PUBLISHED BY THE GLOBAL BUSINESS AND TECHNOLOGY ASSOCIATION

ISBN: 1-932917-05-5

The materials published in this Readings Book may be reproduced for instructional and noncommercial use. Any use for commercial purposes must have the prior approval of the president of the Global Business and Technology Association.

All full papers submitted to the Global Business and Technology Association Conferences are subject to a peer reviewing process, using subject specialists selected because of their expert knowledge in the areas.

Global Business and Technology Association (GBATA) is publishing partner with EBSCO Publishing. This allows researchers from throughout the world to access articles from the Readings Book.

Printed in the United States of America, 2009.

FORWARD

The purpose of the conference is to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations of new challenges in global business and technology: strategies, policies and issues.

All full papers submitted to the Global Business and Technology Association Conferences are subject to a peer reviewing process, using subject specialists selected because of their expert knowledge in the areas.

Academicians, practitioners, and public policy makers at all levels throughout the world submitted original papers for conference presentation and for publication in this Readings Book. All competitive papers were refereed (subject to a peer review). The result of these efforts produced 458 empirical, conceptual and methodological papers involving all functional areas of business education with a special focus on international aspects. Of the 315 papers accepted for presentation at the conference, 163 papers are published in this Readings Book.

ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the Eleventh Annual International Conference of the Global Business and Technology Association (GBATA). The GBATA extends its many thanks to the financial sponsors of this conference: Brno University of Technology, Brno, Czech Republic; Charles University, Prague, Czech Republic; Polytechnic Institute of Leiria, Portugal; State University of New York-Old Westbury, USA; and Tshwane University of Technology, Pretoria, South Africa.

A successful conference could not be possible without the special cooperation and care of the program committee members. Furthermore, many thanks go to the reviewers for reviewing the many papers that were submitted to this conference.

The last but not the least important acknowledgement goes to all these who submitted their work to be considered for presentation at the conference. Also, special thanks to the session chairs and discussants for taking the extra time to make this conference a success.

FIVE YEARS OF BANKING ANALYSIS WITH THE HELP OF PRODUCTION FUNCTION

August Aarma and Jaan Vainu
Tallinn University of Technology, Estonia

ABSTRACT

Econometric models have not been widely used for thorough analysis of the statistics published by Estonian banks. So far no one except the present authors has made an attempt to use models to prognosticate the amount of total income during the following period(s).

The article presents the results of analyses made by the authors during the last five years. These results have been published in a number of collections of research articles and have been reported on international conferences worldwide (in Mexico, South Africa, Egypt, Poland, Check Republic, Chile, China, USA, etc.).

From econometric models the Cobb-Douglas production function with income-earning assets, equity, liabilities and fixed assets as inputs was selected. The time period chosen is from the first quarter of 1995 to the end of 2007, that is a total of 52 periods. The secondary condition set was that the sum of the elasticity multipliers α and β should equal 1.

The balance sheets and income statements published quarterly by the banks were used as the empirical base of analysis.

INTRODUCTION: THEORETICAL BACKGROUND AND OVERVIEW OF RELATED LITERATURE

The history of econometric models is rich and varied. In the 1960s researchers were hypnotically fascinated by the opportunities offered by the introduction of econometric models. However, this history has suffered also less brilliant days: when in numerous countries the actual level of inflation surpassed the level prognosticated economists began to doubt the usefulness of applying econometric models. It was found that the time span over which interrelationships between economic indicators are stable is not long enough and therefore these indicators cannot be used for economic forecasts (Greespan, 2001). It was found that the forecasts made with the help of such models need continuous tuning and are therefore too expensive. (Gaida et al., 1998). Still, over time econometric models have been improved and are again widely used in making economic forecasts.

Economy as a whole functions like a joint organism for which banking is a very important, even vital part. No wonder that in this vital part of economy econometric models have found quite wide application. For example, in 2001 analysts of the World Bank used an econometric model to analyse the influence of deposit insurance on the development of the financial sectors of nations (Cullet et al., 2001). In numerous banks economic indicators have been analysed with the help of econometric models in order to prognosticate the activities of the bank in the future. It was as early as in 1975 that the Federal Reserve Bank of Minneapolis used an econometric model to assess economic activity in the United States. In that model the total output of the economy was selected as the input variable and different components of the federal budget, indicators of employment and some other indices were used as independent variables (Supel, 1975). The latest example of the use of an econometric model in banking analysis could be the model constructed under the guidance of Timothy J. Richards, which treats the competitiveness of banks located in small towns and in rural places in the United States depending on the distances between the banks (Richards et al., 2007). The award of the 2003 Nobel Prize in Economics to Robert Engle crowned econometrics as

a successful branch of economics. The Prize was awarded to Engle for research into methods of analysing economic time series with time-varying volatility (ARCH) and the application of ARCH in the evaluation of banking risks and pricing options (Engle, 2003).

In addition to US economists, econometric models have been applied for analysing banking also by researchers from Russia (Zamkova, 2002; Kraminski, 2003), Ukraine (Azarenkova, 2004), Finland (Pesola, 2005), India (Sathye, 2005), Nigeria (Balogun, 2007) and several other countries. All they set different goals and they used different models; however, the ultimate aim was analogous: prognostication of future conditions on the basis of data collected.

An econometric model used for analysis by the Central Bank of Ireland (McQuinn et al., 2005) was of special interest for the present authors. The reason was that this model was based on the Cobb-Douglas production function. We had not seen earlier the use of the production function as the basis of an econometric model. The model used in Ireland is significantly larger as compared to our model. The aim of the study is to compile such a quarterly model for each country in the EU system so that it would be possible to analyse shocks and simulations in the Eurozone. The model includes 96 variables and 89 equations have been constructed. Without going into detail, we can say that this model has been regarded as suitable for making simulations because it responds to various types of shocks and yields credible results. Thus it was concluded that the model is a suitable tool for analysing economic policies and for macroeconomic prognostications. The time period chosen for the model was 1980–1999.

This stimulated us to continue with our model although the preliminary results had not been especially encouraging.

We made our first attempts at analysing the statistics published by the Bank of Estonia with the help of econometric models already in 2003. By that time the balance sheets and income statements published by the Estonian banks formed already a sufficiently large database so that application of econometric models could be expected to give some results.

Our first task was to select the type of econometric model. As is known, a very large number of different econometric models have been used for analysis in the world and thus the first thing is to select the most suitable of them.

The authors decided to select the Cobb-Douglas production function. We set two additional conditions. The sum of elasticity coefficients α and β had to equal 1 and the values of the elasticity coefficients had to be between 0 and 1. Having solved the first problem, we had to address the next one: what should we choose as variables? For the input variable we selected the total income of banks, as this is the indicator that is of greatest interest for customer groups connected with the bank. Indeed, the total income of a bank (or actually its size) is of interest in addition to the bank's own employees also to shareholders, investors, creditors and borrowers. However, it should be mentioned here that these customer groups do not constitute a very large proportion of a bank's customers because it is the depositors who make up the largest group of bank customers. Their deposits, however, are safeguarded by a relevant law valid since 1998 (RT 1998, 40,612).

Selection of independent variables required more consideration. Theoretically, these could be very different indicators. Finally, we selected four indicators: income-earning assets (x1), equity (x2), liabilities (x3) and fixed assets (x4).

In 2003 it was possible to construct a time series of data available for public use that included information on 30 quarters (1st quarter 1995 to 2nd quarter 2002). The first tests of the suitability of the model were made using the time series of that length. Each year has added four points to the series, and by the time of writing the present paper it included already 52 points (1st quarter 1995 to 4th quarter 2007).

As a production function can simultaneously include only two independent variables, then by using the four selected variables in pairs, six different combinations can be formed. In the further processing we included only the combinations that met the preconditions that $\alpha + \beta = 1$ and that α and $\beta > 0$. All these suitable combinations with their coefficients of elasticity are presented in Table 1.

Table 1: Coefficients of elasticity meeting the precondition set

| Length of time series (points) | Elasticity coefficients | Income earning assets and equity (x1x2) | Income earning assets and liabilities (x1x3) | Income earning assets and fixed assets (x1x4) | Equity and liabilities (x2x3) | Equity and fixed assets | Liabilities and fixed assets |
|--------------------------------|-------------------------|---|--|---|-------------------------------|-------------------------|------------------------------|
| | | | | | | | |

| | | | | | | | |
|----|---------------------|--------------------------------|--------------------------------|------------------|--------------------------------|--------------------------------|--------------------------------|
| 30 | α β | | 0,5414 0,4586 | | | | |
| 31 | α β | 0,921 0,079 | | | | | |
| 32 | α β | | | | | | 0,1675 0,8325 |
| 33 | α β | 0,4023 0,5977 | | 0,0787 0,9213 | 0,4067 0,5933 | | 0,1334 0,8666 |

|--|---------|--|---------------|--------|--------|--------|

Source: Authors calculations

It is possible to get quite a lot of information from this table:

The column where the pair of independent variables consists of income-earning assets and liabilities is quite empty. This is caused by the fact that after the calculation of the random component of the time series we checked correlations between different indicators and we always found multicollinearity between the indicators 'income-earning assets' and 'liabilities'. Therefore this pair was excluded from analysis.

In each row one pair of the coefficients of elasticity is written in boldface. This designates the pair for which the coefficient of elasticity r is the largest, and consequently the model constructed on the basis of this pair is the most suitable and trustworthy.

Figure 1 shows the dynamics of the total income of Estonian banks from the 1st quarter of 1995 to the end of 2007. The time series includes a total of 52 points.

Figure 1. Dynamics of the total income of Estonian banks, 1995–2007 (52 points, semilogarithmic scale)

The production function calculated for this period gave four suitable pairs of indicators meeting the preconditions (see Table 1). The most suitable among them was the pair 'income-earning assets' and 'fixed assets' (see Figure 2).

Figure 2. Total income of Estonian banks and the suitability of the graphs constructed on the basis of the pair of indicators 'income-earning assets' and 'fixed assets' (semilogarithmic scale)

The model constructed on the basis of this pair of indicators

$$\ln y = -2,517 - 0,0071t + 0,0945\cos\alpha + 0,0021\sin\alpha + 0,0083\cos2\alpha + 0,0442\sin2\alpha + 0,0155\cos3\alpha + 0,0812\sin3\alpha + 0,6909\ln x_1 + 0,3091\ln x_4$$

has the coefficient of elasticity $r = 0,89112$. The other pairs of indicators meeting the preconditions have a smaller coefficient of elasticity and thus also their suitability is lower.

It can be deducted from the model that if income-earning assets increase by 1%, the total income will increase by 0,6909% and if the fixed assets increase by 1%, the total income will increase by 0,3091%.

Table 1 suggests that the combination of the indicators 'liabilities' and 'fixed assets' was most often the best one. With certain reservation, this can be regarded as a logical outcome. Liabilities form the base of earning an income by a bank and fixed assets create conditions for earning this income.

As the two graphs in Figure 2 are quite close, we can conclude that the methodology used – application of the production function to prognosticate the future – seems to be promising. However, for this the time series should become still longer because the correlation coefficients calculated already for the time series of all different lengths show a tendency towards increasing, which refers to increasing credibility of the model with lengthening time series.

In Figure 3 the data analysed are presented as real data.

Figure 3. Total income of Estonian banks and suitability of the graph of the model constructed on the basis of the pair of indicators 'income-earning assets' and 'fixed assets (real data)

Also this figure proves close agreement of real data and the model constructed with the help of the production function.

CONCLUSIONS

1. The Cobb-Douglas production function is a suitable modelling tool for revealing relationships between different indicators of banking.
2. The suitability of the production function increases with increasing length of the time series.
3. The production function may prove to be a suitable basis for modelling with the aim of forecasting future values of banking indicators.

FORECASTING OF THE DEVELOPMENT OF BANKING: THE ESTONIAN CASE (5)

August Aarma and Jaan Vainu
Tallinn University of Technology, Estonia

ABSTRACT

The main purpose of the paper is to test the possibilities of treating a bank as an enterprise that produces services and for which the same laws are valid (at least in Estonia) as for other enterprises. As Estonia is a small country, the banks here can be considered small or medium-sized, despite the high profitability of their enterprises. Banks and other financial institutions compose a unique set of business firms whose assets and liabilities, regulatory restrictions, economic functions and operation make them an important subject of research. Banks' performance monitoring, analysis and control deserve special attention in respect to their operation and performance results from the viewpoint of various audiences such as investors/owners, regulators, customers, and management. This paper presents two econometric models. In addition, whether the development of the Estonian banking agrees with R. Solow's theory of balanced growth is considered.

INTRODUCTION

Econometric models have not been widely used for thorough analysis of banks. So far no one except the present authors has made an attempt to use models to prognosticate the amount of total income of banks. We have got remarkable results (Aarma A., Vainu J., 2004-2008).

One can ask what is the production or product of a bank? In our opinion, the product of the bank is the amount of the services, the volume of which can be measured by the total income of the bank, which is the measure of the amount of production. Our main purpose was to test the possibilities of treating a bank as an enterprise that produces services and for which the same laws are valid (at least in Estonia) as for other enterprises.

We made our first attempts at analysing the statistics published by the Bank of Estonia with the help of econometric models already in 2003. By that time the balance sheets and income statements published by the Estonian banks formed already a sufficiently large database so that application of econometric models could be expected to give some results.

Our first task was to select the type of econometric model. As is known, a very large number of different econometric models have been used for analysis in the world and thus the first thing is to select the most suitable of them.

The authors decided to select the Cobb-Douglas production function. We set two additional conditions. The sum of elasticity coefficients α and β had to equal 1 and the values of the elasticity coefficients had to be between 0 and 1. Having solved the first problem, we had to address the next one: what should we choose as variables? For the input variable we selected the total income of banks, as this is the indicator that is of greatest interest for customer groups connected with the bank. Indeed, the total income of a bank (or actually its size) is of interest in addition to the bank's own employees also to shareholders, investors, creditors and borrowers. However, it should be mentioned here that these customer groups do not constitute a very large proportion of a bank's customers because it is the depositors who make up the largest group of bank customers. Their deposits, however, are safeguarded by a relevant law valid since 1998 (RT 1998, 40,612).

Selection of independent variables required more consideration. Theoretically, these could be very different indicators. Finally, we selected four indicators: income-earning assets (x_1), equity (x_2), liabilities (x_3) and fixed assets (x_4).

In 2003 it was possible to construct a time series of data available for public use that included information on 30 quarters (1st quarter 1995 to 2nd quarter 2002). The first tests of the suitability of the model were made using the time series of that length. Each year has added four points to the series, and by the time of writing the present paper it included already 52 points (1st quarter 1995 to 4th quarter 2007).

RESEARCH METODOLOGY

We selected the total income of the banks (y) as the output variable (dependent variable) and used profit earning assets (x_1), equity (x_2), liabilities (x_3) and fixed assets (x_4) as factors (independent variables).

The time series were treated as consisting of three components:

$$(1) \quad y(t) = f(t) + h(t) + e_t$$

where $y(t)$ represents the actual time series;

$f(t)$ represents the linear trend in the time series;

$h(t)$ represents the harmonious component in the time series;

e_t represents residuals.

The harmonious component is determined by Fourier's series:

$$(2) \quad h(t) = a_0 + \sum_{j=1}^k (a_j \cos \alpha + b_j \sin \alpha), \quad \alpha = j \frac{t2\pi}{T}$$

where j represents the number of harmonious components,

t represents time,

T represents length of the time series (the number of periods).

We chose the power function as the type of the model.

$$(3) \quad y = ax^\alpha z^\beta, \quad \alpha + \beta = 1.$$

To estimate the parameters a and α with the method of least squares, it was necessary to first find logarithms of the primary data. Then, according to the rules of analysing time series, we checked for the existence of a trend and harmonious component in the time series of the logarithms of the selected parameters.

We followed R. Solow's approach and assumed that the chosen factors can be regrouped so that two groups would be formed: profit earning current assets, $x = x_1 + x_2 + x_3$; and profit earning fixed assets, $z = x_4$.

$$(4) \quad y = ax^\alpha z^{1-\alpha}.$$

Now we assume that part of the total income will be invested into profit earning current assets:

$$(5) \quad I = sy = dx/dt$$

and that the fixed assets will remain unchanged for a certain period of time.

$$(6) \quad z(t) = z_0, \quad dz/dt = 0.$$

Now

$$(7) \quad \frac{dx}{dt} = sy = sf(x, z) = sf(x, z_0).$$

Now let the ratio of current assets to fixed assets $k = x/z$; then

$$(8) \quad x(t) = k(t)z_0.$$

Differentiating (8) on the basis of time, we obtain

$$(9) \quad \frac{dz}{dt} = \frac{dk}{dt} z_0$$

and

$$(10) \quad \frac{dk}{dt} z_0 = sf(x, z_0),$$

from which

$$(11) \quad \frac{dk}{dt} z_0 = sz_0 f\left(\frac{x}{z_0}, 1\right)$$

and denoting $f\left(\frac{x}{z_0}, 1\right) = f(k)$,

we get

$$(12) \quad \frac{dk}{dt} = sf(k).$$

Equation (12) shows that all investments are directed toward increasing the amount of profit earning current assets. In the case of the power function

$$(13) \quad \frac{dk}{dt} = sak^\alpha.$$

By integrating (13) we get

$$\int k^{-\alpha} dk = \int as dt$$

from which

$$(14) \quad \frac{1}{1-\alpha} k^{1-\alpha} = ast + A.$$

To determine the constant A , we assume that $k(t) = k_0$, if $t = 0$.

$$A = \frac{1}{1-\alpha} k_0^{1-\alpha},$$

$$k^{1-\alpha} = ast(1-\alpha) + k_0^{1-\alpha},$$

$$(15) \quad k(t) = \left[ast(1 - \alpha) + sak^{1-\alpha} \right]^{\frac{1}{1-\alpha}}.$$

The increment of the total income is found as follows:

$$(16) \quad \frac{dy}{dt} = \frac{d}{dt} \left[ax^\alpha z_0^{1-\alpha} \right] = \left[\alpha ax^{\alpha-1} z_0^{1-\alpha} \right] \frac{dx}{dt} = \alpha a \frac{x^\alpha}{x} z_0^{1-\alpha} \frac{dx}{dt} = \alpha y \frac{1}{x} \frac{dx}{dt},$$

$$(17) \quad \frac{1}{y} \frac{dy}{dt} = \alpha \frac{1}{x} \frac{dx}{dt} = \alpha \frac{sy}{x} = \alpha sb,$$

where $b = y/x$ is the productivity of profit earning assets, the rate of increment of which is

$$(18) \quad \frac{1}{b} \frac{db}{dt} = \frac{x}{y} \frac{d}{dt} \left(\frac{y}{x} \right) = \frac{x}{y} \frac{1}{x} \frac{dy}{dt} - \frac{x}{y} \frac{1}{x^2} \frac{dx}{dt} = \frac{1}{y} \frac{dy}{dt} - \frac{1}{x} \frac{dx}{dt} = (\alpha - 1)sb.$$

The rate of increment of the productivity of fixed assets is

$$(19) \quad \frac{1}{v} \frac{dv}{dt} = \frac{1}{v} \frac{d}{dt} \left(\frac{y}{z_0} \right) = \frac{1}{v} \frac{1}{z_0} \frac{dy}{dt} = \frac{z_0}{y} \frac{1}{z_0} \frac{dy}{dt} = \frac{1}{y} \frac{dy}{dt} = \alpha sb.$$

Let us now examine the situation where the increase of fixed assets is linear:

$$(20) \quad z(t) = a_0 + a_1 t.$$

Now the amount of the profit earning current assets is

$$(21) \quad x(t) = k(t)z(t) = k(t)(a_0 + a_1 t)$$

and its increment is

$$(22) \quad \frac{dx}{dt} = \frac{dk}{dt}(a_0 + a_1 t) + a_1 k(t).$$

Assuming the existence of the function

$$(23) \quad y = f(x, z) = f(x, a_0 + a_1 t),$$

we can write:

$$(24) \quad \frac{dk}{dt}(a_0 + a_1 t) + a_1 k_t = sf(x, a_0 + a_1 t),$$

from which

$$(25) \quad (a_0 + a_1 t) \left(\frac{dk}{dt} + k_t \frac{a_1}{a_0 + a_1 t} \right) = s(a_0 + a_1 t) f \left(\frac{x}{a_0 + a_1 t}, 1 \right)$$

or

$$(26) \quad \frac{dk}{dt} = sf(k) - k \frac{a_1}{a_0 + a_1 t},$$

where $a_1 / (a_0 + a_1 t) = n = \frac{1}{z} \frac{dz}{dt}$ is the increment rate of fixed assets.

The condition of equilibrium is here

$$(27) \quad \frac{1}{x} \frac{dx}{dt} = \frac{1}{z} \frac{dz}{dt},$$

from which $m = s/n$, where m represents the ratio of current assets and total income.
As

$$(28) \quad m = \frac{x}{y} = \frac{x}{zf(k)} = \frac{k}{f(k)},$$

then, in the case of equilibrium

$$(29) \quad \frac{s}{n} = \frac{k}{f(k)}.$$

In the case of the Cobb-Douglas function

$$(30) \quad \frac{dk}{dt} + nk = sak^\alpha.$$

Equation (30) is a first-order non-linear non-homogeneous differential equation the solution of which is the function

$$(31) \quad k(t) = \left[\left(k_0^{1-\alpha} - \frac{as}{n} \right) e^{-n(1-\alpha)t} + \frac{as}{n} \right]^{\frac{1}{1-\alpha}}.$$

It can be seen from equation (31) that if $t \rightarrow \infty$, then $e^{-n(1-\alpha)t} \rightarrow 0$ and the ratio of current assets and fixed assets will move towards the equilibrium state $\left(\frac{as}{n} \right)^{\frac{1}{1-\alpha}}$.

RESEARCH RESULTS

Let us first construct two-factor power function (6 functions), of which the best was the function with the minimum standard error

$$(32)$$

$$y = 0,0919 x_1^{0,66} x_2^{0,34} \exp \left[0,1835 \cos \alpha + 0,0266 \sin \alpha + 0,1001 \cos 2\alpha + \right. \\ \left. + 0,0712 \sin 2\alpha + 0,069 \cos 3\alpha - 0,107 \sin 3\alpha - 0,0184 t \right] R = 0,9367.$$

The suitability of function (32) can be seen in Figure 1.

Then we found the parameters of the function $y = f(k)$. As a result we obtained the function

$$(33) \quad y = 79,41k^{0,81}, \quad R = 0,84.$$

The suitability of this model is demonstrated by Figure 2.

Already the figures indicate that the forecasting capability of the models is low due to the rapid economic growth in Estonia in 2007.

Let us now examine the development of Estonian banking from the perspective of the theory of balanced growth. It can be seen from Equation (31) that the state of equilibrium can be calculated using the following formula:

$$y^{bal} = \left(\frac{as}{n} \right)^{\frac{1}{1-\alpha}}.$$

By using Equation (33) and taking $s = 0,1$, we get the value of the equilibrium state equal to 2,1845E+12 million Estonian kroon. Actually, the level of the Estonian banking was 4851,3 million Estonian kroon.

It is absolutely impossible to achieve such a level. The authors are of the opinion that. Solow's theory of balanced growth and "golden age" is just a beautiful concoction.

Figure 1. Suitability of the model,

Source: Authors' calculations

Figure 2. Suitability of the model $y = f(k)$

Source: authors' calculations.

CONCLUSIONS

1. Econometric models can be used to analyse and prognosticate banking parameters; power functions give the best results.
2. Different functions give somewhat different results, but these differences are not large.
3. Analysis of the dynamics of Estonian banking from the perspective of the theory of balanced growth revealed that Estonian banking is far from a state of equilibrium.

POSITIONING OF WHOLESALE IN THE SUPPLY CHAIN: COMPARATIVE ANALYSIS EU-SERBIA

Slobodan Acimovic and Zoran Bogetic,
University of Belgrade, Serbia

ABSTRACT

Wholesale trade has significant place in the distribution of various goods. The theory teaches us that the wholesale trade justifies its position in supply chain with increasing efficiency of transactions, specialization and consolidation of assortment from various suppliers. Too many wholesale enterprises in one supply chain make the turnover more expensive and the final price of the goods too; therefore, sustainability of this system is also problematic. This is actually the characteristic of distributive sector in Serbia – to many wholesale enterprises, their low productivity, insufficient specialization, low quality of the service, non-existence of necessary institutions (for example, wholesalemart), etc. This paper shows short comparative analysis (EU vs. Serbia) of functioning wholesale segment of distributing sector, enabling us to identify key differences. These wholesale developing gaps shall be the basis for proposals for changes that we would suggest in Serbian wholesale trade, and that would be able to help the process of wholesale transformation during Serbian approaching to EU.

INTRODUCTION

When considering historical development of the wholesale trade as an intermediary on the market, one can see its continuous battle for survival. Factors which produced emerging of this intermediary in supply chains (enlargement of transactions efficiency, unification of range of goods and functional specification for assortment) are on “continuous trial” of the market game which is ruling in intermediary channels of all articles in the market. Especially, considering the conditions of the world economic crises, the necessity is noticed that wholesale trade strengthen its place and position within the supply chain, i.e. to adapt its consumer supply and service to actual situation. This paper would stress the comparison of European and Serbian practice in developing wholesale distribution sector. The following indicators would be especially compared: 1) Distribution sector structure and wholesale trade contribution, 2) Wholesale trade efficiency (for example, number of employees per enterprise, number of enterprises/employees ratio in retail trade and wholesale trade, turnover per employee/enterprise in the wholesale trade, etc.), 3) Branch structure of the wholesale trade (according to key groups of goods/assortments) and 4) Quality of wholesale trading network, client’s supply packages and service.

In the next part of the paper we would, in short, point out the problem of shortage of wholesalemart, as a modern market institution in mediation in wholesale, in fruit supply chain, and supply chains of vegetables and other perishable goods in Serbia. This negative example, actually, is the best way to show all the faults with which certain supply systems are functioning (of perishable and extremely sensitive goods) when only one link in the chain (wholesalemart) is left out. Finally, judging by the first indicators from the Serbian market, under the conditions of world economic crises and growing insolvency from every supply chain, the first link is always the first to be left out, and this is, in the most cases, the wholesale trade, which therefore needs significant and faster changes. It appears that introducing some changes in Serbian wholesale trade activities can be of benefit for upgrading business performances of this segment of distribution sector in certain EU countries.

COMPARISON OF EUROPEAN AND SERBIAN WHOLESALE TRADE EFFICIENCY AND QUALITY

Selected indicators of Serbian and European wholesale trade efficiency

The position of every economic branch can be viewed from its participation in gross domestic product. EU data (2004) show the fact that the whole distributing sector (retail trade + wholesale trade + motor vehicles trade and repairs) is making very significant segment in the field of services and that participation is growing in creation newly made value (with 13% in the year 1997 increased to 20% in the year 2004). The wholesale trade is, besides retail trade, the most important part of distributing sector and it is participating with approximately 9% in the number of enterprises, with approximately 20, 6% in income and with about 7,6% in the employment of the whole economy. Distributing sector of Serbia is participating with almost 10% in gross domestic product (the average for the period from 2002-2006 is 8,3% - while including only turnover of classical wholesale trade, without wholesale turnover made by producers and retail trade).

It is very encouraging that the average annual growth rate of Serbian distributing sector is 15%, and the wholesale trade is annually growing 14%, and the whole gross domestic product - 6% (all data are from the period from 2002-2006). All of the above mentioned indicate more dynamic growth rate of activities in distributing sector of Serbia as a whole and especially in the wholesale trade, in relation to the average of the economy. The wholesale trade is participating with 4% in gross domestic product of Serbia, and this is bigger participation from that of retailing and vehicle trade (3,71% and 1.99% respectively - data for the year 2006). These data indicate the fact that the distributing sector and the wholesale trade within is relatively important factor of Serbian economy, but negligible less in relation to the average of EU countries. The following table is showing that the distribution of participation of three main branches within distributing sector is relatively similar in EU countries as well in Serbia:

Table 1. Comparison of distributing sector structure of Serbia and average of European Union

| | Average income for EU countries 2003 | Average income for Serbia for the period from 2002-2006 |
|-----------------------------------|--------------------------------------|---|
| Wholesale trade | 45,5% | 41.11% |
| Retail trade | 39,4% | 38.50% |
| Motor vehicle trade | 15,1% | 20.39% |
| Total trade – distribution | 100,0% | 100,00% |

Source: Eurostat, Statistical yearbook of Serbia

Territorial development and network capacity of any segment of mediating activity are the most important infrastructural assumption for the development of that activity, and it is especially important for the wholesale trade. Looking from the point of view of the structure, quantity, quality and many other factors we can clearly see reached rate of wholesale trade development of any country, at any period of time. According to the quantity (the number of enterprises) of performing wholesale trade activities in Serbia, this economic activity is very intense. With this very short survey we shall show a few comparative facts, especially having in mind comparability of number of wholesale trade enterprises and the relation of the number of wholesale trade enterprises and retail trade enterprises in Serbia and in selected countries of European Union:

Table 2. Comparison of basic indicators of wholesale trade in Serbia and EU

| Country and the year | Number of enterprises (000) | Number of employees (000) | Number of employees per an enterprise |
|----------------------|-----------------------------|---------------------------|---------------------------------------|
| Austria | 25,6 | 193 | 8 |
| Belgium | 43,0 | 233 | 5 |
| Bulgaria | 23,1 | 142 | 6 |
| Check Republic | 61,6 | 237 | 4 |
| Denmark | 16,1 | 164 | 10 |

| | | | |

It is clear that the number of employees per an enterprise in wholesale trade is smaller then in most of European countries, indicating fragmentation of this Serbian distributing sector segment. As a key indicator of irrational wholesale network in Serbia we point out completely opposite relation of number of enterprises/employees in retail sale trade and wholesale trade in Serbia and in European Union countries:

Table 3. Comparative analysis of relation of number of enterprises and employees in wholesale and retail trade in Serbia and EU countries

| Country and year | Number of enterprises in retail trade per one enterprise in wholesale trade | Relation of number of employees in retail trade per employees in wholesale trade |
|------------------|---|--|
| Austria | 1.63 | 1.66 |
| Belgium | 1.69 | 1.25 |
| Bulgaria | 4.06 | 1.77 |
| Czech Rep. | 2.18 | 1.59 |
| Denmark | 1.50 | 1.24 |
| Estonia | 0.52 | 1.08 |
| Finland | 1.46 | 1.60 |
| France | 2.33 | 1.64 |
| Greece | 2.60 | 1.54 |
| Holland | 1.36 | 1.51 |

| Serbia (2007) | 0.53 | 3,36 |

Source: Eurostat, Statistical yearbook of Serbia, Centre for financial status of the National Bank of Serbia

In European countries, the relation of numbers of retail trade enterprises to wholesale enterprises is approximately from 0,4 (Slovakia) to 6,92 (Poland), while the average for the whole EU is 2,22. So, to one wholesaler in EU there are 2,2 retailers, and this is logic ratio in accordance with essence of impact of both trade branches. Data for Serbia show very different relationships in distributing sector, indicating anomalies of relative relation between wholesale and retailing enterprises in EU. If we observe only enterprises which make annual balance sheet in Serbia (without a pretty large number of small shops), then the ratio is as follows: to one wholesaler there is 0,53 retailer, i.e. to one retailer there are 1,88 wholesalers. "Picture from the field" is in favor of the fact that Serbian economy is gradually becoming bigger, but the wholesale trade is still in stagnation, without enough changes.

When realizing the most important proportions in relation of number of employees in retail and wholesale trade, we shall see that only Slovenia has smaller number of employees in retail trade in relation to wholesale trade (the ratio is 0,90). All other EU countries have more employees in retail trade in relation to the wholesale trade, and this ratio is between number of employees (except Slovenia) from 1,08 (Estonia) to 2,64 (Great Britain). Also, average coefficient of ratio of employees' number in these two branches of distributing sector for EU 27 is 1,78. Serbia has significantly different indicator of ratio of employees' number in retail trade to employees' number in wholesale trade (3,5 for the year 2006, i.e. 2007 is 3,36) from all EU countries individually. The cause should be found in still excessively small economic entities and objects of retail trade and much larger number of employees (low labor productivity) from these indicators in all EU countries.

While conducting wider research of Serbian wholesale sector development and position (this paper is only representing the summary), we made comparison of two important indicators in operating of wholesale trade of EU and Serbia - turnover according to an enterprise (in EUR) and turnover per an employee (in EUR). From present point of view (this research was conducted within the period from 2003-2008), these data are not reliable enough because of instability on foreign exchange market in all East-European countries. Namely, under the influence of world economic crisis there is a fall in almost all currencies in East-European countries which are not in EUR zone. Also, the ratio of Serbian Dinar has fallen in relation to EUR for 25%. Based on the all above mentioned, we concluded that the presentation on comparative analysis of financial data on turnover per an enterprise and turnover per an employee in wholesale trade, that we had prepared during the period of growth, would have been pointless.

Quality gap of Serbian and European wholesale trade

Besides presented quantity data on wholesale trade in Serbia and EU countries, quality aspect is also very importing for this analysis, as in any other comparative review. Unsufficient statistical compatibility on the level of all EU countries and Serbia and a very problematic statistical base conducted for any segment of economic activity in Serbia are important reasons that justified introducing quality comapison of wholesale trade in Serbia with

conducting operating activities of wholesale trade in EU countries. When taking into consideration everyday activities in practice, i.e. personal expert experiences of this paper's authors, we estimate that the set of descriptive grades that can be given on quality of conducting wholesale trade in Serbia (the following table) are more reliable indicators for comparison of wholesale trade in Serbia with the same sector in developed countries.

Table 4. Evaluation of quality gap between European and Serbian wholesale trade network

| ASPECT OF ANALYSIS | WHOLESALE TRADE IN EU | WHOLESALE TRADE IN SERBIA | DIFFERATION RATE (large, medium, small) |
|---|---|--|---|
| Concentration rate | Mostly large, with tendency of growing | Small, without serious move | LARGE |
| Specialization rate | Completely recognizable | Gradually identifying | MEDIUM |
| Profitability, its own and in the channel | Large, with small margins, efficient for other participants | Medium, with relatively large margins and expensive mediation in the channel | LARGE |
| Internationalization of business operations | Mostly large, with tendency of growing | Symbolic | LARGE |
| Information connection | Large | Non-sufficient, in opposition to the significance of informatics/computer science for business | LARGE |
| Branch profile | In all wholesale branches | Mostly on consumer goods | LARGE |
| Influence in distributing channel | Solid | Limited | MEDIUM |
| Importance of logistics | Logistics is in the centre of attention | Starting to identify the importance more | MEDIUM |
| Participation in processes of supply chains | More and more | This matter is not familiar enough | LARGE |
| Managing Human Resources | One of the most important segments of business practice | The problem is recognized but there are no quality solutions | MEDIUM |
| Number of employees | Mostly small | Relatively exaggerated | MEDIUM |
| Customer service | Mostly full range of the offer | Solid offer of additional services | MEDIUM |
| Process of receiving and realization of the order | Fast and efficient | Slow, though advanced recently | MEDIUM |
| Speed of business and organizational transformation | Large, with using benchmarking approach and consultancy knowledge | Business models of Western wholesaler are further more desired. | MEDIUM |

We wish to point out once again that this table is made on the basis of knowledge of wholesale theory, but also actual practice of functioning of wholesale sector in developed countries in EU and in Serbia. Furthermore, the table sublimates our estimation of relations in supply channels of both "sides" of wholesale trade (suppliers and retail trade). Above mentioned table has identified 6 large and 8 medium exceptions in quality of Serbian wholesale functioning in relation to the average quality of wholesale development in EU countries. This quality evaluation is additionally emphasizing the conclusion that Serbian wholesale trade is falling behind in many things in its development, regarding modern solution of European wholesale sector solutions (especially wholesale trade in developed part of European Union).

WHOLESALEMARKET AS MISSING WHOLESALE INSTITUTION IN SUPPLY CHAIN OF PERISHABLE GOODS ON SERBIAN MARKET

Wholesalemarket can be defined as primary mediator in perishable products/goods turnover (firstly, fruits and vegetables, also meat, fish, milk, flowers, etc.) that require special terms of preserving and storage. At the same time, this means that the wholesalemarket as mediator undertakes some functions in turnover, functions which are expensive to the others (because, wholesalemarket is working at one place, according to economy of scope system), or, simply, other mediators have no need to perform these functions because there is one organized place for all that. Furthermore, it implied that every wholesalemarket is positioned in distributing chain as a specialized mediator in logistic and/or commercial sense:

Picture 1. Usual mediators in distributing channel of fruits and vegetables in the world

The following picture is showing situation in distributing flow of perishable goods turnover on the Serbian market:

Picture 2. Evaluation of current situation in distributing channel of fruits and vegetables on the Serbian market

The function of wholesale market is pushed out of the market, i.e. it does not exist in institutional sense because only small part of the turnover in Belgrade and Serbian territory is done through wholesale market. A large part of wholesalemartket's deals and functions are not performed at all or they are performed inadequately. Wholesale market, as a supposed "predecessor" of a wholesalemartket, presently, it has almost no capacities at all with which it could attract both supply and demand.

Just because there is no wholesalemartket, it doesn't mean that these functions are not performed at all. The largest part of wholesalemartket's logistic functions are performed in smaller distributing capacities, often in inadequate conditions, bad and old warehouses and in inadequate and worn out cold storage plans in Belgrade and surroundings. In commercial sense, wholesalemartket activities are done today by wholesalers (importers and others), manufacturers and strong retailers, but with more expensive price. Reasons for low efficiency of wholesale turnover and higher price of the services should be found in the fact that all mediators do their activities, there is no correct division of labor, thus affecting increased cost of distribution, therefore also the final price for the goods. Also, as the goods are stored in quite inappropriate conditions, the rate of its depreciation is much larger than usual. The largest price of the fact that there is no wholesalemartket is paid by (as always) the final consumers on the two basis - the goods is more expensive and with poorer quality.

Belgrade, the capital of Serbia, with population of 2 million and quite solid consumer power (in relation to leading consumer's centers of the region,) is the only as large city as it is within Europe that has no wholesalemartket, as the modern wholesale institution for the turnover of fruit, vegetables, fish, meat, milk and other perishable goods. The realization of the wholesalemartket project in Belgrade (preliminary design and technical solution have been already

made) is today the most urgent strategic goal of wholesale function re-composition in Serbia. Temporary markets under the open sky, present all over Serbia, are not suitable anymore as a place for performing this very important wholesale function in the turnover, for human consumption of perishable products. Further delays of building modern capacities of Belgrade Wholesalemarket will mean more goods of poorer quality for final customers, quite larger level of prices, unusually larger percentage of perished goods, smaller tax revenues for the state (because, there is a high level of gray economy within unorganized turnover of fruit and vegetables), marginal import of Serbian fruit on organized way (with making higher level of prices), etc.

RECCOMENDATIONS FOR THE TRANSFORMATION OF WHOLESALE TRADE IN SERBIA

All previous analysis (as many others performed by us, but, due to lack of space, are not included in this text) and differences in performing wholesale in Serbia and other EU countries, speak in favor of the following: 1) Serbian wholesale trade is excessive, both in vertical and horizontal sense, 2) there are a lot of people performing wholesale trade in Serbia, but they are not statistically processed (we estimate that when manufacturers or retailers perform wholesale functions, the efficiency and quality of these functions are even poorer in relation to presented Serbian indicators) and 3) quantity in performing some activity does not mean also the quality of that activity, especially regarding the wholesale trade.

There are numerous specific features, even certain branch anomalies within wholesale trade itself. For example, there is a large concentration in certain branches of wholesale trade which are not specialized at all (in the branch called Mediation in the wholesale trade, the first five firms are “making” almost 35% of income), and that is not the case in the most EU countries. Also, Serbian firms are finding as very attractive branches which are performing wholesale of food and drinks (the first 10 firms participate in the market with almost 42%), while wholesale branches for example wholesale of household products, raw materials and semi-finished goods and waste, and wholesale of machines and devices are almost found unattractive (there is a small number of firms, and a small concentration of large enterprises). This is, certainly, a very bad situation, taking into consideration some general European tendencies in connection with the wholesale trade.

Main anomalies of Serbian wholesale trade are including the fact that it is not profiled (the largest concentration of turnover in trade in so called Other wholesale trade), on the one hand and fragmentation, on the other. Serbian wholesale trade is not specialized, i.e. the largest number of enterprises prefers to have wide range of activities, and they “like” to do everything. The largest turnover in the branch called Other wholesale trade is also partly consequence of previous times when domestic wholesalers were developing their business (the nineties), but also the wish to deal with all goods and to avoid risk from specialization. This is, in a way, normal, because economy in Serbia was unstable within the previous period, therefore hardly any wholesaler could specialize for machine or raw-materials wholesale, when nobody has ever known whether the buyer (some manufacturer) would pay, i.e. would they be able to “survive” transitional changes and/or new competitive advantages.

The key direction of wholesale network transformation in Serbia should be based on the following: 1) making wholesale network larger and rationalized, 2) growth of the volume and productivity of the turnover, 3) more accurate branch segmentation of the wholesale network and 4) introducing missing wholesale institutions (as wholesalemartket). Concentration of the wholesale market in Serbia, and developing countries among EU members is inevitable; all relevant world experiences are showing this, i.e. this is the only possible way for wholesale to survive. This is, at the same time, barrier which prevents other participants in supplying (mostly strong retail sellers) to take over wholesale functions. Therefore, in the future, the main changes on Serbian wholesale market can be expected in the area of its specialization and introduction of new institutions. If we look at the experiences of certain EU countries, we shall see that every wholesale group and sub group has its own strategy, ways of working and very different conditions of competition.

So, what could be the basic recommendation regarding a necessity of restructured development of every aspect in wholesale network in Serbia? Mainly, the specialization is necessary as general tendency in wholesale trade

transformation in Serbia (but also some neighboring member states of EU). Market opportunities, intensified discipline in public procurement and need for faster connecting of domestic wholesaler with foreign enterprises, shall all bring to more correct development of all wholesale network segments in Serbia. Furthermore, this means that in future period of time, further growing of raw-material wholesale is to be expected, because this wholesale segment is marginal on Serbian market today, although it is very important in supply chain of many product articles. A very similar attitude can be also said about the need of further growing of machines and devices wholesales. Increasing concentration in this branch on Serbian market shall inevitably follow by entering strong foreign wholesale companies. This has been already present on Serbian wholesale market of household appliances and other consumer goods - new investments are announced in spite of world economic crises.

Brand new formats are needed for Serbian wholesale market. Most of all, it is about a missing link in supply chain of fruit and vegetables (wholesalemarket). Also, aiming to further development of shoe and cloth wholesale, it is expected in the near future that outlet, cabs&carry stores and wholesale centers are to be opened, for these kinds of goods wholesale, and they would be located on the outskirts of cities. Although a large number of food and drink wholesales have been registered in Serbia, even in this area of wholesale, further changes are to be expected, mainly in domain of further competition, specialization and increasing the productivity.

All together, wholesale trade in Serbia is expecting very powerful changes. The first notions of these change's necessity come out of last couple of months from the market. Namely, under the influence of strong economic crisis, where real sector of Serbia is mostly damaged, Serbian wholesale trade is first to suffer in almost all supply systems. The crisis of insolvency is very much present within the last few years and months on Serbian market and it is attacking "the weakest link in the chain" - and when it comes to distributing sector in Serbia, it is the wholesale trade. The world economic crisis, that reached Serbia also, was merely a "trigger" for further erosion of Serbian wholesale trade. No wonder, having in mind all data we stated in this paper on efficiency and quality of wholesale trade in Serbia, when compared with European benchmarking experiences. Therefore, Serbian wholesale trade (but, it appears also true for wholesale functions of East-European countries, especially countries in the same region as Serbia) needs faster changes than it is necessary for retail trade, where changes happened very much faster, by the nature of things. The necessity of all kinds of market changes in the whole distributing sector and especially in domain of wholesale and different kinds of abilities to adapt are inevitable in expecting process of Serbia approaching EU membership.

THE CHALLENGES OF ENTREPRENEURSHIP IN NIGERIA: A CASE OF SMALL AND MEDIUM ENTERPRISES IN THE TEXTILE INDUSTRY

Shaukat Ali and Oluwatobi Osinaike
University of Wolverhampton, UK

ABSTRACT

SMEs face significant constraints in a turbulent developing economy like Nigeria. This research seeks to analyse and evaluate the factors influencing entrepreneurial activities in Nigeria, based on a survey of ten SMEs in the textile industry and interviews with five bank managers. Major findings of the study are that finance, government, bank policy, economic environment and operating costs are the most important constraints. Also, interviews with bank managers revealed that SMEs generate less than thirty percent of banks' turnover, and that economic and financial instability has a huge impact on banks' ability to provide funds to SMEs. The study argues that the government should not only create and facilitate a business environment that is favorable to SMEs' growth and development, but should also manage such policies efficiently and effectively to ensure higher productivity and competitiveness.

INTRODUCTION

Nigeria, a less developing country (LDC) with low GNP per capital, unemployment, and poor infrastructure has seen rising levels of unemployment and government policies giving rise to entrepreneurship and entrepreneurial development (Iyang, 2004). From a public policy perspective the Nigerian government encourages entrepreneurial efforts because it creates jobs and helps to improve the social and economic well-being of the country and reduces dependence on multinationals whose incomes are often divested to their native countries rather than the host communities. Despite the growing awareness of entrepreneurial activities, and government's strategies to initiate plans facilitating entrepreneurs in the SMEs sector, there still remain drawbacks. Several issues such as corruption, poor infrastructure, political instability, lack of funds, inability of the financial institutions to support fresh ideas and even ethnic conflicts plague the Nigerian economy. Such issues have not just a theoretical but a practical impact on entrepreneurship.

State owned enterprises in Nigeria traditionally clogged business opportunities and state restrictions prevented entrepreneurs from entering the market. The state enterprises did little to promote entrepreneurship despite the fact that governments invested hugely in such public enterprises; mismanagement and corruption often led to the continued low performance of the public sector (Nwoye, 1997). Jones (1981) shared this sentiment that when the state attempts to organize production without being subjected to market discipline, corruption, low productivity and inflationary tendencies often result, making the entire process difficult for more adventurous investors, the entrepreneurs. As Nze and Nkamnebe (2003) state if the public sector is exposed to the influence of entrepreneurship, the ills plaguing state owned businesses pave way for healthy competition and enhanced entrepreneurial activities. Even though markets have now opened to competition, entrepreneurship is still dependent on the economic and political economy. For owners of SMEs in Nigeria, being an entrepreneur provides a certain degree of control over their affairs. It also guarantees job security in the face of massive downsizing and unemployment. People are looking for something that works, thus entrepreneurship offers something to look forward to. The literature on SMEs in Nigeria increasingly considers and attempts to explain the development and

ways of promoting its activities. Little attention has been focused on investigating what goes on within these organizations. In addition, most of the research undertaken on SMEs has often been in the manufacturing industry or the private sector. The Nigerian government in recent times has been initiating schemes to promote SMEs owned and run by the local people; and as such placing bans on some imported goods.

The Nigerian textile industry is rich with opportunities. With constant increase in the activities of internationally reputed fashion designers and models, and with a corresponding increase in the demand for local fabrics, the Nigerian textile industry has seen something of a rebirth. However, the influx of foreign fabrics from Asia, particularly China and the United Arab Emirates, Europe and America, undermine the contribution of local manufacturing companies. Another contributing factor is that most of the locally made fabrics are considered inferior. The government responded by banning the importation of foreign fabrics of certain classes of materials, which include lace materials, Guinea brocade and cotton materials. To emphasize this, government functionaries often wear locally manufactured fabrics to promote Nigerian textile products. But these efforts are a little above significance when compared with the cheap and attractive imported textile products which litter the Nigerian market.

Other challenges affecting the textile industry are common to most industries in Nigeria. Such challenges as power, local materials and particularly technology transfer undermine the capability of Nigerian textile industry to meet up with global standards. One major reason responsible for the popularity of Chinese fabrics is that they offer similar imitation of western fabrics which local textiles manufacturers have not been able to produce. China has the technology to create fabrics in vogue – though most of these are inferior; however, local manufacturers have not been able to meet up with this challenge. Economic Commission for Africa (2001) and Lado and Vozikis (1997) emphasize the need to have technological capital and competence to meet the needs of SMEs in Africa, particularly the manufacturing industry.

ENTREPRENEURSHIP AND SMEs IN NIGERIA

SMEs account for a substantial part of total industrial employment, production and value-added concerns in Nigerian business concerns despite the presence of multinationals like Shell, Mobil and Lever Brothers (Osugwu, 2001). SMEs are generally owned by local people for local markets, and use mainly materials from the locality of the businesses. Developing countries like Nigeria are beginning to value small and medium enterprises for several reasons, such as their potential to grow into larger, more productive units; their ability to invest and adopt new technologies; and their ability to adapt to new economic circumstances (Berry, Rodriguez and Sandee, 2001). SMEs in Nigeria face many obstacles such as inadequate sources of finance and infrastructure but the failure of many can equally be attributed to private, psychological or even social costs or indeed market failure (Uzor, 2004). Nigeria's attitude to investment and entrepreneurship has changed remarkably. There is a sudden upsurge in the number of Nigerian businesses in the country. Government programmes are serving as further catalysts in this new buoyancy in entrepreneurial spirit. The present democratization of Nigeria has necessitated the stimulation of the economy, making it more competitive in the global market with emphasis on the private sector as a means of stimulating this growth. Deregulation and liberalization strategies are being pursued in order to make the economy more competitive.

Perceptions of Entrepreneurship and SMEs in Nigeria

The increasing resort by well-educated Nigerians to entrepreneurship can be attributed to fewer opportunities for work in the government sector and with multinational corporations. As the economic recession restricts jobs in the government and with MNCs to a handful of the well-connected, the vast majority through the cavernous small business sector to earn their livelihood, and even to seek upward social mobility (Monibo, 2003). More so, the possibility of building own business to the level of notable names such as Michael Adenuga, Jimoh Ibrahim, Aliko Dangote, etc., is making people venture into entrepreneurship. Monibo asserts that the reason people resort to entrepreneurship in Nigeria, among other things, is the unavailability of prominent public office positions or desire to gain some recognition in society. This assertion is doubtful, however even if this is the case, for those who do not have any formal education; entrepreneurship and small businesses is possibly perceived as the only

alternative for survival for many. People are therefore looking for something that works not necessarily to gain some recognition in society.

SMEs' Development

Past regulations in Nigeria had tended to favor the development of large-scale enterprises at the expense of the small-scale enterprises. This had restrictive effects on the productive capacity of SMEs, weakened the overall industrial structure and hindered rather than promoted the process of industrialization. It also created market distortions and policy biases to the benefit of large-scale enterprises in Africa (Ekpenyong, 2002). Perhaps the most powerful tributary feeding the river of interest in entrepreneurship was the constriction in the economy after a several decades of economic growth (Shapero, 1985). Over reliance on oil by the government led to the collapse of the oil boom in 1980s. Several economic and social problems plagued the Nigeria economy; for example, the Naira was devalued and there was a reduction in most manufacturing plants (Jamodu, 2001). Consequently, this led to the adoption of the Structural Adjustment Programme (SAP). Two objectives of SAP were to introduce local products to international markets and to increase output, earnings and employment both in industry and agriculture (Iyanda, 2003). SAP emphasized the essential role of the private sector and the need to shift focus from the large businesses or enterprises. Even though SAP largely distorted the operating environment of most businesses in countries that implemented it, the programme received substantial support and several policies were implemented. The main objectives of recent policies are to increase the role of the private sector organisations; to promote entrepreneurship and trade skills development; give assistance to SMEs to ensure their continued existence; increase the utilization of local materials and to increase the competitiveness of SMEs in domestic and international markets (Jamodu, 2001). Despite these and more recent efforts to promote SMEs, their contribution is still relatively low. Nwoye (1997) is sceptical that despite policies to promote SMEs in Nigeria, their impact on the development of entrepreneurship is comparatively insignificant. Government policies and assistance, whilst laudable in theory, tend to fail at the delivery stage. For example, business incubator schemes were designed to expedite the development and promotion of SMEs. However, such incubators failed due to problems such as mismanagement, lack of funding and weak organizational structures; and the few still in operation do not achieve the intended objectives due to several internal problems.

RESEARCH METHOD

This research is exploratory in nature, using surveys and interviews to identify and examine a number of issues. Questionnaires were administered to ten SME companies in the textile industry in Nigeria. The mail questionnaire and semi – structured telephone interviews proved most appropriate due to remoteness of location and time constraints. Interviews were in the form of note taking, these were transcribed and analyzed through reasoning and comparative methods. Banks as financiers of the entrepreneur were also interviewed, to give information on the significance of SMEs as a source of finance, their experiences in relation to today's financial and economic instability and the limitations to providing capital funds to SMEs. Ten questionnaires were sent out; eight were returned but one was unusable, giving a response rate of 70%.

FINDINGS

Most of the companies engaged in trading businesses, either distributive or retailing - mainly importation of textiles - but this has now been banned by the government. Businesses were set up between 1965 and 2007. Assets did not exceed the range of over 100m – 250m Naira, neither did annual profit exceed the range of over 10m – 100m. In addition, the number of employees did not exceed one hundred. Table 1 shows constraints that the businesses faced. Over 71% of the respondents strongly agree, and 28.5% agree, that finance and operating cost are important external constraints on the business. Most of these entrepreneurs or SMEs, clarified that obtaining finance restricted the smooth operation of the business due to high interest rates and often due to restrictive bank lending policies. This might also explain why 71% agreed that bank policy was a constraint on the business; these two appear to be linked. Interestingly, though unsurprisingly, over 85% of respondents disagreed that securing Labor was a constraint. The reason is clearly due to the availability of cheap unskilled labor as well that the nature of the businesses operated does not require a significant number of employees; most of the SMEs employ between 10 to 24

employees, only two employed between 25 – 99 employees; a few with as little as 0 – 9, and have remained small. Coupled with this, all respondents agreed that employees are a constraint in terms of Education and skills, an indication of the level of literacy in Nigeria. One company stated that *“there is more uneducated and skilled labor in Nigeria than the educated ones”*. Nearly all respondents agreed that Government Policy was a constraint, despite all the initiatives and schemes to support SMEs. Over 85% of the respondent cited Political Instability as constraint whilst Legal barriers were thought to be constraints by just over half the respondents.

Interviews with Bank managers gave interesting insights into their approach and attitudes to SMEs financing. The questions were covered under six categories. In terms of “Risks in Providing Loans”, the main concerns were Risk of repayment / default, Diversion of funds; Inadequate entrepreneurial skills to manage business efficiently and Technical competence. In terms of “Significance to SMEs to Bank Turnover”, the consensus was that it was “Relatively low, generally about 30%, for some as low as 10%. When asked what “Internal Firm Limitations” there were to providing funds the factors cited were Lack of adequate security / collateral; High risk of default; Inability of SMEs to allow supervision & usage of funds; Poor managerial abilities; Lack of business plan or planning; Improper accounting records & financial discipline; and Lack of organizational structure / coordinating organization.

Table 1 Constraints to business (%)

| EXTERNAL CONSTRAINTS | Strongly Agree | Agree | Disagree | Don't Know |
|-----------------------------|-----------------------|--------------|-----------------|-------------------|
| Finance | 71.4 | 28.5 | | |
| Bank policy | 28.5 | 71.4 | | |
| Government policy | 14.3 | 85.7 | | |
| Legal | | 57.1 | 28.5 | 14.3 |
| Operating cost | 71.4 | 28.5 | | |
| Technology | | 28.5 | 42.8 | 28.5 |
| Political instability | 42.8 | 42.8 | | 14.3 |
| Local competition | 14.3 | 57.1 | 14.3 | 14.3 |
| International competition | 14.3 | 28.5 | 42.8 | 14.3 |
| Labor | | 14.3 | 85.7 | |
| Education & skills | | 85.7 | 14.3 | |

When asked about “External Factors that impact on provision of funds the factors cited were Inconsistent government policy; Central Bank of Nigeria (CBN); Financial institutions SMIEIS; Ambiguities in regulatory issues e.g. taxation; and Structured and blue-chip companies. When the managers were asked what had the “impact of economic and financial instability had on their operations, they cited high interest rates; insistence on collateral; reduced availability of funds to SMEs; and planning uncertainties. When asked what services they provided to assist businesses they cited low take up but offered legal services; training / workshops; financial advisory services; provision of manpower & investment; and management advisory services. Low response to these services was also attributed to low level of interest by some SMEs.

ANALYSIS AND INTERPRETATION OF EVIDENCE

Empirical results on the challenges of entrepreneurship in Nigeria reveal several factors, some of which are interlinked; not all the constraints were important, though most were. The interviews further elucidated the approach and perceptions of the banks towards SMEs and why granting loans to SMEs is often problematic. The constraints on SMEs in Nigeria, as in other countries, are influenced by the business environment. By examining the environment in terms of its component parts - economic, social, technical, legal and political – we can see the impact of changes in any of these factors on the operations of SMEs.

Economic

The economic conditions in Nigeria, are not ones to facilitate an efficient business management or administration. SMEs are compounded by numerous issues like: finance or capital, competitors, level of productivity, customers, rising price levels due to high inflation and interest rates (19%), government fiscal and tax policies, operating costs etc. For any business to thrive; it cannot ignore these factors otherwise the business will collapse. Similarly, if a system or rule is capricious in nature, SMEs will not feel the need to comply with it. Finance is one of the most important constraints the respondents specified in the questionnaire. As stated earlier, during the interview with the bank managers, it was made known that the reason banks are reluctant to grant loans to SMEs is due to high risk of default, banks will prefer to invest where the risks are relatively low and the returns are high. A 2001 World Bank survey on Nigerian firms showed that although 85 percent of the firms had relationships with banks, not all of them had access to external credit. This also supports the view that banks prefer to give credit facilities to larger firms than SMEs; their structures often restrict or dissuade banks from granting SMEs capital. The survey revealed that most are private firms, the large firms have access to capital and more foreign owned companies have access to capital than indigenous companies. Therefore, banking services are inadvertently modified to suit the needs of large companies. However, banks cannot be completely held responsible for this; the economic and financial instability has reduced the availability of funds. Besides, with CBN mandating banks to raise their shareholders fund from two billion Naira to two hundred and fifty billion; there is a great deal of pressure on the banks to remain profitable and as such a need to be cautious when approving any SMEs business funding. Even though the government is working towards mitigating some of these financial constraints for example, the set up of SMIEIS for equity investment, it has generated five billion Naira so far in the hope that will reduce borrowing and relieve SMEs from interest and other bank charges that are not favorable to their capital structure. Some of these SMEs worry that the funds earmarked, will not be sufficient to satisfy the demand of SMEs in the country, due to the volume of applications already received. Besides, these loans tend to favor those manufacturing rather than those trading.

Taxation is another factor. There are laws but not strictly adhered to; some SMEs have the propensity to evade tax. The government often do not use or allocate tax funds efficiently. Corporate tax level is 30% but the capacity to administer tax collections is low; hence, revenue for the government is reduced. An erratic tax system does not encourage compliance; it creates fiscal problems. Fraud and embezzlement undermines the financial system, thus long-term growth prospects are threatened. Likewise, high interest rates create inflationary problems. The exchange rate is invariably affected, because most of these trading companies import their goods. This in turn affects consumers' purchasing power; the SMEs then compete to meet the changing needs of consumers. Thus, all these factors are interlinked. An unstable economy diminishes the level of productivity of SMEs.

Social

Labor is important in any economy, it is one of the factors that enables any business to function. An unexpected, 85.7% of the respondents indicated that labor is not important, however, the same percentage agreed that education and skills is important. These SMEs find it difficult to employ skilled labor, and those employed soon want to leave, in the hope of working with bigger corporations. Consequently, those employed are often unskilled workers. In the 1999 – 2002 field survey of small enterprises (Ekpenyong, 2002), labor was ranked as the fourth major problem in current operations. Issues related to lack of skilled and unskilled workers and high wage and benefits for skilled workers. Findings from this study have shown that insufficient skilled workers are the major constraint. It should also be noted that this view might not be the same for all trading companies in the textile industry, due to the small the sample size. Nwachukwu (1988) asserted that many Nigeria employees lack a sense of belonging in the organization and act as strangers. He further stated that employees do the least possible to avoid losing their employment, as long as they do not belong, there is a tendency for them not to exert themselves or have a full sense of commitment and dedication. In addition to these constraints, recent government prohibition of imported textiles has been a source of concern for these trading companies. Customers perceive foreign goods to be of a superior quality to locally produced goods. These SMEs fear that government's ban will lead to the demise of their business. This belief also draws attention to the need to renew awareness and confidence in locally produced goods; it also becomes crucial to develop a means, to market locally produced goods in a way that attracts customers; to restore their confidence in the quality of goods. Moreover, it is possible that SMEs will resort to smuggling, if they believe they are losing customers. SMEs do have unexploited potential, and though liberalization seem to have created problems, SMEs can still be more productive and competitive.

Technical

Most of these SMEs involved in trading require little or no technology, particularly the very small businesses. Of the total respondents, only 28.5% agreed technology is an important constraint on the business, 42.8% disagreed about its importance and 28.5% did not even know if this was important – this lays emphasis on the need for good information channels and more knowledge of the dynamic technological environment. Usually, small businesses are more flexible, and can innovate and introduce new products. Conversely, they may not have the expertise, time and capital to develop a new product (Geoffrey, Robert and Philip, 1996). Taking into consideration the nature of the businesses of the respondents, which is trading, either distributive or retailing, there is probably little use of technology. There is an aversion or reluctance to manufacture textiles, particularly due to infrastructure constraints, machinery and costs involved. SMEs in the textile industry, will prefer to trade rather than manufacture and their reasons agree with previous studies and theoretical assumptions. Osuagwu (2001) commented on the reasons small business enterprises prefer commercial / service to manufacturing: there is quick return of profit; capital funds are not usually tied down, there is no heavy machinery / spare parts involved and there are little or no technological risks involved. Theory further maintains that the lack of proper information to help entrepreneurs select the appropriate technology is one of the major causes of low productivity, because SMEs are not encouraged to compete. It cannot be assumed that every sphere of a business will require the use of technology. Any change in technology, in the textile trading industry will take time; some of these traders have not even acknowledged its use or importance; although a few do use computer packages like Excel for their book keeping and accounts. For now, the manufacturing sector of the textile industry will find technology more useful especially for product development like textile designs. It is worth noting that globalisation and the impact of developments in information and communication technology in a subtle way promotes competition, its use of technology can help SMEs to be more competitive. Onyemenam (2004) articulated that this would remain a mirage, unless prerequisites for competition are met locally.

Legal and political

This incorporates the government and the legal system. Governments usually have a tremendous effect on any legal system; and the Nigerian system is no different. Just over 57% of the respondents agreed that the business laws are an important constraint on SMEs in Nigeria, while 28.5% disagreed with this. On the other hand, most of the respondents did agree that government policies and regulations were an important constraint. A respondent indicated that the process of business registration should not be difficult, but lawyers often make this complicated. Others stated that, even though there are policies in place to assist SMEs, there is no visible evidence of anyone benefiting from them. Licensing and business registration also restricts the activities of SMEs in Nigeria. For example, multiple permits and fees are required at the state, local government and municipal levels, often spontaneously, concurrently and with little justification or proportionate benefits. Whilst there is a high degree of entrepreneurial capacity among SMEs, there is a widespread culture of operating in the informal economy. This is due to low trust in the government and low compliance with the law, which they perceive to be time-consuming and corrupt (Anon [3], 2004). Hence, due to arduous processes or administrative barriers, some SMEs operate illegally for example; by setting up stalls without permits. Subsequently, the judicial system is ineffective and corrupt, it can take three years for a claim to be heard at first instance, and companies have little confidence that the process will be fair (Anon [3], 2004). Underlying problems include inadequate training of lawyers, staff shortages, inadequate funding and poor facilities. Disputes are often dealt with through informal mechanisms i.e. alternative dispute resolutions (Anon, [3], 2004). SMEs cannot have their rights adjudicated fairly in such circumstances.

Furthermore, political instability does have an impact on the activities of SMEs whether explicitly or implicitly. Prior to the current democracy, instability was characterized by repeated incursion of the military in government. This is the most apparent rationale for economic instability and perhaps low competitiveness of the Nigerian industry. 85.7% of the respondents strongly agreed that political instability was a constraint on the business. The legal and political situation is a constraint on the operations of SMEs, whether directly or indirectly. The government often makes elaborate plans to implement certain things but eventually do not follow it through. Therefore, inconsistent policies make future planning problematic for SMEs.

Competitive Environment

The nature of the local market seems to be a monopolistic competition. There are several businesses competing for the same customers and all selling very similar products. 57.1% of the respondents indicated that local competition was a constraint on the business, with 14.3% regarding it as very important. As such, SMEs are looking for new ventures, new methods of satisfying the customers. Only 28.5% agreed international competition was a constraint, 42.8% disagreed on this. This was unexpected because some of the manufacturers in China and Korea where these traders buy textiles have now set up premises where these SMEs operate, thus competing for their customers at relatively cheaper prices. While this might stimulate inward foreign investment, it is not favorable to these SMEs. Though, it could encourage these foreign industries to set up manufacturing plants in the country, the economic instability would be a deterrent. One entrepreneur was optimistic it would not be permanent.

Besides competition, the business environment is plagued with infrastructural inadequacies that make business operations difficult. It also impedes international competitiveness. Government's over dependence on the oil sector has also reduced incentives for SMEs to export. Inadequate infrastructures like telecommunications, transportation, electricity, water etc; all have an impact not only on SMEs but also businesses in Nigeria. In the 1999 – 2000 field survey on small businesses, infrastructure was ranked as the second most important problem in their current operations. Respondents in this present study frequently refer to this as a problem. Thus, this study agrees with the above survey as well as a World Bank report. In a 2004 World Bank survey on the barrier to manufacturing competitiveness, out of 233 firms, 94% complain that infrastructure is their major problem. 97% own generators, they depend on it for 67% of the time, to generate electricity 2.42 times more than they would have paid with reliable public provision. In addition to this, these manufacturing companies have to include the cost of maintenance and spare parts etc. The problem of infrequent or inadequate electricity is a major constraint when considering the textile manufacturing industry in Nigeria. This could explain why most of the respondents trade rather than manufacture; and why they find operating costs to be an important constraint.

Nigeria's business environment does not facilitate the growth of SMEs. The business environment entails the customers and competitors, as well as all of the external factors discussed. Entrepreneurs and SMEs must consistently examine the business environment in order to identify its strengths, weaknesses, opportunities and threats. It should also be noted that the government is committed to providing assistance in the form of financial, technical and even proposed privatization schemes. It would be beneficial if SMEs participate in some of the various schemes. Creating a model for the entrepreneurs and SMEs in view of the above discussion is quite difficult. Banks are convinced that SMEs do not make quick turn over, particularly judging from the persistent harsh environment. Though there are new policies generated regularly with different names, which include microfinance, financial assistance is still at low ebb. Uzor (2004) supports our view on the need for SMEs to cluster into a stronger entity. The position canvassed here is relevant to the development of SMEs if current trends in the country are anything to go by. Recently, financial institutions, which include banks, insurance, stock brokerage and securities firms, had to merge to form bigger entity. From 89 banks in 2005, 25 banks emerged from the recapitalization and merger process to form mega banks. This can be applied to the textile industry. SMEs with similar culture and production line can merge or cluster to form larger SMEs. This would make them better positioned for the challenges of increasingly globalised economy. Clustered SMEs have the benefits of enjoying institutional support in finance and technology (Economic Commission for Africa, 2001), can become localization agents for technology transfer for multinational corporations (Robert, 2003) and compete better for exportation in a global economy (Ibeh and Young, 2001). This will definitely impact positively on the physical, human and organizational capitals needed to reposition SMEs for modern businesses environment and ensure steady development (Barney, 2001). This will boost the Nigerian economy as well as promote concerted entrepreneurial activities. The result will be better and well financed local alternatives to direct foreign investment and multinationals.

CONCLUSIONS

In attempting to identify the most crucial factors or constraint on SMEs development in the textile industry, the empirical results reveal that finance, operating costs; government policy and bank policy are the most important

factors. These findings support general notions in the literature and previous studies about some of the factors which impact on SMEs' growth. The state of the business environment, for example poor infrastructure, high interest rates and technological constraint have caused a huge reliance on imported textiles which has now been prohibited to encourage local production and export. Banks cannot be entirely held responsible for low availability of funds to SMEs for the reason that factors like government policy; the economic and financial instability also impacts or restricts their funding capacity. It was surprising that against such a background most of these banks provide services like training workshops and financial services to assist some of these SMEs. However, it was apparent that there are also constraints on the banks' operations as well. Most of the small business owners (57.1%) find the government policies to be ineffective, there was an indication that some of the SMEs programmes are not publicized enough, hence the government and agencies should increase awareness of such programmes and encourage such a culture. The findings suggest the need to take a closer look at policies and their effectiveness. With careful assessment and planning, and proper management schemes, the SMEs can develop and eventually make their mark in the economy. What is evident from the research is that the government seems to be making significant efforts to promote the SME sector. Over reliance on the reducing oil sector and the declining state of domestic production has highlighted the need for the government to begin to value SMEs and encourage the means whereby they can thrive and grow. Even though the government is trying to improve the business environment, the fear is that most of these policies will be shrouded in theory with very little practical application. Notwithstanding, it is anticipated that a positive trend will emerge; the question then is how long will the growth and development take? The answer to that might be to wait and see what transpires. Yet, considering the state of the economy, any noticeable change will inevitably take years to manifest.

