strategies in environments with carbon restrictions and methods proposed to address the problems involved.

### **Method Used to Develop the Proposed Model**

Based on the studies of the authors identified in the literature review as significant for developing the model proposed in this article, we selected and analyzed the concepts and indicators most often used.

In accordance with Lazarsfeld and Boudon's (1973) methodology, five variables were selected encompassing the main aspects of climate strategy. These five variables were sub-divided into dimensions with their respective constructs and indicators. One should remember that a construct is a concept that, associated with an indicator, helps to measure a concept or variable that cannot be measured directly.

Thus, drawing heavily on the three stages described in Hoffman's model (climate strategy, internal focus and external focus) and their corresponding sub-divisions (emissions profile, risks and opportunities, actions, objectives and targets, financial mechanisms, organizational involvement, political strategy and external relations), we started outlining the model at issue, which is explained in detail in the next section.

## **THE CSM MODEL**

Figure 1 is a schematic representation of the Climate Strategy Model – CSM - proposed as a tool for both the development and assessment of business climate strategies, using international benchmarks as a reference. The sun shape was chosen due to its positive “environmental” image, with the model's five variables converging towards the center, as if they were rays of light. This convergence symbolizes the conjugation and fit of strategic efforts designed to achieve a common objective, just as the sun's rays converge towards the center from which energy emanates.

**Figure 1: Climate Strategy Model – CSM**

## Variables, Constructs and Indicators

As shown in Figure 1, the variables that compose the CSM are: impact of the firm on the environment; impact of climate change on the firm; involvement in the firm; motivation of the firm; external relations of the firm.

Table 1 presents these variables and their respective operational definitions. Note that according to Kerlinger (1980, p. 46), an operational definition is “like an instruction manual for the researcher”

**Table 1: Variables and their operational definitions**

| VARIABLE                                     | OPERATIONAL DEFINITION   |
|--|--|
| <b>IMPACT OF THE FIRM ON THE ENVIRONMENT</b> | Degree of impact of the organization on the environment caused by GHG emissions produced by its own operations or those of components of its value chain and other associated emissions.   |
| <b>IMPACT OF CLIMATE CHANGES ON THE FIRM</b> | Degree of impact on the organization of the opportunities and threats represented by climate change, driving the firm to develop and implement a climate strategy.   |
| <b>INVOLVEMENT OF THE FIRM</b>               | Degree of effective involvement of the firm in actions that mitigate and eliminate emissions produced by its own operations and those related to its value chain.  |
| <b>MOTIVATION IN THE FIRM</b>                | Degree of motivation in the firm resulting both from the proactive side of the mobilization of employees and publication of their actions and the relative strength of the obstacles that stand in the way of the implementation of a climate strategy.  |
| <b>EXTERNAL RELATIONS OF THE FIRM</b>        | Degree of influence of the firm and its ability to communicate with the public, governments and private business associations, in order to disclose its actions aimed at reducing emissions, as well as influence the formulation of carbon restricting legislation and regulations. Ability to obtain the support of other entities and the third sector. |

Below we describe CSM’s components: variables, dimensions, constructs, indicators, their values and respective authors’ references. A summary of this is presented in the form of a table.

### Variable 1 – impact of the firm on the environment

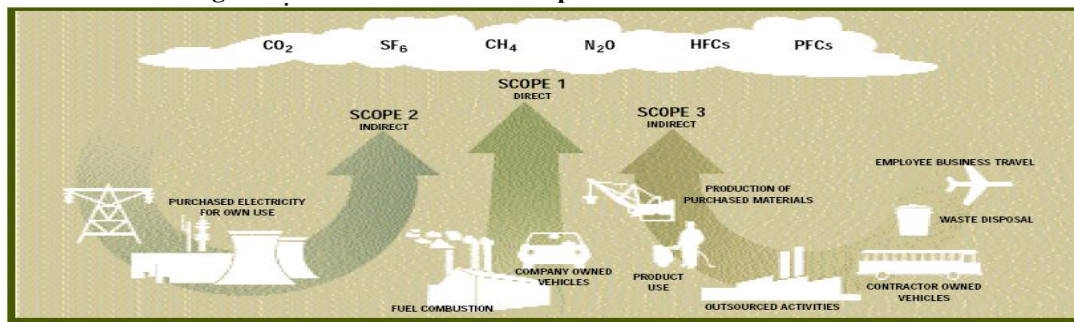

According to Lash and Wellington (2007), by quantifying its emissions, a firm is recognizing the importance of climate change as a source of risks and opportunities and is prepared to manage the reduction of

its emissions. These authors emphasize the importance to measure both the firm's direct and indirect emissions, as well as to determine and periodically adjust the reference level of the emissions that will be monitored over time.

The CSM adopts the emissions classification methodology developed by the GHG Protocol Corporate Standard ([www.ghgprotocol.org](http://www.ghgprotocol.org)) created by the World Resources Institute – WRI together with the World Business Council for Sustainable Development – WBCSD. The GHG Protocol classifies emissions according to the locations of their occurrences in the following way:

- a) **scope 1** – direct GHG emissions, understood as those that emanate from sources owned or controlled by the firm. For example: emissions resulting from combustion in boilers, furnaces, vehicles;
- b) **scope 2** – indirect emissions arising from the generation of electricity purchased by the firm from third parties. They occur in the plant where the electricity is generated;
- c) **scope 3** – other indirect emissions whose measurement is optional. These are emissions that result from the firm's activities, but effectively emanate from sources that are not owned by the firm. For example: emissions that arise from the extraction and production of raw materials and components, transportation of fuels or business trips. Figure 2 presents the 3 scopes of a firm's emissions, in accordance with the GHG Protocol.

**Figure 2: Overall view of the scopes of a firm's GHG emissions**

Source: <http://www.ghgprotocol.org>, GHG Protocol Standards, February 10, 2008

Firms use both absolute and relative yardsticks to measure their GHG emissions. The absolute yardsticks are used to assess the firm's total exposure to carbon restrictions; while relative forms of measurement are used to compare the level of emissions in different divisions of a firm or between firms (HOFFMAN, 2006).

After surveying its level of emissions, a firm can identify and prioritize the existing immediate and low-cost opportunities to reduce them, as well as plan actions aimed at improving the firm's energy efficiency along its value chain. Based on the main indicators obtained from the literature investigated, we developed Variable 1 – Impact of the Firm on the Environment, which was subdivided into direct and indirect dimensions. Its constructs refer to direct and indirect emissions. (see Table 2 for details on Variable1).

## Variable 2 – Impact of Climate Change on the Firms

Climate change's ability to drive the adoption of climate strategies by firms varies according to the industry in which they operate. Climate change poses threats and generates opportunities for organizations (HOFFMAN, 2006).

In the model proposed, the factors that drive the firm to establish a climate strategy were called drivers. According to Hoffman (2006) and Esty and Winston (2006), a firm's degree of exposure to carbon restrictions is not limited to its emissions. It should also take into account the potential impacts on its line of products and services, together with the increasing environmental pressure exercised by a wide variety of stakeholders and which modify the firm's competitiveness.

Amongst the main items to be assessed, the following should be highlighted: the profile of the firm's emissions relative to its competitors, its industry's position in relation to other industries, the present and future regulatory environment, and cost trends and changes in consumers' preferences. Thus the identification of the

risks and opportunities for firms imposed by climate change should take into account present and future conditions of both the firm's emissions profile and the impact of carbon restrictions on its economic and social context.

**Table 2: Variable 1 – Impact of the Firm on the Environment**

| Dimension      | Construct       | Indicator   | Value  | Author/Reference   |
|----------------|-----------------|---|--------|--|
| <b>Direc</b>   | <b>Direct</b>   | Inventory of direct emissions (scope 1)   | Yes/No | Hoffman (2000;2006); Esty and Winston (2006); Lash and Wellington (2007); Kolk and Pinkse (2004); CDP and CERE |
| <b>Indirec</b> | <b>Indirect</b> | Inventory of emissions generated by third parties in the production of electricity purchased by this firm (scope 2) | Yes/No | Hoffman (2000;2006); Esty and Winston (2006); Lash and Wellington (2007); Kolk and Pinkse (2004); CDP and CERE |
|                |                 | Inventory of emissions generated by third parties in the production of inputs and materials (scope 3)               | Yes/No | Hoffman (2000;2006); Esty and Winston (2006); Lash and Wellington (2007); Kolk and Pinkse (2004); CDP and CERE |
|                |                 | Inventory of emissions resulting from the use of the products of this firm by third parties (scope 3)               | Yes/No | Hoffman (2000;2006); Esty and Winston (2006); Lash and Wellington (2007); Kolk and Pinkse (2004); CDP and CERE |
|                |                 | Inventory of emissions resulting from business trips (scope 3)  | Yes/No | Hoffman (2000;2006); Esty and Winston (2006); Lash and Wellington (2007); Kolk and Pinkse (2004); CDP and CERE |
|                |                 | Inventory of emissions generated by third parties in activities outsourced by this firm (scope 3)                   | Yes/No | Hoffman (2000;2006); Esty and Winston (2006); Lash and Wellington (2007); Kolk and Pinkse (2004); CDP and CERE |
|                |                 | Inventory of emissions resulting from the discarding of the products of this firm (scope 3)                         | Yes/No | Hoffman (2000;2006); Esty and Winston (2006); Lash and Wellington (2007); Kolk and Pinkse (2004); CDP and CERE |

From the study undertaken by Hoffman and Pew Center, it is evident that the three main drivers of a climate strategy are cost reduction and social responsibility, as well as reputation. Indeed, a positive reputation increases a firm's power to influence emissions restricting legislation and regulation. In most cases, risk management is also a strong reason for managing the vulnerabilities of the firm generated by climate change. By adopting a risk management approach and gaining experience in this matter, firms begin to focus their strategies on exploiting the opportunities that arise from climate change to create competitive advantages. In an environment that is suffering the impact of climate change, a

“... company's ability to find opportunities in a carbon-constrained world will depend on its skill at hedging against physical climate risk, mitigating regulatory costs, avoiding expensive litigation and other threats to corporate reputation, managing climate risk in the supply chain, investing capital in low-carbon assets, and innovating around new technology and product opportunities” (LASH, WELLINGTON, p.100).

The climate risks imposed on firms can also be assessed through an analysis of their profit structure. To this end, firms calculate the carbon intensity of their profits, that is, the portion of profits derived from products with high GHG emissions. Other potentially affected areas are the cost of raw materials, capital expenditures on the acquisition of new less-polluting installations and, in the case of plants located in areas subject to climate extremes, a substantial increase in insurance costs (LASH, WELLINGTON, 2007).

On the other hand, there are also opportunities created in a carbon constrained environment, especially, a demand for low-emission products and services, carbon credits, resources from investment funds for firms and projects that aim to reduce GHG, acquisition of low-emission assets, besides intangible benefits such as an improvement in the organization's image and reputation. Consequently, a firm's climate risk profile affects its cost of capital and market value (LASH, WELLINGTON, 2007).

In the CSM the dimension of Variable 2 – Impact of Climate Changes on the Firm - refers to driving factors that are sub-divided into the following constructs: new markets, competitiveness, intangible factors, financial factors and exposure to risks (see Table 3 for details on Variable 2).

**Table 3: Variable 2 – Impact of Climate Change on the Firm**

| Dimensions | Constructs         | Indicators   | Value                           | Ref **           |
|------------|--------------------|--|---------------------------------|------------------|
| Drivers    | New markets        | Demand for products with low GHG emissions                 | Degree of importance Likert 1-5 | A, B,C,E,F       |
|            |                    | Demand for services with low GHG emissions                 | Degree of importance Likert 1-5 | A, B,C,E,F       |
|            |                    | Leap in the technological standard of the industry         | Degree of importance Likert 1-5 | A, B,D,E         |
|            | Competitiveness    | Increase in the operational efficiency of the firm         | Degree of importance Likert 1-5 | A, B             |
|            |                    | Increase in competitiveness in relation to the competition | Degree of importance Likert 1-5 | A, BC,D,E,F      |
|            |                    | Cost reduction   | Degree of importance Likert 1-5 | A, B, C,D,E      |
|            | Intangible Factors | Positive reputation of the firm and its brand              | Degree of importance Likert 1-5 | A, B,C,E,F       |
|            |                    | Socially Responsible Behavior                              | Degree of importance Likert 1-5 | A, B,C           |
|            |                    | Coherence with the culture and history of the firm         | Degree of importance Likert 1-5 | A, B, C          |
|            |                    | Improvement in the management of risks                     | Degree of importance Likert 1-5 | A, B,D           |
|            | Financial Factors  | Possibility of generating carbon credits                   | Degree of importance Likert 1-5 | A, B,C,D,E,F     |
|            |                    | New sources of financing (investment funds)                | Degree of importance Likert 1-5 | A, B,C,D,E       |
|            |                    | Tax incentives   | Degree of importance Likert 1-5 | A                |
|            | Exposure to risks  | Restrictive legislation regarding GHG emissions            | Degree of importance Likert 1-5 | A, B,C,D,E,F     |
|            |                    | Restrictive standards for GHG emissions of products        | Degree of importance Likert 1-5 | A, B, E          |
|            |                    | Restrictive standards for GHG emissions of processes       | Degree of importance Likert 1-5 | A, B, E          |
|            |                    | Physical vulnerability of assets                           | Degree of importance Likert 1-5 | A, B, C, D, E, F |
|            |                    | Increase in costs of the inputs of the firm                | Degree of importance Likert 1-5 | A, B, C,D, E     |
|            |                    | Increase in costs of energy consumed                       | Degree of importance Likert 1-5 | A, B, C, D       |
|            |                    | Sharp increase in insurance premiums                       | Degree of importance Likert 1-5 | A, B, D          |
|            |                    | Change in attitudes of consumers or customers              | Degree of importance Likert 1-5 | A, B, D, E       |
|            |                    | Pressure from NGOs   | Degree of importance Likert 1-5 | A, B             |
|            |                    | Occurrence of litigation                                   | Degree of importance Likert 1-5 | A, B, D, E       |

Ref\*\* The letters indicated in the column refer to the indicators' authors and references: Hoffman (2000, 2006), Esty and Winston (2006), Kolk and Pinkse (2004), Lash and Wellington (2007), F - CDP, F - CERES.

## Variable 3 – Involvement of the Firm

After discovering its emissions profile and also the way climate change impacts the firm, actions can be planned to implement a climate strategy aimed at reducing its emissions, mitigating the risks and exploiting the opportunities present in a carbon-constrained environment. This strategy, if well developed, will position the firm positively in relation to the government, non-governmental organizations and the general public.

Defining targets and monitoring the firm's level of emissions is considered to be the first step in a climate strategy. A reduction in emissions can be achieved within the firm, along its value chain as well as outside these environments. Various firms go beyond this and assess the possibilities of reducing GHG in all phases of their product life-cycle, from the manufacture of components by third parties to the moment the product is discarded at the end of its useful life. This is a survey of impacts during a product's life cycle – Life Cycle Assessment – LCA (ESTY, WINSTON, 2006).

According to Hoffman (2006), it is easy, in many cases, to identify low cost and low risk actions to reduce GHG emissions. These actions usually involve energy efficiency programs, behavioral changes and process improvements. In the long term firms can develop more sophisticated emissions reduction projects using technological innovations to achieve a sharp reduction in GHG emissions.

Opportunities also exist for emissions compensation and reduction outside the context of the firm's operations, such as in carbon sequestration forest projects, purchase of credits from Clean Development Mechanism CDM projects, the acquisition of low emission assets and the trading of carbon credits.

Many firms establish both energy efficiency and GHG reduction targets. Energy efficiency targets produce financial benefits for the firm in the short term and are thus usually considered to be strategic, whereas the financial benefits derived from GHG reduction targets are more difficult to quantify and accrue in the long term (HOFFMAN, 2006).

To increase motivation and encourage creativity in the firm, GHG reduction targets should be ambitious. Many firms surpass targets before their deadlines expire, mainly when they have never implemented measures to increase energy efficiency. Moreover, energy efficiency strategies are usually related to discrete energy intensive processes and the responsibility for their implementation lies with the operational units directly

involved with the process. However in the case of GHG reduction targets, the firm should be treated as a whole and durations are much greater. It is advisable to establish specific targets for each of the firm's plants or business units instead of an overall target, thus facilitating respect for the particularities that exist within the same organization as well as enabling more problematic areas to be isolated and dealt with separately (ESTY, WINSTON, 2006). Two other very important actions are to set up a high level executive committee to monitor the results of the measures implemented to reduce GHG and hire an external auditing firm.

Variable 3 – Involvement of the Firm is directly associated with the firm's degree of action with a view to mitigating, or if possible, eliminating its GHG emissions, including those produced outside it. It has a single dimension denominated Scope of Action with the four following constructs: reduction in the firm's emissions, reduction of emissions in the expanded value chain, emissions compensation and emissions monitoring (see Table 4 for details on Variable 3).

**Table 4: Variable 3 – Involvement of the Firm**

| Dimension    | Constructs                                      | Indicator   | Value | Ref*             |
|--------------|---|---|-------|------------------|
| Action Scope | Emissions reduction in the firm                 | GHG emission reduction targets  | yes/n | A, B, C, D, E, F |
|              |   | Development of products with low or non-existent GHG emissions                                | yes/n | A, B, C, D, E, F |
|              |   | Perfecting products to reduce GHG emissions   | yes/n | A, B, C, D, E, F |
|              |   | Energy efficiency programs  | yes/n | A, B, C, D, E, F |
|              |   | Transformation of production process residues into co-products                                | yes/n | A,               |
|              |   | Redesigning the production process to reduce GHG emissions                                    | yes/n | A, B, C, F       |
|              |   | Use of a low GHG emission production process  | yes/n | A, B, C, D, E, F |
|              |   | Replacement of production process equipment to reduce GHG emissions                           | yes/n | A,               |
|              |   | Retrofitting production process equipment to reduce GHG emissions                             | yes/n | A,               |
|              |   | Reutilization of effluents and gases in the production process itself to reduce GHG emissions | yes/n | A, B, C, E, F    |
|              |   | Use of recycled material as a reduction input   | yes/n | A, B,            |
|              |   | Use of renewable energy   | yes/n | A, B, C, E, F    |
|              |   | Energy co-generation  | yes/n | A,               |
|              |   | Fossil fuels replacement program  | yes/n | A, B, C, E, F    |
|              |   | Sale of shareholdings in assets with high levels of GHG emissions                             | yes/n | A,               |
|              |   | Acquisition of shareholdings in assets with low GHG emissions                                 | yes/n | A,               |
|              |   | Encourage telecommuting   | yes/n | A,               |
|              |   | Encourage teleconferencing instead of business trips  | yes/n | A,               |
|              |   | Environmental management systems (ISO 14000 or others)  | yes/n | A,               |
|              |   | Geological CO <sub>2</sub> sequestration (underground)  | yes/n | A, B,            |
|              |   | Terrestrial CO <sub>2</sub> sequestration (tree planting)                                     | yes/n | A, B,            |
|              |   | Ecological building installations (LEED Buildings)  | yes/n | A,               |
|              | Emissions reduction in the expanded value chain | GHG emission reduction targets in the firm's value chain                                      | yes/n | A, B, C, E       |
|              |   | Product life-cycle assessment   | yes/n | A, B, C, E, F    |
|              |   | Supply-chain emissions audit  | yes/n | A, B,            |
|              | Emissions compensation                          | Emissions reduction in product logistics and distribution                                     | yes/n | A, B, C, D, E    |
|              |   | Purchase/Sale of carbon credits   | yes/n | A, B, C, D, E, F |
|              |   | Voluntary actions aimed at compensating own emissions   | yes/n | A, B,            |
|              | Emissions monitoring                            | Partnerships with firms, NGOs or the government in GHG emission reduction projects            | yes/n | A, B, C, F       |
|              |   | Quantification of emissions by year to monitor GHG emissions reduction                        | yes/n | A, B, C, E, F    |
|              |   | Executive committee or equivalent responsible for issues pertaining to climate change         | yes/n | A, B, E,         |
|              |   | Third party emissions monitoring and measurement  | yes/n | A, B, C, E, F    |
|              |   | Equipment to monitor own GHG emissions  | yes/n | A, B, C, F       |
|              |   | Benchmark for GHG emission reduction  | yes/n | A,               |

## Variable 4 – Motivation in the Firm

Due to the complex and long-term nature of climate change related issues, the support of the firm's employees is of fundamental importance. They develop creative forms of achieving targets when these are clearly defined and can perceive their coherence with the firm's vision and values (HOFFMAN, 2006).

The CEO's commitment is indispensable to position environmental issues as a priority; however, in order to effectively implement programs and actions aimed at reducing GHG emissions, the involvement of executives, especially middle management, is fundamental. This involvement can be encouraged by setting up high-level committees with authority to manage environmental targets, and creating financial incentives linked to the attainment of targets and rotating the functions of operational and environmental area executives (ESTY, WINSTON, 2006).

Furthermore, it is important to identify the departments that will initiate the process of change, those that will implement the programs and those that will resist change. In this respect it is also valuable to obtain the support of the more experienced group of professionals.

Some firms promote and encourage actions such as planting trees, purchasing vehicles with a low level of emissions and bicycles for employees, rewarding and publicly recognizing individual initiatives, providing

training programs, and encouraging telecommuting and teleconferencing. The main objective of this process is to transfer climate change related issues from the peripheral areas of the organization to its center (HOFFMAN, 2006).

The publication of reports outlining the firm 's climate targets and related achievements is fundamental to encourage employees, as it promotes the publicizing of actions and the firm 's commitment to climate issues. Moreover, internal reports help to create employee awareness of the firm 's priorities regarding climate change and the environment, and how much they are helping the firm to achieve its objectives.

With a view to reflecting these factors, the research conceived Variable 4 – Motivation in the Firm – associated directly with the degree of motivation in the business environment regarding the implementation of a climate strategy. The variable has two dimensions that are denominated respectively, Proactive and Reactive, and include three constructs: mobilization, publication and obstacles. (see Table 5 for details on Variable 4).

**Table 5: Variable 4 Motivation in the Firm**

| Dimensions       | Constructos         | Indicators  | Value   | Ref**   |
|------------------|---------------------|---|---|---|

## Variable 5 – External Relations of the Firm

According to Esty and Winston (2006), the firm's communication with its external audience is fundamental to promote transparency, publicize actions and engage in a constructive dialogue with its various stakeholders. Publicizing actions in favor of the environment, as well as actions to reduce greenhouse gas emissions, help to generate a favorable attitude to the firm on the part of the general public. The publication of information regarding the environmental (green) attributes of the firm's products and services also contributes to positioning the firm favorably in the market, as long as the data is really true. For this external communication to be successful it is very important to identify various target audiences such as NGOs, government, the community as a whole and investors.

External partnerships are also indispensable for the success of firms' climate strategies. According to Hoffman (2006), alliances with NGOs enhance the credibility of both parties. The best way of finding out the state of its public image is to form partnerships with other organizations (ESTY, WINTON, 2006). Thus, NGOs can help firms discover the public's perception of their brands.

A good relationship with the government is also essential, especially to provide credibility and enable it to influence the formulation of carbon-constraining measures, norms and regulations. The investor community is

also an important stakeholder given that firms' environmental risk and conduct is increasingly influencing investment decisions.

Variable 5 – External Relations is directly associated with the way the firm acts in the external environment to publicize its targets and to establish partnerships aimed at reducing or eliminating greenhouse gases – GHG. It is composed of the Scope dimension and includes the partnerships and publication constructs (See Table 6 for details on Variable 5.)

**Table 6: Variable 5 – External Relations**

| Dimension | Constructs   | Indicators   | Value   | Ref*  |
|-----------|--------------|--|---|---|
| Scop      | Partnerships | Partnerships with other firms<br>Partnerships with NGOs<br>Partnerships with governments<br>Partnerships with professional associations<br>Partnerships with investors | Degree of importance Likert 1-5<br>Degree of importance Likert 1-5<br>Degree of importance Likert 1-5<br>Degree of importance Likert 1-5<br>Degree of importance Likert 1-5 | -5 A, B, C, F<br>-5 A, B, C, F<br>-5 A, B, C, F<br>-5 A, B, C, F<br>-5 A, B, C, F |

## CONCLUSIONS AND RECOMMENDATIONS

The outline of a Climate Strategy Model – CSM presented in this article is based on recent studies of business climate strategies, most of which were undertaken jointly with surveys of how leading global firms manage and seek solutions to the serious problems and restrictions imposed by climate change. As mentioned several times in this article, this model is intended to be used both to develop and assess business climate strategies. Below, we list a few suggestions for applying the model.

In the case of business climate strategy assessment we recommend the following steps:

- collect data pertinent to the indicators of each construct of the CSM;
- verify for each indicator whether values and categories are in accordance with international benchmarks, respecting the characteristics of each type of industry;
- propose alterations in order to attain the benchmarks in cases where the values of the indicators collected are not congruent with those of the benchmarks.

In the case of business climate strategy formulation, we also recommend a few steps, as follows:

- identify international industry strategy benchmarks, in accordance with the constructs and indicators of each variable of the CSM;
- select among the benchmarks identified the ones that are most appropriate to both the firm, considering its resources/competencies and the macro-environmental and industry structure interacting factors, in keeping with the principle of strategic fit (HOFFER & SCHENDEL, 1978).

In the scope of the wider research of which the development of the CSM is an important stage, we intend to perform several case studies, focusing initially on firms in two industrial sectors: the auto and pulp and paper sectors. The main objective of these studies is to test, consolidate and refine the model at issue.

Indeed, it is believed that this model has the potential to contribute to corporate strategic management for which effective climate strategies will be increasingly indispensable in assuring firms' competitive advantages.

# CHALLENGES OF ONLINE ADVERTISING AND MARKETING IN UKRAINE

Leonora Fuxman  
St. John's University, New York

## ABSTRACT

*In this paper authors analyze current Internet advertising market in Ukraine. Ukrainian Internet market is characterized by few broad in content web sites. The number of internet users is still small. However, users' high "quality" levels suggest development of advertising strategies that could be aimed at "exclusive" internet audience. Authors find that such strategies are not yet prevalent. Instead, fueled by advertiser's desires to get the highest trafficked Internet advertising platform, web sites tend to remove content specific information and become large portals. This in turn leads to a loss of Internet user's base "exclusivity" and hurts advertisers. Managerial policy implications are considered. Future development strategies are identified.*

## INTRODUCTION

Emergence of online advertising as an alternative marketing media has been changing traditional marketing strategies for many firms throughout the world faster than many predicted. Recent years have seen dramatic shifts away from the traditional mass marketing media, TV, printed newspapers and magazines, etc., towards more interactive feedback-oriented online advertising. Online advertising has been proven strategically effective and economically efficient since it allows marketers to collect feedback from consumers once the latter click on the banners, or promotional messages marketers post online.

Internet is the fastest growing major medium according to a research firm [ZenithOptimedia](#). [ZenithOptimedia](#)'s outlook for global ad spending projects that internet advertising will overtake outdoor advertising in 2007 and pull alongside radio advertising in 2008. Internet advertising is expected to attract 6.5% of all advertising in 2008, up from 4.5% in 2005 (and up from the 6.0% predicted for 2008 back in December of 2007) ([ZenithOptimedia](#), 2008). Advertising accounted for 0.96% of world GDP in 2005, is expected to rise to 0.99% by 2008 ([ZenithOptimedia](#), 2008).

The biggest trend in advertising market is a gradual shift from more traditional and increasingly expensive media advertisement towards non-traditional online advertisement. According to TNS Media Intelligence reports (TNS Media Intelligence, March 2008), Internet advertising had seen growth of 15.9% within last year – largest among all other advertising media (see Table 1). Share of Internet advertising among all advertising media has been steadily increasing since 2004 (see Table 2), while shares of many traditional advertising media have been shrinking (see Table 2). Although television spending on advertising exceeded \$64 million in 2007 while Internet advertising spending were slightly over \$11million, the growth rate of Internet advertising far exceed that of television (which actually declined within last year (see Table 1)).

However, such a shift does not mean that the traditional media advertisement would fade away in the future. Many studies have indicated that the Online advertising works in conjunction with TV, printed, and other media to generate the greater increase in marketing effectiveness, such as brand awareness (Chao, 2006).

**Table 1: Measured Advertising Spending by Media: Jan-Dec 2007 vs. Jan-Dec 2006**

| MEDIA                 | Jan-Dec 2007 (Millions) | Jan-Dec 2006 (Millions) | % CHANGE    |
|-----------------------|-------------------------|-------------------------|-------------|
| TELEVISION MEDIA      | \$64,421.0              | \$65,552.3              | -1.7%       |
| MAGAZINE MEDIA        | \$30,327.5              | \$28,742.5              | 5.5%        |
| · CONSUMER MAGAZINES  | \$24,431.2              | \$22,830.0              | 7.0%        |
| · B-TO-B MAGAZINES    | \$3,355.3               | \$3,501.0               | -4.2%       |
| · SUNDAY MAGAZINES    | \$1,878.0               | \$1,751.9               | 7.20%       |
| · LOCAL MAGAZINES     | \$435.5                 | \$453.5                 | -4.0%       |
| NEWSPAPER MEDIA       | \$26,362.5              | \$27,918.7              | -5.6%       |
| · NEWSPAPERS (LOCAL)  | \$22,660.6              | \$24,014.4              | -5.6%       |
| · NATIONAL NEWSPAPERS | \$3,346.6               | \$3,540.0               | -5.5%       |

Ukrainian Internet market, although not as crowded as in many other counties, is represented by over 200,000 web sites. Internet advertising is considered to be the most profitable of all the online activities. Besides internet advertising, the most money-generating online activities in Ukraine include online shopping, internet service providers, sale of traffic and other type of information. Although online advertising is the most profitable part of online business according to some sources ([www.meta.ua](http://www.meta.ua)), realistically, paid advertisement is placed on less than 200 web sites in Ukraine.

Online marketing is fairly new but a fast growing non-traditional advertising outlet in Ukraine. Overall advertising expenditures growth in Ukraine ranges around 70-100% annually (see table 3 for results of 2007).. Despite such an explosive growth, share of Internet advertising in the overall advertising spending is only 0.3% annually (see Table 4). It is likely that in near future advertising budgets in Ukraine are not going to see significant shifts in resource allocation towards non-traditional online advertising. Advertising money will continue to be confined to more conventional forms of advertising despite growing Internet market. According to some forecasts ([www.meta.ua](http://www.meta.ua)), a significant shift in allocation of advertising budgets towards online advertising, is not going to happen until the overall contribution of online advertisement reaches at least 1% of the total advertising market. Forecasts for 2008 project just such an increase. Profits from internet advertising are expected to reach \$20 million ([www.meta.ua](http://www.meta.ua)).

**Table 3. Ukrainian Advertising Market in 2007**

| MEDIA TYPE      | SPENDING, \$ MILLION | GROWTH PER YEAR, % |

While Internet proliferation in Ukraine considerably lags behind Russia and United States (see Table 4), Internet as an emerging marketing platform will lead to development of new advertising strategies. The specifics of Ukrainian Internet users coupled with low Internet proliferations rates lead to development of advertising strategies that are unique for Ukrainian market: carefully targeting very well defined audience.

## UKRAINIAN INTERNET MARKET COMPOSITION

Internet users in Ukraine range between 3.5 to 5.2 million of people, which is 7-11% population. Generally, Internet advertising is not as expensive as other more traditional advertising media. However, due to a low Internet penetration in the country, the cost of Internet advertising per contact in Ukraine is actually comparable to that of traditional advertising media. While the cost of Internet advertisement is 7-10 times less per contact than the cost of a TV advertisement, the degree of impact each media type makes is not necessarily comparable. Contact for a TV advertisement is counted when a commercial is watched, while a contact on Internet is counted when a banner is looked at. These two activities result in a very different impact on individual.

Despite the low Internet proliferation (only 7-11% of population) in Ukraine those who have access to Internet are the most educated segment of the Ukrainian population, with the highest income. Thus, these Internet users represent the most attractive part of population for many advertisers. There are already companies who take advantage of this "exclusivity" of online users. Unitrademelon, which is part of A Ventures Group, allocates 2% of its advertising budget to online advertising. The "exclusivity" of online users appeals the company since it gives them direct access to their ideal customer – those who follow the latest technological innovations and become active consumers of latest technologies.

Among the biggest contributors to online advertising in Ukraine are technology selling companies such as mobile phone providers, makers and retailers of electronics, auto dealers, banks, and real estate companies. Majority of advertisers don't even allocate advertising budget for Internet media, but rather use budget overflow to feed this additional advertising platform.

Very few companies share an optimistic view of the future of Internet advertising. For the most part, those online advertisers who are already represented on Internet do it on experimental basis. There are number of other factors contributing towards a slow acceptance of Internet as a fundamentally new and potentially profitable advertising platform. The following sections address those factors.

## **LACK OF CONTEXT SPECIFIC INTERNET RESOURCES – IMPACT ON ADVERTISERS**

Internet advertisers, just as advertisers in other, more traditional media, need target audience. Online audience and its “quality” very much depend on the content of the internet resource. Thus, those internet resources that have specific mission and are content-specific have a good chance of becoming an attractive platform for online advertisers in the long run.

On the other hand, there are very few Internet projects in Ukraine that are sellable due to its content. The reason does not always lie in web sites’ unwillingness to promote development of their resource. Web sites often find themselves following potential advertisers who measure advertising attractiveness of online resource solely by its attendance ratings. Online advertisers in Ukraine tend to favor web sites with highest traffic volume since their primary objective is to maximize impact while minimizing costs. This in turn forces web sites to become more like big portals with concentration of many different resources and where many users spend considerable amount of time.

Web site content becomes a victim of traffic volume. Instead of strategically developing targeted audience and sustaining the content, web site are more concerned with traffic volume and finding ways to attract users, which sometimes include methods that have questionable legality. The so called “traffic generators” enjoy increased popularity on Ukrainian Internet market. Traffic generators web sites overpromise services in order to lure users to their web site (where often content does not correspond to the promise). As the result, such web sites have the most diverse and non-homogeneous user base and online advertisers end up missing their target audience when they advertise on these high-traffic sites ([www.itcg.net](http://www.itcg.net)).

For many advertisers the biggest problem on Ukrainian online market is lack of specialized resources where they would have found their targeted audience efficiently and effectively. For instance, German beer producer Becks, who is interested in younger audience with active life styles, focuses its advertising efforts on popular “younger” Internet web site [www.afisha.kiev.ua](http://www.afisha.kiev.ua). Stella Artois, another beer producer, targets younger Ukrainian audience on a similar entertainment web site [www.kino-teatr.kiev.ua](http://www.kino-teatr.kiev.ua). The Internet advertising budget of Stella Artois in Ukraine consist of 1% of their advertising budget and it is unlikely to change until there are more context specific Internet resources with sizable user base (Companion 2007).

## **LACK OF RELIABLE USER INFORMATION IN ONLINE MARKET**

Another issue that puts a break on faster development of online Internet advertising is lack of reliable information about web site users, including traffic volumes and socio-demographic information about users. Ukraine does not have an independent Internet research resource that would monitor and compile such information. Financial resources needed to fund such a project would have to come from online companies interested in having “someone” tailing them. However, there does not seem to be enough of online companies willing to pay for such research.

Very few web sites are interested in offering truthful information about their user’s profile and volume for risk of losing existing advertisers. Besides, under the existing conditions of shortage of quality specialized online resources, web sites do not find themselves pressured to prove their advertising attractiveness to potential advertisers. Demand for online advertising exceeds the offerings of available advertising platforms. This leads to situation when advertisers have to reserve in advance placement on popular Internet resources.

There are web site that attempt to study their users. However, such efforts usually do not extend beyond general counting of visitors. Demographics and social characteristics of users are not polled. The only information on online user demographics and their social characteristics is available for online shopping ([www.gemius.com.ua](http://www.gemius.com.ua)). Although there are some web sites that attempt to survey their users (on a purely voluntarily basis) to find out gender, age, and income level, for the most part such data could not be trusted.

The first company to undertake a major Internet user research project was Gemius Ukraine. Company has technologies for evaluating number of visitors, their movements within web site, and user's socio-demographic profile. Thus far, only about 50 web sites are included into the research study. Another company, LigabusinessInform, is attempting to consolidate Internet market in order to conduct independent research of Internet users.

## STRATEGIES FOR IMPROVING EFFECTIVENESS OF INTERNET ADVERTISING

Clearly online advertising market in Ukraine is in its early development stages. There is also a shortage of qualified creative marketing and design professionals in the field of online advertisement. Lack of competition in the field allows sellers to choose the cream of the crop among advertisers without giving much thought to their own reputation. Advertising agencies first sell anything that has potential of yielding maximum profit. Thus, it is much easier for an agency to place a banner on a web site for their client instead of developing potentially more effective content-specific advertisement. The former can cost tens of thousands of dollars, while the later is much more labor intensive in development but would cost only couple of hundreds of dollars.

Design and development of online advertising does not exists as an area of specialty in professional carrier. Frequently, online ads simply duplicate hardcopy posters. Popup and rising banners are the latest "designer's" trend, which is proven to yield better clicking response than other stationary styles of ads. However, an increased "clickability" of such ads can also be attributed to user's desire to close the banner, while accidentally opening advertiser's page. Such actions will not generate positive emotions toward advertiser's product from the user.

**Table 5.**

| TWO TYPES OF INTERNET ADVERTIZING |  |  |
|-----------------------------------|--|--|
|                                   | BANNER ADS   | CONTENT-SPECIFIC ADS   |
| DESCRIPTION                       | Animated and multimedia messages, occasionally accompanied by sound                      | Compact text ads tied to user's search inquiry.  |
| EFFECTIVENESS                     | 80-90% - brand information reaching users on emotional level; 10-20% click-through -rate | Effectiveness is measured by number of clicks (pay per click principal)                      |
| COST                              | \$5-14 per 1000 showings   | Starts at \$0.01 per click; depends on number of competing advertisers in a specific inquiry |
| MARKET PENETRATION                | 90%  | 10%  |
| TRENDS                            | Content-specific advertising is expected to grow to 30% of the market within 2-3 years   |  |

Advertisers in Ukraine typically utilize technical specialists mostly programmers to create online ads. While technical specialists are capable of successfully creating a banner or an entire web site, they do not have adequate knowledge in the area of marketing strategy. As the result, there are no qualified personnel to specifically focus on online advertising and on creative process of formulating and implementing Internet marketing strategy.

Effectiveness of online advertising is frequently measured in CTR, Click-Through-Rate (see Table 5). CTR counts number of clicks on advertising message relative to the total number of message showings. Some

evidence suggest that nearly 80% of users who remember banner ads and can verify them through exact description, never actually clicked on the banner (See Shulgina, 2007). Thus, creating content-specific innovative advertising strategies for online marketing should lead to a more efficient way of reaching target audience.

## CONCLUDING REMARKS

Among all segments of media advertizing on Ukrainian market Internet advertising, although representing the smallest segment of the market, demonstrates the biggest growth. Despite increasing attractiveness of this newer advertising platform in Ukraine, businesses are cautious to invest their resources in online advertising. Number of factors specific for Ukrainian online market hinders the process of faster acceptance of Internet media.

Ukrainian online market is characterized by dominance of broad portals. There are fewer content-specific web sites. Advertisers need content-rich web sites to be able to efficiently and effectively find their target audience. Web sites with broad audience attract those advertisers who are interested in traffic volume. The future success and growth in online advertising lies in its ability to offer interactive, instant feedback features advertising opportunities for businesses. Businesses thus are not going to increase their online advertising budgets until they are able to find their online target audience efficiently. Although Ukrainian Internet user base already represent an “exclusive” audience, lack of content specialized web sites deteriorates the natural process of market segmentation in Ukraine.

Lack of reliable Internet user information is another major factor hindering faster acceptance of online advertising. While cost of online advertising compares favorably against cost of other advertising platforms, online advertising is strategically effective when right audiences are exposed to the right type of online advertising. Without knowing Internet users’ socio-demographic characteristics it is nearly impossible for advertisers to develop effective strategies for their targeted audiences.

The general trend in online advertising today is to shift from volume-based performance characteristics of online advertising to quality-based ones. Businesses in Ukraine will start allocating more of their advertising budget toward online advertising when they are able to develop effective content-based advertising strategies. This in turn requires development of socio-demographic networks that are capable of systematically narrowing down Internet user’s interests in order to provide users with advertizing that best matches their interests and requirements.

Development of content-specific advertisements requires specialized marketing knowledge from those who create content advertisements. Ukrainian advertizing market does not have professional resources designated specifically for online advertising and mostly utilizes programmers to develop online advertisements. This also presents a challenge for the future since programmers don’t have a knowledge of marketing and advertising that could be creatively used for online advertising. In the future, as more money would be allocated toward online advertising, there should be more creative online marketing professionals specializing in Internet marketing.

# THE VERIFICATION OF CUSTOMER PERCEPTIONS OF QUEUE MANAGEMENT TO ACHIEVE BUSINESS IMPERATIVES

**Andrea Garnett**

**Vaal University of Technology, South Africa**

**Dylan Garnett**

**Zurich Insurance, South Africa**

## ABSTRACT

*This paper highlights the concept of queue management as a fundamental aspect of the perception of service quality by customers frequenting the retail outlets of an international industrial gases and welding company. The perceptions of customers regarding inefficient queue management and service delivery were investigated in order to gain perspective on the overall value offered by the company. A hypothesis was made that customers were experiencing service inefficiencies due to system constraints. Based on the internal and external empirical findings, the hypothesis was rejected, but several other problem areas regarding service efficiency and customer relationship management in the retail environment were identified. A suggested model for mitigating these problem areas was subsequently outlined.*

## INTRODUCTION

An organisation may strive for competitive advantages, improved efficiency and effectiveness, performance management or various other strategic imperatives. However, many of these interventions may be voided if an organisation does not address their most important consideration, namely the customer. According to Nicholls *et al* (1998) the lifeblood of any organisation is undoubtedly their customer. It is the satisfaction of these customers that provides the organisation with the key for continual growth and survival. Service satisfaction is a function of the consumer's experiences and reactions to a provider's behaviour during the service encounter. It is also a function of the service setting. Customer satisfaction provides the necessary linkage between the level of service that an organisation provides, the customer's perception of that service and the customer's future behaviour towards the organisation. A highly satisfied customer will continue to provide repeat business and constant revenues through increased frequency of visits and positive word-of-mouth advertising. This will translate into increased profits for the company. A dissatisfied customer will have the opposite effect. (Grewal *et al*, 2003).

According to Bolton and Drew (1991), satisfaction is the customer's post-purchase evaluation of a product/service offering. A customer is satisfied when an offering performs better than expected and is dissatisfied when expectations exceed performance. Customer satisfaction/dissatisfaction is typically modelled as a function of disconfirmation, arising from discrepancies between prior expectations and actual performance. Grönroos (1983) suggested a paradigm that described service quality as being distinguishable between technical quality (what is done) and functional quality (how it is done). The model indicated the importance of the service provider matching the expected service and the perceived service to one another.

## BACKGROUND AND RATIONALE

When considering the concept of service quality in an organisation, there are several potential areas that could warrant attention. Fisk *et al* (1993) proposed that service satisfaction centres on the following four areas:

1. Customer expectations of service contrasted with their realisation.
2. Technical and functional approaches to service satisfaction.
3. Influence of time.
4. Service quality versus service satisfaction.

The abovementioned, with especial reference to the influence of time on the service satisfaction of customers, was utilised as the basis of the research. This further elicited the concept of queuing and queue management as Davis and Heineke (1994) also point out that the management of queues should be of particular importance to an organisation, as the speed of service delivered has been shown to provide a competitive advantage in the marketplace.

Whilst addressing the topic of customer's views of queuing, Taylor (1994) denotes that the customer's perception of whether or not the service provider is in control of the situation and the manner in which the delayed time is managed or filled will have an indirect impact on the customer's overall rating of value. It is vitally important for organisations then to exert a degree of control over their relationships with these customers and also the perceptions held by same customers as Davis and Heineke (1994) further elaborate that the customer's perception regarding the performance of the service is more critical than the actual performance itself, although there is frequently a high correlation between the two. This is supported by the work done by Maister (1985) whose fundamental premise was that the perception of the wait determines satisfaction rather than the actual waiting time. He further suggests that people's perception of waiting time is believed to be distorted uni-directionally, so that most customers think they have waited longer than they actually have. Larsons (1987) sums it up succinctly as follows: *"waiting is a form of imprisonment, one is doing time—but why? One is being punished not for an offence of one's own, but for the inefficiencies of those who impose the wait. Hence the peculiar rage that waiting engenders, the sense of injustice. Aside from the boredom and physical discomfort, the subtle misery of waiting is the knowledge that one's most precious resource, time, a fraction of one's life, is being stolen away, irrecoverably lost."*

Customer waiting can take place at any stage of the purchase process, some waits occur before, during or after the transaction experience. Waiting is considered to have a definite negative effect on the perception of service and service satisfaction. It is therefore one of the most critical service attributes for almost all retailers. A study by Chebat *et al* (1994) introduced the "halo effect", which concluded that a customer's evaluation of service quality was affected not only by the end service received, but also by the service delivery process itself, which includes waiting time. It is therefore critical, in situations where waiting is inevitable, that companies attempt to provide a high level of satisfaction regarding the waiting portion of the service experience (Davis & Heineke, 1998). Very often the actual wait duration can only be controlled and improved upon to a point, the next step would be to manage the customer's perception of the wait (Taylor, 1994).

Customers have also indicated that waits provide feelings of uncertainty, anxiety, frustration, annoyance, irritation, stress and anger. Several researchers have shown that when the situation that has caused the delay was avoidable or controllable, then the dominant emotion is that of anger. A higher degree of anger is realised when the customer's perception of the event was that the service provider could have circumvented or mitigated the barrier that prevented the service (Meyer & Mulherin, 1980; Reisenzein, 1986; Weiner, 1980). Similarly, Folkes (1984) found that the more common the delay the less likely that these customers would repurchase.

Research has indicated that the amount of empty queuing time that a person finds tolerable depends on a number of variables; especially the physical environment surrounding the queue, perceptions that a queue is being managed in a socially just manner (*i.e.* following strictly the first-in-first-out principle), and the presence of indicators of a delay's likely duration (Bennett, 1998). Ensuring that there are enough stimuli to keep or occupy the individual's attention can circumvent this. By personally filling the customer's time, a message is conveyed to customers that they have not been forgotten, reducing some of the waiting

uncertainty. The time filling could also convey the message that the customer is considered valuable, thereby possibly reducing anger (Taylor, 1994).

The research on which this paper is based focused primarily customer's perceptions of service quality and queue management within an industrial company. The organisation on which the research focused (hereafter referred to as Company X) is in the industrial gases and welding industry. This is a global company but the research focused on the South African subsidiary. The industrial retail outlets of Company X are the growth drivers for the organisation and thus seen as the largest opportunity for providing revenue growth. The in-store experience and customer perceptions of service quality are therefore critical areas for the delivery of the planned strategic growth.

The in-store purchasing decision consists of many phases and the one of the facets considered in the compilation of the research problem is the type of relationship that customers have with Company X. The customers could be in the straight re-buy stage or still be in the testing stage. The purchasing process is generally divided into the following areas: locating the product; acquiring technical/product/account information; Making the purchase decision; queuing and completing the purchase transaction. Customers purchasing these products could be in various stages of their decision making, which adds to the purchasing complexity. The organisation is thus required to plan for the differing expectations of customers.

The scope of the research was done on the flow of events from when the customer enters the retail outlet to when leaving with the product/s. Customers frequenting the store could be in various phases of the purchasing decision, depending on the product and relationship maturity, and they could be either the driver or the decision-maker. The following is an example of a possible scenario:

- A mature **customer 1** purchasing liquid petroleum gas (hereafter LPG), who is in the straight re-buy phase skips stage 1 – 3 of the purchasing process and moves into stage 4.
- A mature **customer 2** who is the decision maker of the business who is purchasing a welding consumable product will have fewer requirements in stage 2, as he will more than likely not request process or technical product information and will move into stage 4.
- A new **customer 3** walks into the Company X retail outlet and wishes to start a purchasing relationship with Company X. He would move to stage 4 as the person to assist him is behind the counter.
- A mature **customer 4** has completed stages 1 – 4, but is unable to transact due to account problems.
- A **driver 5** is sent to collect a list of predefined goods. He moves straight to stage 4.
- A mature **customer 6** wishes to purchase a new product and requires sufficient assistance during stage 2 of the purchasing process so that he can complete stage 3. However, he is in stage 4 as the person to assist him is behind the counter.

The above scenario merely requires six customers to be in the store at the same time for these events to occur, which places excess demands on the staffing component of the store and facilitates the possible reduction in service quality. Compounding this problem is that customers can enter at varying times. The customers are deprived of service efficiency due to the fact that they will pass through stages 1 – 3 quickly, but will be delayed in stage 4. The retail staff members are only able to engage with the customer in Stage 5, therefore forcing customers to be delayed in Stage 4, resulting in slower queue management.

From the scenario depicted, the problem in question which was researched is that the customers of Company X are experiencing service inefficiencies whilst collecting their products at the Company X retail outlets, which generated to a few possible research questions: What type of service inefficiencies are customers facing? What constitutes value for such a retail customer? What possible changes can be made to improve the overall levels of service satisfaction for the customer? What mechanisms could be instituted to mitigate potential problematic queue management in a retail store? And the hypothesis formulated in line with the research questions is that:

- H1:** The customers currently frequenting the industrial retail stores of Company X are not satisfied with the length of time it takes to complete the transaction and this is due primarily to system constraints.

## METHODOLOGY

The researchers initially made use of an open-ended questionnaire that allowed for a range of possible answers. This was distributed internally amongst employees of company X. The survey was focused mainly on receiving qualitative rather than quantitative data in order to better understand the proposed problem areas in proffering customer service. The researchers identified a list of employees from Company X, comprising representatives from the cross-functional areas (Services, Sales and Retail). A judgement sample of interviewees was drawn based on the following criteria: location to the metropole and direct or indirect regional influence. The researchers made use of structured interviews, which lasted approximately thirty minutes and were either completed by means of face-to-face or telephonic interviews. The data obtained from the internal survey was then used as a basis for developing the survey instrument for the external research.

The external research was primarily focused on customers who frequently collected their products from the Company X industrial retail outlets. A list of 1 500 (sample population) customers was drawn from the Company X database based on their purchasing behaviour. The customers interviewed were then randomly selected from these lists.

The sampling was conducted as follows: given the nature of the research project, a non-probability quota sampling technique was utilised. A total number of 298 customers were interviewed. Samples were determined by region, product category, product use in industry, gender, population group, age and business income. The researchers made use of an experienced, specialised Customer Value Management team to conduct face-to-face interviews with each respondent, based on a structured questionnaire. Each interview lasted approximately forty-five minutes. The Customer Value Management (CVM) methodology utilised by the external marketing research company, was based on service quality research conducted by Parasuraman, Zeithaml and Berry (1988). The constructs evaluated by the CVM process were, however, customised to reflect the South African environment by using inputs from the internal interviews conducted at Company X. The following constructs were measured:

1. Customers' overall value perceptions.
2. The components that make up customer value.
3. The processes that make up the specific components.
4. Specific activities relating to each component of value and service.
5. Loyalty and future intentions.

The research instrument utilised a 10-point scale. Interpretation of the scale for the overall value and for all performance statements was: 1 = 0% (poor value) - 10 = 100% (excellent). Based on industry norms, a rating of 8 on the scale (good) is considered the minimum performance standard. Organisations that are perceived to be providing superior value should be achieving results of more than eighty-nine percent (9 out of 10). The minimum acceptable industry norm is seventy-eight percent. Based on multiple regression analysis, *Derived Importance* or *Impact* scores were developed. These impact scores were used to identify drivers and dissatisfiers. For interpretation purposes, drivers and dissatisfiers are distinguished on the following basis:

- ☐ High impact – Beta Coefficient of 0.3 – 1 = Value driver
- ☐ Moderate impact – Beta Coefficient of 0.15 – 0.3 = Value driver
- ☐ Low impact – Beta Coefficient of less than 0.15 = Dissatisfier / fundamental

## RESULTS AND DISCUSSION

The initial findings resulting from the internal survey are as follows: The perceived time spent on the purchase process ranges from fifteen to thirty minutes during peak time and seven to ten minutes during off-peak periods. The most time spent on the purchase process ideally should be between three and five minutes. Three best-in-class competitors were identified and the attributes that made the best-in-class successful were

listed as the following: Shop floor assistants; Simple Cash Transaction System; Shelf pricing; Bar-coding; Store layout.

Further interpretation of the findings from the internal research survey identified the following as the perceived problem areas in the industrial retail outlets of Company X: debt issues; staff constraints, as most stores are one-man-driven; lack of product and technical knowledge; lack of pricing information on the shelves and items; incoming phone-calls distract employees; retail aptitude and attitude of the staff currently in the centres is poor; performance measurements are more operations-focused than people-focused and the system for cash sales is too complex requiring too many key strokes. It was hypothesized that all these factors could have a potential effect on the queue management system and customer's perceptions thereof. Further analysis of the data indicated that the root causes of these problems were *inter alia*: the Order-to-Cash process; the policies and procedures governing the process are not customer-centred; the wrong people are currently fulfilling the role of the order taker and retail outlets are cost-driven and not service-driven.

Based on the conceptualisation of these problem areas, the external research identified the value drivers of the customers frequenting the industrial retail outlets. The research further determined the customers' view of problem areas and opportunities within the retail environment, which could be managed to improve service quality within the stores. The following figure illustrates the influence of each component of value on the overall perception of value of the customer.

The following can be deduced from the results: *Service efficiency* currently has the highest impact on customers' perceptions of overall value and the goal, as a value driver, is a service level of eighty-nine percent. Both *customer relationship management* and *product* have been identified as drivers of value perceptions. *Price* is still important, but affects value perceptions to a lesser degree. *Image* plays almost no role.

From the figure above it is evident that *retail staff* is the only value driver in the group of service activities. This means that this must be the specific area of focus required to improve customers' perception of overall value. Both marketing and communication and transactions have a minimal impact on service efficiency and they have to be performed at a minimum industry norm of seventy-eight percent.