It is hoped that this research will encourage further comprehensive study of the activities and challenges facing SMEs in the textile industry; and a better practical approach can be espoused.

DO SMEs NEED ACCOUNTING?

TURKEY / KONYA INDUSTRIAL ZONE CASE

Alper Tunga Alkan and Mikail Altan
Selçuk University, Turkey

ABSTRACT

Increasing globalization process accompanied by financial liberalization in the last decade has led to an increase in the costs. Rapid developments in technology also limited the mobility capacities of big companies. To see the matter from the perspective of countries, the importance of the SMEs arises at this point for the survival of economies. The SMEs, which can adapt themselves to new developments rapidly with their flexible nature, have a great share in the number of the businesses both in the EU and Turkey. However, one of the biggest problems of these rapidly growing and changing SMEs is financing. The most efficient factor for the resolution of this financing problem is the realisation of fair and information-oriented accounting appliances. In this framework, the purpose of this research is to analyse whether the 424 SMEs in Konya industrial zone use accounting appliances effectively and need orientation and to understand to what extent they benefit efficiently from accountants.

INTRODUCTION

The process of globalisation and financial liberalisation which continued in an increasing manner especially in the 1980s increased the importance of companies that can easily adapt to changing conditions and innovations. Large-scale enterprises have limited capacity of action in the face of changes in economic and political situation and they experience harmonisation problems because the adaptation of the latest innovations in technology to these enterprises is costly. In contrast, SMEs are highly adaptable to changes in economy, resistant to situational fluctuations and flexible in the face of economic and financial crises and we believe that they are fundamental elements of stability in economic and social life. Therefore, their importance is increasing on a global level (Ergel, 2000).

Accounting for 99.8 % of the total number of enterprises in our country, the SMEs cover 76.7 % of the total employment figure. The share of the SME investments reaches 38 % of the total investments and these same enterprises also produce 26.5 % of the total added value. The SMEs make 10 % of the total exports of our country. When the shares of the SMEs in the total added values of other countries are examined, the figures stand at 43 % in the USA, 49 % in Germany, 25 % in England, 54 % in France and 52 % in Japan. Likewise, when the shares of the SMEs in the total exports of the same countries are examined, it is observed that the figures are 32 % in the USA, 31 % in Germany, 22 % in England, 26 % in France and 39 % in Japan (Ercan, 2005).

The SMEs can prove to be better than large-scale enterprises in some areas by using some of their basic properties that distinguish them from large-scale enterprises. Some of the strengths of the SMEs are that they can establish closer relationships with the customers and their own personnel, are more flexible regarding marketing, production and services in comparison to larger enterprises, can provide more production and wider range of productions with less investment, create more employment opportunities with less investment cost and are less affected by economic fluctuations. However, there are areas where SMEs are not superior to large-scale enterprises. Some of the weaknesses of the SMEs are that their efficiency is low due to the fact that they are very small-scale and disintegrated, their knowledge of the market and the sector as well as their technical information is insufficient, they are weak in terms of management, organisation and competitiveness, and suffer from a lack of infrastructure and know-how regarding marketing and public relations (Yılmaz, 2003; Çelik and Akgemci, 2007: 125).

The most important problems that SMEs encounter in European Union have been defined as administrative and regulatory burdens, access to finance, taxation, lack of skills and access to public procurements (European Commission, 2008). The case is almost the same for the SMEs in Turkey. Some of the problems that the SMEs in Turkey, which is in process of integration with the European Union, experience and that form the fundamental setbacks that prevent them from gaining competitive power both in the world and in the internal markets of the European Union have been defined as insufficient know-how and low level of technology, insufficient financial environment and factors that affect competition between Turkey and European Union (differences in regional development levels, problems concerning infrastructure and environment, low R&D capacity and some sector-based problems etc.) (DPT, 2004).

Financing and taxation constitute a major part of the problems that the SMEs in Europe and in Turkey encounter. In our opinion, the reason for this is the way the SMEs perceive the importance of accounting. The present study investigated how accounting is perceived by the SMEs.

A GENERAL VIEW ABOUT KONYA AND SMEs IN KONYA

Konya was the capital of the Anatolian Seljuk Empire and an important transit center and accommodation for the historical Silk Road. This is one of the most significant characteristics of Konya, which has been standing from the period of the Ottoman Empire, and now it tends to be an important city of industry in Turkey. Konya is a province with a large area of 40.814 km² (tuik.gov.tr). According to the data in 2007, its population is 1,959,082. Konya is rated 26th with 0.25254 index points in terms of level of development among 81 provinces.

In 1965 the Organised Industry Regions were created to develop the manufacturing industry within the Framework of 3rd Development Plan. In accordance with the data in 2007, 150 firms in Organised Industry Region 1 and 274 firms in Konya Organised Industry Region (KOS) are active (Konya Ticaret Odası, 2008: 34).

Konya, which has one of the largest organized industrial regions, is also a Small and Medium Enterprises (SMEs) center. Most of the enterprises consist of small and medium enterprises. Organised Industries came together and built Konya Organised Industry Region (KOS). Konya has been honored as “Runner up”--“The City Following First Class” in the category, “The Best City Having Economic Potential” in a competition organized by “Foreign Direct Investment,” published by Financial Times once every two years. The Konya Chamber of Industry has also been included in Euro Info Centre Network, which operates in all European countries dating from 1987. Its international code has been registered at EICTR705 Konya. (Karasioğlu, Büyüksalvarcı, 2008: 671-672).

RESEARCH DESIGN

Purpose

The purpose of this study is to investigate whether the SMEs in the Organised Industrial Zone in Konya/Turkey are aware of the significance of accounting or not (Karasioğlu, Duman, 2004). On the basis of the data obtained, an attempt will be made to draw conclusions by investigating the relationships between the areas of activity of the firms that participated in the survey and accounting.

Methodology

The survey technique was used in the study. The survey was administered to those who are in charge of the accounting departments, the owners and directors of the SMEs in the Organised Industrial Zone in Konya/Turkey. Since no such study had been conducted for this purpose before, the survey questions were prepared by taking into consideration other survey questions regarding accounting.

The survey consists of three major groups. In the first groups, the firms were asked what they thought accounting and various questions were asked about the accounting system that they used in their enterprise. In the second group,

questions were asked about how the firms utilised the data that they obtained from accounting. In the third group, the firms were asked the services they received from their accountants. The firms that were included in the study were divided into three groups, namely regional, national and international. On the basis of these three main groups, an attempt was made to determine whether there were any differences between the firms in terms of the way they perceived accounting, they utilised the data they obtained from accounting and the services they received from their accountants.

Sampling

The bulk of the study consisted of 424 SMEs in the Organised Industrial Zone in Konya/Turkey, of which 124 firms agreed to respond to the survey. Appointments were made from these firms and face-to-face interviews were held with the relevant personnel. 46 of the questionnaires were not included in the study because the questions on the survey form had not been fully answered. Thus, the survey was administered to 78 firms out of the 424 SMEs, which account for 18.4 % of the total population.

Data Analysis

SPSS 11.0 software was used in data analysis and One-way Anova test was conducted. Our questionnaire contained a total of 38 questions except for the statements regarding the institutional identity of the firms. 17 of the questions were about the first group, 9 about the second group and 12 about the third group. As a result of the tests conducted, of the responses to the questions that we had grouped above, those that contained significant differences in terms of their areas of activity were subjected to an evaluation. As a result of One-way Anova test, 4 of the first group statements, 6 of the second group statements and 4 of the third group statements were included for evaluation as significant differences emerged. Information concerning the frequency distribution of the questions with significant differences is provided.

Findings

Of the 78 firms that were included in the study, 11.5 % were regional, 21.8 % national and 66,7 % international firms.

29.5 % of these firms represented the automotive sector, 11.5 % the agricultural sector, 12.8 % the packing sector, 9 % the construction sector, 28.27 % machinery sector, 5.1 % food sector and 3.8 % the forest products sector.

* The mean difference is significant at the level of .05.

Also perceived as “the language of an enterprise”, accounting plays a significant role in reflecting the economic phenomena that occur in the enterprise to the relevant parties. In this context, all of the firms that participated in our survey responded positively to the statement “accounting is performed for taxation”, but they responded negatively to the statement “accounting is performed to cover up the errors and irregularities in the enterprise”. These responses are positive indicators of how the firms perceive accounting. However, firms that operate on a regional basis display differences in their responses to the statement “Accounting is used for the procedures of assets and liabilities” compared to the firms that operate on a national and international basis. In other words, while regional firms do not accept the statement that accounting is used for the procedures of assets and liabilities (% 66,7), national (% 88,2) and international firms (%100) state that they use accounting for the procedures of assets and liabilities.

Accounting is an important information-generating system within and outside the enterprise. While regional (% 88,9) and national (%70,6) firms responded negatively to the statement “Accounting is used to generate information so as to plan the future of the enterprise”, firms operating on an international level (% 69,2) regards accounting as a tool for generating information to plan the future of the enterprise. In this context, while regional (%77,8) and

national (% 64,7) firms responded negatively to the statement “Needs of the enterprise are anticipated beforehand by the help of accounting” as they did to the previous statement, firms that operate on at international level (% 73,1) stated that they utilise accounting to intuit the needs of the enterprise.

One of the most fundamental principles in the application of a sound accounting system is to act in accordance with the rules, principles and standards of accounting. In this context, as can be seen from the table above, an effort was made to determine the firms included in the survey complied with this principle or not. In conclusion, differences arise in the practices of firms regarding rules, principles and standards of accounting depending on their size. While international firms (%98,1) comply most with the standards, the way national firms (%76,5) and regional firms (%55,6) approach the issue exhibit differences.

* The mean difference is significant at the level of .05.

It is inevitable that accounting data should be used when decisions are made about the interests of the firm, because when plans and programs about future are prepared, firstly financial positions of the firms are taken into consideration. When perceived from this perspective, all firms need to utilise these data when they make decisions about their future. However, of the firms included in the survey, 88,9 % of those that operate on a regional level and 70,6 % of those that operate on a national level either do not utilise accounting data at all or partially utilise them. On the other hand, 63,5 % of the firms that operate on an international level stated that they utilise accounting data of the firm when they make decisions regarding future.

Financial tables constitute the stage where information obtained from the accounting department companies become meaningful and are converted into data. 88,9 % of the regional firms and 88,2 % of the national firms stated that they did not utilise financial tables. This result is in parallel to our previous comment. 52,9 % of the international firms constantly utilise financial tables.

Establishing a relationship between the past and the present is important to shed light on the future. When it is considered if the firms utilise accounting data belonging to the past when they guide their policies regarding future, it is observed that all of the regional firms and 94,1 % of the national firms do not utilise data belonging to the past period. This means either these firms do not have financial tables belonging to the past or they ignored them. On the other hand, 63,5 % of the international firms stated that they took into consideration the financial data they obtained from previous periods when they made decisions about their future. In this context, similar results emerged from the responses to the statement "I can prevent the obstacles that may hinder the progress of the firm by making financial analyses of the information that I obtained from the past financial tables". It is observed that all of the regional firms included in the study and 94,1 % of the national firms do not take heed of their past errors and do not take measures against problems that might arise in the future. On the other hand, 59,6 % of the firms operating on an international level stated that they used the data they obtained in the past as a tool in solving the problems they encountered.

Firms need to predict the opportunities that might arise and form their financial structure accordingly in order to ensure their survival and compete in both national and international arenas. When the issue is perceived from this perspective, it is observed that all of the regional firms included in the study and 94,1 % of the national firms do not follow such a course of action whereas 57,7 % of the international firms stated that they used the data they obtained from the financial tables in order to take advantage of the opportunities that might appear. A similar approach becomes important for the data obtained from the financial tables to meet the firm's needs for funds. Here again, it is observed that 53,8 % of the firms operating on an international level could utilise the data they obtained from the financial tables as a tool in establishing funds needed by them.

Table 4: The Services the Firms Receive from the Accountant Depending on Their Relevant Areas of Activity

* The mean difference is significant at the level .05.

It is not logical to think that the personnel employed in the firms are highly qualified experts in accounting and finance. Accounting and finance are separate fields of expertise as all other fields are. Therefore, firms need to take professional assistance on this issue. All of the firms included in the study stated that they received counseling services from the accountant regarding book-keeping, financial standing, preparation of tax statements and taxation. However, the responses that the firms included in the study gave to the statement about receiving services from the accountant concerning financial issues exhibit differences. 44.4 % of the regional firms that participated in our study stated that they never received services from the accountant regarding financial issues while 22.2 % stated that occasionally they did not receive such services. 70.6 % of the national firms and 78.9 % of the international firms stated that generally they received services from the accountant regarding financial issues.

On the other hand, concerning the statement about receiving services from the accountant regarding financial analyses, 88.9 % of the regional firms stated that they had never received such services. Surprisingly, 88.2 % of the national firms included in the study also declared that they had never received such services. According to these results, it is understood that the firms operating on a regional and national level that are included in the study do not have different approaches regarding the service in question. However, 43.3 % of the international firms included in the study stated that they received services from the accountants concerning financial analysis.

The basic rationale behind receiving assistance from a professional accountant is to determine the risks, threats and opportunities that might confront the firm and determine a strategy accordingly. The professional assistance received here is taken with a view to evading tax. The research results also support this basic philosophy. According to this, 62.5 % of the regional firms, 70.6 % of the national firms and 86.5 % of the international firms do not consider accounting services as a way of tax-evasion. Likewise, the responses given to the statement "The best accountant is the one who keeps the records in accordance with the rules" seem to be in support of our conclusion. Regarding the responses given to this statement, 77.8 % of the regional firms, all of the national firms and 92.3 % of the international firms support this basic idea.

CONCLUSION AND EVALUATION

One of the most important goals of accounting is to produce accurate information that could be used in the decisions of the relevant parties about the enterprise. This imposes different responsibilities on accounting such as analysis, planning, regulating, checking, cooperation with the management and managerial policies in the face of increasing need for information today. This information system, which has a significant influence on the decisions taken about both the current state of the enterprise and its future, is also effective in anticipating the needs of the enterprise that may arise in the future. The most important factor in establishing a sound information system requires acting in accordance with the rules, principles and standards of accounting while performing accounting applications.

According to the results of the study, while regional and national firms exhibit a different approach concerning perception of accounting, international firms seem to have a more professional approach in this regard. It is understood that the regional firms included in the study act on the principle of saving the day and gaining maximum profits in short term and thus cannot plan their future. National firms, on the other hand, attach more importance to accounting because they intend to compete in the free market rather than gaining profits and continue their existence by increasing their market shares. It is observed that international firms utilise accounting in a more efficient way in terms of institutionalisation, reliability, frequency of auditing, taxation differences, experience and comparing themselves with other international firms.

MARKETING A COUNTRY AS AN INVESTMENT LOCATION IN THE REALM OF THE 21ST CENTURY: THE CASE OF THE REPUBLIC OF TURKEY

İpek Altınbasak, Bahçeşehir University, Turkey
Tevfik Dalgic, University of Texas at Dallas, USA

ABSTRACT

Country image has proven to have impact on several areas including the appeal for foreign direct investment (FDI) thus, contributing to the economic development of a country. Therefore, countries like companies are competing with each other and using the marketing tools so as to promote their country as an investment location. Countries like Ireland and Singapore have started promotion activities and applied a strategic marketing management approach at an early era, in the second half of the 20th Century by establishing their “Investment Promotion Agencies”. Although the success of those countries implies the necessity of the functions performed by those agencies, the realm of the 21st Century urges the newly established Investment Promotion Agencies to take a different marketing approach. The paper presents a general overview of the world FDI movements focusing on Turkey and underlines the image of Turkey as an investment environment in the light of empirical research. The description of the activities of Investment Services and Promotion Agency of Turkey (ISPAT) are evaluated and the need for a new marketing approach required to be successful in the changing global environment is pointed out.

INTRODUCTION

Due to recent latest trends in globalization and increasing international trade, the effect of the country of origin image has increased as an important variable influencing the sales of products and services in international markets. In general, many studies in the literature suggest that favorable country perceptions lead to favorable inferences about product attributes and subsequent evaluations. Furthermore, country image has also proven to have impact on several areas such as the development of the tourism, international trade and attraction of foreign direct investment (FDI) thus, contributing to the economic development of a country. Therefore, countries, like firms, are competing with each other in order to attract tourists to visit their country, create demand for their products abroad, encourage foreign students to have education in their universities/schools, and create opportunities to attract FDI.

The creation of a more favorable and appealing business environment is crucial. Although those adjustments are vital for the attraction of FDI, unless they are communicated to the right public, the desired result could not be obtained. That is why several countries have established their investment promotion agencies (IPAs) whose main duties are to promote the formation of business relationships between foreign investors and local companies, assist investors to help them access the required infrastructure, boost trade and generate revenue by creating a favorable image of the country as an investment location. Research supports the promise that investment promotion has a statistically significant influence on foreign investment flows (FIAS, 2000).

As supported by the research, investment promotion agencies are effective in generating foreign direct investments. Those which entered in the market earlier; being more active or concentrated on certain sectors made huge successes which resulted in the faster development of their countries (FIAS, 2000). The countries like Ireland who have recognized the necessity and impact of a strategically managed investment promotion function, made the first move to establish an investment promotion agency in 1960s with its Industrial Development Agency (IDA). The IPA of Ireland succeeded in capturing a very high level of FDI using sound marketing approaches focusing on specific

sectors, whereas, Turkey could achieve the establishment of such an investment boosting organization only in 2006, nearly 5 decades later than Ireland and many years later than its regional competitors (TIPA).

This paper concentrates on the importance of attracting FDI and points out the significance of marketing efforts in reaching this objective. In the first part of the paper, a general overview of the world FDI movements focusing on Turkey is provided. Then, the image of Turkey as a business environment is discussed in the light of empirical research. The final section examines the role of marketing in promoting a country as an investment location and presents the activities of Investment Services and Promotion Agency of Turkey (ISPAT).The paper offers suggestions for a revised marketing approach to investment promotion agencies to cope with the dynamics of the 21st Century.

1. FDI MOVEMENTS IN THE WORLD AND IN TURKEY

The amount of the foreign investment attracted to a country is an important phenomenon contributing to the development of the country's economy. The general macroeconomic figures in the world offer opportunities to compare the performance of countries in terms of attracting FDI. In the literature there are several studies focusing on FDI. Many authors conclude that FDI has a positive effect on economic growth (Choe, 2003; Lipsey and Sjöholm, 2004; Mullen and Williams, 2005). However, others claim that FDI will promote economic growth only when certain economic conditions such as a threshold level of human capital are met in the host country (Borensztein et al., 1998; Alfaro et al., 2008). Furthermore, it is argued that different forms of FDI would have differential effects on economic growth. Based on data for 84 countries from 1987 to 2001, the results of Wang and Wong (2009) indicate that the growth effect of greenfield investment is significantly positive, while that of M&As is negative. On the other hand, Lipsey (2000) finds that the relationship is ambiguous. Nevertheless, a major part of the literature seems to conclude that FDI has a positive impact on growth especially in the presence of sound financial institutions, greater trade openness and greater human capital, (Balasubramanyam, Salisu and Sapsford, 1996; Hermes and Lensink, 2003). All these findings stress the impact FDI has on the host country.

According to the World Investment Report (2008), global FDI inflows rose in 2007 by 30% to reach \$1,833 billion, well above the previous all-time high set in 2000. Despite the financial and credit crises, which began in the second half of 2007, the developed countries, developing countries and the transition economies of South-East Europe and the Commonwealth of Independent States (CIS) experienced a continued growth in their FDI inflows. Around 70% of the total FDI was received by the developed countries, The United States being the largest recipient followed by the United Kingdom, France, Canada and the Netherlands. Whereas, the European Union (EU) was the largest host region, attracting almost two thirds of total FDI inflows into developed countries. The developing countries received \$500 billion FDI inflows which represent the highest ever amount. The least developed countries (LDCs) attracted \$13 billion worth of FDI in 2007 – also a record high (World Investment Report, 2008).

The World Investment Report (2008) further shows that despite the positive picture for 2007, the global economic crisis that started in United States in 2007 has affected financial markets and created liquidity problems in many countries, leading to higher costs of credit. As a result, both inflows to and outflows from the developed countries are expected to decline. The report estimates a 10% decline in FDI flows in 2008 compared to 2007. Meanwhile, FDI flows to developing countries are expected to be less affected (World Investment Report, 2008). FDI in West Asia rose by 12% to \$71 billion in 2007, marking a new record and a fifth consecutive year of growth. More than four fifths of the inflows were concentrated in three countries: Saudi Arabia, Turkey and the United Arab Emirates, in that order. Saudi Arabia was the leading FDI recipient in the region in 2007. Turkey followed, with inflows of \$22 billion – an increase of more than 10% compared with 2006 – despite worsening macroeconomic conditions such as slow growth and rising inflation. The increase in FDI reflected mainly large-scale privatizations and private sector cross-border M&A deals. In 2007, Europeans firms selected Turkey, particularly the Dutch firms invested \$13 billion (Turkey, Treasury, 2008), of which M&A transactions accounted for \$7.2 billion (Deloitte Turkey, 2008).

When the FDI/GDP ratio is examined, the jump that Turkey has made in 2006-2007 is observed to have slowed down in 2008. Compared to the performance of other countries, although Turkey has made a considerable

improvement in terms of attracting FDI, among the countries studied, Egypt, Georgia and even a developed economy, namely France performed better in 2007.

Table 1: FDI/ GDP Turkey 1998-2007

2. T H E I M A G E O F T U R K E Y

RKEY AND THE TURKISH BUSINESS ENVIRONMENT

Academic research on brand image is abundant. However, country image has been a topic of interest mainly in the last decade of the 20th Century (Niss, 1996). When the relationship between the country image and brand image has been examined, it is argued that to the extent that consumers have a negative image for a given country, they develop negative images for the people of that country and this in turn, affects their attitudes towards the products originating from that country (Morello, 1984). Especially when current and accurate information does not exist; wrong images created about the country, its people, and about its products may influence several issues such as the number of the tourists visiting the country, the amount of the foreign direct investment generated, the perceived value of its products etc.. Although a massive work related to country of origin effect and especially tourism image has been carried out separately, the general image of the countries, more precisely that of Turkey has not been deeply investigated until beginning of the 21st Century. In this part of this paper, the empirical research on the image of Turkey, especially concentrating on its effects on FDI will be presented.

The comprehensive study of Altinbasak (2004) attempted to determine the constituents of country image using Turkey as a case. A theoretical framework identifying the antecedents and the consequences of the country image has been developed and the relationships among the variables have been examined (Please See Appendix A for the Model). The “Intention to do business” has been determined as one of the main dependent variables affected by the country image. Therefore, the effect of the independent variables on “the intention to do business in Turkey” is tested in the research. The country image is a multi-dimensional and complex phenomenon involving a wide range of factors. After a thorough literature review a series of in-depth interviews followed by comprehensive statistical analysis through a survey is carried out. As Ger (1996) stated, the country image may vary according to the geographical proximity, cultural contact and familiarity of the respondent with that country. Italy and the United Kingdom are chosen as two European countries to conduct the research. The choice is made taking into consideration many factors such as geographical location, strong economic and trade relationships with Turkey and the approach of those countries with respect to the adhesion of Turkey to EU etc.

As no other similar model is found in the literature and the nature of the topic is of a multi-dimensional type, the qualitative study aims to explore the dependent and independent variables constituting the theoretical framework and derive new scales for the quantitative part of the study. A total of 16 in-depth interviews with the British and Italians working in or visiting Turkey have been conducted. The demographic characteristics such as age, gender,

education and occupation are taken into consideration in choosing the respondents. Interviews are carried out in the native language of the individuals and are tape recorded. The ethnographic summary method is used to analyze the data. Consequently, the researcher developed eight new scales to measure different dimensions of country image to be used in the scale developed. The respondents admitted that country image plays a crucial role affecting the investment decisions of the foreign companies. The perceptions of the foreign managers living in Turkey also indicate that there are certain problems related to the business environment in Turkey. However acknowledging the big market size and the industrial potential of the country, the general expectations about the future are positive. The issues to be prioritized by Turkey in order to attract more foreign direct investment and the opportunities provided by the country are defined as follows (Altinbasak, 2004):

| |
|---|
| Social Environment |
| Improve the education system and the vocational training |
| Ensure the principles of secularism in business systems |
| Political Environment |
| Achieve political stability for long-term commitments |
| Strengthen the legal system in line with EU standards |
| Economic Environment |
| Control the inflation |
| Establish and make sure the application of laws/regulations |
| Diminish red tape/bureaucracy/administrative barriers |
| Refrain from sudden fiscal or taxation policy changes |
| Provide taxation incentives/guarantees and/or other financial support for the establishment of new businesses |
| Provide long-term security to foreign investors |
| Accelerate the privatization programs |
| Solve the problem of corruption |
| Provide specific incentives to diminish regional disparities |
| Invest on the training of the workforce |
| The advantages of Turkey to attract foreign direct investment: |
| The attractive size of the market |
| The young population of Turkey |
| Adaptability of the country's people and its systems to changes and crisis |
| The opportunity of being a hub- advantages of the geographical location |
| Talented, hardworking, reliable work force |
| Dynamism, high energy level of the country |

Another study carried out with foreign business people working in Turkey has revealed very similar results in relation to the economical, political and cultural aspects to be improved to promote the nation brand image of Turkey abroad (Altinbasak, 2008). In this study, 5 focus group interviews with 41 foreign managers working in Turkey were carried out. Germany, France, Italy, Netherlands, Austria and Scandinavian countries' managers participated in the research. The data is analyzed through the content analysis and in line with the previous study, similar themes about the economical and political conditions in relation to the business environment are identified.

The study of Erdal and Tatoglu (2002) has also revealed that the market size and market attractiveness of host country, openness of the economy to foreign trade, existing physical infrastructure, had a positive effect, but exchange rate instability of domestic currency had a negative effect on realized FDI in Turkey. Therefore, beside the economic stability exchange rate stability would contribute to increase the performance of Turkey in order to attract more FDI. In another study (Demirbag et al., 2007), the performance dimensions of Multinational Companies (MNC) in Turkey are examined. The results pointed out that the government regulations have a positive relationship with all performance dimensions whereas, the financial incentives are found to be more important for FDI location decisions.

The research of Altinbasak (2004) revealed that the businessmen are eager to invest wherever there is opportunity. However, those opportunities have to be well communicated to the target group. Otherwise, the potential of the country as an investment location may be misinterpreted or not understood. The findings of the Nation Brands Index (2005:Q1) show that similar to other aspects, Turkey is perceived to be the least attractive as an investment location compared to other 10 countries investigated which are: Italy, Sweden, United Kingdom, USA, Japan, Germany, China, India, Russia, and South Korea.

It is also observed that there are many distorted image themes and prejudices related to religion, living style etc. related to Turkey, mainly originating from history and those images are affecting the potential of Turkey to attract investment, tourists etc. Therefore it is necessary to identify the distorted image issues and try to change them to reflect the real picture of Turkey (Altinbasak, 2009).

2.3 Perception of Turkey as an Investment Location

The previous research reveal that the amount of the foreign investment attracted to a country is expected to contribute to the economic development of that country. When concrete information or experience doesn't exist, the image of the country may affect the decision of the investors. There are international organizations, official groups concentrated on the FDI or on the economic development of the countries, doing periodic research to detect changes and provide assistance and advice to the countries. Turkey, like many other competitive countries while improving the business conditions should also communicate the opportunities to potential investors especially in the targeted sectors. The previous data about the investment environment of Turkey is worth examining to detect the achievements and the areas that need improvement.

The Investment Advisory Council Report for Turkey (April, 2002) pointed out that Turkey may distinguish itself as a trade and investment destination, since its location between Europe, the Middle East and Central Asia provides an economic gateway to regions with sizeable markets and purchasing power. However, the study conducted by FIAS- Foreign direct Investment Advisory Service (February, 2001) revealed that most of the investors were ignorant about Turkey. The main strength of the country is stated to be its geographical location, followed by its large domestic market and cost effective workforce. The World Business Environment Survey (WBES, 2000) had pointed out that inflation and political instability and uncertainty are the leading constraints for Turkey. Besides the high inflation in Turkey, the lack of adjustment accounting, especially for taxation payments purposes was worrying the investors. Furthermore, administrative regulations in Turkey were perceived as burdensome. The foreign investors stated that the legislative reform of Turkey did not appear to be sufficiently reliable. Adopted laws were not often implemented on time.

The Global Competitiveness Report of the World Economic Forum (2000) put in evidence the importance of administrative barriers as having a dampening effect on competitiveness in Turkey is demonstrated by investors surveyed which ranked bureaucratic "red tape" as one of the leading competitive disadvantage of the Turkish business environment. The recent issue of the same report (2008) highlights the bureaucracy problem, presented also by the findings of Altinbasak (2004, 2008) at the top of the problematic issues decreasing the competitiveness of the country. Turkey ranked lower than many other countries in terms of competitiveness indicators, especially in the areas of administrative and procedural matters. The problem with cumbersome, unclear, informal and time-consuming administrative procedures create an opaque and uncertain business environment, which raises costs for investors. Furthermore, Turkey which was at the 40th rank in the World Global Competitiveness Index in 2000, went back to the 63th place in 2008. Market size is the only factor which received a higher score (5.2) in a 7 points scale. Whereas, bureaucracy followed by tax regulations, political instability and access to financing have been cited as the most problematic factors for doing business (World Economic Forum, 2008). Very similarly, a very recent survey conducted among foreign investors operating in Turkey by International Investors Association of Turkey (YASED, 2009) reveal that the main barriers to FDI in Turkey are economic instability, legal framework, unregistered economy, taxes and incentives political instability and red tape.

3. HOW TO PROMOTE A COUNTRY AS AN INVESTMENT LOCATION: THE ROLE OF MARKETING

Although the competition for attracting foreign investment between governments has always existed, its intensity has increased in the last couple of decades. This is mainly due to several factors such as globalization and freer movements of capital, increased number of new players and the changes in the world trade environment. To compete in this era, the governments, like private companies, started to adopt marketing strategies so as to be preferred by foreign investors.

The marketing mix consists of the elements through which the companies seek to reach their marketing objectives. Similar to companies, countries adopted the marketing approach to be able to develop competitive strategies to differentiate themselves from their counterparts. The variables that can be manipulated in the marketing program are (FIAS, 2000):

- The *product*, which will consist of the inherent advantages and disadvantages of the investment site which is the country;
- The *price*, which is the cost to the investor to invest in that country
- The *promotion*, or activities that spread out information about, or attempt to create an image of the country and provide investment services for the prospective investor.

It is also a fact that an active investment promotion and sound investment policy have to go hand in hand. As governments strive to develop transparent and open regulatory frameworks to attract investors, investment promotion agencies have an important role to play as public supporters for investment reforms and to help investors take full advantage of these reforms and the country's comparative strengths (WAIPA Annual report, 2007, p: 13). The survey of Investment Promotion Practices, presented at United Nations Conference on Trade and Development (2000) underlined the importance of Investment Promotion Agencies (IPAs). In order to receive more FDI inflow, it is necessary that foreign business people be familiar with the country, its business environment and opportunities available especially for the targeted sectors. Therefore the investment promotion agencies play a crucial role for the marketing of a country in order to attract long term investment rather than short term capital movements. The survey highlights that investment promotion grew rapidly in the 1980s and 1990s, together with the opening up of the world economy and the remarkable growth of FDI worldwide. At that time, considerable number of IPAs was relatively young, especially in developing countries and transition economies. Important factors behind the increased number of IPAs, especially in the 1990s, were the opening up of Eastern Europe and the Former Soviet-Union and the liberalization of FDI regimes throughout the developing world.

Besides working on image building and investment generation, investment promotion agencies should devote considerable effort for investor servicing functions before and after the investment is made. Those efforts can influence the amount, length of stay and location of investment in different ways. The IPAs also achieve other functions such as investor targeting, after care programs, consulting services, and promotion of privatization etc. according to the stage of development of the country. Among image building techniques are developing promotions with a focus on advertising, participating in investment exhibitions; facilitating investment missions from source countries, and organizing information seminars on investment opportunities to targeted groups. These techniques set the stage, helping convince prospective foreign investors that a certain country may be a good place to invest.

Image building alone is not enough to generate further FDI, however, especially when the reality in a country is better than the perception held by the international investment community, transmitting the real image to those groups is crucial. These activities must be based on truth. The report of UN demonstrates that the role and priorities of the IPAs are different in each country. In some countries government organizations still promote their own sectors/industries, while the IPA focuses its efforts on the sectors which are not capable of promoting themselves. However, the attention of the IPAs to attract foreign investment into infrastructure is observed to increase worldwide (UN Conference on Trade and Development, 2008). The report states that IPAs from developed countries concentrate primarily on attracting FDI into technologically more advanced industries, such as mobile telephony and Internet services, whereas many developing country IPAs also seek foreign investment in the infrastructure services (Conference on Trade and Development, 2008, p:15).

3.1. The Case of Investment Support and Promotion Agency of Turkey: ISPAT

The experiment of the Industrial Development Authority (IDA) of Ireland-which is one of the oldest successful IPA-suggests that, the task of IPAs should be supported by a transparent investment policy in order to attract long-term foreign investments. As suggested, Turkey should enhance the marketing of the country and develop a better image in the eyes of the international investors by establishing a focused and pro-active promotion institution according to international best practice that best suits Turkish promotional needs (FIAS, 2001). Acknowledging this fact, the Investment Support and Promotion Agency of Turkey (ISPAT) is established in July 2006 as the official organization for encouraging and promoting investment in Turkey. ISPAT's mandate is to present investment opportunities (Greenfield investments, privatizations, infrastructure investments, BOT & PPP, etc.) to members of the global business community and to assist them before, during, and after their entry into Turkey. It serves as a reference point for international investors and as a point of contact for all institutions engaged in promoting and attracting investments at national, regional, and local levels (www.invest.gov.tr). The agency set a representative network of 13 countries consisting mostly of nationals from Canada, China, Germany, the Gulf States, France, India, Israel, Italy, Japan, Kazakhstan, Russia, UK, and USA. These representatives are entitled to make first contacts within the strategic priorities set by the Agency. Furthermore, a team of professionals consisting of project experts proficient in several foreign languages is employed to help investors successfully develop their business operations in Turkey. The agency defines its objective as to guarantee continuous client support with a 100% quality service attitude in the Ankara and Istanbul offices. The approach is fully integrated with private sector methods and is supported by all governmental institutions. The Agency provides an extensive range of services to investors through a one-stop-shop approach and assists them in obtaining optimum results from Turkey (www.invest.gov.tr).

ISPAT performs different duties for different parties. The Agency having close contact with existing and potential investors proposes policy reforms to improve the overall business environment to Government. Branding and improving Turkey's image as an FDI destination, promoting sectors/industries with high potential to prospective investors and informing them about investment opportunities in Turkey are among the tasks performed by ISPAT. The Agency also provides support services before, during, and after the investment process, such as acquiring investment-related approvals and permission from central and local authorities and assist foreign investors through start-up clearances.

The main activities realized by ISPAT in 2007 are: (1) *Investor Contacts and participation to national/International events*: In one year, the Agency contacted more than 500 investors directly, 61% of which had no previous investment relationship with Turkey. Furthermore, presentations and speeches are given in 59 different national or international events, delegations led by the Ministry of Foreign Affairs with the participation of relevant institutions made visits to the different regions of the world, (2) *The establishment of a multilingual portal* : On September 24, 2007, an investment Portal, <http://invest.gov.tr>, became operational in 10 different languages, (3) *Advertisements*: In order to promote investment opportunities in Turkey, the Agency has prepared visual advertising materials such as CDs, brochures, TV and magazine ads in 11 different languages and published them in 70 newspaper and magazines in more than 50 countries. Commercials have been on air on the prominent international broadcasting channels (Investment Advisory Council For Turkey Progress Report 2008).

3.2 Suggestions for the policy makers to make ISPAT more effective: A New Approach for the 21st Century

The analysis of the past and current research demonstrates that Turkey could not achieve yet the standards required for a favorable business environment encouraging FDI. The obstacles stated in the beginning of 2000s by foreigners related to FDI in Turkey are still valid. The establishment of an investment promotion agency is a positive step showing the desire of the Turkish government to change the picture. It is crucial to develop a strategic roadmap for the agency, articulating its operating targets and key policy initiatives to advocate in order to increase the country's attractiveness in the eyes of the investors. However, times have dramatically changed since the 1960's when Ireland and Singapore have established their Promotion Agencies and representative offices in multiple countries to increase awareness about and interest into their countries. They managed to reap the benefits of their pioneering act which

was a good fit for their times. The investment model in those times has mostly been green-field investments where companies had to compare and choose countries to invest in. The more they knew about the business environment and opportunities in those countries, the higher would be the chances of investment. At that era, information could be obtained through physical channels and contact. However, now we are living in a digital age where one can obtain all relevant information, country statistics and company data on the fingertips through the Internet, hence diminishing one previous task of the investment promotion agencies. The investment model has also shifted dramatically towards M&As and Privatizations where Private Equity companies or the Acquirers already set their eyes onto some regions, even industries and companies as part of their strategy and then work out operational details such as whom to buy and how.

These developments imply a need to revise the approach towards investors. ISPAT should establish a strong and geographically spread local presence in addition to a broad international presence with a focus on target countries. However, in a period where the resources are tight for every institution, targeting of sectors and countries become crucial for a more focused approach. Reevaluating the marketing mix elements, in terms of *product*, ISPAT has to identify the differentiating advantages of Turkey and communicate them to selected target groups. Policy advocacy is a key function of an IPA as a government entity with close contact with industries and insight on their needs. The successful implementation of this function is vital for ISPAT especially in a period of crisis. Furthermore, to remain competitive, ISPAT needs to work hard on decreasing the costs of investors acting as a channel between foreign investors and the Government. It is no more enough to help the realization of an investment, but the Agency has to help the investors with their on-going operations to encourage them to remain as well. Therefore, the *price* element has to be well managed not only during the entry phase but during the operations of the companies. Providing information on the local business climate as well as on relevant regulations *to promote* the country is among the main tasks of IPAs. Consulting, matching and after care are provided by most IPAs, however, nowadays the needs of investors are more complex. The need for new service products and high-tech areas should be emphasized as well as defense and health related fields. The advertisements emphasizing the strengths of the country need to be backed up by sound economic and political practices. During the global economic crisis where financing is tight and new large-scale investments seem less likely in the short-term, most companies who set up businesses abroad face difficult times and the risk of retreat. All these new issues require a revised and enhanced focus for ISPAT along with the classical image management and promotion activities. In this regard, Kotler's (1986) Megamarketing Mix approach may seem more feasible-adding Public Relations and Politics/Power as the fifth and the sixth marketing mixes. Additionally, a very local concept of FDI attractiveness tool, labeled as BOOM (Build, Own, Operate, Model) by the business media in 1980's may give new impetus to the Turkish efforts to attract more FDI in the years to come.

UNDERSTANDING THE CONSUMER ATTITUDES TOWARD MOBILE ADVERTISING AND ITS IMPACTS ON CONSUMERS' BEHAVIORAL INTENTIONS: A CROSS-MARKET COMPARISON OF U.S. AND TURKISH CONSUMERS

Oylum Korkut Altuna, University of Marmara, Turkey
Faruk Anil Konuk, University of Sakarya, Turkey

ABSTRACT

Regarding the intensified competition and the increased number of alternative brands offering the same kinds of products, new marketing applications have been discovered by companies. A trendy and prevalent example to these applications is mobile marketing which refers to the marketing activities on or with a mobile device such as mobile phone, laptops or pdas. Among the mobile marketing tools, the most frequently applied one is mobile advertising. Mobile advertising is becoming a very popular marketing tool as a result of technological advancements such as the 3G technology. Some common examples of mobile advertising applications are receiving advertisements and coupons by e-mails that can be read anywhere via a portable mobile device (laptop, blackberry, iphone or pdas) that provides a portable mailbox, allows receiving SMS and MMS messages on the mobile phone (sometimes in return of free calls by the telecommunication company), getting incentives and coupons on the mobile phone, being exposed to Bluetooth devices and instant messages.

This study aims to measure the attitudes of U.S. and Turkish consumers towards the mobile advertising applications which are both experienced or are about to be experienced in the short term as companies make further investments to use mobile marketing applications. Besides, the correlation of these attitudes with consumers' behavioral intentions is examined.

The results of the independent sample t-test show that, the attitudes of Turkish and U.S. respondents are different regarding mobile advertisements. The results of the Pearson correlation analysis show that there is a positive correlation between these two constructs.

INTRODUCTION

Concepts like mobile commerce or mobile marketing are known to be derived from the concept of mobility. Mobility is defined as “the quality or state of being mobile” (www.thefreedictionary.com/mobility, May, 5, 2009). As understood from the definition, anything that is wireless, moving and portable is perceived as to be mobile. Oh and Kun-Pyo have listed some properties that they have linked with mobile objects, such as portability, activity and interactivity (Oh & Kun-Pyo, 2005:2).

The remote transportation of information has been an issue of consideration for human beings since ages. Many primitive tools known to be used as information transporters such as drums, pigeons and smoke have turned into more complicated and technological devices at the present day. Today, the wireless technology enables the opportunity of mobility all along the line for humans.

Any kind of a media where the consumers exist and interact is perceived to be an opportunity by marketing professionals. The mobile phones, PDAs, portable computers and wireless networking systems have been developed and improved at a great pace and they have become the inevitables of our lives. Like anything that makes up a vital part in human's life, these devices also have engaged the marketing professionals' attention. As a result, above-mentioned mobile devices have gone beyond being communication devices but become ideal platforms for marketing communications.

As mobile marketing enables more personal and interactive brand-consumer communication than traditional marketing, so many brands invest in mobile marketing applications. These applications such as mobile marketing platforms and global wireless systems enable brands and consumers to interact in a more personalized and customized way (Rohm and Sultan, 2006:5).

The purpose of this study is to empirically examine the U.S and Turkish consumers' attitudes towards mobile advertising and to reveal in what ways those attitudes differ in these two cultures and how they are correlated with the behavioral intentions. .

LITERATURE REVIEW

M-Commerce and Mobile Marketing

"The terms "wireless marketing" and "mobile marketing" are often used interchangeably to describe the use of wireless media as an integrated content delivery and direct response vehicle within a cross-media or stand-alone marketing communications program (www.mmaglobal.com, May 4, 2009).

Mobile marketing is "the systematic planning, implementing and control of a mix of business activities intended to bring together buyers and sellers for the mutually advantageous exchange or transfer of products" (Carter, 2008:62) where the primary point of contact with the consumer is via their mobile device.

In their article through which they aim to posit and clarify certain implications of mobile technology in the context of mobile commerce, Balasubramanian et al. (2002:350) describe mobile commerce as a type of communication that involves "either one-way or interactive, between two or more humans, between a human (or humans) and one or more inanimate objects or between two or more inanimate objects (e.g., Between devices)".

Interactivity, customization – eligibility and being able to be adapted to customization make mobile marketing an important marketing tool. "A survey by Airwide Solutions, a builder of mobile infrastructure and applications, shows that advertisers are ready to invest in mobile. The survey among 50 global brands also found that more brands are looking to spend a greater proportion of their marketing budget on mobile campaigns in the future with 71 percent of brands projecting to spend up to 10 percent of their budget on mobile marketing" (Turner, 2008:122).

Mobile Advertising

Mobile advertising is one of the very common forms of mobile marketing. Leading companies like Procter & Gamble, Microsoft, Disney, Coca-Cola, Sony Pictures and McDonalds have been embracing mobile advertising and including it within their marketing budgets. "Since the first mobile text advertising was done in Scandinavia in 1997, mobile advertising has grown consistently. It's expected that by 2011 marketers will be expending \$11.3 billion annually on mobile advertising, up from \$871 million in 2006. As a reference, it took 2 years for broadcast TV, 4 years for the internet and 5 years for cable TV advertising to reach \$1 billion in ad revenue, and 5 years for internet and broadcast TV advertising to reach 5 billion \$" (Hanley and Becker, 2006:68).

Different from traditional advertising which is non-personal and applicable only via mass media, mobile advertising is more individual and interactive while informing and persuading the customer (Ayanwale et al. 2005:11; Chowdhury et al., 2006:42).

Among the most common mobile advertising applications may be listed the “embed advertisements in mobile radio, inline and interstitial ads on mobile internet sites, text messaging on mobile phones, Bluetooth alerts and multi media messaging” (Hanley and Becker, 2006: 68).

Mobile advertisements’ getting more popular day after day, have made them subject to rules and regulations in some countries. In some countries, new regulations have been brought to mobile advertisement applications like getting the approval of the customer prior to sending the message. For instance, in USA, access to mobile consumers is dictated by federal law and industry best practices. (Mobile Marketing Association, CAN-SPAM ACT 2003) (www.mmaglobal.com, May 4, 2009). In Turkey, efforts are under way to lay down rules and regulations regarding mobile advertisements but there is not a general law in force on mobile advertisements yet (www.dpid.org.tr, May 13, 2009). However, the mobile market in Turkey has become a distinctive market when compared with some developed countries. The youth rate of the population, the increased number of mobile phone users and the emerging wireless internet need makes Turkey a promising market in terms of mobile applications (Barutçu, 2007(b):30).

Attitudes Towards Mobile Advertising

Studies aiming to explore the attitudes towards both mobile marketing and mobile advertisements are based on the theory of technology acceptance models. Among the various theories that contribute to the understanding of the adoption process of new information – communications technologies; *technology acceptance model (TAM)* is one of the most widely visited ones (Yang, 2007:34). Technology acceptance model was first developed by Fred Davis in 1989 (Davis, 1989) and has been developed and extended in many further studies (Davis et al. 1989; Subramanian, 1994; Legris et. al. 2002; Olson and Boyer 2003; Venkatesh and Davis 2000).

As same with other traditional marketing applications, consumer attitudes are decisive in the success of the mobile advertising campaigns, too (Yang, 2007:37). “Based on different strategic applications, wireless marketing can be permission-based, incentive based, or location-based” (Chowdhury, Parvin, Weitenberner and Becker, 2006:36).

The consumer attitudes towards mobile advertisement construct in marketing literature generally is based on four dimensions *as entertainment, informativeness, irritation and credibility* (eg. Ducoffe, 1996; Parissa and Maria, 2006; Tsang et al. 2004). *Entertainment* dimension refers to the enjoyment associated with the message. Many mobile advertisement applications involve games, music and visual applications. “Individual’s feelings of enjoyment associated with advertisement strongly influence their attitude toward advertisement” (Shavitt et al, 1998). *Credibility* of the advertising refers to its truthfulness and believability in general according to the consumer perceptions (MacKenzie and Lutz, 1989:51; Pavlou and Stewart, 2000). The credibility of mobile advertising message is known to have a positive effect on the consumers’ attitudes towards the advertisement (Chowdhury et al. 2006:37). Mobile advertisement research has revealed that informativeness ability of the advertisements can influence the satisfaction and purchase decision of consumers (Ducoffe, 1996:22). *Informativeness* dimension refers to the ability of the advertisement to provide up-to-date, timely and immediately accessible information about the products. *Irritation* is the only negative dimension of attitudes. “When advertising employs techniques that annoy, offend, insult or overly manipulating, consumers are likely to perceive it as an unwanted and irritating influence” (Ducoffe, 1996:23). When consumers receive an advertisement message and feel irritated with it, they may ignore it.

In some of the research studies examining consumer attitudes towards mobile advertisements, another dimension has been added to those basic four dimensions (eg. Ducoffe, 1996; Parissa and Maria, 2006). Mostly this dimension refers to (and named as) *perceived advertising value*. The perceived value of mobile advertising is “a subjective evaluation of the relative worth or utility of advertising to consumers” (Ducoffe, 1995:1).

Measurement of Consumer Attitudes Towards Mobile Advertisements

Mobile advertisement studies regarding the consumer attitudes have mostly cited the study of Ducoffe (1996) where he aims to measure the advertising value on the web. The original Ducoffe scale has 25 items and five constructs (informativeness, entertainment, irritation, advertising value and other items). There are other studies based on the

study of Ducoffe. In some of these studies the researchers developed Ducoffe's model and added new items to the scale (eg. Parissa and Maria, 2006; Tsang et al. 2004; Shen and Chen, 2008).

In this study, the scale used to measure the consumer attitudes towards mobile advertising has been developed by adapting the scales in the studies by Ducoffe (1996), Tsang et al (2004) and Parissa and Maria (2006).

Behavioral Intentions

Customers who remain loyal to the company are likely to engage in favorable word-of mouth behavioral responses. In addition, the company may be able to cross-sell to these customers or even charge them a premium price (Athanasopoulos et. al., 2001: 691). When a customer praises the company, this behavioral response is indicative of the customers' decision to remain with the firm (Athanasopoulos et. al., 2001: 691).

Based on research findings Zeithaml et al. (1996) summarized behavioral intentions with favorable (say positive things, recommend company, remain loyal to the company, spend more with company, pay price premium) and unfavorable (say negative things, switch to another company, complain to external agencies, do less business with company) intentions. In their above-mentioned study, they developed a 13-item scale in order to measure behavioral intentions. As a result of factor analysis they obtained five factors. These factors were labeled as loyalty to the company (*loyalty*), propensity to switch (*switch*), willingness to pay more (*pay more*), external response to problem (*external response*) and internal response to problem (*internal response*).

Likewise Zeithaml, (1996), Athanasopoulos (2001) also measured behavioral intentions by three priori categories: *word-of-mouth communications*, *intentions to switch*, and *decision to switch*. In some of the studies, only the purchase intentions were examined to explain behavioral responses. One of these studies was conducted by Taylor and Baker (1992). In this study, purchase intentions were operationalized like Zeithaml (1996) did with loyalty dimension. Another study conducted by Heijden et. al. (2003) aimed to investigate the factors influencing consumer's intentions of online purchasing at an electronic commerce website.

In this study, in order to measure the behavioral intentions used are mostly generated from the study of Zeithaml et al (1996). Four additional variables were adapted from Heijden et al.'s study (2003).

RESEARCH QUESTION

Within this study, consumers' attitudes towards mobile advertising are investigated in two different cultures: U.S.A and Turkey. The reason why those two countries are included in research is that, these two countries are at different levels in terms of development. U.S is a developed country whereas Turkey is a developing country. For this reason, the results will reflect the position in two countries where as linked with this development level, the level of technology consumption, the attitude towards both technology in general and mobile Technologies particularly and advertisements will differ.

As a result of globalization, those two countries involve same global brands. As mobile marketing has become an important marketing tool for companies all over the world, the results of this study will involve also managerial implications for those companies operating both in Turkey and U.S or other developed countries via revealing the Turkish consumers' attitudes towards mobile advertising and most importantly by emphasizing the comparison of those attitudes with a developed country's citizens.

One can see numerous studies in the field of mobile marketing as the subject is getting more popular day after day in parallel with the technological investments and developments. Among those studies attitudes towards mobile marketing tools and advertising has been investigated. But, the number of studies correlating these attitudes with behavioral intentions is still limited in number (eg. He ve Lu, 2007; Shen and Chen, 2008). For this reason, this study may be a good source to reveal the relationship between attitudes and behavioral intentions.

Based on literature review and the objectives stated above, the research questions below were formulated:

RQ1: Do the attitudes of U.S and Turkish consumers towards mobile advertising show any difference?

RQ2: How these attitudes of consumers in both cultures are correlated with behavioral intentions?

METHODOLOGY

Survey Instruments and Procedures

In this study, two scales are used for measuring the attitudes towards mobile advertising and behavioral intentions. The scale used for measuring attitudes is based upon the ones that were developed by Ducoffe, 1996; Tsang et al., 2004; Parissa and Maria, 2006, whereas the behavioral intentions scale was adopted from Zeithaml et al., (1996) and Heijden et al., (2003). As the surveys were conducted both in Turkey and U.S, the original surveys were back translated to Turkish by a Turkish – English bilingual person. After back translation, in the light of validity studies, the scales were checked by two academicians who are well-known with their cross-cultural and consumer behavior studies. After the face validity studies, a pre-test consisting of sample sizes of 30 in both cultures were conducted. As a result of the pre-tests and face validity studies, some items were dropped and some were adopted because of the cultural differences. As a result of these attempts, the mobile attitudes scale has turned into a modified 22 item revised scale whereas the behavioral intentions scale has turned into a 9 item scale.

The questionnaire consists of 3 parts as the attitude towards mobile advertising, behavioral intentions and demographic variables.

Sampling Method

Based on a convenience sampling method, the questionnaires were administered in two different university campuses in U.S (UTD) and Turkey (Sakarya University). The questionnaire forms were distributed using drop-off survey method where all the questionnaires were left to the respondents and were collected back in 2 days.

Sample Characteristics

The total number of surveys distributed in Turkey was 120. Among those, the number of usable completed surveys was 98 with a response rate of %81. The total number of distributed surveys was 135 in U.S with number of completed surveys of 94 and response rate of %70.

The gender distribution shows that majority of both of the samples were males (61.5% for U.S. and 51.5% for Turkish) and the age distribution was mostly 53 and over for both samples. The major distribution in both samples were married and the education level was mostly bachelor degree with a percentage of 42,2 for U.S. and 57.1 for Turkey.

RESULTS and DISCUSSION

Assessment of Validity and Reliability

In the context of validity studies, the scale was made to be examined by two scholars who are known with their cross-cultural studies. After the face validity studies, the reliability analysis were conducted. In order to assess the reliability of the scale alpha coefficient score has been used. As a result of the reliability analysis for the attitude scale, the Cronbach's alpha was 0,945 which can be assessed to be acceptable level in parallel with Nunnally (1979).

Regarding the behavioral intentions scale, the Cronbach's alpha score was obtained to be 0,898 which is again an acceptable score (Nunnally, 1979).

Descriptive Statistics

In order to analyze the respondents' attitudes towards mobile advertising, first of all descriptive studies were conducted. The results of the descriptive studies may be seen on Table 1 and Table 2 below.

Table 1: Descriptive Statistics for the Overall Respondents' (US and Turkey) Attitudes Towards Mobile Advertising

| Rank | Statement | Standard Deviation | Mean |
|------|--|--------------------|-------|
| 1 | 14. Mobile advertising allows immediate access to information. | 1,152 | 2,79 |
| 2 | 7. Contents in mobile advertisements are often annoying. | 1,116 | 2,73 |
| 3 | 13. Mobile advertising is a good source of up-to-date product information. | 1,230 | 2,65 |
| 4 | 25. Most of the products perform just as the mobile ads claim. | 0,952 | 2,53 |
| 5 | 23. Mobile advertisement helps me buy the best value brand for this price. | 1,137 | 2,47 |
| 6 | 22. Mobile advertisement helps me to know which brands have the features I am looking for. | 1,139 | 2,46 |
| 7 | 16. Mobile advertisement is useful. | 1,014 | 2,45 |
| 8 | 17. Mobile advertisement results in better products for the public. | 0,998 | 2,45 |
| 9 | 18. Mobile advertising presents a true picture of the product advertised. | 1,018 | 2,44 |
| 10 | 3. I feel that mobile advertising is a good source for timely information. | 1,233 | 2,43 |
| 11 | 5. I feel that mobile advertising is irritating. | 1,273 | 2,43 |
| 12 | 19. I trust brands advertised by m-advertising more than brands that are not. | 0,936 | 2,24 |
| 13 | 9. I trust mobile advertisements. | 1,049 | 2,18 |
| 14 | 26. I am impressed by mobile advertisements. | 1,122 | 2,17 |
| 15 | 21. Mobile advertisement helps me to find products that match my personality. | 0,984 | 2,16 |
| 16 | 8. I use mobile advertising as a reference for purchasing. | 1,035 | 2,09 |
| 17 | 11. Mobile advertising is fun to use. | 1,007 | 2,05 |
| 18 | 12. Mobile advertising is exciting. | 1,018 | 1,980 |
| 19 | 10. Overall, I like mobile advertising. | 1,117 | 1,97 |
| 20 | 2. I feel that receiving mobile advertisements is pleasant. | 1,022 | 1,83 |
| 21 | 24. I am willing to pay more for a product advertised by m-advertising. | 0,950 | 1,83 |
| 22 | I feel that receiving mobile advertisements is enjoyable and entertaining. | 0,985 | 1,79 |

The overall sample's descriptive analysis results show that the statement with the highest mean value is "*Mobile advertising allows immediate access to information*" (mean=2,79; s.d.= 1,152) whereas the statement with the lowest mean value is "*I feel that receiving mobile advertisements is enjoyable and entertaining*" (mean=1,79; s.d.=0,985).

Table 2: Descriptive Statistics for the US and Turkish Respondents' (Separately) Attitudes Towards Mobile Advertising

| US | | | | TR | | | |
|------|--|--------------------|------|------|--|--------------------|------|
| Rank | Statement | Standard Deviation | Mean | Rank | Statement | Standard Deviation | Mean |
| 1 | 14. Mobile advertising allows immediate access to information. | 1,246 | 2,75 | 1 | 7. Contents in mobile advertisements are often annoying. | 1,064 | 3,01 |
| 2 | 13. Mobile advertising is a good source of up-to-date product information. | 1,304 | 2,45 | 2 | 5. I feel that mobile advertising is irritating. | 1,225 | 2,99 |
| 3 | 25. Most of the products perform just as the mobile ads claim. | 0,942 | 2,45 | 3 | 13. Mobile advertising is a good source of up-to-date product information. | 1,131 | 2,84 |
| 4 | 7. Contents in mobile advertisements are often annoying. | 1,097 | 2,43 | 4 | 14. Mobile advertising allows immediate access to information. | 1,063 | 2,82 |
| 5 | 16. Mobile advertisement is useful. | 1,009 | 2,34 | 5 | 3. I feel that mobile advertising is a good source for timely information. | 1,168 | 2,73 |
| 6 | 17. Mobile advertisement results in better products for the public. | 0,939 | 2,27 | 6 | 18. Mobile advertising presents a true picture of the product advertised. | 1,005 | 2,70 |
| 7 | 22. Mobile advertisement helps me to know which brands have the features I am looking for. | 1,198 | 2,25 | 7 | 23. Mobile advertisement helps me buy the best value brand for this price. | 1,150 | 2,68 |
| 8 | 23. Mobile advertisement helps me buy the best value brand for this price. | 1,086 | 2,25 | 8 | 22. Mobile advertisement helps me to know which brands have the features I am looking for. | 1,053 | 2,65 |
| 9 | 18. Mobile advertising presents a true picture of the product advertised. | 0,964 | 2,16 | 9 | 17. Mobile advertisement results in better products for the public. | 1,027 | 2,62 |
| 10 | 3. I feel that mobile advertising is a good source for timely information. | 1,230 | 2,12 | 10 | 25. Most of the products perform just as the mobile ads claim. | 0,960 | 2,60 |
| 11 | 19. I trust brands advertised by m-advertising more than brands that are not. | 0,895 | 2,03 | 11 | 16. Mobile advertisement is useful. | 1,013 | 2,55 |
| 12 | 21. Mobile advertisement helps me to find products that | 1,011 | 1,99 | 12 | 26. I am impressed by mobile advertisement. | 1,109 | 2,46 |

| | | | | | | | |
|-----------------------------|--|-------|------|----|---|-------|------|
| | match my personality. | | | | | | |
| 13 | 8. I use mobile advertising as a reference for purchasing. | 1,058 | 1,98 | 13 | 19. I trust brands advertised by m-advertising more than brands that are not. | 0,938 | 2,42 |
| Table 2. (Continued) | | | | | | | |
| 14 | 9. I trust mobile advertisements. | 1,074 | 1,96 | 14 | 9. I trust mobile advertisements. | 0,987 | 2,38 |
| 15 | 26. I am impressed by mobile advertisements. | 1,054 | 1,86 | 15 | 21. Mobile advertisement helps me to find products that match my personality. | 0,935 | 2,32 |
| 16 | 11. Mobile advertising is fun to use. | 0,945 | 1,83 | 16 | 11. Mobile advertising is fun to use. | 1,024 | 2,25 |
| 17 | 5. I feel that mobile advertising is irritating. | 1,023 | 1,82 | 17 | 10. Overall, I like mobile advertising. | 1,109 | 2,21 |
| 18 | 12. Mobile advertising is exciting. | 0,940 | 1,76 | 18 | 8. I use mobile advertising as a reference for purchasing. | 1,007 | 2,19 |
| 19 | 10. Overall, I like mobile advertising. | 1,072 | 1,72 | 19 | 12. Mobile advertising is exciting | 1,047 | 2,19 |
| 20 | 2. I feel that receiving mobile advertisements is pleasant | 0,944 | 1,71 | 20 | 24. I am willing to pay more for a product advertised by m-advertising. | 0,979 | 1,98 |
| 21 | 24. I am willing to pay more for a product advertised by m-advertising. | 0,893 | 1,66 | 21 | 2. I feel that receiving mobile advertisements is pleasant. | 1,082 | 1,95 |
| 22 | 1. I feel that receiving mobile advertisements is enjoyable and entertaining | 0,909 | 1,64 | 22 | 1. I feel that receiving mobile advertisements is enjoyable and entertaining | 1,037 | 1,92 |

Examining the U.S. sample's descriptive analysis, it is seen that the statements with the highest and lowest mean values are the same with the ones of the overall sample. "*Mobile advertising allows immediate access to information*" (mean=2,75; s.d.=1,246) has the highest mean value whereas "I feel that receiving mobile advertisements is enjoyable and entertaining" (mean=1,64; s.d.=0,909) has the lowest mean value again.

The statement with highest mean value for the Turkish sample differs. This time, "Contents in mobile advertisements are often annoying" has the highest mean value (mean=3,01; s.d.=1,064). The statement with the lowest mean value is similar to the one of the overall sample and U.S. samples (*I feel that receiving mobile advertisements is enjoyable and entertaining*) with a mean value of 1, 92 and standard deviation of 1,037.

Comparison of U.S. and Turkish Samples' Attitudes Towards Mobile Advertisements

In order to analyze whether there is a statistically significant difference between U.S. and Turkish samples regarding the overall attitudes (overall mean values for the 26 items) towards advertisement, independent sample t-test was conducted. The results of the t-test show that, with significance value of 0,000 the U.S and Turkish samples' overall mean scores of the 26 items that aim to measure the attitudes towards mobile advertisements show statistically significance difference. Analyzing the mean values, one can see that Turkish respondents hold more positive attitudes (mean value= 2.53) than the U.S respondents (mean value = 2, 15).

Factor Analysis

In order to detail the results and see the dimensions of consumer attitudes towards mobile advertisement factor analysis was conducted. Kaiser-Meyer-Olkin (KMO) measuring sampling adequacy result is 0.931 and Significance of Bartlett's test of sphericity is 0.00. The results of the factor analysis are displayed in Table 3 below.

Table 3: Factor Analysis

| Rotated Component Matrix | Factor 1 | Factor 2 | Factor 3 | Factor 4 |
|---|-----------------|-----------------|-----------------|-----------------|
| Mobile advertisement is useful | .781 | | | |
| Mobile advertising is a good source of up-to-date product information | .767 | | | |
| I feel that mobile advertising is a good source for timely information | .742 | | | |
| Mobile advertising allows immediate access to information | .647 | | | |
| Mobile advertisement results in better products for the public | .641 | | | |
| I use mobile advertising as a reference for purchasing | .620 | | | |
| Mobile advertisement helps me buy the best value brand for this price | .599 | | | |
| Mobile advertisement helps me to know which brands have the features I am looking for | .590 | | | |
| Mobile advertising presents a true picture of the product advertised | .571 | | | |
| I trust mobile advertisements | .522 | | | |
| Mobile advertising is exciting | | .813 | | |
| Mobile advertising is fun to use | | .803 | | |
| Overall, I like mobile advertising. | | .732 | | |
| I feel that receiving mobile advertisements is enjoyable and entertaining | | .595 | | |
| I feel that receiving mobile advertisements is pleasant | | .573 | | |
| I am impressed by mobile advertisements | | .488 | | |
| Most of the products perform just as the mobile ads claim | | | .779 | |
| I trust brands advertised by m-advertising more than brands that are not | | | .647 | |
| I am willing to pay more for a product advertised by m-advertising | | | .597 | |
| Mobile advertisement helps me to find products that match my personality. | | | .512 | |
| Contents in mobile advertisements are often annoying | | | | .715 |
| I feel that mobile advertising is irritating | | | | .696 |

Extraction Method: Principal Component Analysis. Rotation Method: Varimax with Kaiser Normalization.

The factor analysis has produced four factors with eigenvalues larger than 1.0 and they explain the 66% of the total variance. Those four factors are labeled as the *informative dimension of mobile advertisements* (Cronbach's alpha=.922), *enjoyment dimension of mobile advertisements* (Cronbach's alpha=.896), *credibility of mobile*

advertisements (Cronbach's $\alpha=.896$) and *irritation dimension of mobile advertisements* (Cronbach's $\alpha=.651$).

The factors and the variables that make up those factors may be seen on Table 6 above. Those factor analysis results seem to be parallel with the previous research as the dimensions seem to be similarly formed with those of previous studies which are mentioned above.

Correlation Analysis For Consumer Attitudes towards Mobile Advertisements And Behavioral Intentions

As mentioned above, this study not only aims to reveal the consumer attitudes towards mobile advertisements but also to examine how these attitudes are correlated with behavioral intentions.

In order to analyze this issue, Pearson Correlation analysis has been conducted. The results of the Pearson correlation analysis reveal that there is a significant positive relationship between consumer attitudes and behavioral intentions for the U.S. sample, which means the more the U.S. consumers' attitudes are positive towards the mobile advertisements, the more affirmative their behavioral intentions are ($\text{sig.} = 0,000$; $r=.720$). As for the Turkish sample, there is again a statistically significant and positive relationship between these two constructs ($\text{sig.}=0,000$; $r=.630$).

CONCLUSION AND LIMITATIONS

The results of this study show that the attitudes of U.S. and Turkish consumers differ regarding the mobile advertisements. The Turkish consumers reveal more positive attitudes than American respondents regarding mobile advertisements. This result is unexpected in some aspects that the mobile marketing is permission-based in U.S. and more incentive-based. These results may be perceived as the indicators in terms of the marketing mix plans. In Turkey, according to these results, the mobile marketing and mobile advertisement tools may be a better marketing mix component than in U.S. This may be an important implication for global companies. U.S. is a more developed country than Turkey where the technology acceptance is expected to be higher, so for many companies U.S. would seem to be a more promising market regarding the mobile applications than Turkey would. But the results show that, attitudes are not only correlated with the technological infrastructure but also with other cultural properties. Further research based on more qualitative data such as focus groups may reveal the details regarding these attitudes and differences. On the other hand, adding more incentives to mobile advertisements in Turkey may enhance the positive attitudes of consumers. Most mobile activities are in relation to promotions in Turkey (Barutçu, 2007b:30). Those mobile advertisement applications may be enriched via entertainment contexts, incentives and more interactive applications.

As expected before conducting the correlation analysis, the attitudes and behavioral intentions regarding the mobile advertisements show a positive relation. These results are parallel with the limited number of previous research (Bauer et al, 2005; Shen and Chen, 2008). Further research would be efficacious in order to examine in detail how those factors affect behavioral intentions. This positive correlation may point out a competitive advantage for those companies that work and invest on enhancing the positive attitudes towards mobile advertisements by modifying the entertainment, informative and credibility dimensions of these advertisements while decreasing the irritation level.

This study has its own limitations. First of all, the surveys were conducted at university campuses in both countries. This sampling procedure and sample size may deviate the results and decrease the external validity of the study by decreasing the generalizability. In a study by Barutçu (2007a), the Turkish consumers' attitudes towards mobile advertisements were investigated before. The results revealed that, the Turkish consumers hold positive attitudes towards mobile advertisements. Still, considering that this study was one of the pioneer studies in Turkey, the sampling size and procedure may be expanded in the future studies and if the study is repeated using random sampling, the results may be representative to the whole population. Another issue is that, this study only reveals the attitudes towards mobile advertisements in general. Limiting the study with specific product categories and focusing on the attitudes towards these categories may change the results.

In spite of the limitations mentioned above, this study carries the property of being one of the pilot and pioneer studies in this field and still sheds light on the consumers' attitudes towards mobile advertisements and the correlations of those attitudes with behavioral intentions.

EXPORTER FIRMS IN TUNISIA: PROFILE DIFFERENCES

Eleuch Ep Koubaa Amira, Hisao Fujimoto
Osaka University of Economics, Japan

Koubaa Yamen, University of Marketing and Distribution Sciences, Japan

ABSTRACT

The financial and economic actual global crisis has dramatically affected the Tunisian small and medium exporter firms and the government is making effort to sustain the economy. This research tries to draw the profile of mono destination exporter and multi destinations exporter in Tunisia. As essentially differences in resources and management style discriminate between the two types of exporters, the role of the government to help exportation development seems to be essential. The government can enhance Tunisian firms' exportations by promoting the image of Tunisian products and training managers to deal with foreign markets and profit from opportunities.