The abovementioned figure depicts the current performance levels of the service activities. The performance on the only driver of service efficiency, namely *retail staff* (at seventy-eight percent) is considerably short of the required target to ensure customer satisfaction (eighty-nine percent). Another point of concern is that *marketing and communication* (sixty-nine percent) as a business fundamental is also lacking in performance (seventy-eight percent). The *transaction* (seventy-nine percent) activity is on par with the expected performance to deliver customer satisfaction.

To better understand the opportunity for improving overall customer perception of value, *retail staff's* performance was further split into specific attributes that needed to be measured. The following figure illustrates these attributes.

The figure above shows that none of the attributes are close to the desired level of eighty-nine percent. The worst-performing attribute being that of *effective resolution of problems, queries or requests* (seventy-four percent). When examining the *transactions* attribute, efficiency of cash transactions was rated as performing at eighty percent, well above the required seventy-eight percent.

## CONCLUSIONS AND MANAGERIAL IMPLICATIONS

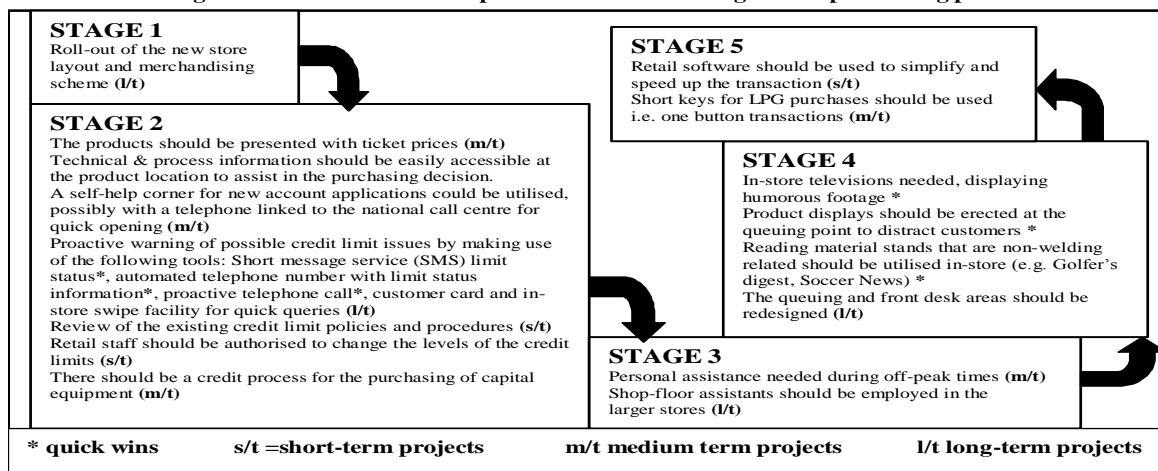

The initial hypothesis formulated from the research questions was that the customers currently frequenting the industrial retail stores of Company X are not satisfied with the length of time it takes to complete the transaction, due primarily to system constraints. However, a conclusion to be reached based on the results is that the transaction time was not causing dissatisfaction due to the fact that customers had given the cash transaction processing a rating of seventy-nine percent, which is sufficiently meets the required service level of seventy-eight percent. Other concerns are that transaction processing was a business fundamental and not a value driver, therefore even if Company X were to dramatically improve the time spent during the transaction process it would not improve the customers perception of overall value or satisfaction.

The hypothesis has thus been rejected, and the null-hypothesis in this case has been accepted. However, other potential problem areas were identified from the external research which have possible managerial implications. Utilising the findings of the external research it was shown that *service efficiency* is the largest component that drives value and that the service element within this group that drives the value, was found to be the *retail staff* which needed to be addressed primarily in order to retain the customers who would consider defecting.

The research showed that the weakest component attributed to *retail staff* was the effective *resolution of problems, queries or requests*. Utilising root cause analysis, the researchers decided to direct the focus onto this one specific problem that would provide the best return on investment, namely improving the problem-resolution process at retail outlets. The scope for further research should become far narrower and more focused on the activities that can influence this area of problem resolution. The area regarding *resolution of problems* required further delineation and the specific issues arising from this were that customers have a problem on their account, customers have a pricing query and customers request particular technical information.

The following model is proposed as a result of the above understanding of the retail environment and the empirical results. Each stage of the purchasing process has been scrutinized and the possible solutions are outlined. The solutions are categorised by ease of implementation, namely quick wins (easiest to implement), short-term projects, medium-term projects and long-term projects. The abovementioned solutions could be implemented in Company X to mitigate the problem areas determined by the research as well as providing insight to other retailers in similar industries regarding customer perceptions. Further research could be undertaken in other environments to verify these results, as the research was limited to the retail situation of one organisation. The model highlights practical solutions to the problem of poor service quality in a retail environment which other organisations should earnestly consider in order to remain competitive.

**Figure 7: Model of service improvements for each stage of the purchasing process**

# **PRELIMINARY CRITERIA REDUCTION FOR THE APPLICATION OF ANALYTIC HIERARCHY PROCESS METHOD**

**Remigiusz Gawlik**  
**Cracow University of Economics, Poland**

## **ABSTRACT**

*The Analytic Hierarchy Process (AHP) is a method for multi – criteria decision making. It consists principally of three levels – Main Goal, Criteria and Alternatives. The Main Goal level can be extended into forces and actors influencing the decision making process, the Criteria level can be divided into criteria and sub – criteria, whereas the decision alternatives can be treated as action scenarios and prognostics of their effects. In turbulent environments of actual global economic reality the number of criteria that need to be taken into account when making strategic decisions can be broad. Theoretically the more determinants at the preparatory stage, the better decision making. In fact, multiplying the number of factors can obfuscate the main goal and result in inefficient final decision. For this reason some kind of rationalization of amount of criteria seems to be necessary. According to T. L. Saaty, the author of AHP method, the number of criteria and alternatives analyzed in decision making processes should not exceed 7 (+/- 2), which gives 9 criteria / alternatives maximum. The article attempts at finding a method for reducing the number of factors taken into account when performing data collection for future decision making. Geopolitical determinants of functioning of international corporations have been used as criteria. The author tries to emphasize the aspect of final decision quality, which should not be impoverished because of limitations of amount of analyzed criteria and strategic alternatives.*

## **INTRODUCTION**

Effective decision making at strategic levels requires a correct identification of factors that can influence business in future time periods. The business environment of international companies consists of a multitude of determinants having stronger or weaker impact on managerial decisions. The ideal situation would be to include all of them as variables decision making process, but such an inflow of information would obfuscate our perception and finally make the distinction between important and unimportant variables impossible. Also methods for multicriterial decision making such as Analytic Hierarchy Process (AHP) accept only a limited number of criteria and alternatives. For this reason the author perceives a need for elaboration of a method that could help dividing the factors into two groups: those that absolutely need to be taken into account and those that could be omitted. When using AHP it is very important to adapt the criteria set to the particularity of the enterprise, namely its goal, size and environment, as well as to the specificity of decision to be made.

In the present paper the author will make an attempt to create a method for limiting the number of criteria for the needs of decision making with use of Analytic Hierarchy Process.

## **GEOPOLITICAL CONDITIONS OF FUNCTIONING OF INTERNATIONAL ENTERPRISES**

According to the Open Systems Model the environment of international enterprises can be divided in three groups. These are the following:

- Determinants of Operating Environment.
- Determinants of Host – Country Environment.
- Determinants of Mega Environment (Deresky, 2006, p. 13 – 25).

The determinants of Operating Environment can be divided into:

- Legal Regulations – a set of legal acts determining the functioning of mother country companies. Three main types of legal systems can be actually found in the world - European Continental Law (codes and legal acts), Common Law (judicial precedents) and Religious Law (religious books).
- Culture in Organizational Aspect – mainly understood as the influence of local human factor on numerous aspects of organizational behaviors. From the organization's spectrum the cultural factors that bear the most important effect on the functioning of organizations are: the level of orientation towards the results, the ability of strategic planning and the orientation towards a human being.
- Skills – special predispositions and preparation of mother country population towards entrepreneurship, team work, problem solving and adaptation to variable environment. Another group of skills are those areas of industry and economy in which the mother country population shows competitive advantage due to some historical reasons or unique conditions of local natural environment.
- Social Responsibility – the level of awareness of mother country population about the questions from Corporate Social Responsibility area. In general this idea bases on an assumption that an enterprise's managerial board should take into account the needs of all shareholders, not only the major ones, i.e. workers, suppliers, local communities, Non – Governmental Organizations, business partners, investors, individual shareholders or single proprietors.
- Ethics – directly linked with social responsibility. It determines the strength of moral rules enrooting in mother country society and shows the level of compliance to these ideals in economic praxis. Ethics can be also understood as a general ability of the society to solve the entity of problems that arise with economic development of a country in an ethical way.

The Host – Country Environment Determinants form the following group:

- Economic Factors – general economic system (free market economy, a centrally planned one or a totalitarian system with elements of free market); investment risk in host – country; stability of host – country economy as an indicator of investment attractiveness; stage of economic development (rich developed countries, developing countries or Third World countries); GNP structure; adopted economic and fiscal policies; disproportions in welfare distribution; model applied for redistribution of fruits of society's work. Although Deresky sees the local competition as a separate determinant the author decided to include it into the group of Economic Factors as well.
- Political Factors – every enterprise's investment decision has to be preceded by an analysis of host – country political risk. T.W. Shreeve divides this risk in two types: the macro – political and the micro – political risk and proposes a list of seven possible events from the political risk area: expropriation of enterprise's assets without

due and adequate recompense; forced sale of actions to host – country citizens, usually below their real value; discriminative treatment of foreign companies when applying the rules of law; creation of abroad fund transfer barriers (profits or actions); deprivation of technology or other intellectual property (patents, trademarks, brands); interference in decision making processes; fraud of state authorities and their representatives, including the recalling or changing of former agreements, bribe extortion, etc (Shreeve, 1984, p. 111 – 118).

- Technological Factors play a crucial role in modern economy and can be perceived dually – as a general level of host – country technological and scientific advancement (number of host – country international industrial patents) or as the level of host – country's preparation for the reception of modern innovative businesses. This factor's indicators are the number of public and private independent research institutions and think – tanks focused on technological development, the percentage of GNP invested into scientific research and education, existence of national innovation strategy, level of intellectual property protection, incentive programs for creation of research nets, number of international R&D projects, level of compliance of technical and informatics solutions elaborated and applied in host – country with those available in the rest of the World (Ostry, 1998, p. 85 – 99).
- Culture in Individual Aspect – mainly understood as its influence on communication between individuals. It can be observed in the following areas: varying society organizations (hierarchical, democratic); adopted system of values; individual ways of thinking (depending on the obtained education); varying social roles of citizens; attitudes towards entrepreneurship and other forms of activity; perception of time (circular or linear); role of language and non – verbal communication (including the body language); proxemics – the extent of personal space in both private and professional life; role of touch and cultural context in multicultural communication.
- Subsidiary & Host – Country Interdependence – level of interdependencies between companies investing and operating outside their country of origin and the host – country. Some countries will be encouraging the inflow of Foreign Direct Investment by providing numerous incentives for foreign enterprises interested in entering their internal markets (tax deductions, cheap ground, infrastructure, technology, trained staff), whereas others will be protecting their local businesses by rising market entry barriers for foreign companies (excessive licensing, high customs levels, direct and indirect aid available to competitive local companies, strengthening of national monopolies).

The Mega Environment determinants are:

- Global Trends and Forces – the entity of economical and political phenomena that together with international and global institutions and Intergovernmental Organizations are bearing an indirect, but important influence on strategic decisions of managerial boards of enterprises. The manager's role is to identify and rank a big number of events from this area. The ability of selecting the important ones, a consequent and skilful building of enterprise's international position and lobbying groups becomes today a crucial skill in the field of international management. PR agencies, lobbying groups and some of the NGOs can be very helpful in this field.

- **Global Competition** – the functioning of international enterprises in global competition does not essentially differ from its substance on a local or regional market. Still two main pillars of the system – consumers and producers do exist. The difference comes with a higher number and scale of competing subjects, new marketing forms and distribution channels, size of logistics operations, diversified access to raw materials and others. All of the above causes automatically a much higher complexity of issues to deal with.
- **Multi – National Companies & Host – Country Interdependence** – the main difference between this determinant and the **Subsidiary & Host – Country Interdependence** is the direction of the relation. When at a regional level it was rather the foreign or mother country company that was the beneficiary of potential help from the state, in the actual case it is the host – country that can be strongly dependent on international businesses operating and paying taxes on its territory. Difficulties encountered by global businesses can have strong effects on host – country's economy, in particular on its tax revenues, unemployment rates or accessibility to modern technologies and level of innovation inflow.
- **International Law** – the multilateral international agreements, the United Nations Universal Declaration of Human Rights, International Court of Justice rulings and laws issued by other international organizations (i.e. EU, WHO, WTO, WIPO, ITU, UNESCO) are forming the body of public and private international law and do strongly influence the global environment of International Companies.
- **Level of Global Technological Advancement** – available technologies in World's scale. When taking a decision about entering the market and investing in a particular host – country the leaders have to take into account the relation of host – country's technological advancement and its ability of new innovations creation in comparison to the level of technology available around the World in general.

The entire set of determinants presented above form the geopolitical environment of a given international company. When building strategic plans and making managerial decisions all of them need to be taken into account – both as a group and individually. The question arises which of the determinants bear a stronger influence on effectiveness of decision making? A useful tool for answering this question could be the Analytic Hierarchy Process presented in Chapter 2. The criteria level would consist of determinants presented in Chapter 1.

## **ANALYTIC HIERARCHY PROCESS – METHOD PRESENTATION**

The Analytic Hierarchy Process (AHP) as well as its evolution – the Analytic Network Process (ANP), both developed by T. L. Saaty, are tools for decision making. Their application seems to be the most reasonable in situations when the decision problem is characterized by high level of complexity. The AHP method can be applied only in cases when the problem structure can be presented as hierarchical and upper hierarchy elements do not interact nor influence the elements placed lower on the hierarchical ladder. Whereas the application of AHP method should be proposed in first instance as an easier solution (when possible), the ANP method does not fall under the same limitations and should be treated as a development of AHP method for fuzzy and more complicated decision making problems. The main difference between both methods is that ANP allows analyzing how elements of different factors interact between each other, not only in pairs (Saaty, 2001).

In situations when the optimal solution has to be chosen from a set of alternatives on a subjective basis (i.e. a managerial decision) the Analytic Hierarchy Process should be taken into consideration. The case of International Corporations acting in a turbulent and uncertain geopolitical environment seems to fall very well under this scope (Saaty, 1999). For this reason the AHP method has been chosen by the author for analyses presented in further parts of the present paper.

According to Saaty, the decision making process involves multiple stages, such as "...planning, generating a set of alternatives, setting priorities, choosing a best policy after finding a set of alternatives, allocating resources, determining requirements, predicting outcomes, designing systems, measuring performance, insuring the stability of a system, optimizing and resolving conflict" (Saaty, 1996, p. 5). The AHP method is composed of three main levels, which are taking into account all of the concerns listed above:

- Main goal level – the goal to be achieved by the analyzed decision making process.
- Level of criteria and sub – criteria and their indicators – used for evaluation of dominance of factors.
- Alternatives – subject to expert opinions with respect to criteria above; also the researched optimal solution arises from this level (Saaty, 1996, p. 5 - 7).

The core of AHP method consists of pairwise comparisons of different alternatives, criteria indicators and entire criteria between each other. For this purpose a hierarchy composed of factors of lowering importance is being formed. Their gradation constitutes the first step of AHP method. In next step these factors are being analyzed in pairs on each hierarchical level. As a result, the dominant factor from the pair below is being linked with the dominant factor from the pair straight above, which gives us a ranking of importance of different criteria. It is important to realize that the gradation allows to include the non – measurable criteria into the decision making process. The transition of non – measurable expert evaluations into numerical data that can be subject for comparisons with existing results of research and available statistical data constitutes the main advantage of AHP method. Last, but not least – obtained numbers are a clear proof for the superiority of alternative A over alternative B (accordingly to the pre – selected criteria) because of their mathematical notation. The cited transition can be effectuated by applying the following instruments:

- Fundamental Comparison Scale.
- Pair – Wise Comparison Matrix.
- Consistency Check.

The Fundamental Comparison Scale is performed at pairwise comparison level. It allows the experts to express their preferences in terms of showing how strong is the dominance of one factor above the other (from the same pair). The expert chooses the most suitable descriptive term to state one factor's dominance over the other from the following set: equal, weak, strong, very strong or absolute. Respectively numbers 1, 3, 5, 7, 9 are attributed. Numbers 2, 4, 6, 8 describe intermediary situations, when a strict choice cannot be made. The Pair – Wise Comparison Matrix is a rectangular array of numbers issuing of expert ratings. Its mathematical notation has been presented on Equation 1 below:

[Equation 1:] 
$$[a_{ij}] = (n \times n)A, \text{ where}$$

[Equation 2:] 
$$a_{ij} = \frac{1}{a_{ji}} \text{ and}$$

[Equation 3:] 
$$a_{ij} = 1, \quad i = \{1, 2, \dots, n\} \text{ and}$$

[Equation 4:] 
$$j = \{1, 2, \dots, n\}.$$

An example of Pair – Wise Comparison Matrix has been presented below:

$$A = \begin{bmatrix} 1 & a_{12} & \dots & a_{1n} \\ \frac{1}{a_{12}} & 1 & & a_{2n} \\ a_{12} & \vdots & \vdots & \vdots \\ \frac{1}{a_{1n}} & \frac{1}{a_{2n}} & & 1 \end{bmatrix}$$

[Equation 5:]

Such a matrix must be normalized in the following way:

$$\bar{a}_{ij} = \frac{a_{ij}}{\sum_{j=1}^n a_{ij}}, \text{ where}$$

[Equation 6:]

$$i = \{1, 2, \dots, n\}.$$

[Equation 7:]

The sum of normalized verses of the matrix allows the calculation of matrix eigenvector.

The goal of Consistency Check is to exclude non – consistent expert opinions. The Consistency Ratio (CR) formula is presented below:

$$CR = \frac{CI}{RI}, \text{ where}$$

[Equation 8:]

CR – Consistency Ratio; CI – Consequence Index; RI – Random Index.

The Consequence Index can be calculated from the following equation:

$$CI = \frac{\lambda_{\max} - n}{n - 1}, \text{ where}$$

[Equation 9:]

CI – Consequence Index;  $\lambda_{\max}$  – matrix eigenvalue; n – dimension of the matrix (Saaty, 1996, p. 17 – 25).

The Random Index (RI) values depend from the dimension of the matrix and can be found in Table 1 below:

Table 2: Random Index values

| N  | 1    | 2    | 3    | 4    | 5    | 6    | 7    | 8    | 9    | 10   | 11   | 12   | 13   | 14   | 15   |
|----|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| RI | 0,00 | 0,00 | 0,58 | 0,90 | 1,12 | 1,24 | 1,32 | 1,41 | 1,45 | 1,49 | 1,51 | 1,48 | 1,56 | 1,57 | 1,59 |

Source: (Saaty, 1996, p. 21)

Expert opinions are inconsistent when the Consistency Ratio (CR) value exceeds 0,1.

In the following Chapter the author provides two proposals of methods for limitation of number of AHP criteria and alternatives.

## PRELIMINARY CRITERIA REDUCTION

Between many statistical methods conceived for grouping and arranging of various analytic criteria the author did not find any strictly applicable for the reduction of criteria number in multicriterial decision making processes. Although Saaty says that his model accepts an unlimited number of entries at the Criteria and Sub – criteria levels, he states clearly that only a limited number of analyzed criteria and alternatives can assure an

appropriate precision of obtained results. Saaty defines this number as  $7 \pm 2$  (which means 9 maximum – Saaty, 2003). At the same time he does not propose any methods of reduction of criteria amount. The author assumes that the reason of this moderation is the particularity of every decision making process. A separate list of criteria should be created for each decision making problem.

Taking all of the above into consideration, the author proposes two separate possibilities of criteria amount reduction:

- Analytical Method – elimination of less important criteria or less likely to happen alternatives based on expert evaluations.
- Deductive Method – elimination of less important criteria accordingly to the particularity of analyzed subject and the evaluation of criteria variability in time (constant and variable in short-, medium- and long time period).

Both proposed methods are author's own concepts and have their positive and negative sides. The main advantage of Analytical Method is that feedback is provided from various sources (more than one expert engaged in criteria evaluation process) which causes a higher certainty of obtained results. The disadvantage could be higher method complexity. The author also doubts seriously whether same experts as for AHP ranking can be used – the risk of self – suggestion seems to be extremely high, which could result in a situation where non eliminated criteria could be perceived as more relevant than in reality. The elimination of this inconvenience would require an extra amount of experts to be hired, which would cause higher financial costs and a larger time span for elaboration of a correct set of AHP criteria.

Between the advantages of Deductive Method (DM) the author would like to underline lower complexity of the method and the fact that it can be applied by the same person that is elaborating the set of AHP criteria. Additionally, if used correctly, DM application can be based on real economic data and as such – become subject to verification and comparisons with available databases. Another positive of DM is that constant and variable determinants in short-, medium- and long period of time are easy to define. On the negative side should be cited the higher uncertainty of results – because of evaluation performed by one person only. For the same reason the Deductive Method leaves more space for mistakes than the Analytical Method.

Despite the existence of important disadvantages, the author bows towards the application of Deductive Method. This decision can be justified by the fact that the cited disadvantages can be easily diminished by several means, i.e. consulting the elaborated list of AHP criteria with other members of enterprise's managerial board or specialists within the company, without hiring external experts. The following Chapter is a proposal of application of Deductive Method. The goal is the limiting of amount of geopolitical determinants of functioning of international companies (presented in Chapter 1) in order to elaborate a list of maximum 9 AHP criteria. The application of Analytical Method has been omitted on purpose – the application of expert evaluations for Analytic Hierarchy Process ranking has been presented in another author's works (Gawlik 2007, CUE & Gawlik 2007, IAE Press).

## **SOLUTION PROPOSAL**

The purpose of the current Chapter is to limit the number of environmental determinants of functioning of international companies (described in Chapter 1) to the number of 9 maximum. The author decided to apply the Deductive Method presented in Chapter 3 above. Recapitulating, the Deductive Method has three main features forming the Deductive Method Features List below:

1. It takes into account the particularity of the decision making process.
2. The features of analyzed subject remain in sight.
3. The evaluation is based on the variability in time of each determinant.

When describing the Deductive Method some more space should be devoted to the issue of criteria variability in time. Usually the first step of strategic decision making consists of determination of time horizon of

planning. Most common intervals are short-, medium- and long time periods. Short time period equals up to one year, medium time period up to 3 years, long time period means a time span no longer than 5 years (Détie, 2000). Planning over the mentioned 5 years is threatened by a high level of risk coming from instability of enterprise's Operating, Host – country and Mega – environment. In other words it is economically unreasonable to plan any enterprise strategy for time periods longer than 5 years because of high unpredictability of geopolitical environment of the enterprise. Hence we can assume that some of these geopolitical determinants in long time periods can be treated as stable, unchangeable – *constans*. The question which determinants can be treated this way without harm to the quality of strategic decision making remains crucial. The author will try to distinguish them from a list of determinants describing the environment of international companies in order to obtain a correct list of AHP criteria. It is important to add that the main goal of the decision making is to assure a constant growth of examined international company.

Two determinants from the Operating Environment seem to be possible subject for reduction. These are the enterprise's Social Responsibility and Ethics. The basis for the elimination of those two determinants is point 1 of Deductive Method Features List described above – the particularity of decision making process. Although the importance of Corporate Social Responsibility, as well as the need of implementing ethical standards in any enterprise seems to be undisputable, it will not assure company's growth. Under these assumptions the inclusion of these factors into the set of analyzed criteria seems to be irrelevant. Both of these issues cannot be treated separately from economic indicators describing the condition of analyzed company. For this reason they will not be taken into account in further AHP analysis. At the same time the first three determinants – Legal Regulations, Organizational Culture, personnel Skills and managerial Know - How bear a strong influence on strategic decision making in enterprises.

In the group of Host – country environment determinants Economic, Political and Technological factors cannot be omitted due to their high significance at numerous fields of enterprise functioning. Referring to point 2 of Deductive Method Features List, Culture in Individual Aspect and the Interdependence between subsidiary enterprise and Host – country can be seen as independent from company's authorities. When trying to reformulate this idea, we could say that in opposition to Legal Regulations, Organizational Culture, Skills (from the Operating Environment determinants) or Economic, Political and Technological factors, these determinants cannot be changed or even influenced by any moves made by company's management, including lobbying. Under this assumption they can be deducted from the AHP criteria set as well. This does not necessary mean that their influence on enterprise's decision making effectiveness is unimportant. They simply belong to the group of factors excluded from management's decisiveness.

Mega Environment determinants are a good example for reduction of number of AHP criteria based on point 3 of Deductive Method Features List, namely the variability of factors in time. Whereas Global Trends and Forces, Global Competition and the Interdependence of Global Companies and Host – Countries can change quickly, accordingly to political climate, economic stability and World's situation in general (at least in a medium time span), the prescriptions of International Law, as well as the Level of Global Technological Advancement show variability only in longer time periods. Under the assumption that any planning over 5 years seems to be unreasonable (already explained before), both of these factors can be treated as *constans* in short- and medium time periods. In other words they can be omitted on the AHP criteria list because of their invariability in time periods relevant for strategic planning.

At this point it is important to underline that the elimination of factors from the list of AHP criteria does not mean that they become unimportant. For the needs of analyzed decision making process they will be simply treated as the statistical group of “*other environmental factors*”, the influence of which can be omitted, but only when making decisions with a short or medium planning horizon.

## CONCLUDING REMARKS

The author believes that the Analytical and Deductive methods of preliminary criteria reduction presented above can become useful tools for elaborating a correct list of criteria for Analytic Hierarchy Process application. Although their simplicity, they can prove themselves as useful in multicriterial decision making

processes, where the number of criteria exceeds the amount allowed by the method or could obfuscate the correct perception of enterprise's environment, which could result in ineffective final decision.

**Tshwane University of Technology, South Africa**

## **ABSTRACT**

Increased competition in the educational environment has contributed to the growing importance of service quality measurement at higher education institutions. This paper investigates aspects of service quality in higher education as a step towards developing a standardised scale for its measurement. Using structured questionnaires, survey data was collected from students ( $n = 391$ ) from two South African universities. Findings indicate that the service quality in higher education scale is a multidimensional construct loading on 13 factors with reasonable reliability coefficient and some construct validity. Significant relationships were found among a number of study variables. Some further research directions were suggested and policy implications discussed.

## **INTRODUCTION**

In response to the dynamic national, regional and global developments, Higher Education institutions have been changing rapidly. In South Africa, examinations systems, structures and other related processes have changed drastically impacting on the pass rate at the highest school levels and affecting intake at tertiary level. Consequently, a large number of students relative to available spaces and available government loans/scholarships apply with limited success. Prospective higher education students and the tertiary institutions' administrators normally undertake extended decision making during their processing of applications for courses of study. De Jager and Du Plooy (2006) noted how the decision-making process with regard to a course or a specific institution can be very complex. An increased understanding of the potential higher education student decision-making process would enable Higher Education institutions to market their courses in a more timely and effective way (Moogan, Baron & Bainbridge, 2001). Consequently institutions of higher education should be well aware of what aspects students value most in order to make a final decision with regard to a specific institution (De Jager & Du Plooy, 2006). Institutions of Higher Education should determine the most important variables that are under their control in order satisfy the changing needs of the students.

### **Service Quality in Higher Education**

According to Berry and Parasuraman (1991) practitioners in quality management have developed methods of improving service quality. Sohail, Rajadurai and Rahman (2003) points out that in the context of higher education many college administrators see implementation of quality practices, such as TQM as a way to reassure that institutions of higher education perform well and that the customers of higher education are being served well.

Oldfield and Baron (2000) suggest that there are three underlying factors of higher education service quality namely, requisite elements (encounters which are essential to enable students to fulfil their study obligations), acceptable elements (which are desirable but not essential to students) and functional elements (which are of a

practical or utilitarian nature). Cheng and Tam (1997) came to the conclusion that based on different conceptions of education quality and the different concerns about achievement of education quality, various people may use diverse indicators to assess education quality and miscellaneous strategies to achieve education quality. It may result in not including all aspects of the input, process and outcome of an education institution. Consequently, our discussion in this paper will focus on the factors emerging from the data.

## **Entering Tertiary Education**

Service delivery and customer satisfaction in an education environment is dependent on personal interaction between students and staff. The personal interaction and labour intensive nature of this service translates in a potentially highly heterogeneous quality service experience (Hill, 1995). In respect of service delivery students are generally not interested in organisational hierarchies and expect all staff (academic or administrative) to work together to represent the institution in their service delivery (Oldfield & Baron, 2000). Students therefore are expected to view any dealing with staff, irrespective of the nature of the dealing, to impact on their experience of service delivery. All learners entering tertiary education have expectations with regard to the learning exercise and individual preferences. Various authors have attempted to identify issues more directly related to higher education institutions in order to determine factors that influence a student's decision making process. More often than not these include support facilities and infrastructure, image and marketing, academic issues, administrative issues, location and access (Peterson & Augustine, 2000; Sporn, 1999; Strydom, Lategan & Muller, 1997; Woodhouse, 1996).

It can be argued that the decision making process of students is based on five factors (Cubillo, Sanchez & Cervino, 2006). Three of these, external to the institution, are personal reasons, previous experiences by acquaintances and the location of the programme. The importance of experiences by acquaintances implies that experience by alumni translates into an important marketing tool and serves as an image builder outside the realm of the institution. The other two, directly related to and managed by the institution, are the image of the university and the perceived quality of the programme of study. Although the relative importance of these factors is not ascertained it is clear that universities have to build and protect both institution and programme images to maintain its competitive position in the industry.

Increasingly, quality as component of service delivery dominates as one of the prime aspects impacting student decision making for education (McBurnie & Ziguras, 2007). The quality of the overall experience for students is crucial to the success of programmes. Ensuring quality content delivery is important as the educational value in education is embedded in the rigour and image of programmes (Desoff, 2006).

## **Higher Education in the Marketplace**

According to De Shields, Kara and Kaynak (2005) marketplace dynamics are forcing business schools around the world to re examine their structures and business strategies and the processes employed to deliver value adding quality education. This follows intense competition around the globe that forces companies to adopt a marketing orientation in order to differentiate their offerings from those of competitors. According to Ford, Joseph and Joseph (1999:171) services industries have been reluctant to adopt this kind of focus and nowhere has it been truer than in the case of higher education. According to these authors many institutions of higher education were in the luxurious position of seeing ever increasing enrolments and resultant budgets. However the boom of the 1970s and 1980s has been replaced by the bust of the 1990s and 2000s. In addition tertiary education has experienced a dramatic decline in government subsidies and an increase in student fees in various countries (Mok, 2003; Palihawadana, 1999; Soutar & Turner, 2002) especially many countries with similar educational systems to South Africa. Kotler (2003) indicates that the numbers of students enrolling in US business schools nationwide has levelled off or declined and new competitors are entering the market continuously. This is due to various changes in the respective environments. It appears as if tertiary institutions face increasing market and financial pressures in developing as well as in developed countries. The result has been a more competitive educational environment. Consequently institutions of higher education are competing for the most promising students, their customers, by applying scientific business principles in order to recruit and retain the student (De Jager & du Plooy, 2006).

According to Abouchedid and Nasser (2002: 198) the service quality concept in higher education is inextricably linked to the competitive service and success of an institution. Service quality serves to meet the basic objective

of retention and enrolment of students in universities. The authors confirm the value of providing acceptable services to students in order to maintain the stature and academic reputation of an institution. Furthering on this Abdullah (2006: 31) states that service quality has emerged as a pervasive strategic force and a key strategic issue on management's agenda. In recent times higher education is being driven towards commercial competition imposed by economic forces resulting from the development of global education markets and the reduction of government funds that forces tertiary institutions to seek funds from other sources. The emerging scenario pushes conclusions along the lines that higher education should not only be concerned about the society's perception about the skills and the abilities of their graduates but also about the perception of students about their educational experience. This also calls attention to some specific management process suggesting that apart from the traditional areas like accreditation and performance indicators of teaching and research, emphasis should perhaps now include focusing on students as customers.

## **Access, Location, Facilities and Infrastructure of Higher Education**

Some demographic groups (including gender, age, ethnicity and social class criteria) often do not enjoy the same degree of access to higher education and it is therefore essential to investigate the access to higher education and the composition of the student body (Halsey, 1992). Variation in access by institution or institution type could also be a result of segmentation and positioning policies adopted by providers (Tonks & Farr, 1995), including government policies. Social class has also been used for describing the social origins of the actual or potential student body and to identify and assess differences between universities and polytechnics in terms of segmentation outcomes (Halsey, 1992). The geographic location of people (closely linked to social class) can be an important determinant of opportunities and capacity to act on them. This is also true for students from poorer areas or countries in Africa with limited financial resources, accesses to transport, library, computer and internet facilities. Factors such as gender, ethnicity, social class and geographic location have a significant influence on the access of African students to educational institutions.

The location of a university and the geographic surroundings are often perceived as aspects which will influence the choice of a particular institution. In South Africa this can be seen as a decisive factor in the decision making process. Because of high unemployment rates and lack of sufficient funds, parents will be more likely to send their children to more accessible locations. Campus atmosphere, access to public transport and parking availability is also pointed out as indicative of a desirable institution of higher education (Moogan, Baron & Bainbridge, 2001, Souter & Turner, 2002). Russell (2005) points out that the effective arrangement of physical evidence is important as prospective students often look at the physical evidence that surrounds the service in forming their evaluation of the service.

Students choosing between higher education institutions will eliminate choice alternatives on the basis of geographic, economic and academic factors (Jackson, 1982). Various research results verify the importance of location when students make decisions regarding higher education (Moogan & Baron, 2001; Moogan, Baron & Harris, 1999; Roberts & Allen, 1997; Welki & Navratil, 1987). Moogan et al. (1999) identify course specifics, location and reputation of the institution as important attributes for UK students. For this study location include aspects such as distance from home, rural/urban place, atmosphere of the campus and facilities of the city/town of the university. The facilities of higher educational institutions can also influence their ability to attract quality research personnel, to create suitable learning environments and student perceptions of their learning experience (Price, Fides, Smith & Agahi, 2003). The infrastructure of the institution such as computer and library facilities, campus security and accommodation is also seen as a major consideration when choosing an institution of higher education (Veloutsou, Lewis & Paton, 2004). Price et al. (2003) in examining the influence of facilities and location factors on the decision making process of undergraduates when choosing where to study found that all aspects relating to learning and teaching facilities, especially library facilities and the availability of computers were regarded as relatively important.

## **South African Universities**

Universities in South Africa have experienced stagnating and declining budgets and simultaneous pressures to increase enrolments (Samoff, 2001). Since the late nineties South African universities have experienced a gradual decline in student numbers translating in more choice and increased pressures on service delivery by students. Pressures also build up in respect of technological advances and skills with some institutions and staff

delivering and using sub-standard computer technology (Miji, 2002; Zaaïman, Van der Flier & Thijs, 1998). An assessment of the South African education system indicates that individual universities display unique sets of characteristics with regard to historical origins, faculty and departmental organisation, human resources and student numbers (Cloete & Bunting, 2000). Each of these in turn contributes to the image and reputation of the university. At the same time all universities are governed by common national regulations which imply a level of homogeneity across all players. South African Universities like other universities in countries such as the United Kingdom and Australia (that have similar educational systems to South Africa) has experienced a dramatic decline in government subsidies and an increase in student fees (Palihawadana, 1999; Soutar & Turner, 2002). In South Africa the decline in funding from subsidies is a direct consequence of the trend of falling pass rates (Naidoo, 2003) and subsequently earns less government subsidy.

Given the above background, the effects of competition on institutions of higher education, especially in the South African context, can be seen as having far-reaching implications for these institutions. Traditionally, Technikons and Universities have competed indirectly, whereas they now compete directly, ostensibly for the same market. The impact of technology and the demand for a technologically literate workforce has also created a third stream of private educational institutions that not only compete for school-leavers, but also on post-graduate level. Private providers meeting a specialised demand are often highly responsive and provide credentials in areas that the public sector does not (Kruss, 2002). This increased level of competition in the education environment has led to institutions of higher education employing managerial techniques to improve the efficiency and quality of services (Palihawadana, 1999) and switching from a passive to a more active market approach (Naudé & Ivy, 1999). If universities are to satisfy student requirements they must be aware of their own offerings and how these are perceived in the market place. Being aware of the influential factors and the associated impact on potential students is important for institutional policy makers (Moogan et al., 2001).

## **Objective of the Study**

The primary objective of the study is to examine some of the criteria used by South-African students, when choosing or evaluating a tertiary institution. The study specifically initiates a process of developing a standardised measure of service quality in higher education and explores the various factors and components within service quality measurement in higher education service delivery in South Africa. In addition, the study examines the relationship between the service quality measures on the one hand and some other related variables such as intention to leave the university, trust in management of the university and the overall satisfaction with the university.

### **Specific Hypotheses Tested:**

1. The service quality in higher education scale is a multidimensional measure
2. There is a significant relationship among service quality measures, intention to leave university, trust in management of the university and overall satisfaction with the university

## **RESEARCH METHODOLOGY**

### **The sample framework**

A random sample of 391 South-African students in the Faculty of Management of two universities was selected (Tshwane University of Technology – TUT and Cape Peninsula University of Technology – CPUT). These Universities were selected because collectively they represents 40 per cent of students enrolment of the Universities of Technology in South Africa. Sample elements were selected from a list of all courses (including numbers of students per course). The sample comprises 41% males and 59% females. The attitudes of the student samples were tested regarding the importance of pre identified service quality variables related to academic and non academic issues when assessing a specific tertiary institution.

### **Measuring instrument and reliability**

The list of items developed to measure service quality in HE was based on an extensive literature research and the findings of preliminary focus groups consisting of students and lecturers. The resulting instrument, a

structured questionnaire, included several variables related to service quality at higher educational institution. The questionnaires were distributed to randomly selected students in pre-determined classes. Some demographic information was sought.

*Service Quality Scale:* service quality in higher education was measured by 52-items on a 5-point scale from “very important” to “not important at all”. Examples of items include: (1) Location of the Institution, (2) Well equipped Computer facilities, (3) Offer wide range of degrees/majors. Cronbach’s alpha of 0.92 was obtained for all items for the sample. *Intention to leave:* was measured on by four items on a 5-point Likert-type scale from “strongly agree” to “strongly disagree”. Example item include: (1) I often think of quitting my present educational institution (reserved score) and (2) I plan to stay in my present educational institution to develop my skills and complete my education. Cronbach’s alpha was 0.70 for the sample. *Trust in Management and Support:* was measured by five items on a 5-point Likert-type scale from “strongly agree” to “strongly disagree”. Example item include: (1) I am convinced my educational institution treat me with respect (2) The management of my educational institution encourages ideas and suggestions about ways to make the institution better. Cronbach’s alpha was 0.86 for the sample. *Overall satisfaction with the university was also measured by a single item:* What is your overall level of satisfaction with the university where you are currently enrolled? Response was anchored on a 5-point scale from “very satisfied” to “not satisfied at all”. The following variables were also measured with a single item fixed choice scale measure. They include academic performance, the main reason for study, living arrangement during school time, and satisfaction with transportation to the university.

## DATA ANALYSIS AND FINDINGS

Our analysis of the respondent profile produced the following results. Respondents were 59% female, about 43% were in their first year, 25% were within the 18-19 years age bracket, 31% were between 20-21 years; while about 18% were over 22 years. TUT had about 59% students participating. On academic performance, nearly 40% indicated a B grade average (60-69%) and 37% a C grade (50-59%). Only 2% reported lower than 40% score while 12 were in the A category (70-100%). Majority of the respondents indicated that they became aware of the University through friends (40%), family member (34%), Media (20%), the institution itself (27%) and teachers (17%). The major reason for study was for better job opportunities (48%), personal development (32%) and higher income (15%). Results obtained on the living arrangement revealed that majority were still living with their parents (41%), University residence (25%), and rented flats (12%). It is also interesting to note that over 60% of respondents were satisfied with their university.

**Table 1: Factor Analysis of Service Quality Scale, Mean, Standard Deviation & Cronbach’s Alpha**

| S/N | Factors (Service Quality Scale)         | No. of items | Mean  | Stan. Dev. | Alpha |
|-----|---|--------------|-------|------------|-------|
| 1   | Internationalisation                    | 6            | 11.76 | 4.21       | 0.82  |
| 2   | Marketing and support                   | 6            | 12.17 | 4.31       | 0.78  |
| 3   | Access and approachableness of services | 7            | 11.35 | 3.81       | 0.81  |
| 4   | International Students and Staff        | 4            | 8.52  | 3.38       | 0.79  |
| 5   | Academic reputation                     | 5            | 7.43  | 2.62       | 0.71  |
| 6   | Student focused                         | 3            | 5.55  | 2.16       | 0.65  |
| 7   | Academic quality                        | 3            | 5.04  | 2.07       | 0.67  |
| 8   | Variety and reach                       | 3            | 5.25  | 2.21       | 0.69  |
| 9   | Location and Logistics                  | 4            | 7.45  | 2.86       | 0.63  |
| 10  | Accommodation and Scholarship           | 3            | 6.17  | 2.63       | 0.57  |
| 11  | Sports reputation and facilities        | 2            | 4.11  | 1.96       | 0.79  |
| 12  | Safety and Security                     | 1            | 1.36  | 0.79       | -     |
| 13  | Parking                                 | 1            | 2.09  | 1.23       | -     |

Factor analysis was used as a data reduction tool and as a technique to establish some construct validity for the measure of service quality in higher education. The principal components analysis methods was used for initial factor extraction and Varimax rotation was applied. Four items were redundant and thus eliminated from further analysis. Thirteen factors were identified as key dimensions of service quality in higher education. These factors were named as indicated in Table 1. Each factor has factor scores higher than  $\pm 0.50$ , which demonstrates

significant evidence about correlations between the items and each factor. Dancey and Reidy (2002) noted that when performing factor analysis, at least 100 participants should be used and the study should have five times as many participants as variables. Both of these criteria were met by the present study, with a 52-item measure and 391 respondents. The percentage of total variance of all 52 items explained by the 13 factors is about 60 per cent. This finding confirms hypothesis 1 that service quality in higher education scale is a multidimensional measure.

The factor analysis also shows evidence of construct validity for the scale and an overall reliability coefficient (Cronbach's  $\alpha$ ) of 0.92. Moreover, the significant correlation with other study variables including intention to leave and trust in management of the university (see Table 2) is an indication of some convergent validity and, to a limited extent, discriminant validity (Churchill, 1995; Cooligan, 1999). Specifically, result shows that intention to leave the university correlates significantly with internationalisation, access and approachableness of services and being student focused. Secondly, trust in management and support correlates significantly with marketing and support; international students and staff; academic quality; and sports reputation and facilities. Finally, significant intercorrelations exist among all the factors emerging from the service quality scale further confirming internal consistency, reliability and some construct validity for the scale. There is obviously need for a more rigorous investigation to confirm these tentative findings.

The intercorrelation matrix among selected study variables is reported in table 2. The higher the academic performance reported the more satisfied students were with the university ( $r = 0.11$ ,  $p < 0.05$ ). Living arrangement, was inversely but significantly correlated with satisfaction with transport ( $r = -0.21$ ,  $p < 0.01$ ), but directly and significantly correlated with overall satisfaction with the university ( $r = 0.19$ ,  $p < 0.01$ ). Students who live farther from the University tended to be more concerned with a convenient transport arrangement. It is equally interesting that the more acceptable the living arrangement is for the student the more positive they generally feel about the university. The higher the satisfaction with transport the higher the trust in management ( $r = 0.20$ ,  $p < 0.01$ ). The significant positive link among trust in management, satisfaction with transport and overall satisfaction with the university is an important signal of the interwoven nature of the study variables. Satisfaction with transportation is a strong indicator of how positively the university administration is perceived by the students.

**Table 2: Intercorrelations among Selected Study Variables**

| Study Variables                     | 2                 | 3                 | 4                | 5                | 6                | 7                | 8                | 9                | 10               | 11               | 12               |
|-------------------------------------|-------------------|-------------------|------------------|------------------|------------------|------------------|------------------|------------------|------------------|------------------|------------------|
| 1 Overall Satisfaction (university) | -.28 <sup>b</sup> | .42 <sup>b</sup>  | .03              | -.00             | -.06             | .01              | .05              | -.04             | .01              | -.09             | -.05             |

Notes: (2-tailed); <sup>a</sup> $p < 0.05$ ; <sup>b</sup> $p < 0.01$ ;  $n = 391$

Another interesting finding is that the lower the intention to leave the university the higher the trust in management ( $r = -0.15$ ,  $p < 0.01$ ) and the higher the overall satisfaction with the university ( $r = -0.28$ ,  $p < 0.01$ ). It is clear that students will want to stay in a University where they are generally happy and satisfied, believes that management of the University will continue to work in their interest hence the trust in management.

## DISCUSSION AND IMPLICATIONS

The study set out to accomplish two main objectives. First, to what extent is the service quality scale in higher education a multidimensional variable and what are the components? Secondly, what is the relationship between the factors that may emerge from the scale and other study variables like intention to leave, trust in management of the university and overall satisfaction with the university. The result reveals that the developing service quality in HE scale is indeed a multidimensional scale loading on 13 factors and showing a very strong internal consistency among the factors. Some of the factors emerging from the scale were also strongly correlated with intention to leave and trust in management, especially notable and important are internationalisation, access and approachableness of services, being student focused, marketing and support; international students and staff; academic quality; and sports reputation and facilities.

Internationalisation also came up as a very important factor in our measure of service quality loading as two interrelated items internationalisation (6-items) and international students and staff (4-items). The importance of internationalisation in the emerging competitive Higher Education sector has been well discussed in many studies (e.g. Meares, 2003; Miji, 2002; Mok 2003; Stephenson, 2006). Similarly, other factors from the service quality scale identified as important in our result and also supported by earlier studies include academic reputation; access and approachableness of services (e.g. Abouchedid & Nasser 2002). Convenient and comfortable living arrangement during school time, and satisfaction with transportation to the university emerged as critical factors in students' satisfaction as well as trust in the management of the university. Similarly the students' overall satisfaction with the university was an important correlate of academic performance, although since the causal direction of the relationship was not established in this investigation the question which precede the other is not answered. Suffice to add also that the lower the trust in management and satisfaction of the student with the university the higher the intention to leave the university.

The findings of this study, tentative as they may be are however encouraging as it opens a number of areas for further research. The management of HE in South Africa continues to be challenging in many respects and especially so with the socio-political pressures given the historical antecedents of segregation and the need to stretch HE to reach all hitherto underprivileged groups while not necessarily depriving all other citizens a fair access. While the present data is not without limitations a more extensive exploration is possible and could yet reveal more meaningful information about the nature of the relationship among the study variables. This could be accomplished with partial and multiple regression analysis to show the partial and full impact of the variables between and among themselves. Follow-up interviews and focus groups discussion with carefully selected students and student groups may generate a wide range of rich additional information to what is obtainable with survey instruments which is not without its attendant limitations.

## CONCLUSION

To conclude, these results emphasise the importance of the interwoven relationship among some of the study variables including the need for effective management in the HE sector in South Africa. Education has always been evaluated in terms of its practical value and in many parts of the world University education is highly revered and treasured because it has always been and may for a long time be available to very few people (De Jager & Gbadamosi, 2008). The importance of demographic differences and other respondent's profile unexplored in the present investigation are worthy of future investigation, just as a more systematic and longitudinal research approach – though time consuming and expensive – may be of significant value in advancing this all important research area in HE in South Africa. There is no doubt that the transformation of HE in South Africa is an imperative that demands innovation both at the HE management – student interface level and in the wider social and policy context.

# STUDIES OF CULTURES AND SUBCULTURES

**Anna Gogleva**  
**State University – Higher School of Economics, Russia**

## ABSTRACT

*This work presents detailed analysis of the literature concerning the concept of organizational culture. The purpose of this work is to define the results of numerous studies of different levels of cultures. At first, examination of the concept of organizational culture is presented. After that, the emphasis on empirical research of subcultures is argued with several conclusions about the possible basis of differentiating the subcultures. At last, the analysis of several subcultures in one Russian company is offered in order to define possible ways of considering the differences between subgroups.*

## INTRODUCTION

Application of the concept of organizational culture started approximately in 1980s (Gordon, 1991; Sinclair, 1993; Sorensen, 2002) though some authors used this concept much earlier (Pettigrew, 1979). And now world experience of studying this phenomenon is rather extensive. This theme became one of the most popular and important issue in organizational studies since the time, when the organizational researchers rose question why Japanese manufacturers competed successfully with American companies (Ouchi and Wilkins, 1985). Studies within the structure perspective have not given any results, so then national features became under investigation. The theoretical and empirical studies showed that even within one national culture there were distinctions in organizational cultures. So the topic of organizational culture became one of the most interesting themes for practicing managers and consultants, and one of the most complicated subjects for scientific researchers.

Concerning the question of organizational development and innovation processes the problem of organizational culture is rather interesting. As it will be shown later, cultures do change but according to their own logic, not according to anyone's plans. This forces management to consider the actual cultural situation in a company: values and assumptions of its employees. This question is well known among managers and consultants, even several tools are elaborated to decrease the level of culture risks. But there is relatively new aspect in studies of organizational culture. It is existence of subcultures. And there are no exact knowledge about mechanism of their creation and being. For practical needs it is rather important to understand the possible ways of managing multicultural organizational environment. Different groups of employees demand different styles of management, while the company applies one strategy. Therefore there is a challenge to the whole company to consider all the differences among employees and to be effective, successful and competitive. There are more questions than answers and this is only a part of them: Whether all subcultures should be considered in a effective company? Is it possible to implement a unified personnel strategy for all employees? How the groups of employees should be distinguished? And finally, are there some extra benefits for the company by managing groups of employees or this is just a new theoretical approach?

This paper presents an attempt to integrate results achieved from studies on organizational cultures and this idea of multiple subcultures. A demonstrative example of one Russian production company and its analysis from 'subcultural' framework will be given. As a result some suppositions about the answers on the questions mentioned above will be made.

## REVIEW OF STUDIES ON ORGANIZATIONAL CULTURE

This problem of studying organizational culture became very popular also because there was feeling, that this direction of studies could give the results which would help to explain failures of implementing management

programs of changes and development in the companies. The literature is abundant with studies about organizational culture as one additional tool in the managerial arsenal of running an organization, thus it seemed that the only question rested without answer is how to achieve efficiency by manipulation of organizational culture (Denison, 1996). So, the researchers were interested in issues about the relationship between organizational culture and effectiveness (Denison and Mishra, 1995; Sorensen, 2002; McKee, 2004), about dependence of new product development process on the characteristics of the organizational culture (Belassi, 1999), about influence of culture on training and appraisal systems of the employees (Huzzard, 2000; Henri, 2006), etc.

Besides, as argued by several authors, the foundations of contemporary approaches to organizational culture are in anthropology, sociology and psychology. And these main directions of studies were separated out, so the gap in development of concepts of organizational culture emerged. This impeded the development of unified understanding of the phenomenon and has brought confusion of concepts (Ouchi and Wilkins, 1985, Denison, 1996, Schein, 1996). Although most authors recognize the multidisciplinary character of this phenomenon the overwhelming majority of organizational studies present a pragmatic view on organizational culture based on psychological framework. For example, Schein (1996) considers that the sociological and anthropological approaches are recommended to be integrated in further investigations because within these approaches there is great experience of revealing culture and studying its internal mechanisms. But on the other hand, sociologists underestimate the influence of individual distinctions on social phenomena which they study. So the further inquiry of organizational culture is a synthesis of these three disciplines and should be based on their achievements.

In spite of the fact that the theme is developed during so many years, there is a set of substantial and methodological questions (Denison and Mishra, 1995; Sorensen, 2002). They led some researchers to conclude that qualitative research would be the only appropriate methodology for the study, while others believe that organizational culture is measurable phenomenon, as well as the others, and they try to investigate it applying quantitative research methods (Hofstede et al., 1990).

Another substantial problem is absence of a precise definition of this phenomenon. The authors, who try to examine their assumptions about the influence of organizational culture, are compelled to combine several models, proceeding from their needs and opportunities. Thus the conceptual integrity and internal consistency of the models are doubtful and beyond their researches. Some authors offer 'working definition' of organizational culture which does not demand clearness of formulations. For example, Sinclair gives the following one: the culture "consists of what people believe about how things work in their organisations and the behavioural and physical outcomes of these beliefs" (Sinclair, 1993, p. 64). Hofstede considers the culture as the collective mental programming – "it is that part of our conditioning that we share with other members of our nation, region or group but not with members of other nations, regions or groups" (Hofstede, 1983, p. 76). Weick characterized organizational culture as a product of attempts by which organization imposes coherence, order and sense in its experience. But the majority of authors prefer to use partially, or with additions, the classical definition of Schein (Denison, 1996; Sorensen, 2002), namely: "the organizational culture is a pattern of shared basic assumptions that the group learned as it solved its problems of external adaptation and internal integration, that has worked well enough to be considered valid and, therefore, to be taught to new members, as the correct way to perceive, think, and feel in relation to those problems" (Schein, 1983).

The complexity of the phenomenon remains the basic obstacle for detailed and deep studies about the nature of interrelation of culture and organizational activities. One of the general results of the studies and methodological researches is the conclusion that it is very difficult to present uniform culture in an organization.

## **STUDIES OF SUBCULTURES**

A new type of literature appeared which affirmed that the organizational culture should be considered as a set of professional cultures which define the nature of individual senses and practice on work (Denison, 1996). Hofstede (1998) argues, that actual existence of organizational culture demands more, than shared categories of schemes, it demands, that schemes and relative blanks in schemes were identical for all members of the organization. This is difficult to imagine and Van Maanen and Barley (1984) assume, that multiple subcultures is the rule, while the uniform culture is an exception.

Kossek (2003) believe that the unitary approach to organizational culture oversimplifies the nature of organizational functioning. He suggests that the organizations will win from development of HR strategy if it distinguishes and considers various subcultures within a company. This new approach of subcultures began to

criticize the previous works, giving the reason that members of one culture do not know about their own culture while they do not collide with the other one (Schein, 1996), and it is better to study norms and values at a level of subcultures because they can be considered as unified and homogeneous (Huzzard, 2000).