INTRODUCTION

Consensus exists on the important role of exportations in developing and enhancing the economy of any nation. Exportations increase currency reserves and limit economic balance deficit. Exportations maximize the use of production capacity, stimulate technology and marketing innovation and encourage the firms' efficiency. Firms in developing countries try to benefit from the exportations opportunities to enlarge their markets and increase their profits as exportations do not absorb resources as do the other forms of internationalization (Katsikeas and Morgan, 1994). This is the case in Tunisia where the economy is basically based on small and medium firms and the currency resources are heavily depending on their exportation activity. The adoption of exportation' activity requires several decisions related to the markets selection strategies, the products to export, the politic of mix marketing to design... Such decisions are aspects of the firm's exportation behavior which is largely influenced by two types of factors. The first group depicts the external variables or macroeconomic variables related to the sector's characteristics and the economic environment in which the firm is operating. The second group depicts the microeconomic characteristics related to the firm itself such as the firm's size, management and the degree of involvement in the exportation activity (Barker and Kaynak, 1996). The interest toward the microeconomic perspective had revealed many exporters typologies. One of these typologies considers the expansion's strategy chosen by the firm to target foreign markets. The expansion strategy is defined as the strategic decision related to the expansion rates of the foreign markets and the allocation of the marketing efforts in the different markets. Two types of exporters are then identified:

- The exporters adopting diversification targeting different markets at the same time: multi destinations firm.
- The exporters adopting concentration targeting only one market: mono destination firm.

In Tunisia, despite the government efforts to encourage firms toward increasing their exportations and diversifying their markets, still many enterprises choose to be oriented to one market avoiding the exploration of new targets choosing to deal with geographically and culturally close market. The identification of criteria differentiating the two types of exporters can help to understand the reasons behind the firm's reluctance to diversify its markets. Hence, our interest to disclose the profile differences between the two groups of exporters. Academically we will try to fill the literature gap by defining multiple sets of variable which could affect the expansion strategy choice. Empirically, this research can help Tunisian government and firms to identify the reasons behind the limitation of exportation activity and then to disclose the area needing improvement and change.

BACKGROUND

The literature stipulates that mainly three types of factors are influencing the exporting behavior of the firm: the firm's characteristics, the manager characteristics (Holzmuller and Kasper, 1991) and the targeted foreign market characteristics. The direct exportation offers an opportunity to the firms choosing to control their products without investing in the foreign markets. Exportation strategy is formulated by analyzing the firm's abilities and the market opportunities in order to neutralize the weakness harming the success. The selection of targeted markets is then a strategic decision deriving from the firm's orientations. The importance of such decision increases with the dependence of the firm on its international involvement. This decision is preceding the evaluation of the market identified as prior to penetrate. The international expansion politic makes the firm thinking about the identification of the potential markets and the penetration priority, the marketing efforts that the firm is able to make and the evolution of the expansion's rate during time. Two alternatives of expansion strategy exist: the concentration and the diversification (Lee and Yang, 1991). The geographic dispersion of the targeted market seems to be the method to differentiate between the two strategies. The diversification means that the firm penetrates several markets trying to diffuse their marketing efforts in all these markets. Such firm is then a multi-destinations firm exporting to many markets. The concentration is characterized by the allocation of financial and human resources to one zone. The firm is then mono-destination steering its exportations to one market.

However, practically, the firm can not be positioned on the extreme of the continuum concentration /diversification. The firm tries to have a mixed strategy. It tries to export to several markets concentrating its resources on some particular markets. Such strategy guarantees to the firm to be concentrated on the most important markets having some flexibility to benefit from the opportunities offered by the other markets at the same time. Some researchers explain the concentration choice by the fact that the firm can gain a great market share in one zone which maximizes its profit.

Other researchers recommend the diversification as small market shares in many zones are more profitable than the concentration. Katsikeas and Leonidou (1996) indicated that empirical researches show that in an early stage of internationalization, the firm adopts the concentration strategy. However, as long as its involvement increases, it becomes more motivated to penetrate different markets. This evolution can be explained by three reasons:

- the firm's resources became enriched with the increasing involvement in exportation activity
- the diversification minimizes the risk and allows better exploitation of the offered opportunities
- the management problems with the targeted market decrease as the firm accesses the information and gain experience

The decision to target one or several markets can be explained through the interaction of some objective (the firm's features the targeted market's traits) and subjective variables (the management characteristics).

The firm's characteristics

-The firm's size: The relation between the firm's size and its exportation activity is depicted through the advantage offered by the size (Cavusgil, 1984). Proportionally to its size the firm can access to some competitive advantages facilitating the presence in different markets. Big firms have easier access to financial resources and management skills. They have greater production capacity and can mobilize more effort to enhance exportation activity. Big firms make more marketing researches and collect information about all the details in their targeted markets. However, small firms with restricted marketing activity and limited resources do not have strategic plans for exportation. Lee and Brash (1987) found that the majority of small firms adopt irrational approach to start exportation. They have ambiguous definition of objectives as they lack developed plans and information access. Small firms perceive more problems related to the exportation and can not tolerate great risk as they have limited financial assets. They are more concerned by information related to the security, insurance and transportation when they export. Small firms prefer to export to « soft » markets where the entry is facilitated by bilateral agreement, favorable taxation and payment facilities. Big firms can export to more "difficult" markets where barriers are more complexes to franchise. The increasing involvement in exportation activity and the expansion on different markets require then adequate human, financial and marketing resources. Big firms have then more chance to diversify their markets as they can assume the inherent consequences. Hence our first hypothesis

H1: Firm's size affects the expansion nature of exportations.

-The firm's experience in exportation activity: Firm's financial resources are not sufficient to explain the decision to continue and expand exportation activity. The experience and learning are also important factors. Firms having more experience in exportation can gain new skills and learn developed technology through their repeated contacts with foreign markets. Such advantages encourage the firm to continue the exportation activity (Burpitt and Rondinelli, 1998). Rhee and Cheng (2002) find that the firms start to export to a geographically and culturally near market. As they accumulate experience, they become oriented to new markets far and different. With experience, firms can be less uncertain in their activities. They can understand better the foreign markets mechanism and perceive fewer problems related to these markets management. Hence our hypothesis:

H2: Exportation experience affects the choice of exportation expansion strategy.

Manager characteristics

In many researches interested to the exportation activity, the personnel involvement of the firm's manager seems to be determinant in the exportation activity and the management system of the firm. The manager has a great role in facilitating or inhibiting the progress of exportation activity as he is the decider about information collect, knowledge development and resources investment. The manager's characteristics are supposed to affect many dimensions in the exportation behavior such as the probability to start exportation activity, the speed of foreign markets penetration and the exportation performance (Léonidou et al, 1998). When studying the manager profile, focus should be made on the variables which can modify his perception of opportunities. The manager's way to select targeted markets, his decision about the marketing strategy to adopt and his management of the relations with the foreign customers are affected by the manager's values and attitudes.

-The attitude toward risk: The attitude toward risk is a discriminator character when drawing managers' typology. Manager who takes the risk is a manager attracted by risky alternatives. Risk's reasons are the lack of the situation control, lack of information and lack of time. Enthusiast managers are tolerant for risk and optimist. They, then, tend to benefit from opportunities. However, pragmatic managers are averse toward risk and avoid enlarging their activity. Their firms stay small limited to one niche in the market. Furthermore, the probability to export is related to the manager aversion toward risk. Managers having negative attitude perceive the exportation as a risky activity, complicated and not profitable. Such attitude limits the manager's involvement and reduces his interest to target foreign markets. Exportations expansion requires a great investment in information collection and in the adaptation to the different markets conditions. Such investment can be a source of risk that the firm must assume if it wants to diversify its markets. If the manager fears the risk, he will limit the targeted markets to one traditional market well known. Hence our third hypothesis:

H3: manager's attitude toward risk affects the choice of exportation expansion strategy.

-The innovation criterion: According to Koh (1996) an innovator person is a person tending to select an innovation as the most acceptable alternative in a fixed time. Innovator manager is then a proactive manager trying to benefit from all the opportunities and having creative ideas concerning the firm's strategies (Kickul and Gundry, 2002). The innovator criterion affects the exportation decision process in four stages:

1- *consciousness*: the innovation sense makes the manager considering the exportation as an opportunity to benefit from.

2 -*the interest*: innovator manager becomes more favorable to run exportation activity

3- *the intention* : the motivation increases with the innovator sense

4- *the adoption* : the manager start to export

The innovation sense helps the manager to continue the exportation and multiply the experiences with the international markets. Innovator managers make more profit from exportation, search for the maximum of information and are oriented to new alternatives rarely chosen by the other exporters. Innovation sense seems to be then essential to push the manager to adopt exportation as a crucial activity for the firm. Innovator managers invest more in information researches and tasks management. Such investment is necessary for firms choosing to diversify their international markets.

Hence our fourth hypothesis:

H4: Manager innovator sense affects the choice of exportation strategy expansion

RESEARCH METHODOLOGY

Research instrument

To test our hypotheses, we carried out an empirical investigation among Tunisian firms. Measurements of the different variables were based on instruments used in previous researches. Two propositions are presented to define the firm's expansion strategy in exportation. The proposition to identify the multi destination firm was: the firm's strategy is to export to the maximum of possible markets without any particular concentration on a specific market. The proposition to identify mono destination is: the firm concentrates its efforts and resources on the exportation to one specific market. The number of targeted markets served to validate the proposed typology. The mono destination firm takes the code "0" and the multi destination firm is coded by "1". The size of the firm was assessed by the number of employees working in the firm. Experience in the exportation was measured by the number of years during which the firm was engaged in exportation activity. The manager attitude toward risk is measured by this question « could you please compare the risk related to the exportation to one market with the risk related to the international markets diversification ». 5point Likert scale was used from 1: not at all important to 5: very important. Measurement of innovator criterion is inspired from the work of Koh (1996). We used a 5point Likert scale for propositions like: "I am always searching for new markets", and "I always look for information about the innovation related to my firm's activity".

The sample and the data

The partially exporter Tunisian firms form the population of our study. Those forms can be grouped according to their activities sectors. The stratified sample is then applied. The sample size was calculated according to the formula of the stratified sample. We find that the number of firms should be equal to 68 firms. The table1 shows the number of firms in every sector and the number to be considered in our study.

Table1: repartition of partially exporter firms according to the activity sector

| Sector of activity | Number of partially exporter firms | Proportions (%) | number in the sample |
|-----------------------------------|------------------------------------|-----------------|----------------------|
| Food-processing industries | 797 | 25.6 | 17 |
| Chemical industries | 382 | 12.3 | 8 |
| Construction materials, ceramic | 428 | 13.7 | 9 |
| Several industries | 234 | 7.5 | 5 |
| Leather and shoes | 116 | 3.7 | 3 |
| Electric and electronic materials | 128 | 4.1 | 3 |
| mechanic | 426 | 13.7 | 10 |
| Textile and clothes | 424 | 13.6 | 9 |
| Wood | 181 | 5.8 | 4 |
| total | 3116 | 100 | 68 |

The questionnaire was delivered by the researcher to the firms' managers. We collected 52 answers. Our answer's rate is then equal to 76%.

Data analysis

Our sample characteristics are presented through some descriptive statistics. We proceed by a factorial analysis to assess the structure of the innovator sense structure. The research's hypotheses will be tested by the binary logistic regression as such method can test the effect of several variables on a dependent variable having two modalities. In our case, independent variables are firm's size and experience in the exportation activity as well as the innovator sense of the manager and his attitude toward risk. Dependent variable is the expansion strategy of the exportation activity. This variable can take two modalities: concentration if the firm is mono destination or diversification if the firm is multi destinations.

FINDINGS

Sample characteristics

Our sample is formed by 32 mono destination firms and 20 multi destinations firms. 78.125% of mono destination firms have less than 70 employees. 71.87% have less than 7 years in exportation activity. 50% of multi destination firms have less than 137 employees and 60% have less than 8 years of exportation experience. Grand Maghreb is the most targeted market by both mono destination (68.75%) and multi destinations firms (93.75%). The European market comes in second place, while the Arab market, America, Asia and Africa are rarely targeted by mono destination firms. Such markets are targeted by multi destinations firms in 65%, 40%, 45% and 65% of cases respectively.

Innovation sense structure

The application of factorial analysis with varimax rotation revealed two factors which underlie the concept of innovation sense. The first one explains 42.27% of the variance. 3 items are highly correlated with this factor “I am always searching for new markets”, “I always look for information about the innovation related to my firm’s activity”, “I agree on making changes to resolve the problems in my work”. These items depict the ability of manager to detect opportunities in the foreign markets through data collection and search of new clientele and his capacity to accept change to resolve problems. This factor can be labeled the manager’s opportunistic sense. The second factor explains 34.12% of the variance. It contains the items “It is easy to me to have new original ideas for my activity in the firm” and “it is easy to apply the new ideas that I got in my work”. This factor can be labeled the creativity of the manager as it presents the existence of creativity in the work.

The global quality of the model

In the logistic regression, the regression equation is:

Probability to be multi destinations = $1 / (1 + e^{-Z})$

$$Z = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 \quad (1)$$

X_1, X_2, X_3, X_4, X_5 are the independent variables namely the firm size, the experience in the exportation activity, the manager attitude toward risk, his opportunistic sense and his creativity.

β_0 : the constant to estimate according to the data

$\beta_1, \beta_2, \beta_3, \beta_4, \beta_5$ are the coefficient respectively related to the independent variables.

To ameliorate the global quality of the model, the observation number 29 was eliminated according to the SPSS out put. The analysis will then consider 51 observations. The significance of Chi2 coefficient prove that in our model there is one variable at least which can predict the exportation expansion strategy of the firms.

In the classification table 2X2, the percentage of correct classification obtained is 78.4%. It is better than the randomly classification rate (50%, 50%). The application of logistic regression is able to correctly predict the fact that the firm is mono or multi destination in 78.4% of cases. The adjustment test of Hosmer and Lemeshow shows the insignificance of Chi2 statistic. Therefore, the difference between the predicted and the observable values of the dependent variable is absent. Then the model is well adjusted to the observed data.

Based on the different tests of the model general quality, we could conclude that the proposed model fits the data.

We can then be based on the Wald criteria and the « odd ratio » to interpret the relationships between the different variables.

The relationships between variables

-The firm’s size: The size of the firm has a Wald index equal to 6.11 with $p=0.013$. This criterion is then significant so we can affirm that the size of the firm can discriminate between the mono destination and the multi destinations firms in Tunisia. Odd ratio is equal to $1.021 > 1$, this means that if the firm’s size increases, the probability that the

firm becomes multi destinations increases. **H1** is then confirmed. The firms concentrating their activities on one market have smaller sizes than the firms acting in many markets. Small firms could not obey to the different demands of several markets. However, big firms have more advantages as they benefit from the economy of scales and have more production resources to satisfy the demand of different markets. Tunisian firms could conquer several international markets as their sizes increase.

-The experience in exportation activity: Wald index related to the experience is equal to 1.792 with the probability equal to 0.181. It is non significant. The experience can not discriminate between the mono destination firms and the multi destinations firms. Our second hypothesis is rejected. Such result is similar to the finding of Katsikeas and Leonidou (1996) who could not affirm the effect of the experience on the exportation expansion strategy. The absence of relationship between the experience and the number of targeted markets can be justified by the approach of the Tunisian firms in the exportation activity. The proactive firms, who give great importance to the search for customers and the stimulation of demand in different markets, can be multi destinations from the beginning of their exportation activity. However, if the firm is reactive and waits to have order from foreign market, it can serve just one traditional market without having the ability to target new different markets. The experience of Tunisian firms in exportation activity is not affecting the choice of expansion strategy. The experience helps the firm to manage their exportation activity without affecting the ability of the firm to diversify its foreign destinations.

-The manager attitude toward risk: The Wald index associated to the attitude toward risk is 4.722 with a probability of 0.03. The significance of Wald index indicates that the manager attitude toward risk is a discriminator variable between the two types of firms. Our third hypothesis is then confirmed. Our result confirms the conclusion of many studies affirming the effect of attitude toward risk on the exportation behavior. Odd ratio is equal to $3.55 > 1$. Such value indicates that the increase of the perceived risk by one unite results in the multiplication of the chance that the firm becomes multi destinations by three times. This effect contradicts our hypothesized relationship stipulating that the manager's fear of risk pushes the firm to be mono destination. Tunisian managers fearing risk tend to diversify the destinations of their firms exportations. They try to minimize the risk of dependence on one market by exporting their products to several international markets. The fear from dependence risk is greater than the fear from diversification risk. The manager try to reach performance in the exportation activity and then he diversifies the markets so the firm could avoid demand perturbation in one market and increase profit resources coming from other markets.

-The innovator criterion: The innovator sense is depicted through two features: opportunistic sense and creativity. Wald index associated with the opportunistic sense is 6.256 associated with $p = 0.012$. The opportunistic sense discriminates between mono destination and multi destinations firms. The odd ratio associated is $4.1 > 1$. As the opportunistic sense becomes stronger, the probability of the firm to be multi destinations increases. Opportunistic manager is searching for opportunities in the foreign markets. This manager accepts changes that could enhance his ability to resolve the problems and to adapt his activity to the foreign markets need. The manager flexibility is determinant to the continuity of exportation activity. Flexible Tunisian managers are more involved in internationalization activities than curator ones. Wald index associated with creativity is 0.086 with $p = 0.769$. The non significance of this coefficient indicates that the creativity can not affect the expansion strategy. It seems that the manager could not benefit from his creativity unless the firm is offering him a favorable environment. In the Tunisian context the manager is facing many impediments related to the rules in the work, the power of foreign customers...etc, so his creativity disappears while trying to obey to all the exigencies of his work. The creative personality could not then have any significant impact on the expansion strategy of exportation. Our fourth hypothesis is then partially confirmed as the innovator criterion of the manager affects the expansion strategy through the opportunistic sense only.

IMPLICATIONS

As the exportation activity is crucial to the firm's growth and the economy's dynamism in Tunisia, exporter firms and organizations promoting exportations should invest more resources and effort to develop exportation activity. The firm should allocate enough resources to make the choice of diversification strategy effective and successful. The Tunisian firms should be more proactive to create demand in the foreign markets. They should better analyze the foreign offers and choose the most efficient ones to maximize their profits within a

long term conceived strategy to internationalize the firm. The Tunisian mono destination firms ought to diversify their markets avoiding the risk of dependency on one market. Such firms could profit from their experiences and their strong relationships with their traditional markets by surpassing the exportation stage toward the establishment of a joint venture or a sales agency in the markets. Through such step, the firm can increase its profit, better control its products and insure a continual presence in the foreign market. The organizations promoting the exportations could have determinant role to strengthen the relationship of Tunisian exporters with scarcely targeted markets by organizing commercial missions and professional meetings between the different officials. They could also run some marketing actions to ameliorate the image of Tunisian products in the foreign markets to create more demand and then to increase the profit from exportation activity. These organizations could assist the firms trying to target new markets by offering them some marketing plans to follow. They could provide training programs for the personnel about the management of several markets portfolio. The role of government seems then to be crucial to assist and encourage small and medium firms to enhance their exportation activities as they have limited access to the resources.

CONCLUSION

Through our study we tried to extend the knowledge about exportation activity. The studies in this area are generally interested to the firm performance in the exportation. We identified some criteria discriminating between mono destination and multi destinations firms. The description of the profile for every type of firms provided some important implications to consider by firms managers as well as the Tunisian government if they want to enhance the exportation policy. Theoretically, we were limited to the effect of the firm features on the exportation strategy. The effect of interaction between those features and the effect of the firm involvement in exportation activity are still to discover. Empirically, the limited sample's size in our study was caused by the managers' refusal to answer the questionnaire. Future researches should consider this impediment. Longitudinal study could indeed contribute better to define the profile for every type of firms and determine the evolution direction in the continuum concentration/diversification.

FOREIGN DIRECT INVESTEMENTS IN THE CROATIAN TRADE SECTOR: DOES THE COUNTRY OF ORIGIN MATTER?

Ivan-Damir Anić
The Institute of Economics, Zagreb

Radmila Jovančević
Faculty of Economics, University of Zagreb

ABSTRACT

The paper examines the impacts of FDI inflows on the Croatian trade sector. Findings indicate that foreign direct investments are positively related to gross fixed capital formation and value added in trade sector. The analysis shows that domestic retailers have still dominant position in the Croatian market and were not crowded out by foreign retailers. The results of consumer survey indicate that the origin of the retailer (as being domestic or foreign-owned) does not play an important role for Croatian shoppers in deciding where to shop and how much money to spend in those stores. Managerial implications are discussed in the paper.

INTRODUCTION

Since the beginning of the 1990s, trade sector in Central and Eastern European countries have experienced remarkable growth in foreign direct investments (FDI). A number of large European wholesalers and retailers have entered the Croatian market, perceiving it as a new market opportunity. Several studies examine patterns, the impacts of FDI and the motives for retail internationalisation (Williams, 1991; Alexander, 1995; Myers and Alexander, 1997; Quinn, 1999; Tatoglu, Demirbag and Kaplan, 2003; Anic and Jovancevic, 2006). However, the retail internationalisation process remains to be complex and poorly understood topic.

Intensive competition, global financial crisis and complex consumers' decision-making make the future growth of companies operating in trade sector more difficult. As attitudes can predict behaviour, researchers express a growing interest in the research of consumers' perceptions towards foreign goods and domestic goods and retailers (Hester and Yuen, 1987; Patterson and Tai, 1991; Hyllegard, Eckman, Descals and Borja, 2005; Wang, and Heitmeyer, 2006; Ilter, Aykol and Ozgen, 2009). Consumers' attitudes were shown to affect the success of FDI and thus they play an important role in designing retail strategy.

The purpose of our research is to gain better insights into the FDI inflows and their effects on trade sector in Croatia as a host country. We examine the impacts of FDI on total gross fixed capital formation (GFCF) and gross value added (GVA) in the trade sector. Two components of FDI are examined: foreign equity investments (FEI) and foreign greenfield investments (FGI). The paper further explores the relationship between the origin of retailers (whether they are foreign- or domestic-owned) and their performance. We examine whether domestic investments were crowded out by foreign investments. Finally, the paper explores to what extent might the performance differences between foreign-owned retailers and domestically-owned companies be explained by consumers'

attitudes towards foreign and domestic retailers. Trade sector includes wholesale trade, retail trade and sale of motor vehicles and automotive fuel.

The empirical analysis is based on primary data obtained from the consumer survey and the statistical data provided by the Central Bureau of Statistics and the Croatian National Bank. Data were analyzed using regression analysis, t-test and analysis of variance (ANOVA). Fishbein's multi-attribute model (1967) was used to analyze the consumers' attitudes towards foreign and domestic retailers.

This paper builds on previous work involving FDI and consumer attitudes towards domestic and foreign retailers. It contributes to the same literature by establishing the relationship between FDI inflows, gross fixed capital formation and gross value added. The paper extends the previous research of Anic and Jovancevic (2006) and contributes to the literature by extending the period of analysis (1993-2007) and analyzing the impacts of three categories of FDI (total foreign direct investments, foreign equity investments and foreign greenfield investments) on the performance of trade sector. It compares the performance of top ten foreign retailers with those of top ten domestic retailers. The aim of this paper is to explore the consumers' attitudes towards foreign and domestic retailers in grocery retail environment. Past research has provided inconsistent results on consumers' attitudes in various environments (Hester and Yuen, 1987; Patterson and Tai, 1991; Hyllegard, Eckman, Descals, and Borja, 2005; Wang and Heitmeyer, 2006; Ilter, Aykol and Ozgen, 2009), while the empirical research on the attitudes of consumers in developing countries and Central and Eastern European countries towards foreign products, and associated marketing practices is somewhat limited (Bhuiyan, 1997).

Several managerial implications might be derived from this study. The results might help public policy makers understand the effects of FDI on the trade sector, and might be useful in creating such environment that would be conducive to faster sector's growth in the long run. Knowing the differences in performance and differences in consumer's attitudes might be helpful for retailers for developing more effective retailing strategies for the Croatian market.

The paper is organized in six sections. Section two focuses on the theoretical background. The methodology used in this research is presented in section three, which is followed by research results in section four. Section five includes conclusions with theoretical and managerial implications and future research direction.

THEORETICAL BACKGROUND

Foreign direct investment (FDI) is a category of international investment that indicates an intention to acquire a lasting interest in an enterprise operating in another economy. It covers all financial transactions between the investing enterprise and its subsidiaries abroad. It differs from portfolio investments, because the direct investor acquires at least 10 % of voting power (United Nations, 2008). FDI might be categorised as inward investments where investment of foreign capital occurs in local resources and outward investments where local capital is being invested in some foreign resource. FDI inflows include equity investments (that include green-field investment and acquisitions), reinvested earnings and other capital investments.

Past research examine trends, patterns and the impacts of FDI on host economy. Although FDI inflows might have negative effects on host economy, including the adverse effects of FDI on competition within the host nation, adverse effects on the balance of payments, and the perceived loss of national sovereignty and autonomy, theory posits that FDI inflows have several positive benefits for the economy, including the resource-transfer effect, the employment effect and the balance-of-payments effect (Hill, 2000). FDI can make a positive contribution to the host economy by supplying capital, technology, and management resources that would otherwise not be available, which might boost that country's economic growth rate. Several studies indicate that FDI is positively related to GDP (Kamath, 2008).

Gross fixed capital formation summarizes the amount of capital invested in new stores, office buildings and other fixed assets in one country. Gross value added in trade sector is the value of output and it is a measure of the contribution to GDP made by trade sector. As the research results for the period of 1993-2002 indicate that foreign equity investment (FEI) was positively related to gross fixed capital formation (GFCF) which in turn positively

affected gross value added (GVA) in the Croatian trade sector (Anic and Jovancevic, 2004, 2006). Other things being equal, the greater the capital investment inflows, the more favourable its future growth prospects are likely to be. Viewed this way, FDI can be seen as an important source of capital investment and a determinant of the future growth rate of trade sector. Based on past research, the following hypotheses are proposed:

H 1a, 1b: The inflow of foreign direct investments is likely to be positively related to (a) gross fixed capital formation and (b) gross value added in the trade sector.

H 2a, 1b: The inflow of foreign equity investment is likely to be positively related to (a) gross fixed capital formation and (b) gross value added in the trade sector.

H 3a, 2b: The inflow of foreign greenfield investment is likely to be positively related to (a) gross fixed capital formation and (b) gross value added in the trade sector.

Many international retailing studies focus on motives and methods for expansion of foreign retailers. As literature on retail internationalisation process suggests, the international expansion of Multinational Enterprises (MNEs) has been motivated by both “push” and “pull” factors, including saturated domestic markets and growth orientated motives (Williams, 1991; Quinn, 1999; Tatoglu, Demirbag and Kaplan, 2003). By entering a less developed market, large competitive companies can take sales and market share away from weaker rivals, build a strong leadership position and earn good profits. Foreign MNEs operating in the host countries may have greater economic power than local competitors because they may be part of a larger international organization. As such, the foreign MNE may be able to draw on funds generated elsewhere to cover its costs in the host market, which could drive indigenous companies out of business and allow the firm to penetrate the market (Hill, 2000). Past research showed that foreign retailers operating in Croatia grew very fast and increased their market share considerably during the period of 1998-2001 (Anic and Jovancevic, 2006). They operate with an internationally appealing and innovative retail concept that helped them to increase their sales significantly. Based on past research, the following hypothesis is proposed:

H 4a, 4b, 4c, 4d, 4e: During the period of 2003-2007 foreign retailers (a) contributed more to employment, (b) achieved greater volume of sales, (c) paid higher salaries, (d) had higher employee productivity, and (e) achieved greater profitability than domestic retailers.

Consumers’ attitudes play an important role in explaining the success of foreign companies that entered the host country. Consumers are essentially decision makers and therefore have a tremendous impact on the selection of retailers and products. The multiattribute model of store choice is often used to predict a customer's evaluation of a retailer based on its performance on relevant attributes and the importance of those attributes to the customer. Although the model doesn’t necessarily reflect customers’ actual decision process, but it does predict their evaluation of alternatives and their choice (Levy and Weitz, 2004), consumer attitudes towards foreign products, and associated marketing efforts, have been considered to be very important influences on purchasing behaviour.

Foreign retailers face both opportunities and challenges on foreign markets and consumers might perceive them as different to domestic retailers on several store attributes (Hyllegard, Eckman, Descalls and Borja, 2005). Some past studies indicate that domestic products and domestic retailers are perceived by consumers more favourably than those of foreign origin (Hyllegard, Eckman, Descalls and Borja, 2005). Other research shows that consumers have an overall more positive attitude toward foreign products and retailers over domestic-produced products and domestic-owned retailers (Wang and Heitmeyer, 2006). Foreign retailers with new retail formats were very popular when they entered the Croatian market. Based on past research, the following hypotheses are proposed:

H 5: Croatian consumers’ attitudes towards foreign and domestic retailers differ significantly, in that way that consumers’ attitudes are significantly higher for foreign than for domestic retailers.

H 6: Shoppers who mostly patronize foreign retailers spend significantly more money in those stores than shoppers who mostly patronize domestic retailers.

METHODOLOGY

This research was based on statistical data collected from the Central Bureau of Statistics, the Croatian National Bank and other sources. Telephone Consumer survey was carried out in March 2009 in order to collect the data on consumer attitudes towards foreign and domestic retailers. Four biggest Croatian cities (Zagreb, Rijeka, Split and Osijek) were selected to participate in the survey. A multistage design was used in developing a sample. In doing this, we first selected four biggest cities in Croatia using disproportional judgemental sampling. Pages in telephone book containing names and addresses of potential respondents were selected using systematic sampling procedure, while simple random sampling technique was employed to choose potential respondents within the selected telephone book pages. A sample included 203 consumers. The questionnaire was composed of the following separate sections: the importance of store attributes in deciding where to shop, consumer beliefs about the performance of domestic and foreign retailers, purchasing outcomes and demographic variables. Summary statistics on sampled shoppers is presented in table 1.

Table 1: The sample profile of shoppers
(N = 203)

| Consumer profile | Percentage (%) |
|---|-------------------|
| 1. Residential area (%) | |
| 1.1. Osijek | 19.21 |
| 1.2. Rijeka | 21.67 |
| 1.3. Split | 22.17 |
| 1.4. Zagreb | 36.95 |
| 2. Gender (%) | |
| 2.1. Male | 32.34 |
| 2.2. Female | 67.66 |
| 3. Average age in years (St. Dev) | 49.15 (15.94) |
| 4. Average number of people in a household (St. Dev) | 3 (1.31) |
| 5. Education | |
| 5.1. Primary School | 10.34 |
| 5.2. Secondary School | 46.80 |
| 5.3. University degree or higher | 42.86 |
| 6. Monthly income (HRK) | |
| 6.1. up to 2500 | 6.93 |
| 6.2. 2501 – 5000 | 23.27 |
| 6.3. 5001- 7500 | 25.74 |
| 6.4. 7501 – 10000 | 16.83 |
| 6.5. 10001 – 12500 | 11.39 |
| 6.6. 12501 and more | 15.84 |
| 9. Percentage of people who are able to speak at least one foreign language | 59.90 |
| 10. Percentage of people who visited at least one foreign country in the last 12 months | 48.02 |
| 11. Average spending of a household on groceries in an average month (St. Dev) | 2870.30 (1520.40) |

Source: Consumer Survey

Descriptive statistics, percentages and growth rates were employed to analyze the FDI data. The regression model was used to identify the relationships between FDI inflows, gross fixed capital formation and gross value added. Our models are the following:

$$[1] \text{ } GFCF = \beta_0 + \beta_1 * FDI + \varepsilon$$

$$[2] \text{ } GVA = \beta_0 + \beta_1 * FDI + \varepsilon$$

$$[3] \text{ } GFCF = \beta_0 + \beta_1 * FEI + \varepsilon$$

$$[4] \text{ } GVA = \beta_0 + \beta_1 * FEI + \varepsilon$$

$$[5] \text{ } GFCF = \beta_0 + \beta_1 * FGI + \varepsilon$$

$$[6] \text{ } GVA = \beta_0 + \beta_1 * FGI + \varepsilon$$

where the dependent variables are gross fixed capital formation (GFCF) and gross value added (GVA). Independent variables are foreign direct investment (FDI), foreign equity investment (FEI) and foreign greenfield investment (FGI).

The performance of top ten 100-percent foreign-owned companies was compared with that of top ten 100-percent domestic-owned retailers. Top ten domestic and foreign retailers were identified from the database of the Croatian chamber of commerce, according to their revenues in 2008. Performance measures used included number of persons employed, average wages, the volume of sales, employee productivity and return on assets (ROA).

Fishbein's (1967) multi-attribute attitude model was used to measure the consumers' attitudes towards foreign and domestic retailers. This model posits that a person's attitude is a function of consumers' beliefs and the implicit evaluative responses associated with those beliefs (Wang and Heitmeyer, 2006). The estimation of attitude is calculated by the following formula:

$$Ab = \sum_{i=1}^n b_i \times e_i$$

where, Ab = attitudes toward behaviour, b_i = belief that performing behaviour (purchasing from a retailers) will lead to certain attributes, e_i = Evaluation of the importance of the attribute, i = attributes. For e_i respondents indicated how important they considered each of the 13 attributes when buying groceries by using a seven-point Likert scale, from 7 (very important) to 1 (very unimportant). As for beliefs (b_i), consumers were asked to indicate how well foreign and domestic retailers provided store attributes by using a seven-point Likert scale, from 7 (excellent) to 1 (poor). Based on the formula for each respondent, the overall attitude toward purchasing from domestic- and foreign-owned retails was calculated, by multiplying the evaluation score (e_i) and the belief score (b_i), and by summing the results for all 13 attributes. Selected grocery store attributes are widely used attributes in the research of grocery retailing (Stephenson, 1969; Pan and Zinkhan, 2006). The Paired-Comparison T-test was utilized to examine whether grocery store attributes contribute to a difference among Croatian consumers in their attitude toward domestic- vs. foreign grocery retailers.

RESEARCH RESULTS

The impacts of FDI the Croatian trade sector

The flow of FDI refers to the amount of FDI undertaken over a given time period, while the stock of FDI refers to the total accumulated value of foreign-owned assets at a given time. Appendix A gives a breakdown of FDI in the Croatian trade sector for the 1993-2007 periods.

As the data indicate there was a marked increase in both the flow and the stock of FDI inflows in the Croatian trade sector. FDI inflows were volatile and fluctuated from year to year, sometimes quite sharply (Graph 1). FDI stock increased from USD 20,6 million in 1993 to USD 2225,7 million by the 2007. The bulk of FDI inflows occurred in the pos-transition period of 2001-2007 (USD 1346, 4 million) as compared to transition period of 1993-2000 (USD 138, 6 million). The main entry strategy undertaken by foreign investors was the green-field investments (88.7 percent of total foreign equity investment, and 68.9 % of total investments in trade sector), what is very high share as compared to total green-field investments in a whole economy (29.8 percent).

Foreign investors operating in the Croatian trade sector originate mostly from Europe (see Appendix B). The majority (65.33 percent) of total inward FDI came from Germany, Austria and Slovenia. Past research indicates that major factors attracting FDI in Croatia were its geographical proximity to the home countries of foreign investors, stable macroeconomic policy, a relatively underdeveloped market and ample labour supply. On the other hand, small market, low income and drawn-out bureaucratic procedures for setting up a business, rigid zoning and opening hour's regulations were identified to be major obstacles for FDI (Anic and Jovancevic, 2004, 2006).

In order to test the hypotheses H 1-3 a,b, six regression models were tested. Research results are presented in table 2.

Appendix C shows summary statistics on GVA, GFCF, and FDI in the Croatian trade sector. Regression coefficients indicate that FDI positively affected gross fixed capital formation (GFCF) and gross value added (GVA) ($\beta = 2.13$, p

= 0.00; $\beta = 7.2$, $p = 0.00$), so the hypotheses H1a, 1b are supported. The regression results further indicate that foreign equity investments (FEI) affected positively both gross fixed capital formation (GFCF) and gross value added (GVA) ($\beta = 3.2$, $p = 0.00$; $\beta = 10.3$, $p = 0.00$), supporting the hypotheses H2 a, H 2b. The hypotheses H 3a, H3b are also supported, since FGI were positively related to gross fixed capital formation (GFCF) and gross value added (GVA) ($\beta = 3.7$, $p = 0.00$; $\beta = 11.9$, $p = 0.00$). The results are consistent with the previous study of Anic and Jovancevic (2006) for the period of 1993-2002, indicating that FDI continued to have a positive effect on gross fixed capital formation (GFCF) and gross value added (GVA).

Along with positive impact of FDI on GFCF and GVA, FDI brought some other benefits to the Croatian trade sector, but also some costs. They were partly identified from the consumer survey. Summary statistics on perceived impact of foreign retailers is presented in table 3.

Table 3: Perceived impact of foreign retailers on the Croatian trade

| | Mean | Std. Dev |
|---|------|----------|
| Imports of products | 5.69 | 1.27 |
| Sales of foreign brands | 5.54 | 1.10 |
| Competition in the trade sector | 5.40 | 1.46 |
| The quality of services | 5.05 | 1.31 |
| The volume of turnover in trade sector | 4.99 | 1.29 |
| Retail prices | 4.89 | 1.46 |
| Employment | 4.86 | 1.51 |
| Opening the stores that become the place where people can meet each other | 4.80 | 1.60 |
| The quality of products | 4.69 | 1.53 |
| Number of stores | 4.67 | 1.46 |
| The quality of standard | 4.24 | 1.50 |
| Sales of products made in Croatia | 3.99 | 1.52 |
| Wages and salaries | 3.53 | 1.55 |
| Exports of products | 2.93 | 1.47 |

Notes: Ratings were indicated on a seven-point scale ranging from 7 = "high influence" to 1 = "low influence".

Source: Consumer survey.

The highest score of perceived impact of foreign retailers on Croatian trade sector consumers attached to raising imports of products and the increase in sales of foreign brands. However, larger imports have negative effect on the balance of payment. Major benefits of foreign retailers include enhancing competition in the sector and improvements in quality of services. Foreign retailers contributed to the growth in turnover of trade sector. Increased competition positively affected retail prices. Foreign retailers were opening new stores and thus contributed to the employment increase and the increase in the number of store. The majority of consumers (76.9 %) believe that the number of foreign retailers is going to increase in the Croatian trade sector in the near future and that the new arrival of foreign companies is likely to have a positive affect on the Croatian trade sector.

Performance of foreign retailers

In order to get a better picture of the performance of firms that have invested in Croatia, data were collected on the top ten 100 percent foreign-owned companies. The crowding out effect was tested by comparing the performance of top ten foreign retailers with top ten 100-percent domestic retailers. The major performance indicators are presented in table 4.

Table 4: Performance of top ten foreign- and top ten domestic-owned retailers
(2003-2007)

| Performance | Domestic retailers | Foreign retailers | T-value |
|-------------|--------------------|-------------------|---------|
|-------------|--------------------|-------------------|---------|

| indicator | 2003 | 2007 | Average value (2003-2007) | Average annual growth rate | 2003 | 2007 | Average value (2003-2007) | Average annual growth rate | |
|-----------------------------|--------|--------|---------------------------|----------------------------|------|--------|---------------------------|----------------------------|--------|
| Employment | 13119 | 21740 | 17398 | 13.5 | 4324 | 7162 | 5941 | 13.4 | 7.35* |

Source: Authors calculations and database "Poslovna Hrvatska";

<http://www.poslovnahrvatska.hr/login.aspx?ReturnUrl=%2fDefault.aspx>

Foreign retailers grew very fast during the period of 2003-2007. On average they increased the volume of sales by 19.4 % and employment by 13.4 % annually, while the growth of salaries and employee productivity experienced slower growth. Despite this impressive growth, domestic retailers were not crowded out by foreign retailers. Top ten domestic retailers also grew very fast. During the period of 2003 – 2007, they employed on average more workers, generated higher volume of sales and had higher profitability than foreign retailers ($p < 0.05$). Therefore, the hypotheses H 4a, H 4b, H 4e were rejected. Foreign retailers paid higher wages and had higher employee productivity than domestic retailers. Hypotheses H 4c,d are supported.

Customers' attitudes towards foreign and domestic retailers

This study investigates whether or not consumer attitudes toward domestic- vs. foreign retailers differ among consumers in Croatia. The Fishbein attitude model was used to measure consumer attitudes towards foreign- and domestic-owned retailers. Table 5 shows the attitudes of respondents towards buying from foreign and domestic retailers.

Results indicate that overall consumers' attitudes toward domestic vs. foreign retailers do not differ significantly (Mean 1 = 409.9, Mean 2 = 403.1, $p=0.71$). Therefore, the hypothesis H 5 is rejected. Consumers had more positive attitudes towards domestic retailers compared with foreign retailers with regard to convenient stores' location and the quality of products offered (Mean 1 = 36,4, Mean 2 = 29.2, $p < 0.05$; Mean 1 = 39.0; Mean 2 = 36.6, $p < 0.05$). On the other hand, consumers had more positive attitudes towards foreign retailers compared with domestic retailers with regard to free parking space provided and speed of check-out (Mean 1 = 30,4, Mean 2 = 34.5, $p < 0.05$; Mean 1 = 30.0, Mean 2 = 33.0, $p < 0.05$). The results indicate that consumers perceive domestic retailers as being similar to foreign retailers on a number of store attributes. Both types of retailers are competitive in the market and have equal chances to be selected by consumers for their store visit. In our sample consumers patronize both types of retailers. The results of our study are not consistent with other research involving consumers' attitudes towards domestic and foreign retailers that suggests that consumers might prefer whether domestic or foreign retailers (Hyllegard, Eckman, Descals and Borja, 2005; Wang and Heitmeyer, 2006).

Table 5: Comparison t-test between Croatian consumer attitudes toward domestic- and foreign-owned retailers on each of the thirteen grocery stores' attributes

| Store attributes | Attitude toward domestic retailer Mean 1 (Std. Dev) | Attitude toward foreign retailer Mean 2 (Std. Dev) | Mean differences | t-value |
|------------------|---|--|------------------|---------|
|------------------|---|--|------------------|---------|

| | | | | |
|-----------------------------------|----------------|----------------|-------|---------|
| Convenient stores' location | 36.43 (12.45) | 29.24 (13.29) | 7.20 | 5.62*** |
| Convenience of shopping | 34.46 (10.82) | 33.51 (10.95) | 0.96 | 0.88 |
| Free parking space provided | 30.43 (19.77) | 34.50 (18.18) | -4.07 | -2.14* |
| Speed of check-out | 29.97 (12.26) | 32.99 (11.27) | -3.01 | -2.58* |
| Store atmosphere | 32.26 (11.74) | 32.84 (11.73) | -0.58 | -0.50 |
| Level of customer service quality | 35.30 (10.69) | 34.34 (10.15) | 0.96 | 0.92 |
| Friendly personnel | 33.63 (12.71) | 32.33 (12.17) | 1.30 | 1.05 |
| Buying on credit | 15.00 (14.99) | 13.44 (14.12) | 1.56 | 1.07 |
| Broad product assortment | 36.10 (10.07) | 36.44 (9.84) | -0.34 | -0.34 |
| Product quality | 38.98 (8.41) | 36.64 (9.22) | 2.33 | 2.65** |
| Store brands' quality | 31.92 (11.76) | 30.91 (11.54) | 1.01 | 0.87 |
| Appeal of sales promotions | 24.71 (13.51) | 23.92 (13.45) | 0.79 | 0.59 |
| Low prices | 30.28 (11.83) | 30.72 (11.76) | -0.44 | 0.38 |
| Overall attitude | 409.91 (92.24) | 403.14 (95.23) | 6.77 | 0.71 |

Notes: * $p < 0.05$; ** $p < 0.01$, SD, *** $p < 0.001$, St. Dev. - Standard Deviation; Mean differences were calculated as the difference between Mean 1 and Mean 2.

Source: Consumer survey.

The model doesn't necessarily reflect customers' actual decision process, but it does predict their evaluation of alternatives and their choice (Levy and Weitz, 2004). In order to get better insights into the relationship between consumer attitudes and their purchasing behaviour, we examined the link between purchases of those consumers who shop mostly at foreign retailers and the consumers who mostly patronize domestic retailers. ANOVA results are presented in table 6.

Table 6: ANOVA results: Relationships between company' ownership and consumer purchases

| | Consumers who mostly patronize domestic retailers (n=159) | Consumers who mostly patronize foreign retailers (n=44) | p-value |
|--|---|---|------------|
| Average monthly amount of money spent (in HRK) | 1956.01 | 1837.50 | $p = 0.53$ |
| Percentage of money spent of total household budget for grocery shopping in favourite retailer (%) | 67.2 | 71.9 | $p = 0.14$ |

Source: Consumer survey.

The findings of one-way ANOVA show that no significant differences existed among the two groups of shoppers in the amount of money spent ($p = 0.53$ and $p = 0.14$). Consumers who mostly patronize foreign retailers did not spend more money than shoppers who mostly patronize domestic retailers. Therefore, hypothesis H 6 is rejected. The results indicate that in the Croatian market origin of a retailer does not play an important role when consumers decide where they will shop and how much money they will spend at those stores.

CONCLUSIONS

The results of the analysis have interesting theoretical and managerial implications. From a theoretical perspective, the research adds to prior work involving FDI and consumers' perceptions towards foreign and domestic retailers. The first contribution of this study is the identification of the relationship between FDI inflows, GFCF and GVA for the period of 1995-2007 in the Croatian trade sector. Regression coefficients in our research indicate that FDI, FEI and FGI drive GFCF and GVA in the trade sector. The results are consistent with previous research of Anic and Jovancevic (2006).

Based on consumer survey, we identified some perceived benefits and costs of FDI for the Croatian trade sector. The perceived costs of FDI were growing imports of products and the sales of foreign brands. The perceived benefits of FDI were enhanced competition, improved service quality and increased volume of sales in the trade sector. Enhanced competition had positive impact on retail prices. Foreign retailers were opening new stores and thus contributed to the increase in the number of store and the employment increase.

The paper examined the performance of foreign retailers. As the findings indicate, domestic retailers were not crowded out by foreign retailers. As compared to top ten foreign retailers, top ten domestic retailers employ more workers, generate higher volume of sales and exhibit higher profitability, while foreign retailers have higher employee productivity and pay higher average salaries.

The results of our study are not consistent with other research involving consumers' attitudes towards domestic and foreign retailers (Hyllegard, Eckman, Descals and Borja, 2005; Wang and Heitmeyer, 2006). In the Croatian market origin of a retailer does not play an important role when consumers decide where they will shop and how much money they will spend at those stores. No significant differences existed among the consumers' attitudes towards foreign and domestic retailers, and in the amount of money spent between the consumers who mostly patronize foreign retailers of shoppers and consumers who mostly patronize domestic retailers.

Several managerial implications might be derived from this study. Knowing that FDI positively affect GFCF and GVA, public policy makers should foster the spread of both FDI and domestic-owned investments in the trade sector. However, more attention should be paid to the costs of FDI with respects to improvement of the balance of payment. The initiative of the Croatian chamber of economy aimed at stimulating the purchase of Croatian products has apparently been successful in Croatia, when consumers' attitudes are taken into consideration. Retailers might use this study to develop a program for attracting customers and improving the chances for increasing store traffic. They might improve their performance by changing performance beliefs, changing importance weights and adding new benefits (Levy and Weitz, 2004). Domestic retailers can increase their competitiveness by providing to consumer better parking opportunities and offering better credit terms. On the other hand, foreign retailers might overcome their weakness with respect to location of stores by providing products of higher quality.

The paper has some limitations. As in most marketing research, the analysis of consumers' attitudes towards foreign and domestic retailers "took a snapshot" of a sample of consumers. Thus it failed to capture the dynamic nature of consumer attitudes. Relatively small sample size makes it difficult to generalise the findings. Despite these limitations, the results of this paper offer useful findings and pose some valuable managerial implications and direction for further research.

Future research should examine the relationship between consumers' attitudes, demographic variables and their purchasing behaviour. Several years of data, greater sample of consumers and a complete census of the firms in this industry would have provided further information on changes in consumer attitudes and their impacts on retailers' performance. To conduct a more comprehensive study, future research could compare foreign retailers on a country basis.

APPENDICES:

APPENDIX A: Inward FDI inflows in the Croatian trade sector, transition period (in mil. USD)

| <i>Components of FDI</i> | Transition period | | | | | | | | Post-transition period | | | | | | | FDI stock | | |

Notes: FDI inflows consist of equity investments, reinvested earnings and other investments. The equity investment is the value of the investment made by a multinational corporation in the subsidiary in Croatia. Its main components include green-field investment (which includes 100 percent foreign-owned company) and other equity investments involving mergers and acquisitions, and joint ventures. The sample includes 100 companies that were registered in the CNB database of the trade sector (section G of the National Classification of Economic Activities);

SMALL BUSINESS VALUATION: A PILOT STUDY ON TURKISH MANUFACTURING FIRMS

Bugra Asfuroglu and Abdulmecit Karatas
Bogazici University, Turkey

ABSTRACT

With the aim of contributing the valuation efforts of small businesses in Turkey, we tested the effects of earnings, book value, dividends, leverage and internationalization on the market value of small and medium manufacturing firms in Turkey. In order to realize this we develop an Ohlson variant linear model and effectuated regression analysis. As data source small manufacturing businesses which are publicly traded in Istanbul Stock Exchange was used. The model explained 52% of dependant variable's variance. Among the independent variables book value and dividends had positive and significant effect on dependant variable. On the other hand earnings had a negative effect and leverage and internationalization proved insignificant.

INTRODUCTION

In Turkey especially after 1980s, the improvements in the manufacturing sector constituted the driving force behind the economic growth performance. With the necessary reforms realized, this sector became more compatible to the global and liberal world. On the other hand when evaluated with an international competition perspective, despite the fact that the manufacturing sector in Turkey records important improvements, it still is outperformed by some other emerging countries' manufacturing sectors (KSEP, 2007).

According to Turkish Statistical Institute SMEs constitute 76.7% of country's employment, 26.5% of investment and 38% of added value. They form 95% of the manufacturing sector and 61.1% of the employment and 27.3% of the added value in this sector (KSEP, 2007). These numbers clearly states the importance of SMEs in Turkey's economy and manufacturing sector.

Moreover efficient distribution of limited resources is also crucial for the economies. In order to maintain a sustainable growth, existing resources should be directed to constitutions that can create added value. Countries effectively distribute the capital to the companies and projects that can create value, have efficient markets and strong economic infrastructure. Therefore it is very important to guide idle resources to borrowing instruments and stocks that have growth opportunities instead of speculators.

Investors when face to multiple investment alternatives seek, according to their risk perception, maximum profit. On that point in order to understand the risk and returns it is crucial to be able to value the different investment options in the real sector projects as well as money and capital markets. Therefore, valuation has a significant importance in directing the capital to companies and projects that can create added value.

In this study with the aim of contributing the valuation efforts of small businesses in Turkey, we tested the effects of a number of independent variables on market value of small and medium manufacturing firms in Turkey. Understanding the valuation and the effect of different variables on the value of SMEs is not only important for the local investors but also for the foreign investors, foreign companies that seek acquisitions or merging as well as SME owners and managers in Turkey who look for a more effective value management for their companies. First of

our variables is the degree of internationalization, which shows the international activity of the company, it generally is represented by foreign sales to total sales ratio. Our other variables are leverage (measured by debt to asset ratio), book value and earnings. One of the objectives of this study is to identify whether investors in Turkey recognize internationalization of the company as a hidden asset, moreover it aims to examine the effects of leverage, book value, earnings and internationalization on the value of manufacturing SMEs in Turkey.

The study will start by a detailed literature survey. Once the reader is acknowledged about the early empirical studies, we will define our data selection criteria, methodology and develop our Ohlson variant linear model in order to examine the effect of internationalization, earnings, leverage and book value. At the end the findings and their effects will be discussed.

LITERATURE SURVEY

In the literature, there is no shortage of research and analysis which explore different drivers of value. In this work we will mainly concentrate on the effects of the degree of internationalization, earnings based variables, dividends, cash flows and leverage on the market value of small and medium production firms in Turkey.

Before getting into the literature survey it is necessary to remind the reader that stock return of a company is the sum of holding gain and dividend paid by the firm (In some studies it is not expressed not as the sum but a function of holding gain and dividend). Holding gain is the change in share price of the company. Due to this strong relation between stock prices and stock returns, we include studies that have stock returns as dependant variable, in our literature survey.

First of all in their study on US- international firms, Agmon and Lessard (1977) found that international firms show lower systematic and unsystematic risk compared to securities of purely domestic firms. Moreover they identified a positive relationship between internationalization and stock returns which means that US investors recognize the international composition of the activities of US based firms. The result of Lane's (1985) study supports the fact that US stock market recognizes the multinationality of a firm and its international activities. In addition AlNajjar and Riahi-Belkaoui (1999) examined the effect of the degree of internationalization (which they measured by foreign revenues/total revenues ratio) on profitability and the market value of the firm. They found out that multinationality (degree of internationalization) has a positive and significant effect on the market value of the firm, therefore the degree of internationalization can be taken as an unbooked, hidden asset. Another article of Riahi-Belkaoui (1999) examined the effect of internationalization on market value by using Ohlson model and by taking foreign revenues to total revenues and foreign assets to total assets ratios as indicators of internationalization. The positive relation between internationalization and the market value of firm is confirmed by the results.

Book value is another variable that we include in our study. In 1991 Chan et al. analyzed (in the Japanese market) the relation between stock returns and earnings, cash flows, size of the company and B/MV ratio. As a result they found out that B/MV ratio and cash flows have a significant positive effect on stock returns. Fama and French (1992) studied effects of various independent variables on the stock returns as a result of which they identified that book to market value ratio has a strong explanatory power on stock return variations. Ramakrishnan and Thomas (1992) guided a research to determine the effects of past information about book value, market value and earnings on share prices. Starting from DDM they explained the value of shares as a function of discounted future earnings streams, and then they developed three different models; first based on book value, second on market value and the third on earnings. The findings indicated that there is a superiority of the book value model relative to the other two models when explaining the earnings series. Barber and Lyon (1997) examined the effect of book value and company size on the stock returns. They also included financial firms in their research. Their findings indicated that book to market ratio has a significant effect on stock returns. Pinfold et al. (2001) realized a research in the New Zealand stock exchange and found that the portfolio of higher book to market ratio firms bring higher returns. Canbaş et al. (2007), in their empirical study for Turkish firms, found out that a portfolio of small firms has higher return than a portfolio of large firms. Moreover higher book to market ratio firms brings higher returns.

There is considerable number of studies that examined the relation between financial structure of the company and stock prices/returns. For instance Miller and Modigliani (1966) realized a research on a basis of electric utility firms

and found that debt policies of the firms does not affect the value of their shares. Bhandari (1988) investigated the effect of leverage on stock returns. The results indicate that there is a significant relation between leverage and stock returns. Further, Fama and French (1992) defined two different variables with the aim of testing the relation between leverage and stock returns. First of these variables is total assets to equity ratio and the second is total assets to market value ratio. In conclusion they found that while the second variable has a positive relation with stock returns, the first one has a negative relation. Moreover Lam (2002) in his research covering Hong Kong stock exchange tested the effect of various variables, including leverage, on stock returns. As a result he found that there is a significant relation between leverage and stock returns.

Last independent variables in this study's area of interest are dividends and earnings. Among the numerous empirical researches about the value relevance of dividends, earnings and cash flows; the research of Miller and Modigliani (1966) on electric utility firms asserts that the dividend policy of the firm does not affect the value of its shares. Ten years after Bar-Yosef and Kolodny (1976) examined the relation between Capital Asset Pricing Model and the dividend relevance. Their findings support the fact that investors prefer dividends to capital gains. In addition, in his research, Bernard (1995) compared the value relevance of book value and expected earnings with expected dividends. He found that the variation in share prices across companies is better explained by book value and earnings. Further, Biddle et al. (1997) tested the relationship between share prices and earnings, EVA, abnormal earnings and cash flow from operations. The findings showed that the changes in share prices and absolute levels of share prices are better explained by earnings than by other variables. Moreover when the measures are used in combination with one other, then they had a better explanatory power of share prices. In 2000 Andreau guided a research for Japanese capital market. As a result they found out that earnings have a stronger statistical association with security returns given cash flows. Moreover the importance of cash flows increase when the earnings are transitional. Moreover, Liu et al. (2002) realized a study with the aim of identifying and comparing the value relevance of historical cash flow measures; EBITDA (earnings before interest, taxes, depreciation and amortization), CFO; accrual based measures; sales, earnings, book value; forward looking measures; EPS forecast, long term EPS growth, long term price earnings growth; EBITDA/ enterprise value, sales/enterprise value. As a result they identified that EPS forecasts explain best the stock prices, historical earnings come next, and cash flow and book value measures tied for third and sales perform worst. Furthermore, in his study Şamiloğlu (2004) investigated the relation of EVA (economic value added), earnings and residual income based variables and stock returns on manufacturing firms from ISE. He found that EVA based variables explain 7.9% of stock returns while earnings based variables explain 6.8% and residual income based variables explain 7.8%. In addition when EVA based variables are combined with earnings based variables they explain 12.6% of stock returns; when combined with RI based variables they explain 27.2% of stock return variance. In 2007 Chang used a model based on real options model in order to identify the relation between earnings yield, capital investment, changes in profitability, and changes in growth opportunities, discount rate and stock returns. His findings indicate that earnings yield, capital investment, changes in profitability and changes in growth opportunities have positive effects on stock returns while changes in the discount rate has a negative effect. In another study Liu (2007) tested the value relevance performance of earnings forecasts, dividend forecast and cash flow forecast multiples. They used multiple based valuation to predict the market value of the companies and they found that earnings forecasts are more performed than dividends forecasts and cash flow forecasts in determination of market value.

MODEL DEVELOPMENT AND METHODOLOGY

The aim of this study is to examine the effect of earnings based variables, cash flows, dividends, book values, debt to asset ratio (leverage) and internationalization on the market value of small production firms from Istanbul Stock Exchange (ISE). In order to realize this we develop three linear models based on Ohlson model.

Variables

The first of our independent variables is earnings. We will use net earnings (E) and earnings before interest and taxes (Ebit) to determine the effects earnings. Secondly as a proxy of cash flows we will use cash flow from operations (CFO). In order to test the effect of dividends dividend paid (Div) will be used. Debt to asset ratio (De/A)

will be the proxy for leverage. Lastly foreign sales to total sales ratio (FSTS) will be used so as to reveal the effect of internationalization on the market value of small manufacturing companies.

Data

With the aim of analyzing the value relevance of internationalization earnings, cash flows, book value, dividends and leverage on the market value of the Turkish manufacturing SMEs, data from ISE is used. In order to identify the SMEs in ISE one needs a rigorous definition of SME. Although at first glance it seems easy, the fact that there is no global definition of what an SME is hinders the task. The difficulty of defining the concept of SME globally is coming from the fact that SME concept expresses a relative size (Budak, 1991). There are definitions based on sales, number of workers, capital size (Tutar and Küçük, 2003), number of machines, capacity and balance sheet values (Müftüoğlu, 1998). The European Union identifies the SMEs according to sales, assets and number of workers (Ercan 2005). In this study, we choose manufacturing SMEs from ISE according to SME definition done by EU. As a result, 36 manufacturing SMEs from ISE are identified. For these 36 companies yearly Financial statements from 1997 to 2007 are gathered from the ISE web page. Among the subject companies, we look for the availability of data and existence of an export activity due to the fact that our major aim is to identify the value relevance of internationalization and export to total sales ratio is our proxy for internationalization. As a result, we had 314 observations.

When it comes to the calculation of the dependant variable, market value, we examined the approach used by Fama and French (1992), Lam (2002) and Canbaş et al. (2007). In their works, they interpolate the companies' year t balance sheet data with the market values in June of the year $t+1$. The reason of such an interpolation is the fact that though a balance sheet is prepared for year end (assume balance sheet for 31.12.2006) it is not publicly announced at year end but during the following months. The market has access to the accounting data only when it is published, thus it reacts according to this data only after the publication. Therefore since the subject companies publishes the balance sheets until June they interpolate the accounting data with the market value in the following June. In our study, we used a slightly different approach. First, we identified for each company/year, when the accounting data is published. Then we collected (from www.analiz.com) 20 work days share price data after the publication date. Afterwards harmonic mean of these 20 work days share price data is calculated. The use of harmonic mean mitigates the effect of too low or high prices on the mean, therefore reduces the effect of volatility. A similar approach is used by Liu et al. (2007). Once the mean is calculated we calculated the market value of the company by multiplying the harmonic mean by the number of shares. Finally we interpolate this market price with the accounting data. Lastly in order to mitigate the effect of inflation on our data Turkish Lira (TL) and New Turkish Lira (TRY) values are converted in to US dollars. A similar approach is used by Şamiloğlu (2004). The exchange rate is determined according to each company's announcement of accounting information. For instance if the accounting data of a firm is published in march, we calculated the mean of march rates and used this in order to convert TL/TRY values in to US dollars.

Model

With the intention of testing the value relevance of our independent variables we develop a linear model that express the market value of the company as a linear function of earnings, dividends, book values, leverage and the degree of internationalization of the company. With the aim of doing so we will start by Ohlson model. According to Lundholm (1995), Ohlson (1995) and Feltham and Ohlson (1995) papers are landmark works in financial accounting. This is mostly due to the fact that this model proposes a linear function of share prices which makes it very interesting for empirical studies. For instance Riahi-Belkaoui (1999) used Ohlson model to test the relation between multinationality and stock prices. Huang and Wang (2008) tested the relationship between intellectual capital and the market value with an extension of Ohlson Model. Liu and Liu (2007) in their study where they compared the value relevance of accounting information among different Chinese stock market segments used a modified Ohlson model.

Ohlson suggests the following linear equation as a function of market value:

$$P_t = (1 - k) * B_t + k\varphi * E_t - k * D_t + \alpha_2 V_t \quad (1)$$

Where P is the price, k is a coefficient that is a function of risk free rate of return, E is the earnings, D is dividends and V is other relevant information. In this equation the market value is a linear function of book value, earnings, dividends and other relevant information. In order to test the value relevance of the degree of internationalization and the leverage, we replace the other information parameter in the model by FSTS and De/A. To operationalize this equation in the empirical testing we estimate the following cross-sectional regressions for each year:

$$MV_{it} = a_{0t} + a_{1t}B_{it} + a_{2t}E_{it} + a_{3t}D_{it} + a_{4t}FSTS_{it} + a_{5t}De/A_{it} + e_{it} \quad (2)$$

Where MV is the market value of the company i at date t, e is the error term and a (j=1,2,3,4,5) is the regression coefficient vector.

According to the model performances we can identify the relation between the value of small manufacturing firms (in Turkey and publicly traded) and their book value, leverage, degree of internationalization, dividends and earnings.

ANALYSIS

This chapter is consecrated to the investigation of the descriptive statistics and results of our regression analysis. The following table shows the descriptive statistics for the variables of our earnings model.

Table 1: Descriptive statistics

| | Mean | Std. Deviation | N |
|------|-------------|----------------|-----|
| MV | 19312490.52 | 4.081 | 314 |
| E | 600332.02 | 5137769.74 | 314 |
| D | 723085.63 | 2324235.88 | 314 |
| B | 13883354.36 | 2.606 | 314 |
| DeA | 0.538 | 0.435 | 314 |
| FSTS | 0.226 | 0.258 | 314 |

As a result a result of our d test (Durbin-Watson) for degrees of freedom 5 and 308, at 0.05 significance level, we obtain d value of 1.999, which confirms that there is no evidence of positive first-order serial correlation. The following table indicates R, R square, adjusted R square values as well as standard error of the estimate.

Table 2: Explanatory power of the model

| R | R Square | Adjusted R Square | Std. Error of the Estimate |
|------|----------|-------------------|----------------------------|
| .721 | .520 | .512 | 2.850 |

According to the R square value, our Ohlson variant earnings model explains 52% of the change in dependant variable. Next table show the standardized coefficients, t values and significances of the independent variables.

Table 3: Coefficients, t values and significances of independent variables

| | Standardized Coefficients | t | Sig. |
|------------|---------------------------|--------|------|
| (Constant) | | .221 | .825 |
| E | -.157 | -2.490 | .013 |
| D | .282 | 3.674 | .000 |
| B | .601 | 7.793 | .000 |
| DeA | .058 | 1.261 | .208 |
| FSTS | -.007 | -.182 | .856 |

With the aim of easing comparison between coefficients we are directly giving standardized coefficients.

When we look at the significance of the variables, earnings, dividends and book value has significant effect on the independent variable, on the other hand leverage and foreign sales to total sales ratio has no significant effects. Among the significant variables earnings has a negative coefficient while dividends and book value have positive coefficients.

CONCLUSIONS

With the aim of contributing the valuation efforts of small manufacturing SMEs in Turkey, we tested the effect of earnings, dividends, book value, leverage and the degree of internationalization on the market value of the firm. By using the Ohlson model we developed a linear model which explains market value of the firm as a function of earnings, dividends, book value, leverage and internationalization. As a result of regression analysis we observed that our model explained 52% dependant variables variance. Among our independent variables dividend and book value had positive and significant coefficients, which is inline with the existing valuation literature. Leverage and internationalization proved insignificant. Therefore we can say that investors in ISE don't recognize the internationalization as a hidden asset. The reason of this may be the fact that existing empirical research on value relevance of internationalization was realized by using the data of big scale multinational corporations; on the other hand, in our case internationalization of a Turkish SME is mostly limited by export. Moreover earnings had a negative and significant effect on (not as significant as book value or dividend) market value which contradicts the results of the existing literature. As a developing country Turkey's economy is relatively vulnerable to global and domestic crises, moreover due to their size SMEs are strongly affected by these crises which cause a significant fluctuation of the firms' earnings. On that point such a volatile data may not be value relevant for investors. On the other hand the reason of the negative coefficient of earnings might be a specific sector. One of the limitations of the study is the size of our sample. Though we realized this research for all Turkish manufacturing SMEs it is not possible to reach the data of the firms which are not publicly traded. Another limitation of this study is the usage of panel data in the analysis. We suggest, for the future research inclusion of a dummy variable; sector, so that we can observe the effect of different variables in different sectors.

THE MEDIATING EFFECTS OF SATISFACTION ON POSITIVE AND NEGATIVE CONSUMPTION EXPERIENCES AND READINESS TO CHANGE BEHAVIOUR

Michael Baird, Robyn Ouschan and Ian Phau
Curtin University of Technology, Australia

ABSTRACT

This study applies the disconfirmation of expectations paradigm to explain what makes the consumption of sin products (high risk alcohol consumption) a satisfactory or unsatisfactory experience. It further tests if it affects readiness to change behaviour. It illustrates that disconfirmation of expectations should focus on consumption outcomes as they motivate customers to consume products and services. Furthermore, both positive and negative outcome expectancies should be included. The alcohol expectancy literature offers operational definitions of positive and negative outcome expectancies. However, alcohol expectancy studies do not use the disconfirmation paradigm to explain high risk drinking behaviours, even though disconfirmation of expectations have been shown to be a better predictor of customer satisfaction and behavioural intentions than customer expectations. Data gained via convenience sampling of undergraduate students from all divisions within a large Australian University provided a usable sample size of 462. The results and analysis illustrate a very distinct separation of four positive outcome expectation factors and four negative outcome expectation factors. These findings are discussed with implications highlighted for theorists, marketers and social policy makers.

INTRODUCTION

Past research has shown that high risk drinking (defined by Oei & Morawska (2004) as four or more drinks for women and six or more drinks for men per drinking episode) amongst university students is a serious problem, both within Australia and the world (e.g. Burden & Maisto 2000; McNally & Palfai 2001; Neighbors et al. 2003; Oei & Morawska 2004; Park 2004). Alcohol is part of the culture of university life and a large proportion of students (44%) have been classified as high risk drinkers in the US (Oei & Morawska 2004). Similarly, the Salvation Army announced that 44% of Australian adolescents engage in high risk drinking behaviours (Channel 9 News 16-9-2004).

Within customer satisfaction and service quality research, disconfirmation has been operationalised in terms of meeting product / service attribute expectations (Oliver & Bearden 1985; Swan & Trawick 1981). Subsequently three types of discrepancies are presented; 1) Positive disconfirmation, where performance exceeds expectations, 2) Confirmation, where performance equals expectations, and 3) Negative disconfirmation, where performance falls below expectations. Due to a shift in focus to customer delight, it has been suggested that customer satisfaction surveys need to measure the whole customer experience and other consequences of it (Shaw & Ivens 2002). A need exists to focus on the disconfirmation of consumption consequences, as customers' are motivated by consumption outcomes, rather than product / service attributes. Studies which have investigated emotional responses to consumption experiences highlight that customers may experience positive (e.g. pleased / arousal) and negative (e.g. displeasure / boredom) emotions which are generally presented in the form of a positive to negative continuum (Mano & Oliver 1993). However, social marketing studies have found that positive experience expectations (e.g. feeling relaxed when consuming large quantities of alcohol) differ conceptually from negative experience expectations (e.g. vomiting after a heavy drinking episode). More specifically, positive expectations of high risk drinking include *fun*, *sex*, and *tension reduction*, and negative

expectations include *physical, cognitive* and *school problems* (McNally & Palfai 2001; Park 2004). A number of studies empirically support the difference between positive and negative outcome expectancies (Leigh & Stacy 1993; McNally & Palfai 2001; Park 2004). However, the alcohol expectancy literature fails to investigate the impact of disconfirmation of consumption outcome expectancies on intentions to engage in harmful consumption behaviours. Considering disconfirmation of expectations is a better predictor of customer satisfaction than expectations and behavioural intentions (e.g. Burton et al. 2003; Oliver 1980; Robledo 2001; Ross et al. 1987; White & Schneider 2000), this is a significant shortcoming as addressed by this study. This study proposes a research model which suggests that satisfactory / unsatisfactory drinking experience mediate the disconfirmation of positive / negative outcome expectancy and readiness to change high risk drinking behaviour.