This approach assumes that behavioral norms and practices differ in organizational units, and they are not necessarily shared by everybody in organization (Kossek, 2003). Researchers began to cast doubt on the analysis of culture which ignores both professional subcultures and empirical studies of multicultural relations (Thorne, 2000).

Van Maanen and Barley define subculture as a subset of members of the organization which regularly interact with one another and identify themselves with the distinct group, share a set of problems, and take action on the basis of collective understanding (Kossek, 2003). The basic difference between culture and subculture is that the culture is uniform, and subcultures make the multiple small cultures coexisting in same organizations (Hatch, 1997). Moreover, subcultures and countercultures can counteract organizational values of dominating culture (Martin and Siehl, 1983).

At least three types of subcultures can potentially exist: enhancing, orthogonal and countercultural (Martin and Siehl, 1983). The enhancing subculture will exist in an organizational enclave in which the commitment to basic values of dominating culture is stronger than in the rest of the organization. In orthogonal subculture members will simultaneously accept the basic values of dominating culture and to separate reconcilable set of their particular values. The third type of subculture is a counterculture. It refers to the case when some basic values of a counterculture will challenge the basic values of dominating culture. Likewise, Smircich (1983) assumed the existence of competing subcultures.

Numerous researchers have proved the existence of subcultures in the companies. Here only a few examples. Schein (1996) has indicated three groups in the organization with their own culture. The 'engineers' design and monitor core technological processes, the 'operators' are the linear employees providing activity and mission realization, and the 'executives' look at the organization as a whole and cope with the other two groups. Hofstede (1998) has successfully applied cluster analysis to reveal subcultures in the insurance company. He managed to reveal three clusters and three subcultures accordingly: the professional, consumer and administrative.

Hofstede (1998) emphasize that, operating the complex organization, it is necessary to understand cultural variety within the organization. Decisions of managers are the result of their own culture and are limited against the rest organization. Ouchi and Wilkins (1985) have presented two various approaches to management. The first approach is based on the idea that management can create uniform joining culture around the ethical values. Compensation, selection and appraisal systems, structure, physical space, rituals and ceremonies - this all should be thought over for strengthening organizational norms and values. The second approach proceeds from the assumption that it is necessary to manage subcultures within the organization, and it considers that culture is an opposition and interaction of different forces.

Kossek (2003) also affirms that organization includes a set of subcultures which are connected with behavioral norms, routines and habits, and also play a significant role, influencing the success of a strategy. Martin and Siehl (1983) have found out through empirical research that the counterculture can carry out useful function, articulating borders between appropriate and unacceptable behavior, and providing safety for development and innovative ideas.

The analysis of the studies on subcultures led us to conclusion that this new framework complicates organizational analysis. According to authors, managers need to take into consideration existent subcultures and their position concerning unified organizational culture. So the internal environment should be monitored to indicate the groups with conflicting values and orthogonal subcultures. This can prevent the company from unnecessary cultural risks in situations of organizational development. The understanding of enhancing groups could help leaders to find support to their actions or helpful feedback.

## **SUBCULTURAL ANALYSIS**

From all told above it is possible to draw a conclusion, that this development of theoretical and empirical researches is natural process based on the understanding of different levels of culture. And the research path goes through all these levels: national culture, organizational culture, group culture and individual culture. While the issues of national and organizational cultures are well researched, the group level of culture is less clear. But we should remember that the notion of culture is sociological, so individual culture should be separated from collective culture.

The core question without answers is about practices and methods of managing organization considering subcultural differences. The internal environment becomes more complex so the study is necessary for making decisions. Apart from monitoring enhancing, orthogonal and counter- cultures, another issue needs to be cleared up. How group of employees can create its own subculture in one organizational environment? The basis for differentiation of employees is very important. The reason is evident. The conflicting values of core employees can damage all plans while in subsidiary unit it is possible. The literature presents several examples of differentiating basis of subcultures.

Three possible distinctions could be noted. The first one concerns the occupational subcultures. The empirical study of Thorne (2000) demonstrated clearly different norms, values and assumptions in managerial culture and in medical and their combination in separate position. The results of Hofstede (1998) and Schein (1996) agree with this distinction. The second distinction concerns the mode of employment. Kossek (2003) raised this question in theoretical work; the main idea was that the uncertainty of employment and the relationship between personnel and the company affect the process of strategy implementation. The third distinction concerns the level in the hierarchy. Detert argues that there are a lot of cases when the organization does not render sufficient attention to norms and values to workers of the bottom level (in Kossek, 2003). Though the managers operate as they are in case, when their managerial subculture presents a common organizational culture.

The case of one Russian company producing ice-cream can help us to illustrate the existence of these distinctions. The qualitative data gave empirical test of theoretical elaborations presented above. In this case 17 deep interviews with employees of different categories and levels were conducted. It was preliminary research with the aim to indicate possible interrelations between organizational culture and different managerial activities. The situation in the company was interesting because the managerial team had been changed, so they started to modify major practices. The result showed that all three distinctions can be presented in one company. Organizational changes revealed these groups of employees as stable groups so these results might be useful for development managers.

The first distinction is occupational. The culture of factory workers differs very much from culture of administration employees even if they are in immediate proximity. Firstly, this distinction can be traced in language – there are different styles of communication with colleagues and supervisors, the themes of talks vary. Then, work attitudes and values are quite different. This is the result of different work conditions, compensation policy, and career perspectives. Additionally, an interesting finding was made: even in the situation of organizational changes, the level of uncertainty among factory workers was higher than among office employees. Factory workers receive only plan for every day, so they are not involved in planning. The main factor of this distinction is the character of the job and supervisors style.

The second distinction is a kind of employment. As the production is seasonal a temporary personnel is engaged. So at least two groups in a factory work together, and the group of temporary employees is seven times as much as group of core workers. The distinction can be traced not only in quantity but also in quality of work force; the average level of qualification among core workers is higher than among temporary workers. Accordingly the contract conditions are different, but main work conditions are similar. The main difference is the level of cohesion. It is predictable, that the core workers are more united contrary to temporary employees. This creates a particular environment in the factory when there are frequent conflicts between employees from different groups. The main factor of this distinction is job security and time perspective.

The third distinction is a level in hierarchy. This distinction was observed both at a factory, and at office. The distance between employees and middle management is rather high. It can be traced through low accessibility of management for employees; most of respondents from bottom level mentioned the lack of meetings, parties are celebrated separately – employees celebrate all holidays without middle and top management. Different traditions and rituals of these groups also indicate the difference, besides, low awareness of employees about future plans and actual situation in the company defines the difference in time perspectives.

The limitations of this research are evident. First of all, it is small number of respondents, so only suppositions could be made. All three possible bases for differentiation are independent, so statistical methods are necessary to prove determinants and organizational conditions. Second, it was difficult to describe common organizational culture because of situation of organizational changes in the company. So the conclusion can be made that new researches are needed.

## CONCLUSION

The paper presents analysis of conceptual development of organizational culture. The first consideration is that the appearing of the notion of subculture in organizational studies is in the framework of level analysis of the phenomenon. It is also argued that this group level should be the last one because individual culture can't be sociological notion.

Examining of Russian organizational science and practices, there is a gap in Russian academic papers and discussions of experts and the world experience. Both theorist and practitioner alike apply only two levels in organizational culture construct. The studies of national culture are rather popular in sociological studies in Russia and there are some examples of organizational researches. But there are no issues of subcultures neither in organizational studies no in managerial practices. This lack of concepts should be overcome by integration in international discussions. Although even in worldwide experience there are no methods elaborated to manage the subcultures in a company.

# ACQUISITION PITFALLS IN DEVELOPING COUNTRIES: A CASE STUDY OF THE ACQUISITION OF CONGOLESE WIRELESS NETWORKS (CWN) BY VODACOM GROUP

**Emanuel Gomes and Marcel Cohen**  
**Coventry University, UK**

## ABSTRACT

*This paper focuses on the analysis of critical success factors related to international acquisition activity in the telecommunications industry in a developing country. It examines the acquisition process of the Congolese Wireless Networks S.P.R.L. (CWN) by the South African based Vodacom Group (Pty) Ltd. Against this background, it examines the quality and approach undertaken by Vodacom's management in implementing an acquisition in a foreign country with different culture, customs, language, laws and history. The results obtained in this study are consistent with other research studies on the subject indicating that, despite the best strategic fit, success requires equal attention to organisational fit and a good management of the implementation phase, especially in terms of leadership style and cross-cultural integration.*

## INTRODUCTION

Privatization and deregulation of the Telecommunications industry in Africa paved the way for increasing international competition. As a result, companies have resorted to mergers, acquisitions and various types of strategic alliances to increase their market power, access new markets, distribution channels and technologies, to acquire new brands, gain economies of scale and synergies (Jemison and Sitkin, 1986; Capron, Dussauge and Mitchell, 1998; Capron, 1999; Ahuja and Katila, 2001; Bower, 2001; Vermeulen and Barkema, 2001; Hayward, 2002; Zollo and Singh, 2004).

However, despite the popularity of these external methods of development, and regardless of the vast amount of research carried out on the relative reasons for success, most fail (Kitching, 1967; Jemison and Sitkin, 1986; Pritchett, Robinson and Clarkson, 1997; Testa and Morosini, 2001; Schoenberg, 2006). The literature on the topic seems to indicate that managers often fail to address the critical success factors related to the pre- and post-agreement phases. Research findings have shown that frequently companies fail to appreciate the difficulties involved at the pre-merger stage by not fully understanding the real strengths and weaknesses of the product, brand or market position of the targeted company, underestimating future investment requirements and paying too high a price (Pritchett, Robinson and Clarkson, 1997; Heifetz and Laurie, 2001; Graebner and Eisenhardt, 2004). The main reasons for failure associated with the post-agreement phase seem to be related to organizational, human resources and process issues such as: poor communication between the parties, lack of decisive action from top management in defining the new direction, different leadership styles, cultural attitudes, behaviour patterns and their capabilities (Kitching, 1967; Lodorfo and Boateng, 2006; Riad, 2007).

This paper will analyse the acquisition process of the Congolese Wireless Networks (CWN) by Vodacom Group (Pty) Ltd, focusing its particular attention on leadership and cultural issues. Vodacom Group (Pty) Ltd (hereafter Vodacom) is the main service provider of communications in South Africa followed by Mobile Telephone Networks (MTN). One of the interesting aspects of this paper is that it analyses an acquisition taking place in a developing country in Africa, the Democratic Republic of Congo (DRC), and the companies involved are both African; CWN, a local Congolese company, and Vodacom, a South African based company. This becomes particularly relevant because of 'cultural specificity' of Central African countries characterised by customary law and tradition where there is neither absolute collectivism, nor total equality, and where the

manifestation of power is personalised in the head of the group. It is important to mention that the South African company was moving into a country with a different official language, French, and a political system linked to a disorganised national economy mainly run by untrained public civil servants.

## METHODOLOGY

The overall approach adopted for this research is the case study with one of the authors having insider status as a former Chief Governance Officer of Vodacom Congo. The case study methodology seems appropriate because it builds from rich qualitative evidence (Eisenhardt and Graebner, 2007), which in this case was captured through direct involvement, and experience of one of the authors in the in real-life activities of the company. According to Yin (1993: 59) the case study method can be defined as “an empirical inquiry that investigates a contemporary phenomenon within its real-life context, addresses a situation in which the boundaries between phenomenon and context are not clearly evident, and uses multiple sources of evidence.” This approach enabled the examination of the intricacies of the acquisition process, including insights into implementation management, leadership and culture.

A combination of both secondary and primary data has been used in this research. A series of interviews with senior and middle managers of Vodacom Congo were also undertaken. All interviews were semi-structured and face-to-face, and were conducted by the authors. However, due to the sensitivity of the topic discussed, most interviewees preferred to remain anonymous. Consequently, this raises fair questions in terms of the validity of this study. This limitation is acknowledged and researchers intend to expand this study in the future by undertaking an anonymous survey to be administered among employees and management of several African telecom companies involved in any type of collaborative arrangement with South African based telecom firms. Hopefully this will help to improve the validity, and especially the reliability of the research. Secondary data such as, websites, organisation’s communication notes, letters, newspaper articles and company documents were used to supplement the interview primary data. This provided a check on the potential bias in interview data.

## LITERATURE REVIEW

Within the context of such factors as globalisation, deregulation, privatisation, reduction of world tariff barriers and growth of national and international markets; mergers, acquisitions and strategic alliances have become the preferred means for achieving growth (Schweiger, Csiszar and Napier, 1993; Capron, 1999; Vermeulen and Barkema, 2001). One of the most important changes in the telecommunications industry’s structure during the last two decades has been the growth of large-scale international companies achieved by these external methods of development rather than by internal growth. These horizontal acquisitions involving firms combining at the same stage of production, and involving similar products or services, leads to the elimination of a competitor, to an increase in the market share of the acquiring firm, and to an increase in the degree of concentration of the industry (Green, 1990). It is important to remember that mergers, acquisitions and alliances offer a quicker way for companies to grow than the establishment of ‘greenfield’ developments and have the additional advantage of broadening the firm’s knowledge and resource base (Vermeulen and Barkema, 2001).

However, the process is complex and most acquisitions fail. Leighton (1993) asserts that whereas strategic and financial aspects are more visible and clearer to assess, those related to cultural differences between the companies involved become much more subtle and difficult to realise. He argues that “in many cases, culture clashes may be the most pernicious enemies of getting a deal done” (Leighton, 1993: 26). A critical mistake that organisations tend to make is overestimating the quality of the management team, their strategic capabilities, cultural attitudes and behaviour patterns (Kitching, 1967; Barret, 1973; Pritchett, Robinson and Clarkson, 1997). Kitching concluded that this was the main reason for failure for the companies analysed in his research, asserting that, “if managerial competence and the requirements of the to-be-purchased organization are not evaluated before the merger, the chance of failure increases markedly” (Kitching, 1967: 96). Leighton and Tod (1969) add that, not just management skills and competences should be evaluated, but also their emotional and personal needs, fears and expectations.

Several researchers suggest that there has been a tendency to underestimate the effect of differences in culture and management style between organizations (Pritchett, Robinson and Clarkson, 1997; Van de Vliet, 1997; Light, 2001; Testa and Morosini, 2001). When this happens, the integration process gets much more difficult and problematic, since the differences between the firms involved are not properly recognised and

handled (Vermeulen and Barkema, 2001). In contrast, more recent research by McDonald, Coulthard and Lange (2005: 8) found that managers “did not see due diligence as simply a financial assessment but a detailed investigation” that should not only evaluate the viability of the proposed merger or acquisition on the basis of its strategic fit, but also its cultural alignment by assessing people skills and attributes. Schweiger, Csiszar and Napier (1993) strengthen this perspective suggesting that managing the differences is a critical aspect, because the success of the merger is ultimately determined to the extent in which the differences between the companies involved are handled. They add that it is of major importance for companies to be open to learn about their counterparts in order to understand their values, norms, routines and procedures; creating a basis by which wrong stereotypes and other potential sources of conflict can be diminished. Therefore, it is of major importance for the new organisation to clarify, as soon as possible, the new ‘way of doing business’, and which kinds of behaviours are now rewarded. Otherwise, culture shocks may emerge and people become confused, frustrated and resistant to change (Pritchett, Robinson and Clarkson, 1997; Bower, 2001). Very et al (1997) assert that mergers between firms, whose organisational cultures are nested in different national cultures, represent a special challenge. They suggest that top management, committed to their way of doing things, will have difficulties in adapting to new management teams, especially when cultural differences between the teams are too large. Therefore, the authors conclude that differences in top management culture need to be handled with special care; otherwise, they may become a reason for major problems in mergers.

Pritchett, Robinson and Clarkson (1997) suggest that a high percentage of merger failures derive, not from lack of strategic planning or choice, but because of faulty management during implementation. This may be associated with the fact that in many mergers, some of the key management talent leave the firm after the deal. However, David Kidd, a partner at Egon Zehnder International, asserts that “it is irresponsible to allow talented individuals to leave, and it is time consuming, risky, and expensive to replace them” (Light, 2001: 38). Capron (1999) suggests that another aspect which tends to create a feeling of diminished relative status within the management of the acquired firm, leading to management turnover, is the fact that often, managers of the acquiring firm tend to ‘colonize’ the target by imposing their own management styles and tools. Kiefer (2002) explains these occurrences suggesting that mergers (with all the organisational change that is implicit) are very emotional events. Therefore, he suggests that firms should pay much more attention to how to address all the emotional and psychological aspects that are part of the merger process, instead of just focusing on rational and cognitive aspects. Anslinger and Copeland (1996) and Inkpen, Sundaram and Rockwood (2000) corroborate this position, arguing that managers tend to focus their attention on strategic, economic and financial aspects and disregard organisational fit and governance. They suggest that it is equally important to define the new shareholder structure and control of the firm, and clear organisational responsibilities and reporting relationships, reflecting the distribution of the decision making power (Inkpen, Sundaram and Rockwood, 2000).

## **PRE-ACQUISITION PHASE: THE ACQUISITION RATIONALE**

The acquisition of 51 percent of the shares of the Congolese company CWN by Vodacom Group took place in December 2001, resulting in the establishment of Vodacom Congo S.P.R.L. This majority shareholding enabled the South African buyer taking control of the Congolese firm. However, this took place within a friendly collaborative climate as both organisations, Vodacom and CWN, signed a gentleman’s agreement aiming to maintain equilibrium between the two groups in terms of top management positions. As a result, a new company was formed under the Congolese Company Act - ‘Vodacom Congo SPRL’.

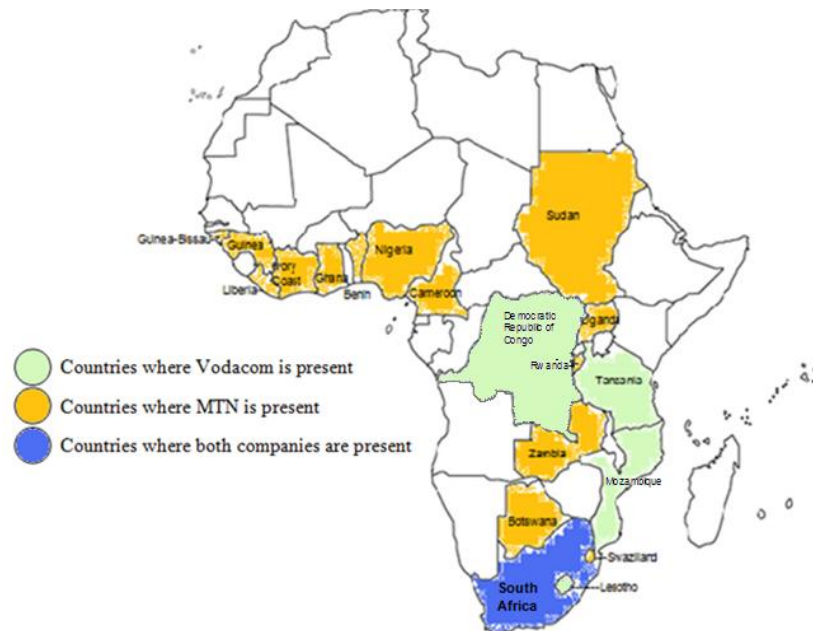

The main rationale behind this acquisition was international market development. Despite being the largest service provider in South Africa, its international geographical scope was limited to only three African countries, Lesotho, Mozambique, Tanzania. In contrast, its biggest competitor, MTN, is involved in 15 African countries and some parts of the Middle East (see Figure 1).

This relatively low degree of international expansion was partly due to an agreement with its shareholders, Telkom (Pty) Ltd and Vodafone Plc, in which Vodacom had been restrained to acquire telecommunications licenses in the Northern Sub-Sahara region. The reason for this restriction was justified by the fact that the shareholders (Vodafone Plc and Telkom RSA) were already operating in that region and would, therefore, want to avoid internal competition from one of their subsidiaries. As a result, Vodacom’s geographical scope of action was restricted to the central and southern regions of Africa.

Moving into the Democratic Republic of Congo (DRC) represented an extra challenge to Vodacom. Political turmoil, economic uncertainty, different culture and official language, and an existing strong

competitive rivalry between a few dominant incumbent firms, CWN, Celtel and Congo Chine and probably in the near future MTN, justified the choice of an acquisition instead of internal ‘greenfield’ development. The acquisition provided Vodacom access into a country with an approximately 58 millions population but where GSM penetration is less than 7% (Vodacom Interim Results, 2006). This low penetration represented a huge potential for growth.

## CHOICE AND EVALUATION OF THE PARTNER

However, the choice of a strategic partner in a developing country by a foreign company has to be taken very cautiously. The analysis of macro economic, political and socio-cultural aspects have to become particularly addressed when evaluating the financial risks of entering into an unstable market. Financial criteria must be complemented by country governance analysis in order to assess the suitability of the target company. In this particular acquisition Vodacom Group did not disregard any of these aspects. It managed to obtain all essential information of its future partner, CWN. Presentation of the accounts (balance sheet, Cash flow statement and L&P statement) were made available to Vodacom and a legal due diligence process took place before Vodacom decided to buy 51% of CWN shares.

As a result, the new combined firm, Vodacom Congo, benefited from synergy effects derived from the parent companies. The South African Company, Vodacom, brought its high end technology and financial resources, while the Congolese company, CWN, contributed with its well trained local workforce and good knowledge of the market, and with a well established distribution network. Marcel Cohen, former Chief Governance Officer of Vodacom Congo, argued that the acquisition seemed to have the right strategic fit, “we have the feeling that the rationale of this alliance was well thought through and both firms contributed to the enforcement of the new company strength. The existing local human resources were complemented by competent foreign experts in Information Technology, and this certainly created a competitive advantage” (Cohen, 2008).

## POST-ACQUISITION SYNERGIES

Vodacom had invested very cautiously in the country in which they had had no previous experience at all. However, despite several external environmental threats that would deter most other foreign companies willing to invest in a developing country, such as the DRC, the acquisition has been successful. In a personal interview, Alieu Conteh, Shareholder and Chairman of Vodacom Congo, asserted that “this partnership with a well established Congolese Company, CWN, has considerably facilitated the creation of the new entity Vodacom Congo (SPRL) which is today the most successful telecommunications company in the country facing four powerful competitors established in the DRC years before the Vodacom alliance with CWN” (Conteh, 2008).

CWN and Vodacom have coordinated their actions and joined their forces effectively. CWN has brought its license and political connections to facilitate the running of the business in the whole country, and particularly in remote areas. It has improved the distribution coverage through well-established dealers and sub-dealers involved in the sales of the products throughout the whole country. Vodacom was more involved in implementing new technology and building new towers to increase the network coverage and quality. There was also good knowledge transfer between the partners taking place through informal and formal modes of diffusion. Vodacom established the objective of transferring their knowledge to the local staff within a two year period. Another important objective in line with the labour law and policy of the country is to appoint more local managers to key positions (Cohen, 2008). To this end, training and coaching programmes were organised for most of the Congolese technicians in Vodacom’s IT Education Centre in South Africa. This proved to be a good long-term investment because operational costs decreased as well trained Congolese staff started taking positions previously occupied by South African expatriates (Cohen, 2008). The realisation of all synergies mentioned above seem to add supporting evidence to previous research arguing that acquisitions tend to be more successful when companies move into areas where they are familiar with the market and the technology (Pettus, 2001). This is precisely the case with this acquisition, which success is due to a synergetic relationship in which each partner contributes with their specific capabilities.

Financial results two years after the acquisition were very positive and the Return On Investment (ROI) was much higher than the one projected during the pre-acquisition evaluation process. As stated by Conteh (2008), “despite political turmoil the business success of this alliance has exceeded our expectations.” The network quality was vastly improved, and new products such as 3G, Data and other value added services have complemented the existing range of products offered by CWN before the acquisition. As a result, the customer base increased from 22,000 in 2002 to 1.6 million in 2006 and to 2.6 million at the end of the 2007 financial year (Mare c. 2008). This has enabled the company to achieve today a 51% share of the market, representing a move from being number four GSM operator to number one (Conteh, 2008). Overall, it has brought not only economic but also socio-cultural and political benefits to the country as more than 620 permanent jobs have been created to date (Mare c. 2008).

## **ORGANISATIONAL AND CULTURAL FIT**

Although the strategic fit between the two companies was categorically proven by very positive financial and strategic results, organisational and human resource issues started emerging after the ‘honeymoon’ period (Cohen, 2008). According to an Anonymous source, the main cause for the rising problems was due to an inadequate draft of the first shareholders agreement in which Vodacom managers were solely responsible for the financial and operational management of the new entity. As a result, Vodacom managers were directly involved in all operational processes, taking responsibility for the whole management of this new subsidiary, Vodacom Congo SPRL. Most key management positions such as, Managing Director, Chief Financial Officer, Chief Information Technology Officer, Procurement Manager, and IS Manager had been exclusively assigned to Vodacom staff, who neither spoke French nor had had any previous working experience in the country.

Although this potential cause of a cultural sensitivity had been highlighted by Congolese staff during the pre-agreement evaluation and negotiation process, all attention and analyses had been focused purely on strategic and financial aspects. This evidence seems to corroborate previous research findings indicating that a common mistake that organisations tend to make is not to dedicate enough attention to the evaluation and choice of the implementation management team, their cultural attitudes and behaviour patterns, emotional and personal needs, fears and expectations (Kitching, 1967; Leighton and Tod, 1969; Barret, 1973; Pritchett, Robinson and Clarkson, 1997; Light, 2001; Testa and Morosini, 2001; Vermeulen and Barkema, 2001).

Since socio-cultural issues and the differences in sensitivity between staff of the two firms had not been properly recognised and handled, the integration process started becoming more difficult and problematic

(Anonymous source, 2007). In a personal interview conducted by one of the authors, an anonymous senior manager of Vodacom Congo S.P.R.L. argued that “top management had joined their strength in a very friendly manner but the employees of both sides were more reluctant to work together because the corporate culture was not compatible” (Anonymous source, 2007). This view was corroborated by several anonymous Congolese employees interviewed by one of the authors of this study. There seemed to be a general consensus between Congolese staff that “there was a serious degree of cultural incompatibility” and on several occasions South African staff were criticised by local staff for their arrogance and disrespect. Congolese staff perceived South African (hereafter SA) managers as lacking good manners because they did not respect the dress code, nor addressed the local staff politely. They would work in their offices and meetings in T-shirt or short sleeved shirt. This was seen as a sign of disrespect towards their Congolese colleagues, which have a high standard of *savoir-vivre* and respect the business suit-and-tie dress code, which is the normal way of showing respect in the business world towards their superiors, fellows and Official authorities.

According to Congolese staff, this disrespect is not only implicit in the way South African staff dress and in their body language, but also in their behaviour. The fact that they don’t make any effort to learn the official language of the country (French) nor do they sit together with their Congolese colleagues in social functions, unless forced to do so, adds to the evidence. However, a more explicit form of disrespect is evident in their talking, greeting, and constant swearing.

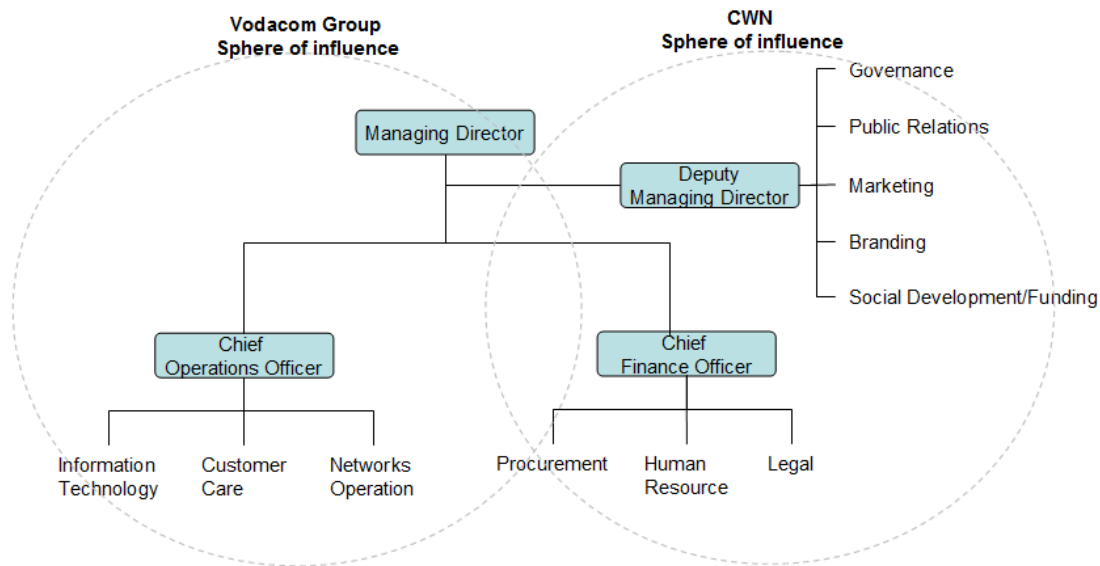

Another important aspect that created unsettled feelings amongst local Congolese staff was the fact that several South African managers, who occupied higher positions in the hierarchy of the new firm, had lower levels of education and competences than their local subordinates. According to an anonymous source, this was the reason why on several occasions some Congolese engineers refused to obey wrong instructions from their SA superiors. This led, occasionally, to disciplinary hearing and dismissal on the basis of insubordination.

According to an anonymous source, the ignorance of the local culture illustrated above started weakening good will and understanding between the local and foreign partners. After five years this situation reached such a degree of gravity that shareholders finally acknowledged the problems and decided to act in order to minimise the ongoing internal clashes, and preserve the success of the acquisition. After some discussion, both parties decided to readjust the company’s operations and organisational structure with a gentleman’s agreement. According to the literature on acquisitions, five years is far too long as readjustment between the partners should take place as quickly as possible (Inkpen, Sundaram and Rockwood, 2000; Light, 2001). A major aspect that was rectified was the existent imbalanced distribution of key management positions as SA managers had previously occupied the most relevant positions. As a result, a new agreement contemplated a new leadership structure in which some key positions were allocated to local Congolese staff. This was done with the objective to address the existing frustration and lack of trust generated by the previous management structure. This seems to corroborate previous research findings arguing that the post-acquisition integration stage is the most difficult to manage and carries a high degree of risk of failure (Habeck, Kroger and Trum, 2000). This is especially due to poor integration planning and execution, mismatch of cultures and difficulties in communicating and leading the organization (Gadiesh and Ormiston 2002). In the case of Vodacom Congo SPRL, mismatch of cultures and leadership structure were the main issues during the post-acquisition phase.

Due to these human relationships issues between local staff and foreign managers, a new agreement has been signed by both firms (Anonymous, 2007). This agreement provided a more impartial division of responsibility at top management level, where foreign managers and local staff managers had a more balanced share of management responsibilities (see Figure 2).

The Figure above shows the new distribution of top management responsibility. Under this new structure the South African shareholders, Vodacom Group (Pty) Ltd, keep the right to appoint the MD and COO positions, while the Congolese shareholders, CWN, hold the Deputy MD and CFO positions. A new more balanced distribution of power helped to re-establish trust and confidence between the parties (Anonymous source, 2007). This was consistent with general advice on acquisition management suggesting that both parties have to find solutions to collaborate fairly in order to compromise on sensitive issues such as management responsibilities to be shared between both parties (Child and Falkner, 1998). The new agreement signed at Vodacom Congo SPRL helped to attenuate conflict of interest, and provided room for mutual cultural understanding between both firms. This was particularly helpful because to date, the main difficulties of this collaborative arrangement were only related to human relationships and power sharing in the new subsidiary. This decisive action took place just in time because the new company, Vodacom Congo SPRL, was, in the opinion of an Anonymous source, on the verge of being liquidated.

**Figure 2. The New Distribution of Power**

*Source: Author analysis based on the new agreement.*

This reorganisation should definitely help to settle disagreements between the parties and help to create a better organisational fit in order to support further growth of the company. Feedback from Congolese staff has been very positive since they see more local staff involved in the decision making of strategic and operational day-to-day activities. According to the new agreement CWN can appoint two senior managers of its choice for the roles of Deputy MD and the CFO. Consequently, this should result in a gradual replacement of most SA Heads of Department by Congolese staff. However, according to an Anonymous source, South African staff have been less enthusiastic about this new structure, and their attitude continues to create some problems, not only from a cultural perspective but also in terms of business practices. Despite being the South African partner who suggested most of the new policies and procedures, SA staff seem to find difficulty in following them. To this respect the Governance Department will certainly have to play a critical and very active role in enforcing and monitoring their adoption and implementation.

## CONCLUSIONS

This case shows that, as in most other parts of the world, cross-border acquisitions have been a preferred method for companies to gain rapid access to foreign markets. It also highlights the need for companies to be able to implement management policies adapted to the social system and specificities of the target region. A common pitfall that companies seem to fall into in Africa is importing and adapting techniques of management of the modern countries to African culture and traditions. South African telecommunication companies seem to be no exception. In this case, South African managers did not seem to be ready to work in a developing country such as DRC where culture, language, law, habits and customs are fundamentally different from their home country. Therefore, despite the financial and economic success of this acquisition, evidenced by a remarkable increase in revenues, market share, distribution channels, service quality and the development of new expertise and capacities, and achievement of economies of scale, its longer term success is far from guaranteed.

In support of previous research findings, this study shows that despite the best strategic and economic rationale and fit, mergers and acquisitions are very complex and difficult to manage. In this case the synergies and complementarities have been realised and the performance of the new company has been undoubtedly improved. However, the acquisition is still at risk of failure because companies failed to appreciate the difficulties involved at the pre-merger stage, by not fully understanding the cultural sensitiveness and need of adaptation in cross-border situations. This is in line with previous studies suggesting that companies need to use the due diligence period to evaluate, not only the financial and strategic aspects, but also the cultural alignment,

management style and expectations between both organizations (Light, 2001; Vermeulen and Barkema, 2001; McDonald, Coulthard and Lange, 2005). Consequently, since the differences between the firms involved were not properly recognised and handled, the integration process became much more difficult and problematic as leadership, cultural attitudes and behaviour issues started emerging. Despite being continuously stressed in the literature for more than forty years (see Kitching in 1967; Pritchett, Robinson and Clarkson, 1997; Riad in 2007), a high percentage of acquisition failures derive, not from lack of strategic fit, but because of faulty management during implementation.

The risk of failure is a major threat, especially to Vodacom Group (Pty), because it is sharing its core competences and unique resources by training Congolese staff and bringing all its core technologies and know-how to its partner CWN. If the acquisition failed Vodacom could lose its investment in this unstable political environment where the rule of law is not entirely implemented. Despite Vodacom Group's majority shareholding, CWN has indeed a dominant position due to its political connections, which are very important in this volatile political environment. Nonetheless, after five years Vodacom and CWN managed to recognise the difficulties, and new management policies and structures have been subsequently adopted in order to save the acquisition. This demonstrates that where there is mutual respect between the parties, and a will to succeed, everything is possible. As Edward T. Hall asserted in his book 'Beyond Culture' "For too long, people have taken their own ways of life for granted, ignoring the vast, international cultural community that surrounds them...Our a-cultural prejudice inclines us to believe that the differences between the people are only superficial. For this reason, not only we deprive ourselves of the enrichment of the knowledge of the other cultures, but we take a long time to correct our errors when they give place to problems" (Hall, 1976).

Finally, we would like to highlight some of the limitations of this study and avenues for further research. We acknowledge that the fact that all interviews were conducted only with Congolese managers and employees, limits the validity of these findings. To overcome the potential for bias, it would be important to collect and evaluate data from South African Managers as well. Since similar issues have been reported in other countries where the two South African companies, Vodacom Group and MTN, are operating through various types of collaborative arrangements, it would be important to compare and contrast those situations. To this end, interviews would have to be complemented by a large scale survey. This is the case because anonymous questionnaires would help employees and managers to overcome the fear of retaliation, and express freely their concerns and issues. This would result in a much more robust study with higher standards of validity and reliability. It is the hope of the authors to be able to conduct this enhanced research in the not too distant future.

# **RISKS THE POOR PERCEIVE WHEN SHOPPING FOR FOOD**

**Patricia Grossi, Paulo C. Motta, Luis F. Hor-Meyll**  
**Pontifical Catholic University, Brazil**

## **ABSTRACT**

*Low-income families must confront situations often marked by restrictions and scarce resources in all aspects of life. The risk of erring when making food purchases makes such decisions highly complex. This investigative study approaches the issue from the perspective of perceived risk. In-depth interviews were held in which factors that generate insecurity in the food purchasing decisions of low-income consumers were identified as well as the mitigation strategies that these consumers employed. The discoveries suggest that understanding the food purchasing decision process of the lower classes, from the perspective of perceived risk, may offer new horizons for academics and professionals.*

## **INTRODUCTION**

Until the beginning of the 80s, the emphasis of studies on the politics of food was aimed at aspects of nutrition. The focus on the problem of the diet of the world's low-income population changed - mainly due to the work of Sen (1981) - from macro politics of production to access to food. Previous treatments focused on supply, while more recent studies have concerned themselves with demand (Maxwell and Slater, 2004). Beginning in the 90s, the attention of academic interest turned to food security and then later on, to poverty (Maxwell, 1998). This new vision also fostered an interest in exploring aspects of the demand for foods, from the point of view of consumer behaviour. Well-recognized is the dearth of research studies carried out after the early work on the consumer behaviour of low-income families (Caplovitz, 1963, Lambert, 1972, Andreasen, 1975, Kelley, 1981) but prior to the types of studies currently in favour – typified by the attention showered on the differences between social classes, which had all but stagnated by the end of the 70s but has recently been resurrected (Henry, 2005).

Consumers hesitate to buy products that involve the risk of incurring a loss (Roselius, 1971). This dilemma is greater still for low-income consumers due to circumstances that are particularly significant: (a) instead of abundance, the poor face situations constantly marked by restrictions and scarcity of resources (Hill, 2002); (b) having active limits for spending on education, health and leisure, the poor suffer from much pressure in trying to satisfy their food-related needs and desires; (c) with limited means to make their money last and to repeat the purchase of badly chosen items, or to correct negative buying experiences, the frustration arising from possible errors in their choices makes decisions related to food purchases some of the most complex they have to cope with (Caplovitz, 1963; Alwitt and Donley, 1996; Leibtag and Kaufman 2003). As such, the poor are keenly perceptive with respect to the risks inherent in food shopping – an activity which is rather less anxiety-inducing for wealthier consumers.

Taking as a given the effects and consequences of decisions that involve risk in consumer behaviour and with respect to low-income consumers, this investigative study seeks to shed light on understanding how the poor can manage limited budgets better: (a) to identify perceived risk factors associated with food shopping (b) to reveal the mitigation strategies employed by these consumers.

## **CONSUMPTION PATTERNS OF THE POOR**

Low-income consumers are rational when making decisions and choices. They favour shops close to their homes or places of work; they optimize the number of shopping trips; and they take into account what products are available and what the credit possibilities are (Parente *et al*, 2005; D'Andrea and Herrero, 2007). In the case of credit purchases, these are made in accordance with payments that fit the budget, the total purchase price not being relevant (Mattoso, 2002). A shop's price level and its physical proximity are important factors taken into consideration when making choices (Mitchell, 1998). Since many do their shopping on foot, they prefer supermarkets, groceries, butchers and markets, either close to the home or workplace, rather than going to hypermarkets (Parente *et al*, 2005), where more variety at lower prices could be found. Purchases are mostly confined to basic-needs goods; traditional brands are preferred to cheaper brands (D'Andrea and Herrero, 2007) due to perceived quality and the faith in the guarantee of good results (Parente *et al*, 2005; D'Andrea and Herrero, 2007). They are also reluctant to try out new brands, for fear of wasting money and of displeasing their families – even though new brands may be more attractively priced (Rangan *et al*, 2007). This preference for traditional brands might be a strategy to reduce the risks of buying something unfamiliar or of wasting money on an erroneous purchase (Rangan *et al*, 2007).

## UNCERTAINTY AND RISK

In a purchasing situation in which there are no guarantees of success, the consumer perceives the risk of suffering a loss (Cunningham, 1967; Hoover *et al*, 1978). This perception may be felt at any (or all) stages of the selection process - whether with respect to the product, the brand or the shop (Mitchell and McGoldrick, 1996). Bauer (1997) noted that the risk perceived involved a combination of uncertainty and the seriousness of the consequences of making the purchase. The consequences were a function of the objectives and the costs, whereas uncertainty appeared to be inversely related to consumer confidence (Cox and Rich, 1964). Peter and Ryan (1976) interpreted these two components as being the risk of potential loss and the probability that this loss should occur. The uncertainty appears during several stages of the process of assessing the risks related to the choices. The set of alternatives is not known prior to an intensive search for information and even after the search, the choices may not be clear to the consumer. Nonetheless, several authors ignore the probability component (Horton, 1976)

Due to cognitive limitations, consumers aren't capable of anticipating a subset of the total number of potential consequences for their choices. The totality of the consequences is unknown, so the individual will have difficulties in associating probabilities with negative consequences (Stone and Gronhaug, 1993). Because consumers may not always be able to calculate the probabilities of risk or of their expectations of the product, they're confined to perceived risks, subjectively construed, leading them to take into account, in their decision-making processes, social dimensions and other non-financial dimensions. Jacoby and Kaplan (1972) identified five dimensions to this construct. Roselius (1971) had already proposed an additional dimension, **convenience loss**, which would involve the time necessary to re-purchase the product (time lost) as the result of its failure. All of the dimensions contribute to the global risk, but such dimensions vary with respect to the specifics of each purchase and with the type of product. Studies related to the risks of retail food purchases (Mitchell, 1998; Mitchell and Kiral, 1999) consider the following dimensions: **a) performance loss** – risk that the product does not function as expected and does not offer the desired benefits. May also be considered as the result of a combination of other losses and be used as a substitute for other risk dimensions that may be present in the buying decision. **b) physical loss** Risks of threats to the consumer's health or appearance. Includes concerns with respect to food safety risk (expiration dates) and in-store hygiene; **c) financial loss** – Includes consumer concerns with respect to cost/benefit (house brands, available discounts, the frequency of promotional prices and store price levels) and the amount the consumer will lose if the product does not perform satisfactorily, as well as additional costs, such as transport or higher prices. It appears that the consumer's main concern with respect to food purchases involves financial aspects (Mitchell and Kiral, 1999). **d) psychological loss** – the risk of disappointment with oneself for not having made a good purchase. This seems to perform an important role, mediating and correlating with the other risks (Stone and Gronhaug, 1993) **e) social loss** – The risk that friends or family might consider that the consumer made a bad or inferior choice. This risk is also present when family or friends may be affected by some consequence of a bad choice. The judgment of others is what matters – regardless of how well the product performs. For low-value items and items of little symbolic value, consumers have difficulty in differentiating between the two concepts and, thus, the co-occurrence of the two dimensions takes on more significance (Mitchell and Grotorex, 1990). **f) loss of time** – Involves the costs of time related to

the purchase of products, such as travelling to the shop, the speed of service and existing facilities for the purchase, as well as the time lost due to product defects.

## **Perceived risk mitigation strategies**

Each product has a set of risks associated with its acquisition and each consumer has an individual tolerance for risk which, when exceeded, will lead him to employ, during the purchase process, strategies to reduce such risk to tolerable levels (Mitchell, 1998). The use of different risk reduction mechanisms depends on the nature of the purchase or on the product in question. Consumers usually favour the use of certain strategies in detriment to others and attitudes and preferences in relation to the reducers of risk vary with each consumer (Roselius, 1971). One strategy is to seek information, making use of personal (Cunningham, 1967; Cox, 1967) and/or market sources (Roselius, 1971), obtaining data from several personal, public, commercial and empirical (i.e. examining and using the product) sources. The more important the decision to be made is, the more alternatives the individual finds, the greater the volume of data obtained, and, therefore, the greater the possibility of receiving conflicting information (resulting in the consumer's confusion) (Mitchell and Boustani, 1994). The task of the individual will be to process the clues and decide which to use, which to discard and forget and which to keep in mind.

In evaluating alternatives, the primary source of uncertainty is the assessment criterion, i.e., the attributes to consider. Depending on their level of involvement, consumers differ significantly in the extent to which they seek information, in the number of attributes they consider and in their motivation to obtain maximum satisfaction (Laurent and Kapferer, 1985). The consumer may be totally ignorant with respect to certain attributes, until the search for information calls his or her attention to their existence (Mitchell and Boustani, 1994). The consumer may also be insecure in relation to the importance of each attribute in evaluating the product or service (Mitchell and Boustani, 1994). The search for information regarding performance will be prioritized when uncertainty about product performance is high. When the risk of poor performance is low, the information will use psychosocial information, if something is to be gained with this action (Cox, 1967).

The assessment of the alternatives leads consumers to develop brand preferences. The greatest preference is for the brand that has the smallest perceived risk (Mitchell and Boustani, 1994). If the lowest-risk brand is not available, the consumer must decide between not buying the product or buying another brand that represents a greater perceived risk (Mitchell and Boustani, 1994). Brand loyalty is usually employed to reduce the perceived risk (Bauer, 1967; Cunningham, 1967). The consumer reduces perceived risk by developing loyalty to particular brands that he/she has used before and which have been satisfactory (Roselius, 1971), this being the most favourable strategy to reduce time loss, physical loss, ego loss and financial loss (Roselius, 1971).

## **METHOD**

The method involved two stages. In the first, informal interviews were carried out with 11 low-income individuals, followed by observations in supermarkets belonging to two chains with strong popular appeal. In this stage, information was sought that would enable the design of an interview questionnaire. In the second stage, a list of open questions and a visual aid in the form of product sheets were developed. The open questions sought to stimulate the informant to talk more in depth about aspects discovered in the first stage, such as the frequency of shopping, the foods essential to the family diet, how shopping was done, the perceived quality of the brands and the perceived uncertainties in food-shopping decisions. The product sheets were made by pasting images of different brands, in 23 distinct product categories, (beans, rice, sandwich biscuits, coffee, etc.) onto A4-size sheets. These images were removed from the advertising inserts from 15 different retail chains, cheap or otherwise, gathered over one month. Care was taken to omit prices and to use photographs of approximately the same size, in order to avoid one brand standing out more than another. This visual resource was intended to help the informant to remember the food-basket products that he/she would normally buy and to be able to comment on his/her brand preferences. The product sheets were not intended to cover all brands in each category or, indeed, of all categories.

Using the designed questions and employing the product sheets as visual aids, 15 in-depth interviews were conducted. The informants, who were residents of the Rio de Janeiro metropolitan area, had family

incomes that were up to three "minimum salaries" (approximately US\$ 750) per month and were the individuals who did the food shopping in their respective households.

## RESULTS

Five factors stood out that led to the perception of risk: The expectations of family members, time restrictions, discrepancies in the perceived quality of products, difficulties caused by the indivisibility of the package and the importance of price. Mitigation strategies for the risks that were found also numbered five: the selection of the product evaluation set, the development of brand loyalties or the diversification of brands, the increase in purchasing frequency, the use of the senses to make better product choices and the search for information prior to making the purchase. First, the causal factors of the perception of risk will be described, and then the risk-mitigation strategies that were found.

### Causal factors of the perception of risk

Family expectations – Frustrating the desires and preferences of the family represents a psycho-social risk to consumers, even though satisfying family members may be a difficult task due to budget limits. The imposition of restrictions increases the difficulty of making choices, so that finding a middle ground between low income and the family's desires amplifies the importance of the negative consequences of making a bad choice: purchases also take on the purpose of demonstrating that consumers are good fathers (or mothers), good husbands (or wives) or good children. The pressure arising from this responsibility causes consumers to perceive that the room for error is nil. The purchase takes on a significance which is more profound than simply supplying the household; therefore, they must choose with care. Not infrequently, more expensive brands are selected in order to avoid displeasing a loved one.

Time restrictions – Those who work a long way from home, or who work long hours, feel that the time that could be spent studying prices, special offers and product varieties is spent on the daily commute to and from work. Compromised by the lack of time, purchases may be subject to incorrect choices, thereby increasing perceived risk (Mitchell, 1998). From the interviews, three limits which afflict consumers appeared: Reduced opportunities to carefully evaluate product attributes (increasing the perception of performance risk); difficulty in taking advantage of sales and special offers, that vary from one day to the next in many shops (creating the perception of financial risk); and, as a function of the reduced number of trips to the shops, two related restrictions -- the cost of the decision to try new products or brands, due to ignorance of important information available at the purchase sites; and, matters concerning how much of a new product to buy. If a large quantity of the product is purchased and it fails to satisfy, the consumer will have to consume it, nonetheless, because of the lack of time to buy the item again. Time restrictions, therefore, seem to significantly increase total perceived risk, in as much as it reduces the ability of the consumer to measure product quantity, quality and price on each visit to the supermarket.

There are other consequences resulting from having a limited amount of time. Low income consumers seem to have limited geographical scope, always doing their shopping close to home. In addition to other restrictions, they must consider distances, transportation time and cost, in order to decide where to shop (following Mitchell, 1998).

Discrepancy in perceived quality The evidence shows that the consumer establishes a minimum tolerable level for physical characteristics (i.e. flavour, aroma, consistency, etc.), that vary in accord with his/her preferences and experiences. The large variety of brands, in certain product categories, accentuates the possibility of quality discrepancies, and concomitantly, the perception of risk. In the collection of advertising inserts, the researchers found as many as 30 brands of rice with different prices. The range of options creates insecurity, since it increases the possibility of buying a product that does not live up to expectations. Recognizing the existence of different levels of quality, consumers must diligently monitor their experiences, especially negative ones and, as a function of their positive experiences, deemphasize the importance of price.

The informants' responses also suggest that special attention must be made with respect to product yield, including it under the heading of quality. In other words, choosing a product that doesn't last long is risky.

Still, financial limitations require that some consumers must consciously buy a short-lasting product, simply because of the low price. In seeking out good quality and value in products, consumers follow a series of clues in order to infer quality, such as brand-name and the product's price, and they use these clues to reduce the perceived risk and to guarantee that their purchase decisions will be intelligent ones. The assessments of quality normally occur in a comparative context and quality is assessed as high or low based on the relative superiority of the products that the consumer had considered as substitutes. The mention of Rice and beans is not surprising since they are part of the basic diet in Brazil. Contrary to products where the quality is assured from the experience of repeat-purchases of known, previously-tested brands, beans are essentially different due to crop variability. This variability, a risk inherent in the category of the product (Bettman, 1973) increases the degree of uncertainty at the time of choosing.

Indivisibility of the package Except when the product is sold by weight (sausages, meats), oftentimes the consumer is forced to acquire a greater or smaller quantity than he/she would like, leading the him/her to perceive risk that is exacerbated when the product or brand is unknown. In wanting to try out a new product or brand, the indivisibility of the package restricts the consumer, leading him/her to forgo trying it. This risk increases if the package contains a quantity that is larger than necessary to test it. If the consumer buys the product and the experience is a negative one, he/she will probably consume it instead of throwing it away, either from shame or from a lack of resources to correct the error.

Importance of price – The price-floor refers to the minimum price that, in the consumer's perception, the product can reach when on sale. The difference between full price and the price floor, as registered in the consumer's memory, influences his/her choice. There exists the possibility that a product, being sold at full price today, may, tomorrow or some other day, be available at a lower price. Insecurity at the time of selection is a consequence of paying too much than one perhaps should (or could). Paying full price causes discomfort and the sensation of having made a "bad buy", the bad feeling being proportionate to the known difference between the full price and the price floor. By analogy, when the consumer identifies items at the price floor, he/she perceives the risk of the price rising and of not being able to find the product on sale on the next trip to the market. Therefore, whenever he/she can, the consumer acquires more units of that product in order to take advantage of the opportunity. It appears that the consumer assumes that there is a minimum limit to which the price floor of a product can fall. If the price is below the price floor, mistrust arises in place of the sensation of having made a good buy. If the price is above the price floor, then there's the perception of financial risk, along with the uncertainty of predicting the price the next time it must be bought. According to the informants' reports, price appears to be a basic criterion for buying food, as Mitchell and Kiral (1999) suggested.

## **Risk factor mitigation strategies**

Consumers are often uncomfortable about trusting offers, such as low-priced merchandise which is being sold close to the expiration date because they perceive physical risk under such circumstances. They may reject offers that they believe are meant for higher income segments. These reasons and others too make shopping for food a constant exercise in juggling price, quality and quantity in order to meet the needs of themselves and their families; consequently, low income consumers develop strategies to reduce the risks they perceive in their buying decisions. In this study, five mitigation strategies were identified.

Formulating the evaluation set - Information provided by the respondents suggests that the consumer accumulates in his/her memory positive and negative experiences which he/she relies on in order to make choices. In this mental catalogue, the consumer records products considered to be bad, that are expected to provide poor quality, and of which the repeated purchase is automatically rejected; products considered to be good and that can be bought again; the minimum and full prices of each product category and of certain brands in particular. This evoked set, comprised of products present in their memories may be added to by others that are met with during shopping. This evoked set minimizes two risk factors: meeting family expectations and coping with limited time. Since this set contains already tested and previously approved products, they reduce the possibilities of frustrating their families' expectations. Without available time to do research the consumer resorts to the evoked set to quicken the time spent choosing rather than trying out other items that may predominate in the shopping environment. On the one hand, there is the problem of choosing among a set of products or brands; on the other, there lays the habitual solution in which the consumer rules out alternative

possibilities and buys the usual brand. What he/she considers, obviously, are brands that have been positively evaluated for buying and consuming. The interviews showed that, besides the evoked set, other subsets exist in the knowledge set: The inert set, and the inept set. The inert set, despite being a conscious one, comprises a set of alternatives about which the consumer doesn't have enough information in order to assess (new brands included): the consumer perceives no advantage whatsoever in buying such items. The brands that the consumer rejected due to prior bad experiences, or due to negative third-party references, comprise his/her inept set.