LITERATURE REVIEW AND HYPOTHESES

While several theories have been used to explain the disconfirmation paradigm (e.g. generalized negativity theory, assimilation theory, contrast theory as cited by Ross et al. 1987), none of these appears to incorporate expectations of negative consumption outcomes. Only one qualitative research paper (Fitchett & Smith 2002), which investigated illicit drug consumption, notes the difference between positive and negative outcome expectancies. They found that satisfactory experiences reinforced future consumption, whereas dissatisfactory experiences would not cause cessation of usage. If consumption was dissatisfactory, users would employ several strategies to justify further use, including attributing the outcomes to other factors in the forms of deferment and/or denial. This clearly highlights the need to distinguish between positive and negative consumption outcomes.

Lovelock et al. (2004) claimed that the most dominant model in satisfaction research is the disconfirmation of expectations paradigm. Moreover, Oliver et al. (1994) stated that this paradigm is fairly robust across a broad range of context, including the consumption of illicit drugs (Fitchett & Smith 2002). Their rationale being that recreational drugs are desired, purchased and consumed just like any other mass consumer goods, and the differences relate more to social and moral beliefs rather than the effects or consequences of use (as suggested by Hoffman (1990) and D' Angelo (1994)). Clearly this suggests that the disconfirmation paradigm applies to consumption of alcohol. This study extends the qualitative research conducted by Fitchett and Smith (2002) as it proposes hypotheses and operational measures for conclusive testing.

Past studies have investigated the link between expectancies of alcohol outcomes and readiness to change (e.g. McNally & Palfai 2001) and drinking refusal self efficacy (e.g. Oei & Morawska 2004). Burton et al. (2003) have noted that behavioural intentions and customer satisfaction are positively associated with each another and this was confirmed with their own study that found willingness to reuse a service was strongly associated with satisfaction. Thus if a consumer experiences high satisfaction with their high risk drinking, the likelihood that they will cease drinking, or even change their drinking behaviour is expected to be low. Another study (White & Schneider 2000) found that disconfirmation of service quality expectations had a direct impact on behavioural intentions (in terms of the commitment ladder). Based on the combination of these findings, this study suggests that satisfaction with the high risk drinking experience partially mediates the relationship between disconfirmation of positive and negative outcome expectancies and readiness to change high risk drinking behaviour. These propositions are summarised in the hypotheses below:

H₁ – Satisfaction with high risk drinking partially mediates the negative relationship between positive disconfirmation of positive outcome expectations and readiness to change high risk drinking behaviour.

H₂ – Satisfaction with high risk drinking partially mediates the negative relationship between negative disconfirmation of negative outcome expectations and readiness to change high risk drinking behaviour.

METHODOLOGY

A four page survey instrument was developed in the form of a questionnaire for self administered completion. The questionnaire used a combination of established scales, some with minor modification to gain the data required. This was preceded by a cover letter outlining the purpose of the study, as well as requiring respondents to answer two screening questions. The screening questions are particularly important for this study as it requires the respondent to have engaged in high risk drinking. Therefore screening question one ensures respondents are over 17 years of age, the legal drinking

age within Australia. Questionnaires marked 17 years of age or below were asked not to proceed any further and were discarded. The second screening question asks how many times the respondent has engaged in high risk drinking in the past four weeks. Since this research is based on the memory of the last high risk drinking experience, it requires respondents for which it has been a fairly recent occurrence in order to limit the possible bias that may occur after a longer period. Questionnaires marked 0 times were asked not to proceed any further and were discarded.

The questionnaire was administered to a variety of lectures within a large Australian University. At least one lecture from each of the 5 divisions of the University was targeted in order to gain a relevant cross section of drinking habits and the behaviour of the University as a whole. A focus was given to lectures within the Business division due to the highest proportion of students residing in this division. Divisions where more than one lecture was targeted were divided into different schools as well as different years so as to avoid any repetition of respondents. The final results were gained from seven lectures and yielded a combination of first, second and third year units. Before the questionnaire was started by students, a brief outline of the study and questions was made clear to all students. Further, an overhead projector slide was shown specifying the number of standard alcoholic drinks found in typical serving containers, so as to avoid any misinterpretation.

RESULTS

The data collection yielded a total of 859 returned questionnaires, gained from ten different lectures across five divisions. 257 were discarded due to the respondent groups not being involved in any high risk drinking in the past four weeks or they were not the legal drinking age. A further 140 questionnaires were rejected due to the respondents failing to pass the manipulation checks or fully completing the questionnaire. This leaves a total of 462 usable questionnaires, equalling a 56% response rate of students that engaged in high risk drinking within the past four weeks of the survey.

The sample comprised of 53.7% male, with 95.2% of all respondents being between the ages of 18 and 25, and the oldest student being 48. The data also showed that the highest percentage of students (57.1%) last engaged in high risk drinking less than 1 week ago, and the mean number of times a student had engaged in this behaviour within the past four weeks was 4.5. 96.5% of all respondents were full time students, and the average semester studying at university was 2.7. The majority of students (45%) chose Spirits (mixed or straight) as their most preferred alcoholic beverage, with Beer second (38.5%). The alcoholic beverage that students consumed during their last high risk drinking episode was also primarily Spirits with 67.5% and Beer at 54%. There was a fairly even spread of respondents for the amount of standard drinks consumed during their last high risk drinking episode. The highest number being 34% for 10 drinks and above, showing that those who are involved in high risk drinking generally do so at extreme levels. Only 19% of respondents were international students. This must be taken with caution, as a large proportion of international students do not consume alcohol.

Factor analysis was done on the 38 item alcohol expectancy disconfirmation scale. The scale was analysed through factor analysis using the Oblimin with Kaiser Normalisation rotation method. The factor analysis shows a very clear and distinct separation between positive and negative factors within the scale. The scree plot suggests eight components. The Cronbach Alpha scores ranged from 0.39 to 0.83. Subsequent factor analysis was run including 28 items, rejecting cross-loadings. A total of eight components were still formed, with a clear distinction of four positive and four negative components. This also improved the Cronbach Alpha scores to read from 0.51 to 0.83. (Factor loadings, Eigenvalues, Cronbach's Alpha, KMO Measure of Sampling Adequacy and Bartlett's Test of Sphericity Significance available in appendix). Collectively this explained 61% of variance.

Varimax with Kaiser Normalisation factor analysis was performed on the 16 item Readiness to Change Likert scale. The analysis gave four components, with Cronbach Alphas ranging from 0.42 to 0.79. As was done previously, a second factor analysis was run, not including the items that cross loaded. This resulted in a factor analysis of 11 items. Once run the components remained unchanged, leaving three components, however for the purpose of this study only the strongest component was chosen, namely 'Action' ($\alpha = 0.79$). The 'Action' component refers to making an effort to change the individuals drinking habits, and was thus renamed 'Action to Change'.

Varimax factor analysis was also done on the 6 item Satisfaction scale to confirm the scale is uni-dimensional. The results showed a single component scale, producing a Cronbach Alpha of 0.88 with all 6 items included (KMO = 0.839, Sig. = 0.000). The Eigenvalue of 3.78 explained 63% of variance.

Mediation Analysis Regressions

A series of linear regression analyses were executed in order to test for partial or full mediation using the 4 step analysis proposed by Baron and Kenny (1986). This will conclude which will be the best predictor of a dependent variable from several independent variables.

The analysis specified that Action to Change is the dependent variable and the four positive components as the independent variables within the equation. In order to test this, a regression was run. The four positive components were regressed against Action to Change. The results show that only the 'Sociable' component is significant (Sig = 0.015, Beta = -0.156, $t = -2.436$).

The next regression was done in order to analyse the effect of the significant positive component as the independent variables (Sociable), with Satisfaction as the dependent variable. The positive component regressed showed that it is significant with Satisfaction (Sig = 0.029, Beta = 0.115, $t = 2.187$) at the 0.05 level. The next regression was done in order to analyse the effect of Action to Change against Satisfaction. It was found to be significant with the independent variable Satisfaction at the 0.01 level (Sig = 0.007, Beta = -0.128, $t = -2.729$).

Further regressions were run with Satisfaction and 'Sociable' against Action to Change as a dependent. It was found that Satisfaction was significant with the dependent variable at the 0.05 level (Sig = 0.025, Beta = -0.108, $t = -2.244$). This is in contrast to 'Sociable' which did not get significant results (Sig = 0.070, Beta = -0.088, $t = -1.820$), thus proving in this equation that full mediation is taking place.

Sobel test analysis was run in order to re-test and confirm its standing as a full mediator. Preacher and Hayes (2004) clearly outlined the method, whereby a number of regressions are run, and raw regression coefficients and standard errors are entered into an equation ($z\text{-value} = a*b/\text{SQRT}(b^2*s_a^2 + a^2*s_b^2)$) where a = raw (unstandardized) regression coefficient for the association between IV and mediator, s_a = standard error of a , b = raw coefficient for the association between the mediator and the DV (when the IV is also a predictor of the DV), and s_b = standard error of b .

The Sobel test was done on the regressions of the independent 'Sociable' against Satisfaction and the independents 'Sociable' and Satisfaction against Action to Change. The Baron and Kenny (1986) method suggested full mediation, and this test confirms that, with a non-significant p-value of 0.053 and a Test Statistic of -1.935.

If this equation is examined in more detail, it can be seen that 'Sociable' consists of the items 'Talkative', 'Talk to people' and 'Outgoing', all of which could be biased aspects of high risk drinking behaviour to individuals that prefer to express themselves. Therefore, it depends on the satisfaction outcome of 'Sociable' as to whether or not the high risk drinker will take the action to change their drinking habits. This is an important finding, as it shows that for this specific positive component, whether or not the drinker is satisfied with their high risk drinking experience (due to it being of a different nature for different people) will ultimately affect the individual's readiness to change high risk drinking behaviour.

The four step analysis was repeated for the negative components. A multiple regression was done whereby all four negative components were analysed as the independent variables, with the Action to Change component as the dependent variables. The analysis shows that only 'Regret' is significant (Sig = 0.008, Beta = -0.129, $t = -2.644$).

A regression was run for the single acceptable negative component (Regret), regressed against Satisfaction. Regression of this negative component showed that it was highly significant with Satisfaction at the 0.01 level (Sig = 0.001, Beta = 0.157, $t = 3.385$).

'Regret' and Satisfaction were regressed against the dependent variable Action to Change. Regression with the dependent showed 'Regret' is not significant (Sig = 0.050, Beta = -0.093, $t = -1.963$), while Satisfaction is significant

at the 0.05 level (Sig = 0.017, Beta = -0.114, $t = -2.393$). This result shows that for this equation full mediation is taking place.

A Sobel test was conducted over the negative equation from the model. The test confirmed that the equation was correct, with 'Regret', Satisfaction and Action to Change giving a p-value of 0.052, and a Test Statistic of -1.955, showing an insignificant result, resulting in full mediation.

The 'Regret' component is made from only two items, 'Guilty' and 'Problems', and although each item did not have very high factor loadings nor combined Cronbach Alpha, this component could be called the most remorseful of the four components developed. The fully mediating pathway is substantial as it consists of components implying the high risk drinker will change their behaviour. As 'Regret' is made from items for which most would feel regretful over, with satisfaction as the full mediator between the two, it would show negative satisfaction, or dissatisfaction from 'Regret' if the Action to Change was taking place.

DISCUSSION AND IMPLICATIONS

There exist a number of key conceptual and theoretical contributions from which this study adds to the literature. The inclusion of negative expectations into the disconfirmation model is one of the major contributions. Previous disconfirmation models have been too simplistic, and a need existed to analyse this in a more in-depth way, namely, distinguishing between positive and negative expectations. The results show the ability to distinguish between them, which future research will find very useful. This will also allow for further dissection of the disconfirmation paradigm. The transfer of concepts from outside the marketing literature is an important step to help better understand the concepts and market to customers more effectively.

Distinguishing between positive and negative expectations/experiences has been a contribution of this research. Previous literature examining affect (e.g. Jun et al. 2001) and sin products (e.g. McNally & Palfai 2001, Park 2004) have been the only areas where positive and negative expectations or experiences have been separated and examined individually. With this extended into the expectations/experiences literature, it allows the ability to pursue further research to better comprehend the factors and after effects of these individual positive and negative experience expectations.

This study has made methodological contributions. It has provided measurement of disconfirmation of expectations in terms of consumption experience outcomes rather than product/service performance attributes. This is one of very few studies which has operationalised consumption experience outcomes, therefore should provide a basis for further investigation. It should be noted that outcomes have the potential to become a large research area, with or without the disconfirmation of expectations.

The research differentiates and operationalises positive and negative discrepancies as separate constructs as well as highlights different dimensions for each. No study was found that separated positive and negative discrepancies, let alone developing different dimensions. The alcohol expectancy disconfirmation scale, which gave a total of four positive and four negative factors, shows that a distinction does exist between positive and negative outcome expectations.

A methodological contribution exists in the measurement of multidimensional outcome variables. This study has shown that through the refinement of existing scales usable and significant results were gained. The multidimensional outcome variables were in the form of the 38 item alcohol expectancy disconfirmation scale.

There are several key managerial contributions. The research model presents a more powerful tool to manage customer experiences and expectations. As all marketers are aware, customer experiences and expectations, usually grouped under satisfaction, have a huge effect on marketing related issues such as word-of-mouth, re-purchase intentions, and complaining behaviour, to name but a few (Gilly 1987, Grewal et al. 2003, Lee 2003, Richins 1983). The model shows that by being aware of the different experience expectations available to consumers, a business should always be aiming to increase their performance to meet or exceed those expectations, thus reducing negative disconfirmation.

This study highlights the need to downplay positive experiences and diminish negative experiences, for which social marketing can benefit. Social marketing campaigns, such as drink driving and quit smoking, are always searching for better ways in which to make their campaigns more successful. This study proves that if the positive experiences are made to look less appealing, and the negative experiences are diminished, the effect of the campaign may be increased. This could be further enhanced by focusing on the specific relationships between the dimensions for positive and negative disconfirmation and readiness to change.

This research has practical contributions for social policy, as it will lead to strategies which are more likely to result in a readiness to change socially undesirable consumption behaviours. Through having a better understanding of how consumers form their expectations and the ways in which to exceed these expectations through the experience, will allow policy makers to develop strategies with means to change the future behaviours of these consumers.

LIMITATIONS AND FUTURE RESEARCH

Although this study has extended the disconfirmation paradigm and highlighted the distinction between positive and negative consumption expectations, it is not without a number of limitations that must be noted. Firstly, a small sample size was used. A more robust and descriptive analysis could be made from a larger sample size.

Secondly, the fact that this study relies on the memory of a high risk drinkers past experience could potentially be a limitation. The study is based on student's last high risk drinking experience, which may provide some bias as to the experience. For example, a respondent that partakes in high risk drinking may have their memory of their last experience altered due to their peers providing new information about that experience. Perhaps future research could examine a longitudinal study to determine the before and after effects of high risk drinking (i.e. track behavioral changes).

This study was based on the results of a single University in Australia. Whilst the use of the student sample is justified, future research should examine a multi-University focus, or possibly entire population focus, in order to draw distinctions between groups. Further, other age group cohorts should be considered for future research.

The results are limited to high risk drinking. While this is an epidemic for teenagers (Gill 2002, Kropp et al. 2004), drug taking may be becoming more prevalent with adolescents (D'Angelo 1994, Fitchett & Smith 2002). Future research should validate\extend the findings to other sin products, such as drug taking, gambling etc.

Another limitation may be the measure of disconfirmation used. The technique of disconfirmation was a combination of Fromme, Stroot and Kaplan's (1993) work and Bhattacharya, Rao and Glynn's (1995) work. Further research could examine alternative measures of disconfirmation (expectation minus performance), in order to determine if significant differences occur between different measures of the same concept.

Supplementary studies may also wish to measure other behavioral intentions, such as word of mouth and/or peer pressure, to determine what, and if they have a bearing on the alcohol consumption in the first place. An interesting study would examine whether repurchase intentions have the ability to change behavioural intentions.

Future research should integrate relevant addiction theories to help further explain high risk alcohol consumption. For example, McCutcheon, Lange and Houran (2002) used the absorption-addiction model to explain individual celebrity worship behaviour. This would enhance the definition and broaden the scope of the research area.

It would be of additional interest to investigate the salience placed on the various positive and negative consequences of binge drinking in future research. This could help in devising strategies of ways in which to reduce the widespread mass consumption of alcohol in high risk people.

APPENDIX

Alcohol Expectancy Disconfirmation Factor Analysis

| Items | | Loading | | | | | | | |
|--|-------------------------------|---------|------|------|-------|-------|------|-------|-------|
| | | P1 | N1 | N2 | P2 | N3 | N4 | P3 | P4 |
| Sociable (Positive) | Talkative | .811 | | | | | | | |
| | Talk to people | .704 | | | | | | | |
| | Outgoing | .650 | | | | | | | |
| Cognition (Negative) | Response speed | | .841 | | | | | | |
| | Difficulty in thinking | | .579 | | | | | | |
| | Clumsy | | .569 | | | | | | |
| Disorderly (Negative) | Loud, boisterous, or noisy | | | .810 | | | | | |
| | Dominant | | | .756 | | | | | |
| | Dizzy | | | .735 | | | | | |
| Sex (Positive) | Enjoyed sex | | | | -.839 | | | | |
| | Lover | | | | -.735 | | | | |
| | Act out my fantasies | | | | -.612 | | | | |
| | Powerful | | | | -.520 | | | | |
| Unsettled (Negative) | Moody | | | | | -.833 | | | |
| | Shaky or jittery the next day | | | | | -.744 | | | |
| Regret (Negative) | Guilty | | | | | | .753 | | |
| | Problems | | | | | | .568 | | |
| Fun (Positive) | Humorous | | | | | | | -.812 | |
| | Sexy | | | | | | | -.803 | |
| | Friendly | | | | | | | -.546 | |
| Relaxed (Positive) | Calm | | | | | | | | -.803 |
| | Peaceful | | | | | | | | -.621 |

BRAND RESONANCE: THE CASE OF BRAND EXTENSIONS OF PROTOTYPICAL BRANDS

Michael Baird and Ian Phau
Curtin University of Technology, Australia

ABSTRACT

Brand prototypicality is an area that has had limited research in the past. With brand extensions becoming more and more relevant in the market, it is important to know how prototypical brands can extend their brand. Further, there is a lack of research that examines brand resonance, specifically in regards to prototypicality. This study replicates and expands upon previous research methodologies (Gürhan-Canli & Maheswaran 1998; Matthiesen & Phau 2005). Using an experimental study, a 3 (congruency) x 2 (typicality) x 2 (motivation) x 2 (brand type) factorial design was developed. Preliminary research chose a brand category of watches, with four real brands. The research will create a uni-dimensional prototypicality scale to use as a manipulation device for the current study, and will be the first to provide a measure for prototypical brands.

INTRODUCTION

The concept of prototypicality has been around since the mid 80's (Carpenter & Nakamoto 1989; Nedungadi & Hutchinson 1985), however it has been of little interest to marketers (Aaker & Keller 1990; Boush & Loken 1991; Kalamas et al. 2006). This is surprising given the recent interest and ever growing body of work done in the area of brand extensions (Aaker & Keller 1990; Kalamas et al. 2006; Loken & Roedder John 1993; Swaminathan, Fox & Reddy 2001; Tauber 1988).

A brand extension involves attaching "an existing brand name to a new product introduced in a different product category" (Swaminathan, Fox & Reddy 2001, p.1). According to the literature, an estimated 81-95% of new brands are some form of extension (Kalamas et al. 2006). There are numerous reasons for doing this; a major factor is cost. The cost estimates for developing a new brand have risen from \$150 million in the early nineties (Boush & Loken 1991) to one billion dollars nowadays (Kalamas et al. 2006).

Brand extensions succeed because they leverage brand equity and provide the all important familiarity and security to prospective consumers (Boush & Loken 1991; Kalamas et al. 2006; Loken & Roedder John 1993; Tauber 1988). As such, an extension has a higher chance of success, as it builds upon the parent brand (Aaker & Keller 1990; Kalamas et al. 2006; Swaminathan, Fox & Reddy 2001).

Tauber (1988) identifies seven different types of brand extensions; however, this study will focus on the two general approaches, line extensions and category extensions (Aaker & Keller 1990; Kalamas et al. 2006). When an existing brand name introduces a new product or service into the same product class, it is called a line extension. The line extension merely expands offerings within the same category. Coca Cola is a good example of pursuing line extensions, as along with the traditional Coke beverage, they also make Vanilla Coke, Diet Coke, Coke Zero, etc. Category extensions are when an existing brand name enters a completely different product or service class. It is a larger undertaking to expand the brand. The Virgin group have mastered category extensions. Virgin started in the music industry, and has since expanded to other unrelated fields including airlines, financial services, and mobile phones to name a few.

A prototypical brand is one which is so strong in its core category, that when it introduces a brand extension the “product category attributes may inadvertently be transmitted with the extension” (Kalamas et al. 2006, p.194). Thus the ramifications for prototypical brands pursuing brand extensions become more complicated. Several authors have called for more research on whether prototypical brands can undertake brand extensions (Aaker & Keller 1990; Boush & Loken 1991; Kalamas et al. 2006). It is important to note that within the literature the terms prototypicality and typicality are used interchangeably (and from here in) (Boush & Loken 1991; Carson, Jewell & Joiner 2007; Gürhan-Canli & Maheswaran 1998; Kalamas et al. 2006; Loken & Roedder John 1993; Loken & Ward 1990; Nedungadi & Hutchinson 1985).

The concept of typicality is in some ways similar to the fit construct, which has been examined thoroughly by researchers in this area. However, typicality also has a theoretical basis in psychological research, which may allow marketers to make more accurate predictions regarding the likely success of brand extensions (Loken & Roedder John 1993). Further, often the brand that serves as the prototype of the product category becomes the prototypical brand (Carpenter & Nakamoto 1989; Carson, Jewell & Joiner 2007). A specific measure does not exist to test for prototypical brands (Carpenter & Nakamoto 1989; Carson, Jewell & Joiner 2007; Gürhan-Canli & Maheswaran 1998; Kalamas et al. 2006; Loken & Ward 1990; Nedungadi & Hutchinson 1985).

Previous literature has examined relationships between prototypicality and attitude (Loken & Ward 1990), brand name awareness, usage and liking (Nedungadi & Hutchinson 1985), product design evolutions (Carson, Jewell & Joiner 2007), congruency (Kalamas et al. 2006), and brand extension strategy (Boush & Loken 1991). No literature has looked at prototypicality and brand resonance.

Brand resonance, defined, refers to the “ultimate relationship and level of identification that the customer has with the brand” and thus “the extent to which customers feel that they are ‘in sync’ with the brand” (Keller 2008, p.72). Keller (2003) developed brand resonance to provide a higher understanding of consumer based brand equity, a tool for marketers and brand managers alike to further comprehend the meaning of a brand.

Brand resonance can be measured through four constructs; behavioural loyalty, attitudinal attachment, sense of community, and active engagement (Keller 2008). Each of these measures have been examined individually within the marketing literature, however Keller is the first to combine these four measures, to create the concept of brand resonance.

A brand with a good resonance allows consumers to feel that they are part of the brand itself, and they can identify with the brand (Keller 2003). The literature notes that very few brands actually achieve complete brand resonance (Keller 2003, 2008). Harley Davidson and Apple are the only brands to date that rate very highly on all the four measures. A brand does not have to rate well on all of the four measures to achieve a good resonance though. Even a brand that rates well on only one of the four measures still has the ability to resonate with its consumers.

The brand congruency literature also builds upon the brand extension literature, as brand congruency relates to how well matched the brand extension information is with the parent brand expectations. The majority of studies that have investigated congruency have defined it in two ways, congruent and incongruent. However numerous studies have also itemised congruency as three measures (congruent / moderately congruent / incongruent) (e.g. Kalamas et al. 2006). Kalamas et al. (2006) note that limited research has investigated prototypical brand extensions with varying levels of congruency.

A congruent brand extension will match the parent brand schema, and thus will result in brand name enhancement (Gürhan-Canli & Maheswaran 1998; Swaminathan, Fox & Reddy 2001). Alternatively, an incongruent brand extension has attributes that mismatch the parent brand schema, and thus result in brand name dilution (Gürhan-Canli & Maheswaran 1998; Loken & Roedder John 1993; Roedder John, Loken & Joiner 1998). A need exists to examine the effect of prototypicality and congruency on brand resonance (Gürhan-Canli & Maheswaran 1998; Matthiesen & Phau 2005).

Motivation processing has the ability to enhance or dilute brand name and brand personality, as shown by previous literature (Gürhan-Canli & Maheswaran 1998; Matthiesen & Phau 2005). Motivation processing refers to how much

effort consumers are willing to expend to process new information (Gürhan-Canli & Maheswaran 1998). Under high motivation conditions, it is expected that consumers will process all the information that is available to them. Alternatively, consumers with low motivation would rely more so on peripheral cues (or heuristic processing), and only process a subset of information (Gürhan-Canli & Maheswaran 1998; Matthiesen & Phau 2005).

With theoretical underpinnings from the Elaboration Likelihood Model and the Heuristic-Systematic Model, motivation processing is an important construct when examining new product evaluations. Being able to control for the effect of motivation, we can effectively modify the level of cognitive processing that a consumer will go through.

A brand type can be classified as functional or symbolic. Functional brands usually correspond to product attributes, and satisfy immediate and practical needs, whereas Symbolic brands relate to needs for social approval, personal expression and prestige, and their practical use is only incidental (Bhat & Reddy 1998). There exists a lack of studies showing the differences between extensions for symbolic and functional brands and their effect on prototypicality (Kalamas et al. 2006) and brand resonance (Bhat & Reddy 1998).

“Park et al. (1986) first proposed that a brand concept can either be functional or symbolic, with brands positioned as either, but not both. Bhat and Reddy (1998) further advanced the theory by proposing that functionality and symbolism are separate components, with it being possible for a brand to have both symbolic and functional appeal” (Mowle & Merrilees 2005, p.221). Bhat and Reddy’s (1998) study also further defined symbolic brands into prestige or personality. For the purpose of this research, we will only be examining straight functional or symbolic brands.

HYPOTHESES DEVELOPMENT

Based on the literature review and the gaps outlined above, this study will investigate the following hypotheses:

H_{1a}: The bookkeeping model will be supported in high-motivation conditions. Brand resonance [(a) loyalty, (b) attachment, (c) engagement, (d) community] enhancement (dilution) will occur in response to incongruent and positive (negative) information, and evaluations will be equivalent across the typicality conditions.

H_{1b}: The subtyping model will be supported in low motivation conditions. Brand resonance [(a) loyalty, (b) attachment, (c) engagement, (d) community] enhancement (dilution) will occur in response to incongruent and positive (negative) information. Evaluations will be more extreme for high- (versus low-) typicality conditions.

H_{2a}: For incongruent extensions, more attribute-related thoughts will be generated with high (versus low) motivation. Attribute-related thoughts will not vary as a function of typicality.

H_{2b}: For incongruent extensions, more category-based and simple evaluative thoughts will be generated with low (versus high) motivation.

H_{2c}: More subtyping thoughts will be generated with low (versus high) motivation in the low- (versus high-) typicality condition in response to incongruent information.

H₃: Brand resonance [(a) loyalty, (b) attachment, (c) engagement, (d) community] enhancement (dilution) will occur in response to congruent and positive (negative) information, regardless of typicality in high- (versus low-) motivation conditions.

H_{4a}: For congruent extensions, more attribute-related thoughts will be generated in high- (versus low-) motivation conditions.

H_{4b}: For congruent extensions, more category-based and simple evaluative thoughts will be generated in low- (versus high-) motivation conditions.

RESEARCH METHODS

Sampling Method

The study will be an experimental study, and consists of a 3 (congruency) x 2 (typicality) x 2 (motivation) x 2 (brand type) factorial design, giving 24 groups. Appendix A shows a flow chart of the design of the research. The study will use one product category with four brands (6 groups per brand). The research will be limited to an Australian context only.

Data Collection

Data collection will take place via a convenience sample, using a classroom setting with approx. 15-30 respondents per sitting (One condition per sitting to eliminate possibility of individuals inadvertently exposed to other conditions and guessing intent of study). Responses will be gained via a survey style questionnaire. Gürhan-Canli and Maheswaran (1998) suggest a sample size of 60-75. Aim: 100 per group x 24 = 2400 respondents. The data collection will take place over 2 semesters using the same 1st year class.

Experimental Study Procedure

Classes will be randomly assigned to either high-motivation or low-motivation conditions. The class will be given a short introduction. In particular the class will be told that this survey is part of a consumer research exercise that is investigating a number of brands. The class will be debriefed once the exercise is finished.

Pretest 1

Pretest 1 was conducted in order to determine the appropriate category in which to study. The category had to have easily identifiable symbolic and functional brands, and highly prototypical and not so prototypical brands. Four categories were chosen, namely motorcycles, mineral water, underwear, and watches. Four sets of questionnaires were divided between 225 students. Questions asked were of an unbiased nature asking respondents to list the brands they could recall. The category of watches was chosen, as the figures were the most easily definable out of the four categories.

Pretest 2

Pretest 2 was conducted to identify the most easily definable brands to be used for the study. Where Pretest 1 was a recall based response, Pretest 2 was a recognition based response, confirming the prototypicality level and brand type. A list of watch brands was given, asking the respondent to rate the prototypicality level for each brand (High/Low). On the following page, the same brands were given, asking the respondents to rate the brand type (Functional/Symbolic). Appendix B shows the brands chosen.

Pretest 3

Pretest 3 was conducted to determine appropriate brand extensions. A list of 23 potential brand extensions were chosen and distributed to 45 students to determine appropriateness. All products listed were the same for the four brands. Respondents were asked to rate how congruent each product was to the parent brand (congruent, moderately congruent, incongruent). The categories chosen for extending the brands based on the results were a clock (congruent), pens (moderately congruent), and a dog bowl (incongruent).

Survey Instrument

A combination of established measures will be used. The survey instrument will begin with a brief introductory page. Following this will be an overall prior evaluation of four brands, in order to get the pretest scores. This scale will consist of four items per brand. Each item will be an overall view of the four measures of brand resonance. Next is a filler task, which will be the 5 item status consumption scale (Eastman, Goldsmith & Reinecke Flynn 1999). This is done to clear the respondents mind to prevent any potential bias. The motivation variation will occur next. This will be done according to the cover sheet of the questionnaire. For the high-motivation conditions, students will be told that they are part of a very small sample and their feedback will weigh heavily on the possibility of the brand extension going ahead. They will also be told that there will be a lucky draw for all completed questionnaires. For the low-motivation conditions, students will be told that they are part of an Australia wide study and their individual feedback will not be taken into consideration, but averaged with many other respondents (Gürhan-Canli & Maheswaran 1998; Matthiesen & Phau 2005).

The advert will be shown next. Following the advert, the 21 item brand resonance scale developed by Keller (2003) will be used to determine the posttest scores. Respondents are next asked to list all the thoughts that came to mind, to measure the motivation processing mode. Next will be an 8 item thought elicitation scale representing attribute-related, category-based, subtyping and simple evaluative thoughts. This will work as a manipulation check. The respondents will be asked about the purpose of the research, as a final manipulation check to ensure the respondents do not know the purpose of the study. Lastly, demographic information will be obtained.

Scale Development

A scale will be developed in order to serve as a manipulation checking device for prototypicality. The scale is expected to consist of a number of items being uni-dimensional in nature. The first step of this scale development is to run an Exploratory Factor Analysis (EFA) on the preliminary list of items gathered for the scale through the literature. The relevant literature gave a total of 24 different definitions of the concept of prototypicality, and as such this was tested with 182 respondents on a 7 point Likert scale. The EFA gave 2 factors with 11 items with a KMO Measure of Sampling Adequacy of .901 and a Bartlett's Test of Sphericity Significance of .000.

The second step of scale development is to refine the items using Confirmatory Factor Analysis (CFA). The 11 item scale was tested with 218 respondents again using a 7 point Likert scale. The analysis was run through the AMOS structural equation modelling package. The results suggested taking away 5 items giving a significance level of .364, and an RMSEA of .021. A second CFA was run to confirm using a different data set of 224 respondents and gave similar results suggesting removal of 5 items giving a significance level of .323 and an RMSEA of .026.

Data Analyses

Further confirmatory factor analysis will be undertaken via Structural Equation Modelling to test the scale, and to check the validity of the scale. To test the main study hypotheses, a combination of ANOVA's, MANOVA's, regressions and t-tests will be run. Appendix C shows the categories to be compared.

IMPLICATIONS

The core contribution of this study is to determine the relationship between brand resonance and prototypical brands. With many brands aspiring towards resonance and prototypicality, it is important to understand the relationship these variables have between each other. Methodologically this study will advance the literature by examining each measure of brand resonance simultaneously, also by using real brands to test the research model. A major practical implication will be providing a measurement tool for the concept of prototypicality that will allow brand managers to periodically monitor the progress of their brand. The research will also supply evidence to support level of congruency fit when extending a brand.

LIMITATIONS AND FUTURE DIRECTIONS

This study will only examine one product category, watches, which will limit its generalisability. Therefore future research should look into studying product categories with differing involvement levels, e.g. underwear. Further, future research should differentiate product categories by way of service, durables, consumables etc. The validation of the Prototypical Scale in other product categories will be required for its validity. Potential research should also investigate prototypical brands extensions influence on other branding concepts, such as brand personality and brand identity.

DEVELOPMENT OF PENSION FUNDS IN SERBIA AND OTHER COUNTRY IN TRANSITION

Mladenka Balaban
Belgrade Banking Academy, Serbia

ABSTRACT

This paper focuses on the development of pension funds in Serbia and other countries in the region. Continuous unfavorable demographic and economic changes make this issue very important and topical today on the world scene and Serbia is not an exception. Pension funds are one of the major players on financial markets in EU countries and USA. These funds are powerful institutions, which ensure greater social and material security and higher pension level in the future. They are part of the pension system that is more effective, efficient and flexible in relation to individuals' needs and that is less dependent from the state. This paper wants to show, what problems have the country in transition to organize and use the pension funds.

INTRODUCTION

Ever since 1981, different countries around the world have been implementing reforms in their pension systems, replacing their pay-as-you-go systems partially or totally with a new system based on individual capitalization and private management of savings leaving the State subsidize. The main reasons for this process are the demographic changes being faced by the world – greater life expectancy due to the advancement in medicine and births –, which have meant in practice that there are increasingly few active workers to finance pensions of those who retire. Among other reasons are the fall in the numbers of employed people and their substitution with new technological developments, which had led to that even the most developed countries had problems to afford a quality pension for their citizens. Because of that many countries are consulting people to turn to additional, voluntary pension funds, in addition to the obligatory ones. This won't solve problems of current pensioners, but will soften struggles of future ones, because it is questionable for how long the old system of financing will be functioning.

Situation in Serbia is even more complicated regarding the number of retired people, because conditions for retirement were very liberal in previous years – age of retirement remained unchanged for a long period of time, it was very easy to retire before the official retirement age, and it was even possible to buy years of service. All this has led to the ratio 1:1, meaning that the state has to finance pension system for about 40%. Without action, such a shift will slow down economic growth and will raise taxes and social insurance contributions. In the end, the problem can be solved by introduction of the three-pillar system:

- Pillar I (pay-as-you-go system) is the one with centralized government management; there employee contributions finance current pensions.
- Pillar II (private mandatory pension funds) is mandatory pillar of the pension system with decentralized private pensions fund management.
- Pillar III (private voluntary pension funds) is also based on the capitalization of assets and would be a form of voluntary saving, where, like in the previous case, the main risk would be borne by the user.

The proof that such three-pillar system is good solution is Chile that started reform in 1981 as the first country that had introduced pension funds and management companies. Employees were obliged to save 10% of their income on individual accounts with the opportunity to pay additional contributions up to other 10%; both amounts were tax

free, as well as the profit realized from investment. After 15 years, pensions were 50% to 100% higher compared to the pay-as-you-go system. Private pension system had accumulated more than USD 25 million, which was about 40% of GDP; economy had grown from 3% to 6,5%, unemployment rate had decreased to 5% and saving rate reached 27% of GDP.

It is impossible to apply all reform elements to Serbia, but the way that Chile managed to overcome transitions costs is very interesting: moving to the Pillar II leads to the deficit in the Pillar I, because the position of the funds is transferred to individual accounts, and state receives less revenues from the current contributions. In Chile, these costs were funded by wage taxes, revenues from company privatizations, funds from issuing long-term securities, decrease in other budget expenses, etc.

PENSION FUNDS IN SOME SOUTH AND EASTERN EUROPEAN COUNTRY

Most South and Eastern European countries had introduced new mandatory individual pension plans to create a capital-funded retirement pillar to diversify retirement income and develop capital markets. As result, deep structural reforms have fuelled a 19% per annum increase in private pension assets.

One of the most important and successful reforms to have taken place in Bulgaria in the transition to democracy and market economy is related to the pension system. The first supplementary pension funds in Bulgaria were created as public limited companies with shares in 1994 and 1995 on the initiative of financial institutions, banks trade unions an insurance companies. In 1997, the Bulgarian Association of Supplementary Pension Security Companies was set up. This was very important stage in the pension reform, because the country was able to use the full potential of the pension funds. It also gave the government the possibility to take part in the pension reform, which was implemented between 1999 and 2003. Because of that, Bulgaria has a new and working three-pillar pension system, including a mandatory and voluntary supplementary pension, which is already showing its social and economic advantage. The State System ensures the aging, disability and death risks, while the Private System ensures a permanent supplementary pension and covers the risk of death. The State does not grant nor ensure any minimum benefit in the Mandatory Supplementary Pension System.

Table 1 – Number of members of pension funds, as of March 31, 2008

| Year | Universal Pension Funds | Professional Pension Funds | Voluntary Pension Funds |
|-------------|--------------------------------|-----------------------------------|--------------------------------|
| 2006 | 2,640,652 | 207,357 | 592,805 |
| 2007 | 2,682,956 | 210,598 | 598,029 |
| Mar-08 | 2,724,951 | 213,929 | 604,957 |

Source: www.fsc.bg

From the table it could be seen that, number of members in all types of pension funds was increasing during the last years. Universal pension funds remain first in the number of members, while in professional pension funds membership is the lowest. By the data of Financial supervision commission of Bulgaria, most people in Bulgaria are members of universal pension funds 76,88% of the market, the following are voluntary pension funds and professional pension funds with 17,08% and 6,04% market share respectively. Through the universal and professional pension funds pension insurance companies offer individual pension insurance scheme, as well as individual and corporate schemes at the voluntary pension funds and in that way help people to plan their financial future.

From table we can see that all three groups of pension funds have diversified investment portfolios. They invest most of their assets in foreign securities, different types of bonds, primarily corporate bond and a small portion of assets is invested in property.

Pension system in Bulgaria has certain priorities and is faced with some challenges: strengthening the role of the universal funds, increasing the contribution rate for supplementary funds, daily asset valuation and rationalization of the switching process. The successful activity of the pension funds in Bulgaria is fundamental for the country's economic development.

Table 2 - Investment structure by type of pension funds in 2007

in 000 BGN

| Investment | Professional Pension Funds | Universal Pension Funds | Voluntary Pension Funds |
|---|-----------------------------------|--------------------------------|--------------------------------|
| Total investment | 322,526 | 1,101,627 | 478,232 |
| Debt securities issued or guaranteed by EU member -states or by their central banks | 79,286 | 305,791 | 112,660 |
| Corporate bonds | 81,289 | 276,585 | 106,260 |
| Mortgage bonds | 8,477 | 31,479 | 17,166 |
| Municipal bonds | 9,921 | 27,686 | 6,883 |
| Shares, right and units | 115,836 | 348,551 | 205,016 |
| Shares, right to the shares of special investment purpose company | 13,543 | 43,257 | 33,504 |
| Shares and units, issued by collective investment schemes | 39,452 | 107,278 | 33,504 |
| Bank deposits | 79,680 | 281,853 | 98,918 |
| Investment property | 10,880 | 27,697 | 44,121 |

Hungary is one of the first country in the region and first EU accession country to undertake such a far-reaching pension reform. Hungary is one more country that had introduced three-pillar pension system.

The first pillar consists of two different tiers. The first has the aim of revenue maintenance through benefits consistent with the pay-as-you-go mechanism and defined-benefit logic. Means tested benefits are provided to people in need who do not have a sufficient contribution record. The second tier is then represented by supplementary funded pensions, based on a fully funded method of financing. Pension funds take officially the form of mutual saving associations whose members are co-owners of the fund. They are administered by the board of directors and monitored by the board of supervisors. The mandatory retirement provision within the scope of fully funded private pension funds represents the second pillar. Mandatory pension programs are then supplemented by voluntary schemes already well developed in the late 1990. Contributions to the voluntary and private programs give right to pensions to be paid as lump sum or annuity. Employers can participate to financial resources of voluntary funds. The mandatory and voluntary funded programs cover more than 80% of the labor force.

At the end of March 2008 in Hungary, there were 20 mandatory and 67 voluntary funds. Decrease in the number of voluntary pension funds compared to the end of previous years was due to mergers of the funds. Moreover, there are a number of private pension funds, which shows that this sector has potential for further development.

Fluctuations in the net assets of both private and voluntary pension funds are due to contributions paid by member's payouts to pensioners. The growth in membership is observed in both private and voluntary pension funds which is good. This shows that population is very well educated and informed about the advantages of pension funds and aware of the benefits and importance of investing in their future.

Pension funds in Hungary operate in a competitive environment, as by the end of March 2008 there were 87 both mandatory and voluntary pension funds. This ensures that all groups of the society are covered, because segments of population targeted by these types of funds are quite different. Among the main objectives of Hungarian authorities for the future are to ensure a cheaper and more transparent system that will allow reduction of the operational costs, to emphasize the system of good governance, and to have a pension system that is more independent of political changes.

Table 3 – Membership and assets of pension funds in Hungary

| Description | 2006 | 2007 | March 2008 |
|--|-----------|-----------|------------|
| PRIVATE PENSIONS FUNDS | | | |
| Total assets at market value (HUF million) | 1,680,509 | 1,966,174 | 1,898,612 |
| Number of members (in thousands) | 2,671 | 2,764 | 2,818 |
| VOLUNTARY PENSION FUNDS | | | |
| Total assets at market value (HUF million) | 722,975 | 786,907 | 722,159 |
| Number of members (in thousands) | 1,373 | 1,386 | 1,393 |

PENSION FUNDS IN REPUBLIC OF SERBIA

Before the implementation of the Law on voluntary Pension Funds and Pension Schemes on 1 April 2006, the pension system in Serbia formally functioned as pay-as-you-go system (PAYG). Such pension system is an intergenerational solidarity system (Pillar I), which implies that pension contributions from the currently employed finance current pensions. To function normally, such mandatory state pension assurance requires a ratio of 3.5:1 between employees and pensioners. In Serbia, this ratio was last recorded in 1981, and since then there was a constant downward trend in the number of employees, accompanied by an increase in the number of pensioners.

Number of employees paying contributions for one pensioner 1986-2004

Source: www.mfin.sr.gov

Figure 1 shows that about 20 years ago there were 3,5 times more employees than pensioners. Data from 2004 show that one employee is financing one pension. Like most countries, Serbia has faced demographic changes – longer life span and lower birthrate. Collected contributions are not sufficient for payment of current pensions. The resulting monthly deficit in the Pension and Invalidity Insurance fund is covered from the budget, representing a considerable burden for the state. All of the above resulted in a reform of the pension system in two directions:

1. Change the Pillar I - Gradual raising of age limit for women)men from the present 58/63 to 60/65 starting from 1 January 2008 until January 2012, by six months per year (in Europe, there is a trend not only to raise the age limit, but also to equalize women and men) Gradual harmonization of pensions twice a year, only with costs of living, and not also with the increase of salaries. In 2008 pension increase is by 12,5% based on salaries and by 87,5% based on costs of living. Change of parameters results in a decrease of an average pension compared to the average salary, amounting to approximately 55%.. The reason for this decrease is the impossibility of financing the state pension insurance.
2. Introduction of the Pillar III, therefore it can be said that the best part of the so-called three-pillar system is functioning in the country. Payments to funds belonging to the Pillar III are Voluntary and can be made by employers, trade unions, associations and all natural persons, while payments to funds belonging to Pillar II are mandatory and can be made by employers for their employees.

The Law on Voluntary Pension Funds in Serbia introduced Pillar III of the pension system, which should make the idea of Pillar II closer to citizens prior to its introduction. Pillar III is represented by voluntary pension funds, institutions that collect contributions from their members and then invest these funds in different assets, with the aim of making profit with minimal risk. According to the Law on Voluntary Pension Funds and Pension Schemes in Serbia assets of voluntary pension funds shall be invested, by principles

Pension contribution up to 50 euro deducted and paid from salary of an employee voluntary pension fund member or by the scheme organizer per scheme member are exempt from payment of income tax. It is important to note that each pension fund member can take advantage of both expedients. According to the Income Tax Law tax capital gain is 20%. Account transfer from one-pension fund to another is not considered as capital gain and thus is not taxed. .

Only 5% of people in Serbia are using private pension funds and that is the lowest percentage in the region. At the end of March 2008 the number of contracts concluded with management companies came to 181.772. The number of individual accounts to which contributions have been paid since the start of operations of voluntary pension funds to date has been increasing to reach 161.173 at the end of March of the current year. According to the report of the National Bank of Serbia, of total payments, individual payments accounted 21,34%, pension scheme 36,18% while the largest portion, or 42,48% referred to contribution payments by employers.

Composition of total assets of funds of Serbia in 2008

Source: www.nbs.rs

The major share of total assets in the first quarter of 2008 was invested into debt securities, as it was in the previous quarter. Debt securities accounted for the largest share of total fund assets 40.61% followed by transaction 35.15%, shares 19.45% and time deposits 4.70%.

Serbian pension market is just developing it should not be looked upon as discouragement. On the contrary, Serbia can explore the paths these countries went through to their introduction of pension reform and learn from them. Most of them through what Serbia is facing today. Small size of Serbia's capital market – if one considers the capacity and quality of securities listed on the Belgrade Stock Exchange, one becomes aware of the difficulties involved in ensuring not only quantity, but also diversification necessary for the portfolio of pension fund whose accumulation power is growing rapidly. This problem could be solved by investing accumulated assets in foreign capital market, but, on the other hand, that would mean the loss of influence of domestic saving and economic growth.

The number of pension funds in Serbia is still small compared to other countries where the environment is very competitive with a lot of pension funds. However, this can be explained by the fact that the Serbian pension sector is still young. The market of pension funds in Serbia is also characterized by the high degree of market concentration, but there is potential for establishment of new pension funds and growth of the existing ones.

CONCLUSION

Today a growing challenge for many nations is population ageing. Throughout Europe. The average lifetime is increasing, thus increasing the length of time that people depend upon income from pensions. Compare Serbia and Bulgaria and Hungary, because they established pension funds at approximately the same time. These countries above are far ahead of Serbia, especially those that are already members of EU. The Hungary and Bulgaria net assets amount up to several billions or even trillions, which are quite large amounts of funds to be invested on the capital market. Portfolio structures of Serbian pension funds are very narrow, while in other countries portfolios are wider, with units of investment funds, foreign shares, property, different types of bonds.

Voluntary pension funds in Serbia operate less than two years, which is quite a short time period considering the long-term character of these financial institutions. These have a huge place for development of the sector, bearing in mind the fact that net assets of funds represent around 0.12% of GDP, which is significantly lower compared to the average EU countries (17%) and the average of countries in the region (5%) and considering also that only 7.4% of employed people have contracts with one of existing pension funds.

Very high transaction cost – according to calculations transition cost would have to be borne by Serbia for a very long time (almost up to 2050) and would cost a great deal (approximately 25-30 million euro at 2005 prices and assuming

zero interest rate) . In any case, this would be a very substantial additional burden on the budget. Alternative solution – such as increasing pension contributions – would additionally burden the economy, while a further reduction in pensions would be socially unacceptable. Privatization income could possibly be used to meet transition cost, but this should be considered in the context of alternative ways of using these funds.

Finally, it is apparent that funds are indeed useful and effective saving vehicles, with the aim providing supplementary pension after retirement. We can expect that pension funds will continue their growth popularity as the population continues to grow and age. Workers in their early years of employment often find discussions of retirement investing creeping into their conversation. This heightened attention to securing for the future will result in an increasing number of pension funds as well as a greater variety of pension fund option to choose among.

AIRLINE OWNERSHIP RESTRICTIONS AND CONTROL, AND EFFECTS ON AVIATION

Ünal Batal
Anadolu University, Turkey

ABSTRACT

This paper aims to provide an analysis of how aviation markets have been influenced to date around the world by airline ownership rules and how governments and carriers have responded to these influences. It reviews the historical background to the current regulations and assesses the influence that these constraints have had on the airline industry. It analyses the pros and cons of ownership rules, the benefits and risks of foreign investment. This paper reviews the current regulations in the EU and, the motives for foreign investment in the EU. Literature from academic, industry and journals is used to support the analysis. Finally, this analysis leads to a discussion of vehicles for regulatory liberalization and the competitive environment looking beyond ownership structures.

INTRODUCTION

Airlines are not able to conduct their business in the same way as other global transnational industries. They are inhibited by the foreign ownership restrictions in Air Services Agreements (ASA) and national laws. Air carrier regulation, in terms of the amount of foreign ownership permitted, is embodied in national laws. The rapidly changing air transport environment of privatization, liberalization and globalization is forcing airlines to seek structural adjustments in order to survive. Carriers are asking to have more freedom in order to ensure their profitability.

Fifty two nations attended the International Civil Aviation Conference in Chicago in November 1944 and discussed the foundations for the future growth and regulation of the industry after World War II. A consequence of this meeting was that each country's airspace became one of its valuable natural resources. The 'Chicago Convention' was signed on 7 December 1944 and contained definitions of sovereignty, territory and cabotage (in Articles 1, 2 and 7, respectively). Each contracting State reserves the right to withhold or revoke a certificate or permit to an air transport enterprise of another State in any case where it is not satisfied that substantial ownership and effective control are vested in nationals of a contracting State, or a case of failure of such air transport enterprise to comply with the laws of the State over which it operates, or to perform its obligations under this Agreement. (Convention on International Civil Aviation 1944)

Air Services Agreements (ASAs)

There are four key elements in most bilateral air services agreements. The first is market access. Usually, a limited number of points/routes and air freedoms are specified (3rd and 4th and occasionally 5th) for each airline listed in the annex. This element determines the geographical limits of the market for an airline. The second is designation and involves each country nominating one, two or more than two carriers, to operate any agreed international route(s). Designated airlines usually must be under the substantial ownership and effective control of nationals of the designating states. This element decides how many players there are in the market. The third is capacity. This limits the service frequency or number of seats that each airline can provide. This element is influenced by airport slots availability and will determine the market size for airlines. The last element is tariffs. Regimes vary from being very restrictive to very liberal. (Yu-Chun Chang, George Williams 2001)

From the above, it is clear that the degree of constraint in an ASA will decide whether a market is monopolistic, duopolistic, oligopolistic or strongly competitive, and so directly affect airlines and consumers. Not surprisingly, bilateral ASAs invariably take time for countries to negotiate.

National Law Regulation in Selected Countries

The particular aims of national regulation in the field of international air transport varies from state to state and are influenced by national economic policies, territorial size and location, the degree of national development, domestic and international politics, and so on. Table 1 lists the ownership and effective control regulations that apply to air carriers for a selection of countries. As may be seen, the airline ownership rules of the US and Canada are particularly restrictive, with each setting a 25% limit on foreign equity. Chile is an exception among the examples shown, with no limit on the proportion of foreign ownership.

Table 1. Status of Foreign Ownership Restrictions in Select Countries

| Country | Maximum % foreign ownership limits in selected countries |
|-------------|---|
| Australia | 49% for international airlines 100% for domestic airlines |
| Brazil | 20% of the voting equity |
| Canada | 25% of the voting equity The maximum single holding in Air Canada by any investor is limited to 15% |
| Chile | Designation as a Chilean carrier (domestic or international) has principal place of business as the only requirement |
| China | 35% |
| Colombia | 40% |
| India | 26% for Air India 40% for privately-owned domestic carriers |
| Indonesia | Requires airlines designated under bilateral agreements to be substantially owned and effectively controlled by the other party |
| Israel | 34% |
| Japan | One third |
| Kenya | 49% |
| Korea | 50% |
| Malaysia | 45% for Malaysia Airlines, but the maximum holding by any single foreign entity is limited to 20% 30% for other airlines |
| Mauritius | 40% |
| New Zealand | 49% for international airlines 100% for domestic airlines |
| Peru | 49% |
| Philippines | 40% |
| Singapore | None |
| Taiwan | One third |
| Thailand | 30% |
| Turkey* | 49% |
| US | 25% of the voting equity |

While foreign ownership rules have protected national airlines, they have also limited the strategies available to governments whose carriers have been in financial difficulties. Governments often state that they find the financing of their airlines' expansion difficult. Without the removal of restrictions on ownership and effective control in bilateral agreements however, foreign investors are prevented from purchasing a majority shareholding in an airline. The right to designate airlines enables a government to safeguard its sovereignty, as designated carriers must be "substantially owned and effectively controlled" by nationals. Most states set up their own airlines in order to exercise the traffic rights exchanged with other countries. Often though, these government-owned airlines have been unprofitable. As a result, their national air transport interests have not been particularly well served. However, states without an international airline of their own have been unable to designate airlines from third countries to exploit their traffic rights (Doganis, 1996).

The Pros and Cons of Ownership Rules

On one side, there are some advantages for governments to keep ownership rules. Firstly, they can protect national interests. All States view aviation as vital to their national economic well-being. Most regard it necessary to support and sustain their own airlines. They also see airlines as useful for security reasons. Often they are keen to ensure that particular routes are served (perhaps to encourage tourism). Secondly, they can enable a government to exercise control over its national airline, enabling it to pursue its aviation policies and other key objectives. Thirdly, they can protect national airlines. One feature of the international regulatory system is that it allows very little scope for trade in airline services. Any routes between two countries are normally dominated by airlines from those countries. As a result, the nationality clauses in ASAs protect national airlines from competing carriers based in third countries. Lastly, they prevent the emergence of flags of convenience. The current regulatory system is built on the concept of airlines having a clear national identity and has been successful in ensuring that flags of convenience have not entered aviation. Changing the ownership rules may lose this protection from flags of convenience, with companies able to escape safety regulations and labor laws. (Yu-Chun Chang, George Williams 2001)

On the other side, there are also some disadvantages for governments retaining ownership rules. Firstly, States without an international airline of their own usually have been unable to designate airlines from third countries to exploit their traffic rights. Secondly, it limits the amount of capital airlines can obtain from other countries. Thirdly, it prevents carriers merging with or taking over other carriers in other countries. US carriers have been able to strengthen their positions through merging with other domestic carriers, leading to huge local networks. Airlines in Europe, Asia and Latin America are unable to grow in this way. Lastly, some routes will lack competition. (Yu-Chun Chang, George Williams 2001)

Benefits and Opportunities of Foreign Investments

Easing the access to much needed capital is one of the significant advantages for a host country. Governments often state that they find financing of their airline's expansion difficult. For the less prosperous countries, or countries faced with economic crises, it may be difficult to get finance from domestic investors. Few individual investors will have sufficient capital to invest and there will be few industrial companies with spare funds to invest in a somewhat risky enterprise, such as an airline. These countries could sell their airlines to foreign investors. This was the policy pursued by Korea, Malaysia and China, when they changed their foreign ownership limits in order to attract capital from new and larger sources. Access to capital has prime importance in those countries that have had a state-owned airline in a loss-making position for a long period. Some of these countries are no longer able to subsidize their inefficient airlines, especially in a liberalized marketplace. This has been the case in several European countries, such as Belgium, Portugal and Spain. The Belgium Government sold a 49.5% shareholding in its national airline Sabena in 1995 to the SAirGroup and the Portuguese Government recently sold a 20% shareholding in its flag carrier TAP Air Portugal also to the SAirGroup. The Spanish national airline, Iberia, is now partially owned by British Airways (9%) and American Airlines (1%). (Yu-Chun Chang, George Williams 2001)

The entry of foreign-owned airlines to a home market will create competitive incentives for both existing airlines and new entrants to diversify services and offer different products. Services developed in foreign countries may be emulated. For example, travelers in Australia are obtaining benefits from the development of low cost airline services by British-owned carrier, Virgin Blue. In June 2000, a price war began in Australia, with a one-way Sydney-Brisbane ticket falling from its typical level of A\$350 (US\$ 202) to as little as A\$33, the promotional fare Impulse has charged on the route (Ionides, 2000).

Foreign investment, apart from providing a financial flow, also brings with it the transfer of technology, knowledge, skills and other sources that represent a foreign airline's intangible assets. Participation of foreign airlines in the management of an inefficient airline may introduce innovative ideas and change management habits. This will stimulate and revitalize existing airline managers, encouraging them to adjust to a more competitive environment and thus, lead to a more efficient distribution of corporate resources and better ways of providing services. This is

likely to prove to be the case with China Airlines, which intends to sell more than 30% of its shareholding to a foreign airline, in order to improve its safety management.

When a national carrier is owned by a mega-carrier, not only will it get benefit from the mega-carrier's strength, but there is also the possibility that the major airport of the host country will become an inter-continental hub or gateway. For example, Oneworld alliance partners are keen to obtain a shareholding in Malaysia Airlines in order to gain a dominant position at Kuala Lumpur Airport, and Star Alliance partners want to get a shareholding in Thai Airways to secure their intercontinental hub at Bangkok Airport.

In addition to the above, there are also some benefits and opportunities for the investing countries. As air freedoms are still heavily regulated by ASAs, acquiring equity in an airline from another country is one of the best ways to access a restricted market. This has been the case for Singapore Airlines, which acquired a 49% shareholding in Virgin Atlantic in order to access the Trans-Atlantic market. Strategic alliances can also benefit. At present, foreign involvement in the Asia-Pacific region is not large, though it is growing. Equity investments may help airlines to develop strategic alliances. A small equity investment in a listed airline is more of a gesture of good faith than a binding commitment. A large investment, such as that of British Airways in Qantas, represents a much stronger commitment, since they are harder to reverse and are usually associated with some say in management. If an overseas airline is able to gain an equity stake in an airline of the region, they become a more attractive partner.

A third benefit may come in the form of slot acquisition. Given the grandfather rights system of allocating airport slots, purchasing an airline is one of the best ways of obtaining these scarce resources. Lufthansa's decision to acquire a 20% shareholding in British Midland may well have been motivated by a desire to gain more slots at Heathrow. Another potential benefit comes in the form of providing feed traffic to a home hub. Some carriers have been keen to acquire airlines in other countries for this purpose. For example, KLM purchased Air UK to connect passengers from a large number of regional airports in the UK with their intercontinental flights. Finally, a policy to ease ownership rules is often accompanied by a liberalizing of other market restrictions. Developed countries with small populations, or countries that are isolated, have tended to have a more liberalized approach to their airline markets, in order to expand the networks of their national airlines. This was the reason why the Netherlands and Singapore Governments signed liberalized ASAs with the US in 1978. The same reasoning has been behind the decisions of Australia and New Zealand to form a single aviation market, which will allow their citizens to invest in each other's airlines. (Yu-Chun Chang, George Williams 2001)

Risks and Dangers of Foreign Investments

There are also some potential risks and dangers associated with foreign investment. By investing abroad, foreign airlines may influence directly macro economic variables, such as capital formation, employment, tax revenues and trade. Indirectly, foreign investment may also influence the structure of the host economy, as well as the conduct and performance of local-owned carriers. Increasing foreign ownership in an existing firm has been the subject of heated debate in both developing and developed countries. Governments are afraid that foreign acquisition of local airlines will not provide benefits in terms of higher employment, investment and productivity. Instead, the foreign owner may lay off staff, cut non-commercial routes and merge local offices. In the US, the major block to changing foreign ownership rules is the Department of Defense (DOD). The DOD relies on US commercial airlines to supplement its own airlift capacity in peacetime and during emergencies, and considers the airlines a vital tool for maintaining national security. The major link between US airlines and military is the Civil Reserve Air Fleet (CRAF) program. DOD officials are concerned about the effect of increasing foreign investment on the willingness of US airlines to continue participating in the CRAF program, especially if foreign control were to be allowed (General Accounting Office, 1992).

Due to cultural, economic and environmental differences, taking-over and integrating a business in difficulty can be both expensive and time consuming. This was the experience that the UK & no frills carrier easyJet had when it took over the failing Swiss charter airline TEA Basle (now renamed easyJet Switzerland). Strong opposition can be expected from labor unions. Some airlines have already suffered strike action by their labor forces, making it more difficult to restructure an acquired airline. The other risk is strong competition from the local carrier. British Airways investments in German carrier DBA and in French carrier Air Liberte provoked aggressive responses from

the respective flag carriers. Both airlines have not performed well since being owned by BA, as a result of the strong competition they faced from Lufthansa and Air France. DBA was forced to review its network and cut some international routes, only achieving its first break-even in 1999. As for Air Liberte, BA sold it in the early part of 2000 to SAirGroup carrier AOM.

From the above, it is clear that foreign investment will benefit some sectors, but will be a risk to others. Therefore, it is important to analyze what will be changed and which parties will be influenced by foreign investment. It is also important to decide what policies host governments and would-be host governments should adopt to capture the benefits, avoid the dangers and maximize the contribution of foreign investment. Table 2 provides a summary of the possible changes that may result from foreign investment.

Table 2 Possible changes resulting from foreign investment

| Item | Changes |
|--|--|
| Market structure Services | Airline services might be increased, if a new carrier sets up or a local carrier is taken over by a foreigner. |
| Competition | If a new carrier sets up or a local carrier is taken over by a foreigner, a competitive market is inevitable due to the desire to increase market share. |
| Network | Some uncommercial routes might be closed if a carrier was taken over by a foreign airline. |
| Airports Slot ownership | If the ownership of a carrier changes, its airport slots will change ownership as well, due to grandfather rights. |
| Hub | An airport's position might be changed, if it is a hub of a foreign-owned airline. |
| National airlines Strategies | In order to compete with a foreign-owned airline, a local carrier's strategies should be adjusted. |
| Finance | If a national carrier was purchased by a foreign airline, its financial situation will improve. |
| Foreign airlines Airline globalization | As mergers and acquisitions become more prevalent, the mega-carriers will become more powerful. |
| Alliances | As foreign investment is allowed in more countries, the airline alliances pattern will change. |
| Governments National economy | As an aviation market grows with the help of foreign capital, it will benefit tourism and business activities. |

Foreign Investment in the EU

In 1992, the liberalization of the internal market of the European Community was finalized with the adoption of three Regulations dealing respectively with licenses, routes and fares. The Third Package of liberalizing measures implemented in the EU in 1993, aside from opening up cross-border and domestic markets, removed national ownership restrictions. Part of the Third Package, Council Regulation 2407/92, requires the granting and maintenance of operating licenses by Member States in relation to air carriers established in the Community. When a company satisfies certain financial and technical fitness criteria, it is entitled to be licensed as an air carrier and as such can operate services wherever it wants within the Union, making its own decisions on capacity and fares. These rights can be exercised by any European Community citizen throughout the whole of EU without discrimination on the grounds of nationality. (Council Regulation 1992)

Given that many governments still view their flag carriers with national pride, it is interesting to analyse the reasons why certain European states have been willing to sell stakes in their airlines to other carriers. Whilst it is undoubtedly true that a key policy objective in the drive to establish a Single Market in Europe has been. Privatisation, it is clear that many smaller states have been reluctant to adopt the strategy with respect to their national airlines. Poor financial performance has been the primary driver in the privatization of most of these state

assets. Table 3 lists the other possible motives. The motives for the major EU flag carriers purchasing shareholdings in other European airlines are summarized in Table 4.

Table 3 Main reasons for the sale of stakes in EU national airlines

| Airlines | Limited home market | Access to capital | Incentives to management | Strengthen the position of airports |
|------------------|---------------------|-------------------|--------------------------|-------------------------------------|

Possibilities for Reform of National Ownership and Control

By bilateral reform in this context is meant not so much the development of a new ownership and control for bilateral air service agreements, but rather the possibility that various governments, responsible for the negotiation of bilateral for one and the same multinational airline, co-ordinate their bilateral negotiations with third countries this is an ad hoc solution, either temporary or permanent, to suit the needs of a particular multinational airline. The best example, currently available, is seen in Scandinavia in the context of SAS (Denmark, Norway and Sweden). (Haanappel, P.P.C., **2001**)

Reforms of national laws pertaining to ownership and control of airlines may be necessary where countries wish to allow cabotage in their territory or the right of establishment for foreign airlines/investors, or where they wish to allow/increase foreign equity participation in their airlines. Regional reform refers to common aviation areas, where, as indicate above, there may be dual system of airline ownership and control provisions for airlines. One solution might be the extension of ICAO recommended community of interest designation from economic groupings of LDCs (Less Developed Country) to also economic groupings of developed countries.

It is likely that worldwide multilateral organizations like WTO (World Trade Organization) in frame work of the periodical revisions of the Air Transport Annex to the GATS (The General Agreement on Trade in Services), UNCTAD (The United Nations Conference on Trade and Development) and/or ICAO will put the reform of airline ownership and control on their formal agendas. The first concrete evidence thereof is a preliminary agenda for an ICAO Conference on the Liberalization of International air Transport, tentatively scheduled for March 2003.

European Civil Aviation Conference (ECAC) is developing an ownership and control clause that would be helpful in the cases of airline privatization, foreign equity participation, multinational airlines and foreign owned domestic airlines having, according to national laws, received permission to fly international route also. Actually, a Task Force on Ownership and Control of ECAC recommended developing a model bilateral clause requiring a designated airline to be incorporated in and to have its principal place of business in the country of designation. A footnote to the ECAC text suggests to assess a carrier's principal place of business according to whether a carrier has a substantial amount of its operations and capital investment in physical facilities in the designating country, whether it pays income tax and registers its aircraft there, and whether it employs a significant number of nationals in managerial, technical and operational positions. (Haanappel, P.P.C., 2001)

CONCLUSIONS

While foreign ownership rules have protected national airlines, they have limited the strategies of governments whose flag carriers have been in trouble. Governments often state that they find the financing of their airlines' expansion difficult. They may also believe that their carriers will perform more efficiently under private ownership. Without the removal of restrictions on ownership and effective control in bilateral agreements, however, foreign investors are prevented from purchasing a majority shareholding in an airline.

Easing of ownership rules is often accompanied by a loosening of other market restrictions. The recent increase in foreign investment in airlines reflects the growing globalization of the industry. Restrictive foreign ownership rules clearly no longer satisfy the demands of today's marketplace and removing the nationality clauses in bilateral air service agreements (ASA's) is a vital step towards achieving a truly competitive global airline industry. The ICAO 'suggestion that the substantial ownership and effective control' clause common in bilateral, be replaced by 'the principal place of business' is one that should increasingly find favour with governments.

Although nationality clauses were removed in the EU Third Package, non-member states in Europe are not subject to this change. Therefore, the potential for a European carrier to build up a large local market base, through merger and acquisition, comparable in size to that of their US competitors, is limited. The TCAA would harmonize the present bilateral agreements between the US and EU countries. While the broader concept exists in the EU and in some of the recent intra-regional agreements, it seems to be anathema to US carriers, as well as to labour unions and Congress, due to concerns over sovereignty and defense. Therefore, one solution may be for the EU to find an alternative way to establish a Common Aviation Area, for example, by linking up with like-minded countries first, such as Australia, Canada, New Zealand and Singapore. On March 30th 2008, the U.S.-EU markets opened up to increased competition. As a result of previous protections, U.S. carriers must quickly adapt to face healthier competition from the EU. This is no longer a domestic business. The networks are global and regulations must adapt to reflect that. The markets are much better equipped than the regulatory regime in dictating how service industries should adapt to change. After all, the regulatory policies of one nation will not stop globalization. (Cosmas, A., Belobaba, P., Swelbar, W., White Paper)

It is evident that the present ownership and control restrictions in aviation treaties impede the long-term restructuring of the sector, restrict adequate financing, and thereby adversely affect the efficiency of airline services.

A complete abolition of the nationality requirement, however, is impossible since that requirement is the core of the present system of bilateral treaties established in the 1940s. States are thus locked up in a system created by them. In order to overcome this stalemate, a two-track strategy should be pursued. Firstly, the EC Council should give the Commission as soon as possible a mandate to start negotiations with the United States on a Transatlantic Common Aviation Area. Then the countries of the European Community will be regarded by the US as one entity, which would enable European airlines to attract foreign capital or even merge into multinational airlines. Once the US has accepted this, it is unlikely that other countries with smaller aviation markets will be obstructive to such European consolidation. Such an agreement between the EC and US could function as a trend-setter or even be enlarged itself. The agreement should ultimately have no geographical limitation, but initially the EU and the US, as the largest aviation markets in the world, should lead the development. Progressively the agreement would get a broader coverage and ultimately it could be the basis for moving to a new multilateral worldwide regime. Secondly, as long as there is no worldwide liberalization of air services, some link between the airline and the country or countries involved is required in order to prevent the phenomenon of 'free riders', *i.e.* airlines benefiting from free market access to a foreign country while being protected through limited market access in their home country. Therefore, a criterion based on the principle place of business and/or permanent residence of the airline should be substituted for the present ownership and control clause. The European Commission should pursue such a broadening of the nationality concept both in bilateral negotiations and within ICAO.

THE CONCEPT OF INTELLECTUAL VALUE: EVIDENCE FROM RUSSIAN LISTED COMPANIES

Elvina R. Bayburina and Tatiana V. Golovko
State University Higher School of Economics, Moscow, Russia

ABSTRACT

The value based management (VBM) principles seem to be very popular in Russia recently. The main aim of the VBM concept is to create the shareholders' value, according to the strategic goals of the company. To achieve this aim top-management that is pressed by the shareholders' plans has to divide the whole value creation process into stages and set some key performance indicators (KPI) for each involved stage. Thereby the "principal – agency" problem probably seems to be solved. Those who have managed to achieve the desired KPIs, have an opportunity to create additional value or value added (VA) in comparison with their competitors. Strategic changes models of large listed companies tend to be the context items, i.e. depending upon various key components. The value as the result of the constant strategic changes becomes the complicated intellectual parameter, which is managed and defined by the multi-level combination of interactions of different groups of stakeholders. Therefore the authors of the article make an attempt to consider the specified Intellectual Value Based concept. The obtained results could be used to evaluate the potential of the particular company future development.

INTRODUCTION

Various groups of the stakeholders of a listed company over more than five years can use the information about these components to solve the problem of information asymmetry. Internal stakeholders (primarily, managers) can use such information to manage the value of the company in the long-term period; and the external stakeholders (investors) can evaluate the potential for future growth of a particular company by means of analysing the information about its IC (along with the information about the fundamental factors of the company's performance); and in this article the authors assume that the major part of the information of the public and listed company over five years is public and available to every individual who has an intention to use it.

At the beginning of 2000 large companies either Russian, or foreign ones, began to initiate more complex information disclosure to reduce the information asymmetry between the company and its stakeholders (of course first of all - investors). The authors can consider the so-called "Enron case" as a borderline, when the window dressing caused a crash of the large and quite prospective company. A more complex information disclosure is the main possibility to reduce the information risks. Such information disclosure about qualitative characteristics of the company's performance goes as the addition to financial reports of the managers. The authors cautiously admit that the main problem of the basic financial reporting is the inability of external parties to get information about the real value and opportunities of the company (Yanenko, 2008). Generally the additional reports published by the company or some other public information may provide details about intangibles of the company (these reports can for example contain rules of various groups of intangible assets accounting principles, their amortization period, etc.) Nevertheless, the so-called *Intellectual capital* reports to some extent can reduce investors' risk, due to the fact that such reports disclose more relevant information in comparison towards standard companies' reports.

The research described in this article focuses on the assessment of *Intellectual capital components and subcomponents'* contribution to the process of the company value creation over the long-term period. The notion *Intellectual capital* in general is more broad and complex than *Intangible Assets* (*Intellectual capital* includes *Intangible assets* and other qualitative, non-financial key characteristics reflecting the current status of the company, by taking into consideration its potential for the future growth). Consequently, in terms of this article *Intellectual*

capital of the company is a range of key qualitative non-financial characteristics of the company, which can be even measured, but their main purpose is *qualitative and the long-run* influence on the company's development. It includes a range of company's employees accrued Knowledge, Competence and Abilities, - a range of characteristics which help to distinguish a particular company from other competitors in the same industry. Such characteristics represent the competitive advantage originated inside and within the company. The authors of this article emphasize that *Intellectual capital* is the aggregate evaluation of competencies, which generates competitive advantage and formulates the unique value proposition of the company.

Intellectual value of the company is a part of the total value, created through the process of the *Intellectual components'* integration. And moreover this value can be "traced" by the external stakeholders of the company. In addition, the authors of this article can underline that the delta (the difference) between the Market value of the equity and its Book value can also be "traced". As a proxy variable for intellectual value of the company in this research the authors consider a calculated parameter of *Intellectual enterprise value* (IEV). The value of this proxy variable is calculated as the delta (the difference) between the Market value of the equity and its Book value (the delta between the Market capitalization of the ordinary shares and the Book value of the equity). The calculated delta reflects the excess of the Market capitalization over the Book value, which on the panel data of over 5 years help to eliminate short-term speculative reactions; this delta also reflects how "the market" (stakeholders and mainly investors) measures the level of the company's internal efficiency.

It is necessary to determine the reason for taking into account only the characteristics of the Equity. The authors of this article may assume (Bayburina, Ivashkovskaya, 2007) that managers when targeting the capital structure of the company do not always consider future growth and sustainable development as the long-term goal especially with the emerging markets sample of companies. That is why the choice of the company's capital structure depends on a range of factors, which cannot be considered in this article and are left for the future distinguished research from the conceptual point of view. Therefore the authors of this article can define two aggregate approaches to the measurement of the company's activity with the purpose of evaluating its potential for future long-term growth (and thereafter). So, according to this logic, the authors of this article can determine two approaches to measurement of the company's value added:

- ✓ the analysis of the company is based on the accounting reports and,
- ✓ actually the analysis is based on VBM principles (Ivashkovskaya, 2004).

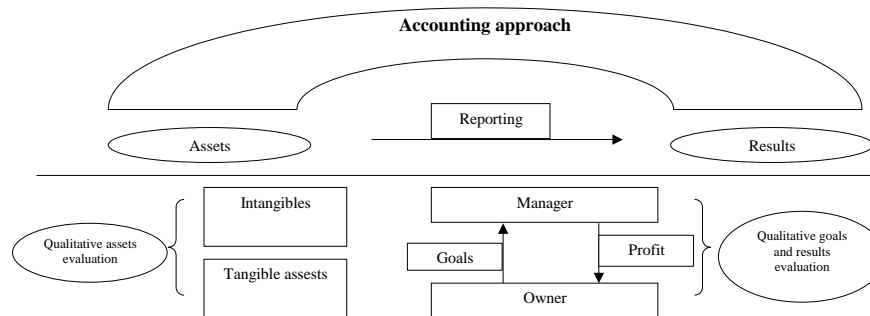

IMPLEMENTING THE INTELLECTUAL VALUE BASED MANAGEMENT APPROACH

The *Intellectual Value Based Management* approach is regarded as the modification of the basic Value Based Management approach in terms of the current dynamic economic changes (see Picture 1,2,3).

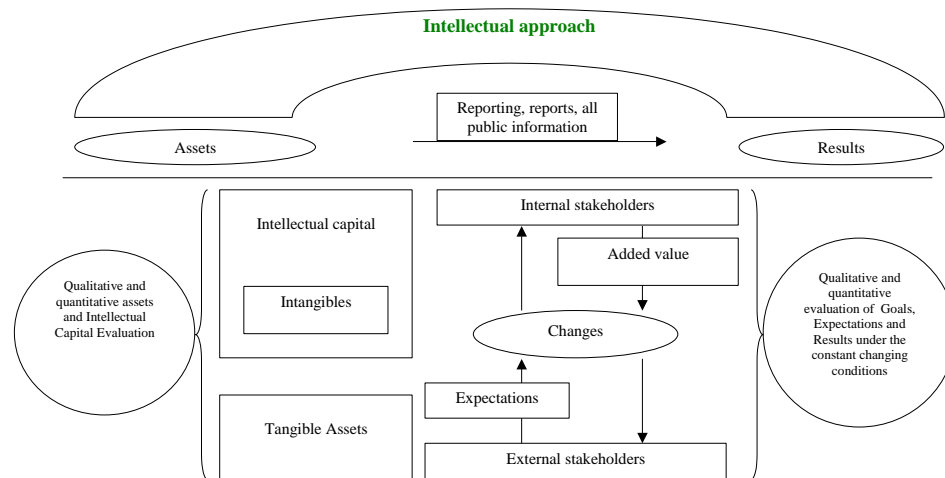

Picture 1. Approaches to measurement of the company's value added.

Picture 2. Accounting approach towards the performance evaluation.

Picture 3. Intellectual approach towards the performance evaluation.

Consequently the analysis of the *Intellectual value* of the company should be systematic (i.e. should be observed across a number of consecutive time periods) and should include either the assessment of fundamental characteristics of the company, or the assessment of its *Intellectual capital* components. The analysis of the company's accrued *Intellectual capital* should serve as the measure of the company's attendant risk, the risk of the deviation of the actual performance results from the predicted ones, including financial performance of the company (Bayburina, 2007). The classification of the factors, which influence the Value of the company created by Edvinsson and Malone (the founders of the *Intellectual capital theory*), is presented in the picture below.

Picture 4. Edvinsson & Malone Classification, 1997.

Since there is a lack of academic research which consider the analysis of *Intellectual capital* components in the large listed Russian companies and which are aimed at revealing the factors of the long-term growth of its value, the results of this research might add to the existing Knowledge Management Concepts, and offer a new instrument for this kind of analysis.

INTELLECTUAL VALUE RESEARCH DESIGN

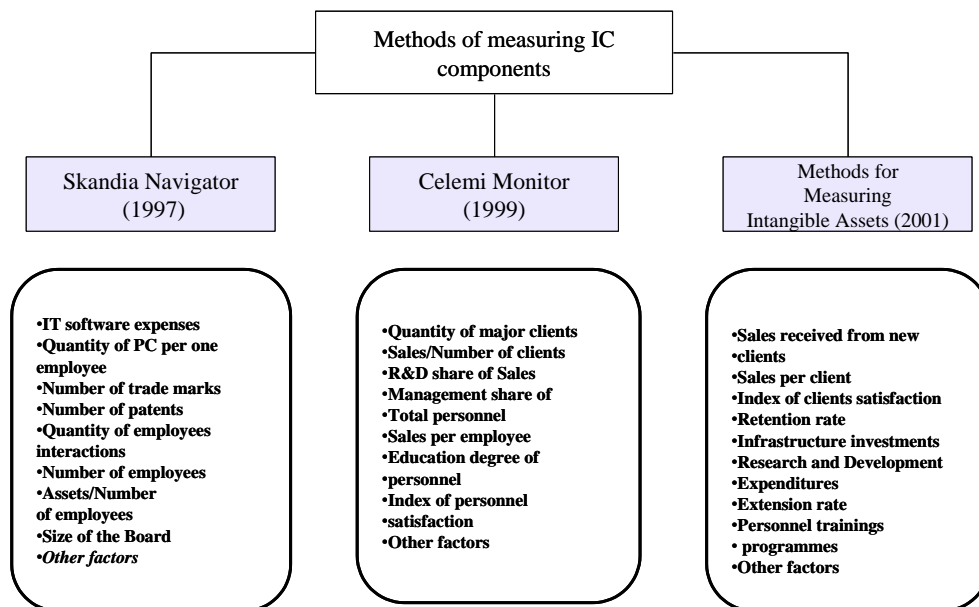

Research Objectives

The main aim of the research is to determine the impact of the following factors (independent variables, IC components and sub-components) on the dependent variables (the indicator of the intellectual value):

- *Fundamental factors* (a group of explanatory variables representing the fundamental factors of the Value's growth of the company);
- *Intellectual capital components* (a group of factors representing the components of the *Intellectual capital*).

The research model is based on the methodologies used by the large consulting companies focused on the Intellectual capital valuation (Skandia Navigator, Celemi Monitor) and methods of measuring intangible assets used by Karl-Eric Sveiby. The examples of *Intellectual capital components* used within the above mentioned methods for evaluating various companies are shown in the picture below.

Picture 5. Methods of measuring Intellectual capital components: some examples of proxy variables.

The results of the empirical research may be used either by internal stakeholders (managers), or by external stakeholders (investors). The former can use it in addition to the basic Value Management principles; however investors can use it in the process of investment portfolio diversification (in terms of buying shares).

Methodology and model specification

To determine the main factors of the company's long-term development the authors tracked the relation between the delta (difference) of the Market value of the company's equity and the dynamics of various groups of factors (fundamental factors and the components of the *Intellectual capital*).

The authors of this article consider *Intellectual enterprise value* (IEV) as the dependent variable. This variable is calculated as the delta (difference) between the Market and the Book value of the equity (the difference between the Market capitalization of ordinary shares and the Book value of the equity).

The research model includes the following fundamental factors:

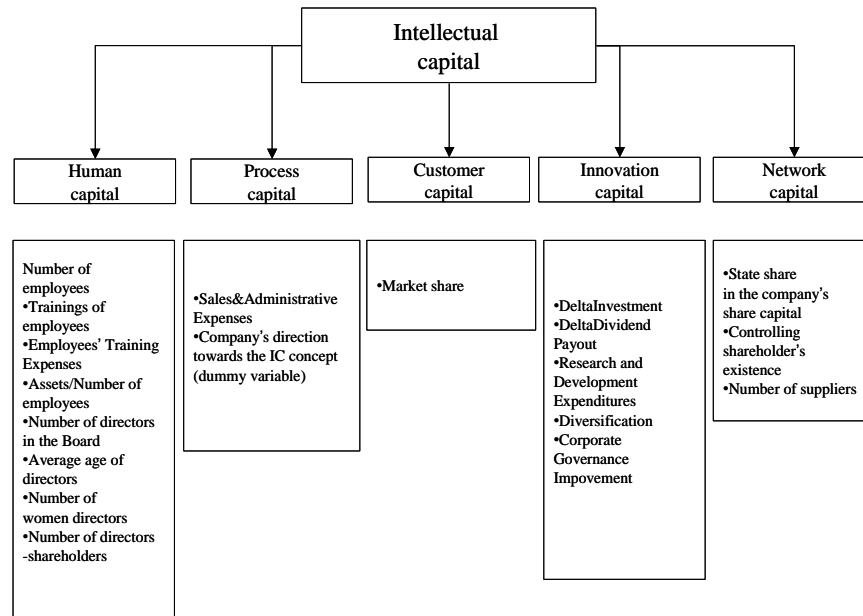

- Book value Assets;
- Net Profit;
- Return on Assets;
- Oil prices;
- Debt-to-Equity ratio;

- LN (Total Assets).

According to the Intellectual capital components' classification, developed by Bayburina, Ivashkovskaya, (2007), the following IC components are used: human capital, process capital, client capital, innovation capital, and network capital.

In order to reach the objectives of the current research the structure of IC, developed in the above-mentioned research, was transformed to the following hierarchy of components (human capital, process capital, client capital, innovation capital, network capital) and the second – level sub-components of IC- the dependent variables of the model. (*trainings of employees, corporate governance specific, etc.*) (see Picture 6).

Picture 6. Structure of IC. Dependent variables of the model.

The simple linear multiple regression tools were used in the empirical part of the research. Due to the fact that the accumulation of IC is the sustained, continuous and recurrent process and the performance results should be evaluated in the long-term horizon the authors of this article can make the following assumptions to the model:

- The authors of this article analyze the information about large Russian companies, which shares are listed on the stock exchanges (including Russian exchanges Russian Trading Systems (RTS) and Moscow Interbank Currency Exchange (MICEX)).

The basic assumption of this article is that the information used in this research is public (is legible to disclosure) and can be considered by potential investors and all other external interested parties and stakeholders.

- The period of listing has a constraint history of not less than 5 years (since 2002 till 2006).

The research sample includes at least a five year listing history of 19 Russian companies working in the following industries: power industry (2), oil & gas (4), petro chemistry and mineral fertilizer production (3), telecommunications (4), transport services (2), consumer goods (2), automobile production (2).

Statistical information for the research sample of 2002-2006 financial years was collected from the source of statistical Bureau Van Dijk (Ruslana Data Base). Ruslana Data Base provides information about company financials in a standardized global format or detailed “as reported” format for Russian and Ukrainian companies.

RESULTS OF THE STUDY

Specific Findings

In order to evaluate the influence of each independent factor a series of linear regression tests has been held. The authors use the panel data, which contains information about the large listed Russian companies. The results obtained are presented in the table 1 below. The following IC sub-components make the main contribution to the model (according to the results): *trainings of employees, the existence of controlling shareholder, total assets/number of employees, delta investment and delta dividend payout*. As the final model of the research the authors of this article have chosen the model in which all the factors are significant (at no less than 5% level of significance).

The authors have carried out some econometrics tests: the Wald Test, Breusch-Pagan Test, Hausman Test.

- 1) Wald Test showed that the Fixed Effect Model provides a better explanation than the Pooled-up Model.
- 2) Breusch-Pagan Test showed that the Random Effect Model provides a better explanation than the Pooled-up Model.
- 3) Hausman Test showed that the Fixed Effect Model is rejected compared to the Random Effect Model.

According to the results the Random effect model of the regression has been chosen. So the basic criterion was the highest value of the Wald statistics (380,95).

Table 1. Model specification.

| Test | Statistics |
|--------------------|---|
| Wald Test | F test that all $u_i=0$: $F(6, 9) = 24,86$ Prob > $F = 0.0000$ |
| Breusch-Pagan Test | $\chi^2(1)=12,28$ Prob > $\chi^2= 0.0005$ |
| Hausman Test | $\chi^2(5)=12,22$ Prob > $\chi^2= 0.0319$ |

The multi-colinearity was not found. The average VIF meaning is 1,47, which is admitted. The final model with the maximum factors (the authors of this article consider a model with 7 factors):

$$IEV_{it} = -1,52*10^{10} + 5,58*SalesAdmin_{it} + 6,01*DeltaInvstmt_{it} + 817,38*TA/N_{emp_{it}} + 1672,67*Tran_Expens_{it} + 6*10^{10}*Control_Shrhldr_dummy_{it} + 5,65*10^{10}*DeltaDivPayout_dummy_{it} + 1,36 * 1010 * ROA_{it}$$

CONCLUSINS AND IMPLICATIONS

The research described in this article focuses on the assessment of *Intellectual capital components and subcomponents'* contribution to the process of the company Intellectual value creation. *Intellectual value* of the company is a part of the total value, created through the process of the *Intellectual components'* integration. And moreover this value can be "traced" by the external stakeholders of the company. In addition, the authors of this article can underline that the delta (the difference) between the Market value of the equity and its Book value can also be "traced". As a proxy variable for intellectual value of the company in this research the authors consider a calculated parameter of *Intellectual enterprise value* (IEV). The authors of this article have constrained the research to at least a five-year period, which can be considered to some extent a long-term period. This assumption let the authors assume that the rest of variables (which were included in the final model) reflect the sustainable long-term trends of the companies' development and leave out the consideration of speculative fluctuations.

According to the results *ROA* (return on assets, significant at 7,5% level) is one of the fundamental indicators of the performance of the company, which investors consider first of all. The impact of which on the dependent variable is comparably lower than the impact of other factors: *the existence of controlling shareholder* (significant at 1% level), *delta dividend payout, dummy* (significant at 0,4% level). It is important to mention that the final model does not include the oil –price (because of its insignificance with respect to the dependent variable).

The negative constant value in the model is conditioned by the fact that the dynamics of most independent factors was positive during 2002-2006. The dynamics of the independent variable was rather ambiguous, i.e. at some points of time there were seen negative IEV value (the difference between market and balance value of the Equity of

the company). The statistic analysis has shown the positive impact of the IC sub-component on the creation of Intellectual value, yet the Intellectual value itself was lost during some periods of time. To some extent it may be connected with the fact that companies partially tended to construct the debt-based Value (Bayburina, Ivashkovskaya, 2007).

Human capital. The majority of companies in the research sample tend to invest into their employees' development by incurring expenses for their education. The IC sub-component or the factor of the model '*trainings of employees*' has the strongest impact on the dependent variable (significant at 1% level). The IC sub-component or the factor of the model "*total assets/number of employees*" reflects the efficiency of the assets usage; this factor reflects the ability of employees to apply their professional skills. That might give the company an opportunity to generate cash flows in future. The contribution of this factor is positive and it is greater than the contribution of the factor "*sales & administrative costs*" (significant at 1% level).

Innovation capital. The IC sub-component or the factor of the model "*delta investment*" (significant at 2,5% level) reflects the system of measures taken by the management of the company and focused on: intensifying the assets by means of expanding investments in fixed assets; the potential ability of the company to hold innovative programs, the orientation of the company towards its assets structure optimization, the equipment refurbishment, etc. Due to the fact that the research sample mainly consists of the so-called capital-intensive productions, the growth of investments in fixed assets naturally has a significant impact on the dependent variable. According to the results of the empirical research the connection between the growth of "*dividend payout*" and the growth of the *Intellectual enterprise value* (IEV) is positive.

Process capital. The extent of the "*sales & administrative costs*" influence is less than the influence of "*dividend payout*". The sum of "*sales & administrative costs*" can indirectly indicate efforts of the company aimed at boosting of its sales. A few years ago the largest Russian companies began to bind the amount of their top-managers' salaries to their actual work performance. In most cases these results are connected with the dynamics of the *Intellectual enterprise value* through the *Market value*. And consequently the connection between the top managers' compensation and the *Intellectual enterprise value* of the growth of the company is strong and positive.

Network capital. The IC sub-component or the factor of the model "*existence of the controlling shareholder*" has positive influence. This pattern reveals the fact that the policy held by the controlling shareholder of the company is generally persistent and stable; such a shareholder has a personal incentive to the stability and prosperity of the company and, ceteris paribus, he has an aim to create a group of talented managers to run the business and such an owner tracks the company's development strategy.

The results of the empirical research may be used either by internal stakeholders (managers), or by external stakeholders (investors). The former can use it in addition to the basic Value Management principles; however investors can use it in the process of investment portfolio diversification (in terms of buying shares).

Consequently, the inclusion of new factors to the model and the panel data enlargement provide new possibilities for the next stage of the research of the process of *Intellectual capital* accumulation and its impact on the sustainable development of the listed Russian companies and their value creation in the long-term period.

EFFECTS OF EXCHANGE RATES, INTEREST RATES AND OIL PRICES ON STOCK MARKET INDICES: EVIDENCES FROM ISTANBUL STOCK EXCHANGE

Mehmet Bolak and Ömür Sür
Galatasaray University, Turkey

ABSTRACT

In this paper, we investigate the relationship between stock market index and the following macroeconomic indicators: exchange rates, interest rates and oil prices. We estimate and test a regression model using monthly observations on the variables for Turkey, during August 2002 – February 2009. The empirical evidence suggests that the natural log of monthly price relative of ISE National 100 Index is explained by its first lag, the first difference of the nominal interest rate (TRLIBOR) and the natural log of the relative USD/TL parities' monthly mean levels. The impacts of these three independent variables on ISE National 100 Index are negative.

INTRODUCTION

Capital asset pricing is one of the most studied issues in the financial economics literature. The identification of major factors influencing returns on capital assets can be considered as the main focus of the studies. The first important asset pricing theory, the capital asset pricing model (CAPM), is developed by Sharpe (1963, 1964) and Treynor (1961) and improved by Mossin (1966), Lintner (1965) and Black (1972). According to CAPM, the equilibrium rates of return on all risky assets are a function of their covariance with the market portfolio (Copeland, Weston, 1992, p:193). CAPM, which is a single-factor model, is theoretically challenged by the arbitrage pricing theory (APT) developed by Ross (1976). The APT states that the expected risk premium on a stock should depend on stock's exposure to several macroeconomic factors (Brealey and Myers, 1996, p:195). However, APT does not say what these factors are. Based on this theoretical foundation, a significant literature has emerged in the area of financial economics over the past several years, that focuses on the investigation of the relationship between stock returns and various macroeconomic variables. Existing financial economic theory provides different econometric methodologies for studying this relationship (e.g. Granger causality, cointegration). Since the literature on this subject is extensive, we focus mainly on recent studies, especially on emerging markets, in reviewing the literature (e. g. Maysami, Howe, Hamzah, 2004, Erdem, Arslan, Erdem, 2005, Kandir, 2008, Gay, 2008, Aydemir and Demirhan, 2009).

Our belief is that the relationship between the “macroeconomic variables” and the “stock prices” has to be tested in different settings and in different periods in order to provide further evidences to investors. The present paper makes a contribution in that direction. More precisely, the aim of this study is to investigate the time-series relationship between stock market indices and the following macroeconomic variables: exchange rates, interest rates and oil prices. The research question of this study is the following: “Can time-series analysis of stock market indices be explained significantly by the exchange rates, the interest rates and the oil prices and what is the significance level of the relationships?”.

This study is organized as follows: The section following the introduction briefly reviews the related literature. The methodological design of the empirical study and the composition of data take place in the next section. Then the empirical results are presented. The paper closes with some concluding comments.

LITERATURE REVIEW

In the finance literature, the relationship between exchange rates and stock prices has been extensively investigated in different settings and these empirical studies have come out with mixed results. In fact, it can be stated that the direction of the relationship between exchange rates and stock prices will depend on the net “exchange rate exposure” position of the quoted firms. Bris and Koskinen (2002) divide the companies, within a country, into two groups using individual companies’ stock market returns: “negative exposure companies” and “positive exposure companies”. While the first group consists of the companies, whose stock returns decrease when the domestic currency appreciates with respect to the foreign currency, the second group represents those companies whose stock returns increase. The first group includes exporting firms, while the second group includes both importing firms and firms financed with large amounts of foreign debt. In other words, the prospective cash flows of these different types of firms will be affected in different ways from the changes in exchange rates. In a recent study investigating the causal relationship between stock prices and exchange rates, Aydemir and Demirhan (2009) found a negative causal relationship between exchange rates and all stock market indices in Turkey, for the period 23/02/2001-11/08/2008. In another study, Gay (2008) investigated the time-series relationship between stock market indices and the macroeconomic variables for Brazil, Russia, India, and China (BRIC), for the period 1999 - 2006, by using the Box-Jenkins ARIMA model and found that there was no significant relationship between exchange rates and the stock market indices.

Concerning the relationship between stock market indices and interest rates, it is generally expected a negative relationship between these two variables. The argument is that people may prefer to invest in banks rather than stock markets when interest rates tend to increase. Therefore, higher interest rates may affect stock markets negatively (Omran, 2003). Another explanation for this negative relationship may be that, as the interest rates rise, the required rates of return from the investments increase and the stock prices, which are calculated by discounting the prospective cash flows, tend to fall. In another study on two developed countries, US and Japan, Humpe and Macmillan (2007) found that in US, stock prices are negatively related to long-term interest rates, over the period January 1965 until June 2005.

Logically, a negative relationship is expected between stock market indices and oil prices. The main reason behind this expectation is the assumption that as energy prices increase, the production costs increase and the prospective cash flows turn out to be reduced. However, the following statement also can be questionable: “Where does the excessive income of oil exporters go, in times of oil price increase?”. Since one of the answers is certainly “stock markets”, why don’t we expect a positive relationship between stock market indices and oil prices? Kandir (2008) investigated the role of macroeconomic factors on stock returns in Turkey, for the period July 1997 - June 2005 and observed that oil prices do not appear to have any significant impact on stock returns. In another study on Brazil, Russia, India, and China (BRIC), for the period 1999 - 2006, Gay (2008) observed that there was no significant relationship between oil prices and the stock market indices.

METHODOLOGY AND DATA

As it is stated previously, the research question of this study is the following: “Can time-series analysis of stock market indices be explained significantly by the exchange rates, the interest rates and the oil prices and what is the significance level of the relationships?”. In order to answer the stated research question, least squares estimation is used. Before running the estimation, we have conducted unit root tests, in order to examine the stationarity of the variables used in the study.

The dependent variable and the independent variables used in the estimation process are presented in Table 1:

Table 1: Variables used in the study

| | Variable's Name | Measurement |
|-----------------------|-----------------|--|
| Dependent Variable | STOCKINDEX | $\ln(\text{ISE100}_t / \text{ISE100}_{t-1})$ |
| Independent Variables | OIL | $\ln(\text{oilprice}_t / \text{oilprice}_{t-1})$ |
| | EXRATE | $\ln[(\text{USD/TLparity}_t) / (\text{USD/TLparity}_{t-1})]$ |
| | <i>NOMIR</i> | <i>TRLIBOR_t</i> |
| | <i>REALIR</i> | <i>real interest rate_t</i> |

| | | |
|--|------------|-------------------------------------|
| | <i>CPI</i> | $(CPI_t - CPI_{t-1}) / (CPI_{t-1})$ |
|--|------------|-------------------------------------|

The dependent variable, denoted as STOCKINDEX, is computed by using the closing value of the ISE National 100 Index, for each month. ISE National 100 Index is the main indicator of the National Market of Istanbul Stock Exchange (ISE), which is the only securities exchange in Turkey. ISE is inaugurated in 1986 and can be considered as an emerging stock market, which is allowed to provide trading in equities, bonds and bills, revenue-sharing certificates, private sector bonds, foreign securities and real estate certificates as well as international securities. ISE National 100 Index, has been calculated since the inauguration of the ISE and it is composed of equities of 100 companies of National Market, except investment trusts.

The first independent variable, symbolized as OIL, is calculated by taking the natural log of price relative of oil prices' monthly mean levels. The exchange rate, EXRATE, is measured by the natural log of the relative USD/TL parities' monthly mean levels. Another independent variable, NOMIR, is the monthly mean level of the Turkish Lira Reference Interest Rate (TRLIBOR). This reference rate for the pricing of lira-denominated financial instruments became operational on August 1, 2002. The fourth independent variable, denoted as CPI, refers to the monthly change of consumer price index and it is considered as the proxy of monthly inflation. Finally, real interest rate, REALIR, is calculated by using the Fisher equation:

$$(1+i)=(1+r)(1+inf) \quad [1]$$

where,

i :denote the nominal interest rate,

r : denote the real interest rate,

inf : denote the inflation rate.

NOMIR, REALIR and CPI are used in the estimation one by one, not altogether, in order to determine the best estimator of the STOCKINDEX. They are not used altogether in the same equation in order to avoid multicollinearity.

The dataset consisting of 79 monthly observations (from August 2002 to February 2009) for each variable, are extracted from different sources (Table 2). Initially, we have determined February 2001 as the beginning date, since in Turkey, the exchange rate regime is determined as floating at 22 February 2001. However, the availability of TRLIBOR as of August 2002, forced us to change the beginning date of the observation period.

| Consumer Price Index (CPI) | website of Turkish Statistical Institute |

EViews 4.0 is used as a statistical software package for all tests carried in this study.

RESULTS

As it is mentioned in the “methodology and data” section of the study, least squares estimation is used for finding the macroeconomic determinants of stock market indice in ISE. Before running the estimation, we have checked the existence of unit root. The procedure that we have followed and the obtained results are summarized in the following paragraphs.

Firstly, we have studied the basic time-series behavior of each variable visually, by examining the plots of autocorrelation function (ACF) and partial autocorrelation function (PACF). The ACF and PACF plots are not reported here due to space considerations.

Then, we have tested the presence of unit root of each variable used in the study. In order to do this, the standard Augmented Dickey-Fuller (ADF) test is performed. The results of the Augmented Dickey-Fuller tests for all the variables included in the empirical study are displayed in table 3.

Table 3: Results of Augmented Dickey-Fuller Unit Root Tests

| | <i>STOCKINDEX</i> | <i>OIL</i> | <i>EXRATE</i> | <i>NOMIR</i> | <i>REALIR</i> | <i>CPI</i> |
|------------------------------|-------------------|------------------|------------------|-------------------------|------------------|------------------------------|
| <i>Test for Unit Root in</i> | <i>Level</i> | <i>level</i> | <i>level</i> | <i>first difference</i> | <i>level</i> | <i>level</i> |
| <i>Trend / Intercept</i> | <i>None</i> | <i>none</i> | <i>none</i> | <i>none</i> | <i>none</i> | <i>trend & intercept</i> |
| <i>Lagged Difference</i> | <i>1</i> | <i>1</i> | <i>1</i> | <i>1</i> | <i>1</i> | <i>1</i> |
| <i>ADF Test Statistic</i> | -5.982422 | -4.315511 | -6.813732 | -3.678253 | -3.321654 | -5.141890 |
| <i>1% Critical Value*</i> | -2.5933 | -2.5937 | -2.5933 | -2.5933 | -2.5929 | -4.0819 |
| <i>5% Critical Value*</i> | -1.9445 | -1.9446 | -1.9445 | -1.9445 | -1.9445 | -3.4688 |
| <i>10% Critical Value*</i> | -1.6180 | -1.6180 | -1.6180 | -1.6180 | -1.6180 | -3.1610 |

(*): *MacKinnon critical values for rejection of hypothesis of a unit root*

According to ADF tests, stationarity exists at levels for all of the variables, except NOMIR. For the variable NOMIR, the first difference is proved to be stationary. Since the trend is observed in the variable CPI, trend and intercept are included in conducting ADF unit root test.

Table 4 summarizes the results of regression analysis.

The natural log of monthly price relative of ISE National 100 Index is explained by the following variables: its first lag, the *EXRATE* and the first difference of the *NOMIR*. All of these three variables have a negative impact on the *STOCKINDEX*. Though the explanatory power of the regression can be considered as low (25.22%), the observed relationships are in line with theory and many other empirical studies' findings, as we have explained in the literature review section of this paper.

Table 4: Results of regression analysis

| Dependent Variable: <i>STOCKINDEX</i> | | | | |
|---|--------------------|-----------------------|--------------------|--------------|
| Method: Least Squares | | | | |
| Included observations: 77 after adjusting points | | | | |
| Variable | Coefficient | Std. Error | t-Statistic | Prob. |
| <i>STOCKINDEX(-1)</i> | -0.407894 | 0.112131 | -3.637673 | 0.0005 |
| <i>EXRATE</i> | -1.179947 | 0.288675 | -4.087458 | 0.0001 |
| <i>D(NOMIR)</i> | -26.40863 | 10.40079 | -2.539098 | 0.0132 |
| | | | | |
| R-squared | 0.271906 | Mean dependent var | 0.012982 | |
| Adjusted R-squared | 0.252228 | S.D. dependent var | 0.106162 | |
| S.E. of regression | 0.091802 | Akaike info criterion | -1.900182 | |
| Sum squared resid | 0.623644 | Schwarz criterion | -1.808865 | |
| Log likelihood | 76.15700 | Durbin-Watson stat | 1.668093 | |

The negative relationship, which is found between *STOCKINDEX* and the first difference of *NOMIR*, can be explained by the following rationale: The increase (decrease) in interest rates may give rise to a decrease (increase) in the demand for stock market securities, which, in turn, decreases (increases) stock prices. As we have previously stated, this finding is in line with our expectation. *It is known theoretically that a decrease (rise) in interest rates may create, among the investors, the expectation of economic expansion (downturn).*

Another finding of the analysis is the negative relationship between STOCKINDEX and EXRATE. This finding proves the argument that the depreciation of domestic currency against the foreign currency may create a negative impact on stock market returns. This result may imply also that ISE is composed largely of “positive exposure companies”, in other words, from the importing firms or the firms having large amounts of foreign debt. Although it is assumed that the direction of the relationship between exchange rates and stock prices would depend on the net “exchange rate exposure” position of the quoted firms, it will not be wrong to claim that the depreciation of local currency may trigger the investors’ pessimism, which, in turn, create negative impact on macro economy and stock market performance.

Regression results revealed a significantly negative relationship with STOCKINDEX and its first lag. The regression coefficient of STOCKINDEX(-1) is $-0,4079$ and it means that a positive or negative change in stock index will be followed next month, by an opposite move of approximately 40% of this change.

Finally, we have not observed any relationship between STOCKINDEX and OIL. This result, also, is in line with the results of many previous studies.

CONCLUSION

As we have already stated in this paper, in the finance literature, there exists a large body of research examining the relationship between macroeconomic variables and stock market returns. The review of the previous studies has shown that the findings may be different depending on the factors such as the proxies of selected macroeconomic variables, the research methodology employed and the country examined.

This study makes a contribution to the finance research field by examining the impact of some macroeconomic variables on the main indicator of Istanbul Stock Exchange, namely, the ISE National 100 Index, for the period August 2002 – February 2009. Macroeconomic variables used in this study are, the exchange rates (USD/TL parity), the interest rates (nominal & real), the consumer price index and the oil prices.

The major finding of this study is that the monthly return of ISE National 100 Index is not fully predictable since an important portion (73%) of the variation in the dependent variable remains unexplained. However, a significantly negative relationship is observed between the natural log of monthly price relative of ISE National 100 Index and the following variables: its first lag, the natural log of the relative USD/TL parities’ monthly mean levels and the first difference of the monthly mean level of the Turkish Lira Reference Interest Rate.

The results of this study may have several implications to both policy makers and investors. Policy makers have to be careful when trying to influence the economic system by intervening to the determination of interest rates and exchange rates. Thus, in a highly indebted country, like Turkey, the decisions of policy makers, who are responsible from economic affairs, are extremely important in terms of their impacts on the stock market. On the other hand, different types of investors (individual or institutional), such as money managers and portfolio managers may alter their investment strategies according to the changes in the nominal interest rates and the exchange rates.

Finally, we are thinking that further study would be necessary in order to obtain a better insight about the stock market return generation process in ISE. Overall, this paper is expected to be useful for both existing and prospective investors of ISE and finance literature by adding new evidence from an emerging market.

CALENDAR EFFECTS ON STOCK RETURNS: EVIDENCES FROM ISTANBUL STOCK EXCHANGE

Mehmet Bolak and Ömür Sürer
Galatasaray University, Turkey

ABSTRACT

Literature review reveals that the calendar anomalies have been observed in many developed and emerging stock markets. This study investigates the january effect, the day-of-the-week effect and the turn-of-the-month effect for the returns of ISE National 100 Index, which is the main indicator of the National Market of Istanbul Stock Exchange, for the period 1986–2009. Our results indicate that stock returns on mondays (fridays) are on average lower (higher) than returns on other days, for the period of analysis, as expected. Moreover, stock returns seem to be higher during the first five trading days of each month.

INTRODUCTION

The efficient market hypothesis (EMH) can be considered as one of the most crucial paradigms in finance literature. As stated by Fama (1970), a market, in which prices always fully reflect available information, is called efficient. “Security returns should be random” reflects the main idea of the EMH (Campbell, Lo, MacKinlay, 1997, p:22). Therefore, any predictable pattern in security returns may be exploitable and judged as evidence against market efficiency (Copeland, Weston, 1992, p:390). Nevertheless, some anomalies, which refer to unexplained results deviating from those expected, are observed in several empirical studies carried out in different settings. One of the well-known stock market anomalies is the *calendar anomaly*. Calendar anomalies can be explained as the calendar effects on stock returns that relate to the calendar, such as the day-of-the-week, the month-of-the-year or holidays (Hansen, Lunde, Nason, 2005). The main calendar anomalies are the January effect, the monday effect, the day-of-the-week effect, the holiday effect and the turn-of-the-month effect. The brief explanations of these anomalies are as follows:

- *January effect*: Stock returns, particularly returns on small stocks, are on average higher in January than in other months.
- *Monday effect*: Stock returns on mondays are on average lower than returns on other days.
- *Day-of-the-week effect*: Stock returns are, on average, higher or lower on some trading days than others.
- *Holiday effect*: Stock returns are on average higher on trading days prior to public holidays.
- *Turn-of-the month-effect*: Stock returns are generally higher during the first few trading days of each month.

A vast amount of empirical evidence on calendar anomalies in stock returns has accumulated in the finance literature over the years. As it is stated by Van Der Sar (2003), understanding the sources of calendar effects is important for rationalizing observed patterns and for making predictions about market outcomes. By departing from this approach, we believe that the calendar anomalies have to be tested in different settings and in different periods in order to provide further evidences to investors. The present paper makes a contribution in that direction. This paper investigates calendar anomalies, on stock market index, in the Istanbul Stock Exchange (ISE) during 1986–2008 period.

The remainder of the paper is organized as follows: The section following the introduction briefly reviews the related theoretical literature and the previous empirical findings. Next section presents the methodological design of

the empirical study. Then the empirical results are presented. *The paper concludes with* some general conclusions about the calendar anomalies in ISE.

LITERATURE REVIEW

As we have stated previously, there is an extensive empirical literature on the calendar effects on the stock returns. Some examples from relatively recent studies, especially on developing countries, and their main findings are summarized in the following paragraphs.

In a relatively early study, Boudreaux (1995) investigated the monthly effect in markets in Denmark, France, Germany, Norway, Singapore/Malaysia, Spain and Switzerland from 4 March 1978 to 30 December 1992. The author provided evidence for the turn-of-the-month effect. His findings about Danish, Norwegian and German markets support the argument that stock returns are generally higher during the first few trading days of each month (at the .05 significance level). In contrast, he found a significant negative effect in the Singapore/Malaysia market (at the .01 significance level). McGuinness (2006) analyzed the intra-month returns for a liquid pool of small-cap stocks in another Asian country, Hong Kong, over the period January 2000 - June 2005 and observed a strong and persistent turn-of-the-month effect. His analysis points also to differential day-of-the-week effects with Tuesday and Friday returns in particular at noticeably lower levels during the final week of a month as compared to earlier weeks. For daily data on a value-weighted index of all shares in Netherlands for the period 1981-1998, Van Der Sar (2003) found abnormally high returns in the pre-Christmas period of the second half of December and around the turn of the month. In the same study, the results reveal that the returns are negative and volatility is relatively high on the Mondays, as expected.

Day-of-the-week effect refers to the higher (or lower) stock returns on some trading days than others. For instance, according to several empirical studies' results, stock returns on Mondays are on average lower than returns on other days. A recent study (Agathe, 2008) on the Stock Exchange of Mauritius, for the period 1998-2006, indicates no significant presence of the day-of-the-week effect across the years and for the whole period. However, Friday returns seemed overall to be very high compared to the other days for the whole period. In another study, Choudhry (2000) investigated the day-of-the-week effect on seven emerging Asian stock markets returns and conditional variance (volatility). He conducted a research for the period January 1990 – June 1995 by the use of the GARCH model. His findings indicate a significant presence of Monday effect on both stock returns and conditional variance.

Another calendar anomaly that held the attention of practitioners, as well as the academicians, is the holiday effect, which refers to the higher stock returns on the trading days prior to holidays. Fazal (1998) attempted to explore the Ramadhan (holy month) effect in the Pakistani equity market (Karachi Stock Exchange) for the period from 1 January 1989 to 30 December 1993. He examined Ramadhan effect on mean returns and stock returns volatility by including a dummy variable in regressions and GARCH models respectively. The analysis provided evidence for a significant decline in stock returns volatility in this month, as expected.

Tonchev and Kim (2004) investigated the calendar effects by using a data set from three developing countries' financial markets, namely, Czech Republic, Slovakia and Slovenia. They examined five calendar effects in both mean by OLS regression and variance by GARCH; the day-of-the-week effect, the January effect, the half-month effect, the turn-of-the-month effect and the holiday effect and they found very weak evidence for the calendar effects in these countries.

METHODOLOGY AND DATA

The dataset used in this study contains daily closing values for ISE National 100 Index during 04 January 1988 – 27 February 2009 and monthly closing values during January 1986 – February 2009. This difference stems from the public unavailability of the first two years' daily data.

Istanbul Stock Exchange (ISE) is the only securities exchange in Turkey and is inaugurated in 1986. ISE can be considered as an emerging stock market, which is allowed to provide trading in equities. ISE National 100 Index is the main indicator of the National Market of ISE and is composed of equities of 100 companies of National Market, except investment trusts.

In this study, the january effect, the day-of-the-week effect and the turn-of-the-month effect are investigated for the returns of ISE National 100 Index. *The methodology adopted for the empirical investigation can be summarized as follows:*

- (1) *Firstly, the means of daily and monthly index returns are calculated.* For each day (month), we have computed a return as the percentage change in the value of the index from the previous day (month).
- (2) *Then, t-tests or the analysis of variance are used in order to test for differences among the different time periods' means, depending on the studied anomaly.*

The dataset is obtained from the head office of ISE. SPSS 16.0 is used as a statistical software package for all tests carried in this study.

RESULTS

Table 1 presents the summary statistics for daily returns of ISE National 100 Index for the period 04 January 1988 – 27 February 2009. As it can be seen in this table, in terms of mean daily returns of ISE National 100 Index (from the highest to the lowest), *the days of the week can be ranked as, friday, thursday, wednesday, tuesday and monday.* Although this finding is in line with our hypothesis, it is necessary to test the significance of the daily returns' differences by statistical methods. As it can be seen in table 2, the ANOVA test has shown statistically significant difference among five days at $\alpha=0,001$. However, it is necessary to examine the differences between the average returns of each pair of days, in order to determine whether some days' average returns are more significantly different than other days' average returns. *With the aim of analyzing this issue, firstly, the differences between the average returns of each pair of days are examined (table 3). Then, the differences between the average returns of each day and those of all other days of the week are analyzed (table 4).* As it can be seen in table 3, average daily returns do not differ significantly for each examined pair of days. The mean differences between daily returns of ISE National 100 Index, for the period examined, seem to be significant only for the following pairs of days: monday-friday and tuesday-friday.

In order to examine whether there is a significant difference among the monthly returns, we have made use of data about monthly closing values of ISE National 100 Index for the period January 1986 – February 2009. The monthly mean returns and the monthly volatilities (standard deviations) of the returns are displayed in table 5. As it is expected, the average return of ISE National 100 Index seems to be significantly higher in January than in other months. The other months in which the average return of ISE National 100 Index is higher relative to others' can be ranked (from highest to the lowest) as follows: december, july and april. The higher returns in December can be explained by the desire of investors to benefit, in advance, from the anticipated increased return in January. Consequently, it can be deduced that an investor may obtain considerably better returns in december and in january, in overall. As it can be seen in table 5, not only in december but also in the months of april and july, relatively high returns are observed. This can occur due to the positive expectations of investors about the financial statements published by the firms in first and second quarters (april and july, respectively). Table 5 displays also that march appears to be the only month where the mean return is negative. This can be related to liquidity considerations. In other words, the stock investors, who are also taxpayers, may need to liquidate their stocks in order to meet their tax payments until end of march and such a behavior of the major part of investors may have a negative impact on index returns. Although these differences are observed among monthly mean returns, according to ANOVA and t-test results (tables 6 & 7), there is no evidence about statistically significant difference among both all of the months and between each pair of months. Such a result can be attributed to high standard deviations of monthly returns. These latter may have a decreasing impact on the effect of the differences among monthly mean returns. Finally, the mean return of each month is compared with the mean of all other months and no statistically significant differences are found, except the month of January (table 8).

The last calendar anomaly, which is investigated in this study, is the turn-of-the-month effect and the findings are displayed in tables 9 & 10. The analysis is conducted by comparing the first trading day's mean return of a month with the mean return of all other days of the same month. Similar comparisons have been repeated five more times between, the first two/three/four/five/six trading day's mean return of a month and the mean return of all other days of the same month. The reported results, in table 10, show that the mean return of the first (from one to five) trading days is significantly higher than the mean return of all other days of the month. This finding is valid also for the difference between the mean return of the first six trading days and the mean return of all other days of the same month, but in this case, the significance level is lower *than 90%*. *The most significant difference is found for the mean return of the first four trading and the mean return of all other days of the month.* So, it can be deduced that *there may be opportunities to earn abnormal returns by investing on stocks at the end of the months and by selling them on the fourth trading day of the following month.*

CONCLUSION

This study examines the return behavior of ISE National 100 Index, which is the main indicator of the National Market of Istanbul Stock Exchange over the period 1986 to 2008. Our goal is to examine three specific types of calendar effects, namely; the january effect, the day-of-the-week effect (including Mondays) and the turn-of-the month effect. The results, on overall, indicate no significant presence of the january effect for the whole period of 1986-2008. Moreover, the findings from our study confirm the absence of month-of-the-year effect Istanbul Stock Exchange. On the other hand, the turn-of-the-month anomaly appears to exist in ISE, in the studied period. Regarding the day-of-the week effect, our study shows that monday (friday) returns appears to be significantly low (high) compared to the other days for the whole period. Thus, we can conclude that ISE is not efficient in weak form in respect of day-of-the-week anomalies. In other words, investors can take advantage of information about the day-of-the-week when investing in ISE. Though these results are consistent with the existing

literature, we believe that further research is necessary on the presence of the day-of-the week effect based on individual securities, which are traded in ISE. The findings of the day-of-the-week effect on ISE National 100 Index may have important implications for investors and academicians. The investors may benefit from these results in making decisions about the asset allocation, hedging and the timing of stock purchases and sales. Academicians may benefit from the results of this study in designing their empirical studies on related subjects.

Finally, it is important to state that more research on calendar anomalies in different time periods, in different capital markets and in different countries (particularly emerging countries) is needed, for providing further evidences to the “behavioral finance” area, which challenges “efficient market hypothesis”

CORPORATE CODES OF ETHICS: AN ANALYSIS OF THE FACTORS THAT INFLUENCE THEIR EFFECTIVENESS IN BRAZIL

Jorge Augusto de Sá Brito e Freitas and Antonio Carlos Capeletti Sarmento
Estácio de Sá University, Brazil

ABSTRACT

The existence of corporate codes of ethics, although not mandatory for all companies in Brazil, is a source of concern for almost all executives. This study aims at investigating which factors are perceived by managers and professionals as significant for the effectiveness of the codes of ethics. A survey was made in five large Brazilian companies, using a structured questionnaire, with questions about 16 variables identified as significant for the effectiveness of codes of ethics. A factor analysis was made, whose solution unveiled two factors, Compliance and Involvement. Compliance addresses to how the code of ethics ought to be managed, whereas Involvement represents the need of seeking adhesion of employees to the corporate ethics program.

INTRODUCTION

The importance of corporate ethics programs has been widely acknowledged in the latest years. Recent scandals involving large corporations have contributed to put light on the relevance of ethics in the business world. Some response was predictable: more legislation, expanded research on antecedents of ethical attitudes and behavior (Giacalone, Jurkiewicz, & Deckop, 2008), development of better corporate governance rules and practice (La Porta et al., 2000), and enhancement of corporate governance structures (Denn, 2004).

Since the enactment of the Sarbanes-Oxley Act in July 2002, companies in the USA have to disclose whether they have a code of ethics for orienting the behavior of their CEO and of other senior managers, mainly in the financial function. These legal precepts apply to every company tradable in the New York Stock Exchange (NYSE), even the foreign-based ones, as a form of shareholders protection and for maintaining stock exchange public credibility.

On the other hand, besides the legal and regulatory environment, stakeholders recognize that individual values play a core role in predicting ethical decision-making (Lefkowitz, 2003) and are placing increasing pressure on business organizations (Treviño, Weather, & Reynolds, 2006). Thus, many organizations have adopted 'ethical infrastructures', such as codes of ethics (Harris, 2004) and policies, aimed at fostering ethical behavior in organization members (Tenbrusel, Smith-Crowe, & Umphress, 2003).

Ethics is being viewed as a critical aspect of organizational life; so, unethical behavior threatens the reputation (Van Riel & Fombrun, 2007), the financial performance (Orlitzky, Schmidt, & Rynes, 2003) and even the continuity (Grant & Visconti, 2006) of companies. Accordingly, ethics in the workplace has evolved from leadership by example to formalization and institutionalization (Carroll & Buchholz, 2006) through codes of conduct, whistle-blowing mechanisms and compliance-based accountability measures (Foote & Ruona, 2008).

In Brazil, ethical issues involving large companies have been commonplace. According to Arruda (2002), most Brazilian corporate codes of ethics were published in the nineties, but the importance of the codes of ethics have received scant attention even in academia, which has turned its focus to the philosophical foundations of business ethics.

Notwithstanding, Brazilian moral patterns have been increasingly challenged in the latest twenty years, due to the exposure to international competition and to the strengthening of civil society and its ability to answer to

improper business behaviors. That reinforced power of society has allowed a wider use of several channels of pressure, such as the courts, the media, consumer defense agencies and even boycott to dishonest companies.

Therefore, concerns about corporate social responsibility (CSR) have proliferated, encompassing newer and larger definitions, hand in hand with worldwide discussions on the theme in academia and business arena. CSR is seen as a key focus of corporate identity and operations, and can be summarized as treating the stakeholders of the firm ethically or in a responsible manner (Clarkson, 1995, Fenwick & Bierema, 2008). Of course, levels of genuine commitment to the ideals of CSR range widely within companies, depending upon managers' personal values (Hemingway & MacLagan, 2004) and affecting corporate strategies (McWilliams, Siegel, & Wright, 2006). Although there is a widespread interest in CSR, expanding its core concerns to intersect with such concepts as corporate social performance (CSP), stakeholder theory, and business ethics theory (Carroll, 1999), it is worth noting that some authors, as Joyner & Payne (2002), consider it as a new language for expressing old ideas such as business philanthropy and organizational citizenship.

In this article, instead of discussing the jungle of these conflicting concepts, the focus aims at the effectiveness of one corporate tool: the code of ethics.

CORPORATE ETHICS AND CODES OF ETHICS

The code of ethics is the foundation of every program of corporate ethics in medium and large companies. Schwartz (2004) states that a code of ethics is a specific formal document that contains moral standards used for orienting corporate and employees behaviors.

Of course, a code of ethics is a necessary, although insufficient, condition to the effective implementation of a business ethics program (Ferrell et al., 2007). In some cases, the code of ethics may not be truly answering to the main organizational issues, existing only for promoting a positive corporate image or even as a legal safeguard in case of judicial litigation (Zylbersztajn, 2002). For instance, Velthouse and Kandogan (2007) point out that ethics is considered one of the least important skills necessary in managerial daily life, although managers use more codified ethics than other categories of employees. In other cases, however, the company really wants to foster an ethical climate and to support its corporate behaviors and activities with principles and values inscribed in its code of ethics, but it faces hurdles in trying to embed these values in corporate and individual behavior.

The main concern of this article refers to the necessary mechanisms to put the code of ethics in real practice. Data were collected in the primary sources, that is, among managers and professionals, the real users of corporate codes of ethics. This study aims at identifying the main variables linked to the format and the managing process of the codes, for both aspects influence their adoption and use, and, therefore, need to be considered when planning and managing corporate ethics programs. Briefly, the core question to be addressed is: Which are the factors that users perceive as significant for the effectiveness of a corporate code of ethics?

This survey does not consider either the content of the codes of ethics or the rules prescribed or the moral principles in which they are founded, assuming that it intends to verify how much a corporate ethics program can influence real users' behaviors.

There is a wide area of convergence where ethical behavior coincides with legal rules. On the other hand, there are many controversial moral issues not covered by legal rules, as well as there are legal rules disconnected from ethical aspects. So, business ethics begins where legal rules end (Crane & Matten, 2004). Business ethics turns its attention to issues not covered by legal rules or to where there is no agreed consensus about right or wrong.

A normative ethics prevails in the business environment, aiming at prescribing rules and establishing moral rules. These contents used to be gathered and formalized in codes of ethics, documents that clarify what the organization considers as ethical behavior, orienting the expected behavior of its workers and laying out a framework of guidelines in such topics as: respect to the national legal system; dealing with conflicts of interest; protection of organizational assets; employee loyalty; superior-subordinate relationships; transparency in communications and relationships with employees and other stakeholders; grievances; intellectual property; government contracts; sexual and moral harassment; alcohol and drug abuse; anti-bribery and anti-corruption measures, etc. (Arruda, 2002).

Codes of ethics need to be dynamic, updated tools that are sensible to environmental changes and fit to a changing business context. For instance, the ever increasing use of internet has brought a radical transformation in business deals, with unforeseeable situations for codes of ethics issued in the nineties.

Adams et al. (2001) state that the mere existence of a code of ethics seems to have a positive impact on the perception of ethical behavior in organizations, even when people cannot recall specific content of the code. Cleek

and Leonard (1998) point out that, besides having a code of ethics, it is worth observing how this code is communicated, enforced, and used, in order to embed it into the organizational culture.

Knights and O'Leary (2005) stress that some ethical failures are essentially due to business leaders' behavior. These authors argue that if leaders create a culture which emphasizes financial performance, and business and individual success; are directly involved in anti-ethical practices; disregard violations by employees; or are neglectful of providing training in abiding by ethical norms; then, these leaders are answerable for the ethical misdeeds of the company.

By the way, it is worth citing the model for elaborating ethical programs in American companies, set up in the Federal Sentencing Guidelines for Organizations, enacted by the American Congress in the nineties, with its seven basic guidelines: a) use of standards and procedures, such as codes of ethics, that could detect and prevent misdeeds; b) appointment of top executives as answerable for compliance of the corporate ethics program; c) caution in delegating authority to people with propensity to misbehavior; d) communication of the ethical standards by means of training programs in ethics; e) implementation of monitoring, auditing, and reporting procedures in case of deviances and violations; f) enforcement of compliance rules and application of sanctions; g) continuous updating of compliance procedures of ethical norms.

ETHICAL PLURALISM AND EFFECTIVENESS OF CODES OF ETHICS

Ethical pluralism is in between ethical absolutism and ethical relativism, that is, accepts different moral convictions, but, at the same time, suggests that it is possible to reach a consensus about basic principles and rules in a specific social context (Crane & Matten, 2004).

Therein, both academia and the business world strive for a global code of ethics, because multinational corporations are aware of moral prescriptions which are valid in their home countries but do not fit in other countries where they operate. These global codes would aim at defining ethical standards based on core human values shared by countries, religions, and cultures, respecting human dignity and fundamental human rights, instituting universal prescriptions concerning, for instance, justice, honesty, mutual respect, and responsibility. On the other hand, these global codes would consider differences in context and culture for setting up specific moral prescriptions.

Bringing theory back to the business environment, it could be said that those classifications do not function as a portfolio of options. Dealing with ethical issues is not so simple. It is an unstructured process, where problems cannot be previously depicted, but they emerge as one tries to solve them. Thus, these issues do not have a single solution, but an array of more or less acceptable alternatives.

In brief, the decision process on ethical issues in business comprises: a) an inductive reasoning, subject to evaluations, conjectures, and hypotheses, with a significant degree of uncertainty; and b) an analysis of the issue under several perspectives, allowing the exploration of many alternatives before defining the action to be taken.

The existence of a code of ethics is not sufficient for orienting the behavior of the company and its employees. The mere formalization of a code of ethics, without other specific actions, could lead it to oblivion in a short span of time. In the same manner, a code that was imposed upon the employees without adequate communication could be useless, besides the risk of converting it into a source of resentments. Yet, an implemented code of ethics which undergoes violations by top management or other senior officials, without reactions within the company, loses its credibility, making its application impracticable. Therefore, it is essential to examine how a code of ethics is developed, implemented and managed so that it is really practiced. One of the most effective tools is compliance, seeking employees' behavior conformity to it through prevention, detection, and punishment in case of violation of its rules.

Effectiveness of a code of ethics can be seen as its ability to influence the real behavior of people that are supposed to be oriented by it. In this article, variables were identified and used to develop a questionnaire mostly based on a Schwartz's (2004) study, in order to get preliminary data on aspects linked to the content and managing process that influence a code's effectiveness in the Brazilian context. Schwartz's exploratory study used a qualitative approach, based on interviews with code users, as most studies on business ethics. With this aim, Schwartz made 57 semi-structured in-depth interviews with managers, professionals and clerical employees of four large Canadian companies in telecom, manufacturing, high-technology and banking industries, all four involved in intensive programs of corporate ethics.

Although the use of statistical techniques in ethics literature is still rare (Dean, 1997), recently issued articles in the international setting use those techniques, as can be seen in an assessment of Australian firms which possess written codes of ethics (Batten, Hettihewa, & Mellor, 2008); or an examination of business ethics codes in the USA and in the Netherlands, attempting to measure unethical behavior in the workplace (Kaptein, 2008).

Schwartz's study was the source of 14 variables to be tested in this research. Two other variables – ethics committees and ethics auditing – were added from early studies by Arruda (2002) in the Brazilian context. All 16 variables and their descriptions are shown in the Methodology section.

METHODOLOGY

The chosen methodology was a survey, using a Likert-type scale of five alternatives. Variables 1 to 14 were extracted from Schwartz's (2004) study and variables 15 and 16 from Arruda's (2002).

Table 1: Description of variables

| Variable | Description | Main Question |
|---|---|--|
| 1- Justification | The code includes justification for behavioral rules. | Can employees' acceptance of the contents of the code be important for compliance? |
| 2- Explanation | It presents examples of practical application of code rules. | Are examples an important part of the code or could they be set aside for use in training and reinforcement activities? |
| 3- Language | A code of ethics must be written in a proper language. | Must an imperative negative language be used, emphasizing forbidden behaviors; or must an inspiring positive language be used, seeking inducing appropriate behaviors? |
| 4- Size | Size, in number of pages or in number of characters. | Does code's size matter? |
| 5- Participation in code's conception | Employees' participation in code's conception. | Does the participative process in code's elaboration contribute to its later applicability? |
| 6- Signature | Employees have to sign the code of ethics, as a way of being accountable for knowing its content. | Do employees consider themselves more accountable to top management for abiding by the code because they have signed the document or do they see this as a senseless bureaucratic formality? |
| 7- Training | Pedagogical activities involving all employees on code's rules, at company's initiative. | In what extent does training at company's initiative could contribute to increase the probability of effective employees' compliance? |
| 8- Reinforcement | Permanent activities of internal communication of the code, through folders, banners, videos, e-mails, and meetings. | Are reinforcement activities seen by employees as effective for increasing the propensity to compliance? |
| 9- Effective practice within the company | Company executives and managers' compliance, giving good example to company's personnel. | Are employees tuned in the company's ethical behavior and do they take it into account for guiding their behavior or do they act unattached? |
| 10- Obligatoriness of communicating deviances | Each employee that knows a violation of the code has to communicate this fact to the company, in order not to be considered neglectful. | Do employees consider that this rule contribute to increase the chance of the code being adequately complied with? |

| Variable | Description | Main Question |
|----------------------------------|--|---|
| 11- Divulcation of violations | Employee communication about internal violations of the code of ethics, and consequent disciplinary measures. | Is the divulgation of violations seen as positive, explaining application of rules or is it seen as negative, focusing on possible dysfunctions and/or inhibiting communication of deviances? |
| 12- Sanctions and rewards system | Rewarding or sanctioning employees' behavior according to compliance with the code. | Are rewards and sanctions considered relevant by employees or is the ethical behavior seen as an obligation and only punishment makes sense? |
| 13- Exigency of compliance | The company permanently requires compliance with the code, neither being neglectful nor tolerating deviances, independently of hierarchical level. | Do employees perceive the level of exigency made by the company concerning compliance with the code or do they consider it irrelevant for their decision on adopting the behavior prescribed in the code? |
| 14- Anonymous phone line | Existence of an anonymous phone line at employees' disposal for orientation and communication of deviances. | Can this tool, under the employees' viewpoint, contribute to more effectiveness of the code or does it not matter, due to low use or misuse under protection of anonymity? |
| 15- Ethics committee | A formal unit in the company's hierarchical structure, aimed at monitoring ethical issues. | Does the existence of the ethics committee signs to personnel company's commitment to deal with these issues or is it considered only as one more unit in the structure, not adding value to expected behavior? |
| 16- Ethics auditing | Activity aimed at verifying if code rules are being complied with and areas of major risk are being adequately monitored. | Do employees consider that this kind of activity could have real impact on the chances of the code be complied with or do they consider this role has already been played by company auditors? |

Source: Based on Arruda (2002) and Schwartz (2004)

Thus, the basic idea is to give quantitative treatment to variables previously identified in a qualitative research undertaken in Canada and try to test them in the Brazilian business context. The sample is formed by five large Brazilian companies with headquarters in Rio de Janeiro, with a formal code of ethics already in force, three companies in the energy industry and two in the telecom industry. Due to the nature and complexity of the theme, subjects have been drawn on two levels: managers and professionals. Twenty questionnaires were sent in October-November 2007 to each of the five selected companies. The final sample was composed of 95 questionnaires, which is compatible with the intended statistical treatment. Furthermore, empirical research in this kind of subject is always difficult due to obstacles in gaining permission to collect data on ethically and legally sensitive matters in organizations (Treviño & Weaver, 2003).

As a starting point, the 16 variables to be studied were gathered in two previously set constructs. The first construct comprises four variables and considers how the code is written. The second one, gathering 12 variables, refers to the way the company implements and manages its code of ethics:

- Construct FORMAT: Justification, Explanation, Language, and Size.
- Construct MANAGEMENT: Participation, Signature, Training, Reinforcement, Effective Practice, Communication of Deviances, Divulcation of Violations, Sanctions and Rewards, Exigency of Compliance, Phone Line, Ethics Committee, and Ethics Auditing.

Data collected from the questionnaires were submitted to factor analysis, using SPSS 13.0 software, aiming at determining factors that, in the users' views, influence the effectiveness of corporate ethics programs.

It is worth pointing at some limitations of the methodology used: results refer only to large companies located in Rio de Janeiro, Brazil; therefore, company size and local culture could interfere and prevent any extrapolation of results to other contexts. Another caveat is the fact of data were only collected among managers and professionals within the companies, what could lead to some skewed homogeneity of responses. Other surveys, using larger probabilistic samples, involving companies of all sizes and from several industries, with different locations and

encompassing all levels of the workforce, probably could allow some degree of generalization of results to Brazilian companies in general.

ANALYSIS OF RESULTS

Below are some comments about the findings after data treatment with aid of SPSS 13.0, as well as the most significant tables. At first, Cronbach's Alpha – the most frequently used internal reliability coefficient - was calculated. Table 2, below, shows the overall results and results for each of the two constructs (FORMAT, with 4 variables; and MANAGEMENT, with 12 variables):

Table 2: Reliability Statistics

| | Cronbach's Alpha | Number of Items |
|------------------------|------------------|-----------------|
| All variables | 0.943 | 16 |
| Construct 'Format' | 0.846 | 4 |
| Construct 'Management' | 0.924 | 12 |

Cronbach's Alpha greater than 0.7 is accepted as an adequate reliability measure (Hair et al., 2009). The data correlation matrix identified a large number of correlations greater than 0.3, justifying the use of the factor analysis technique.

Table 3: KMO and Bartlett's Test

| | | |
|---|--------------------|----------|
| Kaiser-Meyer-Olkin - Measure of Sample Adequacy (MSA) | | .844 |
| Bartlett's Sphericity Test | Approx. Chi-Square | 1286.735 |
| | Gl | 120 |
| | Significance | .000 |

Table 3 shows that the Measure of Sample Adequacy (MSA) had its value above 0.8, indicating the existence of significant correlations between some variables in the correlation matrix. Besides that, Bartlett's sphericity test confirmed the existence of significant correlations. Anti-image matrix correlation also showed MAS values, for each of the variables, always higher than 0.5, thus signifying that the set of variables was fit for factor analysis and this analysis could go further. In the same way, the "commonalities" table showed all its values higher than 0.5, indicating acceptable levels of variance for each variable explained by the factor solution.

Table 4: Explained Variance

| Factors | Explained self-values | | |
|---------|-----------------------|------------|----------|
| | Total | Variance % | Accum. % |
| 1 | 8.888 | 55.548 | 55.548 |
| 2 | 1.747 | 10.921 | 66.469 |
| 3 | .996 | 6.225 | 72.695 |
| 4 | .841 | 5.256 | 77.951 |
| 5 | .760 | 4.752 | 82.703 |
| 6 | .454 | 2.840 | 85.543 |
| 7 | .418 | 2.612 | 88.155 |
| 8 | .373 | 2.333 | 90.488 |
| 9 | .298 | 1.861 | 92.348 |
| 10 | .289 | 1.809 | 94.157 |
| 11 | .250 | 1.563 | 95.720 |

| | | | |
|----|------|-------|---------|
| 12 | .231 | 1.445 | 97.166 |
| 13 | .175 | 1.094 | 98.259 |
| 14 | .125 | .781 | 99.040 |
| 15 | .091 | .572 | 99.611 |
| 16 | .062 | .389 | 100.000 |

Main components analysis was employed as extraction method and varimax was used as rotation method. Table 4 shows the result of two factors with self-value higher than 1 and, therefore, significant ones, explaining 66.469% of variance. In social sciences, a solution that reaches an explanatory level of 60% of total variance can be considered satisfactory. The evaluation of factor charges, which measure correlation between the original variable and its factor, could be carried out better by use of the Rotated Factor Matrix, in order to distinguish factors more clearly.