Brand fidelity or diversification of brands - The possibility of erring in the face of family expectations, his/her limited amount of time, the discrepancy in perceived quality -- all provide the consumer with a reason to develop brand loyalty. Nonetheless, based on the same reasons, the consumer could, eventually, diversify brands. Since the variety of brands is large, and since the consumer has already suffered many bad experiences, in certain categories, he/she develops brand loyalty. Related to loyalty, two additional, and distinct, behaviours were identified. In the first, the repeat-purchase of a brand occurs merely out of habit: a brand which was, perhaps, initially tried because of negative experiences with other brands. Under circumstances such as these, the consumer chooses a brand of adequate quality as his/her usual brand. The second behaviour is the loyalty to a brand because of explicit preference. Though the price may be high, the quality and the pleasure of indulging oneself or the family lead the consumer to associate his/her main-choice criterion with brand. It is possible that certain choices lie with brands that suggest prestige (Mitchell, 1998; Van Kempen, 2003) and the consumer may enjoy showing them off after purchase. The consumer may suspend such brand loyalty if his/her eye is caught by the low price of the new brand, and employ the tactic of buying a small quantity of the new brand, complementing the usual quantity he/she needs of the loyalty-brand, and thereby diluting the risk of buying a "bad" product.

Increase in buying frequency - The consumer minimizes the financial risk of price variations by the frequency of shopping trips. Those who have the flexibility of shopping more frequently can take advantage of the discounts offered with zeal by retailers. When they become familiar with the discount days for each category, increased shopping trip frequency decreases the probability of buying products at full price. This strategy reduces the sensation of spending more when shopping is done less frequently.

Use of senses in choosing products - Interviewees reported using sensory stimuli – appearance, aromas, tastes and textures – in order to differentiate among competing products. The senses help to diminish the discrepancy of perceived quality, the risk of product indivisibility and possible health threats. Examining, smelling, tasting and touching the product provides information which will be added to the "mental catalogue" of positive and negative experiences. Normally, it is the visual aspects which are examined first of all. Consumers make a point of looking carefully at the product: its aspect, integrity and expiration date. Then, they use their sense of smell, mainly to reduce possible health hazards: They often smell products, especially perishable ones, in order to reassure themselves of the minimum expected quality. They use tactile senses – the sense of touch provides information on texture, consistency, firmness or softness. Although tasting products is not allowed within the store, many consumers break basic rules in order to guarantee product acceptability. Several informants reported opening packages, including those of known brands, in order to directly touch the product; they did this because they perceived variations in quality, for example, due to the crop. In this case, brand is not sufficient for decision-making and touching reduces performance risk.

Pre-purchase information search - With a limited budget and many items on the shopping list, the low income consumer seems to try to get the most benefit possible from previous knowledge in order to reduce risks of various types. The most sought-after information is obtained from supermarket promotional advertising inserts and word-of-mouth communication with family members, neighbours or workmates. By gathering information from advertisements and advertising supplements, the consumer seems to feel better prepared to take advantage of price variations, thereby reducing financial risk.

## CONCLUSION

Using in-depth interviews with 15 consumers and the analysis of their responses, five perceived-risk causing factors were shown, all directly related to the dimensions described in the literature: 1) The need to meet family expectations and the desire to not disappoint a loved one, often lead the consumer to buy more expensive

brands; 2) Time restrictions impede the search for better prices and becoming familiar with new brands available on the market and, therefore, the ability to make safer decisions, principally with respect to product performance and price (always an important factor); 3) Discrepancies in perceived quality force consumers to carefully catalogue, in their minds, previous experiences with brands, both positive and negative, and to utilize more frequently their senses in order to assess the quality of the items they intend to buy; 4) Variation in product prices (as a function of the offers at different points of sale or on different days of the week) in conjunction with limited time (to gather information) generate a high degree of insecurity for the low-income consumer. Scarce resources for buying food lead the poor to feel insecure: they perceive that, perhaps, they aren't getting the "best" price; 5) The indivisibility of the package forces the consumer to buy quantities other than those desired and often inhibits him/her from trying a new brand or product (despite its being priced more cheaply) in order to avoid buying a lot of something he/she is unfamiliar with.

Note that each factor may be related to more than one dimension of perceived risk; it would be useful, therefore, to study them in greater depth. Likewise, for a given choice, several of these factors may present themselves simultaneously to the consumer, dramatically increasing his/her anxiety and demanding that he/she employ a combination of mitigation strategies to address the perceived risks. By virtue of the extreme heterogeneity among these consumers and based on the fact that a family income of two "minimum salaries" still leaves the Brazilian consumer squarely at the bottom of the pyramid, future studies should also take into consideration the size of the household, and differences in gender, income and age.

In order to better understand these mitigation strategies and their employment, future studies may choose: to investigate how such consumers construct their set of considerations, assessing the relative importance that they attribute to informational and normative (i.e. from family members) influences and the marketing information they receive; to understand the role of each family member in the decision-making process in question; to understand better the circumstances in which the consumer substitutes the strategy of brand loyalty with the strategy of brand diversification. For food-sector marketing professionals, knowledge of perceived-risk factors will be useful in the development of new products and in the study of the most adequate package sizes of the foods that he/she produces. Store managers can use discoveries related to risk mitigation strategies used by consumers at the point-of-sale in order to better define the product mix in his/her store; managers should also be mindful that oftentimes low-income consumers often seek out higher-priced prestige brands, possibly avoiding stores that only carry cheap products in their mix. Adequate communication strategies, especially with respect to promotions, can be implemented thereby bringing more consumers to the stores that – in addition to offering a good supply of appropriately priced brands – provide better quality information.

# **THE EFFECT OF LEADER MEMBER EXCHANGE QUALITY ON EMPLOYEE'S PERCEPTION OF POLITICS AND ORGANIZATIONAL CITIZENSHIP BEHAVIOR: THE MODERATING ROLE OF ORGANIZATIONAL JUSTICE**

**Sezer Günaydın Çalışkan**  
**Haliç University, Turkey**

## **ABSTRACT**

*Within this article the affect of leader member exchange quality (LMX) on the employees' perception of politics and organizational citizenship behaviors (OCBs) is investigated. The moderating affect of organizational justice composing of procedural, interactional and distributive justice is also tested. Employees with poor quality relationships can create harmful affects both for themselves and their organizations. Perception of political behavior(POPS) is one of them. On the other hand good quality relationships (high LMX) can increase extra role behaviors and contextual performance of the employees. Organizational citizenship behavior (OCB) is one of them. Within this context regression analysis supported that LMX has a low to moderate explanatory power on employee's POPS (a negative relationship) and this explanatory power further increases with higher procedural, interactional and distributive justice perceptions of the employees in other words organizational justice has a moderating affect. However, regression analysis further support that LMX has a very powerful explanatory power on organizational justice, and organizational justice has more explanatory power on POPS comparing LMX which means that justice can have an intervening affect between LMX and POPS. LMX has also a meaningful and significant explanatory power on OCB.*

## **INTRODUCTION**

Empirical studies show that 77 % of the employees in USA are dissatisfied with their jobs and they are unhappy. Studies about intention to turnover of employees states that the prior reason of their turnover is the poor and bad behaviors of their managers and supervisors. On the other hand, employees with poor and bad relationships even they stay in their companies, their level of job and life satisfaction and organizational commitment decreases and they are more open to psychological distress, burnout and depression, they have more conflict between their work and families. All of these recent analyses clearly remark the necessity to search more about the antecedents and consequences of the quality relationships between leaders and members (employees).

Leader-member exchange quality (LMX) is basically is a leadership theory which based on the dyadic relationship between the leader and the employee that is different from an average leadership model (Average Leadership Style, ALS)". (Schriesm, Castro & Cosliger, 1999; Dansereau, Graen & Haga, 1975). Within the last decade LMX may be one of the most searched, criticized and developed leadership approaches in the literature. LMX has influential affects on individual, group and organizational level. LMX is generally found to be associated with positive performance related employee behaviors and attitudes. LMX has either directly or with other OB variables an influence on high employee performance, (Liden, Wayne& Stidwell, 1993), job satisfaction and satisfaction with the supervision (Duchon, Green& Taber, 1986), organizational commitment (Nystrom, 1990), career development (Graen & Scandura, 1987), decrease in turnover and intention to turnover (Veccio, 1985; Schiriesheim, Castro, Coglisier, 1999).

Within this theoretical need, the subject of this article is to investigate the affect of LMX on two important organizational behavior variables namely “perception of politics (POPS)” and “organizational citizenship behaviors (OCBs)”. In the preceding parts, the operational definitions and the theoretical explanations indicating the possible relationships between variables will be discussed.

## **LEADER MEMBER EXCHANGE QUALITY (LMX)**

As it stated before leader-member exchange quality (LMX) theory explain the leadership process as a dyadic linkage between the leader and the member (employee, follower) (Gestner & Day, 1997). According to LMX theory, the quality of the relationship between supervisors and subordinates falls into 2 categories: in-group and out-group (Graen, 1976). Due to time pressures, supervisors develop close relationships with a few key subordinates. These subordinates are referred to in-group. In-groups are characterized by high levels of interaction, support, trust and formal / informal rewards. (High quality LMX) The other category, out-group is characterized by low levels of interaction, support, trust & rewards. In managing the out group, the supervisor relies primarily on formal rules, policies and authority. (Low quality LMX).

The in group and out group exchanges are similar to the concept of “economic exchange” and “social exchange” described by Blau (1988). Economic exchange is contractual in nature. The obligations of the members are clearly defined, thus the conditions of the exchange can be enforced and do not rest on interpersonal trust (Graen & Uhl- Bien, 1995). Out group exchange as one where the supervisor relies almost exclusively upon the formal employment contract in his or her exchanges with the employee, the supervisor can fulfill the employment contract without entering into any or minimal social exchanges. In contrast, social exchange is based on trust and implicit obligations (Dansereau, Graen & Haga, 1975). Thus one member of the exchange may perform a service for the other party without a specified outcome or reward. Leaders encourage their employees to take further responsibility and provide necessary support and resources to reach their goals. (Wang, Law, Wang & Chen, 2001). This social interaction and exchange between the leader and the member increases the quality of the relationship.

In recent studies LMX is measured as a multi dimensional construct (Liden & Maslyn, 1998; Dienesch & Liden, 1986, Wang, Law, Wang & Chen, 2001). Wang et al. (2001) states that LMX is composed of four constructs:

- (1) Affect: The interaction and affect between the supervisor and subordinate besides job related values.
- (2) Loyalty: Commitment to the achievement of shared goals between the supervisor and the subordinate.
- (3) Contribution: The amount, quality and the direction of the contribution of the parties to the achievement of shared goals.
- (4) Professional Respect: The reputation of the dyad to realize their tasks and jobs successfully.

An important component of social exchange theory that is useful in understanding the relationship between LMX and subordinate behavior is “the norm of reciprocity” (Gouldner, 1960). A high quality exchange may create a sense of obligation on the part of the subordinate to reciprocate in terms of the behaviors valued by the supervisor. High quality exchanges tend to be associated with employee behavior that benefits the supervisor and goes beyond the formal job duties (Linden & Graen, 1980). In other words if an employee’s perception of LMX is high he/she will reciprocate by increasing his support and performance toward his leader and his company. Therefore it isn’t wrong to think that high quality LMX may increase the extra role behaviors toward the leader and the organization. One of these extra role behaviors is “organizational citizenship behaviors (OCBs)” which is also in the scope of this article. In the preceding paragraphs OCB and its possible relationship with LMX will be discussed.

## **ORGANIZATIONAL CITIZENSHIP BEHAVIOR (OCB)**

Organizational citizenship behavior (OCB) is referred as set of discretionary workplace behaviors that exceed one’s basic job requirements (Bateman & Organ, 1983). They are often described as behaviors that go beyond the call of duty. Other examples of OCB are willingness to take steps to prevent problems with other employees, and obeying organization rules, regulations and procedures even when no one is watching. In the literature several dimensions of OCBs are stated such as, ‘helping’ behaviors by employees (e.g. supportive actions to assist others and

going beyond the requirements of the job); 'sportsmanship' (tolerating the work environment without excessive complaining); and 'civic duty' (constructive involvement in the processes of the organization beyond the requirement of the job). Smith, Organ & Near (1983) identified 2 dimensions of OCB: altruism & compliance. Altruism refers to behaviors aimed at helping another person such as assisting the supervisor with his/ her work, helping others who have been absent, orienting new people. Compliance refers to impersonal behaviors such as not taking undeserved breaks or time off, being punctual, giving advance notice if unable to come to work. Williams & Anderson (1991) summed these components of OCB under two major components: OCBO (citizenship behaviors benefiting the organization) and OCBI (Citizenship behaviors benefiting the individuals). OCBI component mostly match with altruism and helping behaviors and OCBO mostly match with conscientiousness and compliance (Organ & Konovsky, 1989; Smith, Organ & Near, 1983; Wayne & Green, 1993). In this paper, OCBs will be evaluated within the context of OCBI and OCBO. As Williams & Anderson (1991) stated it is important to search these two components differently since they may have different antecedents.

## **THE INTERACTION OF LMX AND OCB**

Following social exchange theory, OCB may be related to LMX: OCB is not required or part of the formal reward system that an employee who engages in OCB isn't formally rewarded. However OCB may be informally rewarded through LMX. It seems that an employee who engages in OCB would be contributing to the department's efficiency and effectiveness and thus helping the supervisor. Thus, **OCB may be used as a way of reciprocating for support from the supervisor** (Liden & Graen, 1980). Subordinates may engage in OCB and perform at a high level to reciprocate for rewards and support provided by the supervisor, thus maintaining a balanced or equitable social exchange with the supervisor. A number of field studies have found support for the relation between LMX and OCB (Setton, Bennett & Liden, 1996; Wayne & Green, 1993; Settoon, Bennett, & Liden, 1996; Wayne & Green, 1993; Wayne, Shore & Liden, 1997). So,

H1a: LMX has a significant explanatory power on OCBs.

H1b: LMX's explanatory power on OCB can be different for OCBI and OCBOs.

## **PERCEPTION OF POLITICS (POPS) AND ITS INTERACTION WITH LMX**

Organizational politics refers to the actions by individuals which are directed toward the goal of furthering their own self interests without regard for the well being of others or their organization (Kacmar & Baron, 1999; Drory & Romm, 1990; Ferris, Frink, Beehr and Gilmore, 1995; Ferris & Kacmar, 1992; Ferris & Judge, 1991, Pfeffer, 1992). Examples include, bypassing chain of command to gain approval, going through improper channels to obtain special equipment, lobbying high level managers just prior to promotion decisions.(Andrews& Kacmar, 2001).Contemporary research began addressing organizational politics as perceptual phenomenon with negative consequences for those who perceive it to occur (Gandz& Murray,1980; Ferris & Kachmar, 1992)Those who perceived politics occurring within their organization experience reduced job satisfaction, organizational commitment, increased job stress and more likely to leave the organization. (Kacmar, Bateman, Carlson, Anthony, 1999).

Ferris and Kacmar (1992) in their integrated study about POPS found that the quality of the relationship that is conducted with the supervisors is one of the important determinants of POPS. POPS increases in the uncertainty and low trust environments. LMX decreases the level of uncertainty and increase the level of trust. At the same time according to the social exchange theory and the norm of reciprocity, an employee who has high level of LMX perception decreases the level of his/ her harmful or deviant behaviors toward their supervisors. They have no need to use some political tactics to increase their self interests despite their supervisors or companies' aims and interests. In a high quality relationship the employee is already secure and knows that his supervisor protects and maintains his/her interests, gives the necessary information, support and resources to his /her employee and involves him to the decision making procedures. Therefore we can hyphotize that:

H2: When the quality of the relationship between supervisor and subordinate decreases the level of perception of politics increases.

# ORGANIZATIONAL JUSTICE AS A MODERATOR BETWEEN LMX AND POPS

Organizational justice is an important determinant of employee behaviors and attitudes (Masterson et al., 2000) like job and payment satisfaction (Folger & Konovsky, 1989; McFarlin & Sweeney, 1992), performance (Cowherd & Levine, 1992), intention to turnover and absenteeism (Hulin, 1991). Organizational justice is composed of three components: distributive justice, procedural justice and interactional justice (Pillai, Schriesheim & Williams, 1999). Procedural justice concerns the fairness of the ways used to determine the distribution of resources among employees (Greenberg, 1990). Cropanzano & Greenberg (1997) distinguished between structural and social aspects of procedural justice. Structural determinants involve formal rules & policies concerning decisions that affect employees, including adequate notice before decisions are implemented, receipts of accurate information and voice (i.e. employee input in the decision process) (Thibaut & Walker, 1975). Social aspects of procedural justice sometimes called interactional justice, involve the quality of interpersonal treatment in resource allocation. Social aspects include treating employees with dignity and respect and providing employees with information concerning how outcomes are determined (Cropanzano & Greenberg, 1997; Tyler & Bies, 1990). Distributive justice refers to the perceived fairness of the allocation of resources by the organization. Members make evaluations about whether the outcomes (e.g. performance ratings, pay promotions) offered by the organization are fair given to the amount of effort they have put forth (Folger & Konovsky, 1989; McFarlin & Sweeney, 1992).

Researches have shown that, in-group members perceived a higher level of fairness (organizational justice) than do out-group members (Sias & Jablin, 1995; Vecchio & Griffeth, 1986). Those members who are in the in-group (high quality LMX), are often involved in making decisions through their increased interactions with the supervisor (Wayne et al., 1994). This involvement in decision making (voice & choice) has been proposed as a means of control, decreases the level of uncertainty. So we can hypothesize that in justice environments the level of POPS decreases. So, except the direct relation between LMX and POPS as it is stated before, "organizational justice" can moderate the relationship between LMX and POPS. And even we can say that in organizational justice climates, the level of POPS can decrease even LMX is low. Or in other words justice components can compensate the effect of LMX on POPS since both of these variables decrease the level of uncertainty and create a trusting environment.

So we can hypothesize that;

*H3: Organizational justice is a moderator in the relationship between LMX and POPS.*

*H4: Organizational justice can compensate the effect of LMX on POPS.*

The studies in literature support that interactional justice mostly affects employee attitudes toward the supervisor or has a direct influence on satisfaction with the supervisor and OCBI (organizational citizenship behavior toward the supervisor) whereas procedural justice mostly affects employee attitudes toward the company like organizational commitment and intention to quit (Masterson and Taylor, 1996; Maletesta and Byrne, 1997; Moorman, 1991). Within this context the preceding hypothesis can be developed:

*H5: The level of moderating effect of organizational justice between LMX and POPS will be different for the different components of organizational justice.*

## METHOD

### Sampling and Procedure

120 employees that work in banking and transportation sector in Istanbul, Turkey are participated to the study. The questionnaires are distributed anonymously within the period of 1 month. Most of the participants work 5-10 years in their companies (60%). 40% of them are women and 60% are men and their age average is 35. Most of the participants are single (60%) and 73% are university graduates.

### Measures

*Leader-Member Exchange Quality (LMX)*: Liden & Maslyn (1998)'s 16 item multidimensional LMX questionnaire is used. *Organizational justice*: Moorman (1991)'s composed of 17 items is used. 6 of them measures distributive justice, 6 of them measures procedural justice and 5 of them measures interactional justice. *Perception of politics (POPS)*: Kipnis, Schmidt and Wilkinson (1980)'s political tactics scale is used by changing items to perceptions. The questionnaire is composed of 18 items including "coalitions", "self-promotion", "ingratiation", "upward appeal" and "exchange of favors". *Organizational Citizenship Behavior (OCB)*: Williams & Anderson (1991)'s 14 items scale is used.

## FINDINGS AND RESULTS

### Factor Analysis

All of the questionnaires were entered to the factor analysis. The factor structure of the 18 items LMX (MDN) questionnaire (Liden& Maslynb, 1998) are the same with the original component analysis with the Turkish sample. SPSS computed four factors: Professional respect, Affect, Loyalty and Contribution. The reliability analysis applied to the factors indicates that inter item reliability of Professional respect is .93; Affect .91; Loyalty .87 and Contribution is .83. The same analysis is made to the Moorman's 17 item "organizational justice" scale. The factor structure of the scale is again like the original one with the Turkish sample. 3 components are justified with the same items under the same components: procedural justice, interactional justice and distributive justice. The inter item reliability scores (Cronbach Alpha's) for the distributive justice is .94, procedural justice .91 and interactional justice .83. POPS questionnaire scales are entered to the factor analysis and four components are computed. Among 18 items the questions which decreases the inter item reliability and the low factor loadings are excluded from the analysis. The final factor structure analysis of the POPS scale (Kipnis, Schmidt ve Wilkonson, 1980) is stated in Table 1.

**Table 1. Factor Structure and Inter item Reliability of the Perception of Politics (POPS) Questionnaire**

| FACTOR NAME  | FACTOR LOADING | EXPLAINED VARIANCE % | CRONBACH $\alpha$ |
|--|----------------|----------------------|-------------------|
| <b>SELF PROMOTION</b>                                |                | <b>%23</b>           | <b>.91</b>        |
| Pretending to be successfull .                       | <b>.91</b>     |                      |                   |

All of the 14 items of Organizational Citizenship Behavior Scale(OCB) by Williams & Anderson (1991) were entered to factor analysis. With the Turkish sample three components were computed. The items decreasing inter item reliability and the questions that aren't computed in one of the factors are excluded from the analysis. The final factor structure is exhibited in Table 2 : OCBI's (citizenship behaviors benefiting the organization) are indicated in "courtesy" and "altruism" factors composing of of total 7 items and the OCBOs are indicated in "conscientiousness" factor composing of total 2 items.

## Regression Analysis Explaining the Relationships between LMX and OCBs

To test the magnitude and the direction of the explanatory power of LMX on OCB dimensions, three regression models are analyzed since OCB dependents are courtesy, conscientiousness and altruism. None of the components of LMX has a meaningful explanatory power on OCB's courtesy factor. However LMX components significantly explain the "altruism (OCBI)" and "conscientiousness (OCBO)" components of OCB scale. H1 is approved. But there is no difference between the explanatory power of LMX on OCBI and OCBO components which means that LMX can both increase OCBO and OCBI levels. H1a is rejected. Table 3 and Table 4 exhibit the meaningful relations.

**Table 3: Explanatory power of LMX components on “conscientiousness” component of OCB**

## Regression Analysis Explaining the Relationships between LMX, Organizational Justice and Perception of Politics

To be able to test the explanatory power of LMX on POPS, all of the components of LMX are regressed on each component of POPS namely: ingratiation, self- promotion, exchange of favors and coalition building. The results are exhibited in Table 5. As the R Square indicates models have a low explanatory power. The results approve the explanatory power of LMX on POPS with a low explanatory power so H2 is partially accepted.

**Table 5: Regression Analysis Explaining the effect of LMX on POPS**

---

|   |                 |                   |              |  |

| Professional respect   | -, 28         | -2,913             | , 004        |  |

---

In the second step of the regression analysis, the explanatory power of LMX components are regressed on organizational justice variables composed of procedural justice, distributive justice and interactional justice. As it is shown from the Table 6, LMX has a significant explanatory power on all of the justice variables with high Beta scores. The Adjusted R Square scores indicate a moderate to high explanatory power of LMX on organizational justice. The highest Beta score is computed between LMX and “interactional justice” variable.

**Table 6: Explanatory power of LMX on Procedural, Distributive and Interactional Justice**

| Independent variable: LMX   |      |        |              |                   |
|---|------|--------|--------------|-------------------|
| Dependent variables: Procedural, Distributive and Interactional Justice |      |        |              |                   |
|   | Beta | t      | Significance | Adjusted R Square |
| Distributive Justice  | ,46  | 5,219  | ,000         | .20               |
| Procedural Justice  | ,61  | 7,836  | ,000         | .37               |
| Interactional Justice   | ,73  | 10,873 | ,000         | ,23               |

In the third step of the regression analysis, to test the moderating affect of organizational justice between LMX and POPS all of the LMX and organizational justice components are entered as independents into the regression model. The meaningful results are exhibited in Table 7 and 8. Within the interaction model, procedural justice has the only variable that entered to the regression model explaining “ingratiation”; interactional justice is the only variable entered to the regression model explaining “upward appeal” and “ingratiation”. These results indicate that procedural justice and interactional justice has more explanatory power of POPS components comparing to LMX variables within the same interactional regression model which means that justice perceptions can compensate the affect of LMX on POPS and organizational justice is a powerful moderator (H3 and H4 is accepted). On the other hand as Table 8 indicates LMX has a powerful explanatory power on organizational justice which means that LMX explain justice and justice explain POPS. These relationships enforce the argument that LMX influences POPS via organizational justice. Procedural and interactional justice has more explanatory power comparing to distributive justice which means that the level of moderating affect of organizational justice between LMX and POPS will be different for the different components of organizational justice (H5 is accepted).

**Table 7: Explanatory power of LMX and Organizational Justice Components in interaction on “Self-Promotion”**

|  |      |        |              |
|--|------|--------|--------------|
| Dependent Variable: Self promotion component of POPS   |      |        |              |

## DISCUSSION AND MANAGERIAL IMPLICATIONS

The important finding of this article is that the positive relationship between LMX and OCBs are approved. As Organ (1988) noted that OCB is held to be vital to the survival of an organization. Organ further elaborated that

organizational citizenship behavior can maximize the efficiency and productivity of both the subordinates and the organization that ultimately contribute to the effective functioning of an organization. OCB is desirable from the organizational point of view because such behavior is thought to increase the available resources and decrease the need for costly mechanism of control (Organ, 1988). As the results indicate, LMX not only increases the OCB behaviors toward the individuals namely the managers but it also has an equal affect on the OCBs toward the company. So to increase contextual performance and extra role behaviors of the employees, developing high quality relationships with the employees is crucially important. Managers have to give attention to build and maintain high quality relationships to increase the efficiency and productivity of the company.

The findings of this research also approve that LMX and organizational justice can compensate each other in the explanation of the employees' perception of political behavior. So managers have to give importance to increasing the level of procedural and justice perceptions of employees to detect the negative affects of POPS on the company. They have to behave in respect and dignity to their employees, at the same time they have to give a chance to "voice" and "choice" to their employees about the decisions related to employees. Even tough LMX has a low explanatory power on LMX comparing to justice perceptions, the results show that developing high quality relationships also prevent employees from harmful and destructive behaviors of the company. So developing a trustful and qualified relationship is in the hands on managers. The most important limitation of the research is to use convenience sampling due to time constraints, but the same model can be generalized by using a larger sample and with the different sectors and the companies.

# THE IMPACT OF PATERNALIST LEADERSHIP ON RESISTANCE TO CHANGE: THE MODERATING AFFECT OF LMX AND POLITICAL SKILL

Sezer Günaydın Çalışkan

Haliç University, Istanbul

Ash Erim

Istanbul Commerce University, Istanbul

## ABSTRACT

*Within this research model the impact of a culturally specific model of leadership namely “benevolent leadership” on resistance to change will be investigated. Two levels of moderators are also included into the model. One is about the context of the relationship namely: leader member exchange quality and the other is an individual level variable namely: political skill. The impact of these moderators on resistance to change seems to be a new research idea when we review the resistance to change literature.*

## LITERATURE REVIEW

### Resistance to Change and Leadership

Organizational change is an empirical observation in an organizational entity of variations in shape, quality or state over time (Van de Ven and Poole, 1995), after the deliberate introduction of new ways of thinking, acting, operating (Schalk et al., 1998). Organizations in today’s business environment have to implement numerous regulatory, economic, competitive and technological organizational changes to survive in order to improve in performance or compete better. Every change brings potential benefits and risks.

It has been argued that employee reactions to change e.g., resistance to change and support for change have critical implications for the outcomes of organizational change (Kotter, 1995). The reasons for the failure of many change initiative can be found in resistance to change. The term resistance to change is used on organizational change, usually as an explanation for why efforts to introduce large-scale changes in technology, production methods, management practices or, compensation systems fall short of expectations, or fail altogether (Oreg, 2006). Resistance to change introduces costs and delays into the change process (Ansoff, 1990) that are difficult to anticipate (Del Val, Fuentes, 2003).

The context-specific antecedents of resistance have been addressed in many researches. Whereas some antecedents have to do with the outcomes of change such as losing or gaining power. According to Dent and Goldberg (1999), organizational members resist negative consequences (e.g., losing one’s job) and not necessarily change in itself. Others focus on the way in which change is implemented such as the amount of information about the change is given to employees (Oreg, 2006). Therefore, the belief that people resist change hinders organizations’ changes of understanding and dealing with real organizational problems. *At this point we believe that leadership plays an important and critical role on managing resistance to change.* With the right strategies and tactics, leaders can minimize the resistance to change in their organizations. Nult (1987) has examined the tactics used by leaders to implement change. Research on overcoming resistance to change centers

on the effects of subordinate participation in decisions about the change. Thus, for Nult (1987) participation is an implantation tactic designed to reduce resistance. Lawler (1986) and Lawrence (1969) show that participation can lead to significant reductions in resistance.

Leaders can demonstrate organizational support by effecting and communicating efforts that go well beyond what is required. The higher level of mistrust in the organization's leaders, the lower the likelihood that changes will survive. These factors contribute to an environment that more readily accepts and promotes change (Krause, 2008). Leaders' behaviors that influence perceptions of trustworthiness include consistency, integrity, sharing control in decision making and through delegation, communication and benevolence, therefore, in this research, benevolent leadership on resistance to change will be investigated.

## **A culturally Specific Leadership Model: Paternalist Leadership**

Paternalist leadership consists of 3 elements: Authoritarian leadership, benevolent leadership and moral leadership.

Authoritarian leaders stress their unquestionable and absolute authority and they will take rigorous control over their subordinates and demand complete obedience from them. The concrete behaviors that characterize authoritarian leadership are control and domination underestimating the ability of subordinates, building a lofty image of the leader and instructing subordinates in a didactic style (Cheng, 1995). As distinct from the supervisory power coming from the position in the West, the power of authoritarian leadership reflects familism, paternalistic control and submission to the authority.

Benevolent leader is a leader who displays personal, overall and long term concern for the well being of subordinates. It differs from leader consideration (Stodgill, 1974) and supportive leadership. Benevolent leadership goes beyond the work domain and it is also applied to personal issues, is long term oriented, involves the granting of grace and protection to subordinates, and is exercised in the context of strong authority so that the subordinate don't forget who is the boss.

Moral leadership is characterized of a high degree of personal integrity, self-cultivation and selflessness. A moral leader should demonstrate behavior that their authority isn't only for personal benefit but also for the public good. The actual behavior includes unselfishness, being upright and responsible, leading by example, and not mixing with business interests with personal interests (Cheng, Chou, Fang, 2000).

In paternalistic cultures the employees voluntarily accept the authority of their managers and leaders. Managers are like "father figures". They give help, assistance and support to their employees in return for an unquestioned commitment and loyalty to the leader and his objectives. Paternalist leaders take decisions in the name of their employees because they have an assumption that "I know better than you" against their employees. Within that theoretical explanation we can assume that paternalistic leadership can reduce the employee's uncertainty perceptions, in such a relationship followers believe that the leader will protect him against the uncertainties that the change brings and he will take the right decisions in the name of themselves. A family culture can prevail in paternalistic leadership environments. So as a culturally specific model paternalistic leadership can facilitate change and reduce the negative reactions of the followers to change especially in a paternalist culture like Turkey.

## **Leader Member Exchange Quality (LMX) and Resistance to Change**

Leader-member exchange quality (LMX) theory explain the leadership process as a dyadic linkage between the leader and the member (employee, follower) (Gestner & Day, 1997). According to LMX theory, the quality of the relationship between supervisors and subordinates falls into 2 categories: in-group and out-group (Graen, 1976). Due to time pressures, supervisors develop close relationships with a few key subordinates. These subordinates are referred to in-group. In-groups are characterized by high levels of interaction, support, trust and formal / informal rewards. (High quality LMX) The other category, out-group is characterized by low levels of interaction, support, trust & rewards. In managing the out group, the supervisor relies primarily on formal rules, policies and authority. (Low quality LMX). When the LMX quality is high,

resistance to change will decrease since a high LMX context reduces the level of uncertainty. The employees in the in-group will have much more access to information channels, they will be more participated and included to the decision processes and they take more respect, consideration, help and support from their managers. In a changing environment with high level of uncertainty employees perceiving a high LMX level, by perceiving a trusting environment will be able to cope with this uncertain situation (Farr Watton & Brunetto, 2007). Therefore it can be assumed that resistance to change will decrease in a high quality leader-member exchange relationship. Paternalistic leadership decreases resistance to change and a high LMX context can further increases this affect so LMX can be considered a moderator between paternalistic leadership and resistance to change.

## Political Skill and Resistance to Change

Political skill of the employees can have a similar uncertainty reducing affect on resistance to change. Political skill is the ability to effectively understand others at work, and to use such knowledge to influence others to act in ways that enhance one's personal or organizational objectives (Douglas & Ammeter, 2004). Politically skilled individuals convey a sense of personal security and calm self-confidence that attracts others and gives them a feeling of comfort. People high in political skill not only know what to do in different social situations at work but how to do it in a manner that disguises any ulterior, self-serving motives and appears to be sincere.

There are 4 key dimensions under political skill construct (Ferris, Treadway, Kolodinsky, Hochwater, Kacmar, Douglas and Frink (2005): Social astuteness: People high in this dimension have an accurate understanding of social situations as well as the interpersonal interactions that take place in these settings. Interpersonal influence: Politically skilled individuals have a subtle and convincing personal style that exerts a powerful influence on those around them. Individuals high on this dimension are capable of adapting and calibrating their behavior to each situation in order to elicit particular responses from others. Indeed interpersonal influence dimension capture what Pfeffer (1992) referred to as "flexibility" which involves adopting one's behavior situational to different targets to influence different contextual conditions in order to achieve one's goal. Networking ability: Politically skilled individuals easily develop friendships and build strong, beneficial alliances and coalitions. Apparent sincerity: Politically skilled individuals appear to others as possessing high levels of integrity, sincerity and geniuses. Because their actions are not interpreted as manipulative and coercive, individuals high in apparent sincerity inspire trust and confidence in and from those around them.

So we can hyphotize that as an individual variable political skill can be a moderator between paternalistic leadership and resistance to change. Politically skilled individuals can successfully tolerate and cope with organizational changes. Paternalistic leadership decreases resistance to change and political skill further increases the magnitude of this relationship. At the same time we can say that LMX and political skill can compensate each other in such a model. Because those employees who experience low quality relationships with their supervisors are not likely to experience the same outcomes (e.g. network formation, promotions etc.) as those high quality relationships with their supervisors, they need some way of acquiring those desired outcomes their own. Political skill is the mechanism for which can be accomplished. So even tough a politically skilled employee has a poor quality relationship with his leader can cope with organizational change and his resistance level decreases comparing to a low politically skilled individual.

## METHOD

### Sampling and Procedure

*Participants*: The sample for the survey study consisted of 80 Executive MBA students at a large university working full time in an array of industries including, computer services, accounting and, customer relations.

*Procedures*: Questionnaires are distributed to those volunteered to participate in this study in classrooms and collected within 2 hours period of time. The surveys were also accompanied by a letter

explaining the focus of the study. It was reminded the participants that their responses were completely confidential.

## Measures

Paternalist Leadership scale: Paternalism was measured with 13 items based upon Ayman's initial item pool from the preliminary stages of her scale development (Ayman, 2005). LMX was measured with LMX7 developed by Graen & Scandura (1987). Political skill was measured by Ferris, Treadway, Kolodinsky, Hochwater, Kacmar, Douglas and Frink (2005)'s political skill inventory. Resistance to change (RCT) was measured by Shaul Oreg's 17 items Resistance to Change Scale (2006).

## FINDINGS AND RESULTS

To be able to test the relationships between model variables factors are computed and the reliability analysis were done to all of the factors. When we look at the factor structure of paternalist leadership scale SPSS 13.0 version computed two factors. From 13 items of the original scale, items decreasing reliabilities are excluded. One factor is about the father figure of the manager the other one is about the managerial concern of the managers. The Cronbach Alpha scores of the factors are .85 and .89. The sample items of the factors for being a father figure is like: "My manager behaves his/her employees as if a father", "My manager created a family climate in the workplace". Sample items of the managerial concern figures are: "My manager concerns with the every aspect of his employee's lives", "My manager participates the very special days of his/her employees (wedding, funeral etc...). The result of the factor analysis of two moderating variables namely LMX and political skill: LMX is a one factor variable and for the political skill again SPSS computed four reliable components namely: social astuteness, interpersonal influence, analyzing ability of the people and apparent sincerity. The reliability score of LMX7 is .85. And the inter item reliability scores of political skill factors are .83 for social astuteness, .71 for interpersonal influence, .83 for apparent sincerity and .72 for analyzing people. For the RCT scale with 17 items SPSS computed 2 main factors. One is "dislike change" the other one is "being stressed under change". 7 questions were excluded from the analysis since their scores decreases reliability coefficient.

To be able to test the explanatory power of independent variables on RCT, multiple regression analysis were made. In the first step the paternalist leadership style factors are entered to the model and regressed on RCT factors. However no meaningful explanatory power can be measured between being father like figure and managerial concern on "disliking change" and "being stressed under change" contrary to our theoretical framework explanations which means that benevolent or paternalist leadership has no a direct influence on the change perceptions and resistance to change reactions of the employees. In the second step first LMX and later political skill factors are entered to the analysis. However LMX doesn't change the explanatory power whereas the only meaningful variable that have an explanatory power on RCT factors are "analyzing skill" component of the political skill variable. The Beta and R Square scores are given in Table1.

**Table 1: Explanatory power of political skill on RCT (Stepwise Multiple Regression Analysis)**

Dependent variable: Resistance to change factors: "dislike change" and "being stressed under change".  
Independent variables: LMX, Paternalist leadership factors (being a father like figure and managerial concern), Political skill components (social astuteness, interpersonal influence, analyzing people and apparent sincerity)

The variable entered to the analysis: Analyzing ability component of the political skill

|                  |                     | Being stressed under change | Dislike change |
|------------------|---------------------|-----------------------------|----------------|
| Analyzing people | R                   | .29                         | .28            |
|                  | R Square            | .10                         | .10            |
|                  | F test              | 5.030                       | 4.459          |
|                  | F test significance | .02                         | .02            |

|                  |      |      |
|------------------|------|------|
| Beta coefficient | -.29 | -.28 |
| Significance     | .02  | .03  |

---

All of these analyses indicate that when an individual has political skill he/she can more easily tolerate the change process. As it is explained in the literature review part, political skill decreases the level of uncertainty of the individual which in turn can decrease the level of fear from change or being stressed during change periods. Most of the previous studies in the RCT literature give importance to the context of the change and they state that change process has to be carefully managed. But the relationship between political skill of the employees and resistance to change provides an important cue for the change management which is even the leadership or LMX has no influence on RCT political skill can compensate their non effect. So if a manager has to cope with resistance to change he/she has to be aware that politically skilled individuals who have an analyzing power of the different people will less resist to change. He/she can use these people as catalyst in the change process. At the same time if a company is in the change process, in personnel selection, HRM department can give importance to this personality trait in the selection of new employees. As it is shown, personality of the employees can be an important determining factor of RCT. The up coming studies may concentrate on the affect of different personality traits and variables together with political skill on RCT of the employees.

The most important limitation of this study is the time limitation and the low number of participants to the questionnaires. These are an impediment to the generalization of the study result. So we can assume that this study a pilot and generalize the study results with the new factors and different samples.

# ENTERING STRATEGIES FOR PRIVATE LABEL BRANDS IN EMERGING ASIAN MARKETS

**Costas Hadjicharalambous**  
**State University of New York, USA**

## ABSTRACT

*Several attempts to launch lines of private label groceries by hypermarket chains in Asia have been documented but very few have been commercially successful on a sustainable basis. Given the lower price of private label brands and the lower disposable income of consumers in emerging Asian markets one would expect that lower priced private label grocery brands would have done better than they have. The paper examines the reasons of “failure” of private label grocery brand in Asian markets and concludes with managerial implications of how private label brands opportunities can be better exploited.*

## INTRODUCTION

During the last decade the retail grocery structure in many of Asia's emerging economies has changed significantly from locally-owned supermarkets and small family stores to the more international hypermarket format. The average size of individual hypermarkets throughout Asia is between 100,000 to 200,000 square feet, with 60 per cent of sales accounted for by groceries. The majority of hypermarkets sell groceries on an everyday low price (EDLP) strategy, supplemented by broadly advertised sales promotions (Davies & Alexander, 2003). Given the lower price of private label brands and the lower disposable income of consumers in emerging Asian markets one would expect that that lower priced private label grocery brands would have done better than they have. However this is not the case. An AC Nielsen (2003) study in 36 countries throughout the developing and developed world, reported that private label grocery brands enjoy an aggregate global market share of 15 per cent (US\$ 26 billion). According to the study the United States was the most valuable private label grocery market from the viewpoint of overall sales value. The United Kingdom was reported to have a relatively higher private label grocery market share of 31 per cent (AC Nielsen 2003). Several attempts to launch lines of private label groceries by hypermarket chains in Asia have been documented but very few have been commercially successful on a sustainable basis. It is a widely shared belief among international marketers that Asian grocery purchasers have consistently demonstrated a stronger preference for national (international) brands over private label (Ahuvia & Wong, 1998; De Mooij & Hofstede, 2002). The gross national income per capita between the United Kingdom, United States and selected Asian countries differs quite significantly. This suggests that hypermarket grocery shoppers in emerging Asian markets are severely restricted in terms of their disposable incomes compared with Westerners. Several academic researchers (e.g. Batra & Sinha, 2000; Raju, Sethuraman & Dhar, 1995) found that low income seems to increase price consciousness, which in turn increases interest in private label brands. However, in Asian emerging markets low disposable income does not seem to boost private label growth. The next section reviews relevant literature in an attempt to explain this rather counterintuitive phenomenon. The paper concludes with managerial implications and some suggestions of how private label brand opportunities in Asian Markets can be exploited.

## LITERATURE REVIEW

One of the early attempts to examine why private label brands fail in Asia was undertaken by Mandhachitara, Shannon and Hadjicharalambous (2007). Due to the very small literature on private label grocery brands in

Asian, the authors reviewed a wide range of Western literature related to attitudes, perceptions and preferences toward shopping in general and private label grocery shopping in particular. The gross national Shopping behavior was found to involve social dimensions in several studies. Dholakia (1999) found that shopping in a group or with others leads to greater shopping enjoyment, with men attaching greater importance to shopping as a means of 'interacting with family'. Buttle (1992, p.363) stated 'shopping with others can be a pleasure or a pain', which highlights the potential importance of situational influence and may be manifested in cognitive, affective and behavioral responses (Ellis, Tuck, Martin & Brown, 1981). Tajfel and Turner (1979) suggested that people identify and assess themselves partly in terms of their social groups. Similarly, research has found that people identify and define themselves partially based on those they have direct and recurring contact with (Solomon, 1983). Thus, the greater the social commitment one has to a group, the more one perceives it as an important part of who, one is. This becomes important when considering Asian collectivist cultures, as the importance of the group is magnified in contrast to individualist cultures. Members of Eastern cultures have been characterized as exhibiting higher uncertainty avoidance than members of individualist cultures, and thus would be drawn to products offering lower risk (Moss & Vinten, 2001). Batra and Sinha (2000) study reported that respondents who prefer well-known brands, although with higher prices, believe that those brands offer higher quality and are less likely to find private label brands appealing. De Mooij and Hofstede (2002) suggested that collectivist cultures are more likely to prefer national or global brands to private labels, and commented that private labeling is more common in individualist cultures. They cited two reasons for collectivists preferring national brands: 1) face, status and power distance, and 2) the need for harmony leading to a desire or preference for long-term relationships and thus for known national/global brands. This directly links to risk aversion in that individualistic cultures face less interpersonal influence, and people in them would more likely use logic based on price, quality or their own interests rather than be concerned about what others think. Collectivist cultures tend to be more risk averse and place more importance on brand names and the perceived link between price and quality, all of which should reduce the appeal of private label brands in such cultures. In attempting to maintain face and group harmony, collectivist cultures tend to consume more luxury goods and prefer known, accepted brands (Ahuvia & Wong, 1998; Schutte & Ciarlante, 1998). Consequently, they are more likely to rely on extrinsic cues, such as the belief that higher price equals higher quality and that famous brand names offer higher quality, partly to reduce the risk of losing face. Consumers who believe in price-quality relationship are more likely to rely on brand names and engage in price seeking behavior (Tellis & Gaeth, 1990). Perception of quality is essential to the acceptance of private label brand usage. If all brands in a category are seen as having similar quality, then private label brand usage increases (Batra & Sinha, 2000; Richardson, Dick and Jain 1996). However, Hoch and Banerji (1993), Sethuraman (1992) and Ailawadi et al. (2001) found that quality is more important than price in usage of private label brands. Richardson et al. (1996) found that respondents who judge products by brand, price or packaging were less likely to buy private label brand groceries. With issues such as quality and price at stake, the question of risk becomes more prominent. Consumers will feel less interested in buying private label groceries if the level of perceived risk in that category is high. Batra and Sinha (2000) concluded that if the consequences of making a purchase mistake are high or quality variability is high, then interest in private label groceries goes down.

In a collectivist culture, shoppers face more interpersonal influence, resulting in lower levels of innovation to maintain group harmony. Shoppers in an individualistic culture are less likely to concern themselves about what others think, hence they could be more innovative and less risk averse. Further, they would be more attracted by products on sale (promotion prone) and would be less likely to perceive private label brands as risky. Roy (1994) looked at mall shopping motives as being functional, deal prone and recreational. Within the Western context of time pressure and more utilitarian or functional shopping, there are those who have investigated 'smart' shopping (Mano & Elliott, 1997). They agree that there may be utilitarian and hedonic aspects of shopping, but look at aspects that utilitarian shoppers would find hedonic – such as investing time to gain more knowledge, which would lead to saving money. Thus, smart shopper behavior may involve more information search, more pre-planning behavior, and more use of lists and budgeting, but at the same time have hedonic outcomes – such as a sense of accomplishment or feelings of happiness at getting a good deal through price savings or purchasing something that was on sale (Burton et al., 1998).

From a Western point of view then, shopping is work, but some consumers with hedonic tendencies may enjoy the fruits of their labor (Mano & Elliott, 1997). Shoppers with utilitarian values are likely to have more grocery market knowledge. Because saving money is important, they are more likely to exhibit sale proneness, which could extend to coupon use and private label brands – all of which lend themselves to the Western view of smart (utilitarian) shopping. Private label brands are said to appeal to time-pressured consumers by offering a heuristic of known value for money (Ailawadi et al., 2001). When compared with their western counterparts

Asian consumers have less market knowledge, therefore they rely more on price to assess quality. Differences also exist in the social aspects of shopping behavior. Their choices are influenced more by interpersonal factors than Americans, making them less prone to bargain hunting (Mandhachitara et al., 2007).

## MANAGERIAL IMPLICATIONS

Given the lower income that characterizes Asian consumers when compared with their American counterparts' one would expect that lower priced private label grocery brands would have done better than they have. The managerial question is that if private label grocery brand provides opportunities to retailers in the East Asian region how can these be better exploited? In doing so, retailers in the region may try to understand the reasons hindering the success of private label groceries. As the literature review shown, consumers in Asian emerging markets, generally have less market knowledge. The quality price relationship was identified as the second most important discriminating factor from their westerners' counterparts. Moreover, because the introduction of private label brands in the region is relatively new, market knowledge and awareness levels of private label brands is even lower. The possible interaction between overall market knowledge, the relatively recency of the availability of private label brands and price-quality comparisons put private labels brands at a disadvantage in relation to national brands. For example, in Thailand on average the price of private label grocery brands is 30% lower than the price of the corresponding national brands (AC Nielsen, 2003). A price differential of 30% is very considerable and could possibly reflect a product of lower quality. Since Thai and other Asian consumers consider price to signal quality when making purchase choices, a more effective strategy may be to offer private label products at higher prices closer to the national brand level, thus partially addressing the lower perception associated with deeply discounted prices.

Moreover, Sethuraman (2003) found that consumers have an overall preference for national brands and that they are willing to pay a premium for brands with strong reputation. His finding showed that most consumers are willing to pay a premium for national brands even if they perceived the quality of the private label brands to be equal. This non-quality equity associated with national brands is defined as the premium that consumers would pay for national brands even when they perceived no quality differential between national and private label store brands. The fact that Asian consumers have lower level of market knowledge when compared with their American counterparts creates an additional challenge for grocery retailers operating in such markets. Closing just the quality gap between private label and national grocery brands may not be enough. Retailers aiming to increase private label grocery brand share could try to close the non-quality equity by enhancing the image of private label brands through better packaging, sophisticated space and shelf allocation and local advertising (Corstjens & Lal, 2000). A starting point may be identified within the frequently purchased product categories. Within the frequently purchases product categories the uniqueness, and therefore the imagery and the non-quality equity associated with national brands, is diminished, creating opportunities for private label products. Retailers perhaps can use frequent visits to educate consumers concerning their store's private label brands. In the absence of knowledge consumers' rely on extrinsic cues in assessing quality. Extrinsic cue reliance amplifies perceptions of quality between national and private label store brands. In the absence of information with reference to intrinsic quality, extrinsic cues such as price, brand name, packaging and labeling serve as proxy indicators of quality as demonstrated Richardson et al. (1996). Asian retailers could learn from their European counterparts who successfully increased store brand acceptance with continuous improvements in package design, labeling, store space and shelve allocation and branding strategies (Hester, 1988).

Due to the inferior quality perceived among private label grocery brands, retailers could gain a better acceptance by strategically examining and managing product categories differently. Some product categories are more appropriate for private label products than others. National brands are found to be higher in quality in hedonistic products than in functional ones (Hirschman & Holbrook, 1982; Levy & Czepiel, 1974). Consumers usually attribute high performance risk to private label brands since they question their ability to deliver expected benefits because of the inherent difficulty of assessing the quality of intangible elements associated with the purchase of hedonistic products. Retailers could begin, after considering category dynamics, with product categories in which quality is easiest to assess like edible products and more frequently purchased functional products where performance and social risk is relatively low.

Given that the phenomenon of private label brands in Asia is relatively new the lack of market knowledge and low familiarity of Asian consumers' result in low evaluation of private label products because consumers view them as products of questionable quality and possibly consider them as risky choices. Based on conventional wisdom and economic rationale it is expected that Asian consumers with lower income will prefer private label

brands because of their lower price. However, it can be argued that consumers with lower incomes may be willing to pay a higher price premium for national brands as an insurance against possible product failure. If perceived performance risk is high, low income consumers value their limited income more and as a result may avoid a questionable choice such as a private label brand. Livesey and Lennon (1978) found that English consumers serve well known national branded tea to guests in social settings but they use less expensive private label tea in other occasions. If social risk affects the selection of private label products according to usage situation in countries like England, one expects that in collectivist cultures social risk will have an even bigger effect. Store brands should be marketed in such a way to define the store's own point of difference. Customers should be given reasons for visiting the store and these must be clearly communicated. Intangible factors such as an exceptional service, store cleanliness, interior design, customer friendly lay out and friendliness of store employees may prove effective. Once they have established their position and image in these dimensions, it will be easier private label categories retailers to use this equity to create inroads into other more difficult product categories by leveraging their own private labels. Finally in order to increase market share and penetration rates of private label products retailers operating in collectivist cultures could launch premium lines and improve branding and image of their offerings. Introducing private label grocery brands under programs such as selector premium may close the current price quality gap that exists between private label and national brands.

# **THE EVOLUTION OF THE WHISTLE BLOWER INTO A PROTECTED DISCLOSURER- PUBLIC POLICY AND ETHICAL CONSIDERATIONS**

**Natasja Holtzhausen**  
**Tshwane University of Technology, South Africa**

## **ABSTRACT**

*South African whistle blowing legislation goes further than the British law and also covers both public and private sector employees. This paper will investigate relevant national and international legislation and policies in South Africa, Australia, the United Kingdom and the United States of America with the aim of providing managers and policy makers alike with suggestions on how to practically implement policies and to take into consideration the ethical issues involved. This paper will also elaborate on lessons learned from international cases, predominantly cases from the UK, USA as well as India.*

## **INTRODUCTION**

Whistle blowers are both citizens and managers, and are therefore exposed to dilemmas in both roles. As citizens, they want to see the termination of wrongdoing. As managers, they would prefer whistle blowing incidents to go through internal channels only. However, if whistle blowing is ineffective, it benefits no one. Public administration in South Africa has to overcome numerous difficulties caused largely by the burden of history, unethical and corruptive constraints and government secrecy. In the face of these difficulties, efficient administration that serves the needs of all citizens is one prerequisite for strengthening the rule of law and the credibility of the state, both internally and externally. Such administration must be transparent, responsible and accountable, and served by honest officials. In the current context of the globalisation of the world economy and the fluidity of cultural boundaries, administrations in all countries also face a variety of issues, including the ethical problems concerned with the protection of employees who expose malpractice or misconduct in the workplace, transparent administration and good governance. Several statutes and pieces of legislation were introduced over the a period of time aimed at the institutionalisation of formal structures for openness, the disclosure of malpractice and transparency to combat crime and corruption and the enforcement of constitutional rights over the past few years. There is an increasing focus on good (and bad) corporate governance in South Africa and internationally, and institutions that are transparent and open will benefit from more favourable investor perceptions. Improved relationships with the public show that a substantial effort has been made to endow public administration with a legal framework that encourages the players involved to assume a greater sense of responsibility and develop practices to promote transparency and to protect whistle blowers.

## **CONTEXTUALIZING WHISTLE BLOWING/WHISTLE BLOWER**

According to Calland (2004:2), "... whistle blowing is about basic issues which lie at the heart of human activity. It covers loyalty and the question of dubious practices. It concerns communication and silence. It is about practicing what one preaches and about leadership. It focuses on responsibility toward others and the accountability of those in charge. It is where public and private interests meet". Whistle blowing is when

organisational wrongdoing is brought to the attention of persons in positions of authorities (complaint recipients) who are able to do something about the situation. Hunt (1998:529) focuses on the contextual issues that represent an act of disclosure. This involves knowing what is disclosed, by whom, and to whom. Only when organisational wrongdoing is disclosed, moral, ethical and public interests are at stake. The focus on public interest should on the other hand not be restricted "to issues in which an overriding societal value is at stake" (Alford 2001:18), such as where people's lives are in danger. Any disclosure exposing something that is "not for the public good" can be seen as whistle blowing. Petersen and Farrell (1986:4) stress the special form of dispute that characterises whistle blowing: "Whistle blowing is a special form of dissent in which a member or former member of an organisation goes outside the organisation or outside normal organisational channels to reveal organisational wrongdoing, illegality, or accusations that threaten the public."