Table 5: Rotated Factor Matrix

| Variables | | Factors | |
|-----------|-----|---------|------|
| | | 1 | 2 |
| Exigency | V13 | .846 | .321 |
| Practice | V09 | .830 | .293 |
| Commun | V10 | .800 | .110 |
| Audit | V16 | .797 | .172 |
| Train | V07 | .797 | .248 |
| Sanction | V12 | .797 | .152 |
| Sign | V06 | .720 | .327 |
| Reinforce | V08 | .683 | .484 |
| Language | V03 | .605 | .443 |
| Explan | V02 | .597 | .552 |
| Size | V04 | .590 | .434 |
| Partic | V05 | .071 | .893 |
| Phone | V14 | .326 | .772 |
| Justif | V01 | .344 | .763 |
| Divulg | V11 | .132 | .723 |
| Commit | V15 | .403 | .614 |

Extraction method: main component analysis

Rotation method: varimax, with Kaiser Normalization

Obs.: rotation converged in 3 interactions

Analysis of the rotated factor matrix showed the existence of variables with high factor charge in both factors. So, successive adjustments were made in the specification of the factor model, gradually removing variables that showed relevant factor charge in both factors. At each new processing, resulting parameters were reevaluated and the specification of the factor model was refit, removing variables and leading to new successive processing, and at the end of this iteration seven variables were eliminated: V1, V2, V3, V4, V8, V14, and V15.

Next, results of the final processing are shown, with the nine remaining variables specified in the factor analysis:

Table 6: Reliability Statistics

| Cronbach's Alpha | Number of items |
|------------------|-----------------|
| .896 | 9 |

Table 7: KMO and Bartlett's Test

| | | |
|---|--------------------|---------|
| Kaiser-Meyer-Olkin – Measure of Sample Adequacy (MAS) | | .833 |
| Bartlett's sphericity Test | Approx. Chi-Square | 568.946 |
| | Gl | 36 |
| | Significance | .000 |

Table 8: Explained Variance

| Factors | Explained self-values | | |
|---------|-----------------------|------------|---------------|
| | Total | Variance % | Accumulated % |
| 1 | 5.238 | 58.198 | 58.198 |
| 2 | 1.251 | 13.895 | 72.093 |
| 3 | .714 | 7.939 | 80.032 |
| 4 | .504 | 5.602 | 85.634 |
| 5 | .377 | 4.183 | 89.818 |
| 6 | .358 | 3.976 | 93.794 |
| 7 | .232 | 2.573 | 96.367 |
| 8 | .209 | 2.317 | 98.684 |
| 9 | .118 | 1.316 | 100.000 |

Final data resulting from this processing can be considered satisfactory, since they showed compatible values in all tables. Cronbach's Alpha kept up a high score, indicating data reliability and the correlation matrix showed adequate values. In the same way, Bartlett's sphericity test and MSA also showed results compatible with factor analysis.

Regarding commonalities, the lowest score was 0.666, revealing that data treatment through factor analysis was a good choice. The two factors extracted during processing showed levels of variance explanation of 58.198% and 13.895%, totaling 72.093%, better than the previous score of 66.469%, obtained in the initial processing. Finally, the factor matrix showed charges with practical significance for all nine variables, each one displaying high scores in only one factor.

According to Hair et al. (2009), after reaching a factor solution where all variables have significant charge in one factor and irrelevant in the others, one must look for giving a meaning to the factor charge pattern. As factor charges with high scores are seen as the most important ones, they must prevail on the name chosen for representing the factor. Thus, all variables were examined, aiming at giving a name that could reflect, as accurately as possible, variables with charge in that factor. Accordingly, the following table summarizes, for each factor, the meaning of each remaining variable, ranked by its factor charge:

Table 10: Factors and Variables

| FACTOR 1 | | |
|----------|-----|--|
| 1 | V13 | The company needs to permanently enforce compliance of the code of ethics by all employees, independently of rank. |
| 2 | V10 | Every employee ought to communicate any violation of the code of ethics. |
| 3 | V16 | The company must periodically audit compliance with code of ethics rules. |
| 4 | V09 | Employees must see their managers as a good example of compliance with the code of ethics. |
| 5 | V07 | Company sponsored training on the code of ethics is essential. |
| 6 | V12 | There are sanctions for employees who violate the code of ethics. |
| 7 | V06 | Employees must sign a document, formally testifying they know the contents of the code of ethics |
| FACTOR 2 | | |
| 1 | V05 | Employees must participate in the elaboration of the code of ethics. |
| 2 | V11 | The company must divulge violations of the code of ethics and the resultant measures taken. |

The concepts embedded in the variables that belong to the first factor were: exigency of code compliance; employees are obligated to communicate any violation; auditing; managers have to give a good example to employees; training; sanction of deviance; and employees' signature collection. All those concepts are linked to management tasks, aimed at exerting or asking for responsibility towards the code of ethics. This is consistent with the findings that authenticity (i.e, the consistency between leaders' true ethical intention and behavior) moderates the relationship between leaders' ethical behaviors and employee outcomes (Zhu, May, & Avolio, 2004)

In this context, training can be seen as a useful tool for putting all other concepts into action. Without proper knowledge and understanding of the rules prescribed by the code (Hargie & Dickson, 2007), compliance, auditing, and sanctions would be useless. Likewise, the exigency of the employee's signature, testifying knowledge of the code, is a natural consequence of the idea of punishment in case of code violation. It follows from this kind of analysis the choice of the name and definition of the first factor:

Compliance - company's actions aimed at exerting and asking for responsibility of every employee, independently of rank, regarding compliance with corporate code of ethics.

The second factor comprised employees' participation in the process of conceiving the code, a measure that could be important for a more realistic code, improving the quality of its content, and also for creating higher employee commitment to its further practice. Divulcation of violations by the company and the resultant measures taken can further better employees' awareness regarding behavior rules, by virtue of acknowledging real situations in their context and, at the same time, serving as an indicator that the company is effectively engaged in complying with its code of ethics. Thus, the second factor has got the following name and definition:

Involvement - company actions towards increasing employees' participation in the ethics program, giving them opportunity to contribute to the conception of the code and keeping open a channel of information about its application within the company.

Both factors confirm Cleek and Leonard's (1998) view, when they state the relevance of the company carefully monitoring how its code is communicated, enforced and used, in order to be incorporated to its organizational culture.

The Compliance factor could be considered consistent with the guidelines for elaborating corporate ethical programs issued by the Federal Sentencing Guidelines for Organizations, because, among its basic rules, they include compliance, application of sanctions, training, auditing, and communication of violations.

Conclusions

Although this subject is in an initial phase in Brazil, one can see many publications and academic researches, educational programs on ethics and consulting firms specialized in corporate ethical programs. In the Brazilian context, one can also see an increasing growth of specific units for monitoring and evaluating the ethics program within the organizations (generally designated as compliance departments), namely in organizations which have some structure of corporate governance.

The findings of this research can be in aid of Brazilian companies and even of other organizations in emerging countries involved in the implementation and/or improvement of their corporate ethics programs, arousing their interest in compliance and involvement, and hence, trying to warn them about the dangers of more emphasis on the formal aspects of the code elaboration than on the actions that lead to its greater effectiveness.

According to this survey, companies need to develop the aspects linked to compliance, setting up consistent actions in all aspects unveiled by the seven variables which showed better power of influencing employees' behavior. Therefore, to call for permanent compliance with the code of ethics, managers giving good example, to train, to audit, to collect employees' signature, to punish deviances, and to inform any violation; are managerial actions, turned to the exercise and accountability regarding the corporate ethical behavior of the employees. In addition, companies must seek involvement of their employees, allowing opportunities for them to participate in the elaboration and/or review of the code and properly divulging eventual violations and consequent measures taken.

One could conclude that, in the Brazilian business context, education in corporate ethics ought to receive more attention, it is imperative to increase research in this theme, and legislation needs to be improved.

Thus, there is a promising field for further research on corporate ethics in the Brazilian business scenery. If considered the psychic distance construct of the Uppsala internationalization model, some national cultural similarities could point to some useful lessons that can be profited from the Latin American and the Portuguese-speaking countries.

Furthermore, by the very nature of the theme, there could be some hurdles in getting the acceptance of some companies for this kind of survey. They could offer some degree of resistance to give information on the subject. However, on the other hand, in order to overcome these difficulties, there could be a fruitful opportunity to bring together academia and business leaders around the table to discuss ways to increase the effectiveness of the codes of ethics.

MANAGING IT: DOES ‘AGILE’ SOFTWARE DEVELOPMENT SOLVE BUYER NEEDS?

John Brown

Department of Immigration, Commonwealth of Australia

Lloyd Conrade and Guy Callender

Curtin University of Technology, Australia

ABSTRACT

A variety of innovations in software development practices, referred to by the collective term ‘agile’, have arisen in recent years partly as an attempt to deal with the considerable amount of complexity inherent in many software development projects. These agile approaches to software development are increasingly gaining acceptance with suppliers of software development services. Agile, in its various forms, appears to be a range of supplier responses to a set of problems traditionally incurred in contracted software development projects. Yet the extent to which the needs of the public sector (as one category of procurer) are faced is more questionable. Are the needs of a public sector procurer really satisfied with agile methods and practices as the framework for software development? Is agile really the solution to the original problem set?

INTRODUCTION

Core motivations incurred within the public sector often differ fundamentally from those experienced by the private sector (Sykes & Callender, 2009). For the latter, wealth-maximisation for shareholders, often through pursuit of maximisation of profits, is a strong driver for decision-making. This pursuit and motivation can give rise to a wide range of risk-taking thresholds by both the owners and managers of private sector entities as they seek opportunities to render higher profits and higher returns on investment.

For the public sector, however, the profit motive is usually less significant. In its place, a greater responsibility to government and to the wider society is present, bringing with it diverse and competing goals both public and functional in nature. The need for a greater level of accountability within the public sector means that increased transparency in decision-making is required, with standard and often rigorous procedures developed and instituted to accord with such transparency and accountability requirements. A general aversion to risk consequently arises in the public sector, which influences public sector procurement decision-making. In recent years the rise of ‘value for money’ as an increasingly dominant determinant of financial decisions reinforces a predilection for as much up-front certainty as possible concerning the various criteria which may influence a procurement decision. Knowledge (and, likewise, certainty) is power – the power to make effective procurement decisions.

Procurement of software development services is no exception in this quest for greater certainty, witnessed, for example, through the extent of general procurement guidelines issued by the Australian Commonwealth Government (COA, 2008). The often large value of expenditure involved in software development procurement by public sector entities makes the overall ‘success’ of software development projects much more vital. On the other

hand, perceptions of public sector project ‘failure’ (whether accurate or not), if played out publicly in the mass media, can have considerable undesired repercussions (Callender, Twomey, Chong & Huang, 2008).

If uncertainties associated with a project, particularly a large-scale project, are reduced at the beginning, then higher quality decisions can theoretically be made at the early procurement stage of the project, thus reducing the chance of ultimate project failure. The quest for up-front certainty is both a contributor to improved procurement decision-making as well as mitigation against the potential for project failure later, with its resultant potential for political and public repercussions.

Recent moves within the software development industry to adopt what have become known as ‘agile’ practices are an attempt to improve upon software development practices and to deal with certain types of failure recurrent in software development projects. Indeed, the incurrence of these failures has been sufficiently frequent that they have often seemed almost endemic to the provision of software development services.

THE COMMON PROBLEMS OF PROJECT ‘FAILURE’

Awareness of the relatively high frequency of specific software development failures stretches back several decades. Naur and Randell (1969) reported that the Conference Sponsored by the NATO Science Committee had recognised that software development projects often suffered a specific set of recurrent problems: they frequently and significantly exceeded their original budget; they frequently and significantly exceeded their originally envisaged period for development; and they frequently fell considerably short on initially envisaged functionality. Such was the perceived extent of these problems that the term ‘software crisis’ was coined and has frequently been used since then to describe the common recurrence of these problems. However, some academics and practitioners, such as Glass (2005, 2006), question the extent of the problems and whether there has ever actually been such a ‘crisis’ in software development, referring to the amount of well-functioning software on which we currently rely. Nevertheless, whether a project meets or exceeds its original budget, meets or exceeds the originally allocated development schedule, or fulfils or otherwise falls short on planned functionality have often been perceived as core criteria for determining whether a software project can be categorised as a ‘success’ or a ‘failure’.

The most commonly referenced source of information for software project failure rates has, over the last one-and-a-half decades, been a series of Chaos Reports issued by the Standish Group. Most references are to the initial 1994 report which suggests that from a survey of 365 executive managers covering 8,380 applications (presumably meaning IT projects) only 16.2 percent of IT projects are ‘successful’ while 31.1 percent of projects are cancelled at some point prior to completion. The remaining 52.7 percent are categorised as ‘challenged’, which is defined as: “The project is completed and operational but over-budget, over the time estimate, and offers fewer features and functions than originally specified”. These are the same three aspects of project failure which were referred to by Naur and Randell in 1969 as bringing about a software crisis.

By the 2006 Chaos Report, the Standish Group had found a trend towards greater success in IT projects since their 1994 report and that successful projects by 2006 constituted approximately 35 percent of projects, cancelled projects totalled 19 percent, and challenged projects had fallen to 46 percent of the total number of IT projects. The reported figure of challenged projects is still a very significant percentage of the total, even if approximately correct as an indication of over budget, over time, and functionally short projects in the software development industry. Any such extent of failure would probably be thoroughly unacceptable in other industries.

However, and despite the frequency of references to the Standish reports, deficiencies in the conclusions reached in these reports, as well as doubts about the research methodologies employed, have been highlighted by Jørgensen and Moløkken-Østvold (2006) and Glass (2005). Indeed, it is not at all clear if Standish classifies a project as challenged if only one or two of the three aspects of failure of challenged projects apply to that project: the Standish definition of challenged seems to require all three aspects of failure to co-exist in the one project. Clearly there are deficiencies in the Standish conclusions which need to be interpreted and applied with caution. Further, although one or more of these aspects of failure may have been incurred within a particular project, the final implemented product may actually meet with considerable success due to sizable gains arising from functionality, productivity, or financial improvements (Callender, Twomey, Chong & Huang, 2008). Is such a project a failure or

success, or does each aspect of failure or success, however defined, need to be considered on its own merits? Perhaps there is a need for more rigorous, comprehensive, and up-to-date research to be conducted in this area.

A partial-corollary of the problem of projects falling short on functionality in order to meet the time or cost constraints is the alternative problem of 'scope creep'. Scope creep is the repeated pressure to extend the scope of a project to include ever-increasing levels of newly-desired functionality. If the time and cost constraints are allowed to loosen, scope creep often replaces the functionality-deficiency problem. As the scope continues to widen, the project takes even longer and costs even more, and thus scope creep fuels these two other problems. Consequently, the existence of scope creep is often viewed as a warning sign that a project may ultimately fail (Thorpe, 2008).

With a lack of currently available information providing a more comprehensive and precise assessment of how much projects do not actually meet their time, budget, and functionality targets, or incur scope creep, it is commonly agreed that these types of failure in software projects remain a sufficient problem to be an ongoing concern, even if their extent may not currently be considered sufficient to constitute a software crisis as originally described by Naur & Randell (1969).

THE PUBLIC SECTOR AND PROJECT FAILURE

Any occurrence of these types of failures of software development projects can be significant when the project is in-house within the private sector. Such failures are particularly critical when a software development project is the subject of an outsourcing agreement as the contractual relationship brings legal responsibilities as well as legal and financial risks associated with agreed outcomes not being met.

The vital aspect of the project outcomes may assume even greater significance when the buyer of the software development services is from the public sector. This is because a public sector procurer usually has heightened accountability for outcomes, is often constrained by considerably fixed financial budgeting, and often has rigorous and complex procedures to follow in an atmosphere which pressures for transparency in relation to, for example, procurement of goods and services. Software development success (in terms of not incurring excessive scope creep, meeting the agreed budget, meeting the allocated period for development, and meeting the functionality agreed up front) is therefore often a critical requirement for a public sector procurer of software development services.

Bellamy and Taylor (1998) suggest that public sector IT development proceeds through three stages. 'Automation', as the first stage, represents the replacement of manual, mainly paper-based, work with much the same work being conducted by machines. 'Informatization', as the second stage, focuses on making information more accessible through integration of data sources, improved use of organisational and external data, and flexibility of communication of, and access to, data. 'Transformation', as the third stage, involves business process re-engineering, including across organisational boundaries, to reorientate delivery of services around the composite needs of specific types of customers. Progress of IT development through each of these stages accords with a continual increase in inherent complexity and associated uncertainty. This is particularly true in the third stage of transformation which may often require the satisfaction of seemingly conflicting or competing needs from multiple public sector entities each with their own political and economic agenda.

In recent years there has been an increasing acceptance and adoption by the software development community of what have become known as agile practices and methods of software development. These practices and methods have been specifically aimed at dealing with the problems associated with projects containing considerable uncertainty and complexity.

TRADITIONAL SOFTWARE DEVELOPMENT: WATERFALL AND ITS VARIATIONS

In describing his own experience with large software developments, Royce (1970) illustrated a basic flow of seven successive steps involved in developing software where each step is completed prior to the commencement of the next (see Figure 1). The basic form of his model has since become widely known as the waterfall software development lifecycle. Contrary to many references to the waterfall lifecycle since, Royce did not propose that software developers follow his basic process model. Rather, he considered that its “*implementation ... is risky and invites failure*” (Royce, 1970, p. 329). In addition, he viewed iterations of the steps within the entire process, together with elements of re-design, as being essential to successful project completion, and he also recommended prototyping of the final software product envisaged. However, Royce’s suggested embellishments were ignored in the mainstream and the strict sequential form of the waterfall process has been treated since as the standard conceptual base framework for software development, albeit with some naming and interpretive alterations of the steps involved (see Figure 2).

The waterfall software development lifecycle provides a considerably fixed structure for the sequence of the types of activities that need to be performed in software development. A traditional belief is that there should be an emphasis on sound documentation being developed as comprehensively as possible throughout every stage of the development process and “that no phase is complete until the documentation for that phase has been completed” (Schach, 2007, p. 51). Comprehensive documentation theoretically provides all parties associated with the project with the information they need to make decisions and to progress the project further, and theoretically provides confidence that the project is on track. For example, by thoroughly specifying the project requirements by the end of the requirements and analysis stage and incorporating a budget for the entire project, financial decision-makers have sufficient information to decide whether to proceed with the project and can then budget and allocate funds accordingly. This information is crucial in the public sector, for example, where there are strong capital budgeting constraints and budgets are most often set at least a year in advance.

It is widely believed that the strict sequential flow of the waterfall lifecycle is never actually followed in practice. Rather, as was recognised by Royce (1970), software projects always undergo some degree of iteration of the phases involved. This is the result of a variety of factors. For example, the complexity of many large software development projects means that, no matter how detailed the development of requirements in the beginning, some level of detail will inevitably be omitted in that phase and only noticed at a later stage, perhaps not until after the project has been implemented. Refinement of the quality of the product may also be recognised and require further work or re-work. The near inevitability of human error also contributes to the need to revise and improve upon the work of an earlier phase. Consequently, a range of variations to waterfall have been proposed over the years (see Figure 3, for example) which attempt to portray the iterative nature of software development projects within a waterfall lifecycle context. With each iteration or additional level of work resulting from unforeseen complexity, the project incurs the risks of scope creep, and of running over budget and over time. The common method of dealing with this is to build additional time and cost allowances into the project from the beginning. But what constitutes a sufficient allowance in an environment of indeterminate levels of uncertainty and complexity? Clearly, with project failure still so prevalent, this level of management of uncertainty and complexity seems to frequently be proven inadequate.

THE RISE OF AGILE

In recent years various alternatives collectively referred to as agile processes have become more popular as mechanisms used by software developers to attempt to deal with project uncertainty and complexity. In early 2001, 17 software development practitioners gathered, over a series of days, for the purpose of identifying commonly-held ideas which could collectively form the core of an alternative to standard software development practices. The outcome of their gathering included what became known as *The Manifesto for Agile Software Development* (2001), which states that:

We are uncovering better ways of developing software by doing it and helping others do it. Through this work we have come to value:

- ***Individuals and interactions*** over processes and tools
- ***Working software*** over comprehensive documentation
- ***Customer collaboration*** over contract negotiation

- **Responding to change** over following a plan

That is, while there is value in the items on the right, we value the items on the left more.

The participants backed their Agile Manifesto with a set of twelve associated principles which, in combination with the manifesto, have spurred an agile software development movement. It should be noted that the term 'agile software development', often simply referred to as agile, is not a reference to one strict agile methodology. In fact the original proponents of the Agile Manifesto themselves had between them a variety of approaches to software development. They continue to pursue these approaches under various terminologies such as Scrum, Extreme Programming, Crystal Development, Lean Development, Feature-Driven Development, Dynamic Systems Development Method, Adaptive Software Development, and (Agile/Rational) Unified Process. Each approach has its own methodologies and/or processes but they all endeavour to comply both with the values of the Agile Manifesto and the twelve principles.

Figure 1: Royce's Model That Became the Basis for the Waterfall Software Development Lifecycle.

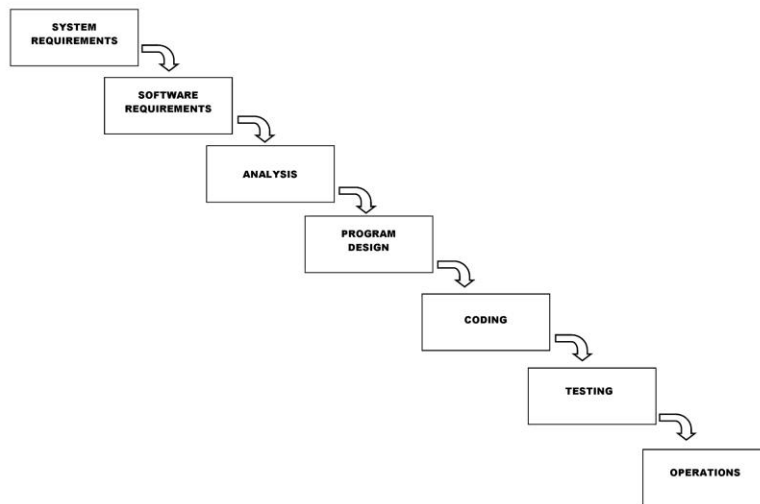

Figure 2: A Common Version of the 'Standard' Waterfall Software Development Lifecycle.

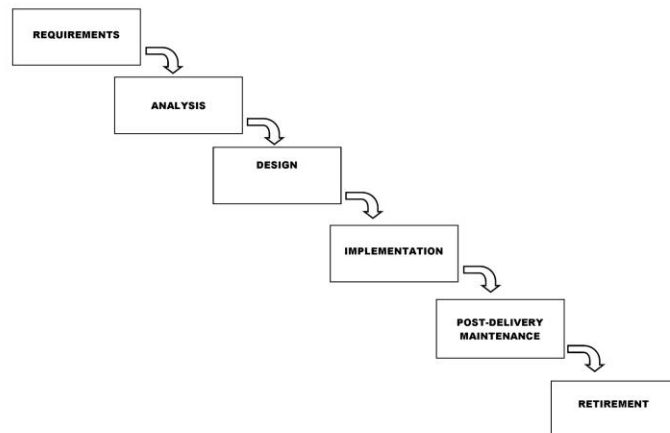

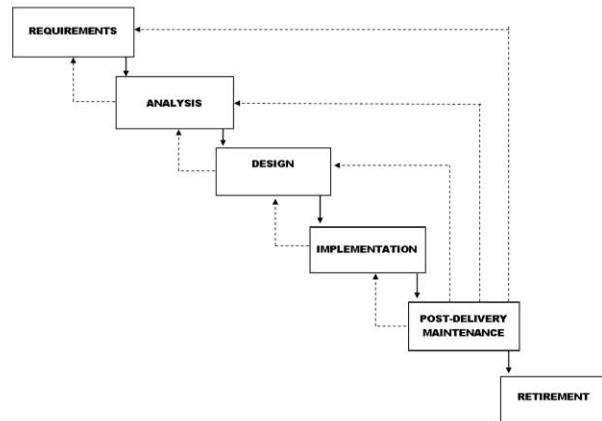

Figure 3: A Variant of the Waterfall Software Development Lifecycle showing Iterations to Development.

Regardless of the specific approach adopted, there are various typical characteristics of projects developed through agile processes, as explored at length by Highsmith (2002), and Sliger and Broderick (2008). For example, there is an emphasis on first delivering to the customer those aspects of functionality that are considered most important. A requirement of strong customer involvement throughout each iteration is seen as being amenable to the generation of immediate feedback regarding the appropriateness or otherwise of a product delivered. Practices such as pair-programming (two programmers working together with one checking the work of the other) are frequently promoted for rapid, focussed development turnaround.

There is also a strong emphasis on frequent delivery to the procurer of progressive iterations of ‘workable’ software, with the development team often seeking to deliver some additional functionality as frequently as every month, every fortnight, or even every week. At this rate of iterative and incremental development, there is automatically far less emphasis on developing comprehensive documentation—a fact agile proponents readily admit. This rate of iterative delivery also fundamentally alters the software development lifecycle so that, for each iteration delivered, the developers by necessity work on every phase inherent in the waterfall software development lifecycle but with specific emphasis on the short-term work relating to that specific iteration.

Clearly, agile software development is oriented towards attempting to manage development projects in an adaptable manner (by both the development team and the customer) with less comprehensive planning (especially at the beginning of the project) and a shorter-term focus throughout. Proponents of agile view their processes as an attempt to deal with relentless speed and change through an ability to act quickly to deliver fast results. Highsmith (2002, p. xxii) suggests that “problems characterized by change, speed, and turbulence are best solved by agility”, with XP, Crystal, and Scrum being “particularly relevant to extreme or complex projects – those that have an accelerated time schedule combined with significant risk and uncertainty that generate constant change during the project”.

Agile software development processes are a clear recognition by the proponents of agile of the existence of inherent complexity and uncertainty in software development and a response by developers seeking improvements in the way they conduct their development work. Agile attempts to deal with the complexity and uncertainty of projects by ensuring a shorter-term focus and more frequent delivery of smaller units of product in order of the most-needed functionality. Thereby, they perceive that they provide their customer—the purchaser of their services—with the elements of a product most needed by that customer. In fact, their customer’s needs might

critically be the totality of product, not some prioritised portion of the totality. Agile processes are therefore a developer's perspective in seeking to resolve the perceived problems inherent in software development.

THE COST OF AGILE

Proponents of agile software development processes, however, have had little to offer a public sector procurer in terms of the reliability of the pricing of agile projects, and because most proponents publicly remain totally silent on this issue. Sliger and Broderick (2008) see a difference in how the costing of agile projects must occur compared with how costing of traditional (waterfall and related) projects are usually conducted. For traditional projects, Sliger and Broderick believe, the entire project work is broken down into specific tasks, cost estimates of the likely resources required for each task are ascertained, and the total cost of the project is the total of all the task cost estimates. This approach, referred to as 'bottom up estimating', is possible because the project has been analysed in considerable detail up-front.

However, with agile projects no such detail of project break-down is performed up-front. Such a level of detail of the project is developed, if at all, progressively during the various iterations of the project's development and a total cost of the project may not be known until the final iterations of the entire project. The focus of the development team at any time is only on the shortest time horizon—the work immediately at hand (Sliger & Broderick, 2008, p. 42):

A team should only plan one release at a time: this release. Likewise, a team should only task out one iteration plan at a time: this iteration. Estimating top-down and relative to the horizon lowers the upfront planning costs as well as the cost of change later in the project.

Consequently, there is no firm basis at the beginning of undertaking a project for an agile developer to reach any reliable measure of the total project cost. Sliger and Broderick seek to diffuse the responsibility of the software developer (as supplier) to accurately place a cost on their services by stating that "it's very difficult, if not impossible, to predict costs for a complex situation" (Sliger & Broderick, 2008, p. 113). Yet estimating costs and providing the public sector purchaser with a price up-front is exactly what is required of a supplier of software development services seeking to bid for the project, no matter how difficult or seemingly impossible it appears to be to do so. And the same responsibility exists regardless of whether the supplier chooses agile development processes. If the chosen process of the supplier does not allow the supplier to meet the essential requirement of the public sector procurer (that is, an accurate estimate of price for a given scope and declared project duration), then that is a limitation of the development process chosen.

Sliger and Broderick further attempt to diffuse this fundamental issue by declaring that: "Agile projects have the ability to always be on time, and within budget, if the scope is flexible" (Sliger & Broderick, 2008, p. 117). The problem with this is that scope is rarely flexible on the downside. With an outsourced IT project, this is akin to the supplier suggesting to the buyer: *If we don't get all the work completed that we committed to finish within the time period we committed to, we won't charge you more than we committed to charge you. But if you really want the project completed in its originally foreseen entirety, it may take longer and cost more than we previously identified.* With this lack of full commitment from the agile supplier in relation to the supplier's own tender, the fundamental problem of outsourced software development projects is not addressed, let alone resolved, by engaging in agile processes.

If the price of commitment to project duration and project cost by an agile developer, as supplier, is the project scope (and scope could also quite validly in this context incorporate product functionality), then it is quite reasonable from the public sector procurer's perspective for the credibility of an agile supplier's tender to be called into question from the outset. The procurer is seeking a commitment from the supplier in relation to cost, scope, and duration and the agile supplier readily admits that the procurer can, at most, have a commitment to only two of these three project fundamentals.

If this is the case, the tender and agile development processes appear to be fundamentally in conflict from the procurer's perspective regarding requirements of and constraints upon the software development project. The

price of agile software development may well then be more than just the total financial cost to the buyer. There may also be ultimate pressure on the procurer to forego one of the procurer's fundamentals of the project—to either forgo the limit on time, or forgo the limit to cost, or (even more likely) forgo the scope and functionality of the product produced.

CONCLUSION

Several core problems continue to arise in software development projects. These are the problems of functionality being eliminated from the end product as originally envisaged, software projects taking longer than forecast, original budgets being exceeded, and/or the continual issue of scope creep. These are of particular concern for the public sector with its strong accountability requirements which necessitate considerable certainty associated with procurement decision-making. These problems, from the procurer's perspective, are actually issues of uncertainty: where what was considered to be certain or true at the beginning of the project becomes less and less certain, or less and less true, as the project progresses.

To this extent, agile software development contributes no advancement to the solution of the core problems faced by the public sector procurer. Rather, it has the potential to contribute further uncertainty up-front in terms of the scope and the functionality to be incorporated in the final product, the time to develop the product, and the total cost of the product to the procurer. The extent to which agile software development contributes to this uncertainty constitutes a backward step for the public sector procurer and extends the problems incurred.

Agile software development is the software development supplier's response to the problems the developer faces in the course of his/her own contributions to software development projects but it is not a solution to the repetitive occurrence of the specific software development problems faced by the public sector procurer. The public sector incurs specific constraints and needs simply because of the very nature of the public sector. These constraints and needs do not change to accommodate an agile software development supplier. Proponents of agile software development need to recognise this and then deal with the problems that arise from the public sector procurer's point of view rather than to potentially add to those problems.

If proponents of agile software development fail to deal with these issues, then perhaps it is appropriate to view agile processes and practices as falling short of the needs of the public sector procurer. Developers applying agile software processes are seeking improvements to how software is developed from their own perspective. That is commendable, yet their improvements are not solutions to the core problems faced by the public sector procurer. They have yet to deal with the core, long-standing problems of their public sector customer from their public sector customer's perspective.

FORECASTING THE PRICES OF ALUMINUM, COPPER, AND ZINC WITH GARCH MODELS

Burcak Bulut and Ugur Soytaş
Middle East Technical University

ABSTRACT

In this paper we investigate the forecasting performance of GARCH and EGARCH models for world aluminum, copper, and zinc prices. We discover that although there is an ARCH effect in the prices of these non-ferrous metals, our results do not indicate a significant leverage effect. The forecasting performance of both models seems to be similar with respect to several criteria. However, slightly better forecasts are obtained with the GARCH model. Since it is a simpler model, we recommend the use of the GARCH model for forecasting the price of the three non-ferrous metals traded in LME.

INTRODUCTION

The ability of a mining company to generate profits and the decisions related to the mineral investments are significantly affected by volatility of metal prices. Furthermore, from an investors point of view the fluctuations in commodity market prices may contain important information. Chou (1988), for example, states the importance of commodity volatility forecasts in valuation, portfolio formation, managing risk, and determining optimum options and futures trading strategies for hedging purposes. From this point of view, metal price forecasting will play a role in reduction in price instability and unpredictability. As a result of this reduction, the mining companies can be easily assisted for their forward plans and investors can take this new information into account in their investment decisions. Economic time series, particularly financial time series, exhibit periods of high volatility followed by periods of low volatility, which means the constant variance assumption is violated. The most appropriate method to deal with this violation is the use of ARCH models. The non-linear models have been the most commonly used tools in volatility modeling and forecasting.

The primary aim of this paper is investigating two generalized autoregressive conditional heteroskedasticity (GARCH) models in terms of their forecasting ability of selected nonferrous metal prices. London Metal Exchange (LME) 3-month forward prices for aluminum, copper and zinc are used to analyze the performances of the models. Time period covered is 12/12/2003 – 15/12/2008, which consists of 1305 observations for each metal.

This paper is organized as follows. The next section gives a brief review of the literature, which briefly describes the previous GARCH applications and literature related to metal price forecasting. Section 3 presents the data and methodology used. Section 4 provides the empirical results of the study and concluding remarks are presented in the last section.

LITERATURE REVIEW

We divide the relevant research into two major areas, which are mainly volatility modeling and metal price forecasting. In a recent study, Engle (2004) provides historical details related to the development of conditional heteroscedasticity models and their evolution into more generalized models. According to Engle (2004), the GARCH(1,1) model has become “the workhorse of financial applications” when describing volatility dynamics.

Comparing the Models

Engle (1982) introduced the ARCH models; which were then generalized by Bollerslev (1986). Another important article on ARCH is the review paper of Bollerslev, Chou and Kroner (1992) which gives the overview of the developments in the formulation of ARCH family and a survey of the numerous empirical applications using financial data. Nelson (1991) presented a more interesting class of ARCH models that are the "asymmetric" or "leverage" volatility models, in which future volatility can be affected differently by good news and bad news. These models do not suffer from some of the drawbacks of GARCH models like the negative correlation that exist between current returns and future returns volatility. GARCH models rule this out by assumption. Additionally, interpreting whether shocks to conditional variance "persist" or not is difficult in GARCH models. The empirical work of French, Schwert and Stambaugh (1987) inspired a motivation for these models by finding the evidence that stock market returns are negatively correlated to the change in the volatility of stock returns. Engle and Ng (1993) made a systematic comparison of volatility models while focusing on the asymmetric effect of news on volatility. They proposed volatility models and fitted these to daily Japanese stock returns from 1980 to 1988. All the models pointed out that negative shocks show more volatility than positive shocks but the diagnostic tests indicated that the modelled asymmetry is not sufficient. The exponential GARCH model, the model proposed by Glosten, Jagannathan, and Runkle and the partially nonparametric (PNP) ARCH model gave similar volatility forecasts for reasonable shock. However, these forecasts differ dramatically for more extreme shocks. In Morana's (2001) article, the GARCH properties of oil price changes are used to forecast the oil price distribution over short-term horizons. The semi parametric forecasting methodology is based on the bootstrap approach. Morana (2001) suggests the use of the semi-parametric approach to construct a performance measure of the forward oil price using Brent oil prices. The semi-parametric methodology is suggested for the oil price forecasts as well. Radha and Thenmozhi (2002) develop a univariate model for forecasting the short-term interest rates. The models under study are Random Walk, ARIMA, ARMA-GARCH and ARMA-EGARCH. According to the results of this study, volatility clustering effect is dominant in interest rates time series. As a result of this GARCH based models are more appropriate to forecast than the other models. The moment structure of the general ARMA-EGARCH model is considered by Karanasos and Kim (2003). They show the differences in the moment structure between the EGARCH model with the standard GARCH model or the APARCH model and use these differences for comparison. They find that the autocorrelations of the squared observations can be applied so that the properties of the observed data can be compared with the theoretical properties of the models. Allen and Morzuch (2006) summarized the past twenty five years of econometric forecasting in their paper published in International Journal of Forecasting. "A whole alphabet soup of generalizations of the original ARCH model has been proposed, and this work dominates the financial forecasting literature. ARCH has made much less headway in other applications of econometric forecasting." (Allen & Morzuch, 2006). Bowden and Payne (2008) utilize three time series models, ARIMA, ARIMA-EGARCH, and ARIMA-EGARCH-M models to examine the day-ahead forecasting performance for hourly electricity prices for the five hubs of the Midwest Independent System Operator (MISO). The models did not differ significantly regarding their insample forecasting performances. However, with respect to the model performance in out-of sample forecasting, they find that the ARIMA-EGARCH-M model is superior to the other models. Agnolucci (2009) compares the predictive ability of GARCH-type models and implied volatility models. The aim of this study is to select the best model which produced the best forecast of volatility for the WTI future contract, evaluation criteria was based on statistics and regression results. However, they also investigated two another topics: whether the asymmetric effects have an influence on volatility of the oil futures and whether the distribution of the errors effects the parameters of the GARCH models. According to the results of predictive ability tests, GARCH-type models seem to outperform the implied volatility (IV) model.

Forecasting Metal Prices

McKenzie, et. al (2001) investigate a range of commodity futures prices traded on the London Metals Exchange. They consider the ability of the Power GARCH models to capture the some features of volatility in these prices. The results of this study show that the LME futures data generally do not contain asymmetric effects. This paper suggests that the Taylor GARCH model outperforms other models included in the study. Dooley and Lenihan (2005) analyzed the ability of two time series forecasting techniques to predict global future lead and zinc prices. The time series methods used in the study are ARIMA and lagged forward price models. They argue that price forecasting is difficult. The results from their analysis suggest that ARIMA modeling provide better forecasts than lagged forward price modeling. They also claim that the models discussed in the study are widely used for base metal forecasting by the metal companies. Hammoudeh and Yuan (2008) utilize three "two factor" volatility models

of the GARCH family to examine the volatility behavior of three strategic commodities: gold, silver and copper, in the presence of crude oil and interest rate shocks. The results of the standard GARCH models suggest that gold and silver have almost the same volatility persistence which is greater than that of copper. The results of CGARCH and EGARCH procedures suggested that metals can have different volatilities because of their own special factors and uses, but not only driven by crises and common macroeconomic factors. Figuerola-Ferretti and Gilbert (2008) apply the bivariate FIGARCH model to aluminum and copper prices, which are the two most important metals traded in the London Metal Exchange. This model allows parsimonious representation of long memory volatility processes. The results show that spot and three-month aluminum and copper volatilities can be represented as long memory processes, in which the processes are symmetric and a common degree of fractional integration is exhibited by both of the metals. The review of literature shows that ARCH modeling is widely used in several time series for forecasting and GARCH and EGARCH models are extensively used in volatility forecasting. However, there exist very few researches which applies the ARCH-GARCH family to commonly traded non-ferrous metals. The literature shows that GARCH models are very successful at capturing the volatility clustering effect of financial time series and EGARCH model outperforms the traditional models in capturing asymmetric effects. Thus, this paper focuses on forecasting of price volatilities non-ferrous metals traded in the London Metal Exchange using non-linear models.

DATA & METHODOLOGY

Data

Daily time series for the mean three-month futures prices of three commonly traded non-ferrous metals (aluminum, copper and zinc) are used for this study. The sample covers the period December 12, 2003 – December 15, 2008. All three-month futures prices are sourced from London Metal Exchange (LME) and these prices are given in US dollars per ton. The total observations for each metal are 1305. All data used is in natural logarithm form of prices for forecasting the metal prices. The last thirty days data are kept as the hold out sample and estimate the models with the remaining data set. Then the forecasting accuracy of the models is evaluated using the holdout sample.

Unit Root Tests

In time series models in econometrics, the ARCH modeling requires that the series under study be in stationary form, so the first part of the analysis focused on the unit root properties of the variables. Several tests are available for testing the existence of unit roots, but the results are sometimes conflicting. In order to continue with the analysis safely, the stationarity of the series must be ensured. In theory, a time series is considered to be stationary if the series fluctuates around a constant mean which implies that the series have a finite variance. On the contrary, if a time series have a unit root this means the process is non-stationary. Namely, the series do not have a constant variance and no tendency to return to the predetermined path. The commonly used methods in the literature to test for the presence of unit roots are augmented Dickey–Fuller (ADF) test belongs to, as the name implies, Dickey and Fuller (1979), Phillips–Perron (PP) developed by Phillips and Perron (1988), Elliot–Rothenberg–Stock Dickey–Fuller GLS detrended (DF–GLS) test proposed by Elliott, Rothenberg, and Stock (1996), a more comprehensive Kwiatkowski–Phillips–Schmidt–Shin (KPSS) test is presented by Kwiatkowski, Phillips, Schmidt, and Shin (1992), Elliott, Rothenberg, and Stock (1996) developed a more recent test which is Elliott–Rothenberg–Stock (ERS) test and, Ng–Perron $MZ\alpha$ (NP) test is created by Ng and Perron (2001). All of these procedures are applied so that the results of the study are more reliable. Detailed explanations of each of these procedures are not given here due to space limitations. However, extensive researchs of Maddala and Kim (1998) and Ng and Perron (2001) can be used for detailed information about unit root tests. In general, the ADF and PP tests are criticized because they have very low power; these tests cannot differentiate highly persistent stationary processes from non-stationary processes and the power of these tests diminish as deterministic terms are added to the test regressions. KPSS also has the same low power problems. Efficient unit root tests are proposed for maximum power by Elliot, Rothenberg, and Stock (1996) and Ng and Perron (2001). These tests have considerably higher power than the ADF, PP or KPSS unit root tests. All of these tests are included in this study because they are still in use in literature. Null hypothesis of all unit root tests employed in this study states that the series under analysis has a unit root (non-stationary) against the

alternative that it is stationary. The only exception is the KPSS where the null hypothesis states that the series is stationary.

ARMA(p,q) – EGARCH(1,1)

The most common of the several asymmetric GARCH specifications is the EGARCH model, which is argued to be superior to alternative models (Radha & Thenmozhi, 2002). In order to carry out the analysis of metal price data, a form for the variance equation must be selected. The GARCH(1,1) specification for the variance equation is suggested in the literature for modelling volatility, so the EGARCH(1,1) model will be used in this study. The reason for that is the GARCH models do not take into account the leverage effect and hence the EGARCH model is used to capture whether the asymmetric effect is present. Proposed method of exponential GARCH or EGARCH model to capture the leverage or asymmetric effects by Nelson (1991) includes a coefficient, γ , that account for such asymmetries, as seen in the variance equation in equation 1:

$$\ln(\sigma_t^2) = \omega + \beta \ln(\sigma_{t-1}^2) + \gamma \frac{u_{t-1}}{\sqrt{\sigma_{t-1}^2}} + \alpha \left[\frac{|u_{t-1}|}{\sqrt{\sigma_{t-1}^2}} - \sqrt{\frac{2}{\pi}} \right] \quad (1)$$

Therefore, this variance equation follows the mean equation that is assumed to follow an ARMA(p,q) model. In this study, we select the the best ARMA specification (p and q) based on Akaike Information Criterion (AIC). The ARMA model in general form is represented in equation 2:

$$y_t = \mu + \sum_{i=1}^p \phi_i y_{t-i} + \sum_{i=1}^q \theta_i u_{t-i} + u_t \quad (2)$$

First of all, stationarity of the series has been tested to ensure that they do not contain unit roots. After ensuring stationarity of the series, the models are estimated by maximum likelihood estimation procedure and the best model with the appropriate AR and MA lengths are selected via the minimum Akaike information criterion (Bozdogan, 2000). Then the inverted roots of the final model are also checked the stationarity of the model. Last step in selecting the best ARMA specification is done for each non-ferrous metal price by significance tests of coefficients of the AR and MA terms. Additionally, the leverage effect is tested via the coefficient, γ , added into equation that account for such asymmetries.

ARMA(p,q) – GARCH(1,1)

Bollerslev (1986) introduced the generalized autoregressive conditional heteroscedastic (GARCH) models which describes the dynamic changes in conditional variance are dependent upon previous own lags. Because of this reason, the GARCH model is a more parsimonious model than the ARCH model. The GARCH family is extensively surveyed by Bollerslev, Chou, and Kroner (1992). They believe that the GARCH model is a very effective tool for examining volatility. Since the variance is known at time (t-1) in this model, one-step-ahead forecasts are already available. Multi-step-ahead forecasts can be calculated by repeating same procedure infinitely. As it was mentioned earlier in this paper, GARCH(1,1) model is selected for variance equation while modeling volatility. The variance equation is given in equation 3:

$$\sigma_t^2 = \alpha_0 + \alpha_1 u_{t-1}^2 + \beta \sigma_{t-1}^2 \quad (3)$$

As in the EGARCH process, the best ARMA(p,q) specification (see equation 2) must be selected for the mean equation. The best specification selection proceeds exactly the same with the best ARMA specification selection in the ARMA(p,q) – EGARCH(1,1) part of the study, except the leverage effect part.

Forecasting

The best specification selection is followed by the evaluation of the forecasting results of GARCH(1,1) and EGARCH(1,1) models. Several measures are used to carry out this comparison and these measures are calculated as follows :

$$\text{Root Mean Squared Error (RMSE)} = \sqrt{\frac{\sum_{t=T+1}^{T+h} (\hat{y}_t - y_t)^2}{h}} \quad (4)$$

$$\text{Mean Absolute Error (MAE)} = \frac{\sum_{t=T+1}^{T+h} |\hat{y}_t - y_t|}{h} \quad (5)$$

$$\text{Mean Absolute Percentage Error (MAPE)} = 100 \sum_{t=T+1}^{T+h} |\hat{y}_t - y_t| / y_t / h \quad (6)$$

$$\text{Theil Inequality Coefficient} = \frac{\sqrt{\sum_{t=T+1}^{T+h} (\hat{y}_t - y_t)^2 / h}}{\sqrt{\sum_{t=T+1}^{T+h} \hat{y}_t^2 / h} + \sqrt{\sum_{t=T+1}^{T+h} y_t^2 / h}} \quad (7)$$

The first two error statistics, RMSE and MAE, mainly based on the dependent variable scale. Forecasts of different models are compared by using these relative measures. The model with the lowest value of the error statistics will lead to a better forecasting performance. The other two statistics do not depend on a relative scale. MAPE equals to when explaining a perfect fit. However, MAPE does not have an upper restriction. The Theil inequality coefficient always gives values between zero and one, where perfect fit indicated by zero.

Decomposition of the mean squared error into proportions is given below:

$$\text{Bias Proportion} = \frac{(\sum \hat{y}_t / h - \bar{y})^2}{\sum (\hat{y}_t - y_t)^2 / h} \quad (8)$$

$$\text{Variance Proportion} = \frac{(s_{\hat{y}} - s_y)^2}{\sum (\hat{y}_t - y_t)^2 / h} \quad (9)$$

$$\text{Covariance Proportion} = \frac{2(1-r)s_{\hat{y}}s_y}{\sum (\hat{y}_t - y_t)^2 / h} \quad (10)$$

where $\sum \hat{y}_t / h$, \bar{y} , $s_{\hat{y}}$, s_y are defined as the means and standard deviations of \hat{y}_t and y_t and correlation between them is r . The bias proportion measures how far the mean of the forecasts is from the mean of the actual data. The variance proportion measures the difference between the variation of the actual data and the variation of the forecasts. The covariance proportion measures the remaining unsystematic part of the forecasting errors. These proportions have to add up to one. Accurate forecasts have small bias and variance proportions so that most of the error can be attributed to the covariance proportions.

EMPRICAL RESULTS

Summary of the results of the unit root tests are given in Table 1. ADF, DF–GLS, and PP critical values are sourced from MacKinnon (1991). KPSS critical values are from Kwiatkowski, Phillips, Schmidt, and Shin (1992) and MZA critical values are from Ng and Perron (2001). Elliot, Rothenberg, and Stock (1996) gives the critical values of ERS. Although the results seem to maintain a conflict between the tests, in general the aluminium, copper, and zinc prices are stationary in levels which means that all variables are integrated of order 1.

Literature suggests that the presence of autoregressive conditional heteroscedasticity in the residuals raises the possibility of the leverage effect. In order to examine the possibility of the leverage effect, an ARMA-EGARCH (1,1) model is estimated. The ARMA models of order up to 1,1 for the natural logs of three metal prices are estimated. Stationarity of the series is tested by ensuring that they do not contain unit roots. According to the test results, all of the specifications do not contain unit root which means analysis can continue without a stationarity doubt. The Akaike information criterion (AIC) (not reported here) choose ARMA(1,0) specification for the prices for aluminum and copper. For zinc, ARMA(1,1) specification minimizes the Akaike Information Criterion. In addition, t-statistics of coefficient estimates are used to evaluate the performance of the selected specifications. The tests (not reported here) show that ARMA(1,0) specification is statistically appropriate for the prices for aluminum and copper. Identically, the results for t-statistics ARMA(1,1) specification is appropriate for zinc. For all the metal prices, parameter estimation is conducted similarly on an EGARCH (1,1) for variance equation and the appropriate ARMA model for the mean equation. Best specifications for aluminum and copper prices is ARMA(1,0)-EGARCH(1,1) and ARMA(1,1)-EGARCH(1,1) for zinc. Proposed method of exponential GARCH or EGARCH model to capture the leverage or asymmetric effects is Nelson's (1991) which includes a coefficient that account for such asymmetries. The interpretation of this coefficient in the variance equation of the EGARCH model shows that asymmetric effect is not present in prices of the three commonly traded non-ferrous metals and it is statistically insignificant (unit root test results will be available upon request).

Table 1 EGARCH versus GARCH¹

$$\ln(\sigma_t^2) = \omega + \beta \ln(\sigma_{t-1}^2) + \gamma \frac{u_{t-1}}{\sqrt{\sigma_{t-1}^2}} + \alpha \left[\frac{|u_{t-1}|}{\sqrt{\sigma_{t-1}^2}} - \sqrt{\frac{2}{\pi}} \right] \quad (1)$$

$$\sigma_t^2 = \omega + \alpha_1 u_{t-1}^2 + \beta \sigma_{t-1}^2 \quad (3)$$

| β | 0.976429 ^c (0.008434) | 0.976574 ^c (0.010879) | 0.971787 ^c (0.009974) | 0.904395 ^c (0.022494) | 0.892974 ^c (0.035641) | 0.910125 ^c (0.021346) |
| γ | 0.043081 ^a (0.028731) | -0.003261 ^a (0.028650) | 0.003219 ^a (0.026896) | - | - | - |
| α | 0.132326 ^c (0.036731) | 0.156935 ^c (0.046162) | 0.166648 ^c (0.044247) | - | - | - |
| α_1 | - | - | - | 0.067203 ^b (0.027845) | 0.078360 ^b (0.026566) | 0.074418 ^b (0.019853) |

¹Notes to Table: Coefficient estimates and their standard errors are given in parantheses. ^{a, b, c} Significant at 1%, 5%, and 10% levels, respectively.

As it was mentioned in Data & Methodology part of this paper, best ARMA specification selection for the GARCH models proceeds exactly the same with the best ARMA specification selection in the ARMA(p,q) – EGARCH(1,1) part of the study, except the leverage effect part. Best specifications for aluminum and copper prices is ARMA(0,1)-EGARCH(1,1) and ARMA(0,0)-EGARCH(1,1) for zinc.

After the best specification selection, this study continues with the evaluation of the forecasting results of the selected specifications. Based on the RMSE and MAE performance measures in Table 3, GARCH(1,1) models are slightly superior to EGARCH(1,1) models for all three non-ferrous metals. Also the interpretation of MAPE results confirms the RMSE and MAE results (see Table 2) that GARCH(1,1) model results in a slightly better fit than EGARCH(1,1) models for all three metal price data. However, Theil inequality coefficient gives conflicting results with other three forecasting error statistics for all three data sets. Namely, EGARCH(1,1) models result in a better fit than GARCH(1,1) models according to Theil inequality coefficient estimates (see Table 2). Also, proportions that decomposed from forecasting errors confirms the results of Theil inequality coefficient because GARCH(1,1) models have higher variation from the actual data than EGARCH models and GARCH(1,1) models have no covariance component (see Table 2).

Table 2 Forecast Statistics

$$\ln(\sigma_t^2) = \omega + \beta \ln(\sigma_{t-1}^2) + \gamma \frac{u_{t-1}}{\sqrt{\sigma_{t-1}^2}} + \alpha \left[\frac{|u_{t-1}|}{\sqrt{\sigma_{t-1}^2}} - \sqrt{\frac{2}{\pi}} \right] \quad (1)$$

$$\sigma_t^2 = \omega + \alpha_1 u_{t-1}^2 + \beta \sigma_{t-1}^2 \quad (3)$$

SUMMARY AND CONCLUSIONS

In this paper the three non-ferrous metals' prices are modeled using nonlinear autoregressive conditional heteroscedasticity models. We discover that the three prices are governed by the conditional heteroscedasticity effects. However, on the EGARCH specification the leverage effect was not significant for any of the three metals. We then proceed with the comparison of the forecasting accuracy of the GARCH and EGARCH models. We find that in general both models show similar performance in forecasting the prices of the three metals. However, the GARCH model performs slightly better than the EGARCH model according to several criteria. Furthermore, since the GARCH model is more parsimonious, we recommend the utilization of the GARCH model for forecasting the prices of aluminum, copper, and zinc traded in the LME.

VARIOUS USER GROUPS' PERCEPTION OF CORPORATE ANNUAL REPORTS: EVIDENCE FROM TURKEY

Ahmet Büyüksalvarcı and Fehmi Karasioğlu
Selcuk University, Turkey

ABSTRACT

The aim of corporate annual report is to provide useful information to various user groups, all of whom have different information needs. The perception of various user groups of corporate annual reports has been investigated in a number of studies. The vast majority of these studies, however, have covered developed economies. Little reference has been made in the literature to the developing countries. In this study an attempt is made to provide empirical evidence on the usefulness of different aspects of the corporate annual report to various Turkish user groups. We provide evidence based on a questionnaire of seven different user groups. A questionnaire was distributed to 100 individual investors, 50 institutional investors, 50 financial analysts, 100 academics, 50 bank loan officers, 50 stock market brokers and 100 auditors. A total of 328 completed questionnaires were returned giving a response rate of 65.6 percent. Descriptive statistics, Chi-Square and Kruskal-Wallis tests were used to analyze the results.

INTRODUCTION

A corporate annual report can be viewed as the major output of the financial accounting system. The annual report consists of the chairman's letter, the director's report, the financial statements, footnotes to financial statements, the auditor's report and various other disclosures. This report is also the main vehicle for managers to demonstrate how effective they have been in meeting their fiduciary duties and carrying out their stewardship functions in the organization (Anderson and Epstein, 1995). The objective of general purpose corporate annual reports is to supply information to a number of user groups to enable them to make investment decisions about the allocation of scarce resources. This report should contain information about the financial condition of the enterprise and other information that would be of interest to the user groups.

This paper attempts to discover the most important sources of information about Turkish companies with particular emphasis on the corporate annual report. The research also provides evidence on the importance, understanding and usefulness of corporate annual reports to various user groups in Turkey.

CORPORATE ANNUAL REPORTS IN TURKEY

Corporate annual report preparations have flourished (evolved) in each country based on the nature of its capital market, the level of economic development, legal systems, the regulatory enforcement regime and the quality of accounting regime (Saudagaran, 2004).

In this framework, Capital Markets Board of Turkey (CMB) makes the preparations in annual activity reports of registered companies in Istanbul Stock Exchange (ISE) and amendments consisting of these concepts. In accordance with the amendment (Corporate Governance Principles of Turkey) put into effect in 2005 (CMB, 2003); the annual

report should be prepared in a manner to ensure public access to all kinds of information regarding the company's activities. Statistical data and graphics should also be incorporated in the annual report.

The annual report should be signed by the board chairman, chief executive officer/general director and department manager responsible for the preparation of periodical financial statements and reports or by the company official who was appointed to fulfill such responsibility, as well as board member(s) responsible for the preparation of the financial statement and reports if a distribution of duties is performed among the members of the board of directors and a statement indicating that the current periodical financial statements completely reflects the true financial status of the company and that the company acts in accordance with the related legislation should be provided. In case any of the above-mentioned persons disagree with the information included in the annual report, the matters disagreed should be included in the annual report in writing.

The below listed issues should be incorporated in the company's annual report;

- Scope of activities of the company,
- Information about the sector in which the company operates and the company's status within this sector,
- Board of directors' evaluation and analysis of financial status and operation results; level of achievement of the planned operations; the company's position with respect to the defined strategic objectives,
- Board of directors' statement about the status of internal control system,
- Audit firm's opinion about the internal control system,
- Rating agency's opinion about the company,
- Detailed explanation about the foreseeable risk factors regarding future operations,
- Analysis of significant transactions carried out during the preceding year with the group companies and other related persons and institutions,
- Commercial and non-commercial transactions between the company and companies, where board members, executives and shareholders, who either directly or indirectly own at least 5% of the company's capital, possess at least 5% and more of shareholding or having the control of the latter,
- The curriculum vitae of the company's board members and executives; their duties and responsibilities within the company; positions held outside the company and compliance with the internally established company rules in that respect; independence statements by the independent board members; remuneration, bonuses and other benefits offered and performance evaluation of the corporate governance committee; proportion of shares and amounts invested in the company's capital; transactions made between the mentioned persons and the company, possessions in the company's capital market instruments; lawsuit filed against them on company operations,
- Changes in the organization, capital, ownership and management structure of the company,
- Ownership structure table showing the controlling shareholder(s), as released from any indirect and cross ownership relations,
- Fines levied as a result of practices acting against the legislative provisions and the reasons thereof,
- Changes in the legislation that may affect the company operations at a significant level,
- Important lawsuits filed against the company and possible consequences thereof; warnings, notifications or administrative fines and similar information submitted by public authorities,
- Dividend policy; the reason/s for not distributing dividends, if applicable,
- Future forecasts for sales, company's level of efficiency, company's market share, income yielding capacity of the company, company profitability and the company's debt/equity ratios and similar issues,
- Access to transcripts of information about the function of general shareholders' meeting, shareholders rights and the Principles that refer to the exercise of these rights.
- Precautionary measures that may be taken in order to prevent any possible conflicts of interest arising between the company and the related organizations which offer investment advice, investment analysis, and rating activity etc.

RESEARCH METHODOLOGY

Objectives of the Study

The aim of this study is to empirically examine the importance, understanding and usefulness of corporate annual reports to external users in Turkey. In order to achieve its objective the study will seek answers to the following questions:

- Is there difference among user groups on their frequency of annual report usage?
- What are the sources of corporate information used by the various Turkish user groups?
- How different various user groups of the corporate annual reports in Turkey perceive the importance of the various sections of these reports?
- How different various user groups of the corporate annual reports in Turkey perceive the understandability of the various sections of these reports?
- How different various user groups of the corporate annual reports in Turkey perceive the usefulness of the various sections of these reports?

Data Collection and Sampling

To provide empirical evidence on the above research questions, a questionnaire was designed to fulfill our research objective. An extensive review of the literature (see for example, Baker and Haslem, 1973; Lee and Tweedie, 1975a,b; Wilton and Tabb, 1978; Arnold and Moizer, 1984; Abu-Nassar and Rutherford, 1996; Bence *et al.*, 1995; Naser *et al.*, 2003; Alattar and Al-Khater, 2007; Al-Razeen and Karbhari, 2004 a,b; Stainbank and Peebles, 2006; Berry and Waring, 1995; Barlett and Chandler, 1997; Alijarde, 1997; Wallace, 1988) was undertaken to ensure that no important point was omitted. The questionnaire was divided into two parts. The first part sought general information on the respondent's demographic profile. The second part of the questionnaire was related to the respondent's opinion regarding the level of importance, understanding and usefulness of the various sections of the corporate annual reports when making investment decisions.

Drawing on the literature and considering the Turkey environment, seven groups of external users of annual corporate reports were identified which include: individual investors, institutional investors, financial analysts, academics, bank loan officers, stock market brokers and auditors. The respondents were asked to indicate their opinion on a five-point Likert scale in terms of "very important (5)", "very useful (5)", "very understandable (5)" or "strongly agree (5)" to "not important at all (1)", "not useful at all (1)", "not understandable at all (1)" or "strongly disagree (1)". The questionnaire was delivered by hand and by e-mail in period between September and November 2008. Details of the number of questionnaires that were distributed, the number of returned questionnaires, the response rate for each group and the overall response rate are presented in Table 1 below. It can be observed from Table 1 that a total of 500 questionnaires were distributed to the seven groups in our sample. We received a total of 328 usable responses generating an overall response rate of 65.6 per cent.

Table 1: Questionnaire response rate by user groups

| User Groups | Distributed Questionnaire | Received Questionnaire | Response Rate (%) |
|-------------------------|---------------------------|------------------------|-------------------|
| Individual investors | 100 | 84 | 84 |
| Institutional investors | 50 | 28 | 56 |
| Financial analysts | 50 | 34 | 68 |
| Academics | 100 | 73 | 73 |
| Bank loan officers | 50 | 32 | 64 |
| Stock market brokers | 50 | 23 | 46 |
| Auditors | 100 | 54 | 54 |
| Total | 500 | 328 | 65.6 |

Descriptive statistics namely frequencies and measures of central tendencies were used for data analysis. In addition to the descriptive statistics, Pearson Chi-Square and Kruskal-Wallis tests were used to determine whether or not the mean responses of the seven user groups are significantly different. The tests were carried out for significance at the 5 percent confidence levels in order to confirm the results of significant differences among means.

RESEARCH FINDINGS

Findings About Demographic Profile of Respondents

User groups who took part in the survey were asked to give information about their gender, age, level of education and years of experience. Sixty-eight percent of the respondents were male. Participants' age ranged between 25 and 65. The average age of the participants was 37 years and 79 percent of them indicated that they hold a bachelor degree or more. Ninety-two of the respondents have more than six years of working experience.

Findings About Level of Annual Report Usage

One of our aims is to determine if there is a significant difference in the frequency of annual report usage by different groups.

Table 2: Level of Annual Report Usage (%)

| Level of Frequency | Individual Investors | Institutional Investors | Financial Analysts | Academics | Bank Loan Officers | Brokers | Auditors | Total |
|---------------------------|-----------------------------|--------------------------------|---------------------------|------------------|---------------------------|----------------|-----------------|--------------|
| Always | 17.7 | 4.9 | 5.5 | 11.3 | 7.6 | 4.3 | 8.2 | 59.5 |
| Usually | 3.4 | 3.0 | 4.9 | 6.4 | 2.1 | 1.8 | 4.3 | 25.9 |
| Sometimes | 2.4 | 0.6 | 0.0 | 4.6 | 0.0 | 0.6 | 4.0 | 12.2 |
| Seldom | 2.1 | 0.0 | 0.0 | 0.0 | 0.0 | 0.3 | 0.0 | 2.4 |
| Never | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |

Table 2 shows how often different groups use financial reports for decision making purposes. The results indicate that more than 85% of the user-groups regularly turn to annual reports for making investment decision. The result of the Pearson chi-square test ($\chi^2 = 55.351$, $p = 0.000$) show statistically significant difference at the 1% level for all seven levels of the frequency tested. Hence, we can say that there is difference among user-groups on their frequency of annual reports usage. User-groups use annual reports with different levels of frequency.

Findings About the Sources of Corporate Information

To investigate how user groups rate the influence of different sources of information, participants were asked to rate the importance of nine separate possible sources of information about companies. The respondents were asked to rate them on a five point Likert-type scale. The scale ranges from 1 “not important at all” to 5 “very important”. The results are reported in Table 3. As seen in Table 3, at the whole sample level, users ranked the annual report as the most important source of information and friends' advice as the least important source. As for the separate user groups, on the other hand, five out of the seven user groups (institutional investors, financial analysts, academics, bank loan officers and auditors) indicated that the annual report is the most important source of information about companies. While individual investors indicated that tips and rumors is the first source of corporate information, brokers pointed out that published daily price is the first source of information when making investment decisions about a company. Kruskal-Wallis tests were carried out for each of the nine different sources of information to gauge the extent of similarity in how user groups perceived the importance of these items. The results of the analysis indicate no statistically significant differences among users about the annual report, government publication, newspapers, magazines and journals, published daily share price and direct information from company. But there is a statically significant difference among users about the stockbrokers' advice ($\chi^2 = 78.880$, $p = 0.000$), friends'

advice ($\chi^2 = 167.960, p = 0.000$), tips and rumors ($\chi^2 = 21.189, p = 0.002$) and specialist's advice ($\chi^2 = 14.324, p = 0.026$).

Table 3: Influence of Difference Sources of Information as Mean Scores (rank in parentheses)

| Sources of Information | Individual Investors | Institutional Investors | Financial Analysts | Academics | Bank Loan Officers | Brokers | Auditors | Total |
|------------------------------------|----------------------|-------------------------|--------------------|-------------|--------------------|-------------|-------------|-------------|
| Annual report | 4.62 (2) | 4.68 (1) | 4.59 (1) | 4.60 (1) | 4.81 (1) | 4.52 (2) | 4.56 (1) | 4.62 (1) |
| Government publication | 4.31 (8) | 4.11 (6) | 4.38 (4) | 4.19 (6) | 4.69 (2) | 4.17 (6) | 4.20 (3) | 4.28 (5) |
| Newspapers, magazines and journals | 4.31 (8) | 3.96 (7) | 4.32 (5) | 4.19 (6) | 4.41 (5) | 4.43 (3) | 4.06 (4) | 4.23 (6) |
| Published daily share price | 4.36 (7) | 4.46 (3) | 4.53 (2) | 4.38 (3) | 4.28 (7) | 4.70 (1) | 3.93 (5) | 4.34 (3) |
| Stockbrokers' advice | 4.55 (6) | 2.61 (9) | 3.59 (8) | 4.15 (7) | 4.28 (7) | 3.91 (7) | 3.67 (7) | 3.98 (7) |
| Friends' advice | 4.58 (5) | 2.82 (8) | 2.79 (9) | 4.26 (5) | 1.88 (8) | 2.22 (8) | 2.44 (8) | 3.39 (8) |
| Tips and rumors | 4.64 (1) | 4.29 (4) | 4.18 (7) | 4.37 (4) | 4.38 (6) | 4.22 (5) | 3.85 (6) | 4.32 (4) |
| Specialist's advice | 4.60 (4) | 4.25 (5) | 4.24 (6) | 4.37 (4) | 4.47 (4) | 4.30 (4) | 3.93 (5) | 4.34 (3) |
| Direct information from company | 4.61 (3) | 4.54 (2) | 4.47 (3) | 4.58 (2) | 4.53 (3) | 4.52 (2) | 4.43 (2) | 4.54 (2) |

Findings About Importance Level of Annual Report Sections

Since one of the objectives of the study is to determine how respondents rate different sections of the annual reports, the annual report was divided into eight sections and the respondents were asked to indicate to what extent these sections are important when making investment decisions. Table 4 shows the mean importance score that user groups accorded to the different parts of the annual report and their ranks. It can be seen from the table that eight sections of the annual report were considered remarkably important to user groups in Turkey, implying that they all are relevant for investment decision making with the balance sheet, income statement and auditor's report being of the there most important parts of the annual report. The results of Kruskal-Wallis test show that there is a statistically significant difference between user groups about the statement of cash flows ($\chi^2 = 18.460, p = 0.005$), accounting policies ($\chi^2 = 17.488, p = 0.008$) and historical information ($\chi^2 = 22.247, p = 0.001$). There is no statistically significant difference among user groups about the remaining five sections of annual reports.

Table 4: Importance of Annual Reports Sections as Mean Scores (rank in parentheses)

| Sources of Information | Individual Investors | Institutional Investors | Financial Analysts | Academics | Bank Loan Officers | Brokers | Auditors | Total |
|------------------------|----------------------|-------------------------|--------------------|-------------|--------------------|-------------|-------------|-------------|
| Balance sheet | 4.60 (2) | 4.57 (3) | 4.35 (5) | 4.68 (1) | 4.47 (6) | 4.57 (1) | 4.56 (2) | 4.57 (1) |
| Income statement | 4.61 (1) | 4.54 (4) | 4.29 (7) | 4.68 (1) | 4.44 (7) | 4.43 (3) | 4.59 (1) | 4.55 (2) |

| | | | | | | | | |
|-----------------------------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Footnotes to financial statements | 4.28 (5) | 4.57 (3) | 4.50 (2) | 4.45 (3) | 4.72 (2) | 4.26 (4) | 4.50 (4) | 4.45 (5) |
| Statement of cash flows | 3.80 (6) | 4.32 (5) | 4.47 (3) | 4.41 (4) | 4.53 (4) | 3.87 (7) | 4.41 (6) | 4.23 (6) |
| Accounting policies | 3.73 (7) | 4.32 (5) | 4.32 (6) | 4.23 (6) | 4.44 (7) | 4.13 (6) | 4.44 (5) | 4.17 (7) |
| Auditor's report | 4.55 (3) | 4.75 (1) | 4.41 (4) | 4.55 (2) | 4.56 (3) | 4.48 (2) | 4.52 (3) | 4.54 (3) |
| Board of directors' report | 4.52 (4) | 4.61 (2) | 4.71 (1) | 4.45 (3) | 4.75 (1) | 4.26 (4) | 4.44 (5) | 4.52 (4) |
| Historical information | 3.67 (8) | 3.18 (6) | 4.18 (8) | 4.29 (5) | 4.50 (5) | 4.22 (5) | 4.41 (6) | 4.06 (8) |

Findings About Understandability of Annual Report Sections

The user groups' level of understandability of different part of the annual report is reported in Table 5. At the whole sample level, statement of cash flows is the least understandable section though its mean was 4.21. On the other hand for the whole sample demonstrated that it is easy to understand balance sheet. The results of Kruskal-Wallis test revealed that although users groups' views regarding their understandability of notes to financial statements ($\chi^2 = 16.093$, $p = 0.013$) and statement of cash flows ($\chi^2 = 23.233$, $p = 0.001$) were significantly different, they shared similar views on their understandability of balance sheet, income statement, accounting policies, auditor's report and board of directors' report.