## **LEGISLATION: SOUTH AFRICA, UNITED STATES OF AMERICA, AUSTRALIA AND THE UNITED KINGDOM**

Attention will be restricted to the Protected Disclosures Act of South Africa, the Whistleblower Protection Act of the USA, Queensland (Australia) and the United Kingdom's Public Interest Disclosure Act.

### **The Protected Disclosures Act (PDA) 2000 (Act 26 of 2000) of South Africa**

Until the year 2000, neither the South African common law nor the South African statutory law made provision for ways to protect whistle blowing employees. The PDA was enacted with a view to creating a culture in which employees may disclose information on criminal and other irregular conduct in the workplace in a responsible manner, thus promoting the eradication of crime and misconduct in organs of state and private bodies. Each of the procedures designed to ensure that the discloser is protected has certain requirements to be complied with. If a disclosure is made to a legal representative, there are only a few requirements, but the requirements become more comprehensive as one moves up the ladder, with the most comprehensive requirements applying to making a general disclosure. Any concerns that the Act favours employees are unsupported. The Act is specifically structured in a way that best serves the interests of accountable organisations. Only when internal channels have been exhausted or fail are broader disclosures to external bodies protected, meaning that the disclosure must be made in accordance with the prescribed process. The Act can and will make a difference in the way organisations and the state receive complaints about wrongdoing and how conscientiously these are addressed. This Act makes provision for procedures in terms of which employees in both the private and the public sector may disclose information regarding unlawful or irregular conduct by their employers or other employees in the employ of their employers. It provides for the protection of employees who make a disclosure that is protected in terms of the Act and provides for relating matters. The objectives of the Act are threefold. It aims to provide for procedures in terms of which an employee can, in a responsible manner, disclose information regarding improprieties committed by his or her employer; it protects an employee, whether in the private or the public sector, from being subjected to occupational detriment on account of having made a protected disclosure; and it provides for certain remedies in connection with any occupational detriment suffered on account of having made a protected disclosure (Holtzhausen 2007).

### **The United States Whistleblower Protection Act (WPA) of 1989 – 1994**

The US's WPA of 1989 which was further strengthened in 1994 through the enacting of Public Law 103-424 was promulgated to enhance the protection of federal employees, government corporations and to those employees in the Veterans Administrations. The model of whistleblower protection applied in the US is based on the multilateral system where-in a whistleblower who believes that the retaliation is the result of the disclosure of illegal activities, have the right to petition to government Executive branch agencies for protection. (Caiden and Truelson 1994; Groeneweg 2001). This whistleblower protection model is an anti-retaliation statute prohibiting the federal government from taking reprisals against employees who blow the whistle on public sector misconduct and providing means of redress for employees. This aspect is the acknowledgement that good faith whistleblowers represent the highest ideals of public service and the American tradition for individuals to challenge the abuse of power (Devine 1999, Groeneweg 2001). The WPA was promulgated in response to the failure of the Civil Service reform Act of 1978 and was subsequently strengthened as indicated above. This

legislation and its consequent administrative/organizational structure implemented to support it, prioritizes the person from whom the information came more so than the information itself. The upholding and implementation of the WPA is entrusted to the Office of the Special Council (OSC) and the Merit Systems Protection Board (MSPB). These bodies have a relationship reminiscent of the prosecutor to the judge respectively. The WPA makes it mandatory for the OSC to provide appropriate feedback to whistleblowers pertaining to the information provided and the action taken, it is entrusted to seek corrective action to the agency concerned on behalf of the whistleblower and provides systems of appeals to the MSPB in case the OSC fails to seek corrective action (Devine 1999, Groeneweg 2001). The model recognizes that the system lack the element of acting proactively as a result, its integrity is measured on how much money is saved and how many people are willing to put their careers in a precarious position. This is evidenced by the scope of the eligible litigants under the WPA, to file complaints. They include; former employees, part-time and temporary employees, probationary workers, and Schedule C political appointees (Devine 1999: 4 *cf.* Devine 2004). In relation to the private sector, corporate whistleblower rights are generally characterized as witness protection. In 2002, as a result of the ENRON, MCI WorldCom and similar corporate scandals, the Sarbanes-Oxley corporate accountability law was enacted (Diale and Holtzhausen 2005:15).

## **Queensland's Whistleblower Protection Act (1994)**

The Queensland's legislation is the frontrunner in the efforts to formalize and legalize ethical measures for the exposure of wrong-doing in the whole of the Australian public service. This aspect is attributed to the rampant corruption throughout the late 1980's and 1990's. The Act provides special protection to public interest disclosures about unlawful, negligent or improper public sector conduct, danger to public health, safety or environment. The act creates a forum for which dealing with reported misconduct is actualized. The disclosure is defined in terms of the person who makes it, the type of the information disclosed and the entity to which the disclosure is made. Central to the validity of the disclosure is the ethical yardstick of the honest belief based on reasonable grounds. A reprisal on the basis of having made a disclosure is considered a serious offence punishable with a maximum penalty of imprisonment of up to two years (De Maria 1999 *cf.* 2002, Groeneweg 2001). In addition, a right to a civil action claim for damages as a result of reprisals is provided. The Act makes provision for parliamentary accountability through annual reports to parliament. This requirement may be used for a review exercise where necessary but, it is not compulsory. The act again does not impose a duty to investigate and does not have an independent authority with the disclosure reception, investigatory and educative powers. These responsibilities are part of the Minister's portfolio list. To actualize the disclosure agenda, a document titled *Exposing Corruption: A CJC Guide to Whistleblowing in Queensland* has been prepared and published to guide aspects of disclosure (Diale and Holtzhausen 2005:15).

## **United Kingdom's Public Interest Disclosure Act (PIDA) 1998**

The UK's legislation came to surface and was supported mainly due to the information gleaned from the inquiries into major disasters that workers were aware of and afraid to disclose for fear of victimization. The scope of coverage includes both private and public sectors employees. The thrust of this legislation is that of a compulsory disclosure pathway, where-in when one chooses to blow the whistle, they must first do so within their own agency or department (Vickers 2000, Groeneweg 2001). The PIDA place emphasis on procedural correctness of the disclosure overloaded with the ethical requirement of good faith, while at the same time does not impose the duty to investigate the disclosure, it neither provides for a compulsory review mandate nor parliamentary accountability through periodic reporting to parliament. Though the act provides for compensation for reprisals due to disclosure action, it does not provide for services in relation to whistleblower feedback, counseling and relocation. The UK's PIDA virtually gave birth to the South African Protected Disclosure, as the two pose striking resemblance. The two legislations interestingly, are applicable to both the private and public sectors, and to qualify for protection one has to pass through the institutional procedural pathway, secrecy laws prevent employees from disclosing certain types of information regarded as classified and most importantly, burden of proof and good faith requirements are entrenched. These aspects are, according to De Maria (2002), the additional ethical high jump deliberately imposed on whistleblowers by the State in return for protection (Diale and Holtzhausen 2005:16).

## SELECTED SOUTH AFRICAN AND INTERNATIONAL CASES

### South Africa: Mike Tshishonga

The first claim before the Labour Court for compensation arising from the PDA is the case of Mike Tshishonga vs. the then Minister and Director General of Justice. In October 2003 Mike Tshishonga (employed at the Department of Justice for 30 years and the managing director of the Master's Office Business Unit) levelled serious accusations at former Justice Minister Penuell Maduna. Tshishonga was responsible to eradicate corruption in the liquidation industry (Davids 2007: 1-4). The case concerned the appointment of a liquidator in the Retail Apparel Group (RAG) that was liquidated in May 2002. Tshishonga alleged that Maduna had a "questionable relationship" with Enver Motala, a private-sector liquidator. The allegedly nepotistic relationship had led to Maduna's alleged "abuse of the infrastructure and staff of the justice department for the purposes of advancing his personal interests," and of endangering South Africa's criminal justice system. Motala was dissatisfied with the manner in which he was sidelined in the appointment of liquidators.

Tshishonga was in the process of restructuring the Master's office and the appointment of liquidators. Motala attended a merger meeting of the insolvency practitioner's bodies at the request of the former Minister where other liquidators were excluded. The former Minister met with Tshishonga and expressed his dissatisfaction with the fact that Mr Motala was not appointed as a liquidator. Minister Maduna then instructed the master in the Pietermaritzburg office to appoint Motala. Mr Tshishonga, unhappy with the appointment, acquired a legal opinion as to the Minister's powers. The appointment of Mr Motala was successfully challenged in court and it was established that the Minister did not have the power to appoint liquidators. The Minister then appointed a subordinate of Mr Tshishonga, without discussing it with him, to oversee the appointment of liquidators in Pietermaritzburg in the RAG case. Mr Motala was then appointed as the fifth liquidator. Former Minister Maduna thereafter removed Mike Tshishonga as head of the unit and refused to meet with Tshishonga. Subsequently, Mr Tshishonga enquired from the previous Director General how a politician could instruct an administrator and how the instructions could be executed without following proper procedure, but no reasons were provided. The issue of poor performance was raised, but at a later disciplinary hearing the former Director General stated that poor performance was never an issue and that Tshishonga had in fact sent a clear message of good governance (Davids 2007: 1-4 *cf.* Holtzhausen 2007).

The former Director General commissioned a forensic investigation into Tshishonga's corruption allegations but did not react on the report received. Mike Tshishonga then called on the Office of the Public Protector and when nothing was done about the complaint, he went to the Auditor General. Again, as in the case of the Public Protector, nothing was done. At last, the Public Protector referred the matter of Tshishonga's poor treatment to the Public Service Commission while the Public Protector investigated the allegations of irregularities. As a final resort Mr Tshishonga discussed the matter with the Minister in the Presidency who stated that a meeting will be set up between the Minister and Director General of Justice and Mike Tshishonga. This meeting never took place. Mike Tshishonga then only set up a press conference and was suspended a week later for divulging sensitive information and two weeks after that he was charged with misconduct. He successfully challenged the suspension in the Labour Court and was reinstated in his previous position. The Department of Justice however did not comply with the court order and still continued with a disciplinary hearing where an independent chairperson found Tshishonga not guilty. The former Director General refused to reinstate Mr Tshishonga and instead offered a settlement and terminated his employment as agreed by both parties. The court found that the disclosure made by Tshishonga to the media was reasonable as the media disclosure was the fifth disclosure (firstly the disclosure was to the Director General, then to the Public Protector, Auditor-General, fourthly to the Minister in the Presidency and lastly to the media) and that the correct procedures were followed and that all the requirements of the Act was complied with. The Minister of Justice and the Justice Department was ordered to pay the legal costs. The Department of Justice received negative publicity and embarrassment. The court said of this case: "Thus a defence that the employee breached confidentiality has to be approached so cautiously that it does not strip the PDA of its content" (Davids 2007: 1-4 *cf.* Holtzhausen 2007).

## India

Twenty years ago, in 1984, Indian workers, together with a local journalist, raised concerns about a gas leak and safety measures to the local authority and Union Carbide India Limited, which chose to ignore them. This resulted in the deaths of 3 800 people and 2 680 people left with partial disabilities ([www.psir.org](http://www.psir.org)). This case reminds one of the South African Lenasia chemical factory workers case. In both cases the safety concerns were communicated to the employers as well as to the relevant authorities (the South African Department of Labour and the Indian local authority). In both cases lives were lost (Holtzhausen 2007).

## United States of America

According to Near, Regh, Van Scotter and Miceli, (2004:219) Time Magazine honoured Sherron Watkins, Colleen Rowley and Cynthia Cooper by selecting them as their “persons of the year” for 2002. Sherron Watkins, an internal accountant at Enron, set out her concerns on potential problems with accounting practices in a letter to the Chairman of Enron, Kenneth Lay, in 2001. While this letter has proved extremely useful to the subsequent investigation into the collapse of Enron, it did not initiate the investigation and Ms Watkins did not take action until the investigation was already under way. This may be explained by the fact that there is no comprehensive whistle blower protection for private sector employees in the United States of America. Colleen Rowley blew the whistle by sending a memorandum to Director Mueller of the Federal Bureau of Investigation in which she alleged mismanagement of the investigation of terrorists by senior managers. Cynthia Cooper reported falsified accounting records to the Audit Committee at WorldCom. The Audit Committee dismissed the Chief Financial Officer who was later found guilty of using illegal accounting practices. In all three the cases, the whistle blowers disclosed internally, but the correspondence was leaked to Congress or the media (Near *et al.* 2004:219).

According to Uys (2006:221) the Challenger launch disaster that happened on 28 January 1986 is another pertinent example. The initial culture of National Aeronautics and Space Administration (hereafter referred to as “NASA”) was one of a “get there safely” single goal/culture where internal whistle blowing was encouraged. In NASA there was a change in the culture when challenges led to a multiplicity of inconsistent goals, leading to a culture of “get there safely, cheaply and on time”. Severe problems were identified in the seals of the rocket booster during April 1985. Concern was expressed by engineers involved in the project who wrote a memorandum to senior management stating that losses might occur unless improvements were made. It was decided that there was insufficient proof to postpone or cancel the launch. Allan McDonald and Roger Boisjoly, engineers at Morton Thiokol Inc. in the United States, testified before the Rogers Commission investigating the 1986 Challenger shuttle disaster that there had been ongoing problems with the rocket’s P-rings and that they had urged their supervisors and NASA officials to postpone the fatal launch. Following their testimony, the engineers were demoted to menial jobs. Only the intervention of the Commission members saw them being reinstated (Ettore 1994:18 *cf.* Holtzhausen 2007).

## The United Kingdom

In the United Kingdom, the Bingham Enquiry into fraud and corruption at the Bank of Credit and Commerce International found in 1991 that, due to an autocratic environment and a climate of intimidation, neither employees nor firms were willing to voice their concerns. An internal auditor who raised concerns was dismissed. This led to new rules in the United Kingdom on the duties of auditors and other firms to report suspected irregularities (Camerer 2001:2). However, public officials may also be asked or instructed by their political masters to act in an unlawful way. In March 2004, it was claimed that the United Kingdom’s immigration service had secretly allowed thousands of ineligible migrants to enter the country. Claims were made that this was done “to massage figures so it did not appear there would be mass influx when eastern European states joined the EU on May 1” (Wintour in Auriacombe 2005:16). The public official who blew the whistle was dismissed. However, the responsible minister subsequently resigned when evidence against her started to mount up.

It is clear from the above that the position occupied by an individual in an organisation is not the driving factor behind the choice to blow the whistle on wrongdoing. Informants can also act as whistle blowers. Such informants may work, for example, for the police or a regulatory authority. They can either be placed in the organisation for the purpose of uncovering evidence of suspected wrongdoing or may be employees of organisations who have been recruited by the relevant authority. This may sound more like fictional crime and spy stories, but there is growing evidence of police forces using this tactic to root out corruption (Diale and Holtzhausen 2006:15).

## **PUBLIC POLICY AND ETHICAL CONSIDERATIONS**

Whistle blowers raise a number of specific ethical concerns. Ethical tension points can either be procedural or substantive. Loyalty lies at the heart of substantive ethical questions. The challenge is to try and establish a balance between multiple loyalties, the truth, obligations and values. A nurse might for example have difficulty blowing the whistle on inadequate practices as she or he has an obligation towards patients, the hospital administration, her or his peers, supervisors, the medical profession, her or his own self-worth, the general public and the truth (Jensen 1987:324-325). Choices must be made between values such as loyalty to the organisation and to co-workers. The choice might further be complicated if the potential whistle blower has incomplete information and uncertainty about the consequences of blowing the whistle. The culture and ethos can be communicated in part through value statements that express a commitment to shared values which includes ethical values. A positive moral atmosphere contains a healthy degree of diversity among the employees in terms of their ethical beliefs, values and moral reasoning characteristics. As a result of this positive atmosphere, individuals will feel free to express a variety of moral views that might be different from other views in the organisation. By sharing different ideas, a better understanding can be reached of the different value systems which in turn could lead to finding a common understanding on what is acceptable behaviour within the organisation and what would be classified as wrongdoing (Holtzhausen 2007).

Although legislative measures protect the whistle blower and an ethical code of conduct provides guidelines, it is important that the organisation set up a policy for whistle blowing. The disclosure of wrongdoing, thus whistle blowing should be perceived as positive in the organisation. A whistle blowing policy should focus on the following (Barker and Dawood 2004:129):

- A disclosure made by the whistle blower must be in the public interest and in good faith.
- The whistle blower should not be guided by personal gain.
- A manual should be available on the policy and the procedures pertaining to the process of whistle blowing.
- It should be clear that malpractice will not be tolerated.
- There must be examples of what counts as malpractice.
- The confidentiality of the employee raising the concern should be respected.
- Systems that can be responsive and supportive to the whistle blowing process need to be devised and implemented.
- Whistle blowing can be viewed as appropriate if it involves the disclosure of illegal or unethical actions in the organisation.
- In order to educate employees on their right to disclose alleged wrongdoing, regular workshops should be conducted.
- Employees need to know of all the possible whistle blowing avenues available to them.
- Alternative channels, separate from line management, should be made available.
- All internal avenues should be exhausted before the matter is taken up by the hierarchy of the organisation.
- Strict internal disciplinary procedures need to be implemented once there is evidence of wrongdoing.
- A dedicated senior public official should be appointed to deal with the concerns of employees and to provide protection to whistle blowers.
- Employees must know about the proper procedure in terms of external disclosures (in case they need them).
- Access to other external bodies, e.g. a professional body, should also be allowed.

- Employees of key subcontractors should also have access to the whistle blowing policy.
- The alleged unethical or illegal conduct must be perceived to be able to cause death, ill health or injury.
- The whistle blower needs to receive feedback.
- Abuse of the scheme must be avoided at all costs.

An internal whistle blowing strategy will help to prevent employees from blowing the whistle externally. External disclosures are better avoided, since they could raise ethical as well as legal issues in terms of confidentiality and might affect the relationships between the organisation, the media and the government. In addition, external disclosures could involve regulatory issues requiring intervention, and could lead to negative publicity, especially since anonymous disclosures are almost impossible to investigate (Dehn and Borrie 2001:6), especially if the anonymous disclosure was made through a hotline.

## CONCLUSION

Protected disclosures must become part of the organisational culture. For this to become a reality, employees need to know that they will be protected from occupational detriment and retaliation if they disclose wrongdoing through the appropriate channels. Managers should also know how to act when wrongdoing is disclosed. It is imperative that a whistle blowing policy be implemented. Whistle blowing might be perceived as a deficiency in the organisational system that should be provided for in an accountable manner. Organisations should have a communication strategy in place to deal with whistle blowing in an effective and proactive manner, informing all stakeholders about whistle blowing (options, procedures, possible consequences, and possible responses).

## **ABSTRACT**

*The proliferation of information needs and communication modalities, the diffusion of digitalization, the globalization of financial markets and client investments, and the advent of the 24-hour marketplace have all enhanced the importance of dynamic intellectual capital and immaterial assets. These changes render the business world simultaneously more receptive and more threatening to corporate ambitions than in the past. In an economy of burgeoning intangible and symbolic resources, information reigns as both the strongest and subtlest form of power. We identify four vital relationship-driven ways in which companies can capture value in an increasingly information-denominated world: (1) globally networked distribution and information systems, (2) global alliances within an industry sector, (3) domestic or international partnerships across allied sectors, and (4) customer relationship management. Concentrating on these factors enables a company to achieve a privileged position within an industry. Privileged companies control an integrated set of business activities and interactions promoting both the equity basis (shareholder value) and end-user loyalty and satisfaction (customer value) in the firm. We focus on how successful companies come to dominate, directly or indirectly, essential value-related business relationships, as seen for instance in the airline industry and associated travel sector. Major companies influence an array of discernible value chains spanning geographic and industry borders—for example, in considering the requisite steps for venturing enjoyably from New York to Mumbai. In sum, we address capturing value by reframing businesses and controlling key relationships.*

## **INTRODUCTION TO VALUE: PROVIDING COHERENCE AND A STRATEGIC VISION**

Value creation, whether from the customer or shareholder perspective, represents a cornerstone concept in the modern business management literature and a critical managerial function in any global corporate strategy. An orientation toward dual-faceted (customer and shareholder) value reinforces established paradigms such as process and flows management, resources and competences analysis, and organizational skills development (Kay 1993; Hamel and Prahalad 1994; Anderson, Narus and van Rossum 2006) offering central business insights to managers. Concurrent with the persistent importance of value creation, new factors in the business environment—for example, the increased significance of services or expanded access to worldwide capital and consumer markets (Kaplan and Norton 2004b; Reinartz and Ulaga 2006)—make it harder to define evaluation criteria, set standards, protect innovation, and regiment quality control within firms. Yet evolution in the business environment also generates exceptional opportunities for heightened differentiation and competitiveness in the product and service offerings of multinational corporations.

Technologies fostering novel products or services impact not only the nature of companies but also the characteristics of markets and the definitions of success. For example, airlines such as RyanAir or JetBlue that are strong regional players with streamlined web-based (and hence borderless) customer management systems have triumphed in the global economy. The value perceived by customers and clients, as manifest in their dualistic revealed preferences (e.g., for service and simplicity, prestige and practicality, efficiency and equanimity), provides in effect signposts safeguarding managers against forays into unprofitable domains (Normann and Ramírez 1993; Leszinski and Marn 1997; Jallat and Wood 2005). The scope of management extends beyond issues of internal organizational arrangements and organization-environment fit to specifically encompass developing and sustaining processes for creating value on the client's behalf. This aspect of value creation can be termed "satisfaction streams management." Given an enlarged perspective on the managerial mandate, numerous strategic occurrences—alliances and partnerships, for example, or other varieties of synergy and convergence between firms or industries—can be posited to arise from thoughtfully-construed intentions as opposed to from short term opportunism or pure luck.

The paradox of information, which provides structure and meaning in organizations, lies in the fact that information can also engender disorder and confusion (Brown and Duguid 2000). For example, to paraphrase luminaries of contemporary film productions, their industry is currently like a sandwich: a digital filling between two slices of analog technology (cf. Perretti and Negro 2006). Digitalization at all phases of film making will soon end the need for mechanical projection and traditional photography in movie production (Seifert and Hadida 2006). Yet by provoking the demise of complex, heterogeneous, costly techniques and by integrating processes at various phases of production, digital technologies will also spawn new cinematic enterprises in a manner unparalleled since the birth of moving pictures. Such changes represent an excellent opportunity for some and a stringent threat for others. In an economy spurred by symbolic and intangible assets, where intellectual capital (the capability to innovate) more and more dominates the resource mix of the firm, the apparent technological disorder should be interpreted as a new form of organization, reframing competitive advantages, marketing channels, and industry borders (Jallat and Capek 2001).

The preeminence of the customer in the value chain, the potential payoff from customer-corporate co-production, and the promise of new modes of consumerism have fostered competitive conditions increasing the complexity of the historic production-distribution-consumption sequence (Prahalad and Ramaswamy 2000; Normann 2001; Solomon 2003). In the new, more complex scenario, the laws of supply and demand will no longer be defined in terms of an optimum but rather via enhanced interdependencies and improved cross-industry and intra-industry affiliations. Value creation will apply over an entire sequence of processes creating an updated global business model for the firm and a uniquely differentiated product or service experience for the customer (Kay 1993; Anderson and Narus 1995; Treacy and Wiersema 1995; Reinartz and Ulaga 2006).

In today's market, value seldom remains frozen for long. On the contrary, it derives its existence from circulation through financial, informational and experiential components (Rachline 1994; Rayport and Sviokla 1994; Pine and Gilmore 1999; Kaplan and Norton 2008). Regardless of a firm's nature and area of activity, it is essential that top management understand the intangible economic flows so as to strategically position the firm to influence the preferences of market arbiters (Wise and Baumgartner 1999; Jallat and Wood 2005).

Still not fully exploited sources of customer satisfaction and loyalty (e.g., personalized service, time saving measures, insurance, information access, and integrated solutions) have emphasized "high-touch" as well as "high-tech" strategic approaches: by listening to clients and by critically analyzing the traditional value chain (updating relationships and technologies as required), firms have converted their own dissatisfied clients, courted the dissatisfied clients of others, and captured entirely new client segments (Normann and Ramírez 1993; Fites 1996; Baldwin and Clark 1997; Evans and Wurster 1999; Jaworski, Kohli and Sahay 2000; Díez-Vial 2007; Hortaçu and Syverson 2007). Illustrating the rewards of these approaches, Amazon.com within five years of its 1995 founding already had a client base worth more than 80 years of the firm's sales. The trailblazing company had become (and remains) the required stop for internet shopping in numerous product categories and had emerged as the most desirable partner for the many operators paying an entry fee and toll to appear on the Amazon website as a means of accessing its educated and affluent clientele.

## **BEYOND VALUE: THE UNDERLYING FACTORS OF**

# ECONOMIC COMPETITION

Today 85% of corporate assets are intangible versus only 35% twenty years ago (Kaplan and Norton 2004a; Malone and Rose 2006). Given the rising importance of intangible assets and timely and effective information dissemination, four fundamental factors—openness, digitalization, speed, and convergence—define the competitive environment dictating the rules of new business models:

## Openness and Intangibility

A business is a constantly changing system affected by shifts in both the economic and social realms. As the advanced economies grow more reliant on intangible assets and less assured of sustained rapid growth (Romer 1990; Slywotzky and Wise 2003), the business environment becomes more complex and firms of necessity must be more open and evolving (Rachline 1994; Stewart 2002; Kaplan and Norton 2006; Malone and Rose 2006; Warsh 2006). As a changing social entity in an evolving environment hosting diverse boundary-spanning connections, the modern corporation exists as an open, networked system. If the openness to external forces guarantees vulnerability, it also ensures selective survival (whether of corporations or of corporate practices), since new talents and ideas or additional and complementary resources often lie beyond the previously-drawn perimeters (Jaworski et al. 2000; Prahalad and Ramaswamy 2000). The networked company represents a collection of porous yet advantageous competitive arrangements better adapted to environmental contingencies than the traditional, hierarchical, process-based and more administrative organization.

## Digitalization

An object's tangible and material nature disappears as that object metamorphoses into digital, readily modifiable form. Two examples in particular highlight this point.

First, modern telecommunications services have virtually replaced answering machines. The shift from a commonplace household object to a monthly bandwidth service represents the transition from physical marketplaces to conceptual “consumerspaces” (Rayport and Sviokla 1994; Solomon 2003). Telecommunications companies developed, bundled and sold the voice messaging services strengthening the relationships to their subscribers (although subscribers certainly retained the discretion to change service providers, albeit not always without charge). These relationships manifested a new multifaceted, revenue-enhancing form shifting power from the traditional equipment manufacturer to the innovative service provider. Customers become adherents of a cyber-electronics system and an advanced business model rather than of a concrete product or an historic brand.

Second, digitized music files in the latest MP3 format signaled a paradigm shift whereby the successors of Napster and iTunes (Gnutella, OpenNap, iMesh...) bypassed the majors (Universal, Sony, Bertelsmann, EMI, Warner), neutralizing the power and control of the majors’ previously privileged and unchallenged positions. In brief, the majors’ tacit agreements regarding the global music market no longer prevailed. Digitized recordings have instead become “fluid” products escaping the major record companies’ proprietary control. Within the new paradigm, sharing replaces traditional transactions: each person becomes a content provider and active player in a 24-7 borderless network of data exchanges. Using distance-spanning fiber-optic or satellite connections, we can download music and upload payment in any country at any hour of the day or night.

## Speed of Action

Business observers today speak in terms of virtual, imaginary, agile or dismantled groups and organizations (Goldman, Nagel and Preiss 1995; Rayport and Sviokla 1995; Hughes and Scott Morton 2006). This terminology highlights the essential dexterity and nonlinearity enhancing speed of execution at all levels of the firm—and in particular, from the managerial perspective, speed toward capturing value, increasing power, and maintaining control. Over the past 30 years, the quest for flexibility coupled with a client-centered business logic has become a strategic ideal translating into a global corporate project (Bruhn 2002; Peelen 2005). Interface management between marketing, human resources, ICT, supply chain and production has assumed an

increasingly sophisticated and tactical nature favoring multidisciplinary approaches and project management skills. These approaches underscore how much an organization's vitality depends on the quality and speed of shorter-term actions and reactions rather than on a contrived long-run strategic intent (D'Aveni 1994).

## **Convergence and Integration**

A networked company—open, digitized and rapid of execution—is itself an open system as well as one of many nodes in a larger open (or opening) economic system. Compared to a traditional relatively closed and rigidly hierarchical organization, the networked company possesses more flexible boundaries, more interconnections, and hence better convergence with consumer requirements for mass customization and personalized production. An open and integrated organization profits not from traditional economies of scale but rather from the capacity continuously to discover new links between solutions and needs (Hedberg, Baumard and Yakhlef 2002).

Recent competitive analyses help us to understand corporate behavior as aggregated, interactive and evolving and to comprehend strategy as a sequential game. Competition does not occur between pairs of companies in isolation but rather takes place between groups of firms efficiently organized into sectors focusing on business processes and models more than on products. This shift in the level of competitive aggregation concomitant with the change in focus from products to processes and models derives directly from an ongoing transition: we have been moving from an industrial to an experience, entertainment, attention and information-based economy (Pine and Gilmore 1999; LaSalle and Britton 2003; Schmitt 2003).

## **ATTRACTION AND RETENTION: DEFINING CUSTOMER RELATIONSHIPS THAT ENHANCE CORPORATE POWER**

Customer retention is not only pertinent but compulsory for sustained success in a competitive environment (Reichheld 1993, 2003; Peelen 2005). The need for companies to create database and customer relationship management systems, maintain customer infrastructures, and develop virtual communities emphasizes the change from a downstream to an upstream logic, leading to an “inverted value chain” initiating from the end market (Wise and Baumgartner 1999; Jaworski et al. 2000; Díez-Vial 2007; Hortaçsu and Syverson 2007).

## **Value versus Retention**

The key difficulty lies in defining value as perceived by the client as well as by multiple stakeholders of the corporation. It is difficult to understand how an organization can respond internally to a problem defined externally. The concept of value encompasses a variety of intertwined phenomena: customer value can be synonymous with quality or excellence, with meeting specifications or standards, with respecting user guidelines or customer expectations; shareholder value refers almost exclusively to stock price. Multiple definitions merge to underline the strategic and multifaceted nature of value. The logic of value creation, if well executed, enables the company to capture markets and increase market value while retaining customers, employees and partners (Reichheld and Teal 1996; Jallat and Wood 2005).

## **Industry Reconfigurations**

Narrowly defined, an industry encapsulates a set of production processes transforming raw materials into end products, resulting in profits distributed amongst the organizations involved at different phases of the transformation. From a strategic perspective, the top managers of a company should analyze its processual positioning in an industry toward identifying other economic actors and operations leading to the same downstream market of end users. They should also identify all required components of the end product and the key suppliers of those components. These identifications and analyses will assist managers in understanding the power structure of the industry sector and in positioning the company to become effective in the sphere of interrelated operational activities. Businesses can be re-invented and products re-differentiated to take advantage of profit-making opportunities in salient markets (Fites 1996; Zook 2004; Kim and Mauborgne 2005).

The surge in intangible assets and technological advances, coupled with the pervasive deregulation of the past two decades, has facilitated disintermediation throughout the business world. The widespread attrition of intermediate actors and operations compresses the value chain, encouraging new entrants who position themselves as “system aggregators” in the absence of middlemen. Lacking industrial infrastructure, the aggregators nonetheless have information and power networks easily substituting for ownership of physical assets (Jallat and Capek 2001). “Imaginary organizations”—capable like Smart, Zara, Nike or Dell of subcontracting large segments of their value chains—rely on extended business partnerships to connect their large variety of products and services to efficient information and supply chain management systems in other corporate contexts (Evans and Wurster 1999; Baumard 2002).

## **Alliances and Partnerships**

The strongest companies—whether defined by (consumer) market share, (stock) market capitalization or technological expertise—do not always win. Lobbying, alliances and networking play an important role in an increasingly complex and competitive environment. In a business climate characterized by increased outsourcing and the overall growing externalization of strategy implementation, the historic cooperation versus competition dilemma has been more and more resolved through new forms of “co-opetition” (Brandenburger and Nalebuff 1996). Alliances between competitors become a form of strategic leverage, shifting the business game from head-on contests to partnerships of complementary interests. In any case, even the most competitive economic exchanges would not be purely combative because such entirely destructive interaction would reduce value and profits—and even the most cooperative interactions could not be truly balanced because players could not altogether abdicate their egocentric interests (or statutory obligations to their shareholders).

## **LESSONS FROM THE AIRLINE INDUSTRY**

We focus on global alliances within sectors, with particular attention to the airline industry in the travel and transportation sector. These alliances or partnerships within sectors and within or across industry boundaries access a succession of value chains—for instance, the chains comprising the total travel experience might involve multiple transport modalities, accommodation sites, tours, dining and entertainment. A value chain contributes to the fulfillment of a product or service. Managerial cognizance must encompass the total product or service compilation requirements from start to finish. We address constructive dominance in key business relationships along a customer-oriented trajectory representing the concatenation of relevant value chains.

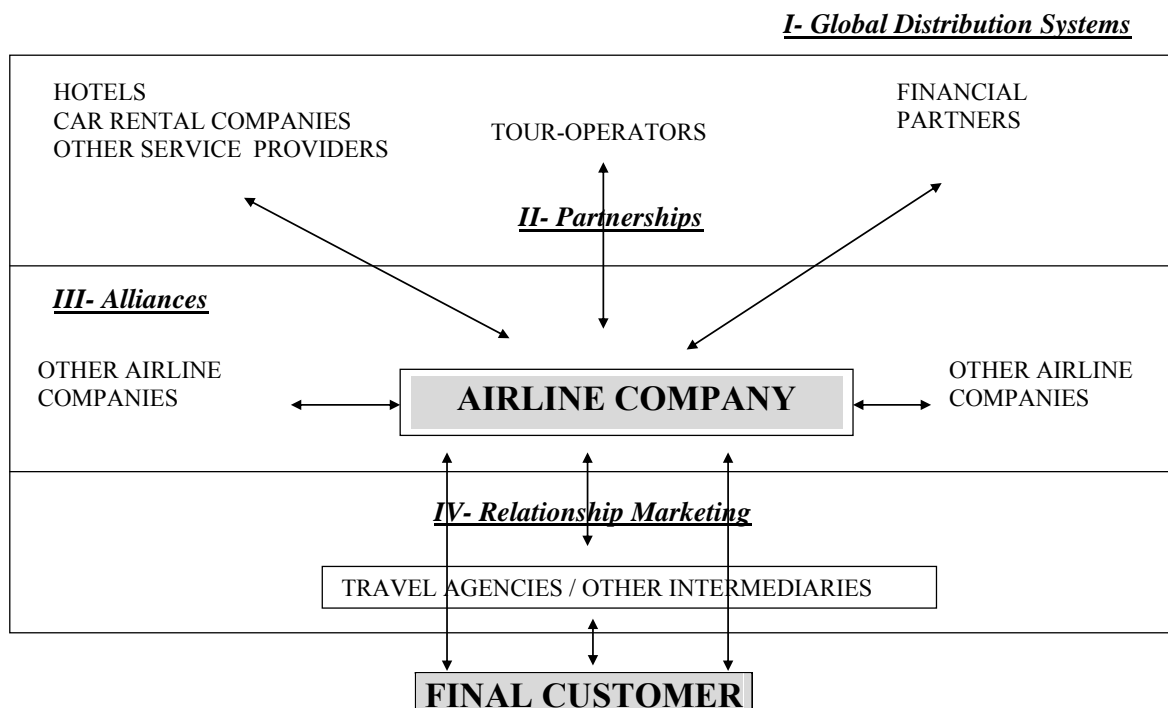

Consistent with the reasoning above, a company can be defined not only as a nexus of contracts but also as a portfolio of alliances (Gomes-Casseres 2006). Figure 1 illustrates the strategy of airline companies which have become pivotal players in their industry as well as worldwide leaders in the transportation sector. Capturing markets and creating customer and shareholder value here follows three main operating modes: (1) information systems integration, (2) partnerships and alliances formation, and (3) customer relationship management. The realization of these strategic and operational goals reinforces the competitive strength of the major airlines.

Starting in the 1950s and 1960s, major airline companies (for instance, American Airlines, Delta, and, before its demise, PanAm) partnered with IBM to develop and launch powerful, criteria-refined computerized reservations systems for booking airline tickets. Subsequently known as global distribution systems (GDS), the original computerized reservations systems expanded to allow the booking of reservations for air travel, hotel rooms or rental cars from multiple companies. The first-mover advantage belonged to American Airlines with its SABRE reservations system. From the full-scale launch of SABRE in 1964 until its spinoff as Sabre Holdings in March 2000, American Airlines reaped on average more than half its annual profits from this groundbreaking computerized travel reservations system. (Private equity firms Silver Lake Partners and Texas Pacific Group in early 2007 acquired Sabre, which by then included Travelocity, and profitably re-sold it to Electronic Data Systems later the same year.) The irony is that the GDS had provided greater financial rewards for the airlines company than the air travel itself, and the core GDS later handsomely enriched the private equity players within a very short period of time.

Using sophisticated database management methods, the airline companies that initially owned these systems controlled the flow of information on flight reservations (sometimes privileging their own flights over those of

competitors). Thanks to their dominant negotiating power, major airlines became obligatory partners for additional firms in the travel business. For instance, Hertz, Marriott and American Express all signed agreements early on to participate in SABRE and to access the American Airlines yield management system.

**Figure 1: Managing Relationships and Capturing Value in the Airline Industry**

Global distribution systems became a powerful means for managing (controlling) business partners and for building customer loyalty while generating profitable returns—an excellent example of simultaneous customer and shareholder value creation. The partnerships enabled leading airlines to offer customer-centered global solutions integrating extensive travel-related services (e.g., air or rail transport, car rental, directions, financing, insurance, hotel reservations, restaurant recommendations, sightseeing tours, concierge assistance). The airlines handily dominated travel agencies and other intermediaries while serving customers through widely marketed product bundles and loyalty programs. It comes as no surprise that the prevailing GDS today (Amadeus, Galiléo, Sabre and Worldspan) account for 82% of the total distribution of airline tickets and travel packages. The irony continues in the form of costly victories. By impelling relationships among competitors and between airlines and ancillary firms, GDS helped provoke the consolidation within the airline industry. Some of the formerly powerful players have been merged out of existence, while those that remain, shorn of direct ownership of their GDS, struggle harder for profitable existence. Still the overriding point remains concerning the efficacy of value chain clarification, firm positioning and partnerships.

The final analysis emphasizes the customer loyalty programs of the airlines—programs bypassing the online or brick-and-mortar travel agencies and directly courting travelers. The extant airline companies have fortified these programs by enlarging the number of travel firms participating in customer-affinity alliances (e.g., Star Alliance or SkyTeam). Through these alliances, airlines group their commercial efforts, including the number of available planes, ground services, destinations, open hubs, and business clubs. Unlike the proprietary GDS which had an overtly dominant partner/owner, the updated alliances more equitably (if not always perfectly harmoniously) conjoin former competitors, now each seeking to capture the highest possible market share and to appease ever-more demanding and time-pressured clients, who evidence increasingly vocal concern over punctuality, duration of stopovers, boarding facilitation, in-flight services, and the potential for upgrades to more prestigious cabin seating.

Combining the aforementioned collective elements (power of the global distribution systems, scope of the partnerships impacting the applicability of mileage rewards and loyalty cards, breadth of the alliances allowing for larger choice of flight destinations...) with direct involvement from individual companies (via bonus mileage plans, complementary services, promotional pricing, online check-in, and overall heightened attention to passenger comfort) puts major airlines in a position to orchestrate the travel sector logic for their benefit.

Technological innovation, complex optimization, and systemic strategic analysis maximize the contextual information and influence available to the major airlines. By obtaining and controlling substantial data on both customers and context, the airlines can reorient the consumer markets toward the airlines' specific strategic interests. Airline companies then set the stage to maintain privileged positions in their customer relationships over the long term, ultimately enhancing their global corporate power and profitability.

# DEVELOPING AN EFFECTIVE SEXUAL HARASSMENT POLICY FOR HIGHER EDUCATION INSTITUTIONS IN SOUTH AFRICA

Pierre Joubert  
Vaal University of Technology, South Africa

## ABSTRACT

*The relatively high number of reports of sexual harassment in the South African media raises questions about the extent of this social phenomenon. These questions are investigated scientifically to distinguish between sensationalism and empirical evidence of the extent of sexual harassment. This paper reports on the research in progress to determine the perceived incidence of sexual harassment of staff at Higher Education Institutions in South Africa. It refers to the theoretical basis of the research by describing organizational models for the study of sexual harassment, the legal requirements to be met by employers and the need for effective policies.*

## INTRODUCTION

South Africa is currently experiencing a proliferation of sexual harassment cases. These cases are also high-profile and are well reported in the media. The case of *Grobler v Naspers Ltd* (2004) 25 ILJ 439 not only focused on the sexual harassment of an employee by a manager, but also on the vicarious liability of an employer. The findings of this case have far-reaching implications for employers who need to protect themselves against claims for damages suffered by the harassed party. In the *Grobler/Naspers* case, an amount of close to R1 million was awarded to Grobler for loss of earnings, loss of past income, loss of future earnings and for medical expenses. This finding by the Cape High Court was upheld by the Supreme Court of Appeal. (*Media 24 Ltd and Samuels V Grobler* (2005) 16 (4) SALLR (SCA)). A similar case was heard by the Labour Court in the matter of *Orr v Unisa and Motimele*. Apart from the amount of R500 000 that Unisa was ordered to invest in a bursary fund for needy, black female students; the University was also ordered to apologise unconditionally to Prof Orr for the professional and personal suffering that she had to endure. What is of even more importance for this researcher is the order of the court that Unisa must undertake to implement its policy on sexual harassment and that the University must commit itself to the application of a code of conduct for its council members and that it must maintain an approved grievance procedure for employees and for students. This amounts to a rapping over the knuckles for Unisa as well as an indication by the Labour Court that it views complaints of sexual harassment as very serious, especially when employers fail to act or do not act timeously.

Two very important issues for employment relations are raised by the courts. Firstly the mention of a sexual harassment policy and secondly the implementation of a grievance procedure by employers are seen as mechanisms for preventing and dealing with complaints of sexual harassment. By adhering to this policy and by implementing this procedure effectively, the employers mentioned in these two court cases could have prevented the matters from developing into litigation with the resultant high costs. It is assumed and even accepted that most organizations do have these policies and procedures in place. What can not be readily accepted is that these policies and procedures are effective and that they are applied in an effective manner. This study should shed some light on this question. The fact that this case occurred at a university adds to the need for this study that will be conducted at Higher Education Institutions (HEI's) to determine the perceived incidence of sexual harassment among colleagues at universities.

# LITERATURE REVIEW

A review of the relevant literature on sexual harassment leaves no doubt that it is described from the viewpoints of various disciplines. These disciplines range from psychology (understanding the behaviour of harassers and victims) to sociology (studying environmental factors which influence the prevalence of such in organizations) to legal studies (prosecution of transgressors and compensation for victims). (Timmerman & Bajema: 2000; Snyman–Van Deventer & De Bruin: 2002). These disciplines are involved in the study of sexual harassment as the origins of sexual harassment are formed in cultural, social, behavioural and other areas. (Grobler, Erasmus, K  lkenbeck–Ruh: 2003). The multi-faceted nature of sexual harassment forces any researcher of this phenomenon to be specific in its approach and not to confuse the causes, contributing factors, consequences, costs and management of sexual harassment. It is however imperative that a study will refer to these diverse areas; as part of a discipline-specific approach. In order to meet the research objectives of this study only the literature relating to sexual harassment policies and procedures will be reviewed.

## DEFINITION

It is suggested that the definition provided by the 2005 Amended Code of Good Practice on the Handling of Sexual Harassment Cases which was issued in terms of the Labour Relations Act No 66 of 1995 is used as a universally accepted definition of sexual harassment. This definition will in all probability be used by courts and councils when a case of sexual harassment is arbitrated and will aid employers in providing an objective and “legal” definition of sexual harassment. According to this code, sexual harassment is defined as follows:

“Sexual harassment is unwanted conduct of a sexual nature that violates the rights of an employee and constitutes a barrier to equity in the workplace, taking into account all of the following factors:

- whether the harassment is on the prohibited grounds of sex and/or gender and/or sexual orientation;
- whether the sexual conduct was unwelcome;
- the nature and extent of the sexual conduct; and
- the impact of the sexual conduct on the employee.”

This definition is in line with the underlying approach that harassment is essentially a discrimination issue (Basson, 2007) and for the purposes of this paper, this definition will apply.

## THE NEED FOR A SEXUAL HARASSMENT POLICY

Numerous studies have concluded by expressing the need for an effective policy on sexual harassment as the first step in the attempt by organizations to prevent and mitigate the effects of sexual harassment. Stimpson (1989) argues that while progress has been made in combating sexual harassment by accepting it as a problem, conducting workshops and creating grievance procedures; many other organizations are still begging in this respect. Hulin, Sitzgevalde and Drasgow (in Stockdale (1996) suggest that the prevention of sexual harassment by aggressive intervention programs appear to be the best defense organizations have to reduce their liability to victims. A number of authors stress the need for sexual harassment policies by indicating: the value of a well-drafted, carefully considered policy (Wilken & Badenhorst, 2003); the understanding of human sexual behaviour and its effect on improving appropriate behaviour in the workplace (Corr & Jackson, 2000); how organizations could benefit from increased understanding of how organizations culture affect their employees perceptions of unwanted sexual behaviours (Timmerman & Bajema, 2000). It can be deducted that consensus exist among authors on sexual harassment that an effective policy is critical for a harmonious, non-threatening working environment that will contribute to employee wellness.

### Legal Perspective

When viewing sexual harassment from a legal perspective, the literature is clear on the value of implementing a fair and reasonable policy dealing with workplace sexual harassment in avoiding liability (Aalberts & Seirduran,

1996, Snyman-Van Deventer & De Bruin, 2002). An employer is expected to take reasonable steps to prevent sexual harassment. This can be done by developing a sexual harassment policy that establishes a procedure for investigating complaints quickly, confidentially and impartially. It should ensure that action is taken against harassers and that victims are protected from reprisals. This means that prevention is the key to avoiding liability. Vicarious liability places responsibility on the employer for the conduct of its employees, even if the employer was not aware of their actions (not responding to complaints of sexual harassment).

## Effectiveness of policies

When considering all the emphasis that is placed on the need for the sexual harassment policy to prevent and deal with sexual harassment in the workplace, it becomes necessary to investigate the existence of these policies. The effectiveness of policies in preventing and managing sexual harassment should also be determined and the necessary corrections made should it be found that the policies are not effective. Timmerman & Bajenna (2000) found that at that stage little was known about the effectiveness of sexual harassment policies and procedures. Their study also showed that few organizations evaluate their sexual harassment policy and this causes them to form the impression that current policies and procedures have not solved the discrepancy between relatively high numbers of instances of sexual harassment and the low incidence of reporting. Another need for this research is the recommendation by Luther & Pastille (2000) that further research is needed to determine the effect sexual harassment policy and specifically training programs have on influencing the perception of social-sexual interaction. They also stress the need for these programs (as part of the policy) to be evaluated for effectiveness.

The first step of the model proposed by Grobler *et al* (2003) for the management of sexual harassment in South African companies, entails the execution of a company-specific audit. They motivate the need for this step by stating that “if the company fails to conduct such an audit, but merely develops a policy which defined the company’s views and the subject, various individuals may not agree with the company’s interpretation/definition of the phenomenon. This, in turn, will result in individuals rejecting the policy.” The objective of the audit is to determine what workplace behaviour constitutes sexual harassment and what should individual employees do when they regard themselves as victims of sexual harassment. The study by Wilken and Badenhorst (2003) found that not one of the eight universities that were part of their analysis, paid sufficient attention to the implementation of and training in sexual harassment policies. The universities were especially lacking in the evaluation of supervisors, periodic feedback to all stakeholders and surveys at all levels of the institution to determine stakeholder satisfaction, the effectiveness of the process and the success of disciplinary steps. It becomes clear that the implementation of sexual harassment policies at universities in South Africa is problematic and this leads to the following research questions:

- To what extent do employees at HEI’s regard themselves as victims of sexual harassment?
- How effective is the implementation of the sexual harassment policy at the participating institutions?
- What is the level of awareness of staff regarding the existence and content of the sexual harassment policy at their institution?
- Do staff know their rights and do they know who to approach with complaints of sexual harassment?

## Policy Development

Wilken *et al*, 2003 combined the views of numerous authors on policy development and categorized the comprehensive process of policy development into eight categories. A brief summary of these categories/steps is provided with reference to the work of other authors as well. The first step is termed the creation of open debates by Wilken *et al*, 2003, while Grobler *et al*, 2003 refers to a company-specific audit. Aalberts *et al*, 1996 regards knowing the workplace as the first step in policy development. This means that management must talk to employees to determine their concerns and specific conduct that need to be addressed. By talking openly about sexual harassment in the workplace, different perceptions, cultures and social backgrounds are considered in determining exactly what constitutes harassment. Since all employees are consulted, they will accept ownership of the policy which will contribute to the effectiveness of the policy.

The second step aims to create an all-inclusive definition on sexual harassment that will ensure that every employee know what sexual harassment is and knows how to express what type of conduct they perceive as offensive. The definition must be supported by examples to aid employees in identifying harassing behaviour in the workplace. Thirdly, policy development should involve all the different structures and levels of an organization. This will ensure the objectivity and political-correctness of the policy making it more acceptable to the community it is developed to serve. While the debate about formal versus informal complaint procedures does not seem to be settled, a compromise will be to provide for both. The fourth step must focus on the development of an effective grievance procedure that encourages the reporting of incidents of sexual harassment in a safe manner.

Step five involves the development of a well established training program that will educate employees about the prevention of sexual harassment. This knowledge as well as knowledge about how to deal with such situations will add value to the successful implementation of the policy. The appointment of a person responsible for implementing the policy is step six of the development process. This person should have the necessary skills and authority and be acceptable to the majority of employees. Whether a representative of only one gender meets this requirement, will be further investigated in the empirical study. The last step is to create an evaluation system that will review the effectiveness of the policy on a regular basis. Statistics should be compiled when reviewing the effectiveness of the policy to ensure that scientifically interpreted data is used to improve the overall efficiency of the policy.

By following these steps, a comprehensive, inclusive policy will be developed. Employers should not be naïve in assuming that the policy alone will eradicate sexual harassment from their workplaces and safeguard them from liability claims. Developing a sexual harassment policy is only part of the total strategy to manage sexual harassment and may be regarded as the easier part as numerous guidelines, codes and examples of effective policies exist. The implementation of this policy by means of an enforcement mechanism may prove to be more difficult.

## **Implementing a Sexual Harassment Policy**

A number of authors are in agreement that the mere presence of a policy does not ensure its effectiveness (Paludi, 1996; Laabs, 1998 and Orlov, 1999). A policy has to be effectively implemented in order to have value and to avoid becoming another well-formulated, impressive sounding document compiled by consultants and filed by the Human Resources Department. The following guidelines are suggested for the effective implementation of a sexual harassment policy:

- a) Create awareness by including the policy in as many programmes, such as orientation, education, training and diversity awareness, as possible. This will contribute to the creation of a culture where sexual harassment is not tolerated. Trade unions should be involved in every step of the implementation process.
- b) Communicate the policy to all employees at every level of the organization by providing each one with a copy of the policy and keep signatures on file that employees received the policy. This signature may prove vital in an organisation's defense against claims of vicarious liability.
- c) Conduct regular training sessions or workshops where the content of the policy and the complaints procedure is explained. "These training sessions should continuously reinforce the conditions that contribute to a harassment-free working environment, and should familiarize or acquaint each employee with their rights and responsibilities"
- d) Ensure that managers and supervisors are aware of their responsibility for implementing the policy and ensuring compliance.
- e) Provide specialized training for individuals who were assigned an official role in administering the organisation's complaint procedure.

( Finnemore *et al*, 2000; Laabs, 1998; Orlov *et al*,1999; Paludi,1996 and Retief, 2000).

## **THEORETICAL BASIS FOR THE STUDY**

The theoretical basis of this study is based on labour legislation, psychology, sociology and organizational theory. This statement is motivated as follows. Harassment is listed in the Employment Equity Act no 55 of 1998

as a form of unfair discrimination. The rationale of the Act focuses *inter alia* on the eradication of unfair discrimination of any kind (Tinarelli, 2000). It can therefore be argued that the Employment Equity Act places a legal and moral obligation on employers to ensure that their workplace policies and procedures are non-discriminatory meaning that an effective sexual harassment policy is non-negotiable in order to avoid being accused of discrimination. Apart from this Act, the National Economic Development and Labour Council (NEDLAC) has issued a Code of Good Practice on the Handling of Sexual Harassment Cases in terms of section 203(2) of the Labour Relations Act, 1995. This code encourages and promotes the development and implementation of policies and procedures that will lead to the creation of workplaces that are free of sexual harassment, where employers and employees respect one another's integrity and dignity, their privacy, and their right to equity in the workplace. This code will form the legal motivation for the conduct of this study.

## Organisational Theory

A detailed discussion of organizational theory will be regarded as obsolete under these circumstances as employers have no choice but to comply with legislation, whatever their approach to organizational change and organizational development.

A brief overview of some organizational theories is provided to ensure a balanced approach to this study and to shed some light on the behavioural dimensions of workplace policies and procedures.

**Table 1: Implications of Organizational Theory for People Management**

| Organizational Theory                   | Implications for people management  |
|---|---|
| Welfare Capitalism                      | Provide benefits and establish in-house committees and <i>grievance procedures</i> to facilitate problem solution                                     |
| Human Relations School                  | Nurture good interpersonal <i>relations</i><br>Extensive <i>counselling</i> of employees<br><i>Fair treatment</i> as incentive for worker performance |
| Theory of institutional leadership      | Positive leadership influence employees to advantage of organisation<br><i>Sensitivity training</i>   |
| Fox's Sophisticated Paternalistic Style | Positive motivation of employees<br>Gain employee commitment by good <i>human resource policies</i>   |
| Fox's Sophisticated Modern Style        | Establish <i>procedures</i> to regulate behaviours within the relationship  |

(Adapted from Bendix, 2005)

## RESEARCH DESIGN

A questionnaire was developed to meet the specific objectives of this study. It would have been possible to make use of the Sexual Experiences Questionnaire (SEQ) developed by Fitzgerald, Shullman, Bailey, Richards, Swecker, Gold, Ormerod and Weitzman (1988), which is a standardized measuring instrument designed to assess the prevalence of sexual harassment in a psychometrically sound manner. The SEQ is however limited in its application as it only measures the actual experiences of respondents. Respondents who are aware of or who have witnessed incidents of sexual harassment will not be able to contribute to the objective of determining the perceptions of staff of the incidence of sexual harassment in their institution. The SEQ was also not designed to measure the awareness of sexual harassment policies and procedures or to evaluate the effectiveness of these measures. For this reason the Sexual Harassment Questionnaire (SHQ) was developed based to some extent on the work of Retief (2000), Jardim (2004) and Kolkenbeck-Ruh (2003).

## The Sexual Harassment Questionnaire

The SHQ consists of a standard section to obtain biographical information from the respondents. Due to the sensitive nature of the topic the questionnaire is completed anonymously and institutions are not identified. Section B consists of 22 items describing sexual behaviour. The items are grouped into five dimensions namely sexual favouritism, non-verbal harassment, verbal harassment, physical conduct and *quid pro quo* harassment. This section also contains the direct question "Have you ever been sexually harassed on campus?" followed by

options to indicate the gender, job level and relationship of the alleged harasser. Section C is made up of 15 items designed to determine the level of awareness of respondents of the existence and effectiveness of sexual harassment policies in their respective institutions. It also asks respondents to indicate whether the incidence of sexual harassment at their institution is high or low. Their responses will be correlated with the responses in section B relating to the incidence of harassment. Section D focuses specifically on the sufficiency of grievance procedures to deal with complaints of sexual harassment. This section consists of 19 items which correlates with the requirements for an effective grievance procedure. These requirements are visibility, intelligibility, steps and time scales, credibility, support, commitment and fairness.

## Research methodology

South Africa currently has 23 universities which are divided into three types. Eleven traditional universities offer theoretically-oriented degrees, six comprehensive universities were formed by combining technikons with traditional universities and they offer a combination of theoretically-oriented degrees and practically-oriented diplomas and degrees while six universities of technology offer diplomas and degrees in mostly technical fields. All the universities were invited to take part in the study and were requested to provide name lists of all their full-time, permanent staff. A random sample will be drawn from each participating institution. The sample will be stratified to include staff members from the academic, administrative and other sectors of the institution. Questionnaires will be mailed to the participants together with a pre-addressed, stamped envelope to return the completed questionnaire. Regular mail was selected as electronic mail will identify the sender of the completed questionnaire and might compromise confidentiality. Given the sensitive, personal nature of the information requested, confidentiality is crucial to the success of the study.

## CONCLUSION

The majority of existing research has examined sexual harassment in non-academic settings or focused on the more traditional incidence of harassment among academics and students. It may be argued that because academic settings are regarded as training grounds for future professionals, harassment in such settings may serve to spread, rather than mitigate the incidence of harassment in other settings. The results of this empirical study will contribute to the body of knowledge on sexual harassment at Higher Education Institutions in South Africa. It will shed some light on the incidence of sexual harassment and will be an indication of the extent of the problem. Inferences will be made to determine if the reported cases of sexual harassment at Higher Education Institutions are isolated incidents or whether the occurrence is widespread. Meaningful data will be collected on the frequency of harassment, the characteristics of the harasser, awareness and knowledge of the dynamics of sexual harassment policies and whether grievance procedures are regarded as sufficient remedial measures to deal with complaints of sexual harassment. This data will be analysed and interpreted and will form the basis of the model to develop an effective sexual harassment policy for Higher Education Institutions in South Africa.

## ABSTRACT

*Strategic alliances require mutual adaptation to execute strategies effectively. Also mutual adaptation is said to bring the performance gains result such as productivity gains, competitive advantage and stronger market position.*

*A few previous researches on buyer-supplier relationships have found some common drivers of mutual adaptation, but our research focuses on differential drivers of mutual adaptation. We assume the focal firm will mainly do adaptation to achieve its specific goals, whereas it will perceive that partner firm's adaptation is secured not by partner's goals but by alliance structure they adopt. This is because the focal firm wants to control partner's behavior and alliance structure can be used as a mean to do it.*

*Using OLS, we test a model of factors that includes purpose of alliance, alliance structure, dependence, and the partner's adaptation on the mutual adaptation of firms in the Korean e-business industry.*

*The results of the study indicate that main purpose of alliance (new product development, building distribution channel, and promotion) and the alliance structure (bilateral alliance vs. multilateral alliance, equity alliance vs. non-equity alliance) play different role for mutual adaptation. Specifically, focal firm adaptation is impacted not by the alliance structure but by the purpose of alliance. Partner adaptation, on the other hand, is impacted not by the purpose of alliance but by the alliance structure.*

## INTRODUCTION

The number of strategic alliances is increasing rapidly in recent years, and it is attributable to the emergence of the Internet and e-alliances. The compound annual growth rate of e-alliances from 1995 and 2000 was 103.5%, which was several times higher than that of traditional alliances, 14.8% (Ernst et al. 2001).

Online alliances are partnerships formed based on e-business strategies and often times involve multilateral partnerships (Ling 2002). Online alliances are faster and more flexible than traditional alliances and the depth of the relationships varies greatly (Segil 2001).

Online alliances can be regarded as firms' responses to new technologies so quick response to a new technology will garner first-mover advantage (Lee and Grewal 2004). Barnes & Noble's partnership with AOL to market its web site is an example of drawing on the IT expertise of partners. Advantages of alliance come from reduction of transaction costs (Gulati 1995), and increase of knowledge bases (Parkhe 1993).

Despite the rush of alliances, 75% of them fail or underperforms mostly due to poor or damaged relationships (Ertel et al. 2001). Dependence on partners for technological know-how causes a smaller share of alliance pie, which is another reason for low performance (Das, Sen, and Sengupta 1998).

Mutual adaptation allows each better fit together so it is a good way to improve the alliance performance (Hagberg-Anderson 2006). We investigate the drivers of mutual adaptation in online marketing alliance. We examine the influence of the main purpose of alliance, partner's adaptation, alliance structure, and dependence to test if they are significant in both parties of alliance.

# ADAPTATION

When the alliance partners strive to produce mutually beneficial outcomes, coordination efforts such as sharing of information and joint activities must be considered (Jap 1999). Interfirm or mutual adaptation is defined as adapting products, processes, and procedures to the capabilities of partner (Hallen et al. 1991). Mutual adaptation is very similar to joint action in industrial purchasing relationships because the latter includes various activities such as tool development and product design, value analysis and cost targeting, design of quality control and delivery systems, and long-term planning (Heide and John 1990). As the joint action increases the relationship becomes partnership. Similarly, in buyer-seller relationships mutual adaptation takes place when the two parties develop more effective relationships. There also are adaptation pressures that tend to go high in the transaction environment when demand, supply, and technology conditions change.

According to previous research drivers of mutual adaptation are economic elements such as dependence and social elements such as trust and commitment (Hallen et al. 1991; Mukherji and Francis 2007). Hallen et al. (1991) turned to social exchange theory, which views mutual adaptation as dynamic processes. For example, if one party starts by adapting the product, the other will respond by adapting production processes, which leads to another adaptation.

## RESEARCH HYPOTHESIS

A few previous researches on buyer-supplier relationships have found some common drivers of mutual adaptation, but our research focuses on differential drivers of mutual adaptation. We assume the focal firm will mainly do adaptation to achieve its specific goals, whereas it will perceive that partner firm's adaptation is secured not by partner's goals but by alliance structure they adopt. This is because the focal firm wants to control partner's behavior and alliance structure can be used as a mean to do it.

### *Purpose of alliance*

Firms have many different purposes when they form an alliance. R&D and marketing represent two common purposes of alliance. If the purpose accompanies greater risks of opportunism firms tend to form an equity alliance as mutual hostage taking. Alliances formed for new product development purpose may involve more mutual collaboration than those for promotion purpose. In high technology industries, firms often derive their competitive advantage from R&D or NPD activities (Pangarkar and Klein 2001). To achieve a success in joint new product development firms will have more incentive to adapt their products, processes, and procedures with those of their partners. Even firms in the same alliance can have different purposes and their intention to adapt will be mainly influenced by their own purposes.

H1: Firm's adaptation in an alliance will be influenced by its own purpose. Specifically firms with NPD purpose will adapt more than the firms with promotion purpose.

### *Partner's adaptation*

When partner firm adapts, a firm is more likely to adapt because partner adaptation signals a long-term commitment to the relationship. It also suggests a sense of partnership and collaboration firms can expect from their partners (Mukherji and Francis 2007). So partner adaptation is likely to reinforce mutual adaptation. Interfirm adaptations in a business relationship are elements in a trust-forming social exchange process so that the adaptations by the two parties in the relationships are related positively to each other (Hallen et al 1991).

H2: Firm's adaptation in an alliance will be positively influenced by the adaptation of partner firm.

### *Dependence*

In a buyer-seller partnership dependent buyers will not behave opportunistically against their suppliers (Keith et al. 1990). In the situation of reciprocal interdependence continuous adaptation between partners as ongoing decision making about task allocation (i.e. planning) and continuous communication (i.e. mutual adjustment) is required (Thompson 1967, Gulati and Singh 1998). Dependence is an economic power one firm has over another, which can result in high levels of adaptation (Zaheer and Venkatraman 1995). Dependence on partner increases when there is few alternatives, when partner's role is critical, and when a firm affected greatly

by losing its partner (Ganesan 1994). So we can expect that the more a firm is dependent on its partner, the more likely it is to adapt itself to its partner's needs.

H3: Firm's adaptation in an alliance will be influenced by its dependence on partner firm.

#### *Equity vs. non-equity alliance*

Equity stakes mitigate the possibilities of opportunism and free riding by partners thus are important decision parameters when forming alliances (Gulati 1995). Thus firms will choose equity alliances when the transaction costs in an exchange are high. Firms in an equity alliance may be able to have members on the Board of Directors, thus participating in management decision makings. In addition, equity owners can access to reliable and accurate information to each of the partners (Gulati 1995). Since firms in an equity alliance have much control power than those in a non-equity alliance, they will demand high level of adaptation from partner firms.

H4: Firm's adaptation will be higher in an equity alliance than in a non-equity alliance.

#### *Bilateral vs. multilateral alliance*

One outstanding aspect of e-alliance is multilateral alliances can be formed easily and at low costs. Information technology is used to establish a desired level of control and flexibility, thus wide spectrum of electronic partnership – ranging from dyads to multilateral linkages – has emerged.

Under the conditions of low process/product criticality companies may be encouraged to form loosely coupled partnerships so that they attract many more business partners and companies who are able to realize benefits from scale economies and specialization (Chatterjee et al. 2006). When dissipation risk is high firms prefer bilateral alliances which increase switching costs and thereby deters opportunistic behavior.

H5: Firm's adaptation will be higher in a bilateral alliance than in a multilateral alliance.

## **METHOD**

### *Measurement*

*Purpose of alliance:* The purpose of marketing alliance is categorized into three choices – new product development, building distribution channel, and promotion.

*Partner's adaptation:* Adaptation was measured by three items - product/service, marketing process, and marketing plan – using five point Likert scale. The measures are adopted from Hallen et al. (1991) and measured for both parties.

*Dependence:* Dependence was measured by single item five point Likert scale and measured for both parties. The scale was reversed.

*Equity vs. non-equity alliance:* Joint ventures and partial equity stakes are coded as equity alliance and other contracts without equity stakes are coded as non-equity alliance.

*Bilateral vs. multilateral alliance:* One to one alliance was coded as bilateral alliance and one to many and many to many alliances are coded as multilateral alliance.

### *Sample*

Our research population is the domestic companies that made an official contract of 'online marketing alliances', specified the cooperation area and time period. Banner exchange or affiliate program, not being accompanied by mutual commitment, did not considered in the study.

In order to search for companies that have made an online marketing alliance, we collected 378 online alliance cases through the Internet search of news items confined to last three years. We reviewed the cases and selected 308 cases which can be classified into marketing alliance. The contact information of alliance partner firms is collected by a research company in Korea through direct contact with the partners' PR department or Internet site of Korea Internet Company Association (KICA) ([www.kinternet.org](http://www.kinternet.org)). The contact information of total 530 companies is collected. During the contact with the members of KICA, we have identified additional companies that are likely to conduct online marketing alliance. These companies were included in the final list of research although they are not included in the online news list.

The telephone interviewers contacted companies' marketing managers and requested the survey of online marketing alliance. For the companies in the online news list, the survey was about the online marketing alliance

reported on the newspapers. For the other companies, the survey was about the latest online marketing alliance which can be evaluated in terms of performance. Survey was conducted through e-mail and fax, resulting 186 samples (response rate of 35.1%). Final 185 samples were used for empirical analysis, excluding the one sample in which the critical item was missing.

In the sample, 58.4 percent were online-offline alliance and 41.6 percent were online-online alliance. Alliance purpose was development of marketing channel and new sales network (35.1%), advertising/promotion/brand awareness building (24.86%), customer DB sharing and customer base expansion (12.43%), supply of contents (12.43%), product and solution development (7.57%), business diversification and new market penetration (6.49%), others (2.7%), respectively. The number of employees is as follows: under 10 (18.38%), 11-50 (24.86%), 51-200 (24.86%), 201-1000 (16.22%), above 1001 (6.49%), no response (9.19%).

## RESULTS

The hypotheses were tested using a regression analysis. Focal firm's sales volume (in log transformation) and alliance duration were included as control variables. Alliance purpose and alliance structure were coded as dummy variables. Specifically, promotion purpose was coded zero (0), while others were coded one (1). Likewise bilateral or equity alliance is coded one (1), and multilateral alliance or non-equity alliance were coded zero (0). Variation Inflation Factor (VIF) for all independent variables has shown that multicollinearity among independent variables would not be an issue during regression analyses (The highest VIF was 1.453 for partner's dependence in Model 1 and 1.403 for partner's dependence in Model 2, respectively). Regression results are shown in Table 1.

**Table 1. Regression results**

|  | Model 1<br>(DV : Focal firm adaptation) | Model 2<br>(DV : Partner adaptation) |
|--|---|--------------------------------------|
| <i>Alliance purpose</i>                  |   |                                      |
| NPD                                      | 0.389* (0.161)                          | 0.051 (0.163)                        |
| Building distribution channel            | 0.457** (0.148)                         | 0.113 (0.186)                        |
| <i>Partner's Adaptation</i>              | 0.420*** (0.076)                        | 0.492*** (0.083)                     |
| <i>Dependence</i>                        |   |                                      |
| Focal firm's dependence (reverse)        | -0.135 (0.074)                          | 0.187* (0.078)                       |
| Partner's dependence (reverse)           | 0.230** (0.071)                         | -0.323*** (0.074)                    |
| <i>Alliance Structure</i>                |   |                                      |
| Bilateral Alliance                       | -0.030 (0.134)                          | 0.325* (0.027)                       |
| Equity Alliance                          | -0.277 (0.189)                          | 0.665** (0.195)                      |
| Focal firm sales (in log transformation) | -0.059* (0.025)                         | 0.035 (0.027)                        |
| Alliance Duration                        | 0.002 (0.004)                           | -0.004 (0.005)                       |
| R square (Adjusted R square)             | 0.33 (0.28)                             | 0.38 (0.33)                          |
| F-value                                  | F (9, 119) = 6.6**                      | F (9, 119) = 8.0**                   |

DV : dependent variable

Entries are nonstandardized regression coefficients (standard errors).

\* p < 0.05, \*\* p < 0.01, \*\*\* p < 0.001

In model 1 (focal firm adaptation model), focal firm's adaptation was regressed on the independent variables. In model 2 (partner adaptation model), partner's adaptation was regressed on the independent variables. As apparent in Table 1, multiple regression analyses confirm both Hypotheses 2 and 3, as the coefficients of partner's adaptation and partner's dependence were significant in both models. Hypothesis 1 was supported only in the focal firm adaptation model. In contrast, both Hypotheses 4 and 5 were supported only in the partner adaptation model.

The empirical results of the study have shown that main purpose of alliance (new product development, building distribution channel, and promotion) and the alliance structure (bilateral alliance vs. multilateral alliance, equity alliance vs. non-equity alliance) play different role for mutual adaptation. Specifically, focal firm adaptation is impacted not by the alliance structure but by the purpose of alliance. Partner adaptation, on the other hand, is impacted not by the purpose of alliance but by the alliance structure.

## DISCUSSION

Mot previous research on mutual adaptation focused on buyer-seller relationships. This study focuses on mutual adaptation in the situation of online marketing alliances.

We surveyed the perceptions of focal firms on mutual adaptation and found that the influences of each other's adaptation and dependence are significant for both parties. Those findings are consistent with previous research noting that mutual adaptation is influenced by both social and power elements of partnerships (Heide and John 1992; Mukherji and Francis 2007; Hallen et al. 1991).

Hallen et al. (1991) proposed a symmetrical model to explain interfirm adaptation and their result also indicated symmetry as the test does not reveal any significant differences between the parties in the explanation of adaptation. We also got the same symmetrical results for the variables they had used, but we found asymmetrical results for our new variables, alliance purpose and alliance structure.

A key contribution of this research is to find different influencers for each party's adaptation. Focal firm's adaptation was influenced by its own alliance purpose, whereas focal firm saw partner's adaptation had nothing to do with partner's alliance purpose. Instead focal firms perceived alliance structure influenced partner firm's adaptation. Specifically they perceived that bilateral alliance and equity alliance is effective to get partner's adaptation. Interestingly focal firms did not think that their adaptation was influenced by the alliance structure.

Previous research (e.g. Hallen et al. 1991) predicts that reciprocal adaptation develops over time and takes cost, but in online alliances those restrictions did not matter anymore.

## CONCLUSION

Our research provides some common and different determinants of mutual adaptation that can develop between partners. Reciprocity and dependence are commonly important to secure each other's adaptation. Different factors such as purpose of alliance, and alliance structure are also important to develop an alliance strategy. Firms are so self-oriented when they make a decision on adaptation that it would be very helpful to know partners' purpose of alliance in getting their adaptations. And also firms can show their intention to adaptation by choosing the right alliance structure.

The research has some limitations. Firstly, we tested a causal model but the findings should be considered with caution, as the data is cross-sectional. Secondly, we surveyed only one party of each partnership to validate determinants of mutual adaptation. If we survey both parties of a partnership we could understand the relationship better.

Finally, we did not include some relationship variable such as trust, and commitment in our model. Since we focused on online alliances mostly in the early stages of alliance omitting such variables that develops over time does not seem to hamper our results a lot.

# FDI AND ECONOMIC GROWTH NEXUS EVIDENCE FROM SEVEN EMERGING ECONOMIES

**Burhan Can Karahasan and Mehmet Hakan Sengoz**  
**Istanbul Bilgi University, Turkey**

## ABSTRACT

*Globalization era attracted great attention to capital flows, especially among developing economies, thanks to the enhanced liberalization around the globe. While expectations regarding the positive effects of FDI flows to countries is a fact, recent time series evidences underline the possibility of a reverse causality running from economic growth to FDI inflows. In line with this causality debate, this study aims to make a quantitative assessment of the causal link between foreign direct investment (FDI) inflows and economic growth by using a sample of seven emerging economies. Results underline the dominance of a reverse causality running from FDI inflows toward economic growth.*

## INTRODUCTION

Recent two decades exhibit a significant shift on the discussion topics of global economy, from trade liberalization to capital accounts liberalization. Although these concepts are regarded as closely related, a vast amount of literature devotes itself about capital flows and economic growth. Especially emerging and/or developing economies are at the heart of this debate. According to the United Nations Conference on Trade and Development (UNCTAD), developing economies' inward stock of FDI amounted to about one-third of their GDP, compared to just 10 per cent in 1980. In addition, one-third of this trade accounts for intra-firm.

Moudatsou (2003) outlines the relationship between FDI and economic growth and argues that links between FDI and GDP may arise in possible three ways. First case may occur where economic growth in the host country attracts FDI. Second, FDI helps out with the economic growth of host country and third, FDI and economic growth may be bi directionally linked. Those links may possibly be attributed to the levels of economic development. In general, FDI aims to take advantage from cheaper resources of host country. Thus, a promised economic growth may seem desirable for investments coming from more developed economies. Empirical studies discussing the stated three hypotheses are clustered in late 1990s. Cross sectional studies underlines the efficiency of FDI to explain the economic growth levels of countries. Borensztein et al. (1998) uses a sample of 69 developing countries to investigate the relation between FDI flows and economic growth. The results indicate a strong positive relationship between the variables, running from FDI inflows toward economic growth. Moreover, Stiglitz (2000) asserts that FDI flows are preferable over portfolio investments, as latter causes higher levels of instability rather than economic growth. While the effect of FDI on economic growth is clarified by major cross sectional studies, rise of time series evidences remark the need for country based analysis. Chowdhury and Mavrotas (2006) underlines the presence of bi-directional causality for the selected three emerging economies.

Originating from the ongoing debate, we analyzed seven emerging economies for the post 1970 period to understand the causal relationship. Both short run and long run relationship is investigated by following VAR and VECM frameworks. In our sample of seven countries, all but one (India) presents an evidence for causation from GDP to FDI. Consequently, we may suggest that different phases in economic development would yield different types of causal relationships where our sample consists of countries with, more or less, similar characteristics and finally yield more generalized results.

The next section gives a literature review on the subject of the relationship between economic growth and FDI. The third section presents an overview of the methodology, the fourth one presents the findings of the study while the last section concludes.

## FDI INFLOWS AND ECONOMIC GROWTH

Dritsaki et al. (2004) builds up a model to understand the causal relationship in Greece. Findings state that FDI inflows is a significant factor behind the economic growth. Another study that validates the FDI leading view is constructed for Ghana by Frimpong and Oteng-Abayie (2006). Authors detect a relationship from FDI inflows to economic growth for a given time span of the overall sample. Meanwhile, Bashier and Batanieh (2007) in a recent study examine the interrelation between FDI inflows and savings in Jordan. Results underline that FDI inflows is a leading factor for saving accumulation. A second set of empirical studies concentrates on the possible reverse causality. Kholdy (1995) used five emerging economies to question the interaction of FDI inflows with technological efficiency and then with capital formation. Findings underline the absence of a significant relationship between FDI inflows and technological efficiency. However a significant relationship is detected between FDI inflows and capital formation, running from capital formation towards FDI inflows. Chakraborty and Basu (2002) discussed the relation in India proposing that economic growth is the driving force behind the acceleration of FDI inflows while reverse is not the case. Similarly Liu et al. (2002) examined China, underlining that a bi directional relation exists between economic growth and FDI inflows. Finally Chowdhory and Mavrotas (2006) also remarked two way causality for Chile. Findings of the study also show that economic growth is a leading factor behind FDI inflows in Malaysia and Thailand.

Meanwhile, Dhakal et al. (2007) examined the relationship in an outline based on economic and social variables. These variables are economic growth, capital accumulation rate and factors affecting the total factor productivity. (i.e. education level, institutional quality, macroeconomic stability, trade openness, and etc.) In that sense, we assume a matrix of FDI performance and FDI potential will help us to cover these matters all in one. Therefore, we introduce such a matrix following UNCTAD methodology for FDI flows. The inward performance criterion ranks the countries by the FDI volume that they receive relative to their economic size. In other words, it is the ratio of a country's share in global FDI inflows to its share in global GDP. The potential criterion is a more complex measurement, which consists of 12 different variables, to define the attractiveness level of a country for FDI inflows.

For simplicity reasons, we employed an average ranking for countries' FDI performance and potential, from 1989 to 2005. The following matrix yields the results for the countries that we include in our study. It should be noted that this matrix approach to the FDI evaluation holds a time horizon for more than two decades. Furthermore, some countries presented below are members of common global economic organizations and/or definitions (i.e. BRIC, ASEAN, and NAFTA) while their FDI practices differ.

**Table 1: FDI Performance Matrix**

|                           | <b>High FDI Performance</b>                  | <b>Low FDI Performance</b>                              |
|---------------------------|--|---|
| <b>High FDI Potential</b> | Front-runners<br>( <i>Malaysia, Mexico</i> ) | Below potential<br>( <i>Brazil, S. Korea</i> )          |
| <b>Low FDI Potential</b>  | Above potential                              | Under-performers<br>( <i>India, Indonesia, Turkey</i> ) |

## METHODOLOGY

The model that we will introduce through out this study aims to evaluate the causal link between foreign direct investment and economic growth in seven emerging economies; Turkey, Malaysia, India, Indonesia, Mexico, Brazil, South Korea. In line with the literature we use real per capita GDP and FDI inflows as percentage of GDP for the period of 1970-2006. Data is obtained from World Bank's World Development

Indicators (WDI-2007) for the seven emerging countries. Overall for six of the countries in our sample we have 36 observations; however for South Korea we have 30 observations. We subtract Russian Federation from the study due to insufficient number of observations (12 observations). Moreover as also mentioned in the empirical investigation part, due to technical reasons we also subtract China from our sample of countries.

The standard procedure that we intend to follow will be building up vector autoregressive (VAR) models to understand the causal relationship between economic growth and foreign direct investment inflows in each of the seven countries in our sample. Moreover based on the integration order of the variables, we will try to distinguish the possibility of long run, short run dynamics and adjustments. As a starting point we will check for the stationarity of the variables under concern for each of the countries separately by implementing Augmented Dickey Fuller Tests -ADF- (Dickey, Fuller, 1979). If the variables under concern are found to be stationary  $I(0)$ , we will estimate a two variable (x and y)  $k^{\text{th}}$  order vector autoregressive model (VAR), described in equations one and two and directly apply Granger Non Causality test.

$$(1) \quad x_t = \eta_1 + \sum_{i=1}^k \omega_{1i} x_{t-i} + \sum_{i=1}^k \mathcal{G}_{1i} y_{t-i} + u_{1t}$$

$$H_0 : \mathcal{G}_{11} = \mathcal{G}_{12} = \dots = \mathcal{G}_{1k} = 0$$

$$(2) \quad y_t = \eta_2 + \sum_{i=1}^k \omega_{2i} y_{t-i} + \sum_{i=1}^k \mathcal{G}_{2i} x_{t-i} + u_{2t}$$

$$H_0 : \omega_{21} = \omega_{22} = \dots = \omega_{2k} = 0$$

Standard Wald test will be implemented for equations one and two respectively. Tested hypothesis are reported with the equations above. Rejection of the null hypothesis will help us to comment on the possible causal link. In such a case we will be rejecting the hypothesis of y (x) does not Granger Cause x (y) in equation one (two).

However if the observed variables are found to be non-stationary then we will check for the order of integration by using ADF test in the differences of the variables (Dickey, Fuller, 1979). Based on the results, if we detect that variables are integrated at the same order, we will apply Johansen cointegration test (Johansen, 1988). In case, we fail to find any cointegration between the non stationary variables, we will estimate the VAR models represented in equations three and four and apply directly the Granger Non-Causality Test as described above.

$$(3) \quad \Delta x_t = \eta_1 + \sum_{i=1}^k \omega_{1i} \Delta x_{t-i} + \sum_{i=1}^k \mathcal{G}_{1i} \Delta y_{t-i} + u_{1t}$$

$$(4) \quad \Delta y_t = \eta_2 + \sum_{i=1}^k \omega_{2i} \Delta y_{t-i} + \sum_{i=1}^k \mathcal{G}_{2i} \Delta x_{t-i} + u_{2t}$$

Though, if the observed variables are cointegrated, following a vector error correction model (VECM) seems to be more appropriate. As discussed by Engle and Granger (1987) and Johansen (1988), cointegrated variables should have an error correction term (represented by *EC* in equation 3 and 4) which has to be included into the model. *EC* represents a linear combination of the non stationary variables which at the end yields a stationary term. Overall all components of the VECM become stationary. Actually using the levels of the data in the error correction term will help us to capture the long run behavior of the variables while short term adjustments are also allowed. This property of VECM is the major answer to the VAR models' shortcoming; differencing the non-stationary variables causes some of the information to be lost, which at the end prevents us to comment on the long run behavior of the concerned variables. The bi variate VECM with one cointegration relationship will be as follows, where x and y represents the cointegrated variables based on Johansen test (1988);

$$(5) \quad \Delta x_t = \zeta_1 + \kappa_{11} EC_{t-1} + \sum_{i=1}^{p-1} \gamma_{1i} \Delta x_{t-i} + \sum_{i=1}^{p-1} \nu_{1i} \Delta y_{t-i} + \varepsilon_{1t}$$

$$(6) \quad \Delta y_t = \zeta_2 + \kappa_{21} EC_{t-1} + \sum_{i=1}^{p-1} \gamma_{2i} \Delta x_{t-i} + \sum_{i=1}^{p-1} \nu_{2i} \Delta y_{t-i} + \varepsilon_{2t}$$

After estimating the VECM, the major emphasis will be on the causality debate. However capturing the causal relationship in a VECM is not straightforward as implemented in a VAR model. There may be three sources of causality in a VECM. First coming from the long run relation of variables, second which may prevail during the short term adjustments of the variables and finally an overall causality may be found coming from their joint manners. Using equations five and six, we will first check the significance of the error correction component, which contains the information regarding the long run relationship, weak exogeneity test. Next we will test the significance of lagged differences of the variables that will help us to understand the short run dynamics of the relation. Finally we will check for the joint significance of the lagged differenced terms and the error correction term, strong exogeneity test. While first two tests will distinguish the short run and long run behavior, strong exogeneity test is also commonly used as to understand the overall relation between the examined variables. Based on the results we will have some room to discuss the direction of the relation between the selected economic growth indicator and the foreign direct investment indicator.

## EMPIRICAL FINDINGS

As a starting point, FDI indicator and economic growth indicator for each country is checked for stationary. Here ADF test results show us that for China, per capita real GDP becomes stationary in its second difference (not shown in table 2), whereas FDI indicator is stationary in its first difference. Hence we decide to exclude China and add Malaysia into our sample. ADF test result reported in table 2 underlines that, variables under concern are found to be non stationary in their levels and become stationary after first differences of variables are taken.

**Table 2: ADF Test Results**

|             | FDI/GDP |              | Per Capita GDP |              |
|-------------|---------|--------------|----------------|--------------|
|             | $Y_t$   | $\Delta Y_t$ | $Y_t$          | $\Delta Y_t$ |
| Brazil      | -1.584  | -4.490*      | -3.404         | -4.368*      |
| Indonesia   | -2.978  | -7.814*      | -2.032         | -4.457*      |
| India       | -1.165  | -3.775*      | 2.331          | -4.459*      |
| Mexico      | -3.344  | -7.323*      | -1.799         | -4.495*      |
| Turkey      | 0.235   | -4.706*      | -1.922         | -6.464*      |
| South Korea | -2.011  | -3.775*      | 1.763          | -4.861*      |
| Malaysia    | -2.627  | -6.525*      | -2.981         | -8.167*      |
| China       | -1.284  | -3.574*      | 4.503          | -0.611       |

\* represents rejection of unit root at 5% significance level

Once finding that all variables under investigation are I(1), we move on by applying Johansen Cointegration test to each of the countries separately as proposed by Johansen (1988). For the non stationary variables if cointegration is detected a VECM will be estimated, however in case we realize that variables are both non stationary and non cointegrated then estimation of a VAR model in the differences and Granger Non Causality test seems to be appropriate. Results of the Johansen cointegration test is reported in table 3. As results of Johansen test is sensitive to the selected lag length, we use both Akaike Information Criteria (AIC) and Schwarz Information Criteria (SIC) during the estimation of VAR models of the variables, which in turn will represent the relevant lag length of the Johansen test.

Table 3 gives the summary of the Johansen test. For simplicity just trace statistics are reported. Based on two different information criterions for each country two cointegration tests are implemented. Findings of the

Johansen Cointegration test propose that for the countries of Indonesia, India and South Korea cointegration is detected. For the remaining four countries we reject the presence of cointegration.

**Table 3: Johansen Cointegration Test Results Based on Trace Statistics**

|           | Selected<br>Lag Length Based on<br>AIC, SIC |     | k based<br>on AIC |         | k based<br>on SIC |         | 5%<br>Critical Values |      |

k is the lag order of the cointegration test, \* represents chosen integration order

Turning back to the core objective of the study, next we perform the Granger Non Causality tests to the relevant models. First of all, for the countries that we fail to find cointegration relation between FDI inflows and economic growth - Brazil, Mexico, Turkey, Malaysia -, we estimate VAR models in the first difference of the variables as constructed in equations 3 and 4. Lag order of the models are chosen based on AIC and SIC. For Brazil, Mexico and Turkey appropriate lag length is one based on both criterions. For Malaysia optimal lag length is found to be 1 and 6 based on SIC and AIC respectively. Finally Granger Non Causality test is performed as to understand the possible causal link between the variables in the countries under concern. Table 4 gives the results of the causality tests.

**Table 4: Granger Non Causality Wald Test Results**

|          |                        | k=1                | k=6               |
|----------|------------------------|--------------------|-------------------|
| Brazil   | FDI $\nRightarrow$ GDP | 0.09273<br>(0.761) | -                 |
|          | GDP $\nRightarrow$ FDI | 0.16302<br>(0.686) | -                 |
| Mexico   | FDI $\nRightarrow$ GDP | 2.4047<br>(0.121)  | -                 |
|          | GDP $\nRightarrow$ FDI | 4.263<br>(0.039)   | -                 |
| Turkey   | FDI $\nRightarrow$ GDP | 0.77942<br>(0.377) | -                 |
|          | GDP $\nRightarrow$ FDI | 21.653<br>(0.000)  | -                 |
| Malaysia | FDI $\nRightarrow$ GDP | 2.0123<br>(0.156)  | 7.2114<br>(0.302) |
|          | GDP $\nRightarrow$ FDI | 4.039<br>(0.044)   | 23.099<br>(0.000) |

k is the appropriate lag length based on AIC and SIC,  
P-values in parenthesis

Although, due to the absence of cointegration, we can not comment on the long run behavior of the variables, we may comment on the possible short run dynamics of the process in each country separately. Findings of table 4, the non causality test, underlines that; just for Brazil we report the absence of a relation between the variables. However, we fail to reject the hypothesis that FDI inflows does not Granger cause economic growth for the rest of the countries in the test reported above. Moreover findings underline that there exists a relation running from economic growth towards FDI inflows, giving rise to the view in favor of the growth leading view of the relationship.

Next we estimate VECM, presented in equations five and six, for the three of the countries that we detect cointegration: Indonesia, India and South Korea. First to understand the long run behavior, we test the weak exogeneity by observing the significance of the error correction term by using a simple t test. Second we test the joint significance of differenced FDI (GDP) indicator in GDP (FDI) equations, which will help us to comment on the short run relationship. And finally strong exogeneity test is implemented as to understand the joint significance of the differenced lagged values and the error correction term. To choose the relevant lag length of the VECM, we use AIC and SIC yielding 6, 1 and 2 levels respectively for each country. Note that as the lag length of the differenced variables in VECM is lag length of the VAR models minus number of cointegration relations, we fail to estimate the short run dynamics for India. Results of the VECM are reported in table 5. For Indonesia and South Korea we detect the presence of both a short term and also long term relation running from economic growth towards FDI inflows. Findings are in line with the results obtained from the VAR models. Finally for India, we can only comment on the long run relationship between economic growth and FDI inflows. Findings underline that unlike the whole sample, there seems to be a bi directional relation between two variables in India.

**Table 5: Estimation Results of VECM**

P-Values in Parenthesis

## CONCLUSION

The causality debate between FDI inflows and economic growth give rise to two different conflicting views. While the traditional approach working in favor of FDI inflows as a motivation behind economic growth is a policy fact of neo liberal policies, another discussion also prevails proposing the demand pulling effect that causes economic growth to be regarded as an inspiration by the FDI inflows. In line with the remarks of the time series evidence the chosen emerging countries validates our concern regarding the causality issue. While three out of seven countries in our sample signals a long run relation, findings underline that other than India, which reports two way causality, Indonesia and South Korea are specific examples of economic growth driven models. It should also be added that short run dynamics of these countries also shows us a relation running from economic growth toward FDI inflows. Our sample for the remaining countries emphasize that, other than Brazil, we are detecting a short term relation running from again economic growth to FDI inflows. The general picture of the empirical study demonstrates that country based studies open a discussion regarding the reverse causality in the neo liberal expectations. It seems for emerging economies in our sample, FDI inflows have limited ability to explain economic growth. Instead there evolves a mechanism in these countries that direct FDI inflows. Assuming per capita GDP as the core indicator of demand potential, a mechanism based on the attractiveness of these countries in terms of income can be modeled and augmented.

# CONSUMERS' PERCEPTIONS OF TECHNOLOGY AND THE BENEFITS OF TECHNOLOGICALLY IMPROVED MARKETING ACTIVITIES

Nur Esra Kardeş & Hande Kımıloğlu  
Boğaziçi University, Turkey

## ABSTRACT

*Studies about the effect of technological improvements on marketing are very common in the literature. This is because marketing activities occupy an important place in people's lives as consumers and marketers continuously seek ways to improve their offerings by the help of technology. Therefore, understanding whether these improvements are perceived to be beneficial by consumers is crucial. For this purpose, an exhaustive list of technological improvements in marketing has been created by the authors and individuals' perceptions of the value of these improvements have been measured. These perceptions are expected to be influenced from consumers' general dispositions toward technology; and they are expected to impact individuals' perceptions of their quality of life as consumers. These issues are investigated in this study based on the data collected in Turkey from 197 individuals.*

## INTRODUCTION

There is widespread acceptance that technology is a central component of business operations and extensively used in marketing (Brady *et al.*, 1999; Shugan, 2004; Smith and Culkin, 2001; Ranchhod and Gurău, 2004; Zineldin, 2000). In order to create a competitive edge, companies integrate technology into various aspects of their marketing activities. As Zineldin (2000) mentions, everything companies do to build consumer loyalty is affected by technology. As a result of these, customers face innovations in marketing in the marketplace through continuous improvements of the marketing mix: in products, prices, distribution and selling channels, marketing communications, customer services and customer relationship management.

In today's highly technology-oriented marketing environment, it is crucial for marketers to determine and design the marketing activities and implementations that produce the most positive benefits for their target consumers. Such activities can be expected to generate an overall consumer perception that technological improvements and their impact on companies' marketing practices enrich the quality of consumers' lives. Whether consumers' general dispositions toward technology also have an impact in the development of such perceptions can be an interesting research theme as well. In light of these ideas, the current research aims to find answers to the following questions:

- What are consumers' general dispositions toward technology?
- What are consumers' attitudes toward various technologically improved marketing activities?
- Do consumers' dispositions toward technology influence their attitude toward technological improvements in marketing?
- What is the overall perception of consumers with respect to the contribution of technological improvements in marketing to their quality of life as consumers?
- Which of these improvements play the greatest role in the creation of stronger perceptions of consumer quality of life?

## LITERATURE REVIEW

In the review of the literature for this research, one group of studies that has been examined is those that include a technology attitude measurement to form the basis of the assessment performed in this study. Another set of studies about the impact of technology on marketing has also been reviewed for the purpose of identifying the comprehensive list of marketing activities or implementations that are influenced from technological developments.

## **Attitude Toward Technology**

Consumers' attitudes toward technology affects the way they purchase, what they buy, when they buy, when they purchase and even how they pay for purchases (Mohr, 2001 c.f. Edison and Geissler, 2003). Therefore, people's attitudes toward technology has interested many scholars. Studies conducted on this subject cover a wide range of interest areas such as social impacts of technology on people's lives, organizational change caused by the necessity of IT, technological improvements and their environmental side-effects, public adoption to technology and its problematic areas, etc.

One of the most important studies in the marketing literature that offers a multi-item scale about this topic has been performed by Parasuraman (2000). In this study, the author proposes "The Technology Readiness Index" which aims to measure people's propensity to embrace and use new technologies for accomplishing goals in home life and at work. It includes four major dimensions: optimism (a positive view of increased control, flexibility, and efficiency offered by technology), innovativeness (tendency to be a technology pioneer), discomfort (feeling of lack of control over technology) and insecurity (skepticism and distrust toward technology). Edison and Geissler (2003) also developed a scale to observe individuals' behavior concerning technology. This scale measures people's degree of affinity (positive attitude) toward technology with 10 items about the technology friendliness of the individual in general, desire to learn about and use technology, computers and machines.

In another study, Mick and Fournier (1998) discuss technology as a paradoxical phenomenon which brings both privileges and difficulties into people's lives. After pilot researches and face-to-face interviews with 29 households, eight paradoxes, which are caused by technology and affecting human life were developed. They can be listed as "control vs. chaos" brought by technology, "freedom vs. enslavement" caused by technology, technology renewal frequency as "new vs. obsolete", "competence vs. incompetence" people feel because of technology, "efficiency vs. inefficiency" technology brings to people's lives, technology "fulfills vs. creates" needs, "assimilation vs. isolation" caused by technology and people's "engaging vs. disengaging" because of technology and the erosion of certain human skills as a result of this.

In this study, Mick and Fournier's (1998) paradoxes have been turned into statements for the purpose of capturing people's general dispositions toward technology and its impacts on their daily lives without any intention to assess their usage of or competence in technological devices, systems, etc.

## **Impact of Technology on Marketing**

Marketers and managers must be aware of new developments in technology and their possible effects because technology can and does affect marketing in many different ways and influences the creation of marketing mixes that satisfy customers (Zineldin, 2000).

The transformation starts within the organization. Brady et al. (1999) suggest that companies should make use of IT to be more innovative, flexible, and competitive so that they improve their ability to serve their customers and their overall marketing performance. Using computerized marketing information systems for decision making instead of using it simply for justifying decisions only can make a significant difference (Davenport, 1994 c.f. Brady et al, 1999). Another instance can be using IT to create new and strong relationships and alliances, e.g. between logistics suppliers, manufacturers and retailers (Zineldin, 2000). Another suggestion made by Barlow et al. (2004) for retail marketing is that the goal should be integrating offline and online operations, allowing consumers to purchase products in the way that suits them best and the most common way

to do this is utilizing the Internet. Ranchhod and Gurău (2004) posit that the role of information becomes highly important when fast decisions need to be made and systems have to be able to offer this facility. As technology becomes more sophisticated and can deliver data and video links at increasing speeds, marketers need to understand its capability in effective marketing implementation. Shugan (2004) goes one step further and suggests that the ability to perform rapid computations online allows rapid adaptation to unexpected demand conditions, complex loyalty programs, the use of complex interactive dynamic pricing mechanisms, etc.

Technologies used to enhance marketing activities exemplified by various studies and public surveys are numerous. Intranet, Internet, electronic data interchange (EDI) systems, ground positioning systems (GPS) into mobile phones, blue-tooth devices, ATMs, kiosks, interactive televisions, mobile phones, personal digital assistants (PDA) are some of the tools used to accomplish marketing activities. However, along with the tools the activities and implementations designed to offer advantages to consumers in various areas such as product development, advertising, CRM activities, distribution channels, customer services, pricing mechanisms, information and data collection systems, etc. are the major domains in which these impacts are felt most strongly. This study suggests 30 items relating to these different areas as crucially important for consumers. The aim is to assess how beneficial consumers find these technologically improved marketing activities.

## RESEARCH QUESTIONS AND HYPOTHESES

In this study, there are three major groups of questions asked to individuals. One of them aims to measure their general attitude toward technology by determining their agreement level with a set of 12 statements consisting of 6 positive and 6 negative items. People's agreement level with each item has been measured with a 4-point interval scale with the labels *Strongly Agree*, *Agree*, *Disagree*, and *Strongly Disagree*.

The second group of questions assesses how beneficial consumers find each of 30 marketing activities and implementations affected from technological improvements. This has been measured with a 5-point interval scale with the labels *Very Beneficial*, *Partially Beneficial*, *Undecided*, *Not So Beneficial*, and *Not Beneficial At All*.

The third and last question aims to measure how the quality of consumer life is affected by technological improvements in marketing activities in general. A single question is asked to respondents about how much their life quality has been affected from the technological advancements in the field of marketing in general. The answer options were *Very Positively Affected*, *Partially Positively Affected*, *Not Very Positively Affected*, and *Not Positively Affected At All*. Figure 1 displays these question groups and the proposed relationships.

**Figure 1: Variables of the Study and the Proposed Relationships**

Based on these variables, there are three hypotheses in this study:

- H<sub>1</sub>: People's general dispositions' toward technology (V1) and the benefits they perceive from technologically improved marketing activities (V2) are correlated.
- H<sub>2</sub>: Technologically improved marketing activities and implementations are highly valued by consumers (V2).
- H<sub>3</sub>: The benefits of technological improvements in marketing (V2) will be perceived differently by consumers who experience different levels of improvements in their overall consumer quality of life (V3).

## Data Collection and Sampling

The data for this study has been collected from individuals in Turkey. The sample was targeted to be composed mostly from individuals who have some accumulated experience as individual consumers. Collection of the data was done through the Internet through two channels. One of them was sending the survey link directly to individuals who are members of the working population and who were conveniently available. The other channel was sending the survey to groups and communities in the online environment which used keywords such as technology, marketing, IT, management, business etc. in their descriptions. From the group descriptions, it can generally be inferred that most of the members are working and are aware of the recent developments taking place in the world of business and technology. The survey link was sent to the moderators/owners of these electronic groups (e-groups), and if they gave approval, an e-mail with the survey link was delivered to the members of selected e-groups.

Since it is not possible to have an exact population frame for this topic, using non-probability sampling is acceptable. Through the channels mentioned above, 197 units of data have been collected through convenience sampling. The demographic profile of the respondents is displayed in Table 1.

**Table 1: Demographic Profile of Respondents**

This distribution suits the targeted profile for this study with respect to four major demographic

|                  | <b>18-23</b>                      | <b>24-29</b>                              | <b>30-35</b>                               | <b>36-41</b>                       | <b>&gt;42</b> |
|------------------|-----------------------------------|---|--|------------------------------------|---------------|
| <b>AGE</b>       | 11                                | 123                                       | 30   | 17                                 | 16            |
|                  | 6%                                | 62%                                       | 15%  | 9%                                 | 9%            |

|                  | <b>&lt;1000 YTL.<br/>(≈\$815)</b> | <b>1000-2500 YTL.<br/>(≈\$815-\$2035)</b> | <b>2500-4000 YTL.<br/>(≈\$2035-\$3260)</b> | <b>&gt;4000 YTL.<br/>(≈\$3260)</b> |               |
| <b>INCOME</b>    | 23                                | 98  | 52   | 24                                 |               |
|                  | 12%                               | 50%                                       | 26%  | 12%                                |               |

variables. The sample consists of equally distributed groups of early adult and middle-aged consumers with 62% in the 24- 29 range which corresponds to a young urban working population. The number of females is a bit higher than males, but each gender group is represented adequately. Distribution in education levels shows that respondents with university and postgraduate degrees are dominant. The reason for this is because the survey was conducted online and shared with white collar employees of companies and academic or profession community groups. Regarding income levels, half of the respondents have an income of 1000-2500 YTL (\$815-\$2035) per month which can be accepted to correspond to a medium and mid-high income level for this population. The rest of the income levels are partially represented, too.

## FINDINGS OF THE STUDY

### Findings About General Dispositions Toward Technology

In this study, one of the goals is to assess people's general dispositions toward technology and to see if this variable is correlated with their attitude toward technological developments in marketing. For this purpose, a scale of 12 items has been formulated based on six of the paradoxes of technology offered by Mick and Fournier (1998). Table 2 includes the items used and the average agreement levels with each one.

**Table 2: Mean Agreement Levels with Statements about General Dispositions Toward Technology**

|  | <b>Mean<br/>(over 4)</b> | <b>St. Dev.</b> |
|--|--------------------------|-----------------|
|  |                          |                 |

|  |             |            |
|--|-------------|------------|
| As a result of technological developments, people can benefit from changes and novelties in science rapidly. <i>*(new)</i>   | 3.18        | 0.67       |
| Technological developments offered to consumers can become outdated quickly. <i>*(obsolete)</i>                              | 3.29        | 0.63       |
| Technology increases people's productivity and efficiency. <i>*(efficiency)</i>  | 2.86        | 0.79       |
| Technology can sometimes unnecessarily complicate people's lives. <i>*(inefficiency)</i>                                     | 2.72        | 0.72       |
| Technology makes it easier for people to meet their needs. <i>*(fulfills needs)</i>  | 3.13        | 0.52       |
| Technology can trigger or intensify needs that have not been felt or realized by individuals before. <i>*(creates needs)</i> | 3.17        | 0.66       |
| Technology makes people feel more intelligent and successful. <i>*(competency)</i>   | 2.38        | 0.70       |
| People may feel incompetent when they cannot use technology well. <i>*(incompetency)</i>                                     | 2.88        | 0.64       |
| Technology brings system and order to many aspects of human life. <i>*(control)</i>  | 2.83        | 0.62       |
| Technology may cause chaos when it is not used well. <i>*(chaos)</i>   | 3.24        | 0.70       |
| Technology makes people more independent with the conveniences it offers. <i>*(freedom)</i>                                  | 2.59        | 0.81       |
| Technology imprisons people to itself. <i>*(enslavement)</i>   | 2.77        | 0.82       |
| <b>Average Score for Dispositions Toward Technology</b>  | <b>2.41</b> | <b>.27</b> |

1-Strongly Disagree      2 – Disagree      3 – Agree      4 – Strongly Agree

*\*The asterisks denote which paradox from Mick and Fournier's (1998) study the item has stemmed from.*

As the results in Table 2 show, except one of the items about competency, subjects have agreed with all of the items at an above average level. Therefore, even though one positive and one negative statement was put for each paradox, when the negative items are reverse coded to compute the average technology attitude score, the sample produces a mean level of 2.41 over 4. This shows that people are equally aware of the benefits and challenges introduced to their lives by technology. This is confirmed by the reliability scores achieved for the scale. Without reverse coding the negative items, in its original form, the scale produces a Cronbach's alpha of .61 which is acceptable for exploratory studies (Hair, 1998). However, if the reverse coded items are used, alpha level decreases to .49 which shows that the scale is much more consistent in its original form with both positive and negative items. Thus, it can be said that people are aware of both the advantages and disadvantages of technology for their lives.

The next question is whether this disposition influences the benefits they perceive from the implementation and activities in marketing which are influenced from technological advancements. This is tested by correlating the average technology attitude score of the sample with their average score of the value they attach to 30 different technologically improved marketing activities and implementations. The correlation coefficient between these two variables is .119 with a significance level of .095. The mean technology attitude score is 2.41 while the mean perceived benefit score for the average of 30 technologically improved marketing activities is 4.08. Since the correlation is significant at the 90% confidence level but not 95%, we can say that ***H<sub>1</sub> is partially supported***. This shows that even though technology attitude scores of individuals are not as high as their scores for perceived value of technologically improved marketing activities, these variables still seem to have a tendency to move in the same direction.

## Findings About Perceived Benefits of Technologically Improved Marketing Activities

In this part of the study, consumers have been presented with 30 marketing activities from different implementation areas ranging from product development to pricing mechanisms, from selling channels to advertisements, from CRM to customer services, etc. They have been asked to state the level of benefit they perceive in each technologically improved marketing activity over a 5-interval scale ranging from "very beneficial" to "not beneficial at all". Table 3 displays the mean value of benefits attached to each marketing implementation.

**Table 3: Mean Values of the Perceived Benefits of Technological Improvements in Marketing**

| <b><i>Variables with a Very High Level of Benefit Perceived By Customers</i></b>  | <b>Mean<br/>(over 5)</b> | <b>Std.Dev.</b> |
|---|--------------------------|-----------------|
| Production of products in a way that improves customer safety   | 4.73                     | 0.60            |
| Production of products from nature-friendly inputs, protecting the environment and human health   | 4.59                     | 0.84            |
| Being able to make payments easily and in various ways  | 4.55                     | 0.71            |
| Being able to find a product easily in a specific sales point (computerized systems to locate products, opportunity to order a desired product immediately, etc.)   | 4.49                     | 0.73            |
| Constant accessibility of companies   | 4.49                     | 0.77            |
| Production of products with improved durability   | 4.45                     | 0.92            |
| The availability of a product in various sales points   | 4.45                     | 0.77            |
| Improved security of payment systems  | 4.45                     | 0.80            |
| Faster and more effective provision of after sale services  | 4.43                     | 0.80            |
| Decrease in service time during shopping (food ordering, retail shopping, etc.)   | 4.40                     | 0.87            |
| Emergence of alternative shopping channels (TV, telephone, Internet, etc.)  | 4.36                     | 0.81            |
| The geographical diversity of markets in which firms can sell their products  | 4.32                     | 0.82            |
| Customers' opportunity to find information about companies, people, etc. in a much shorter period of time   | 4.26                     | 0.84            |
| Increased level of information customers have about products and service in the market  | 4.25                     | 0.84            |
| Increase in price variety in most products  | 4.17                     | 0.98            |
| Improvements in shopping environments with respect to design, architectural and technological elements  | 4.05                     | 0.98            |
| Production of products by companies that are customized according to individual or customer groups  | 4.02                     | 0.93            |
| Capability of companies to offer personalized alternatives to customers (promotions, information about products and prices, etc.)                                   | 4.01                     | 0.88            |
| Increased security in companies' collection of customer data  | 4.01                     | 1.10            |
| <b><i>Variables with a High Level of Benefit Perceived By Customers</i></b>   | <b>Mean<br/>(over 5)</b> | <b>Std.Dev.</b> |
| Increase in variety in both durable consumer goods (automobile, mobile phone, white goods, etc.) and nondurable consumer goods (fast moving consumer goods)         | 3.97                     | 0.91            |
| Decrease in human factors in shopping (payment systems, learning product prices through barcodes, etc.)   | 3.90                     | 1.10            |
| Collection of customer data from various channels (telephone, Internet, sales points, etc.) in a much shorter period time   | 3.79                     | 1.16            |
| Improved attractiveness of advertisements and other marketing communications activities in terms of visual or other attributes                                      | 3.79                     | 1.04            |
| Personalized advertisements and marketing communications reaching the right target market at the right time and place through mobile advertising                    | 3.77                     | 1.05            |
| Rapid and frequent decreases in the prices of high-technology products  | 3.72                     | 1.14            |
| Being exposed to advertisements and marketing communications activities in a higher variety of media (TV, Internet, telephone, outdoor) and any visible environment | 3.51                     | 1.12            |
| Increased level of information companies own about customers  | 3.46                     | 1.17            |
| Frequent renewals and improvements of the attributes of products offered to consumers   | 3.40                     | 1.14            |
| Frequent exposure to advertisements and marketing communications activities   | 3.39                     | 1.20            |
| High amount of customer information recorded and retained by companies  | 3.26                     | 1.23            |
| <b>Average Perceived Benefit in Technological Improvements in Marketing</b>   | <b>4.08</b>              | <b>0.52</b>     |

*1-Highly Beneficial 2-Partially Beneficial 3-Undecided 4-Not So Beneficial 5-Not Beneficial At All*

In this part of the research, a set of technologically improved marketing activities or implementations have been presented to individuals for the purpose of measuring how much benefit they perceive in each. The expectation is that, in all of these various areas of improvements about products, sales channels, customer relationship management, customer information, advertising, and services, consumers will perceive and give high value to the benefits these developments introduce into their lives. This is the second hypothesis of this

research and the findings about the mean perceived benefit levels attached to the above factors confirm this hypothesis. From a set of 30 technologically improved marketing activities, 19 of them have a mean perceived benefit level that exceeds 4, and 11 of them have a mean perceived benefit level that exceeds 3.26. The mean value of the “Average Level of Benefit Perceived in Technologically Improved Marketing Activities” which is computed as the average score of all 30 items is 4.08 over 5. Based on these values, **Hypothesis 2 is supported.**

A closer look at the technologically improved marketing activities or implementations that are very highly valued by consumers yields interesting results. First of all, it is seen that consumers value improvements in production technologies greatly. They attach very high level of benefits to the production of products that improve customer safety, protect the environment and human health, have higher durability and are customized according to individuals or customer groups. This implies that product-based improvements are adopted by consumers rapidly and extensively. They value personalization not only at the production level but also in promotions or the information they receive about products, prices, etc. Additionally, consumers are also very significantly impressed by transactional improvements related to the shopping process. One such highly beneficial implementation is easy, convenient and safe payment mechanisms. Similarly, they have very positive attitudes toward the opportunity to find any product they want either through computerized systems or because of the availability of various sales points and alternative shopping channels. Service quality is also very important; faster and more effective services and reduced service provision time are significantly beneficial implementations. Moreover, consumer see great value in being able to access companies and find any piece of information they want very easily and constantly as well being able to give their information to companies in a secure way. They are aware that improvements in many marketing-related functions of companies such as offering a greater geographical diversity of markets and higher price variety in their products are have very positive reflections on consumers’ lives. Finally, consumers are also highly aware of the increase in the quality of the shopping process such as being exposed to superior-designed and technologically equipped shopping environments.