Table 5: Understandability of Annual Report Sections as Mean Scores (rank in parentheses)

| Sources of Information | Individual Investors | Institutional Investors | Financial Analysts | Academics | Bank Loan Officers | Brokers | Auditors | Total |
|-------------------------------|----------------------|-------------------------|--------------------|-------------|--------------------|-------------|-------------|-------------|
| Balance sheet | 4.57 (2) | 4.61 (2) | 4.38 (4) | 4.70 (1) | 4.50 (4) | 4.57 (1) | 4.57 (2) | 4.58 (1) |
| Income statement | 4.60 (1) | 4.50 (4) | 4.32 (5) | 4.68 (2) | 4.50 (4) | 4.43 (2) | 4.54 (3) | 4.55 (2) |
| Notes to financial statements | 4.27 (4) | 4.54 (3) | 4.53 (2) | 4.51 (3) | 4.78 (1) | 4.13 (4) | 4.52 (4) | 4.46 (3) |
| Statement of cash flows | 3.74 (7) | 4.39 (5) | 4.47 (3) | 4.41 (5) | 4.53 (3) | 3.70 (6) | 4.44 (5) | 4.21 (7) |
| Accounting policies | 4.05 (5) | 4.29 (6) | 4.26 (6) | 4.29 (6) | 4.38 (6) | 4.13 (5) | 4.43 (6) | 4.24 (6) |
| Auditor's report | 4.35 (3) | 4.71 (1) | 4.32 (5) | 4.51 (3) | 4.47 (5) | 4.13 (4) | 4.61 (1) | 4.45 (4) |
| Board of directors' report | 4.04 (6) | 4.54 (3) | 4.56 (1) | 4.47 (4) | 4.63 (2) | 4.23 (3) | 4.44 (5) | 4.37 (5) |

Findings About Usefulness of Annual Report Sections

The participants were asked to give their level of agreement with six statements that may reflect the areas where the annual report sections can be useful to the user groups. The results of their answers are presented in Table 6. As shown in Table 6, all seven groups assigned an average usefulness mean above 4.4 to each of the given six statements, revealing a strong agreement on the usefulness of information contained in the annual report sections for investment decisions. Respondents gave a preference for using annual report sections to provide primary

information for making investment decisions over the five statements. The results of Kruskal-Wallis test show that there is no statistically significant difference among user groups about six statements.

Table 6: Usefulness of Annual Report Sections as Mean Scores (rank in parentheses)

| Annual Report Sections... | Individual Investors | Institutional Investors | Financial Analysts | Academics | Bank Loan Officers | Brokers | Auditors | Total |
|--|-----------------------------|--------------------------------|---------------------------|------------------|---------------------------|----------------|-----------------|--------------|
| To provide primary information for making investment decisions | 4.43 (1) | 4.54 (2) | 4.47 (5) | 4.64 (2) | 4.56 (4) | 4.35 (2) | 4.60 (3) | 4.53 (1) |
| To provide information about the company's liquidity | 4.37 (3) | 4.57 (1) | 4.65 (1) | 4.52 (4) | 4.75 (1) | 4.22 (4) | 4.64 (1) | 4.52 (2) |
| To provide information to help investors to monitoring their investment | 4.40 (2) | 4.46 (3) | 4.62 (2) | 4.62 (3) | 4.44 (5) | 3.96 (6) | 4.54 (5) | 4.47 (3) |
| To help investors to predict future dividends of the company | 4.29 (5) | 4.39 (4) | 4.53 (3) | 4.70 (1) | 4.63 (3) | 4.39 (1) | 4.40 (6) | 4.47 (3) |
| To help investors to evaluate company's performance overtime | 4.35 (4) | 4.39 (4) | 4.47 (4) | 4.49 (5) | 4.38 (6) | 4.30 (3) | 4.56 (4) | 4.43 (4) |
| To help investors to make comparison between a company's performance with other companies' performance | 4.29 (5) | 4.32 (5) | 4.41 (5) | 4.40 (6) | 4.66 (2) | 4.13 (5) | 4.63 (2) | 4.41 (5) |

CONCLUSIONS

The main purpose of this study was to investigate the perception of various user groups towards corporate annual reports in Turkey. Hence, seven user groups were surveyed: individual and institutional investors, financial analysts, academics, bank loan officers, stock market brokers and auditors.

It is possible to summarize the findings as in the following;

- Majority of respondents indicated that they regularly used annual reports for making investment decision. And user groups used annual reports with different levels of frequency.
- Annual reports were rated as the most important source of information about companies. Friends' advice was considered as the least important source of information by all user groups. Also there is a statically significant difference among users about the stockbrokers' advice, friends' advice, tips and rumors and specialist's advice.
- Balance sheet, income statement and auditor's report were identified as the there most important parts of annual reports based on the results of mean importance score. And there is a statistically significant difference between user groups about the statement of cash flows, accounting policies and historical information.
- There was general consensus within the user groups that all of the main sections of the annual report published by Turkish companies are not difficult to understand. Balance sheet was rated as the most understandable section of annual reports. Although users groups' views regarding their understandability of notes to financial statements and statement of cash flows were significantly different, there is no statistically significant difference between user groups about their understandability of balance sheet, income statement, accounting policies, auditor's report and board of directors' report.
- When the comparison of the usefulness of information contained in the annual report sections for the user groups are examined, it is seen that there is a strong agreement. According the results, respondents gave a preference for using annual report sections to provide primary information for making investment decisions over the five statements. Also there is no statistically significant difference among user groups about six statements.

AUTOMATIC IDENTIFICATION OF THE GARCH MODEL ORDER USING NEURAL NETWORKS

**André Machado Caldeira PUC-RJ, Reinaldo Castro Souza-PUC-RJ, Ricardo
Correia Geffroy
Walter Gassenferth, Maria Augusta Soares Machado
Faculdades IBMEC/RJ, Brasil**

ABSTRACT

GARCH models are being largely used to model the volatility of financial assets, the GARCH(1,1) being the most used one in practice. The identification phase of the GARCH model orders specification has not been fully looked into. However, the technology of knowledge-based systems has been used in some applications of time series models such as time series classification problems (Reynolds et al, 1995) and in identifying ARMA models (Machado, 2000) and SARIMA ([Luiza]). This paper aims to develop an intelligent system that can correctly identify the specification of GARCH models, thus allowing for an easier choice of the model to be used and avoiding the indiscriminate use of GARCH(1,1) model.

INTRODUCTION

“Identifying the order of a GARCH model to be adjusted to an actual series is usually hard. Using low order models, such as (1, 1), (1, 2) or (2, 1) and then choosing the model based upon various criteria such as AIC or BIC is recommended...” (Morettin and Tolo, 2004).

The ARCH and GARCH models have been widely used, both theoretically and in practical applications, since they were created in 1982 and 1986, respectively. Nevertheless, the focus of studies has been turned chiefly to either the theoretical studies or to predicting the volatility in the studies applied to actual series, where the GARCH(1,1) is usually assumed.

There are not many studies concentrating on the order identification phase of GARCH models. Some studies using computational intelligence have been developed in time series models such as in time series classification problems (Reynolds et al, 1995) and in identifying ARMA models (Machado, 2000) and SARIMA. In face of this context, this paper aims to create an intelligent system using Neural Networks that is able to improve the order identification phase of models, thus avoiding the indiscriminate use of the GARCH(1,1) model. For such, simulated time series will be used to validate the system proposed hereby. The outcomes achieved with the intelligent system will be compared to the choice of the models through the AIC (Akaike Information Criterion) and BIC (Bayesian Information Criterion) statistics.

CONCEPTS

Garch Model

Today’s financial market has been greatly influenced by everyday events. By analyzing a series of financial returns, which can be usually represented as a time series that shifts between periods of large and small fluctuation of values around its mean and makes “agglomerates”, volatility can be defined as “the variation over time of the conditional variance of a time series.” (Veiga; Fernandes and Baidya, 1993)

This volatility is good and beneficial for the financial market, since an increase in volatility is of interest not only to market investors and analysts but also to economists and policymakers. However, when such volatility is excessive, it affects economy in a negative manner and impairs the ‘smooth running’ of the financial system.

Excessive volatility might interfere with the financial market in many ways, namely:

- The prices of financial assets: such volatility may affect the level of investment, since the risk would be higher, prompting a search for other lower-risk assets in other markets.
- The interest rate: with higher costs to take credit or loans for investment projects, economy level might fall.
- The exchange rate: it may cause a significant reduction in the country’s imports if the prices of imported and exported goods increase due to exchange risk, causing the consumption of such goods to be reduced.

Volatility is very important within the economy and for the financial market. For that reason, economic estimates and forecasts have a different treatment from that of the classical models of time series (ARIMA de Box.& Jenkins, 1976), since they do not duplicate any underlying characteristics (stylized facts) such as conditional/unconditional non-normality and non-constant conditional variance over time.

There are several types of models for volatility modeling such as the Exponential Smoothing (EWMA), stochastic volatility models (VE) and GARCH. This paper focuses on the GARCH family models. For further details on other models, please refer to Clark (1973), Taylor (1980 and 1986), Tauchen and Pitts (1983). Hull and White (1987), and Harvey et al. (1994).

Before starting with the GARCH models, it is important to know some stylized facts of financial series in order to clarify the inspiration behind such models. For a deeper study on these stylized facts, please refer to Bernardo and Fernandes (1999).

- Stylized Fact 1 – Stationarity: the statistical properties of the series are invariant over time.
- Stylized Fact 2 – Poor/No linear dependence and non-linear dependence (GARCH effect): normally, the series is poorly or not self-correlated, but the series containing the square of the observations is self-correlated.
- Stylized Fact 3 – Non-normality: The distributions of the financial series generally show heavy tails and asymmetry, not fitting the Gaussian curve.
- Stylized Fact 4 – Existence of Volatility clusters: The financial series usually shift between periods of high and low volatility; that is, the conditional variance of the series varies over time.

A core hypothesis concerning derivation of the model for pricing options, as suggested by Black and Scholes (1973), is the assumption for the series of assets returns to have a log-normal distribution with constant mean and variance over time. However, it was faithfully used until Mandelbrot (1963) proposed the distribution of heavy tails and the volatility clusters. The characteristics were interpreted as evidence of stochastic volatility of financial assets.

In order to represent such characteristics, for approximately two decades the GARCH family models have been broadly used in the finance literature, especially regarding derivatives. The initial success of the ARCH models to capture non-linear dependence allowed for many extensions.

Garch Model Representations

The first model of the GARCH family was suggested by Engle (1982) with a goal to capture a part of the stylized facts of financial series. He proposed to model the series of the return squares by a q-order autoregressive model (AR(q)), thus naming such model Autoregressive Conditional Heteroskedastic or ARCH(q), which can be expressed by:

$$u_t^2 = \zeta + a_1 u_{t-1}^2 + a_2 u_{t-2}^2 + \dots + a_q u_{t-q}^2 + w_t \quad (0.1)$$

where w_t is a white noise:

$$\begin{aligned} E(w_t) &= 0 \\ E(w_t w_\tau) &= \begin{cases} \lambda^2 & \text{para } t = \tau \\ 0 & \text{caso contrário} \end{cases} \end{aligned} \quad (0.2)$$

At times it is convenient to use an alternative representation for the ARCH (q) process that imposes a slightly stronger assumption regarding the serial dependence of u_t . Suppose that:

$$u_t = \sqrt{h_t} v_t \quad (0.3)$$

where:

$$E(v_t) = 0 \quad E(v_t^2) = 1 \quad (0.4)$$

if h_t is written as:

$$h_t = \zeta + a_1 u_{t-1}^2 + a_2 u_{t-2}^2 + \dots + a_q u_{t-q}^2 \quad (0.5)$$

this implies that:

$$E(u_t^2 | u_{t-1}, u_{t-2}, \dots) = \zeta + a_1 u_{t-1}^2 + a_2 u_{t-2}^2 + \dots + a_q u_{t-q}^2 \quad (0.6)$$

Therefore, if u_t is generated by (0.3) and (0.5), then u_t follows as ARCH(q) process; and if (0.3) and (0.5) are replaced in (0.1), the result is:

$$h_t v_t = h_t + w_t \quad (0.7)$$

By using the specification of (0.3), the innovation w_t on the representation of AR(q) for u_t^2 in (0.1) can be expressed as:

$$w_t = h_t (v_t^2 - 1) \quad (0.8)$$

Notice that from (0.8), even if the unconditional variance of w_t was assumed as constant, the conditional variance of w_t varies over time; thus, the ARCH model can describe the volatility clusters.

In 1986, Bollerslev observed through empirical evidence that it was necessary to estimate the ARCH models with very high orders so as to capture the dynamics of conditional variance. By that, he created a more general and parsimonious of the ARCH models, called Generalized ARCH or (GARCH) (Bollerslev, 1986) to get that problem solved.

The same parsimony idea used in the ARMA models was used in GARCH models. That is, it can be easily demonstrated that an order one MA is equivalent to an infinite order AR. So, in order to reduce the number of parameters of the model, the AR-MA conjunction is used, thus forming the ARMA. The GARCH model is based upon the specification of the infinite-order ARCH model and h_t can be expressed as:

$$h_t = k + \sum_{i=1}^q \alpha_{t-i} u_{t-i}^2 + \sum_{j=1}^p \beta_{t-j} h_{t-j} \quad (0.9)$$

Just like the ARCH model depends on restriction for h_t to be positive for every 't', the GARCH models depend on the restrictions of $k > 0$, $\alpha_i \geq 0$ e $\beta_j \geq 0$. Nelson and Cao (1992) observed that the conditions $\alpha_i \geq 0$ and $\beta_j \geq 0$ were sufficient, but not necessary. By that, they inferred that, by imposing that all coefficients are non-negative, it is very restrictive and some of such coefficients were estimated to be negative in practice with the positive conditional variance. Consequently, such imposition was relaxed and in practice estimations are usually made without those restrictions.

In many high-frequency time series applications the conditional variance estimated through a GARCH(p,q) process shows strong persistence, namely:

$$\sum_{j=1}^p \beta_j + \sum_{i=1}^q \alpha_i \approx 1$$

If $\sum_{j=1}^p \beta_j + \sum_{i=1}^q \alpha_i < 1$, the (u_t) process is a second-order stationary, and the shock on the conditional variance of σ_t^2 has a decreasing impact in σ_{t+h}^2 , when 'h' grows, and it is asymptotically insignificant. This property is called persistence in literature.

Other variations were proposed which had diverse objectives such as the Exponential GARCH (EGARCH) and the TGARCH [Zakoian, 1991, Glosten et al., 1993, Rabemananjara and Zakoian, 1993], which seek to capture the asymmetry effect, that is, the fact of negative shocks on the returns of assets has a greater impact than that the positive shocks. The ARCH and GARCH models will be used as the object of study.

Modeling Strategy

According to Franses and Dijk (2000), the modeling sequence normally involves the following steps:

- Calculate time series statistics (ACF and PACF)
- Compare the values or sizes of such statistics to theoretical values that state whether the model is adequate. (Identification)
- Estimate the parameters of the suggested model in step 2. (Estimate)
- Assess models using adequacy metrics. (Validation)
- Re-specify the model, if necessary.
- Use the model with descriptive or predictive purposes. (Forecast)

The concern of this study lies on the phase of identifying the appropriate lag structure for the conditional variance equation in a GARCH process. The autocorrelation and partial autocorrelation functions of innovation series are normally used to identify and validate the time behavior of the ARMA model series (Box and Jenkins, 1976). Bollerslev et al. (1988) demonstrated that these very functions, when applied to the residues square series, can be useful to identify and validate the time behavior of the conditional variance equation in the GARCH form. So, identification and validation of a GARCH process can be performed as follows:

Being τ_n the n-th autocorrelation and ϕ_{kk} the k-th partial correlation of u_t^2 obtained through the solution of the equations for the GARCH, similar to the equations of Yule-Walker. Usual interpretations are applicable. For an ARCH(q) process, ϕ_{kk} has an abrupt cut after the q-th lag, a behavior that is identical to the partial autocorrelation function of the AR(q) processes. On the other hand, the autocorrelation function of u_t^2 for a GARCH(q,p) process is, in general, different from zero and decreases slowly. This way, the autocorrelation and partial autocorrelation functions of u_t^2 can be used to identify and validate the form of the GARCH models.

Another way to identify the architecture of the GARCH models is using the AIC and BIC statistics – the model showing the smallest statistics is selected as the identified model. Chapter 3 presents some results using this type of identification.

This paper focuses on the identification phase of the models, particularly in the identification of symmetrical GARCH models.

Neural Networks

One of the most widely used models of computational intelligence of present times is the neural networks. According to Haykin (1999), in 1943, McCulloch and Pitts set the beginning of the modern times for neural networks through a pioneer and innovative work. By putting together the expertise of McCulloch, a psychiatrist and

neuroanatomist, and the logic thinking of mathematics expert Pitts, this paper depicts a logic calculation of neural networks, assuming a model of a neuron that followed an “all-or-nothing” type of law. With a sufficient number of such units and duly adjusted synaptic connections operating synchronously, they demonstrated that a network built that way would accomplish, in principle, computing of any computable function. That work was an inspiration for several researchers such as Von Neumann, Hebb, Ashby, Taylor, amongst others, and is considered the starting point for the neural networks and artificial intelligence subjects.

The neural networks are mathematical models inspired in the human brain, that is, they are built from architectures of connected neurons, each neuron being represented by a mathematical equation and each connection between neurons being represented by weights or functions, which generate propagation signals and simulate synapsis.

The input layer represents the standards (or observations) to be presented to the network. This layer is connected to the first intermediate layer by weights, that is, how influential a given standard will be on each neuron of the next layer. Hidden layers are also connected by synaptic weights, which can also be interpreted as their contributions to the next connected neurons. These weights have “the knowledge” of the network, since they are the ones adapted during training. The hidden layer is where most of the processing is carried out. The output layer provides the result of all calculations among input values, weights and activation functions.

Each neuron (of the intermediate and output layers) has an activation function whereby, given the signal received by the other neurons, that neuron gets more active or not. The result of such activation is used to pass the signal on to another neuron or to the network’s final result. A neural network is mainly specified by its topology, by the characteristics of the neurons and by training rules.

Most of neural networks is trained by some algorithm represented by a mathematical equation or by various combined equations with an aim to produce, from the network’s output, a numerical value that will adjust the value of the weight connections of each processing unit. That algorithm determines how the network connection weights will be adjusted. By that, it changes the activation of the neurons in face of a specific set of input stimuli, which can be called learning.

There are two types of learning for neural networks, supervised and non-supervised. In supervised learning, also called learning by error correction, the data have examples; thus, it compares to the network’s output through the examples, that is, these types of algorithms aim to minimize such error. As for non-supervised learning, also called memory-based learning, there are no examples to be followed and the algorithms aim to group data which have similarities and maximize the difference between the characteristics of different groups.

Identification Using AIC and BIC

In order to test the identification of the models on the basis of the AIC and BIC criteria, the first step was simulating time series through GARCH family models. Matlab was the tool used in this study.

The models used for comparison were: ARCH(1), ARCH(2), GARCH(1,1), GARCH(2,1) and GARCH(1,2). Simulation involved 1,600 series using each of the previous models (varying the size of the series, representing daily series of one month (22), one quarter (66), one semester (132), and one year (264), respectively), amounting to 8,000 series. For that simulation, random figures were generated in interval (0,1), complying with the Stationarity conditions of the GARCH models. As for the identification criteria, the models selected were those with such a structure that has the lowest AIC and BIC statistics amongst the models estimated by maximum likelihood. Table 1 shows a sensitivity analysis for model identification match when the size of the series is increased.

Table 1: Results of model identification by the AIC and BIC criteria

| Size of the series | Identification by AIC | | Identification by BIC | |
|--------------------|-----------------------|---------|-----------------------|---------|
| | Match | % match | Match | % match |
| 22 | 488 | 24.4% | 465 | 23.3% |
| 66 | 809 | 40.5% | 734 | 36.7% |
| 132 | 1,070 | 53.5% | 947 | 47.4% |
| 264 | 1,371 | 68.6% | 1,200 | 60.0% |
| Total | 3,738 | 46.7% | 3,346 | 41.8% |

Identification through these criteria had a low match of 50% on average. For the annual series, the matching was better, at 68.6%. However, considering the series with the lowest number of observations (for example, series of companies that took IPO recently), identification gets much lower.

By observing the identification error by each model, as shown in Table 2 and Table 3, it can be noticed that the higher the model's order the greater the identification error. Intuitively, that result was expected, since these statistics seek parsimony, that is, they penalize the models with higher orders, tending to bias identification for lower order models. Since the AIC criterion showed a better classification result, such criterion will act as a parameter for comparison of the suggested identification model.

Table 2: Matching percentage in model identification by AIC

| N | ARCH(1) | ARCH(2) | GARCH(1,1) | GARCH(2,1) | GARCH(1,2) | Total |
|-------|---------|---------|------------|------------|------------|-------|
| 22 | 94.5% | 22.5% | 3.5% | 1.5% | 0.0% | 24.4% |
| 66 | 92.8% | 64.8% | 29.5% | 8.0% | 7.3% | 40.5% |
| 132 | 92.3% | 82.5% | 54.0% | 23.3% | 15.5% | 53.5% |
| 264 | 93.0% | 89.8% | 74.5% | 53.0% | 32.5% | 68.6% |
| Total | 93.1% | 64.9% | 40.4% | 21.4% | 13.8% | 46.7% |

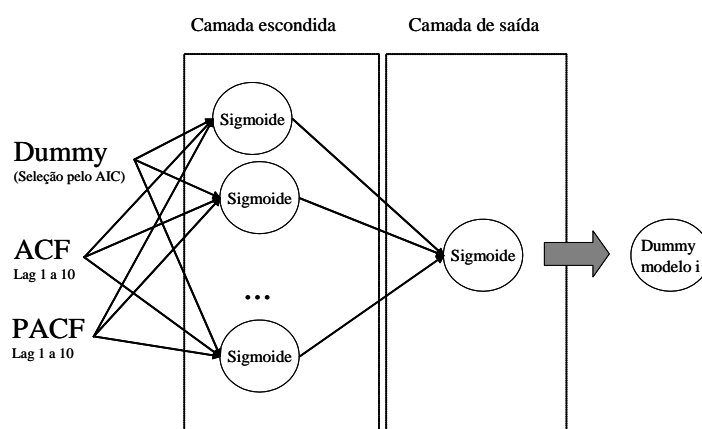

Table 3: Matching percentage in model identification by BIC

| N | ARCH(1) | ARCH(2) | GARCH(1,1) | GARCH(2,1) | GARCH(1,2) | Total |
|-------|---------|---------|------------|------------|------------|-------|
| 22 | 96.8% | 16.0% | 3.0% | 0.5% | 0.0% | 23.3% |
| 66 | 98.8% | 56.5% | 25.0% | 2.0% | 1.3% | 36.7% |
| 132 | 99.3% | 79.0% | 53.8% | 3.5% | 1.3% | 47.4% |
| 264 | 99.5% | 91.5% | 83.0% | 19.8% | 6.3% | 60.0% |
| Total | 98.6% | 60.8% | 41.2% | 6.4% | 2.2% | 41.8% |

Identification Using Neural Networks

In order to verify the opportunity to identify the GARCH models using computational intelligence techniques, a neural network was specified and its structure can be seen in Figure 1.

Figure 1: Network structure for GARCH models identification

The neuron of the hidden layer and those of the output layer are represented by sigmoid functions (30 neurons in the hidden layer and 1 neuron in the output layer). The network was implemented in the MatLab software. For this experiment to be carried out, 8,000 series were used which had the same characteristics as those of the past experiment for training and validation of neural networks and the same series used in the past experiment were used for comparison and testing. The first step was selecting the relevant variables for the networks. For such, the SIE

[Cao e Rossiter, 1997] method was employed, and for selecting which of the 21 variables (10 lags of ACF and PACF, adding to a selection dummy through the AIC method). For each of the models we have the selection of the variable as per Table 4.

Table 4: Selection of variables by the SIE

| Model | Variables selected by the SIE (importance) |
|------------|--|
| ARCH(1) | ACF1 (60.2%); DummyAIC (19.7%); ACF3 (6.5%); ACF5(2.2%) and PACF1 (1.9%) |
| ARCH(2) | DummyAIC (59.4%); PACF1 (7.3%); ACF4 (6.1%); ACF7(3.1%) and ACF1 (2.5%) and ACF1 (2.3%) |
| GARCH(1,1) | DummyAIC (39.9%); ACF5 (13.3%); ACF10 (9.7%); ACF3(6.3%); ACF8 (5.9%); ACF9 (5.6%); ACF6 (3.8%) and ACF1 (2.0%) |
| GARCH(2,1) | DummyAIC (55.4%); ACF2 (21.8%) and ACF1 (18.2%) |
| GARCH(1,2) | ACF2 (33.2%); DummyAIC (23.6%); ACF8 (10.4%); ACF1(7.2%); ACF10 (5.5%); ACF4 (3.0%); ACF5 (2.8%) and ACF6 (1.9%) |

After the training of the networks with the previously selected variables, a definition was made as to the selection criterion that network presenting the output value that is closest to one. The results of such experiment can be seen in Table 5.

Table 5: Identification matching percentage through the neural network

| N | ARCH(1) | ARCH(2) | GARCH(1,1) | GARCH(2,1) | GARCH(1,2) | Total |
|-------|---------|---------|------------|------------|------------|-------|
| 22 | 66.3% | 23.5% | 27.3% | 9.0% | 38.8% | 33.0% |
| 66 | 86.0% | 61.8% | 25.5% | 8.5% | 54.5% | 47.3% |
| 132 | 89.3% | 81.5% | 42.5% | 23.5% | 62.8% | 59.9% |
| 264 | 92.0% | 89.5% | 57.0% | 53.0% | 69.3% | 72.2% |
| Total | 83.4% | 64.0% | 38.1% | 23.5% | 56.3% | 53.1% |

This experiment suggests that the results of identification through the AIC and BIC criteria can be improved, showing an overall matching percentage of 53.1%, that is, 6.4 p.p. higher than the classification through the AIC criterion, and 11.3 p.p. higher than the BIC criterion.

The results of this experiment show a great classification improvement, especially in GARCH(1,2) models. Such result can be interpreted as the utilization of the ACF statistics, especially that regarding to lag 2 (which was considered the most important variable for that model). Lower order models have worse classification, especially because the selection by AIC and BIC tend to benefit lower order models.

CONCLUSIONS

As can be seen in Section 3 above, the AIC and BIC information criteria match only 46.7% and 41.8% of the cases, respectively. Disregarding the annual series, the matching performance is 39.5% and 35.8% for the AIC and BIC criteria, respectively. Thus, an opportunity for improvement clearly exists in the identification phase of the GARCH models. As next steps, the intention is to implement testing of such identification method in order to choose models to be applied in forecasting the volatility of series regarding the actions by the companies that took IPO recently. Such application will be important, since the Brazilian stock market is consolidating itself as a good option for attracting funds to medium- and large-sized companies. This kind of series will be even more present in the financial market.

LOST IN TRANSLATION: COGNITIVE FAILURE IN POST-COMPUTERIZATION BUSINESS MODELS

Guy Callender
Curtin University of Technology, Australia

ABSTRACT

The advent of widespread practical electronic computing provided a gateway to many new business opportunities and represented a quantum leap in business processing. At the time of widespread implementation of computing in the finance industry the nature of information shifted significantly, though the changes were little noted at the time. Clerical-based recording was replaced by machine-based recording. The speed and scale of information capture and storage increased. There was a time of mourning for lost or superseded skills that were recorded in the literature of the period. Yet a literature review spanning nearly 50 years reveals little understanding of the data loss that occurred as transaction speed grew at geometric proportions and data changed to suit the demands of binary code. Loss of job content and context were often remarked upon, but the meaning of the loss of data is much harder to document and evaluate. This paper represents an initial attempt to transfer the implications of data loss from implicit to explicit knowledge. It records the personal experience of the author and is linked to more recent research into the deficiencies of current due diligence procedures in the finance industry. These deficiencies are believed to have their roots in a failure, nearly half a century ago, to align computerized information transfer to the cognitive needs and skills development of their users.

INTRODUCTION

In the years 1957 to 1965 two British researchers investigated the impact of computerization upon the banking system of the UK and published the research in a book under the modest title of *The Computer and the Clerk* (Mumford & Banks, 1967). Their project involved an examination of the social and organizational implications of the shift from manual clerical procedures to electronic data processing (EDP). When reviewing their comprehensive report, one is struck by the concentration on human behavior and the lack of focus upon the quality of information which had to be acted upon by a human after the EDP task was done.

This should not be a surprise. The organizational behavior themes of the period were centered, for example, on behavioral psychology (Asch, 1955), motivation theory (Maslow, 1954; McClelland, 1961; Skinner, 1972), socio-technical research (Trist, 1981; Trist & Bamforth, 1951), and leadership (McGregor, 1960; Blake & Mouton, 1968). In many countries the union movement was also reaping the benefits of post-war prosperity, seeking better salary and working conditions for their members. The EDP developments of the time seemed, to many, to create the workplace risks that were also associated with the efficiency outcomes of the work of earlier management thinkers such as Frederick Taylor (Kakar, 1970; Smith, 1998; Kanigel, 1999), Emerson (1913), Casson (1935), and the Gilbreths (Thickett, 1970), which entailed a rapid increase in productive capability potentially creating a fall in job opportunities.

Two years after the publication of the Mumford and Banks (1967) research the first international symposium on cybernetics was held in London in 1969 (Rose, 1970). During the conference one of the speakers defined cybernetics as “the science of control and communication in animals, men and machines, and is especially concerned with systems that are adaptive, capable of feedback, and are also in evolution” (George, 1974, p. 114).

Elaborating on this theme, one of the lead papers in the symposium (Ashby, 1970, p. 57) commenced with the statement:

We have brains primarily so that our bodily activities may be coordinated; so that our left hand shall act properly in conjunction with our right. Co-ordination and integration have long been recognized in physiology as the brain's highest function, but cybernetics today is equally concerned with coordination in systems of other types.

If this was the prevailing view of the 'brain's highest function' then it may be no surprise that there was little attention paid to the intrinsic content of the data collected in manual systems and transferred to the computer. Yet this was also the era of enhanced communications especially in the news media and in organizational communications, the essence of which was captured by writers such as Mumford (1972), McLuhan (1970, 1972), and Townsend (1971). Each one of these authors argued passionately about their view of 'automation'. McLuhan (1972) spoke of the value of enhanced information flows and feedback systems, miniaturization of production equipment, information processing speed, and the positive impact of automation through EDP. Mumford (1972), by comparison, spoke against automation, expressing concerns about control (including fears of loss of control), and information overload. Mumford (1972, p. 115) touched on the quality of data but in the context of message control, remarking that in "face-to-face communication, even the most ignorant person can answer back, and he [*sic*] has various means at his command beside the word – the expression of his face, the stance of his body, even threat of bodily assault". Townsend (1971) argued, more pragmatically, for improvement in manual systems before they were computerized, suggesting that the failure to do so would simply 'speed up the mess'. Describing aspects of these changes, Trist (1981, p. 11) noted that:

... changes in technology bring about changes in values, cognitive structures, lifestyles, habitats and communications which profoundly alter a society and its chances of survival. Socio-technical phenomena are contextual as well as organizational.

While expecting to find the results of a more detailed examination of the physical structure of data as it changed from manual processing to EDP, this was not the case. However, the 'cognitive structures' may be the essence of the problem, but different to the structures considered by Trist (1981). Some of the questions that might have been asked were: How does the intrinsic meaning of data change as it moves from manual to EDP format. What is gained and lost in this change? How fundamental to successful communication is the change?

This paper is related to some separate research being undertaken to better understand the failure of 'due diligence' processes that were related to the failure of the sub-prime mortgage market in the USA during 2008. This research gave rise to questions about the implications of the excessive volume of transactions now being experienced in the finance system and posed questions about the ability of average human beings to synthesizing large amounts of data in short periods of time. These thoughts then moved back to the beginning of computerization; to the dawn of EDP.

The questions the researcher sought to answer relate to areas of perceived cognitive failure arising from the implementation of EDP or Information Technology (IT). Three areas of cognitive failure are addressed in this paper. First, the failure to create (or be able to create) data files of equivalent content to the manually created files they were replacing. Second, the failure to address significant data input bottlenecks created by the use of data entry devices such as keyboards. Third, the failure to systematically evaluate the productivity increases attributable to IT investment. The conclusion speculates upon the links between these issues and the transactions associated with the sub-prime mortgage crisis.

CHANGING DATA STRUCTURES TO SUIT INFORMATION TECHNOLOGY

As a young person I worked in the environment that Mumford and Banks (1967) researched: a bank. Over the years of 1967 to 1975 my role changed from ledger keeper (of 100% manual ledgers) to a retail lender to an auditor pioneering the introduction of systems-based audits (Stettler, 1967). In the same period, the bank I worked for shifted from being a partially mechanized bookkeeping operation (see below) to a computerized system with delayed processing of transactions (using paper-tape) to 100 percent on-line processing of most transactions. As I moved from operations to lending I was struck even then by the intrinsic changes in information transfer. Petty as they seemed at the time, I believe these changes still have a significant impact nearly forty years later.

The organization was gradually moving towards automation of its tasks and it was obvious that many routine activities could be simplified by use the power of the new technology. Machine-readable encoding of transactions occurred quite early and substantial clerical factories were established by the large banks in my country to process checks and deposits. The system is still partly in use today. A check, which had the unique branch and account number already printed on its face, was deposited in a bank many hundreds of miles from the 'home' branch of the person signing the check. The check was sent 'for value' to the home branch via the Clearing House where the value of the check was inserted by a machine operator. Thereafter the check could be machine read until it reached the home branch where it was charged to the customer's account by a human ledger keeper and, with a different type of machine, entered onto the customer account statement.

In this case, the system of handling the check was not changed, but the pathways were changing and there was a combined machine, EDP, and human intervention. At this stage, on-line transactions were not available. As on-line processing became available the system then began to change but the detail of the transaction and its nature remained constant. Each check created a legal transfer of funds, assuming it was always honored by the issuing bank. The value entered on the face of the check remained the same, as did the branch and account number. An innocent bystander could easily reconcile the type of transaction and its processing. The audit test was to ensure that the face value of the check was always reliably charged to the correct account and the relevant interest and charges were not only charged to a customer but also lodged into the correct income account of the bank.

In circumstances where subjective judgment was part of the working environment, however, the data changes between manual and EDP records were significant. The manual ledger or ledger card was regarded as an accountable document which was kept for long periods of time and represented a semi-permanent record of a customer's account history. On the one page appeared all transactions initiated by the customer (deposits and checks) and the bank (interest earned or loan charges). In the case of a checking account, it also showed transactions that drew more funds from the account than were lodged by the customer (an overdrawn account), dishonored checks, and any other irregularities. All the calculations made and reviewed by bank staff also appeared on the ledger card.

Most importantly, the scale of any problem was instantly obvious and clerical or technical errors would usually be quickly corrected. But what happened when a judgment about a customer had to be made from the record. Whether this person a low risk or a high risk customer? It was at this point that the cognitive agility of humans came to the fore. The best example comes from the detailed information once contained in a personal loan ledger card. This document showed all loan transactions and any additional charges incurred by the borrower during the life of the loan. A personal loan was the predecessor of the credit card account. It was a highest interest rate, low administration cost product. A bank approving a personal loan charged a flat interest rate (about double the rate charged for mortgage loans) and required the borrower to repay the loan in equal monthly installments (typically 24 or 36 months). The loans targeted consumer purposes such as motor vehicles, holidays, minor home renovations, and white goods. As the payments were made, the date and amount was entered on the ledger card. If the payment was received late, the customer was charged penalty interest and all the details were entered on the ledger card.

Personal loans were popular and many clients simply took out a new loan as soon as they repaid the last. Part of the approval process involved checking previous borrowing history (credit ratings were not in widespread use at the time). The easiest check for a repeat loan was to view all previous personal loans. The old ledger cards were held for three years in the home branch of the bank and a glance at the ledger sheet told an important story: name and address; address changes during the life of the loan; loan amount; term and interest rate of the loan; and repayment history including late payments and penalty interest charges.

In a few moments an experienced lender could see whether late payments were a major or minor problem, whether address changes were frequent or only occasional, and indeed the entire health of the prior loan could be assessed in an instant. However, with computerization this rich detail became minimized to showing just the current address, the number of late payments as a bald number and the penalty interest simply as an amount. Any major or minor problems? Were many payments late by one day? Or were a few payments badly delayed? Difficult to say. The qualitative value of the record was significantly diminished.

This case attempts to recount how data structures and contents were changed to suit IT requirements without ensuring that data quality was being maintained. The data simplification was probably not intended, but rather based upon an evaluation of what was the most important information to capture. The choices may have been made by IT system designers rather than the end users, although this is mere speculation at this stage of the research.

EVAUATING OPERATOR SPEED AND PRODUCTIVITY

The issue of speed has been one of the productivity lures of computer technology. Transaction speed and transaction numbers are theoretically limited only by the load capability of the data transmission system. The change in capability can be illustrated by the experience of history. Norway (1954, p. 76) reports on the 1924 experience of calculating stress for the airship R100:

The stress calculation for each transverse frame [of the airship] for instance, required a laborious mathematical computation by a pair of calculators [people, not machines] that lasted for two or three months before a satisfactory and true solution to the forces could be guaranteed.

The rise of working computers such as the Electronic Numerical Integrator and Computer (ENIAC) in 1945 facilitated calculations (Saville & Callender, 1991) but still did not meet the specifications that would enable wider usage. This came via two inventions: the Electronic Delay Storage Automatic Computer (EDSAC) which held computer programs in its memory; and the transistor invented by Shockley, Bardeen and Brittain (Saville & Callender, 1991). These developments were so swift that computer-aided calculations found their way, for example, into the design of the high speed aircraft within 50 years of Norway's laborious experience with human calculators.

In the more mundane world of the office, however, computers have been related to significant social and systems changes (Trist, 1981). But despite the volatile results reported for IT-related productivity (Stiroh, 2008), the absence of deeper research into this issue is quite remarkable. When Frederick Taylor produced the results of his elaboration of 'scientific management' (Kanigel, 1999), his research was based on one of the most common low-paid jobs of this era (circa 1860-1915): the laborers' task of shoveling. When Mumford and Banks (1967) published their research, they too were examining a common, modestly-paid occupation: the clerk. Yet as computing continued to change office structures, the focus was on the loss of job content rather than the expected changes in productivity. The management focus of the time seemed to be upon the need to be up to date with their competitors and to gain the transaction load capacity offered by high speed processing. Yet it seems almost no attention was paid to the weakest link: the input rate by human beings via computer keyboard.

Again it is worth looking back at Taylor. Regardless of the many controversial features of his work (Kakar, 1970; Kanigel, 1999), Taylor identified a base-line activity that needed development to meet the productivity requirements of that time: shoveling. When it came to a revolution in office automation, the focus was on middle management (Ginzberg & Vojta, 1985) and work content (Mumford & Banks, 1967; Mumford, 1972). At this point, many interesting changes were occurring that have not been widely researched. Social change and power structures were significantly altered, but so too were the patterns of office work wherever there was interaction between the computer and a typical computer operator and their manager.

The social change at the keyboard was both subtle and far-reaching. It is difficult to track the exact circumstances that placed women in the office in front of keyboards, but Saville and Callender (1991) suggest that the clerks around the time the typewriter was invented saw this equipment as best compared to manual labor, and a role they would not consider undertaking. Whatever the reason, this outcome had significant social and institutional

effects. From a social perspective, women in business, professional, and government offices obtained a monopoly over all typewriters (and possibly most business machines) whether they wanted it or not. This condemned them to junior, low-paid technical functions in most cases. However, it also handed them considerable potential informal power over workplace output. Work could be done well and quickly or it could also be done in a slovenly, desultory fashion. The clerks might fume, but they had no access to the typewriter. Furthermore, if they had dictated their letters (shorthand was an additional technical skill held by many typists), they could not easily recover their words without doing the work again. This power, if it was such, was mitigated by poor pay and barriers to salary rises. In Australia, for example, the basic rate of pay for most office workers was set by industry-wide labor agreements. These included secretaries and office machine operators who gained a small productivity-based allowance according to their typing and shorthand speed and accuracy.

When computers entered the office the social arrangement became less clear. The pressure for equal opportunity in the workplace also had an input. As computers in offices moved to the front counter, men and women (whether clerks or typists) all found themselves with a keyboard and, soon, a 'mouse'. Labor agreements also changed and the pay differences between clerks and typists blurred in a way that matched the changes in workplace roles. But what of the institutional factors? These changes required fundamental shifts in homes and educational institutions. In traditional families a typing and shorthand technical education was often seen as a typical post-school pathway for a young woman. For men, this pathway was unlikely, perhaps because the majority of staff and students in typing and shorthand classes were women. Their pathway was more likely to be professional, clerical, or in the trades. When the keyboard and screen arrived on most desks, a logical response might have been to teach everyone how to use a keyboard efficiently. But did this happen? The answer is pretty clear.

Watson (1990, p. 398) notes that in "the 1960s there were predictions that the home of the 1990s would be 'computer controlled' with a central computer". He found that by the 1990s, while computers were pervasive in the home, they were inside each individual piece of equipment. This serves as an interesting comparison with the office. Whereas the computer of the 1960s was a centrally-controlled and centrally-controlling device, today's computers are small, distributed, and immensely powerful. But has there been a change in operation?

The reality is that, while there have been significant attempts to remove the keyboard as the principal interface between humans and the computer, it remains. Furthermore, whatever the layout of the keyboard, the fastest typing performance comes from the trained operator. However, how many organizations have made keyboard skills mandatory for their staff? Are standards of keyboard output a requirement? How many schools or universities make keyboard skills a study option? The focus point has seemingly been computer processing speed rather than the slowest part of the process: the speed of the keyboard operator.

The consequences, from a productivity perspective, are profound. A trained keyboard operator can be expected to touch-type between 30-60 words per minute with 100 percent accuracy. The Australian Standard Keyboarding Speed Tests (AS2708-2001) (Standards Australia Committee, 2001) sets performance levels for testing candidates which prescribe the conditions and criteria but not overall benchmarks of performance. However, it should be noted that candidates in this test are expected to maintain continuous, accurate performance over a period of five minutes—their performance is expected to be sustained over time and workload (one more link to Taylor and his efforts to create continuous workload rather than peaks and troughs in work performance).

This is the minutiae of productivity, not unlike Taylor's focus on shoveling. Just as his study examined a core task of laborers, so AS2708- 2001 provides some insight into typing or keyboard speed and accuracy. While performance standards are set, there is little pressure to enhance this level of performance. Indeed, as computers have become an essential part of the office scene, touch-typing skills have disappeared or are not a requirement for the majority of workers, management, and staff. Thus, a core skill has been diminished at the very time the computer has become dominant and is a deficiency that is unrecognized in micro-economic examination of the productivity changes (Stiroh, 2008). This is a topic to be examined in the next section.

THE PRODUCTIVITY ATTRIBUTED TO INFORMATION TECHNOLOGY INVESTMENT

Research by Ko, Clark and Ko (2008) includes a literature review linking IT investment and productivity. They report that, in the majority of cases, there were mixed results in terms of the relationship between IT investment and productivity improvements. These findings were confirmed by Stiroh (2008) who makes some interesting observations about average labor productivity (ALP) which he defined as “output per hour worked” (p. 358). This research traces the poor productivity growth in the USA between 1973 and the mid-1990s, followed by a sharp increase between 1994 and 2004 and a more recent decline. One of the major difficulties of this type of micro-economic review is in understanding the exact causes of these productivity changes and its relationship to IT investment. Stiroh (2008, p. 369) notes that “in response to the enormous relative price declines for IT investment, firms rapidly substitute IT assets for other inputs, e.g. a web-based accounts receivable system for an accountant or a word processor for a secretary”.

In terms of this paper, such alternatives pose some fascinating questions: What is the relative productivity of a word processor compared to a secretary, or the accountant compared to any web-based system? How can we apply an economic productivity value to the keyboard skills of an average keyboard operator? How can a micro-economic (*sic*) variable such as a keyboard stroke (one character on a keyboard) be converted into a productivity factor? The list of questions could be developed much further. Yet the fact that they have not already been asked reflects an enthusiasm for building IT assets on the assumption that higher computing speed and capacity can be equated with higher productivity. The evidence collected for this paper suggests researchers have overlooked operator speed at the keyboard—a factor that may now be *the* core IT productivity issue.

There is anecdotal evidence that employers engaging data entry staff set performance criteria based on key strokes per minute. But is this a performance indicator for a sales clerk, airline check-in agent, branch clerk, office assistant, or secretary? AS2708-2001 provides some clues on the scale of this change (Standards Australia Committee, 2001, p. 4):

Modern technology has necessitated several changes in the previously accepted rules of speed tests. The most obvious of these is the change from the concept of a speed test as a test in which error correction was not permitted to a test where corrections are permitted ... The change was brought about by the rapid replacement in the workplace of manual and electric typewriters by computer-based equipment, which allow quick and imperceptible correction of errors ... Although the Standard does not enable comparisons to be made between speeds achieved on different types of equipment, e.g. computers, electronic and manual typewriters, it will enable employers to confidently compare speeds achieved by different persons on particular equipment.

This section makes a brief but significant comment about the traditional methods of measuring the productivity arising from IT investment and the failure of these methods to bring to account the individual performance of IT operators. At this stage of the research, a more precise estimate of the impact of operator performance on overall productivity of IT can only be surmised, but anecdotal evidence suggests that sustained and accurate data entry speeds of around 30-60 words per minute (AS 2708, 2001) are unlikely to be found in the majority of workplaces. Further research is needed to quantify this productivity shortfall and to integrate it into micro-economic estimates such as those discussed by Stiroh (2008).

SOME PRODUCTIVITY CONCLUSIONS

This paper commenced as a reflection on the changing content of documents as a key to understanding the impact of IT on the cognitive responses of people to electronically generated data and became an examination of the impact of content and data input on productivity. It is a first attempt to better understand the nature of IT productivity and the cognitive impact on data reliability as it shifts from a format that matches the cognitive capabilities of humans to the data management requirements of IT equipment. It seems that this debate should have occurred 40 years ago, but is only now emerging because of the extensive failures occurring in the finance sector with its heavy reliance on IT to manage client data.

From a management perspective, the findings of this research suggest that significant productivity gains are available to organizations which provide their staff with extensive keyboard training designed to increase the speed and accuracy of data input by staff at all levels of an organization.

MOVIE DOWNLOAD CHALLENGES TRADITIONAL MOVIE RENTAL

Chiang-nan Chao, Robert J. Mockler, and Leonora Fuxman
St. John's University, USA
Dorothy Dologite, Baruch College
City University of New York, USA
Larry Wander

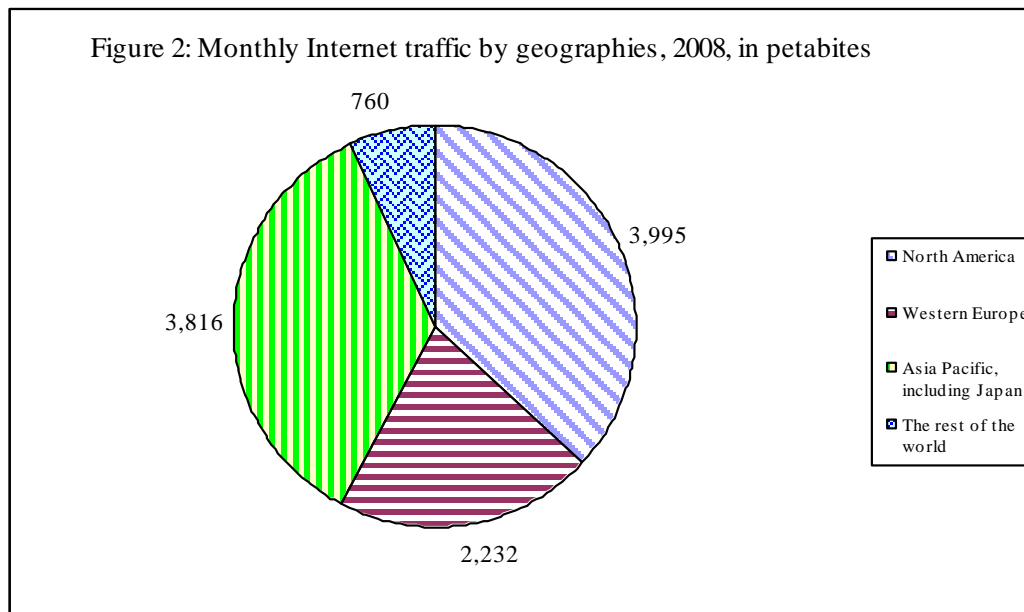

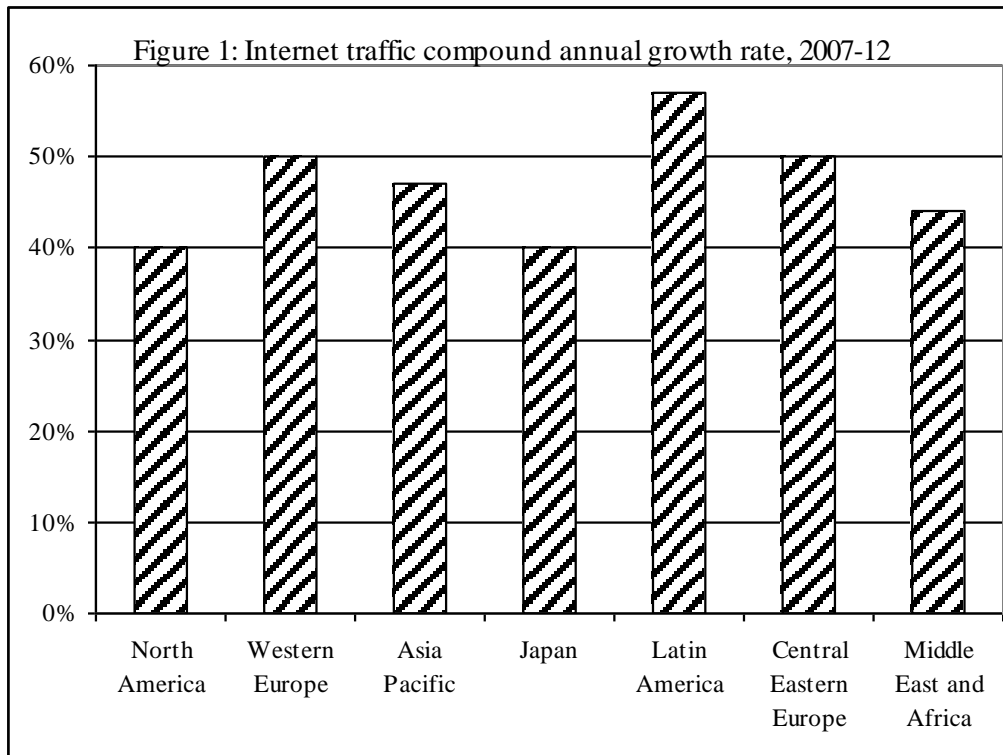

ABSTRACT

Movie download has emerged through an E-commerce transformation from the typical movie rental store visits to picking up DVD disks, and from website visits to placing orders online and waiting the orders showed up in the mailbox. Movie download does not only challenge the traditional way of seeing movies in the movie theater, but also impacts on the traditional movie rental business. Although Blockbuster and Netflix have websites where customers can add all their favorite movies to a queue and pay a flat rate to receive a certain number of DVD's by mail each month, their e-commerce model has its delivery inadequacy since it was introduced. The traditional process is still handled by a physical distribution system that may take days for the DVD disks to arrive. The study, through an empirical experiment, focuses on consumers' preference over price, product quality and delivery of movie downloading from the internet as compared to the traditional movie rental. Movie download presents overwhelming advantages over the traditional movie rental delivery. E-commerce shows a trend in the movie industry that consumers can stream movies and TV shows directly from the internet instead of waiting for the DVD's in the mail. As technology advances globally, movie download perhaps will prevail in next few years.

INTRODUCTION

The competition in movie industry takes different forms. Traditional movie theaters require the physical presence and enable movie goers to enjoy the high quality picture in large screen and high quality sound effects; movie rental provides the convenience for the customers who do not have to go to the movie theaters, and the customers either visit local movie rental stores or browse and place their orders online; while movie download has emerged as a new way to watch movie without either going to the movie theaters or going to movie rental stores, or waiting their movies showed up in their mail boxes when rental orders placed on line. Thanks to the advancement of high speed internet connections and continuous improvement in movie quality, movie download may become next music download.

This emerging phenomenon of movie download in the recent years depends heavily on the technology advancement in computers, networking, and most of all the speed and capacity of the internet. The thirst for internet traffic, i.e. peer-to-peer (P2P) file sharing networks in 2008 carried 600 petabytes per month more than they did in 2007, which means there was the equivalent of an additional 150 million DVDs crossing the network each month, for a total monthly volume of over 500 million DVD equivalents, or two exabytes [Cisco, 2008]. Figure 1 and 2 present the internet traffic growth and global internet traffic.

Video sharing was now approximately one-quarter of all consumer Internet traffic in 2008, not including the amount of video exchanged through P2P file sharing. Internet video grew from 12 percent in 2006 to 22 percent in 2007, and reached 31 percent in 2008.

Internet video will account for nearly 50 percent of all consumer Internet traffic in 2012. Internet video-to-PC will make up the majority of Internet video at 31 percent of total Internet traffic, but Internet video-to-TV will grow rapidly to 18 percent of the total in 2012 Cisco, 2008 [Cisco, 2008].

Non-Internet Internet Protocol (IP) video will increase more rapidly than consumer Internet. The twin trends of on-demand viewing and high-definition video are generating very rapid growth in cable video and Internet Protocol Television (IPTV) traffic transported over IP in the metro. Consumer IPTV and Cable Television (CATV) traffic will grow at a 68 percent compound annual growth rate (CAGR) between 2007 and 2012, compared to a CAGR of 41 percent for consumer Internet traffic [Cisco, 2008].

This study intends to examine the some key issues of price and promotion, product quality, and delivery of movie download through an empirical experiment to explore the consumers' preferences.

REVIEW OF LITERATURE

Video consumption and distribution has grown exponentially in the past few years, converting and preparing this content for the digital realm was largely a 'black art' until recently, when several enterprise-grade solutions came onto the market.

The traditional movie rental giants, Blockbuster and Movie Gallery were able to generate billions of dollars in revenues in the past, have suffered huge losses in the recent years. They are losing ground to more internet based movie rental firms, i.e. Netflix and Amazon.com. Netflix has grown to a 10 million customer base in ten years, with a user-friendly website which allows its customers to search by title or type, then add those titles to a waiting list of movies to watch called a “queue”, without due dates and late fee penalties. Netflix ships to most locations by first class mail in the following day when orders are placed online [Netflix profile, December 2008].

Many traditional cable companies, i.e. Comcast (CMCSA), Time Warner Cable (TWC), and their ilk are going on the offensive. Long technology laggards, the cable companies have set up skunk works. The aim of doing so is twofold: putting more of their content online and making the regular television and movie viewing experience more Weblike. Even as they move online, the cable companies are scrambling to make TV as interactive as the Web. For years they've tried and largely failed. Now the industry may have hit on the answer. It's called tru2way, a service arriving in the coming months that will allow viewers who have the latest generation of set-top boxes and televisions to more easily search for TV shows, play games, chat, and even browse the Web. Beyond improving the viewing experience, the technology also will allow the cable companies to offer interactive commercials. For example, viewers will be able to request more information about a sponsor's product and, at some point, even buy it through their televisions [Lowry, 2009].

Piracy. The convenience of downloading movies from internet has caused some concerns from the movie industry, as untold thousands of people watched a version of “X-Men Origins: Wolverine” online in early April 2009, a full month before its scheduled theater release, while the film's distributor, 20th Century Fox, said it did not know how the unfinished copy of the comic book adaptation was leaked onto the Internet. Even the copy was missing many special effects and included temporary sound and music, it circulated widely online beginning on April 1, 2009, even prompting some viewers to publish reviews, favorable and unfavorable, of the hotly anticipated film [Stelter, 2009].

Price. The cost of movie download varies, depending on the internet service providers' fees. For example, when a customer in a remote country town buys a new Apple TV because he wants to rent high-definition movies he might wind up paying Time Warner Cable as much as \$30 when you download a movie using its high-speed Internet service, as compared with a fixed fee from Netflix of about flat fee of \$5.00 a month with unlimited movies. Time Warner is still working on what to charge people who exceed their limits. Bell Canada has imposed bandwidth limits on its customers from 7.50 Canadian dollars for each gigabyte when customers exceed the 30-gigabyte limit on a plan that costs 29.95 Canadian dollars a month. Since the average high-definition movie is 4 gigabytes to 5 gigabytes, that would mean a charge of at least \$30 a download for customers on a plan like that that were over their limit. Some Internet Service Providers (ISPs) suggest that it is a more straightforward pricing system that does make heavy users pay more, especially since some Internet service providers are quietly slowing down or otherwise restricting some service, most notably to users of the BitTorrent file-sharing protocol. Whether cable users agree, or

they start to complain because of occasional surprise bills for \$30 movie downloads, depends on how Time Warner actually structures its rate plans [Hansell, 2008].

Walmart and others will also be launching their own services, possibly with in-store DVD burning kiosks as well. As download services become more popular, the large DVD retailers, particularly Walmart and Target, will continue to push for lower wholesale DVD prices as well. Hopefully, competition from these various services and products will ultimately push consumer prices down.

Many movie downloaders have found that in many ways, download DVD movie still cost more than renting DVD movies. Some factors affect movie downloading pricing can be summarized in the following manners: (1) Piracy (leakage) that violates the intellectual property right, would make the movie industry hesitate to put movie online for downloading; (2) Competition that forces the ISPs to cut and/or increases prices depending on market conditions and how many providers in the fields, i.e. Netflix, Walmart, etc; (3) Broadband roll-out (market) that those backbone infrastructure providers, i.e. Cisco, Verizon, and Time Warner, etc.

Quality. With numerous online video platforms on the market, choosing a solution is difficult. Some offerings focus on content management and monetization, while others are geared towards enabling syndication and interactive advertising campaigns. For an entire industry that defines itself based on the word "quality", today there is still no agreed upon standard for what classifies HD quality video on the web. Both Microsoft and Adobe have different views on what classifies a video as HD and many content owners don't truly know themselves how to classify HD videos on the web. If the industry wants to progress with HD quality video, there must have an agreed standard [GigaOM Daily Feed, 2009].

Delivery. Netflix recently announced that it would likely add a video-streaming-only option for subscribers as the largest U.S. movie-rental service via mail shifts more of its resources toward digital content delivery. Such a streaming video is content sent in compressed form over the Internet and displayed by the viewer in real time. This technology revolutionizes the delivery. The company also estimated that the number of subscribers who rent Blu-ray discs could jump 50% this year [SearchUnifiedCommunications.com website, 2009].

Netflix's fourth-quarter profit surged 45% as its customer base grew faster than it forecast 2008. The company, which added more than 600,000 customers during the first six weeks of this year for a total of more than 10 million, attributed much of its recent growth to its efforts to augment its DVD-rental service with an expanded video-streaming offering. Netflix reached agreements in 2008 to make its more than 12,000 digital titles available for streaming through components such as Microsoft's Xbox 360 videogames consoles, TiVo digital video recorders and Blu-ray players from Samsung and LG Electronics. The company has estimated that subscribers for its DVD-delivery service will peak between 2013 and 2018. Netflix, as the leader in the movie rental and online delivery service, foresee the future would be more internet download than current mail delivery [King, 2009].

As movie downloading is emerging as a formidable phenomenon, and predicted internet movie will reach \$5.8 billion in 2011, it may be a growth stimulus during this global economic recession [Farlex, website, 2007]. Many interesting questions from both academia and practitioners remain to be answered.

METHODOLOGY

With the focal questions in mind, this research studied the views of consumers with regards to how they download movies as compared to other ways, i.e. mail order, and/or online order and mail delivery. A survey was developed to investigate the pros and cons in the consumer preferences on products and their quality, price and promotion, deliveries, together with other features available using different shopping methods. The following variables were based on literature reviews.

Variable Selection

The following variable selections affect how and where consumers make their purchase decisions.

1. *attractive prices, as compared to other methods.*
2. *variety of selection.*
3. *free movie legally and ethically even the movies are copyrighted.*
4. *good quality products, i.e. high definition and superb sound quality.*
5. *your opinion: movie downloading is easy.*
6. *your opinion: movie downloading is secure and safe.*
7. *privacy protection.*
8. *easy way for delivery.*
9. *your opinion: movie downloading enables you to keep a copy of the movie.*

Hypothesis, test of hypothesis, and sampling

The hypothesis for this research is to find if there is a significant difference between movie downloading and other methods of viewing movies. The hypothesis for this study states:

H: There is no significant difference between movie downloading vs. other methods of obtaining movies.

Alternatively, there is significant difference between movie downloading vs. other methods of obtaining movies.

Due to the nature of this empirical study, the questionnaires were distributed in college students in a large university campus in the northeast for a convenient sampling since students tend to browse on the websites and download movies. The respondents were asked to evaluate the selected variables in a five point Likert scale, with 5=strong agree, 4=agree, 3=neutral, 2-disagree, and 1=strongly disagree. Since the data collected are of ordinal scaling, the Mann-Whitney nonparametric statistic test was used to test the hypothesis. The Mann-Whitney U test, often referred to as the rank sum test, was applied to test the null hypothesis. If the null hypothesis that the two samples were drawn from the same population were true, the totals of the ranks (or equivalently, the mean ranks) of the two samples would be expected to be about the same. The null should be rejected if the significance level is less than or equal to 5% in any one criterion.

RESULTS

173 hundred consumers were surveyed, with 97 completed responses for analysis that represents 56 percent of the total surveyed. Table 1 presents the general information of the respondents.

Table 2 presents the test results that include Mann-Whitney U test, Z value and the significance. Out of variables studied, three variables: *attractive prices*, *easy way for delivery*, and *your opinion: movie downloading enables you to keep a copy of the movie*, present significant differences (less than 5%) exist between movie downloading and movie rental. The respondents give high means for movie rental to movie downloading. Therefore the hypothesis is rejected.

Table 1: Backgrounds of the respondents

| Categories | mean |
|--|------|
| 1. Age 1<18; 2=18-35; 3>35 | 1.97 |
| 2. family annual income? 1< \$25k; 2=\$25-\$30k; 3>30k | 2.09 |
| 3. how many dvd movies do you watch a month at home or on your pc? 1=1, 2=2-3, 3>3 | 2.50 |

| | |
|--|------|
| 4. methods of obtaining movies: 1=download from online source; 2=rent at a local store or browse online stores; 3=buy from stores and websites; 4=all of the above | 2.37 |
|--|------|

Table 2: Mann-Whitney test results

| categories | Mann-Whitney U | Z | Asymp. Sig. (2-tailed) |
|---|----------------|-------|------------------------|
| <i>attractive prices, as compared to other methods.</i> | 3546.50 | -3.66 | 0.00 |
| <i>easy way for delivery.</i> | 4158.00 | -2.31 | 0.02 |
| <i>your opinion: movie downloading enables you to keep a copy of the movie.</i> | 4175.00 | -2.08 | 0.04 |
| <i>free movie legally and ethically even the movies are copyrighted.</i> | 4235.50 | -1.82 | 0.07 |
| <i>variety of selection.</i> | 4400.00 | -1.52 | 0.13 |
| <i>privacy protection.</i> | 4665.50 | -0.84 | 0.40 |
| <i>your opinion: movie downloading is easy.</i> | 4683.00 | -0.79 | 0.43 |
| <i>good quality products, i.e. high definition and superb sound quality.</i> | 4682.50 | -0.69 | 0.49 |
| <i>your opinion: movie downloading is secure and safe.</i> | 4861.00 | -0.23 | 0.82 |

MANAGERIAL IMPLICATIONS

Through our survey we conclude that consumers still favor movie rental as compared to movie downloading, even the later can result in substantial reduction in delivery costs. Currently movie rental, led by Netflix with a \$5.00 a month subscription fee is apparently very attractive, while movie quality appears indifference. The mail service is adequate and easy.

Although movie downloading is growing rapidly, still lacks some of the advantages movie rental offers. For time being, movie rental industry may still focus on the traditional ways to handle movies business, however, the industry should keep movie download as a major alternative for the future.

This research, as it surveyed only college students, the cautions must be made when one tries to generalize the outcome of the research, as the sample size and the representation are both narrow. This may throw light for future studies in a broader way.

CONSUMER BUYER BEHAVIOUR ASSOCIATED WITH THE PURCHASE OF ORGANIC FOOD PRODUCTS IN CHINA –DEVELOPMENT OF A CONCEPTUAL MODEL.

**Jue Chen, Antonio Lobo and Bruno Mascitelli
Swinburne University of Technology, Australia.**

ABSTRACT

This research aims to investigate the determinants of consumer buyer behaviour relating to the procurement of organic food products. There are several reasons why consumers are motivated to purchase organic food products. We shall evaluate relevant extant research which has been well developed in North America and Western Europe. We then intend to develop a conceptual model and validate it in China – a fast growing economy where organic foods are increasingly being marketed. This paper will be limited to the development of a conceptual model of buyer behaviour of organic food products. In the future, we intend to validate this model by collecting relevant data from consumers in China.

BACKGROUND OF THE RESEARCH

This research aims to investigate the determinants of consumer buyer behaviour relating to the procurement of organic food products in China. In the last decade or so, there have been significantly increased interests in organic foods (Makatouni 2002). There are several reasons why consumers are motivated to purchase organic food products. We shall evaluate relevant extant research studies, which have been well developed in North America and Western Europe (Bonti-Ankomah and Yiridoe 2006). Many developed countries have set stringent standards to ensure quality of their organic food products. A number of developing countries including China have also started to establish national organic products' standards and regulations (Food and Agriculture Organisation of the United Nations 2002).

A study by Chan (2001) claimed that with increasing affluence derived from rapid economic growth, certain sections of Chinese society and Chinese government have begun to realise the hazardous impact of environmental deterioration on national well-being. The Chinese market for 'green' and 'organic' food is uneven. The standards are low, inspections are weak, and regulations are not adequately policed. In recent years, the Chinese government has increased warnings against sub-standard food products, and consumers have become cautious about food safety issues (Ho et al. 2006). In order to regulate the growing market, in 2005 China's Council of General Administration on Quality Supervision, Inspection, and Quarantine published guidelines for organic food production, certification, labelling and marketing with effective punishment for non-compliance (Baer 2007).

Only a handful of studies have been conducted in Asian countries such as Japan, Taiwan, India and Thailand, which investigate the perceptions of consumer attitudes toward the purchase of organic food. These studies also confirm that the most important reasons and motivation for consumers buying organic food are health, food safety, concern for the environment and animal welfare. As best as can be ascertained, very few studies of this nature have been undertaken in China – a fast growing economy where organic foods are increasingly being marketed. Little is known or understood about Chinese consumers' attitudes towards organic products or their purchasing behaviour.

The United States Department of Agriculture (2009) defines: *'Organic' as a labelling term that denotes products produced under the authority of the Organic Foods Production Act*. The Food and Agriculture Organisation of the United Nations (2002 p.1) defines organic products as those 'products being certified as having been produced through clearly defined organic production methods'. The International Federation of Organic Agriculture Movements (IFOAM)'s goal is to build a global organic movement platform, the IFOAM Organic Guarantee System facilitates organic certifiers to become 'IFOAM Accredited' and for their certified operators to label products with the IFOAM seal (IFOAM 2009).

The term 'organic food' has many different connotations and interpretations, and is sometimes used interchangeably with the term 'green' food. Various contrasting 'organic' definitions are often coupled and confused with terms such as 'biological', 'ecological', 'natural', 'alternative', 'unsprayed', 'free of pesticides', 'without artificial', 'without chemicals', 'environmentally produced', 'green', and 'sustainable' (Essoussi and Zahaf 2008). This definition dilemma has caused confusion in the minds of consumers worldwide. The stereotypical images of organic consumers as 'greenies', 'health nuts' or 'yuppies', which are more interested in fashion than anything else, hence consumption of organic food reflects a 'greening' lifestyle (Lockie et al. 2002). For regular organic food buyers, consumption of organic food is part of a lifestyle, with related interests in nature, society and environment lifestyle (Schifferstein and Oude Ophuis 1998).