In the second set of findings, technologically improved marketing activities or implementations which are highly valued by consumers can be seen. There are some additional product-related features that are highly valued by consumers such as increase in product variety, frequent improvements in product attributes and rapidly decreasing prices of high-technology products. Consumers are also found to place high benefit on the automation of shopping systems as well as the efficient collection and utilization of customer information. Finally, advertisement and communication-related activities are found to be among the highly beneficial implementations affected from technological advancements. Improved attractiveness, personalization, and media variety in advertisements and marketing communications and consumers’ heightened exposure to these activities are all perceived as very high-value implementations.

In short, customers seem to be greatly aware of the impacts of various technologically improved marketing activities and implementations. Their general attitude toward such developments in a diverse set of areas mentioned in this section is generally very positive.

## **Findings About Impact of Technological Improvements in Marketing on Consumers’ Quality of Life Perceptions**

The third major research question in this study is “Which of the technological improvements in marketing play the greatest role in the creation of stronger perceptions of consumer quality of life?” Hypothesis 3 posits that if people have different perceptions of their quality of life as consumers as a result of technological advancements in marketing, the benefits they perceive in each improvement will also be different. For this purpose, a general question about the overall impact of technological advancements in marketing on consumer quality of life has been asked with the following response options: *very positively affected; partially positively affected; not very positively affected; not positively affected at all*. However, from 197 respondents, no one has selected the “not positively affected at all” response option and only 14 respondents have selected the “not very positively affected” response option. Table 4 shows the distribution of the respondents with respect to this variable.

**Table 4: Distributions of Respondents With Respect to the Overall Impact of Technological Advancements in Marketing on Consumer Quality of Life**

|                                | <b>Freq.</b> | <b>Perc.</b> |
|--------------------------------|--------------|--------------|
| Very positively affected       | 61           | 31%          |
| Partially positively affected  | 122          | 61.9%        |
| Not very positively affected   | 14           | 7.1%         |
| Not positively affected at all | 0            | 0%           |

According to this distribution, in order to test Hypothesis 3, only the two groups which can be distinguished as consumers who are “partially positively” vs. “very positively” affected from technological advancements in marketing can be compared. Thus, t-tests for differences of their means with respect to the benefits they perceive for each of the 30 technologically improved marketing activities and implementations have been conducted and shown in Table 5.  $\mu_1$  and  $\mu_2$  are the mean perceived benefits for partially vs. very positively affected groups respectively.

**Table 5: Differences in Perceived Benefits from Technological Improvements in Marketing Between Two Groups with Different Levels Perceived Quality of Life as Consumers**

|   | <b>t</b> | <b>Sign.</b> | $\mu_1$ | $\mu_2$ |
|---|----------|--------------|---------|---------|
| Increase in variety in both durable consumer goods (automobile, mobile phone, white goods, etc.) and nondurable consumer goods (fast moving consumer goods)       | -3.57    | 0.000        | 3.80    | 4.30    |
| Collection of customer data from various channels (telephone, Internet, sales points, etc.) in a much shorter period time   | -4.29    | 0.000        | 3.57    | 4.30    |
| Increased security in companies' collection of customer data  | -3.32    | 0.001        | 3.85    | 4.39    |
| Personalized advertisements and marketing communications reaching the right target market at the right time and place through mobile advertising                  | -3.45    | 0.001        | 3.62    | 4.16    |
| Capability of companies to offer personalized alternatives to customers (promotions, information about products and prices, etc.)                                 | -3.04    | 0.003        | 3.90    | 4.31    |
| Improved attractiveness of advertisements and other marketing communications activities in terms of visual or other attributes                                    | -2.92    | 0.004        | 3.68    | 4.13    |
| Increased level of information companies own about customers  | -2.82    | 0.005        | 3.33    | 3.82    |
| The availability of a product in various sales points   | -2.65    | 0.009        | 4.36    | 4.67    |
| Frequent exposure to advertisements and marketing communications activities   | -2.41    | 0.017        | 3.27    | 3.70    |
| Decrease in human factors in shopping (payment systems, learning product prices through barcodes, etc.)   | -2.32    | 0.022        | 3.80    | 4.20    |
| High amount of customer information recorded and retained by companies  | -2.20    | 0.029        | 3.14    | 3.56    |
| Faster and more effective provision of after sale services  | -2.16    | 0.032        | 4.36    | 4.62    |
| Being exposed to advertisements and marketing communications activities in a higher variety of media (TV, Internet, phone, outdoor, any visible environment)      | -2.06    | 0.041        | 3.44    | 3.79    |
| Customers' opportunity to find information about companies, people, etc. in a much shorter period of time   | -2.05    | 0.042        | 4.20    | 4.46    |
| Being able to find a product easily in a specific sales point (computerized systems to locate products, opportunity to order a desired product immediately, etc.) | -2.05    | 0.042        | 4.42    | 4.66    |

*1-Highly Beneficial    2-Partially Beneficial    3-Undecided    4-Not So Beneficial    5-Not Beneficial At All*

These findings demonstrate that consumers who feel the overall impact of technological advancements on their quality of life value the above technological improvements much more greatly than other consumers. Thus, this table can also be accepted as the list of technological improvements in marketing that contribute most strongly to improving consumer quality of life. In accordance with these findings, increase in product variety and widespread product availability improve consumers' life quality greatly. Additionally, consumers also value the information advantage offered by technological advancements greatly. Consumers who perceive very positive effects of technology on their quality of life attach very high levels of benefits to companies' collection of

customer data through various channels in a secure way and being highly informed about them by keeping this information for useful purposes. They also value being able to find any information they want very easily. Another group of variables which seem to improve consumer quality of life extensively are technological improvements in the field of advertisements and communications. Consumers value personalized advertisements and promotions and are highly affected from their attractiveness as well. Thus, they perceive frequent exposure to advertisements through a higher variety of media as a beneficial improvement. Finally, consumers who are partially vs. very positively affected from technological implementations have different significantly different values attached to service-related factors as well. In this area, decreased human factors in shopping services and faster and more effective services provided to consumers are highly influential. Although the mean benefits attached to these improvements are positive for both groups, this section denotes the variables that create a marginally higher contribution to consumers' life quality. These issues are crucially important for marketers to work on and develop further. Since 15 of the 30 technological developments have been found to create this marginally higher contribution and denote differences at the 0.05 level between the two consumer groups with relatively different levels of consumer life quality, we can say that **H3 partially supported**.

## CONCLUDING REMARKS

This study aims to shed a light on consumers' technology perceptions and the benefits they attach to technological improvements in marketing. Findings of the study show that individuals tend to be aware of both the benefits and limitations technology creates in their daily lives. However, regardless of this mediocratic view of technology, they perceive great benefits in the technological developments in marketing and believe these contribute greatly to consumers' quality of life. In other, their moderate dispositions toward technology are heightened when they are asked to state the benefits they get from technologically improved marketing activities.

Numerous benefits in the areas of product development, pricing, distribution and selling channels, CRM, services, advertisements and marketing communications have all produced very high levels of perceived benefits for consumer. Furthermore, in each of these areas, some of the unique benefits offered by technology are valued relatively more by consumers who believe these developments contribute strongly to their quality of life as consumers. These can be summarized as product variety and availability, advertisement effectiveness and availability, information advantages and service-related factors. These are obviously the most important areas marketers should keep working on to satisfy their customers further.

In short, marketers should see that consumers are highly aware and satisfied from the technological improvements in various aspects of the marketing functions in companies. As further research opportunities, the impact of technology on each area can be investigated deeply and factors that contribute further to the development of consumer quality of life can be discovered. Also, predictive or exploratory studies that aim to discover what consumers would like to be offered further by companies as technologically improved marketing benefits beside the current set of activities or implementations would contribute greatly to this area. This could lead companies to direct their resources and investments into those areas.

# THE DOUBLE DIPLOMA IN AVE AS THE TOOL OF INTEGRATION OF RUSSIA IN THE EUROPEAN EDUCATIONAL SPACE

**Natalia Khutorova and Alexander Samoldin**  
**Moscow State Forest University, Russia**

## ABSTRACT

*In condition of increasing global competition, societal developments, globalizations of Economies and of markets, new information and teaching technologies development throw new challenges for contemporary Universities.*

*Universities need to adapt to a new realities in order to be more competitive and to keep the position at the market of educational services. This problem rises in conditions of restructuring the educational system of Russia in frame of Bolonian Process. Increasing demand in permanent education in all sectors of economy in conditions of rough growth is one of the most important and challenging goals of current EU and Russian policy. There is a great demand for the high skilled experts at Russian labor market, we have the overproduction of different kind of specialists who are looking for job and who want to have new profession. In these conditions the labor market needs the flexible system of education and training; it is possible to achieve this goal by the creating different Advanced Vocational Educational (AVE) programs.*

*AVE development and support is one of the ways of universities' internationalization and collaboration. Authors' personal experience of execution the transnational join project (Russian-Swedish) is described. Basic problems of the teaching and training process and their resolutions are shown from the professor's point of view. The main basic stages and points are given in this article.*

## INTRODUCTION

In condition of increasing global competition, societal developments, globalizations of Economies and of markets, new information and teaching technologies development throw new challenges for contemporary Universities.

Universities need to adapt to a new realities in order to be more competitive and to keep the position at the market of educational services. This problem rises in conditions of restructuring the educational system of Russia in frame of Bolonian Process. Increasing demand in permanent education in all sectors of economy in conditions of rough growth is one of the most important and challenging goals of current EU and Russian policy.

Nowadays Russia is going into WTO (World Trade Organization), in this case one of the most weak sector of economy is banking. They can suffer damages first of all because of the volume of assets and very important indicator as the degree of professional qualification of the staff of banks and relevant companies.

The Expansion of the Western banks into Russia will lead to the reduction competitiveness of the Russian bank sector. Russian banks risk to lose their positions in the market. Very often the management of banks (Russian and foreign) have to employ the specialists to the top positions who have graduated from the western universities, in this case they incur extra costs. But the problem is the lack of well educated skilled specialists and experts in Russian labour market. At the same moment there is a great overproduction of different kind of specialists who are looking for job and who want to have new profession. In these conditions the labor market needs the flexible system of education and training. As a rule, the people, who have graduated from the technical universities, have a great potential for studying of applied economic sciences. It doesn't take them long

time and hard work to get the new extra qualification for banking and relevant companies. Nowadays there is a great demand for different kinds of high qualified and skilled specialists in emerging financial market of Russia. Without any doubts, this kind of staff can be trained by Russian educational centers.

Following to Russian law the Educational services can be rendered only by the licensed establishments. Moscow State Forest University has this kind of license and it is well known in Moscow region, it has rather high rate among the technical universities in Russia, besides it collaborates with number of western European Universities.

The example of double diploma is not unique and new, but this practice used only in the system of MBA education and in segment of basic education. All of these reasons made us to look for new tools for increasing the competitiveness of our university in educational market. We wanted to start the encroaching the new segment of educational market-AVE (Advanced Vocational Education).

After the monitoring the situation on the labour market we have created the conclusion that it would advisable to make an agreement with the Western university which had rich experience in AVE program in this field. Our university has cooperated with the Swedish Agency (SIDA) for long period and SIDA has a long list of the AVE program for internal needs. So in 2006 year we signed the agreement with Swedish Folkuniversitet to get knowledge how to create and to realize the AVE project. The topic of our AVE program was "Economic analytics". The main goal of this project was to train the specialists for banking. This AVE program was occurred for 40 credits and had the following conditions:

- The model and style of education should be Swedish
- The trainers should meet the requirements of the students and to be certified by Swedish partner
- The training should be in close connection with business
- There program should include 2 trainee periods (one in Russia and the second in Sweden)
- As the result double diploma of AVE

## IMPLEMENTATION

It was a rather long period of preparation for this project, it took us much time to arrange all the details but in 2007 we started the program. These are the main stages of our project in table 1.

We started our activity by the monitoring the labour market in Moscow region. After this we evaluated the list of Companies (banks and relevant companies) in that market. The next step was collecting questionnaire for them to find out what kind of specialists the market needs. Analyzing the needs of employers we definite the title of AVE program: "Economic analytics". Very important point was to analyze the competition between the educational companies (Universities) in Moscow region. We surprised a lot to find out that the competition had not been still very strong. The next step was learning the Sweden experience in organization AVE program, the coordinator and administrator of this program were sent to Sweden. They got the special certificate. The draft of study plan was completed, it consisted of 3 parts (fig.1).

### **Market block includes:**

- Marketing
- Management
- Project management

### **General block includes:**

General disciplines like the probability theory, finance, currency and banking, financial management

### **The special block includes:**

Several very specific disciplines like: financial risk, financial math, financial analyze, financial derivatives financial dealing, business correspondence and etc.

And after that we started very important stage of selection of trainers. The criteria for them were:

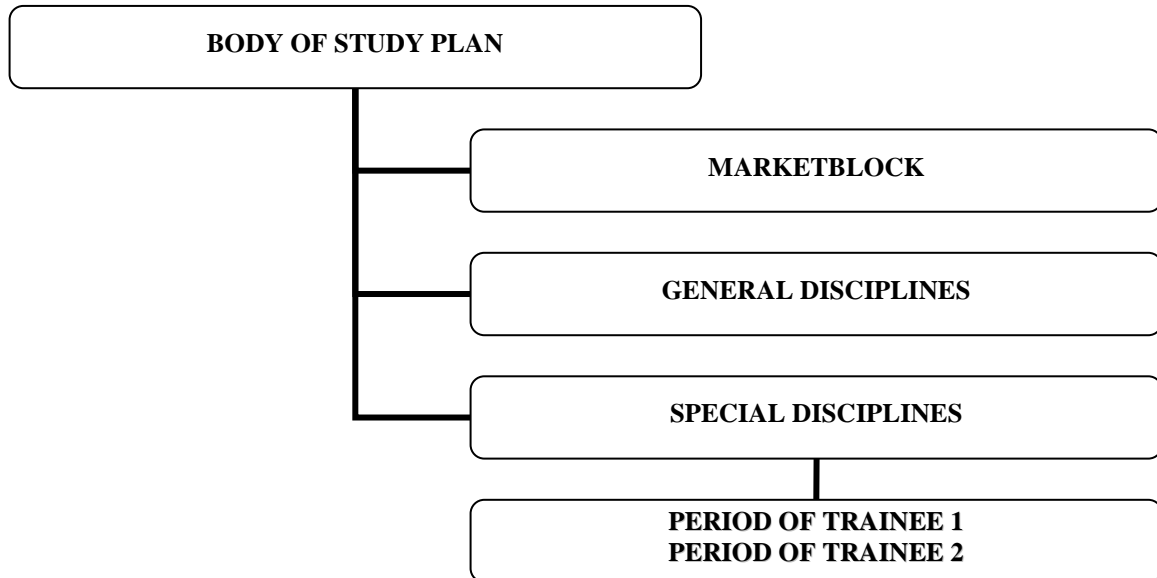

- Rich experience in education ( to deal with adults)
- Rich experience in business
- Flexibility
- Amiable and open
- "Member of the team"
- Fluent in English

All of the trainers should use main teaching methods for our program

- Case study

- Role play
- Interactive form of education
- Theoretical knowledge combined with practical learning

**Figure 1: Study plan**

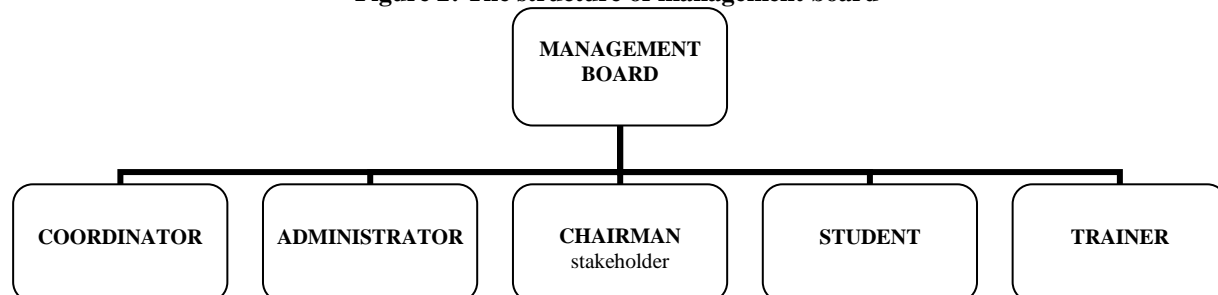

The students need to be motivated to make permanent job during the course: case presentations, research, home assignments, internet search and communications, written tests, group projects discussion and preparation.

Final confirming the candidatures for trainer was made after their examination by Swedish partner. Every trainer created his own study program and after this went to Sweden for study visit. And during this time we were recruiting the students for the pilot group. There were several criteria for them:

- To graduate from the institute (high technical education)
- To work at relevant field
- To wish such studying

We were ready to start our pilot program. At the very beginning we created the management board of our program, there were 5 members. It is quite unique position for Russian style of education (fig.2).

**Figure 2: The structure of management board**

During the period of study the students evaluated their skills and knowledge and the trainers. It helped the management body to analyze the progress. After the first part of study the students went for their first training period to Russian company, and after finishing theoretical course if they wanted they could go to the Swedish company for the second training period.

In the end of study the students have the task to write the final diploma work and to defend it in the expert council consisted of Russian and Swedish members. As the result they got double diploma (the diplomas of Swedish Folkuniversitet and Russian from Moscow State Forest University).

**Table 1: Main stages of AVE program.**

| Stage | Activity   |
|-------|--|
| 1     | Monitoring the labour market in Moscow region. Consumer study in the labour market.<br>Revelation the list of Companies in that market |
| 2     | Collecting questionnaire   |
| 3     | What kind of specialists does the market need? Analyzing the needs of employers  |
| 4     | Analyze the competition between the educational companies (Universities) in Moscow region.   |
| 5     | Learning the Sweden experience in organization AVE program   |
| 6     | Selection of trainers  |

| 12    | Implementation of the final report.<br>Project evaluation report   |

## CONCLUSIONS

AVE development and support is one of the ways of universities' internationalization and collaboration. Educational activity today needs to be focuses on an international perspective. At the age of globalization national university integrate into international educational space, aimed to developing of the social partnership and creation the new employment possibilities. These transformations are taking place thanks to academic exchanges, foreign students extended usage of international educational materials, and because of growing demand of labour market for internationally oriented high educated and skilled people.

# THINKING STYLES OF ENTREPRENEURS MATTER IN INNOVATION: A STUDY OF TECHNOLOGY- BASED FIRMS IN CHINA

Stephen Ko  
The Hong Kong Polytechnic University

## ABSTRACT

*In an increasingly complex and volatile business environment, the growth and development of a firm depend on its ability to introduce innovation over time. This research examines the relationship between thinking styles of entrepreneurs and innovation in Chinese technology-based firms. In a mail survey of 66 technology entrepreneurs, results showed that only liberal style of entrepreneurs was related positively to innovation. Implication for practices was discussed.*

## INTRODUCTION

In an increasingly complex and volatile business environment, the growth and development of a firm depend on its ability to introduce innovation over time (Dougherty & Hardy, 1996; Penrose, 1995). Many studies have demonstrated that organization processes and leadership are conducive to innovation (Chandler, Keller, & Lyon, 2000; Elenkov, Judge, & Wright, 2005; Elenkov & Manev, 2005), but there is an increasing attention to look into individual entrepreneur's ability to innovate (see Baumol, 2006; Marvel & Lumpkin, 2007). Nevertheless, these studies focus on entrepreneurs' relative ability to create, and fail to study their preferences for using different thinking styles, which ultimately result in varying degree of innovation (Sternberg, 1997; Stewart et al., 1998).

There has been extensive research on the use of thinking styles but they focused on purely students and teachers. For instance, previous research that investigated thinking styles has considered from the educational and psychological perspectives in a number of cultural groups, including Hong Kong, Mainland China, the Philippines, and the United States (e.g., Balkis & Isiker, 2005; Bernardo, Zhang, & Callueng, 2002; Dai & Feldhusen, 1999; Zhang, 1999; Zhang, 2001; Zhang & Sternberg, 1998). This narrow focus limits the application of different thinking styles in the entrepreneurial context. It would be more intriguing to embrace such differences and consider how they relate to innovation. This line of research also serves to address the recent call for more research in entrepreneurial cognition (e.g., Gaglio & Katz, 2001; Krueger, 2003; Mitchell & Chesteen, 1995; Mitchell et al., 2000; Mitchell et al., 2002). Thus, this study seeks to examine the relationship between thinking styles of entrepreneurs and innovation in Chinese technology-based firms.

This research contributes to the growing body of literature on transitional economies by examining the role of thinking styles of Chinese entrepreneurs in innovation. It suggests that these thinking styles can make a difference in innovation. Goldsmith (1987) identified creative ability and creative style as separate constructs. In a similar vein, entrepreneurs not only differ in their relative ability to create, but also possess different thinking styles with which they prefer to innovate. If there is any particular thinking style that can help innovation, entrepreneurs can learn and practise thinking in a particular way, resulting in more innovation. This insight also extends the current state of knowledge about thinking styles to the entrepreneurial context.

# THEORETICAL UNDERPINNINGS

Innovation is an iterative process initiated by the perception of a new market and/or new service opportunity for a technology-based invention, which leads to development, production, and marketing tasks striving for the commercial success of the invention (OECD, 1991). From this perspective, innovation is viewed here as a multistage process, with different activities and different individual behaviors necessary at each stage (Scott & Bruce, 1994). It occurs along the dimensions of (a) new businesses, (b) new products/services, (c) new processes, (d) new markets, and (e) new ways of acquiring resources.

To date, a number of approaches have been used to understand what contribute and hinder innovation at and across multiple levels of analysis (see Gupta, Tesluk, & Taylor, 2007 for review). For example, Elenkov and Manev's (2005) work shows that leadership factors have strong effects on top-management innovation influence. Strategic leadership behaviors were found to have a strong positive relationship with executive influence on both product-market and administrative innovations (Elenkov, Judge, & Wright, 2005). Still other scholars (Anderson & West, 1998; Bain, Mann, & Pirola-Merlo, 2001; Cardinal, 2001; Damanpour, 1991; Oldham & Cummings, 1996; Sosik, Kahai, & Avolio, 1998, 1999) have emphasized the need for leaders to support creative efforts. Supervisory support and reward system support were also found positively related to innovative culture (Chandler, Keller, & Lyon, 2000).

At the individual level, entrepreneur's ability to innovate has increasingly received attention. For instance, Baumol (2006) indicated that independent entrepreneurs were more likely to account for the most fundamentally novel innovations. Marvel and Lumpkin (2007) also found that innovation radicalness was associated with technology entrepreneurs' formal education and prior knowledge. These behaviors are indicative of a level of creative ability possessed by entrepreneurs. However, among the literature focusing on the central role of individual entrepreneurs in innovation, entrepreneurial cognition emerges as a more promising area (e.g., Baron, 2004, 2006; Gaglio & Katz, 2001; Ko & Butler, 2006, 2007; Krueger, 2003; Mitchell & Chasteen, 1995; Mitchell et al., 2000; Mitchell et al., 2002; Mitchell et al., 2004; Mitchell et al., 2007; Ward, 2004).

Cognition is defined as "a forward-looking form of intelligence that is premised on an actor's beliefs about the linkage between the choice of actions and the subsequent impact of those actions on outcomes" (Gavetti & Levinthal, 2000: 113). In entrepreneurial cognition research, some scholars suggest that entrepreneurial decision is made upon some cognitive scripts, which include arrangements, ability, and willingness scripts of an individual in question (Mitchell, et al., 2000). Arrangement scripts entail the contacts, relationships, resources, and assets necessary to form a new venture. Ability scripts are about what capabilities, skills, knowledge individual entrepreneurs have to diagnose their ventures, apply learned experience, and create opportunities. Willingness scripts are commitment to venturing and receptivity to the idea of starting a venture, and therefore include actionable thoughts on opportunity seeking with such behaviours as openness, orientation, and drive toward seeking out new situations and possibilities and trying new things.

## Thinking Styles

While cognitive scripts (see Mitchell et al., 2000) provide a very important theoretical foundation for entrepreneurial cognition research, it fails to account for varying representation and processing of information in the individual mind that can help explain why some people and not others are able to innovate. In managing daily activities, people choose their own preferred styles to represent and process information. These different ways of governing or managing the activities are called "thinking styles" (Sternberg, 1988).

Because the ways individuals govern or manage their daily activities are just like the ways governments govern the societies, Sternberg (1997) used the metaphor "mental self-government" to illustrate the different preferred ways of thinking. It serves to describe how individuals prefer to use the cognitive abilities they possess, rather than the actual content of our thinking process (Sternberg, 1997). It also involves varying representation and processing of information in the mind given different situations and different times (Balkis & Isiker, 2005).

In mental self-government theory, Sternberg (1997) postulated 13 different thinking styles that fall along five

dimensions: functions, forms, levels, scopes, and leanings as applied to individuals. The first dimension is the function of mental self-government, including legislative, executive and judicial thinking styles. An individual with a legislative thinking style enjoys being engaged in tasks requiring creativity. An individual with an executive thinking style is more concerned with performing tasks with clear instructions. An individual with a judicial thinking style focuses his/her attention on evaluating the results of other individuals' activities.

The second dimension of the mental self-government form includes hierarchical, oligarchic, monarchic and anarchic thinking styles. An individual with a monarchic thinking style enjoys being engaged in tasks that allow him/her to focus fully on one thing at a time. An individual with a hierarchic thinking style prefers focusing his/her attention on tasks according to an order of importance. An individual with an oligarchic thinking style prefers to work on several tasks within the same period of time without setting any priority. Finally, an individual with an anarchic thinking style enjoys dealing with tasks that will grant him/her flexibility as to what, where, when, and how he/she works.

The third dimension is the level of mental self-government which includes global and local thinking styles. An individual with a global thinking style focuses on the whole and abstract ideas. An individual with a local thinking style enjoys dealing with tasks which allow him/her to focus on specific aspects of an issue.

The fourth dimension includes the internal and external thinking styles which lie in the scope of mental self-government. An individual with an internal thinking style enjoys being engaged in tasks which allow him/her to work independently. An individual with an external thinking style prefers to deal with tasks which allow interaction with other individuals.

The fifth dimension is the tendency of mental self-government which includes liberal and conservative thinking styles. An individual with a liberal thinking style enjoys dealing with tasks which present novelty and ambiguity. A person with a conservative thinking style has a tendency to perform his/her duties according to the approved rules and procedures.

In examining the usefulness of these measures, empirical research has been conducted in educational settings. For instance, students from higher socioeconomic status families scored higher on the legislative style than did students from lower SES families (Sternberg & Grigorenko, 1995). Students in natural science and technology tended to think more globally than those studying in social science and humanities (Zhang & Sachs, 1997). Teachers with long experience used more executive, local, and conservative styles than those teachers who had taught for a short time (Sternberg & Grigorenko, 1995). Zhang and Sternberg (1998) showed that higher achieving Hong Kong university students tended to score significantly higher on the executive, local, and conservative styles, while higher achieving mainland Chinese students scored significantly lower on the executive style.

While the concepts of thinking styles were applied to the educational setting in prior research, it could be extended to entrepreneurial domain. Teachers and students have different preferred ways of thinking, and so do the entrepreneurs. Stewart et al. (1998) suggested that entrepreneurs with comparable abilities to innovate might prefer widely different styles. Applying Kirton's (1989) Adaption-Innovation Theory, Goldsmith and Kerr (1991) showed that entrepreneurs tended to prefer a more innovative style in solving problems and making decisions than managers. However, there are different thinking styles with varying characteristics, according to Sternberg's (1997) mental self-government theory. It is therefore worthwhile to examine if any particular style(s) of thinking can enhance innovation. Thus,

***Hypotheses: Thinking styles of entrepreneurs (legislative, executive, judicial, monarchic, hierarchic, oligarchic, anarchic, global, local, internal, external, liberal, and/or conservative) are related positively to innovation.***

## METHODS

### Sample

I tested the hypotheses in a mail survey of 66 technology entrepreneurs from Guangdong Province of China, primarily in Guangzhou and Shenzhen cities where majority of Guangdong's technology firms are located. Late-wave analyses were conducted to evaluate non-response bias. Results indicated that late respondents did not differ significantly from the early ones in terms of demographic characteristics.

I received 63.6 percent of responses from business owners or entrepreneurs, 24.2 percent from CEOs, and the rest from directors (12.1%). On average, they were 37 years old. Their average industry experience was 10.7 years. Seventy-four percent (74.2%) attained tertiary education or above. Nearly two-thirds (64.6%) had varying degree of involvement in R&D. All this indicated that respondents were knowledgeable about the issue under study.

Of the responding establishments, 39.4 percent engaged in the information technology field, 21.2 percent in electronics industry, 10.6 percent in environmental products, 7.6 percent in telecommunication, and the rest from biotechnology, pharmaceutical, materials, and electric industries. The average firm size and age were 106 full-time employees and 7.0 years respectively. Mean R&D expenses as a percentage of sales were 19.6 percent. On average, 41.3 percent of firm's total full-time employees were engineers or scientists whereas 45.9 percent of management had engineering or science background. A total of 77.3 percent of establishments were independent firms while the rest (22.7%) were corporate divisions or subsidiaries. Eighty-five percent (84.8%) were privately-owned and the rest were joint venture (6.0%), state-owned (4.5%), wholly foreign owned enterprise (3.0%) and others (1.5%) respectively.

## Measures

The conventional method of back-translation was used to translate the measures from English to Chinese. I refined the measures to ensure their relevance to the Chinese context upon the results of pilot study. To minimize any bias associated with the retrospective data collection, I restricted target respondents to entrepreneurs/chief executive officers, and the recall time frame to three years in the questionnaire design.

The thinking styles, independent variables, were assessed from the Sternberg-Wagner Thinking Styles Inventory (1997) on a seven-point Likert scale, ranging from "not at all well" (1) to "extremely well" (7). Respondents indicated how well the statements describe themselves. Some sample statements included "when making decisions, I tend to rely on my own ideas and ways of doing things" (legislative style); "when discussing or writing down ideas, I follow formal rules of presentation" (executive style); "when discussing or writing down ideas, I like criticizing others' ways of doing things" (judicial style); "when talking or writing about ideas, I stick to one main idea" (monarchic style); "I like to set priorities for the things I need to do before I start doing them" (hierarchic style); "when I undertake some tasks, I am usually equally open to starting by working on any of several things" (oligarchic style); "when I have many things to do, I do whatever occurs to me first" (anarchic style); "I like situations or tasks in which I am not concerned with details" (global style); "I like to control all phases of a project, without having to consult others" (internal style); "I enjoy working on projects that allow me to try novel ways of doing things" (liberal style). The Cronbach's alpha values of all these scales were above .70.

These measures of thinking styles, Sternberg-Wagner Thinking Styles Inventory (1997), exhibited good reliability and validity. Internal validity of the measures has been demonstrated in many studies (e.g., Bernardo, Zhang, & Callueng, 2002; Dai & Feldhusen, 1999; Zhang, 1999; Zhang & Sternberg, 1998) conducted among students and teachers from a number of cultural groups, including Hong Kong, mainland China, the Philippines, and the United States. External validity of the measures also has been obtained through examining the nature of thinking styles in relation to Biggs' (1992) concept of learning approach (Zhang & Sternberg, 2000), Holland's (1973, 1994) notion of career personality types (Zhang, 2000), Costa and McCrae's (1992) big five personality traits (Zhang, 2002a), and Perry's (1999) construct of cognitive development (Zhang, 2002b).

Innovation, a dependent variable, was a composite measure computed by adding standardized values of R&D spending (the percentage of total annual sales on R&D spending) and number of patents. Combining patents and R&D spending captures organizational innovation efforts more completely, with R&D spending measuring investments in innovation and number of patents indicating innovation outputs (Balkin, Markman, & Gomez-

Mejia, 2000). Another reason for this composite measure is that R&D spending and number of patents are highly correlated with each other in this study ( $r = .47, p < .01$ ).

Several measures were used as control variables. These included firm size (the natural logarithm of the number of full-time employees), origin (dummy-coded: “independent” = 0, “corporate” = 1), and firm age (in years), which were used to control for scale effects on R&D spending and number of patents (Chandler & Hanks, 1994; Cohen & Levinthal, 1990; McCann, 1991).

## Analysis

Hierarchical regressions were performed to test the hypotheses. First, the three control variables were entered as a block in step 1. Next, I entered the thinking-style variables in step 2 to examine the corresponding level of statistical significance and the amount of unique variance in innovation accounted for by thinking styles.

## RESULTS

I tested the hypotheses using hierarchical regression analyses by first introducing into the equation the block of control variables, followed by the independent variables. Control variables exhibited no effects on innovation ( $p > .05$ ). To examine the hypotheses, thinking styles were entered into the equation. Results indicated that only liberal style produced a positive and statistically significant effect on innovation ( $\beta = .70, p < .01$ ). Other thinking styles were not related to innovation ( $p > .05$ ).

## DISCUSSION AND CONCLUSION

Results indicated that only liberal style was related positively to innovation. In other words, higher preference for thinking in a liberal way will lead to more innovation. To create more new products and/or services, one should think in a liberal style, which allows an individual to go beyond existing rules and procedures, maximize change, seek situations that are somewhat ambiguous, prefer some degree of unfamiliarity in life and work, and work on tasks that involve novelty (Sternberg, 1997: 74; Zhang, 2004: 1310). This also corroborates the work of Zhang (2002c) in that liberal style is one of the manifestations of creative endeavours.

Nevertheless, such thinking styles as legislative, judicial, or global that were considered a manifestation of creative efforts in the study of Zhang (2002c) were found not related to innovation. This divergence may be due to sample difference. In Zhang’s (2002c) work, her sample was mainly freshmen studying in the University of Hong Kong, while the current study was based on Chinese technology entrepreneurs. According to Sternberg (1997), legislative people like to “come up with their own ways of doing things, and prefer to decide for themselves what they will do and how they will do it” (p. 20). Judicial people like to “evaluate rules and procedures, and prefer problems in which one analyzes and evaluates existing things and ideas” (Sternberg, 1997: 21). Global people like to “deal with relatively large and abstract issues. They ignore or don’t like details, and prefer to see the forest rather than the trees” (Sternberg, 1997: 24). It is plausible that technology entrepreneurs are more down-to-earth sort of people who create new products, services, and technologies in the market. They are never comfortable with staying in their own ivory towers by thinking about methodology, evaluating existing things, or focusing on abstract issues. People with these three thinking styles may tie up with creativity but not innovation in a practical sense. This is also a good reason to explain why internal people who tend to “be introverted, task-oriented, aloof, and sometimes socially less aware” (Sternberg, 1997: 25) are not related to innovation in this study.

This research also suggests that an executive or conservative entrepreneur has no relationship with innovation. Executive people like to “follow rules and prefer problems that are pre-structured or prefabricated. They like to fill in the gaps within existing structures rather than to create the structures themselves” (Sternberg, 1997: 21), while conservative people like to “adhere to existing rules and procedures, minimize change, avoid ambiguous situations where possible, and stick with familiar situations in work and professional life” (Sternberg, 1997: 26). These styles have nothing to do with innovation because of their low tolerance for change.

In addition, entrepreneurs preferring monarchic, hierarchic or local thinking styles do not relate to innovation. A monarchic person is “someone who is single-minded and driven ... not to let anything get in the way of his or her solving a problem” (Sternberg, 1997: 22), while a hierarchic person “has a hierarchy of goals and recognizes the need to set priorities, as all goals cannot always be fulfilled, or at least fulfilled equally well” (Sternberg, 1997: 23). Local people like “concrete problems requiring working with details” (Sternberg, 1997: 24). However, innovation is about creation, which usually comes from “cross-over” or bisociation (Koestler, 1976), and draws from different perspectives and disciplines. Given its complexity and unstructured problem-solving in nature, innovation is never an easy task if one is single-minded, well-structured or detail-minded.

Lastly, the oligarchic, anarchic, or external thinking styles have no relationship with innovation. The oligarchic person likes to “do more than one thing within the same time frame ... but ... be motivated by several, often competing goals of equal perceived importance” (Sternberg, 1997: 23). The anarchic person likes to take what seems like a random approach to problems, reject systems, and fight back at whatever system they see as confining them (Sternberg, 1997: 23). Both oligarchic and anarchic people usually find themselves in busy time schedule, without much time to think about how to connect the dots (Baron, 2006; Ko & Butler, 2006). For external people, they tend to “be extroverted, outgoing, and people-oriented. Often, they are socially sensitive and aware of what is going on with others. They like working with other people wherever possible” (Sternberg, 1997: 25). Given the widespread of dysfunctional competitive behaviours in China (Ahlstrom & Bruton, 2001; Li & Atuahene-Gima, 2001), it is plausible that entrepreneurs prefer not to talk with others about their trade secrets, which potentially lead to innovation.

The above results are informative for both entrepreneurs and researchers with substantial interest in innovation. Entrepreneurs using liberal style are more likely to enhance innovation, which is critical to the viability of organizations in an increasingly complex and volatile business environment, like China. Entrepreneurs can practise thinking in a liberal way by asking themselves: “Are there any novel ways of doing this?” “Can I change routines to improve the way tasks are done?” “Can I challenge old ideas or ways of doing things and seek better ones?” “What would it be if I look from a new perspective?” By doing so, entrepreneurs can raise the awareness of their thinking styles, deliberately focusing on liberal way, which can potentially lead to more innovation.

Researchers also can benefit from this research, which is one of endeavours to answer the call for more entrepreneurial cognition research. Other than innovative ability, preference for thinking in a liberal style is equally important in innovation research, which supplements the widely used Adaption-Innovation Theory (Kirton, 1989) by applying Sternberg’s (1997) mental self-government theory. Although this study re-emphasizes the importance of centrality of individual entrepreneurs in innovation, there is no intention to downplay the roles of other individual, organizational and contextual factors that may contribute to innovation. Nevertheless, research on how individual represents and processes information in the mind given different situations and different times can add value to our understanding of innovation at the individual level because the cognitive processes of entrepreneurs “are likely to have strengths and weaknesses in various competitive environments” (Alvarez & Busenitz, 2001: 757).

When interpreting the results of the study, readers should be aware of certain limitations. Since a causal model was estimated on cross-sectional data in this study, one should be careful not to over-interpret the results with regard to causality. Future research should establish the causal claim that liberal style is related to innovation. To this end, field experiments and longitudinal research designs might be applied. Such designs may be more conclusive about the causal linkages among the constructs. Also, another concern is the generalizability of results. Other than the limited sample size and low response rate, the data in this study were drawn from a single research context that was bounded by industry considerations and geography. Care should be taken in generalizing these results to entrepreneurs in other settings. Future research can replicate this study and see if there is any convergence of the findings.

With self-report measures, one cannot entirely rule out the possibility that common method bias may have augmented the relationships between constructs (Podsakoff, MacKenzie, Lee, & Podsakoff, 2003). The relationships between the predictor (thinking styles) and outcome (innovation) may include common method variance. The measures used to tap each of these constructs were taken from one source only (the entrepreneur), which means the answer to one item may influence the answers to others. These associations could therefore be

attributed to a response bias on the part of the entrepreneur. To address this issue, a Harmon's (1960) single-factor test was conducted. Results showed that no single factor emerged from the factor analysis, though the absence of a single factor is not evidence that the measures are free of common method variance (Podsakoff, MacKenzie, Lee, & Podsakoff, 2003). Nevertheless, a key informant approach is deemed appropriate in entrepreneurship research because entrepreneurs are more competent and knowledgeable to report the information of interest in this study (Kumar, Stern, & Anderson, 1993). Moreover, given a single-blind research technique applied to measure thinking styles and innovation, it seems unlikely that respondents could structure their responses (Doty, Glick, & Huber, 1993). Thus, the likelihood of common method variance is relatively small in this study.

Apart from the above possible avenues for further research, the findings of this study point to several new research agendas. Entrepreneurial cognition research can apply theories and concepts of cognitive science and neuroscience to explore and understand how representations and processes of information actually work in an individual mind that can lead to more innovation. Another promising research agenda is to examine what factors that may help entrepreneurs effectively activate their preference for liberal style of thinking. All this can add value to our understanding of innovation at the individual level, and ultimately create benefits for the mankind.

# **POSITION OF LEADERS IN THE PROCESS OF TRANSITION TOWARDS MARKET ECONOMY IN SERBIA**

**Krisitijan Kolakovic**  
**University of Braca Karic, Belgrade**

## **ABSTRACT**

*Leaders have a great role in conducting the process integration of Serbia into EU, more exactly, concerning the development of qualitative economic and political relations with the countries-members of the EU. Leadership is the process of guiding and influencing the activities that are relevant for the realization of objectives of group members, and therefore we have indicated its importance in economic, political, non-governmental and other organizations in Serbia, whose activities contribute to the integration into the EU. In order to highlight the mentioned great importance of leaders, we have analyzed their role and contribution to the development of the economic system of Serbia, wherein they have been presented at the main carriers of the process of transition towards market economy. Besides that, we have pointed out the importance of participation of leaders in fulfilling the basic conditions for our country to become a member of the EU, related to the solution of complicated problems, as well as for the economic system and for the intensity of carrying out the institutional reforms.*

## **INTRODUCTION**

Facing challenges of the 21<sup>st</sup> century, for which it has been said, that it is “the century of changes” initiated by the tendencies of globalization, deregulation and liberalization, the political and economic leadership of Serbia will have a serious task to initiate economic potential in order to achieve competitiveness. That process would be impossible to achieve without industrial and developmental integration with the regional countries, bearing in mind the importance of synergetic effects that will be achieved in that way in certain economic activities.

For the recovery, development and return of the Serbian economy to the international market, the development of relations with the EU countries is of strategic importance and it is determined by the following reasons:

- The EU represents a significant market potential,
- The EU market is characterized by high purchasing power and the population able to pay demands.

From the standpoint of formulating the strategy of foreign-economic relations, the EU market potential cannot be treated simply as a trade or even only economic block, but as a highly integrated and homogenized space founded on simple values, political, developmental and geo-strategic postulates, whereby we should emphasize:

- The achieved high level of functional integration accomplished by long-term stimulation and support of the flows of goods, services, people, knowledge, capital and information;
- High level of connection in the field of communications, infrastructure, culture and public services;
- Established high level of institutional cooperation, by developing a network of supranational institutions, in the strategically sensitive field of foreign policy, security, environmental protection, monetary and economic policy;
- Compatibility of technical, technological, sanitary, health, safety and administrative standards as well as homogenization of the business regime of companies and banks;
- High level of intraregional market correlation.

In order to provide economic connection of our country with the European market defined in this way, it is necessary to carry out radical changes, more exactly, the reforms of economy in order to adjust it to the market principles and the international systems of quality.

Besides that, the process of integration of Serbia into the EU will depend on the success of transition of economy, bearing in mind that the fulfillment of economic criteria is a significant prerequisite for gaining membership. Implementation of such big and radical changes in the economic policy and economic organizations in our country can be realized efficiently, only if it is managed by the people who possess leadership abilities and skills, and who have energy to convey their vision into reality.

## **STARTING THE PROCESS OF TRANSITION IN SERBIA**

The role of a leader in the transition of economy implies initiating and carrying out changes that will enable the establishment of the market system, new ownership structure, competition and other changes, in order to improve the performances of economy and its connection with the international market.

Bearing in mind that one of conditions for gaining membership in the EU is the reform of economic system, Serbia started the process of transition of its economic system towards market economy in 2000. Even during the first year, the EU issued positive comments about that process. Thus, the European Bank for Reconstruction and Development proclaimed Yugoslavia to be the most successful country in transition, out of 27 countries of the Southeast Europe in 2001, whereby in the range of grades from one to four, it got the grade three for privatization, for liberalization of prices and foreign-trade exchange, grade two for infrastructure development, and grade one for restructuring the economic and banking system. The fact that the FRY entered the world of transition as the last country on the continent, which opted for that transitional stage into the capitalism, speaks also in favor of the importance of obtained positive grades.

The role of political leaders was especially highlighted in the processes of reforming the economic system of our country, considering the fact that only they have a legal authority to create economic policy, as well as the fact that they lead the foreign policy, influences considerably the development of economic relations and cooperation with foreign countries.

However, within a scope of the leadership in economic organizations, and the leadership which dominates on the political stage, it is possible to identify various types of leaders, characterized by various attributes and styles of behavior. Taking into consideration that the process of transition is associated with carrying out a great number of radical and complex changes, there is an understanding represented in the literature that the main carriers of transition the so-called leaders of changes, i.e. the leaders reformers. Their key tasks are:

- To motivate the followers by increasing the level of cognition of importance and value of set of goals,
- To explain to the followers the possibilities of adjusting their personal interests with the general public interests,
- To create the atmosphere of trust and to convince the followers of the necessity of relying on one's own strength.

Beside the reformist, more exactly transforming leadership, one cannot neglect the implication of charismatic leadership on the reform of economy, especially bearing in mind that this type of leadership has often been related to the political leadership. The following table demonstrates that the charismatic leaders have an important role in the process of transition and the basic differences between charismatic and non-charismatic leaders have been shown.

Based on the analysis of the characteristics of charismatic leaders it can be clearly observed from the table that their main role in the process of transition is to initiate changes, which they manage by a strong vision and personal expertise, and thereby transform the system of values and understanding of the followers in order to include them in their implementation. The main motive, that moves those leaders to initiate transitional changes,

is their dissatisfaction with the status quo, which refers to the low economic efficiency, unreasonable use of the production factors, unfavorable economic structure, unfavorable relation between small, medium-sized and big companies, high unemployment.

Duration and complexity of the process of transition in the world have differed between certain countries, depending on the level of development of their economic systems, more exactly the seriousness and the scope of reforms that had to be carried out.

**Table 1.- The main behavioral differences between charismatic and non-charismatic leaders**

|  | <i>Charismatic leader</i>   | <i>Non-charismatic leader</i>  |
|--|---|--|
| Relation towards status quo                            | Essentially against status quo & strives to change it   | Essentially agree with status quo and strives to maintain it                     |
| Goal   | Idealized vision, considerably different in relation to status quo  | Goal is not essentially different than status quo                                |
| Disposition of followers                               | Mutual prospects and idealized vision make him popular and honest hero worthy of identification and imitation | Mutual prospects make him popular  |
| Expertise  | Expert in using non-conventional means to overcome the existing situation                                     | Expert in using available means to achieve goals in the existing situation       |
| Feeling for environment (attitude towards environment) | High need to know the environment (to change status quo)  | Small need to know the environment (wants to maintain status quo)                |
| Articulation   | Strong articulation of vision and motivation  | Weak articulation of goals and motivation  |
| The basis of power                                     | Personal power, based on expertise, (expert power), respect and admiration                                    | Power of position and personal power (based on prizes, expertise and similar.)   |
| Relation towards followers                             | Elitist, entrepreneurial, exemplary, transforms people so to accept radical changes                           | Egalitarian, based on consensus or directive imposes his own attitudes to people |

Source: Jay A. Conger and Rabindra Kanungo, “*Toward a Behavioral Theory of Charismatic Leadership in Organizational Settings*“, Academy of Management, San Francisco, 1987, pp. 637- 647

In the past seven years, the leaders in Serbia have carried out numerous reforms in order to establish macroeconomic stability and viable and stable economic development, to restructure big systems, to privatize companies and join the EU that includes various legislative adjustments in all domains of economy and society.

In the process of managing transitional changes the Serbian leadership had the first task of facing a difficult heritage, which referred to

- The economic structure formed a quarter of a century ago, and dominated by energy, raw materials, and food, with the additional consequence of foreign indebtedness;
- Non-market behavior of economic participants as a consequence of self-managing and state socialist model of economy that lasted for decades;
- And finally, difficult economic and social crises in terms of a dramatic fall of the social product and the standard of living during 90-ties, due to the break up of the former SFRY, the international sanctions, wars and numerous failures of economic and total policy.

Thereby, in order to change over to the market economy, it was necessary to achieve certain macroeconomic objectives, which referred to: the inflation, prices, export, import, balance of payments, earnings, unemployment, etc. Namely, it was necessary for the leaders to define adequate policy directions that would enable the realization of macroeconomic stability, such as:

- Anti-inflation policy
- A new fiscal policy and reform,
- Equilibration of the balance of payments,
- Income policy,
- Social program, as the set of measures for solving problems caused by the strict anti-inflation policy.

Thus, the main objectives of our economic policy include sustaining macroeconomic stability and at the same time attaining a high rate of economic growth (the average GDP growth rate for the period 2001 to 2006 was 5.3%). The market activity after 2000 has encompassed some positive processes of economic transition and reform of the tax system, labor market and social sector. There has been a stability of the exchange rate of national currency – dinar with a continual growth of foreign currency reserves, considerable deregulation of prices and international trade and better relations with international financial institutions. A considerable improvement has been made in the field of structural reforms, especially in company privatization and consolidation and privatization of banking sector that includes 350 new laws that support structural reforms.

## ACHIEVED RESULTS AND THEIR IMPORTANCE

The improvement in structural and institutional reforms in 2006 in 20 European transitional countries has been summarized by European Bank for Reconstruction and Development (EBRD). It was done with the help of transitional indicators that confirm that Serbia finished the first phase of transition successfully. The following table shows the value of EBRD indicators for Serbia for the period 2000 – 2006.

**Table 2. The values of annual EBRD indicators for Serbia for the period 2000 – 2006.**

| EBRD indicator                              | 2000 | 2001 | 2002 | 2003 | 2004 | 2005 | 2006 |
|---|------|------|------|------|------|------|------|
| Liberalization of prices                    | 2.3  | 4.0  | 4.0  | 4.0  | 4.0  | 4.0  | 4.0  |
| Exchange system and trade liberalization    | 1.0  | 2.7  | 3.0  | 3.0  | 3.0  | 3.3  | 3.3  |
| Privatization of small companies            | 3.0  | 3.0  | 3.0  | 3.0  | 3.3  | 3.3  | 3.7  |
| Privatization of big companies              | 1.0  | 1.0  | 2.0  | 2.3  | 2.3  | 2.7  | 2.7  |
| Restructuring of company                    | 1.0  | 1.0  | 2.0  | 2.0  | 2.0  | 2.3  | 2.3  |
| Competition policy                          | 1.0  | 1.0  | 1.0  | 1.0  | 1.0  | 1.0  | 1.7  |
| Reform of bank sector                       | 1.0  | 1.0  | 2.3  | 2.3  | 2.3  | 2.7  | 2.7  |
| Reform of non- bank financial institutions  | 1.0  | 1.0  | 1.7  | 2.0  | 2.0  | 2.0  | 2.0  |
| Infrastructure reforms                      | 2.0  | 2.0  | 2.0  | 2.0  | 2.0  | 2.0  | 2.0  |
| <i>Mean value of annual EBRD indicators</i> | 1.6  | 1.9  | 2.3  | 2.4  | 2.5  | 2.6  | 2.7  |

**Source: EBRD Transition Report 2006**

Comparing the average annual transitional indices of 20 European transitional economies shows that in 2006 Serbia was on the 17<sup>th</sup> place with the index of 2.7, while only Belarus, Bosnia and Herzegovina and Montenegro had worse results. Hungary, with the highest index (4), was closest to the level of developed market economies of Europe.

In 2006, Serbia was successful in two fields: in small company privatization and in the policy of competitiveness. However, there is still the biggest lag in the field of the policy of competitiveness where the indices are at the lowest level (1.7). The average improvement was made in the process of privatization of big companies (2.7), banking sector reforms (2.7) and company restructuring (2.3), while a modest result (2) was made for the economy security, non-banking financial institutions and in the field of infrastructural reforms.

After the price liberalization, with reduction of the most important price disparities which was done in phases, the inflation was reduced from 111.9% in 2000 to 17.7% in 2005, i.e. 6.6% in 2006. The key factors that the

leaders are going to consider while planning the inflation reduction in the following period will be coordinated activity of macroeconomic policies, monetary and fiscal policies and structural reforms.

The mentioned facts clearly show the success of Serbian transitional economy so far, i.e. explain the current state of affairs of the economic system whose future development will depend on the leaders' aptitude to recognize mechanisms for effective continuation of the process towards market principles.

Another important task that the leaders have will include the construction of modern material and informational infrastructure, i.e. modernization of companies in order to enhance value added per an employee. This is especially important since the process of approaching GNP *per capita* in Serbia to the revenues in the EU, except in some exceptional circumstances and in short terms, is possible only through a constant growth of productivity and competitiveness.

The changes at the political scene of Serbia in 2000 considerably changed the structure and way of functioning of its economic system. That is why the subject of the analysis in this chapter will be economic indices for the last seven years since the very change of political objectives contributed to reconsideration of the old type of economic activities, which is also a turning point to market principles, i.e. the process of huge transitional changes began.

One of the main economic growth indicators of a country is related to its GDP that presents the final result of its manufacturing activity. Graph 1 shows GDP growth in Serbia in percentages in the period 2001 – 2006. It can be seen that real economic growth in 2006 was 5.7%, which is lower comparing to 2005 when it was 6.2% and especially comparing to 2004 as the record year when it was 8.4%. The consequence of such a state is poor growth of production and growth in service sector (especially in retail and wholesale). It happened because of the reduction of the public expenditure due to the slowing down of credit activity of banks, i.e. restrictive measures of the National Bank of Serbia.

Transitional changes affected the whole structure of the economic system of our country with considerable implications on all its sectors. These changes redefined the participation of individual sectors in forming gross value added. According to the data from 2005, manufacturing industry and trade generated the biggest part of the total turnover (66.9%), gross value added (50.9%), profit (47. 7%) and employees in Serbia. This can be clearly seen in the following table that shows their proportion comparing to other sectors.

**Table 3. Economy structure of Serbia in 2005 (in %)**

| Sectors                | Turnover | GVA   | Profit | No of employees |
|------------------------|----------|-------|--------|-----------------|
| Economy                | 100.0    | 100.0 | 100.0  | 100.0           |
| Agriculture            | 2.9      | 3.7   | 2.9    | 4.8             |
| Industry               | 36.5     | 41.9  | 43.8   | 43.2            |
| Manufacturing industry | 25.9     | 30.0  | 25.1   | 36.4            |
| Civil engineering      | 5.1      | 7.0   | 6.5    | 7.2             |
| Trade                  | 41.0     | 20.9  | 22.6   | 23.1            |
| Traffic                | 7.2      | 13.9  | 17.4   | 8.8             |
| Other services         | 7.3      | 12.6  | 6.8    | 13.0            |

Source: Report on Serbian development in 2006, Republic Development Bureau, Belgrade, 2007, p.18

These results are the consequence of manufacturing industry privatization, as well as the service sector in which we have to emphasize trade, traffic and tourism. However, our country is still facing the challenges of new economic structure changes. The most prominent are: structural problems in the field of industry, dominated by traditional ways of production, low level of technical and technological equipment and low level of company competitiveness.

The favorable aspect of the economic growth in recent period has been the important growth of investments thanking to state companies' privatization. In 2006, Serbia had record sales from privatization including €1.5

billion from the sale of a mobile communications provider to Norwegian Telenor and mobile telecommunications license sale to Austrian Telecom for €320 million. Investments were also ensured by selling of Panonska bank to Italian SaoPaolo IMI for €122 million and Vojvodjanska bank to Greek NBG for €385 million. These transactions in 2006 were record ones and the total income was €3.2 billion, which was the best result since the beginning of transition.

However, the process of privatization has not been realized to the end. That is necessary to be done in order to enable market economy.

The success of privatization in Serbia is best illustrated by EBRD indicators that can help us make a comparative analysis of individual countries so that we can position our country. The following graph shows how EBRD transitional indicators moved after the big companies' privatization in Serbia, Albania, FYR of Macedonia and Slovenia. It can be seen that Serbia had a growth from 1.00 in 2001 to 2.67 in 2007. However, that is much lower comparing to other surrounding countries. The most important success in big companies' privatization is made by Hungary that has had a constant EBRD indicator of 4.00 since 2001.

High rate of unemployment that was 33% (ILO: 21%) continues to be one of the biggest challenges for Serbian economy. However, in 2006, there were no changes in the labor market. The unemployment rate increased from the average 32% in 2005 to 33.2% in 2006 while the employment decreased for about 1.5% due to the current restructuring in market sector. The real net earnings growth was considerably accelerated during the last months of 2006 as the result of governmental policy of earnings in pre-voting period. They were characterized by the average growth of 11.6% (2005: 6.4%). At the same time, manpower productivity rose for 13.5% (2005: 9%) which is, most probably, rather the result of reducing the number of employees due to restructuring than enhanced productivity.

One of the possible ways for the unemployment problem solving and improving economic competitiveness of Serbia present FDI (foreign direct investments), that have an important place for new job openings, export enhancement and improvement of corporative management. In last two years, the investment climate in Serbia has considerably improved which resulted in FDI enhancement that amounted to USD 4.4 billion in 2006. The largest part of FDI was in postal activity and telecommunications (28.3%), manufacturing industry (18.2%) and financial intermediary services (36.8%).

Foreign direct investments in Serbia in the period 2000 – 2006 amounted to net USD 7.96 billion. The following graph presents the participation of individual countries in FDI in Serbia (in percentages) that brought the biggest amount of money.

## CONCLUSION

According to the analysis of the main indicators of Serbian economic growth we can conclude that, beside some improvements in the period 2001-2006, there is still no macroeconomic stability, that the process of economy restructuring is harder than planned, that domestic accumulation is minimal and pressures on personal and public expenditure are far above manufacturing possibilities of the economy.

Thus, the strategy of economy development should base upon:

- Change of GDP usage in favor of investments in fixed funds,
- Maintaining a dynamic and sustainable economic growth,
- Reduction of the public expenditure share in GDP
- Monitoring current balance of payments so that it will not affect the foreign debt,
- Sustaining price stability – all in conditions of liberalized international trade and enhanced price liberalization (monopoly elimination).

In the next five years, Serbian economy should make sure that the value of annual export will be enhanced from present \$3.8 billion to over \$10 billion. Such an improvement is possible only if the competitiveness of Serbian economy become significantly better and with the full benefits in relation with the process of approaching the EU and WTO, as well as with much more effective usage of Free Trade Agreement and co-operation with

neighboring countries.

# **INTERNATIONAL INITIATIVE IN BIOLOGICAL MEDICAL SUPPLY: A PARTNERSHIP IN INTRAVENOUS IMMUNOGLOBULIN PRODUCTION**

**Thomas Kollars and Gerald Ledlow  
Jiann-Ping Hsu College of Public Health,  
Georgia Southern University, USA**

## **ABSTRACT**

*The growth and use of medicinal biological regimens since 1950 are exponential. This fact necessitates new production strategies and partnerships to meet a price sensitive demand for products such as Intravenous immunoglobulin. Intravenous immunoglobulin (IVIG) is a medicinal biological that is used to treat multiple diagnoses, such as Kawasaki's Disease. International collaboration on IVIG production is not a common occurrence except between technologically similar and medically mature and experienced countries (such as between the USA and Austria by the Sandoz Corporation). This is due to governmental regulations and issues regarding purity of the blood based IVIG product. This paper evaluates the following questions: 1) Can a partnership in IVIG production develop between an USA based company and an India based company? And 2) Can the IVIG product developed through the USA-India partnership be competitive in the global marketplace given the governmental, safety, and consumer perception barriers?*

## **INTRODUCTION**

International collaboration in the business of healthcare and healthcare product manufacturing is commonplace among developed and medically sophisticated nations. As a growing industry niche, medical tourism has established itself as an option for people residing in high medical cost nations, as in the United States, to seek medical procedures in developing nations such as cardiac surgery in India and plastic surgery in Mexico and Thailand. Collaborative international medical product processing and/or manufacturing, in this case a biological pharmaceutical, Intravenous Immunoglobulin (IVIG), is commonplace between developed and medically sophisticated nations. However, biological pharmaceutical processing is rare as a collaborative business venture between developed and underdeveloped nations. In this manuscript the medicinal background of IVIG is reviewed, the key elements of a U.S. and Indian business venture are detailed, and the socio-cultural barriers of the marketplace as it pertains to the IVIG processing venture are explored.

## **MEDICINAL BACKGROUND OF INTRAVENOUS IMMUNOGLOBULIN**

IVIG is a biological, namely a blood based product, delivered to appropriate patients through an intravenous line directly into the blood stream. IVIG contains heightened levels of antibodies extracted often from a thousand or more donors' blood plasma. IVIG was first used to treat immune deficiency in 1952. (Scheinfeld, 2008) Treatment regimens with IVIG fall into three major patient categories of diseases; 1) Immune system compromising diseases or syndromes; 2) autoimmune diseases including chronic inflammatory (Gern, 2002; Nimmerjahn and Ravetch, ) conditions; and 3) Highly acute infectious diseases. Typically, IVIG builds in the patient's system to reduce and then negate inflammation, which lessens the acuity of disease

in the patient (Sirigam, et. al., 2006) through the Fc receptor or by reacting with T and B cells and monocytes. (Bayry, et. al., 2003)

IVIG, according to Scheinfeld, serves as a critical treatment component of the following U.S. Food and Drug Administration (FDA) approved condition and a rather lengthy list of off label conditions:

“The FDA has approved the use of IVIG for the following 6 conditions:

- Primary immunodeficiencies
- Immune-mediated thrombocytopenia
- Kawasaki disease
- Hematopoietic stem cell transplantation in patients older than 20 years (Gamimune-N only)
- Chronic B-cell lymphocytic leukemia
- Pediatric HIV type 1 infection

Its reported uses have been outlined by the National Guideline Clearinghouse, including the following (off-label) applications:

- Hematology
- Aplastic anemia
- Pure red cell aplasia
- Diamond-Blackfan anemia
- Autoimmune hemolytic anemia
- Hemolytic disease of the newborn
- Acquired factor VIII inhibitors
- Acquired von Willebrand disease
- Immune-mediated neutropenia
- Refractoriness to platelet transfusion
- Neonatal alloimmune/autoimmune thrombocytopenia
- Post transfusion purpura
- Thrombotic thrombocytopenia purpura/hemolytic uremic syndrome
- Infectious diseases: Conditions in which acquiring an infectious disease could be deleterious include low birth weight (i.e., <1500 g), solid organ transplantation, surgery, trauma, burns, and HIV infection.
- Neurology
- Epilepsy and pediatric intractable Guillain-Barré syndrome
- Chronic inflammatory demyelinating polyneuropathy
- Myasthenia gravis
- Lambert-Eaton myasthenic syndrome
- Multifocal motor neuropathy
- Multiple sclerosis
- Obstetrics: IVIG may be helpful for recurrent pregnancy loss.
- Pulmonology
- Asthma
- Chronic chest symptoms
- Rheumatology
- Rheumatoid arthritis (adult and juvenile)
- Systemic lupus erythematosus
- Systemic vasculitides
- Dermatomyositis, polymyositis
- Inclusion-body myositis
- Wegener granulomatosis: Successful remission induction with the use of IVIG and steroids alone as been described in a woman diagnosed with de novo Wegener granulomatosis during the first trimester of pregnancy.
- Miscellaneous

- Adrenoleukodystrophy
- Amyotrophic lateral sclerosis
- Behçet syndrome
- Acute cardiomyopathy
- Chronic fatigue syndrome
- Congenital heart block
- Cystic fibrosis
- Autoimmune blistering dermatosis
- Diabetes mellitus
- Acute idiopathic dysautonomia
- Acute disseminated encephalomyelitis
- Endotoxemia
- Hemolytic transfusion reaction
- Hemophagocytic syndrome
- Acute lymphoblastic leukemia
- Lower motor neuron syndrome
- Multiple myeloma
- Human T-cell lymphotropic virus-1–associated myelopathy
- Nephritic syndrome
- Membranous nephropathy
- Nephrotic syndrome
- Euthyroid ophthalmopathy
- Opsoclonus-myoclonus
- Recurrent otitis media
- Paraneoplastic cerebellar degeneration
- Paraproteinemic neuropathy
- Parvovirus infection (general)
- Polyneuropathy, organomegaly, endocrinopathy, M-protein, and skin changes (POEMS) syndrome
- Progressive lumbosacral plexopathy
- Lyme radiculoneuritis
- Rasmussen syndrome
- Reiter syndrome
- Acute renal failure
- Thrombocytopenia (nonimmune)
- Streptococcal toxic shock syndrome
- Uveitis” (Scheinfeld, 2008)

Clearly, IVIG is an important treatment component for a vast array of medical diagnoses. Nine major companies are processors/manufacturers of IVIG and serve the United States and Europe; at least one of these companies, Sandoz in Vienna, Austria collaborates in an international venture with the United States (blood plasma donors are from the U.S.). (Scheinfeld, 2008) As a medically sophisticated biological pharmaceutical blood product, much less processing/manufacturing occurs in underdeveloped regions of the globe. This sets the stage for the business venture of interest to this manuscript, the MIT Holdings (U.S. company) and TriGenesis Lifesciences (Indian company).

## **U.S. – INDIAN BUSINESS VENTURE REVIEW**

In January 2006 the decision was made to take MIT’s pharmaceutical division into the global market focusing initially on Intravenous Immunoglobulin (IVIG) products and medical supplies. After making contacts in the Dominican Republic (DR) with the intent to sell IVIG blood products and medical supplies/equipment to the DR government and others, the search for a supplier began. MIT was interested in IVIG products

manufactured outside of the US that was World Health Organization (WHO) certified, instead of US Food and Drug Administration (FDA) approved, in order to find a product at a lower price. One of MIT's domestic suppliers introduced MIT to National BioProducts Institute (NBI) who is a manufacturer of WHO certified IVIG in South Africa. Negotiations began with NBI to buy product from them and import it into the Free Trade Zone in San Juan Puerto Rico and then ship to countries throughout the Caribbean and Latin America. MIT purchased the IVIG product (Polygam, powder) in August 2006 and stored it in space leased from Imex Zone Logistics in Puerto Rico. With product ready, MIT entered into a business relationship with the pharmaceutical company, Redifar, to purchase and sell IVIG and other medical products within the Dominican Republic.

With the relationship between MIT and Redifar established and product ready for distribution, MIT began searching for other suppliers of IVIG, this time focusing on India. A manufacturer was located in Bangalore, TriGenesis Lifesciences, who MIT accepted as an established pharmaceutical supplier since 1981 selling a wide range of pharmaceuticals and medical supplies. TriGenesis claims to have ISO 9001 certification, to follow ICH guidelines and cGLP (current Good Laboratory Practices), and to have "WHO-GMP Certified International Standards Manufacturing Facilities." After approximately three months of communication (including a visit from the manufacturer's representatives to MIT in Savannah), TriGenesis and MIT signed a letter of intent to enter into a joint agreement that would give MIT exclusive distribution rights to all of TriGenesis' products in the international market, except in countries where they have an already established agreement. TriGenesis began work on the local documents necessary for MIT to do business in India, prepared paperwork for registering their products with the Dominican government, and began designing the packaging and labeling for MIT. Both parties then signed a distribution agreement. In February 2006, MIT negotiated a purchase order for IVIG kits from the Dominican government for use in its hospitals. TriGenesis agreed to fill the order upon receipt of half of the payment from MIT. Several months were spent attempting to register the product in the DR and getting government approval for the purchase. By May 2007 approval from the Dominican government for the purchase had not occurred, so MIT cancelled the order from TriGenesis. MIT learned later that TriGenesis does not manufacture the IVIG product at its Bangalore facility. Instead, Harbin Sequel Bio-engineering Company, Ltd, manufactures the IVIG that TriGenesis sells in China. TriGenesis provided MIT with a GMP certificate issued by Chinese authorities for the manufacturer, but the certificate did not claim GMP certification according to the WHO and it was a not for the specific product.

During the time spent working with TriGenesis, no further progress was made in selling the IVIG product previously purchased from NBI (South Africa). The product being stored in Puerto Rico was not sold and distributed. It was allowed to expire, some in June 2007 and the remainder in February 2008.

## **SOCIO-CULTURAL MARKETPLACE BARRIERS**

Numerous accounts of quality and safety problems of pharmaceutical and other products manufactured in developing countries by the public have lead to increasing pressure upon businesses and diplomatic agencies to not only address but resolve this problem. There is only one satisfactory solution - manufacture of all precursors and products used within the pharmaceutical industry must originate from facilities satisfied as using Good Manufacturing Practices (GMP). Below are brief excerpts from the GMP certification guidelines used by key organizations.

### **World Health Organization Certificate Scheme on the Quality of Pharmaceutical Products Moving in International Commerce**

"Guidelines are based on good manufacturing practices (GMP) in operation within countries participating in the Convention for the Mutual Recognition of Inspection in Respect of the Manufacture of Pharmaceutical Products, and other major industrialized countries. The Scheme (WHO Certification Scheme) is an administrative instrument that requires each participating Member State, upon application by a commercially interested party, to attest to the competent authority of another participating Member State that:

- A specific product is authorized to be placed on the market within its jurisdiction or, if it is not thus authorized, the reason why that authorization has not been accorded;

- The plant in which it is produced is subject to inspections at suitable intervals to establish that the manufacturer conforms to GMP as recommended by WHO; and
- All submitted product information, including labeling, is currently authorized in the certifying country.”

States (countries) who feel that they meet eligibility requirements apply for membership in the certification Scheme. The WHO maintains a list of authorities in each participating country. Authorities of participating countries issue certificates for products and are asked to follow a standard format to ease in interpretation. Attached to certificates are “Explanatory Notes” about the product. The certificate is not directly issued by the WHO, but by the certifying authority of the manufacturer’s country of origin. Certificates should not bear the WHO emblem, but a statement should always be included to confirm whether or not the document is issued in the format recommended by WHO. The importing country uses the certificate issued by the exporting country when considering licensing the product or extending the license of a product. Applications to certify products include: “the name and dosage form of the product, the name and amount of active ingredient(s) per unit dose (International Nonproprietary Name(s) where such exist(s)), the name and address of product licence holder and/or manufacturing facility, formula (complete composition including all excipients; also particularly when no product licence exists or when the formulation differs from that of the licensed product), and product information for health professionals and for the public (patient information leaflets) as approved in the exporting country.” (WHO, 2008)

## **GMP from Pharmaceutical Inspection Co-operation Scheme (PIC/S) Guide to Good Manufacturing Practice For Medicinal Products**

PIC/S began as the Convention for the Mutual Recognition of Inspection in Respect of the Manufacture of Pharmaceutical Products (cited in the WHO certificate scheme explained above.) The PIC/S GMP Guide is currently used by 33 member authorities in 32 countries, including 22 of the 25 European Union member states, 4 other European nations, Argentina, Australia, Canada, Malaysia, Singapore, and South Africa.

“Originally, the PIC/S GMP Guide (“PIC Basic Standards” of 1972) derives from the WHO GMP Guide and was further developed in order to comply with stringent manufacturing and health requirements in PIC/S countries, to cover new areas (e.g. biologicals, radiopharmaceuticals, etc.) and to adapt to scientific and industrial technology (e.g. biotech, parametric release etc.). The aim of such improvements was to ensure that high quality medicines were produced in line with the PIC Convention and then the PIC Scheme. In 1989, the EU adopted its own GMP Guide, which – in terms of GMP requirements – was equivalent to the PIC/S GMP Guide. Since that time, the EU and the PIC/S GMP Guides have been developed in parallel and whenever a change has been made to one, the other has been amended so that both Guides are practically identical.” (PIC/S, 2008)

## **The International Conference on Harmonisation of Technical Requirements for Registration of Pharmaceuticals for Human Use (ICH)**

The ICH includes representatives from regulatory agencies and pharmaceutical experts from Europe, Japan, and the United States who meet to, “discuss scientific and technical aspects of product registration.” From this group, a subcommittee was formed in 1999 called The ICH Global Cooperation Group (ICHGCG) whose purpose is to, “make available to any country or company that requests it, the information on ICH, ICH activities and ICH guidelines.” In addition to representatives from the three regions mentioned above who make up the ICH Steering Committee, the ICHGCG also includes the ICH Secretariat at the International Federation of Pharmaceutical Manufacturers & Associations (IFPMA), and ICH Observers (from the WHO, Canada and the European Free Trade Association (EFTA)). The IFPMA is a non-profit, non-governmental Organization (NGO) representing national industry associations and companies from both developed and developing countries. “Other regional harmonisation initiatives (RHIs), namely Asia-Pacific Economic Cooperation (APEC), Association of Southeast Asian Nations (ASEAN), Gulf Cooperation Countries (GCC), Pan American Network

on Drug Regulatory Harmonization (PANDRH) and Southern African Development Community (SADC), have been invited to designate permanent representatives to the GCG.” (ICH, 2008)

## **U.S. Food and Drug Administration (FDA)**

The FDA is responsible for protecting the public health by assuring the safety, efficacy, and security of human and veterinary drugs, biological products, medical devices, our nation’s food supply, cosmetics, and products that emit radiation. The FDA is also responsible for advancing the public health by helping to speed innovations that make medicines and foods more effective, safer, and more affordable; and helping the public get the accurate, science-based information they need to use medicines and foods to improve their health. The Code of Federal Regulations (CFR) is the codification of the general and permanent rules published in the Federal Register by the executive departments and agencies of the U.S. Federal Government. As part of the GMP certification a number of regulations are used. Title 21: Food and Drugs, part 640 addresses Additional Standards for Human Blood and Blood Products. Subpart J addresses Human Immune Globulin including 1) Proper naming, 2) General Requirements, 3) Manufacture of Human IG, 4) Final product and 5) Potency. (National Archives, 2008)

## **PREPARING FOR GLOBAL SALES OF IVIG**

Returning to the fundamental questions that sparked this inquiry, 1) can a partnership in IVIG production develop between an USA based company and an India based company? and 2) can the IVIG product developed through the USA-India partnership be competitive in the global marketplace given the governmental, safety, and consumer perception barriers? The answers are somewhat opaque but learning from this experience, a partnership such as this can be developed, should be developed and must be developed considering the worldwide production of such products. Barriers can be reduced to create a salient marketplace for these products. In order to have positive outcomes considering both of these questions a number of steps must be taken in order to develop a successful partnership between an U.S. and foreign manufacturer in order to distribute IVIG and other blood products within a viable market. These include:

- 1) Identifying a manufacturer that is GMP certifiable under an accepted regulatory agency
- 2) Thoroughly reviewing the GMP certification of the potential manufacturer under the appropriate regulatory agency.
- 3) Thoroughly reviewing the GMP certification requirements of the countries exporting and importing the IVIG product.
- 4) Ensuring proper logistical support to maintain the products viability as well as meeting agency regulations.
- 5) Ensuring oversight by in-house managers qualified in pharmaceutical GMP.

These steps of due diligence would enhance the potential and reduce the risk of such business ventures.

## **CONCLUSION**

In the ‘no error’ healthcare treatment business, safe and effective blood-based biological products such as IVIG are essential to modern medicine. Demand for such products will continue to increase yet the business culture, social culture and worldwide standards must be considered in the equation of a business partnership of this kind. The due diligence required should incorporate the essential steps listed previously. Originally, it was hoped that this partnership would produce the desired outcomes and that this manuscript would focus on the socio-economic marketplace and barriers to psychological entry into that market, however, the reality of the struggles of this type of partnership produced a more valuable set of tenets that could facilitate improved international partnerships of this kind in the future.

## ABSTRACT

*This paper studies country and brand image multi-dimensional structures across several brands, countries, and products. Results show a consistent direct effect of country image on brand image, a consistent direct effect of country image on product evaluation, and a less consistent effect of brand image on product evaluation. Results support Laroche et al (2005) finding that there is a simultaneous effect of country and brand images on product evaluation in addition to there separate effects.*

## INTRODUCTION

The marketing literature abounds with research evidence in support of a significant effect of country of origin information or product country image on brand image perception, product evaluation, and consumer subsequent behavior (Bilkey and Nes, 1982; Verlegh and Steenkamp, 1999; Jaffe and Nebenzahl, 2001).

Though numerous were the research, few that have attempt to conceptualize country image and brand image as multidimensional constructs actually measured by a set of separate dimensions (Hsieh et al, 2004; Laroche et al, 2005). The multidimensional aspect of human cognitive structure (Farquhar and Herr, 1993) implies that consumers are likely to perceive images through different dimensions varying in terms of strength and number. The present paper aims at studying those two concepts and their potential interactions across several products, brands, and countries. The primary goal is to provide further clarifications on the complex issue of country image and brand image cognitive processing and structure. We first describe and empirically test country image and brand image as multidimensional concepts. Subsequently, we test the relationship between country image, brand image, and product evaluations. The findings are then interpreted and practical implications are discussed.

## BACKGROUND

Brand image is the reasoned or emotional perceptions consumers attach to a specific brand. It consists of functional and symbolic brand beliefs (Dobni and Zinkhan, 1990) (10). Brand image is made up of brand associations. "Brand associations are the category of brand's assets and liabilities that include anything "linked" in memory to a brand" (Aaker, 1991) (11). Associations are informational nodes linked to the brand node in memory that contains the meaning of the brand for consumers (Keller et al, 1998) (12). According to the associative network model (Farquhar and Herr, 1993) (8), a person's memory is made up of links and nodes: links represent relationships (positive or negative, weaker or strong), and nodes represent concepts (e.g. brand associations) and objects (e.g. brands). Beliefs have two structural properties, namely, abstraction and complexity. Its must be taken into account in assessment of the structure of brand associations. The role of abstraction in classifying associations finds its evidence in the means-end chain theory, which reflects the

memory linkages among attributes (i.e., means), consequences, and attitude (i.e., end) on the basis of the notion that the product and the consumer's sense of self may be hierarchically linked through an interconnected set of cognitive elements along with different levels of abstraction. The role of complexity finds its rigueur in Eagly and Chaiken's (1993) (15) work. The authors affirmed that the complexity of beliefs associated with an attitude object is typically defined as the dimensionality of the beliefs that a person holds about an attitude object, i.e., the number of dimensions needed to describe the space utilized by the beliefs ascribed to the attitude.

The matricidal shape of human memory backs of multidimensional perceptions of human being. Brand image is likely to be perceived along different dimensions linking the nodes in human memory. In an international study about cars, Hsieh et al (2004) found that brand image has a three-dimensional structure enclosing symbolic benefits, experiential benefits, and functional benefits. Koubaa (2007) found similar results with brands of electronics. Brand image has multiple facets in consumer's imagination. Early researches on brand image perception revealed differences among brands images with brand image concept taken as an overall entity across countries of production (Barnabas and Jonathan, 1999; Usunier, 2002), across brands (equities) (Baker and Michie, 1995; Buhian, 1997), and across products. Knowing that brand image is better assessed when conceptualized as multidimensional and relying on past researches' results, it is safe to expect that brands images structures will differ across countries of production, across brands, and across products.

*H1: brand image has a multidimensional structure rather than a single factor structure.*

*H2: brand image structures differ across countries of production, across brands, and across products*

Papadopoulos (1993) posits that the image of an object results from people's perceptions of it and the phenomena that surround it. Based on the studies conducted in eight countries, Papadopoulos et al (1988) were among the first to incorporate distinct country image measures in country of origin research, and the first to attempt to model the relationship between country beliefs, product beliefs, familiarity, and product evaluation and willingness to buy, using structural equation modeling. After further elaborating of the data from the above and other studies, they proposed that consumers' perceptions of the country image comprise: a cognitive component, which include consumers' beliefs about the country's industrial development and technological advancement; an affective component that describes consumers' affective response to the country's people; and a conative component, consisting of consumers' desired level of interaction with the sourcing country.

Despite the theoretical appeal of the above conceptualization, most empirical studies have not considered the multidimensionality of country image when operationalizing the construct (Laroche et al, 2005). Further, most measured country image through product rather than country measures (Han, 1989), and some focused on affect-oriented country/people measures rather than cognitive ones (Knight and Catanlone, 2000). Laroche et al (2005) tested Papadopoulos et al (1988) model of multidimensional country image. Relying on a large investigation and on a structural equation modeling, they found that country image is well assessed through three dimensions namely; country beliefs, people affect, and desired interaction with the people of that country.

Adding the matricidal shape of human memory presented earlier, similarly with brand image, country image should be conceptualized as a multidimensional concept enclosing country beliefs, people affect, and desired interaction. Such conceptualization appears to be more suitable and accurate in extracting country of origin effects.

As with brands, country images had been found to be different across countries (equities) when taken as an overall entity. Hence, we expect that different countries will exhibit different image structures.

*H3: country image has a multidimensional rather than a single factor structure.*

*H4: different countries will exhibit different image structures*

A significant impact of country image on brand image perception was well supported (D'astous and Sadruddin, 1999; Kotler and Gertner, 2002; Stennkamp et al. 2003; Hsieh et al, 2004; Cervino et al, 2005)

When evaluating a product, consumers compare the sponsor brand to a brand A on attribute X (e.g. country of origin), to brand B on attribute Y (e.g. style), to brand C on attribute Z (e.g. reliability) and so on. For a final choice to be established, one brand is likely to be evaluated along many dimensions. In line with pervious findings (product country image as a single factor affects brand image as a single factor), we propose that product country image as multidimensional construct will affect brand image as multidimensional construct.

*H5: multidimensional country image will have a significant effect on multidimensional brand image.*

Categorization theory suggests that since the capacity of short term memory is limited and external stimuli are many, people will divide stimuli in their environment into categories to get the most useful information for the least effort and to ensure that the environment is inherently structured (Coupey and Nakamoto, 1988). According to the categorization theory, attitudes toward a stimulus are directly related to attitudes associated with the activated category (Alba and Hutchinson, 1987; Fiske, 1982). Consumers have to deal with categorical cues like brand name and country of origin when they form attitudes toward products. In term of consumers purchasing

foreign products, the country of origin information as well as others products attributes may serves as cues, which will activate certain experience or information (schema) associated with the relevant country or brand, which in turn will guide the consumer to put the product in a certain category stored in memory. The consumer will make then a favorable or unfavorable decision (product evaluation, purchase intention) accordingly. Consequently, when consumers are processing product related information, the activated stereotyped country or brand image associated with the product will have significant impact on product evaluation and preference formation.

*H6: product country image and brand image are significantly related to product evaluation*

To test our hypotheses, we propose a model inspired from the “flexible” model of Knight and Calantone (2000). The product country image and brand image are both conceptualized as multidimensional constructs. Dimensions are drawn based on a principal components analysis (PCA) followed by a confirmatory factor analysis (CFA) of the pattern of items measuring each brand and each country image. Han (1989) concluded that, depending on consumers’ level of familiarity with the country’s products, country image may serves as a Halo from which consumers’ infer a product’s cues, or as a summary construct that summarizes consumers’ beliefs about these cues. Knight and Calantone (2000) criticized Han’s conceptualization for not accounting for the simultaneous processing of country image and brand image that take place during consumer attitude formation. They came with a “flexible” model that explicitly accounts for the simultaneous processing of country image and brand image. The authors argue that both the country image and brand image are used simultaneously and in varying degrees to form attitudes toward the product. Furthermore, country image is assumed to have indirect effect on product evaluation through brand image. The proposed model posits a simultaneous processing of country image and brand image. Country image is expected to influence brand image (H5) which in turn will affect product evaluation. In addition country image is expected to have a direct effect on product evaluation.

*H7a, Country image is significantly related to brand image*

*H7b: Country image and brand image are significantly related to product evaluation.*

Figure I: the proposed model

## METHOD

A within-subject investigation was performed in Japan, reflecting the Japanese-Asian culture; France, reflecting the European culture; and Tunisia, reflecting the Arab-Muslim culture. Three products (computer, hand cream, and sport shoes) and three brands for each product were investigated. Each respondent was provided with two alternatives for each brand. In total we had 3\*3\*2 combinations (3 products\*3 brands\*2 alternatives) which result in 18 alternatives. Other product cues (e.g., price, warranty, etc) were provided in accordance with their appearance on the market. Brands and country labels were varied among alternatives by a way to have different combinations in terms of brand and country of origin equities. Product categories, brand names, country labels, and other product cues were fixed through two phases. First, a discussion séance involving marketing professors and MBA students was held. The séance ends with three product categories namely, electronics, apparels and shoes, and cosmetics; and three brands, respectively three countries of origin, for each product category. Similarly, we selected a product to be investigated from each category. Product cues, other than brand name and country of origin, were fixed by the researchers based on a literature review. Second, final respondents were asked to evaluate countries labels and brand names equities. Brand image items were developed from the set of retained cues. Items for country image were reproduced from the work of Laroche et al (2005). Table 1 presents brands and country labels and their classifications via the discussion séance.

**Table 1: brands and country labels classification**

| Product category | Brand by order of equity | Country by order of equity |
|------------------|--------------------------|----------------------------|
|------------------|--------------------------|----------------------------|

|             |                         |                    |
|-------------|-------------------------|--------------------|
| Computer    | Dell/Sony/Acer          | Japan/France/China |
| Hand cream  | Nivea/L'oreal/Shiseido  | France/Japan/China |
| Sport shoes | Nike/Asics/Lecoqsportif | France/Japan/China |

All scales were a five point scales ranging from 1: totally disagree to 5: totally agree. 1400 respondents were provided with the questionnaire: 500 from Japan, 500 from France, and 400 from Tunisia. The main criterion of selection was the experience of buying and/or using the product. Useful returned questionnaire were 448. Respondents have an average age of 34.5 years, an average yearly income of 10000 USD, 32% have a senior high school education, 54% have a university education, 10% have a graduate level and 4% have other levels. 220 were males and 228 were females. Cronbach's alphas were all superior to the cut point of 0,7 indicating acceptable reliabilities. KMO-Bartlett test of sphericity were all significant supporting the multidimensional structure of the used scales.

## FINDINGS

Scores' mean and standard deviation (*SD*) values confirmed the classifications of brands and countries labels via the discussion séance with computers and hand cream. With sport shoes, Asics and Lecoqsportif as brands and France and Japan as country labels had similar means values and a *SD* close to 1. Asics was slightly better than Lecoqsportif and France and Japan had almost same perception. China had the lowest score as a producer of good sport shoes and Nike had the highest score as a famous brand of high quality sport shoes. Though, the classification via the discussion séance was not exactly confirmed, it was almost confirmed. To extract country and brand images structures, we proceed by a principal components analysis (PCA) with Varimax rotation.

**Table 2: PCA results for brands images structures:**

| Alternative | Structure       | Specification   | %     |
|-------------|-----------------|---|-------|
| DELL1       | Bi-dimensional  | Operational and market performance                          | 54.34 |
| DELL2       | Bi-dimensional  | Operational performance and appearance                      | 62.08 |
| SONY1       | Bi-dimensional  | Overall performance and economic performance                | 57.88 |
| SONY2       | Bi-dimensional  | Overall performance and durability                          | 59.63 |
| ACER1       | Bi-dimensional  | Durability and economic performance                         | 64.27 |
| ACER2       | Uni-dimensional | Overall performance   | 59.94 |
| SHISEIDO1   | Uni-dimensional | Overall performance   | 49.14 |
| SHISEIDO2   | Uni-dimensional | Overall performance   | 51.03 |
| NIVEA1      | Uni-dimensional | Overall performance   | 53.46 |
| NIVEA2      | Uni-dimensional | Overall performance   | 57.07 |
| L'OREAL1    | Bi-dimensional  | Suitability and reliability                                 | 54.57 |
| L'OREAL2    | Bi-dimensional  | Suitability and operational and market performance          | 63.45 |
| NIKE1       | Bi-dimensional  | Operational and market performance                          | 50.77 |
| NIKE2       | Tri-dimensional | Reliability, appearance, and durability                     | 63.95 |
| ASICS1      | Bi-dimensional  | Appearance and durability                                   | 57.07 |
| ASICS2      | Tri-dimensional | Operational performance, appearance, and market performance | 65.25 |
| COQSPOR1    | Bi-dimensional  | Operational and economic performance                        | 63.12 |
| COQSPOR2    | Bi-dimensional  | Operational and market performance                          | 51.53 |

When most of items are correlated to one factor, we named it as "overall performance". Otherwise it is named with accordance to the following classification: operational performance (those items assessing the operational aspect of the product such as good performers, do not need frequent repairs, long lasting, and highly technical with computers; has no undesirable effect, highly efficient, and with long effect with hand cream; and highly technical, good performers, does not harm my feet, and long lasting with sport shoes); appearance with computers and sport shoes (those items assessing the outside appearance of the product such as good looking and luxurious) and suitability with hand cream (e.g., suitable for my hands and reliable); perfection (manufactured under strict norms); and finally economic performance (inexpensive) and market performance (sold worldwide). 13 alternatives revealed multidimensional structures and 5 delivered one-dimensional structures. Though, there is a dominance of "operational performance" as a first factor across several brands, consistent differences are remarkable along the second factor and the third factor. Differences were found across brands (e.g., Dell1/Sony1; Shiseido1/L'oreal1; and Nike1/Asics1), across the same brand produced in different countries

(Dell1/Dell2; L'oreal1/L'oreal 2; and Asics1/Asics2), and across products. The robustness of the extracted structures (multidimensional structures) was examined via a confirmatory factor analysis (CFA). First PCA was run based on the data of the whole sample (the data collected in the three countries together). With CFA, each structure was checked three times with reference to the data of each country separately. Such method ensures the diversification of data among different contexts and hence strengthens the reliability of the results. Table 3 presents CFA results:

**Table 3: CFA results for brands images structures:**

| Alternative  | GFI   | RMR   | RMSEA | Chi <sup>2</sup> | Alternative           | GFI          | RMR          | RMS EA       | Chi <sup>2</sup> |

*Note: Jap: Japan/ Fra: France/ Tun: Tunisia*

Except for Coqsportif1 with Tunisia sample, all others structures had been confirmed. Structures' confirmations were based on a combination of indices namely, GFI (Goodness-of-fit index), RMR (Root-mean-square residual), Chi<sup>2</sup> (Chi-square), and RMSEA (Root mean square error of estimation). GFI should be near to 1, RMR should be close to 0, and RMSEA should be within the interval 0.05 and 0.08 or close to those two poles. Based on PCA and CFA results, albeit the one-dimensional image structures for some brands, most of the studied alternatives revealed multidimensional image structures. Differences in brand image structures were found across different brands produced in the same country, across brands produced in different countries, and across products. Hence H1 is partially confirmed and H2 is totally confirmed.

Similarly with brands images, countries images were first extracted through PCA from the data set of the three countries then checked via CFA with reference to the data set by country of investigation. Because the items drawing country image cannot be used to ask respondents about the image of their own country, the images of Japan and France are thus checked with reference to two samples only.

**Table 4: PCA results for countries images:**

| Country | Structure      | Specification                           | %     |
|---------|----------------|---|-------|
| Japan   | Bi-dimensional | Country beliefs and people affect       | 56.04 |
| France  | Bi-dimensional | Country beliefs and desired interaction | 57.79 |
| China   | Bi-dimensional | People affect and country beliefs       | 61.66 |

**Table 5: CFA results for countries images:**

| Alternative | GFI   | RMR   | RMSEA | Chi <sup>2</sup> | Alternative | GFI   | RMR   | RMSEA | Chi <sup>2</sup> |
|-------------|-------|-------|-------|------------------|-------------|-------|-------|-------|------------------|
| Japan Fra   | 0.977 | 0.020 | 0.049 | 0.974            | China Jap   | 0.963 | 0.034 | 0.075 | 1.533            |

| France Tun  | 0.959 | 0.053 | 0.075 | 1.607            |             |       |       |       |                  |

*Note: Jap: Japan/ Fra: France/ Tun: Tunisia*

Goodness-of-fit indices (GFI, RMR, and RMSEA) show an acceptable fit and hence extracted country images can be confirmed. Japan, France, and China had all multidimensional and different image structures. Dimensions differ in terms of content and explanation power. Country beliefs was the first dimension with Japan and France, however it was the second with China which had people affect as the first dimension. People affect was the second dimension with Japan and desired interaction was the second dimension with France. “Country beliefs” appears to be a consistent dimension with high equity countries. People affect was the most dominant component of low equity country image. Hence H3 and H4 are totally confirmed.

A full model was developed for each alternative revealing a multidimensional brand image. Country and brand images were those confirmed via CFA. Product evaluation was an observable variable actually measured by one question. Structural equation modeling (SEM) using AMOS4 served for analyzing those models.

**Table 6: SEM estimation results:**

*NB: only significant models that are presented*

| Alternative  | GFI   | RMR   | RMSEA | Chi <sup>2</sup> | CI→BI (p)     | CI→PE (p)            | BI→PE (p)           |

| Coqsportif 2 | 0.895 | 0.090 | 0.078 | 3.849            | 0.270 (0.08)  | <b>0.274 (0.147)</b> | <b>1.577 (0.23)</b> |

*Note: CI: country image/BI: brand image/PE: product evaluation*

Only 7 alternatives led to consistent models. Across the three product categories, there are alternatives of high equity brands and country labels. However, there are alternatives of high and low equity brands (Dell, Sony, and Nike/ Acer, Asics, and Coqsportif) with low and high involvement products only. Risky products (hand cream) had only one alternative of high equity brand (L'oreal). As with CFA, selection of consistent models was based mainly on three indices namely, GFI, RMR, and RMSEA. All the 7 alternatives revealed a significant effect of country image (CI) on brand image (BI) at  $p < 0.1$  and 6 supported a significant impact of country image on product evaluation (PE) at  $p < 0.1$ . However, only 2 alternatives that had a significant effect of brand image on product evaluation. Hence H5 is totally confirmed and H6 is partially confirmed.

## DISCUSSIONS

Consistent with Hsieh et al (2004) and Koubaa (2007) we found that brand image may have a multidimensional structure in consumer mind. Brand image structures are found to be different across brands, across the same brand produced in different countries, and across products. Dimensions of brand images differ in terms of number and strength. Multidimensionality implies a need among consumers for multiple and specific information. Depending on the product category, brand's equity, and country of origin; consumers' need for brand related information differ. When brand and country of origin are incongruent (high vs. low equity brand and country and vice-versa) and there is no advantage in other attributes, (e.g., price, warrant, etc) consumers express a need for numerous information with the focus on operational performance (e.g., Dell2, Sony2, L'oreal2, and Nike2). However, if they are incongruent and one or many other attributes are better than those of other available alternatives, consumers appear to proceed by a trade off between main attributes (attributes they perceive the most important) and try to infer an overall performance of the product without segmenting the brand image (e.g., Acer2, Shiseido1, Shiseido2, Nivea1, and Nivea2). In the later case, marketers should focus more on the upper attributes to orient consumers towards a trade off and escape the incongruence of the brand-country match.

Moreover, this research proved that country image has a multidimensional structure varying across countries. Nevertheless, unlike Laroche et al's (2005) findings, we found that country image has a bi-dimensional structure. With high equity countries (e.g., Japan and France), the cognitive component dominates followed by the affective component with Japan and the conative component with France. With low equity countries (e.g.,

China), the affective component had the biggest contribution followed by the cognitive one. Marketers should look at the country image as a combination of those country specificities. Product country image related research concentrated on how consumers feel and behave when they are exposed to the country of origin information. In this research, we focus on what shape this image in consumers mind and how they may use it to perceive brand image and infer product evaluation. Our findings indicate that regardless of the country image structure, there is a strong effect of country image on brand image. However, the effect on product evaluation was stronger with countries that have a strong cognitive component (e.g., Dell1, Acer1, Shiseido1, L'oreal1, Nike1, and Asics1) than with countries that have a strong affective component (e.g., Sony2 and Coqsportif2). Country image and brand image affect simultaneously product evaluation. The latter finding was not strongly supported, only Sony2 and Acer1 that led to significant simultaneous impacts of country image and brand image on product evaluation. Sony2 and Acer1 are alternatives of high involvement products and both experience incongruence between brand and country equities. Dell1, a congruent alternative led to a non-significant impact of brand image on product evaluation. Congruent (Nike1 and asics1) and incongruent (Coqsportif2) alternatives of low involvement products led to non-significant effects of brand image on product evaluation. The unique congruent alternative of risky products (L'oreal1) led too to non-significant impact of brand image on product evaluation. When the cost of inappropriate evaluation is high, case of most high involvement products, consumers express a higher need for an accurate evaluation. Previous findings showed that a high equity brand logo or a high equity country label provide consumers with a psychological warrant about the reliability of the alternative and ease the task of evaluation. Nevertheless, those two cues are not always congruent and usually lead to disparate information. Anderson (1981) proved that corroborate information lead to an easily deductible positive evaluation and disparate information lead usually to a negative evaluation preceded by a developed cognitive effort. This research testifies Anderson's (1981) conclusions. With incongruent alternatives of high involvement products, country image and brand image interact (positive effect of country on brand image) and both images influence simultaneously product evaluation. Consumers seem to indulge in an effortful processing of all the available information hoping for the most accurate evaluation and hence minimizing the probability of a costly wrong choice. With low involvement products, brand image appears to be with less effect on product evaluation comparing to country image. However, product evaluation was influenced by country image in both cases of congruence and incongruence. The effect of brand image on product evaluation appears to be absorbed by, and transferred into the effect of country image with low involvement products. Congruent alternative of risky products had similar results to those of low involvement products. Regardless of product category, brand name, and brand-country congruence; product country image looms heavily in product evaluation and affects significantly brand image perception. Nevertheless, brand image effect is product and brand-country congruence specific. When highly involved; under brand-country incongruence, consumers tend to recall more information, to process it independently and simultaneously to get the most accurate evaluation; under brand-country congruence, the process is simplified and product country image gains in importance in deducting brand image perception and product evaluation. Marketing actions should be specified along a matrix of criteria including product category, brand equity, country equity, and brand-country congruency/incongruence. Under brand-country congruency of high involvement products, product country image should be emphasized through promotional activities. Brand should also be emphasized; nonetheless, it should be under the shadow of the product country image which prime in consumers' minds. Under brand-country incongruence, both cues should be emphasized with more effort to the brand image. With the two incongruent alternatives Sony2 and Acer1, the absolute value of the effect of brand image on product evaluation is much higher than the absolute value of the effect of country image on product evaluation. Under incongruence, brand image primes in consumers' minds. Under brand-country congruency of low involvement and risky products, country image should be the focus. Implications for low involvement and risky products under incongruence conditions could not be provided as there are no significant alternatives. This question is a window for future researches.

As most studies, this research has its limitations. First, we could not test for the effect of consumers' familiarity with the country product. Further research may face those limits by a more convenient choice of brands and countries and a wider sample. Second, the use of non-experimental data in modeling casual relationships may relatively affect the reliability of our findings. However, we think that this limitation is attenuated by the use of structural equation modeling.

# RECONSIDERING COUNTRY OF ORIGIN EFFECT

**Yamen Koubaa**

**University of Marketing and Distribution Sciences, Kobe, Japan**

## ABSTRACT

*This paper proposes that the confliction marking COO researches may be due in part to the quantification of human judgment and the research settings. Relying on the scatter model and on a likely real purchase situation, this paper shows that the impact of country of origin related attitudes is either significant or non-significant and varies in strength depending on a matrix of attitudes influencers. Moreover, it tests for the effect of any variation of country of origin information on product evaluation and for potential interaction between country of origin and product evaluation in affecting consumer behaviour.*

## BACKGROUND

Human cognitive structure is complex (Farquhar and Herr 1993) and product's cues are numerous and variable. Hence consumers as well as researchers tend to simplify the task of decision, the former by relying on image to infer a judgment (Huber and McCann 1982) and the later by assuming linear or a specific non-linear structure of human thinking (Goldberg 1968). The study of behaviour is, in large part, the study of decision making. Decision making is a major characteristic of consumer behaviour (Green and Wind 1973). Whenever we make a decision, we are faced by a multitude of alternatives; each one may be specified along numerous attributes. One alternative may be better than another on one attribute, yet worse on another. Attributes may be consistent or inconsistent. Hence going to gain on accuracy, consumers anchor their decisions on a multi-attribute evaluation. Understanding consumer decision making requires ascertaining how one trades off between attributes. The task is no doubt complex. Marketers have two choices when dealing with this complexity. Either they will severely simplify the phenomena under study and base all their conclusions on the simplified model; or attempt to grapple with all the complexities simultaneously, hoping for an inspired solution. Statisticians, psychologists, and marketers are struggling since decades to find the best way to quantify human decision making which results in a multitude of scales and models.

Although, COO researches were many, conflicting were their results (Samiee, 1994). Many scholars have tried to find the reasons behind such confliction. For instance, Bilkey and Nes (1982) argue that the single-cue research setting may be one of the reasons and Lielfeld (2004) posits that most of the significant detected COO effects are probably due to experiments' manipulations and not due to its reliability in affecting consumers' decisions. However, possible effects of inappropriate human decision quantifying models in creating such confliction were not evoked. Most of the COO researches were designed to check for the presence or the absence of effects. Each research had a specific setting and researchers, usually relying on comparative methods, e.g., T-tests, ANOVA, and MANOVA; or on linear explicative methods, e.g., linear regression; tried to prove a significant effect of COO on product evaluation or to deny it within the framework of their experimental settings. Those settings suffer often from being unrealistic or manipulated to drive respondents' answers. Moreover, usually researchers decided about the way they will process respondents' answers before collecting the data and forget that what we expect (as researchers) to have -in terms of shape and quality of the data- from respondents' answers is not necessary what we will get exactly and sometimes does not even converge toward what we expect. Our position is that a reconsideration of COO effects along two dimensions may draw us near to its exact effect, namely situation's characteristics (research setting), and decision making assessment. First we propose to simulate a real purchase situation. Second, with reference to Brannick and Bannick's (1989) scatter model, we will try first to detect the shape of respondents' answers and then study COO effects related attitudes accordingly.

One intriguing observation in the marketing research is that some attitudes have a strong impact on consumer's perception and behaviour, whereas some others attitudes do not influence a person's actions at all (Doorn et al. 2007). Albeit, the proven strong relation attitude-behaviour in psychology literature, many empirical researches in marketing find only low effects of attitudes on behaviour, namely those related to COO information. We suggest that the conflicting evidence on the attitude-behaviour link is partly due to only extreme attitudes effecting behaviour. Thus, possible non-linearity not detected by standard linear models could occur in the relationship attitude-behaviour. That's to say, depending on attitudes' strength, consumers are likely to proceed either by a simple way (mostly reflected in traditional linear models) of processing the information related to the attitude's stimuli or by a more complex way of combinations (better assessed through non-linear models) (Holland, Verplanken, and Van Knippenberg 2002) before they took the final decision. An example from the field of public policy is that many consumers –to some extend- are aware about the global warming and care about the environment; however most of them do not behave in an environmentally friendly way, which is reflected in the excessive use of energy, excessive consumption, and continuous devastation of the eco-system. In terms of consumers purchasing products, COO, brand, and others cues will serves as attributes to evaluate and distinguish between alternatives. Attitudes towards attributes differ in terms of strength (relative importance for consumers) and sign (positive with one alternative and negative on another alternative); and alternatives are many. Thus consumers may proceed by a simple or a complex way of combining attitudes towards attributes and then infer an evaluation. hence, going to solve a part of the COO effects confliction, it seems wise to set first a reliable research setting and second to look on the shape of consumers' thinking (linear or non-linear) before studying the effect of attitude, e.g., COO related attitudes, on judgment and behaviour.

Several linear models have been developed to assess consumer decision making. Linear regression is probably the famous and the most used one. Similarly, many non-linear models emerged. Perhaps logarithmic, exponential, and the multiplicative models are the most known and used. However, and despite its salience and proven superiority to other non-linear models, the scatter model (Brannick and Brannick 1989) had been rarely used to assess human decision process. The Scatter model is a mix of a linear model and a Scatter term. Eq1:

$$y = a + b_1 X_1 + b_2 X_2 + ..... + b_n X_n + b_{k+1} \sqrt{\sum_{i=1}^n (X_i - \bar{X})^2} \text{ Where:}$$

$X_i$  is the  $i$ th reaction toward an attribute,  $\bar{X}$  is the average of reactions in one profile,  $B_{k+1}$  is a coefficient to estimate. It indicates whether consumer is more influenced by negative values or positive values when evaluating a product. The first part is as a linear model. The second part is a sum of the negative or positive values that may occur when evaluating each attribute according to the decision maker expectation. The scatter term measures the sum of deviation of consumer's reactions toward each attribute. The scatter term model enables us to disclose whether consumers have referred to a linear combination or to a non-linear combination while evaluating the product. If the estimated relation is really linear then the scatter term will be non significant and the traditional linear model is rejoined. However, if it was really non-linear, the scatter term will be significant and subject to a negative or a positive value. The signal of the scatter term is of a great utility. In fact, if it is negative, that means that the consumer evaluation is more influenced by negative reactions toward attributes than by positives ones. If it is positive, that means that the consumer is more influenced by positive reactions than by the negative ones.

*H1: the significance and the strength of the country of origin related attitudes on product evaluation will depend on the situation's characteristics and the way consumers process attributes related attitudes.*

The Scatter model may result in either a linear or a non-linear model depending on the way consumers combine information. Though linear combinations seem to be easy to understand, non-linear combinations require further investigation. Non-linearity in decision making can be expressed in two different functions: the marginal utility function and the interaction effect

Once the evaluation along one attribute increases or decreases, the resulted effect on overall evaluation will occur at a decreasing or increasing rate for each increase or decrease in the reaction to the attribute. That's to say there is a disproportional effect of each reaction toward a given attribute on the overall evaluation: a marginal utility. An increasing marginal utility means that increases in overall evaluation will occur at an increasing rate for each unit of increase in reaction towards a single attribute. A decreasing marginal utility argues that increases in overall evaluation will occur in a decreasing rate for each unit of increase in reaction toward a single attribute. Marginal utility can be assessed through a second-order polynomial model.

Eq2:

$$y = a + \sum_{i=1}^n biXi + \sum_{i=1}^n bjXi^2 + e \text{ Where}$$