Although a very small and almost insignificant percentage of the total Chinese population consume organic food products, China has gone well beyond being an adopter of the world organic concepts, and is now an active organic innovator by promoting the concept of 'green food' (Paull 2008). Both green food and organic food concepts can be claimed 'safe and ecological environment' in China (Zhang 2007). The Chinese green food specifies two standards, i.e. 'A' and 'AA', 'A' represents a transitional level between conventional and organic food, allowing restricted use of chemical fertilisers and pesticides; 'AA' represents full organic status and matches all the international organic food standards, 98 percent of green food produced in China are 'A' standard, not 'AA' standard (Sanders 2006). In a Chinese survey (Li et al. 2005) show that 92.2 percent of respondents had heard about 'green food', only 37.2 percent of respondents were aware of 'organic food'. The term 'green food' is much more popular than the term 'organic food' in China, the interpretation of green food in China is different from western countries. Generally speaking, in many western countries, the interpretation of 'green' connotes environmental meaning, the fear of global warming, saving the planet by reducing carbon emission (Bonini and Oppenheim 2008). Shamdasani et al (1993 p.488) claimed 'The green consumer is generally defined as one who adopts environmentally-friendly behaviour and / or who purchases green products over the standard alternatives'.

THEORIES ASSOCIATED WITH PREVIOUS RELATED STUDIES

There are many models related to consumer behaviour in the marketing discipline. One of the most classical model which measures consumer buyer behaviour is the Consumer Decision-Making Process (CDP) model (Blackwell et al. 2006). In recent years, there has been increased interests in the study of consumers' behaviour for organic food, various approaches that consumers make in their purchasing decision have been developed (Vindigni et al. 2002).

Motivations for Purchasing Organic food

Current literature has shown that there is a prevalent belief that organic food is healthier, safer, more nutritiousness, and of higher quality, and presents a higher level of intention to purchase by consumers (Chen 2007). The strongest motivation in the purchase of organic food is health concerns (Squires et al. 2001). Consumers' interest in health seems to correspond to their interest in and desire to use organic food (Wier and Calverley 2002). Buying organic food is driven by growing consumer interest in more healthy food, increasing personal healthy consciousness. Health consciousness is considered to be a major motivation for buying organic foods and the consumption of organic foods (Verhoef 2005). Another main motivation for buying organic food is driven by growing consumer interest in ecological values, concerning about the environmental sustainability and threat of conventional

agricultural production (Honkanen et al. 2006). Hence consumers are willing-to-pay greater premium price for pesticide elimination and organic food (Botonaki et al. 2006). Even in newly emerging markets, consumers are still willing to pay premium for higher quality, taste, and 'safety' certified food (Grannis et al. 2001). Food safety is the one of most important issues to influence consumer purchasing organic food (Tsakiridou et al. 2006).

Psychologist and marketing researchers have also effectively used the 'theory of reasoned action' and the extended theory of 'planned behaviour' to explain consumer's food choice behaviour (Chen 2007). These models have been used intensively in applied food decision-making, food consumption attitudes, and predicting food choice, as it is the best predictor of food consumption behaviour, and explain all parts of the processes that determine consumer behaviour.

Magistris & Gracia (2008) investigated the consumers' decision-making process of organically produced foods. It found consumers' attitudes towards health attributes, such as healthy diet and balanced lifestyle, and towards the environment are the most important factors that explain consumers' decision-making process for organic food products' variables. Consumers purchase organic food is based on subjective experiences and perception of organic food products (Hughner et al. 2007). It is perceived that organic food is healthier, natural, nutritious and environmentally friendly. The consumers' attitude toward the purchase of organic food is assumed to be positively related (Chen 2007). It is perceived that organic food has better quality. Consumers with positive attitudes toward organic food are more likely to form positive intentions to purchase organic food (Honkanen et al. 2006).

Barriers for Organic Food Consumers

Study also revealed that some of the reasons for the non-purchase of organic food include consumers perceptions of it being expensive, limited in availability and choices (Sanjuán et al. 2003), unsatisfactory in appearance (Radman 2005), misleading labelling and certification (Krystallis et al. 2006), low profile distribution channels (Sanjuán et al. 2003), and lack of perceived value (Gallagher and McEachern 2003). It is still debatable whether organic food production is an opportunity or just hype (Bhaskaran et al. 2006).

Demographic and Psychographic Influences

A consumer perception and demand for organic food study (Chang and Zepeda 2005 p.164) suggest that 'consumers' preferences and food choices appear to be influenced by socio-demographic factors such as income, family structure, lifestyle, dietary restrictions and some social values and beliefs'. It assents to consumers' decision-making process model, and consistent with some previous consumers' behaviour towards organic food findings. Higher income and education levels have a strong correlation with food safety and environment concerns (Tsakiridou et al. 2008). Older consumers (aged over 51) have more positive attitudes towards organic food rather than other age groups (Roitner-Schobesberger et al. 2008). Women are more likely to choose organic food rather than men (Lea and Worsley 2005).

Our preliminary research indicates that the purchasing behaviour of organic food in Asian countries is different to consumers in western countries. For example the environment is not a major motivation for Indian organic buyers, however health and nutrition are still major drivers (Chakrabarti and Baisya 2007). There are also different motivations to purchase organic food in Thailand. Like other developed countries, consumers in Thailand expect to obtain health benefits as well as have a better tasting for from organic products. It was observed that organic food as a new and fashionable product was also an attraction for Thai consumers as they look for new, fresh and trendy products. Meanwhile men in Bangkok seem to be more likely to purchase organic food than women (Roitner-Schobesberger et al. 2008). It contrasts other findings that women are more likely to purchase organic food.

DEVELOPMENT OF A CONCEPTUAL MODEL

Our intention is to develop a conceptual model, which explains the dimensions of Chinese consumers' decision-making process with respect to the consumption of organic food products. Additionally, we intend to research the demographic and psychographic profile of Chinese consumers in urban cities relating to the purchase of organic

food. The beneficiaries of this research will be the vendors, and consumers of organic foods, government and other stakeholders.

Our research aims to find answers to the following research questions:

- Why do Chinese consumers purchase or not purchase organic food products?
- How do Chinese consumers make decisions relating to the purchase of organic food products?
- When do Chinese consumers change or alter their consumption pattern of organic food products?
- What is the demographic and psychographic profile of Chinese consumers who purchase organic food?

The conceptual framework shown below describes Chinese consumers' decision-making process in choosing

Figure 1: Conceptual Model
Chinese Consumers' Decision - Making Process in Choosing Organic Food

(Source: authors, 2009)

organic food.

The original Consumer decision making process (CDP) model consists of need recognition, search for information and pre-purchase evaluation of alternatives, before consumers actually make purchase (Blackwell et al. 2006). The developed conceptual model of this search depicts that consumers' pre-purchase evaluation reflects three dimensions i.e. personal beliefs and motivations, product and regulatory, demographic and psychographic evaluations.

In global studies, essentially, personal beliefs and motivations, which indicate food safety concern appears as the most important factor to influence purchasing decision-making. Organic food is perceived as healthy and natural, less chemical residues products. Consumers are motivated by ecological concerns, which contain personal health and environmental consciousness. Meanwhile, other factors, such as, the way of lifestyle and culture influence can also drive the personal beliefs. Personal health concern and environmental sensitivity are directly and positively associated with the buying decision making of organic food, but this situation needs to be measured in the Chinese environment. Therefore, which is the most important factor that drives the Chinese consumers' demand for organic food?

Once a need has been recognised by consumers, searching for information emerges across the continuum. The credence characteristics of organic food product attributes, which includes health, taste, appearance, freshness, smell, environmental, animal welfare are important products attributes' aspects to determine consumers' consumption process. In addition, labelling and certification seem one of the significant issues among organic food purchasing. Organic food products characteristics and regulatory are directly and positively associated with the buyer decision-making process, again, this also needs to be tested in China.

The socio-demographic profile seems to significantly influence consumers purchasing organic food. Demographic factors which include level of income, education, occupation, gender, marital status, age group, social status, place of residence (first or second tier cities in China) show significant influences on consumer attitudes toward organic food. Further more, psychographic variables, such as personal values and lifestyle concepts also affect consumers purchasing intention. Based on different socio-demographics & consumers segments with different attitudes towards organic food, the hypotheses purchasing intention will be developed and tested in China.

The correlation between organic foods purchase decision associated with people's attitudes is positive and significant from previous studies. Positive attitudes are more likely to have purchasing intention behaviour, eventually conduct actual purchasing; negative attitude towards organic food leads not purchasing decision-making. Barriers of purchasing organic foods can be discovered in this phase. Does an organic food higher price mean a symbol of quality or burden of purchasing? Personal normative beliefs and subjective perception of the environment influence directly or positively impact on Chinese consumers' purchasing decision intention of organic food. We are intending to research these facts in China.

DISCUSSION AND CONCLUSION

Past studies related to consumer attitudes and behaviour toward organic food have provided evidence that consumers consider health concern and environment issues as the most important factors that influence their purchasing decision-making process. Organic foods are perceived as being more nutritious and healthier, safer, environmentally friendly, contain less chemical residues and taste better than normal food. Positive attitude towards organic food leads to positive behavioural intentions and actual purchase. Demographic and psychographic factors show significant influences on consumers' purchasing decision-making.

There are hardly any studies done associated with consumers of organic food in China. In fact, there are misconceptions of the terms 'Organic' and 'Green' types of food and these are interchangeably used by consumers there. It is our intention to empirically investigate the various determinants related to Chinese consumers' pre-purchase evaluation of organic food. These determinants are related to the constructs of consumers' personal beliefs, product features and their demographic profiles.

This paper will be limited to the development of a conceptual model of buyer behaviour of organic food products. In the future, we intend to validate this model by collecting relevant data from consumers in China, and subsequently relevant hypotheses will be tested. This study will provide valuable insights into the global consumer behaviour related to organic foods, and it will also build a new body of knowledge with regard to the future potential of the organic food business in China. Beneficiaries of our study include various stakeholders in China and globally, for example the consumers, vendors both local and international and government agencies.

ABSTRACT

The scheduling problem considered in this paper is a flowshop with bottleneck machines in the system. The objective of the problem is to minimize the total flow time of jobs. A bottleneck-based heuristic algorithm is proposed to solve the scheduling problems. To evaluate the performance of the suggested algorithm, the shortest processing time (SPT) dispatching rule and bottleneck-based dispatching rules collected from literature are investigated for comparison purposes and computational experiments are performed on randomly generated test problems. Results show that the suggested algorithm performs better and more robustly than those dispatching rules for various test problems.

INTRODUCTION

A flowshop scheduling problem with bottleneck machines is considered in this paper. The objective of the scheduling problem is to minimize the total flow time of jobs. Flowshops are common in a real-world factory. The flowshop scheduling problems have been extensively studied. The bottleneck phenomenon frequently occurs in flowshops (Rajendran, 2007). Goldratt and Cox (1992) proposed the idea that overall system performance is governed by bottleneck resources. Bottleneck management is a very important task on the shop floor and is really effective in production scheduling. Therefore, using bottleneck-based heuristic methods to solve production scheduling problems has attracted many researchers.

Adler et al. (1993) considered a practical scheduling problem for plants that produce multiple paper bags. The machine environment can be regarded as a flexible flow shop, and the machines at any given stage may not all be identical. They developed an ad hoc bottleneck-based heuristic to solve the specific problem. Chen and Lee (1998) suggested a heuristic bottleneck-based group scheduling procedure to solve flow line cell scheduling problems. This procedure was based on the bottleneck machine and attempted to fully utilize the bottleneck machine and minimize makespan. Chen and Lee (2001) proposed another bottleneck-based group scheduling procedure to solve group scheduling in job-shop cells. This bottleneck-based method is the most robust and shows the best average makespan. Lee et al. (2004) proposed a bottleneck-focused heuristic algorithm to solve a multiple-stage problem involving identical parallel machines and to minimize the total tardiness scheduling problem. The algorithm focuses on the bottleneck stage first, constructs a schedule for the bottleneck stage, and then further schedules for other stages based on this first schedule. This is because the bottleneck stage may not be the first stage, and the ready time of the jobs may not be zero. The algorithm first uses the sum of processing times of operations on the job at the upstream stages as the estimated ready time of the job at the bottleneck stage and produces an infeasible schedule. Then, it iteratively updates the ready times of operations at the bottleneck stage until it becomes a feasible schedule. Lee et al. (2004) compared eight well-known dispatching rules with the performance of the bottleneck-focused algorithm. The outcomes demonstrated that the heuristic algorithm shows better results in regard to the total tardiness criterion. Rajendran and Alické (2007) proposed several bottleneck-based dispatching rules to solve flowshop scheduling problems with bottleneck machines. Chen and Chen (2008) proposed a bottleneck-based heuristic to minimize the

number of tardy jobs from flexible flow line scheduling problems.

In this paper, we are interested in studying a flowshop with bottleneck machines. The objective of the scheduling problem is to minimize the total flow time. The flowshop scheduling problems are NP-complete in nature. Heuristics are acceptable approaches in practice. Hence, a heuristic scheduling algorithm based on the maximum workload machine (bottleneck machine) is proposed to solve the problem. The rest of this paper is organized as follows. Section 2 describes the problem considered in this paper. Section 3 presents the proposed heuristic algorithm. Section 4 describes and analyzes computational experiments. Finally, section 5 summarizes the major findings of this paper and proposes some promising directions for future research in this area.

DESCRIPTION OF THE PROBLEM

A flowshop scheduling problem can be formally stated as follows: a set of N jobs is to be processed on M machines sequentially. All machines are continuously available. A job is to be processed on the machine at a time without preemption and the machine processes no more than one job at a time.

To describe the proposed algorithm, we use the following notations:

i = job index, $i=1,2,3,\dots,N$

k = machine index, $k=1,2,3,\dots,M$

b = bottleneck machine index, $b \in [1,2,3,\dots,M]$

A_b = the available time for bottleneck machine b

a_{ib} = the arrival time of job i at the bottleneck machine b

C_{ib} = the completion time of job i at the bottleneck machine b

p_{ib} = the processing time of job i at the bottleneck machine b

R_{ib} = the ready time for job i at the machine b

q = the position of the bottleneck machine b

q' = the position of the bottleneck machine b

Z_i = priority index of job i

The total flow time objective is considered in the paper. The scheduling problem considered in this paper is to minimize total flow time. This objective can be defined as follows:

$$\text{Objective} = \text{Minimize} \sum_{i=1}^N C_{iM}$$

BOTTLENECK-BASED HEURISTIC ALGORITHM

The proposed bottleneck-based algorithm revises the method proposed by Chen and Chen (2006) for flexible flow line scheduling problems with unrelated parallel machines. A typical flexible flow line scheduling problem can be defined as follows: many jobs pass through multiple stages with one or more parallel machines at each stage, and there are unlimited intermediate storage areas between any two successive stages. The flow of jobs through the shop is unidirectional and moves from the first stage to the last stage in order. In the method proposed by Chen and Chen (2006), a bottleneck stage was identified, and then, a schedule for the bottleneck stage was constructed; the schedules for the upstream stages ahead of the bottleneck stage were then fixed simultaneously. Finally, the schedules for the downstream stages, beyond the bottleneck stage, were based on the schedule for the bottleneck stage. The workload was used as an indicator to define the bottleneck stage.

In the proposed algorithm, a bottleneck machine was identified, and then a schedule for the bottleneck machine was constructed; the schedules for the upstream machines ahead of the bottleneck machine were then fixed simultaneously. In order to schedule jobs at the bottleneck machine, a greedy algorithm was proposed here to obtain the schedule of the bottleneck machine. The iteration method was adopted for the greedy algorithm to construct the

schedule of the bottleneck machine. The algorithm decides a job's schedule at the bottleneck machine at a time (per iteration) and after n iterations, all jobs will be scheduled completely at the bottleneck machine. Since the bottleneck may not be the first stage, the arrival time for the jobs at the bottleneck stage may not be zero. The arrival time depends on the scheduling of jobs upstream in the flowshop. To get the arrival time of jobs at the bottleneck machine, we try to simulate each job in the upstream machines ahead of the bottleneck machine and from this we can get the temporary schedules and the arrival time for each job. The greedy algorithm chooses the job with the highest priority among jobs that are yet to be scheduled at the bottleneck machine. The sequence of jobs at the bottleneck machine will guide the sequence of jobs entering the system. After the greedy algorithm chooses the job with the highest priority in iteration, the schedules of the job at the upstream machines, ahead of the bottleneck machine, will be determined and fixed. The status of the system will also be kept. The next iteration for computing the arrival time of a job at the bottleneck stage is based on the previous status of the system.

The greedy algorithm combines the shortest completion time at the bottleneck machine and the ready time of job i at bottleneck machine b into one rule. The ready time means the starting time of the next unscheduled job i that can be processed on the machine b . The arrival time can be regarded as the flow time for the upstream machines ahead of the bottleneck machine. The ready time is combined into the shortest completion time priority function, this means that the new priority function not only considers the effect of the flow time, but also considers the machine waiting time. We also perform a pilot test for measuring the effectiveness of the arrival time and ready time information. The results show the algorithm including the ready time works better than the rule containing the arrival time. Therefore, the ready time information is adopted in this study. The main difference between the proposed algorithm and the method proposed by Chen and Chen (2006) is the ready time information. The method proposed by Chen and Chen (2006) did not consider it. The greedy algorithm is presented as follows:

Greedy algorithm: A bottleneck with ready time and the shortest completion time at the bottleneck machine (BRS)

- Step 1.* Assign all jobs to set Ω , where $\Omega = \{1, 2, 3, \dots, N\}$. Set the schedule for the bottleneck machine $S = \phi$ and set the available time for each machine to zero in the bottleneck and non-bottleneck machines.
- Step 2.* If Ω is ϕ then stop.
- Step 3.* Compute the arrival time a_{ib} for each job $i \in \Omega$.
- Step 4.* Compute the ready time R_{ib} , where $R_{ib} = \max\{A_b; a_{ib}\}$ for the bottleneck machine b and for each job $i \in \Omega$.
- Step 5.* Compute $Z_i = \{R_{ib} + C_{ib}\}$, where $C_{ib} = R_{ib} + p_{ib}$ for the bottleneck machine b and for each job $i \in \Omega$.
- Step 6.* Assign the job i to S , remove i from Ω and update the next available time of machine b , $A_b = R_{ib} + p_{ib}$. Fix the schedules of job i at the upstream machines ahead of the bottleneck machine b .
- Step 7.* Go to step 2.

When the jobs for the bottleneck machine and the upstream machines ahead of the bottleneck machine are scheduled, the dispatching rule could be used to schedule jobs for the downstream machine beyond the bottleneck machine.

COMPUTATIONAL EXPERIMENTS

In order to evaluate the performance of the bottleneck-based algorithm suggested here, the computational experiments can be divided into two parts. Experiments of the first part consider the flowshop with one bottleneck machine. The second part experiments consider two bottleneck machines in the flowshop. For the first part experiments, the shortest processing time (SPT) dispatching rule and bottleneck-based dispatching rules (PR1 and PR2) proposed by Rajendran and Aliche (2007) are used for the comparison of performance. For the second part experiments, the shortest processing time (SPT) dispatching rule and bottleneck-based dispatching rules (PR3 and PR4) proposed by Rajendran and Aliche (2007) are used for the comparison of performance. The SPT rule performs

well in regard to the total flow time criterion (Brah and Wheeler, 1998; Hunsucker and Shah, 1994; Kadipasaoglu et al., 1997). The SPT greedy algorithm is used to schedule the bottleneck and non-bottleneck machines. In addition, the SPT dispatching rule is also used in the bottleneck-based algorithm to schedule jobs for the downstream machines beyond the bottleneck machine. The priority function of the rule is stated as below:

Shortest processing Time (SPT)

$$\text{Min } Z_i = p_{ik}$$

Two bottleneck-based dispatching rules, PR1 and PR2, are proposed by Rajendran and Aliche (2007) to solve flowshop scheduling problems with a bottleneck machine.

PR1 can be defined as follows:

Case 1: job i on machine j and $j \leq q$

$$Z_i = \sum_{k=j}^q p_{ik}$$

Case 2: job i on machine j and $j > q$

$$Z_i = \sum_{k=j}^M p_{ik}$$

PR2 can be defined as follows:

Case 1: job i on machine j and $j \leq q$

$$Z_i = \sum_{k=j}^q (b - k + 1) p_{ik}$$

Case 2: job i on machine j and $j > q$

$$Z_i = \sum_{k=j}^M (M - k + 1) p_{ik}$$

Two bottleneck-based dispatching rules, PR3 and PR4, are proposed to solve flowshop scheduling problems with two bottleneck machines.

PR3 can be defined as follows:

Let their positions be q and q' , and let q be $< q'$. PR3 rule works as follows:

$$\begin{aligned} Z_i &= \sum_{k=j}^q p_{ik}, \text{ if } j \leq q \\ &= \sum_{k=j}^{q'} p_{ik}, \text{ if } q < j \leq q' \\ &= \sum_{k=j}^M p_{ik}, \text{ otherwise.} \end{aligned}$$

PR4 can be defined as follows:

$$\begin{aligned} Z_i &= \sum_{k=j}^{q'} p_{ik}, \text{ if } j \leq q' \\ &= \sum_{k=j}^M p_{ik}, \text{ otherwise.} \end{aligned}$$

A series of computational experiments are presented to make comparisons between the results given by the heuristic algorithm, the SPT greedy algorithm, and bottleneck-based dispatching rules on randomly generated problems. All algorithms are implemented in C++ language, and all experiments are performed on a PC Pentium 4 2.4 GHz with 512 MB. For the first part experiments, the experimental parameters and their values used in these experiments are summarized in Table 1. In regard to the problems, there are four factors: number of jobs, number of machines, positions at the bottleneck machine, and workload difference between bottleneck and non-bottleneck machines. The number of jobs has three levels with values set to 30, 50, and 100 (low, medium, and high). The number of machines has three levels with values set to 5, 10, and 20 (low, medium, and high). To set the bottleneck machine, we trisect the flowshop. The bottleneck machine may exist in these trisections. The position of the bottleneck machine in the flowshop has three levels and is randomly set to a position between the first trisection, the second trisection, and the third trisection of the line. The workload differences between the bottleneck and non-bottleneck machines which have the highest workload among the non-bottleneck machines are set at the ratios of 1.5, 2.0 and 2.5 (low, medium, and high). To set the three levels, the processing time of each operation on the bottleneck machine is generated from

a discrete uniform distribution [51, 100], [51, 150], and [51, 200] separately. The processing time of each operation on non-bottleneck machines is generated from a discrete uniform distribution [1, 100]. There are a total of 81 test scenarios and 30 data sets generated for each scenario, and 2430 problems.

Table 1. Experimental design for one bottleneck machine.

| Problem parameter | Values used | Total values |
|------------------------------------|--|--------------|
| Number of jobs | 30, 50, 100 (low, medium, high) | 3 |
| Number of machines | 5, 10, 20 (low, medium, high) | 3 |
| Position of the bottleneck machine | the first trisection, the second trisection, the third trisection, | 3 |
| Workload differences | 1.5, 2.0, 2.5 (low, medium, high) | 3 |
| | Total parameter combinations | 81 |
| | Number of problems/ combinations | 30 |
| | Total problems | 2430 |

The SPT greedy algorithm, two bottleneck-based dispatching rules, and the proposed bottleneck-based heuristic result in four algorithms. These algorithms are evaluated on the basis of the relative percentage deviation (RPD) from the best solution, the number of cases where each rule found the best solution (NBS) and the average total flow time. The RPD is defined as follows:

$$RPD = \frac{S_a - S_b}{S_b} \times 100.$$

S_a is the solution value obtained by method a, and S_b is respectively the best solution value among those obtained by the algorithms included in the comparison.

The results of the main experiments are summarized in table 2, where it is observed that the proposed bottleneck-based algorithm perform more effectively in terms of RPD than other algorithms in regard to all problems. The BRS algorithm can find the best solutions for almost 87% of the problems. We further study the performance of BRS under different production scenarios. Tables 3-6 summarize the average RPD and NBS for each level of the four factors for generating the 81 production scenarios. Table 3 shows BRS performs better at the high level number of jobs size. Tables 4 and 5 show BRS performs well at the low level machine size and bottleneck machine at the first trisection. This means the bottleneck machine in the back machine of the flowshop leads the BRS to inferior performance. However, this algorithm still works better than the other rules. Table 6 shows BRS performs better at the high level workload difference. From these results, one can be observed that BRS heuristic fits well to be applied in the smaller machine size, no matter what the job size.

Table 2. Performance comparisons of all algorithms.

| Algorithms | Relative percentage deviation index (RPD) | | | Average total flow time |
|------------|---|--------------------|----------------------------|-------------------------|
| | Average | Standard deviation | Number of best solutions * | |
| SPT | 4.4003 | 2.872 | 688 | 171091.1 |

*Number of best solutions for the level of each factor found in a total of 2430 problems.

For the second part experiments, two bottleneck machines are considered in the flowshop. The factors of job sizes and machine sizes are identical to the first part experimental design. In addition, as for the presence of the two bottleneck machines in the flowshop, we adopted the following three settings:

Case 1: Positions of two BMs are in the first trisection and the third trisection, and discrete processing times of jobs

on both BMs are sampled from the uniform distribution in the range [51, 99].

Case 2: Positions of two BMs are in the first trisection and the third trisection, and discrete processing times of jobs on the former BM are sampled from the uniform distribution in the range [76, 124], and the discrete processing times of jobs on the latter BM are sampled from a uniform distribution in the range [51, 99].

Case 3: Positions of two BMs are in the first trisection and the third trisection, and discrete processing times of jobs on the former BM are sampled from the uniform distribution in the range [51, 99], and the discrete processing times of jobs on the latter BM are sampled from a uniform distribution in the range [76, 124].

There are a total of 27 test scenarios and 30 data sets generated for each scenario and 810 problems. The SPT greedy algorithm, two bottleneck-based dispatching rules, and the proposed bottleneck-based heuristic result in four algorithms. These algorithms are evaluated on the basis of the relative percentage deviation (RPD) from the best solution, the number of cases where each rule found the best solution (NBS) and the average total flow time.

The results of the second part experiments are summarized in table 7, where it is observed that the proposed bottleneck-based algorithm performs more effectively in terms of RPD than other algorithms in regard to all problems. The BRS algorithm can find the best solutions for almost 85.5% problems. We further study the performance of BRS under different workload scenarios. Table 8 summarizes the average RPD and NBS for each level of the factor workload differences for two bottleneck machines. The results show BRS performs better in Case 2 and Case 3. The consequences are similar to the results of the first part experiments.

For evaluating the efficiency, the average CPU time required for solving a problem in the BRS algorithm is less than 0.2 second, which is short enough for it to be used in practice.

Table 7. Performance comparisons of all algorithms for two bottleneck machines.

| Algorithms | Relative percentage deviation index | | | Average total flow time |
|------------|-------------------------------------|--------------------|---------------------------|-------------------------|
| | Average | Standard deviation | Number of best solutions* | |
| SPT | 3.7578 | 2.998 | 243 | 172254.4 |

*Number of best solutions for the level of each factor found in a total of 810 problems.

CONCLUSIONS

This paper presents a bottleneck-based algorithm to minimize the problems of the total flow time in a flowshop with bottleneck machines. In this algorithm, the bottleneck machine is first identified, and then a schedule of the bottleneck machine is constructed using the heuristic procedure proposed here. The schedules for the upstream machines ahead of the bottleneck machine are formed at the same time. Finally, the dispatching rules can be used to build the schedules for the downstream machines beyond the bottleneck machine. In order to evaluate the performance of the proposed algorithm, several rules such the shortest processing time (SPT) dispatching rule, and bottleneck-based dispatching rules collected from literature, are used for comparison with it via computational

experiments. Since the bottleneck machine may not be the first in the flowshop, the arrival time of a job at the bottleneck machine depends on the schedules at its upstream machines. A trial simulation method is adopted to simulate each single job at the upstream machines ahead of the bottleneck machine then the job of temporary schedules and the arrival time for each job can be obtained. The experimental results show the proposed heuristic focused on the highest workload bottleneck, and performs better than all other heuristic algorithms whatever the presence of the one or two bottleneck machines in the flowshop.

Our future research will consider other system characteristics, which are not included in this paper, such as setup operations required between jobs and re-entrant processing.

CONCEPT ANALYSIS: EVIDENCE-BASED PRACTICE AND ITS IMPORTANCE TO NURSE-PRACTITIONERS

Stuart Childers and Jean Gordon
Capella University

ABSTRACT

This paper provides a review of Evidence-Based Practice in the nursing environment, and validates its use and growing interest among nurse-practitioners. Through an extensive literature review and development of a concept analysis, it has been established that Evidence-Based Practice provides a scientifically based evaluation of information required to improve nursing care decisions. Evidence-Based Nursing Practice improves one's utilization of time; reduces medical costs to treat illness; and improves patient satisfaction. Through the use and understanding of available information, Evidence-Based Practice provides a sense of integrity and renewed appreciation for factual, empirical data as it relates to a patient's medical prognosis and treatment.

INTRODUCTION

The position of nurse holds with it a certain level of knowledge and respect. With the title comes the need for integrity and factual information that patients can rely on when addressing their individual medical needs. The importance of the nurse has been prevalent since the time of Florence Nightingale in the 1860's and continues to hold a position of stature in today's society. This paper examines the use of Evidence-Based Practice as necessary for today's nursing staff, and discusses how its use creates responsible recommendations for nursing care based on quantifiable information. This approach to providing appropriate healthcare and decision-making is of great importance, and will have significant impacts on both the social and financial aspects of the medical industry in the future. The implications to new nurses will also be significant as the concentration on education and the use of the best resources to obtain information related to medical concerns (Bertulis, 2008; Simon, 1999) will raise the expectation of the nurse's practice standards. By addressing the research, one will be bridging a long-term gap between the needs of the researcher and that of the nurse-practitioner, which provides validity to what is represented as evidence and can be used in a working environment (Mulhall, 1998).

LITERATURE REVIEW

The need for Evidence-Based Practice in the nursing field has grown and is at the greatest pace since its inception. To ensure adequate care for patients based on responsible decision-making and the necessities to reduce medical costs, more nurses are depending on Evidence-Based practices along with other aspects of clinical knowledge including experience, past case histories, and the expert opinion of the care giver (Salazar, 2003). While these aspects are important, nurses still realize that the randomized controlled trial reviews are still the gold standard, and rate as the highest level of evidence used to direct clinical decision-making (Beyea & Nicoll, 2000; Girard, 2008; Jennings & Loan, 2001). Each of these components along with patient preference is driving change. These changes show the need for Evidence-Based Practice and what the construct represents to the medical community and its patients. The utilization of Evidence-Based Practice solely is not the answer to all nursing issues, but does provide a more cost-effective savings of healthcare dollars, a higher quality of healthcare to the patient, and a significant

decrease in nursing time within a clinical setting (Salazar, 2003; Youngblut & Brooten, 2001). These savings can be realized across virtually all medical and nursing disciplines and specialties.

Advocates of Evidenced-Based Practice realize the diversity of information sources and how the nature of evidence can be different based on its application. While there is a significant separation among the medical community about what constitutes “true evidence”, most believe that there must be quantifiable scientific evidence to support the decision-making process and the administration of healthcare to the patient (Rycroft-Malone et al, 2004). This establishes the need to have both an explanation for evidence, and the caregiver’s assurance that it is the most reliable information available.

Many studies on Evidenced-Based Practice have realized the omission of three primary factors leading to its successful implementation. The first of these is the lack of time provided to nurses to both carry out their day-to-day duties, and still have time to research available evidence to support learned medical diagnoses (Bertulis, 2008; Gerrish et al, 2007; Sredl, 2008). As a result of this deficiency, most nurses use alternative methods of information collection. These include asking peers for advice, actual observation, personal experience or other methods that rely on something other than available research.

The second factor creating issues for the nurse is the minimal diffusion of education on the subject of Evidenced-Based Practice, and the lack of access and understanding that accompanies the learning process. Based on past research studies, the amount of information related to evidence is sparse, and past literature reviews on the subject have yielded little data (Franco, 2001). Some of the confusion occurs due to the sheer number of sources that exist for the nurse. They must be able to understand the information and then apply it to a specific situation (Rousseau & McCarthy, 2007). This can be a very daunting task for even the most seasoned veteran of nursing. Additionally, there are problems with the arrangement of the information. Although there are more sources from which to pull from, the way it is delivered can be confusing and makes the searching even more difficult (Franco, 2001).

Lastly, there is real confusion among the medical community on what actually constitutes the term useful evidence (Sredl, 2008; Youngblut & Brooten, 2001). This gap requires a significant need for updating the current sources of information, and the methods behind the educational process for training nurses, both new graduates and current practicing nurses, in research retrieval and comprehension. At present there are a number of different avenues that can be accessed to provide the best known protocols of practice. The list includes peer-reviewed journals, government organizations, internet sources, libraries, and databases. The primary health care source, The Cochrane Library, is one used by nurse-practitioners and medical professionals towards a multitude of medically-related concentrations (Rosswurm & Larrabee, 1999; Youngblut & Brooten, 2001). For some, this source is still referred to as clinical and difficult to use (Bertulis, 2008). Other noted research support for nurses can be found at sites such as Campbell Collaboration, which provides decision-making help on social, behavioral, and educational issues; The National Guideline Clearinghouse, which addresses medications and their prescribed guidelines; and the Appraisal of Guidelines for Research & Evaluation, which is recommended by the Council of Europe and the World Health Organization as the guideline to validate medical publications and their content (Hanson, Hoss & Wesorick, 2008). Electronic library databases such as Ovid are also sources as well as online professional organizations such as the ANA, NLN and specialization professional organizations.

THE NURSE

Practitioner

As a trusted medical agent, the nurse is put in a position to make decisions based on one’s current medical condition and the external factors that affect those conditions. This realization is referred to as the nurse and the patient being captives together and it acknowledges that both parties must interact through a physiological and social approach (1997). There lies the necessity for this mindset as nursing requires an evaluation of many aspects of the patient, and not all of these are medically focused. The result is the need for nurses to be both learned in the medical sciences, as well as that of the behavioral and social sciences (Craig & Smyth, 2002). By utilizing empirical scientific research, the nurse of today limits the possibilities of error and meets what is known as the error criterion. While this does not completely eliminate errors, it minimizes the number of occurrences to accepted levels for which true research allows (Paley, 2005).

As part of their position as practitioners, nurses are responsible for individual medical support and obligated with a great deal of responsibility. This is evident by their position of authority, which requires all of their attributes to assist with one’s most important healthcare decisions. To maintain the highest level of integrity and provide the best

professional advice, nurses must be able to utilize factual, quantifiable information, reliable data from all available resources. This approach goes against what is usually substituted for evidence. This includes things like archaic knowledge, one's own experiences, specific skills, hype, beliefs, and what is described as mindless mimicry of top performers (Pfeffer & Sutton, 2006). Different factors related to environment, circumstances and medical condition are important, but they can not act in place of true, scientific evidence.

Decision Maker

To support the true processing of evidence, one must first understand that nurses are required to make decisions for their patients as part of their daily routine. There are many influences that affect these decisions. The list includes evidence as well as characteristics such as individual values, choice, theories, clinical judgments, ethics, legislation and practice-environments (Canadian Nurses Association, 1998). The process of decision-making is defined as a purposeful act, which is intended to achieve a desired outcome based on the vision of the decision maker (Levin, 1972). Thus, the true meaning of decision-making must be understood, and how it applies to medical initiatives and specifically the profession of nursing. As there has been a transformation of beliefs, some researchers have gone away from the previously supported view of basing decisions on one's individual intuition or experience, and have started making managerial decisions based on the best available scientific evidence (Rousseau & McCarthy, 2007). The use of Evidence-Based Practice follows the same criteria and applies this approach to nurses and how they make decisions concerning their patients, while still allowing for these additional influences that affect the outcome of the process.

Decision-making was best represented by one of the most influential social scientists of the 20th century, Herbert Simon, who recognized that this act is not as simple as some may have previously believed. This was clear when Simon stated, "A decision is not a simple, unitary event, but the product of a complex social process generally extending over a considerable period of time" (1965). For nurses, this same importance applies as their decisions not only relate to time-critical outcomes, but ones that occur over longer periods. These decisions may require a number of different measures be taken to resolve the individual medical concerns and conditions of their patients. As a result, each one must be made based from accurate data, applicable evidence, and facts related to the patient's symptoms, while maintaining an environment that supports an evidence-based culture (Ciliska, Dicenso & Cullum, 1999; Craig & Smyth, 2002; McSherry & Haddock, 1999).

According to a leading advocate of Evidence-Based Medicine, the pre-cursor to Evidenced-Based Practice, the ideals that support the theory eliminate uncertainty because they are the "conscientious, explicit, and judicious use of the current best evidence in making decisions about the care of individual patients" (Sackett et al, 1996). Other experts have provided definitions that recognize the process as a "systematic finding, appraising, and using of contemporaneous research as the basis for clinical decisions" (Long & Harrison, 1996). Still the Sigma Theta Tau International Evidence-Based Practice Task Force describes it as "the integration of the best evidence available, nursing expertise, and the values and preferences of the individuals, families, and communities who are served" (DiCenso et al, 2004). Each of these representations acknowledge a utilization of the best and most reliable information available, which supports the decisions of nurses, and makes them better equipped to provide accurate medical advice to their patients. This is of major importance as the decisions of one's nurse can mean the difference between life and death. Among the list of many reasons why Evidenced-Based Practice is important, this is the one which is most imperative to the patient as well as the practitioner.

REASONS FOR INTEREST

As with other medical processes, the use of Evidenced-Based Practice has become more important to today's nurse practitioner, the medical community, and the individual receiving the treatment or diagnosis. There are a number of reasons for this increased interest, some of which includes the need for cost-effective measures that improve health policy, needed improvements in both level and access of information, and the patient's increasing knowledge about treatment options and available care providers (Gerrish, Ashworth, Lacey, Bailey, Cooke, Kendall, & McNeilly, 2007; Youngblut & Brooten, 2001). The suggestion has been made that there is also a necessity for an evidence-based approach because it will guide new practitioners in their decision-making, and it promotes the more experienced ones to maintain accepted clinical competencies (Simon, 1999). The uniformity in approach among the nursing staff promotes a favorable response from the patients. It ensures the progression of nursing by influencing

policy and creating consistent guidelines for both experienced and novice caregivers alike (Cleary-Holdforth & Leufer, 2008).

ATTRIBUTES AND USES OF EVIDENCE-BASED PRACTICE

As the fundamentals of Evidenced-Based Practice have existed for some time, Evidenced-Based Practice itself is a newer concept. The ideals that support the practice include evidence obtained by using recognized procedures that rule out or minimize the possibility for error (Paley, 2006). This position is represented by nursing authorities when they take the position that evidence-based decision-making is an important element of quality care in all domains of nursing practice (Canadian Nurses Association, 1998).

Theoretical

As with any ideology, Evidenced-Based Practice acknowledges specific attributes that relate to the concept. Some of the primary ones utilized provide the use of evidence from research, clinical expertise, and client preference, in addition to other available resources, to make decisions for current patients (Ciliska, Pinelli, DeCenso, and Cullum, 2001; Mulhall, 1998). By using Evidenced-Based Practice, nurses are applying a scientific research approach that recognizes a starting point or theoretical assumption, and addresses that paradigm through a continually changing process. As with any medical issues, this same flexibility must be used to provide the best healthcare decisions. As noted by Thomas Kuhn, the results gained in normal research are significant because they add scope and precision in which the paradigm can be applied (Kuhn, 1996). This allows one's nurse to improve upon the existing factors already applied to in nursing activities such as experience, education, and intuition and to strengthen these with factual, supporting documentation based on scientific evidence.

Operational

Evidenced-Based Practice also provides a recognized operational perspective for nurses who use it to provide medical recommendations. To experience its full impact, nurses who prescribe to Evidenced-Based Practice must follow well-established guidelines that include the following: (1) the formulation and asking of questions that evidence-based research can answer; (2) the collection of evidence and information from known sources; (3) the conducting of a critical analysis of the evidence for validity, generalizability and transferability; (4) the integration of the evidence with knowledge, clinical expertise, and patient preference; and (5) the evaluation of the outcome to make adjustments or improvements (Cleary-Holdforth & Leufer, 2008; French, 1998; & McSherry & Proctor Childs, 2001). To adequately operate based on an Evidenced-Based Practice approach, each one of these steps is used in a linear fashion to prescribe educated recommendations to patients.

To provide a clear explanation of what is applicable to the nurse-practitioner, the author has provided a visual depiction of areas of concern from an operational standpoint (Refer to Figure 1-1). While there are many functional activities of the nurse, these four are primary based on the author's point-of-view. They include the relationship of Evidence-Based Practice to the nurse; one's health; one's environment; and the perception of the patient.

First, the nurse must establish decision-making results based on fact and provide medical evaluation and recommendations from legitimate sources of research. Second, the healthcare community establishes standards based on the quality of outcomes. Third, the healthcare environment requires a high level of education, training, and support based on factual concepts and ideas. Last, the nurse-practitioner uses concepts of Evidence-Based Practices to establish the highest level of patient satisfaction. Each of these areas requires support and application from all operational levels and determines the success of establishing an Evidence-Based Practice meta-paradigm within the medical community.

CONCLUSION

The primary objective of this paper was to establish a concept analysis of Evidenced-Based Practice. Through a comprehensive literature review, the theoretical and operational concepts of Evidenced-Based Practice have been discussed, and both the current and future impacts of utilizing this approach to nursing and healthcare have been

acknowledged. Based on an analysis of the available information, the philosophy and process of Evidenced-Based Practice provides a scientifically, supportable method of providing nursing diagnosis and treatment of patients. Although there is an agreement among the nursing ranks that Evidenced-Based Practice cannot be used by itself, each practitioner concurs that it enhances the other methods of diagnosis and patient care. Although this research has recognized current limitations and deficiencies in the process, the use of Evidenced-Based Practice will continue to increase in importance to all healthcare professionals directly related to the field of nursing. Based on what has been evaluated, the author suggests further research be conducted on ways to improve upon accepted medical sources; the amount and type of training provided to nurses related to research; and improved educational curriculums addressing information gathering and comprehension.

Relationship of Evidenced Based Practice to the Nursing Meta-Paradigm

A NEW DIMENSION OF SISTER CITY RELATIONSHIPS IN THE 21ST CENTURY: A PILOT STUDY IN AUSTRALIA

**Mona Chung, Deakin University, Australia
Bruno Mascitelli, Swinburne University of Technology,
Australia**

ABSTRACT

Sister City agreements have historically provided a goodwill platform for countries to undertake activities for the enhancement of peaceful and cooperative relations. They have also become instruments for cities to develop their own form of internationalization and to provide for specific activities of cultural, educational or other similar cooperative exchanges between cities generally in different nations. Sister City Relationships are broadly-based, officially approved, long-term partnership between two communities in two countries. Using on-line questionnaires distributed through the membership of Australian Sister City Association (ASCA), this pilot study confirmed that the existing relationships are mainly focused on cultural exchange, education and council exchange. An overwhelming majority of the local governments, however, are ready for the extension of the Sister City Relationship by developing business and economic related activities. In fact the pilot study confirms this research is timely and necessary especially in developing policy guidelines and operation frameworks.

INTRODUCTION

Sister City agreements have historically provided a goodwill platform for countries to undertake activities for the enhancement of peaceful and cooperative relations. They were especially utilized during the aftermath of the Second World War to create bridges between former warring nations. In the more recent years, they have also become instruments for cities to develop their own form of internationalization and to provide for specific activities of cultural, educational or other similar cooperative exchanges between cities in the same country. In short a Sister City Relationship is a broadly-based, officially approved, long-term partnership between two communities in two countries. However Sister City Relationships were rarely seen as vehicles for business promotion between cities and countries. The aim of this research is to understand the receptiveness of local governments to adding business as one of the activities of a Sister City Relationship. In doing so, the paper also aims to produce future research direction in order to provide guidelines and frameworks for local governments in advancing Sister City Relationships.

SISTER CITY RELATIONSHIPS

Sister Cities are named in different ways such as Sister Cities, twinning, twin cities, friendship cities, *Jumelage* (French), *partnerstadt* (German) and *Gemellaggio* (Italian). On the whole a Sister City Relationship is a broadly-based, officially approved, long-term partnership between two communities in two countries (O'Toole 2001: 403). A Sister City Relationship becomes official with a signing ceremony of the top-elected officials of the two local jurisdictions, following approval by the local city councils. Sister City programs are also unique in that they inherently involve the three main sectors in a community: local government, businesses, and a wide variety of citizen volunteers (and civil society or non-profit organizations).

The Sister City, county and state affiliations date back to the immediate aftermath of the Second World War. Two towns, one Ludwigsburg in Germany and Montbéliard, France were in 1950 the first such Sister City

arrangements. However the concept was most embodied and driven by the US and developed into a national initiative when President Eisenhower proposed the people-to-people program at a White House conference in 1956. The history of the Sister City Relationships as a post-war phenomenon is most comprehensively presented by Cremer et al (2001) however this analysis had little or no explicit reference to international trade and economic co-operation as one of the objectives of the relationship.

SISTER CITIES IN AUSTRALIA

Today Australian cities have over 475 Sister City Agreements in place throughout the world and this number increases every year (ASCA 2009). Over the last decade Sister City Relationships in Australia (and elsewhere) have received unfavorable publicity and comment from the media. Sometimes this has flowed over to outright hostility by the media against 'money wasting' Sister City Relationships by local government. While serious academic research is not influenced by this negativity it has acted as a brake on Sister City development and the fear of only addressing economic development issues. In other media outlets accusations of 'junkets' and other critical commentary because in essence the 'peace' factor is no longer sufficient and government can no longer live on playing a social and political role but must now respond economically. These new political pressures on local government to fend off these criticisms make Sister City Relationships difficult to pursue.

To date, limited research has been conducted in the field of local government and Sister City Relationships and there is a lack of studies across these relationships across countries (de Villiers et al, 2006:9). Moreover the small amount of research that has emerged mostly from Anglo-Saxon/English speaking countries reflecting the narrow base from which our studies are based.

Over the recent period a few number of scholars have examined international Sister City Relationships as a policy instrument to facilitate business relationships between countries with different cultures (Ramasamy and Cremer 1998). O'Toole (2001) suggested the emphasis of Australian Sister Cities in the recent period has changed from friendship ties to those of exchange of economic development. Cremer et al (2001, p. 377) suggested the Sister City Relationship provides a hybrid form of entrepreneurialism 'municipal-community entrepreneurship' in which is a valuable facilitator of economic and social vibrancy of cities. Local governments may play a role in promoting business and being a facilitator between its own jurisdiction and business with other countries.

This pilot study was supported by the Australian Sister Cities Association (ASCA). The ASCA was established in 1979 around a small convention established in the city of Newcastle and is a non-government voluntary organisation and has functioned as a promoter and focal point for local government authorities. Two years later the ASCA established a solid basis for its existence at their 1981 conference presented their four objectives which ultimately defined their organisation. They were:

1. To extend the hand of friendship nationally and internationally;
2. To encourage an interchange between the nations to consolidate this friendship;
3. To help cities to re-personalise and motivate communities towards 1 and 2;
4. To promote and foster the affiliation of Sister Cities (O'Toole 2001).

METHODOLOGY

As a pilot study, the questionnaire was distributed to all members of Australian Sister City Association (ASCA). It took place solely in the form of an on-line survey. The study seeks to highlight the drivers, the motivations, the impediments and the potential for these relationships. The total number of responses was 59 local governments (out of cohort of 112 members) throughout Australia (ASCA 2009). This gives the respondent rate of 53%. The questionnaire does not exclude respondents without existing Sister City Relationships of which there are 8 of the respondents in this category.

The survey was available to all members of the Association for a period of 9 weeks. The association prompted their members on a weekly basis to participate. The distribution of the questionnaire was kept within the members of the Association because it was the understanding that all members of the association had an interest in Sister City Relationships. The questionnaire consisted of 22 questions in which 19 questions were quantitative questions while 3 questions were open ended and respondents were encourage to provide qualitative comments to the questions.

FINDINGS AND DISCUSSIONS

Table 1 illustrates the distribution of respondents by State in order to determine the location of the respondents. As the survey was distributed among the members of the ACSC which numbered 112, the responses strongly reflected the (actual) strength of membership in each state as can be evidenced in Table 1. NSW, Australia's most populous State had the greatest number of actual members and in the response registered the greatest number of responses (44.07 percent) of all responses.

Table 1 - State location of respondents in survey of Sister Cities, 2009

| State | Absolute frequency | Relative frequency % | Actual membership distribution |
|------------------------------|--------------------|----------------------|--------------------------------|
| Australian Capital Territory | 1 | 1.69 | Not indicated |
| New South Wales | 26 | 44.07 | 55 |
| Northern Territory | 1 | 1.69 | 3 |
| Queensland | 11 | 18.64 | 18 |
| South Australia | 2 | 3.39 | 2 |
| Tasmania | 2 | 3.39 | 8 |
| Victoria | 11 | 18.64 | 15 |
| Western Australia | 5 | 8.47 | 11 |
| Total | 59 | 100 | 112 |

Source: Questionnaire responses, 2009

Table 2 demonstrates that the 45 percent of the respondents were from cities with populations of over 100,000. This would indicate that the response from respondents on a population basis is significant.

Table 2 – Population of city/shire governments from the survey responses, 2009

| Size of population | Absolute frequency | Relative frequency % |
|------------------------|--------------------|----------------------|
| 10,000 or less | 2 | 3.39 |
| From 10,001 to 20,000 | 4 | 6.78 |
| From 20,001 to 50,000 | 9 | 15.25 |
| From 50,001 to 100,000 | 17 | 28.81 |
| Over 100,001 | 27 | 45.76 |
| Total | 59 | 100 |

Source: Questionnaire responses, 2009

Table 3 highlights the area in which the portfolio of Sister City Relationships might sit within the specific city council. In many respects the response provided is an indication of the focus of the Sister City Relationships. 18 percent indicated that their International Relations area had responsibility for Sister City relations. More than 22 percent indicated that Sister Cities was covered by their cultural/education or sports section. A low 7 percent had an economic development area responsible for Sister City relations while a high 22 percent of 'Other' indicated responsibility. This is a very telling table as it indicated the Sister City Relationships are in a category of undetermined roles. They are certainly not seen as an economic responsibility and that in many cases Sister City Relationships would appear to be more 'sidelined' as an activity. Most of the city councils that responded as 'Other' also included Mayors, Councilors or engaged in other executive and non-executive positions.

Table 3 – Role of the respondent of the Sister City survey, 2009

| Role | Absolute frequency | Relative frequency % |
|-------------------------------------|--------------------|----------------------|
| International relations | 11 | 18.64 |
| Economic/Business development | 7 | 11.86 |
| Cultural/Education/sport activities | 13 | 22.03 |
| Other | 22 | 37.29 |
| Not answered | 6 | 10.17 |
| Total | 59 | 100% |

Source: Questionnaire responses, 2009

90 percent of the respondents indicated that the person completing the questionnaire had responsibility for the Sister City Relationship. This is a pleasing result as it proves the validity of the data.

Over 28 percent of the respondents had only one Sister City Relationship. 17 percent had two Sister City Relationships while 13 percent had three Sister City Relationships. A further 13 percent had no Sister City Relationship. No respondent indicated they had more than seven relationships and 8 had no relationship at all (see Table 4).

Table 4 – How many Sister City Relationships does your city/shire have?

| Number | Absolute frequency | Relative frequency % |
|--------|--------------------|----------------------|
| 0 | 8 | 13.56 |
| 1 | 17 | 28.81 |
| 2 | 10 | 16.95 |
| 3 | 8 | 13.56 |
| 4 | 5 | 8.47 |
| 5 | 2 | 3.39 |
| 6 | 1 | 1.69 |
| 7 | 1 | 1.69 |
| Total | 59 | 100% |

Source: Questionnaire responses, 2009

The activities currently undertaken by the respondents provided a valuable overview of the current activity undertaken by local governments when in Sister City agreements. 26% of the Sister City Relationships were (Table 5) that of ‘cultural exchange’. The next activity was ‘education’ with 22 percent followed by ‘people to people’ with 20 percent response. ‘Business’ only managed to receive 8 percent of the responses as an activity of the local government.

Table 5 – What are the most important forms of activities undertaken within your Sister City Relationships?

| Activity | Absolute frequency | Relative frequency % |
|-------------------|--------------------|----------------------|
| Education | 35 | 22.73 |
| Council exchange | 27 | 17.53 |
| Cultural exchange | 41 | 26.62 |
| People to people | 32 | 20.78 |
| Business | 13 | 8.44 |
| Other | 6 | 3.90 |
| Total | 154 | 100 |

Source: Questionnaire responses, 2009

A major feature of the debate when discussing Sister Cities is the ‘negative’ concern and its origins. The questionnaire responses make clear that many local governments are fearful about the backlash from various sources of the establishment of Sister City agreements. The survey response provided interesting testimony to this concern in which it highlighted that 35 percent of the concern came from the media and over 36 percent of the respondents concerned about ratepayer backlash in pursuing Sister City Relationships is the issue of community/ratepayer support to these relationships. The concern for proper (and improper) use of rate payers rates and contributions figures prominently in Sister City discourse and often comes under the label of Council ‘Junkets’. This clearly concerns the local governments (see Table 6). A factor that has concerned many local governments as witnessed in table number six with.

Table 6 - In your opinion where do the greatest concerns about Sister City Relationships come from?

| Source | Absolute frequency | Relative frequency % |
|-------------------------|--------------------|----------------------|
| The Council | 6 | 8.22 |
| The Media | 26 | 35.62 |
| The Councilors/Aldermen | 10 | 13.70 |
| The ratepayers | 26 | 35.62 |
| Others | 5 | 6.85 |
| Total | 73 | 100 |

Source: Questionnaire responses, 2009

As for the countries which Australia most establishes its relationships with is Japan, over 50 percent. This is followed by United States 8.47 percent; China 8.47 percent and New Zealand 8.47 percent as the second equal large group of countries (see Table 7).

Table 7 – With which countries have Sister City Relationships have been the most successful?

| Country | Absolute frequency | Relative frequency % |
|---------|--------------------|----------------------|
|---------|--------------------|----------------------|

| | | |
|---------------|----|-------|
| Britain | 1 | 1.69 |
| China | 5 | 8.47 |
| France | 1 | 1.69 |
| Japan | 31 | 52.54 |
| South Korea | 2 | 3.39 |
| New Zealand | 5 | 8.47 |
| Portugal | 1 | 1.69 |
| United States | 5 | 8.47 |
| Not answered | 8 | 13.5 |
| Total | 59 | 100 |

Source: Questionnaire responses, 2009

Compared to a survey by O'Toole (2001) in 1999, Japan came third behind USA and China, the friendship focus has clearly shifted in a matter of 10 years. According to O'Toole (2001) many of the Sister City Relationships between Australian and Japanese cities has been a product of Japanese local government internationalization of Japan (*Kokusaika*). Moreover the same study has established that by the 1990s Japan had over 85 separate Sister City agreements with Australian cities (O'Toole 2001 p. 407).

The study sought to highlight the benefits attained by city councils (as indicated by the respondents) with their Sister City Relationships and the activities they associate with this function. The study also sought to inquire into the potential for current Sister City arrangements to pursue business development and facilitation as an extra function of this relationship. An overwhelming majority 61.02 percent (Table 8) confirmed that their local city/shire should act in a role of facilitating business activities utilizing Sister City Relationships.

Table 8 – Should Sister City Relationships become business facilitators for your city/shire business community?

| Response | Absolute frequency | Relative frequency % |
|------------|--------------------|----------------------|
| Yes | 36 | 61.02 |
| No | 13 | 22.03 |
| Don't know | 10 | 16.95 |
| Total | 59 | 100% |

Source: Questionnaire responses, 2009

The general sentiment from the respondents on the potential sustainability of business relationships within Sister Cities is overwhelmingly supported as is evidenced from Table 9 below. It is an understood sign of the times that representatives realize they must pursue this avenue of enhancing the Sister City Relationships with a commercial scope alongside other non-business relationships. This is especially evident with reference to the growing number of Sister Cities with China and India.

Table 9 – Are sustainable business relationships possible within Sister City Relationships?

| Response | Absolute frequency | Relative frequency % |
|------------|--------------------|----------------------|
| Yes | 41 | 69.49 |
| No | 10 | 16.95 |
| Don't know | 8 | 13.56 |
| Total | 59 | 100 |

Source: Questionnaire responses, 2009

The respondent's preference for specific kinds of business activities included networking (33 percent) as well as Sister Cities providing a greater meeting point for buyers and sellers (26 percent), as can be seen from Table 10. 23 percent of the respondents felt that Sister Cities could provide greater access to each others respective market (see Table 10).

Table 10 – What specific benefits do you believe Sister City Relationships could provide for the business community?

| Activity | Absolute frequency | Relative frequency % |
|---|--------------------|----------------------|
| Provide access to the market | 29 | 23.39 |
| Bring potential buyer and seller together | 33 | 26.61 |
| Networking | 41 | 33.06 |
| Demonstrate government support to the process | 20 | 16.13 |
| Other | 1 | 0.81 |
| Total | 124 | 100 |

Source: Questionnaire responses, 2009

Sister Cities that were part of the study indicated the main nations in the world where the relationship had succeeded and where they had not. They also defined the issues which brought the cities together and the issues which did not. Moreover Sister Cities were often influenced by local conditions and political factors. There was much trepidation about ratepayer concern and the wise use of ratepayers revenues as well as the ability of the respective local government to get the local media on side with exchanges between cities and the avoidance of the 'junket label' which many inside local government feared.

New studies and theoretical appraisals of the functionality of Sister City Relationships in Australia (and elsewhere) have raised discussion towards an inclusion and consideration of the commercial utility of such relationships and not solely cultural (O'Toole 2001).. In part definitions of the relationships have reflected this change of emphasis especially in the last decades of the twentieth century characterised by growing forces of globalisation (de Villiers et al, 2006). As early as 1990, Zelinsky made the observation that shared economic interests actually account for numerous Sister City Relationships within the United States. These included examples such as Pittsburgh with metallurgical centres such as Sheffield in the UK, Houston is twinned with oil rich Baku in ex-Soviet Union Baltimore twinned with ports like Genoa and Rotterdam in the Netherlands (1990). As such the use of Sister Cities was also seen as a trade and economic mechanism of economic enhancement.

28 respondents made qualitative comments addressing an array of issues about Sister City Relationships. These comments cover a broad range of issues. One respondent suggested research into establishing frameworks for local governments when establishing Sister City Relationships:

"It would be very useful if the researchers could also identify and come up with a framework with which we are able to assess/quantify the benefits of Sister City relationships (Comment n. 17)."

This is a pleasing indication that this research is timely and necessary.

The following passage is the best example of what this research is aimed to establish. Sister City Relationships have served their purposes in the past successfully; it is only timely that local government and local community are looking for further development of Sister City Relationships.

"Currently our Sister Cities relations mainly focus on cultural and educational programs. They are very successful and many residents of Logan/ communities are given the opportunity to be a part of the program. We are currently looking for more economic returns for future investment opportunity (Comment number 11)."

I believe some countries do establish Sister City Relationships because of economic value i.e. China however with any relationship having first established the cultural side is important and the bonus is if it then extends to the wider community eg. A business proposal (Comment number 8)."

Comment 27 made the point very abruptly and vividly. It stated:

"Getting the ratepayer who has not been part of the Sister City relations to see the benefits."

Alongside this sentiment, comment number 2 was more explanatory of the process and how to win public support to these relationships. It stated:

"Prior to establishment of a relationship, there should be broad community support. If there is a strong local community from the country selected their involvement and full support is essential. Visits to any Sister City should not be treated as a 'junket'. Ratepayer funds should be kept to a minimum and citizens from the community should be invited and encouraged to participate. For inbound visits citizens from the community should also be involved in activities (Comment number 2)."

Comment number 7 made the same point concerning the cost and benefit relationship. The comment stated:

"Marketing and base root support is essential to have Sister City relationships succeed. If ratepayers do not see value for money they do not want such a relationship. Cost and accessibility to each country is a big factor (Comment number 7)."

This concern is further illustrated through the comments below and it leads to action which may be seen as "hiding truth from tax payers":

"...There is often a fear (by Councils) to publicize visits which then prevents positive stories from being told about benefits to the community and to business from these partnerships (Comment number 9)."

Alongside the rate payers, there was also concern for the negative role played by the media. Comment number 22 addressed this well:

"Sometimes the political nature of these relationships can overpower the long term benefits and can be aggravated by negative media portrayals. Much is dependant upon the very people involved in building and maintaining these links - being selfless and working towards a strong agenda link. The benefits flow after the relationship has been forged. There are not many opportunities to make strong links with cities that can develop economic, social and cultural links just by calling up to start a relationship -"

Sister Cities are the bridge! All the people from our city who have visited Springfield (over 200) would not have done so without the Sister City relationship (Comment number 22)."

In closing a number of difficulties in sustaining Sister City Relationships were mentioned by the respondents. Many of these comments gravitated to the need for resource sustainability for the Sister City Relationships to be effective. They included lack of resources, language and cultural barriers. Comment number 26 stated:

"Sister City programs must be adequately resourced through Council policy" (Comment 26)."

CONCLUSION

The survey undertaken from the membership of the Australian Sister Cities Association provides us with a statistically relevant and authoritative sample of the thinking within these local governments of matters relating to the management and direction of Sister Cities in Australia. This is the first study on Sister City Relationships in the last 10 years. The findings of the survey confirmed that local governments are prepared to see Sister Cities facilitate business as one of its tasks in the functionality of these relationships. While not all respondents were overwhelmed by the proposition, which were largely related to limitation of resources, past negative experience such as the 'junket' phenomenon and undetermined strategic positioning of the Sister City Relationships, it is clear that research on this topic in order to produce policy guidelines and framework is welcome and timely. To the issues identified have led to a slow down in the acquisition of new Sister City Relationships especially on the cost benefit argument from both the public arena and the rate payer community groups. The 'junket' factor from the survey responses seems to be the major argument for local governments in seeking for better solutions of Sister City Relationships. A framework which provides a method of measuring their Sister City performances and guidelines of policy development would be timely and necessary. This should be expended and supported by a larger scale research. The next stage of the research will seek to evaluate the potential of Sister City Relationships being extended to business relationships.

COLLABORATION AMONG GOVERNMENTS AND COMPANIES IN MANAGING NATURAL PARKS IN THE CITY OF RIO DE JANEIRO: DOES IT PAY?

Marcos Cohen and Jorge Ferreira da Silva
Pontifical Catholic University of Rio de Janeiro, Brazil

ABSTRACT

This paper presents the analyses and conclusions of an empiric research regarding the management of natural parks in Rio de Janeiro through the implementation of collaborative strategies between government agencies and local companies. Case studies were carried out in seven natural parks by means of dozens of interviews with park managers, business managers and other social actors. The results provide evidence that the collaborative strategies used are still insufficient to handle all organizational, material and human limitations that exist in the central agencies responsible for those parks, but they are a promising course of action if governments and companies succeed in overcoming cultural and operational barriers.

INTRODUCTION

Under the National System for Conservation Units (SNUC) was created in 2000 by Law 9985. It regulates the management of different types of environmental conservation units in Brazil with the objective of guaranteeing the preservation and/or sustainable use of a range of areas with relevant natural characteristics in this country. One of the most common forms of conservation units are the natural parks. SNUC identifies five main objectives for a park-type conservation unit (Brazil, 2000; Chapter III, Article 11): 1. Preserve natural ecosystems of great ecological importance and scenic beauty; 2. Enable the execution of scientific research; 3. Develop activities for environmental education and interpretation; 4. Develop recreation activities that include contact with nature; 5. Develop ecological tourism. SNUC establishes a guideline which would help to reach these objectives in a collaborative and participatory way (Brazil, 2000, Chapter II, Article 5): that in which the managing agencies of Conservation Units must seek “the support and cooperation of nongovernmental organizations, private organizations and individuals for the development of studies, scientific research, environmental education practices, leisure and ecological tourism activities, monitoring, maintenance, and other conservation unit management activities”. In Rio there exist dozens of conservation units, among which stand out 17 municipal natural parks, 3 state parks and 1 national park. Each one of these parks is administered by the management agency responsible (within the respective government sphere) which nominates an agency staff member to exercise the function of park manager. Meanwhile, audits have registered that a good many of these parks lack sufficient infrastructure and the financial, human, and management resources to comply with the directives and objectives advocated by SNUC (PCRJ-SMAC, 2005; TCMRJ, 2005). One of the available alternatives to overcome these deficiencies is to seek collaboration among the different social actors: organized civil society and private organizations, whether companies or non-governmental agencies (NGOs). Within this context, an exploratory study was carried out with the objective of understanding how the collaborative strategies used by the management agencies of the natural parks in the city of Rio de Janeiro have been implemented and how such strategies affect the results of management and the relationship with the different groups of social actors involved. Additionally, it was sought to understand the behavior of the businessmen in relation to these parks.

THEORETICAL REFERENCES

Collaborative Strategies and Companies in environmental issues

Gray (1985) defines collaboration as “the reunion of tangible and/or intangible resources by two or more parties interested in resolving a set of problems which neither of them could resolve alone”. Wondolleck and Yaffee (1997) affirm that collaboration can lead to decisions which are both more efficient and easier to implement. At the same time, communities, private organizations and government agencies who collaborate acquire abilities which can serve them in future situations in a process of collective learning. For Wondolleck and Yaffee (1997), building bridges between governments, private organizations and individuals creates mutual understanding, support and growth of all those involved. Pressure from society itself, ever more concerned with environmental issues, takes it upon itself to oblige governments at the federal, state and municipal levels to seek partners. Thus, temporary or permanent partnerships are formed between the conservation unit (represented by the government agency to which it is subordinate) and a certain social actor (a stakeholder) or more complex partnership networks between the conservation unit and a range of social actors. The concept of collaborative strategies applied to the environment incorporates many kinds of collaborative arrangements, temporary or not, with many participants or few, official or informal, including some traditional arrangements such as strategic alliances or networks. Some of the main collaborative strategies identified in the literature on conservation unit management are: Simple Partnerships – those focused on one or two subjects, involving a small number of partners and possessing a few specific objectives. (Wondolleck and Yaffee, 2000; Presas, 2001); Multiple Partnerships – Those involving a large number of partners, in general focusing on more complex environmental projects (Wondolleck and Yaffee, 2000; Petrobras Ambiental, 2008); Interagency Coordination (Government agencies) – actions integrated between agencies of the same government or different governments for the purpose of attaining common objectives vis-à-vis environmental issues. (Wondolleck and Yaffee, 2000; PCRJ - SMAC, 2005); and Participatory Management of conservation units – includes participation by surrounding community in the conservation unit by means of an Advisory Council (Oliva; Magro, 2004). Even though it is clearly perceived in the literature that government agencies linked to the environment foster the participation of the community and other entities of society, this process has not always been effective. Wondolleck and Yaffee (2000) alert to the institutional and structural barriers to collaboration that are present in the complex situations of environmental projects. The main barriers identified by them are: lack of opportunities and incentives; parties at cross-purposes; inflexibility of policies and procedures of the involved parties; limited resources; mutual lack of confidence and incompatible organizational standards and culture.

Senge and Carstedt (2001) state that the perception that companies are part of complex and evolving systems accentuates the role of the relationships, and increases confidence in them. According to them, it is no longer possible for companies to make decisions without considering the impact on third parties. Regardless, the environmental laws in effect, combined with environmental standards (e.g., ISO 14001) voluntarily accepted by companies and the pressure from society itself, have propelled private and state companies to take the initiative to act in a more conscientious and cooperative manner in relation to the environment. As such, in recent years a series of private arrangements have developed which are designed to foster action from companies vis-à-vis their impacts on the environment. This paradigm is known as private environmental management (Maimon, 1996; Barbieri, 2004). According to Barbieri (2004), the environmental concerns of businessmen are influenced by three basic sets of forces: pressure from environmental agencies, society, and the degree of insertion of the firm in the market. Were it not for the pressure from society and government measures, the growing involvement of companies with environmental issues would not be witnessed. One of the results of this social and market pressure is the ever increasing adoption of the sustainable development concept by private companies under the terms “corporate sustainability” or “triple bottom line” (ELKINGTON, 1994; BARBIERI, 2004). In the case of companies, the perception is growing that their interdependence with the social, economic, cultural and political contexts, in parallel with the notion that the economics of natural resources affects their bottom line and naturally their stakeholders, too (ELKINGTON, 1994). In practice, this means the adoption of ecologically correct strategies and operations, and partnerships with other social actors (PRESAS, 2001). As can be seen, companies can act either as instigators of environmental harm or as agents of conservation. The latter behavior is framed within the concept of socio-environmental responsibility, and includes the meeting of the various basic demands originating in the social elements with which the company maintains some sort of exchange (MORSING; SCHULTZ, 2006). In this sense, Richers (2000) confirms that the ecological area is the one

requiring the most urgent efforts and that, sooner or later, all companies will have to concern themselves with this, whether due to pressure from the judiciary, consumers, or nature itself.

RESEARCH METHOD

An exploratory research study was carried out using a qualitative approach (Creswell, 2003), operationalized by means of a strategy of multiple case studies (Yin, 1994), with the objective of increasing the capacity to generalize, based on the research. The reliability of the research was insured by means of a case study protocol and a continuous process of triangulation of the data sources, following Yin (1994). The article presents the results of the analysis of the collaborative strategies used in the management of five natural municipal parks (Mello Barreto, Chico Mendes, Marapendi, Bosque da Barra and Bosque da Freguesia), one federal park (Tijuca National Park,) and one state park (Pedra Branca State Park) in the city of Rio de Janeiro involving collaboration or conflict with companies. Sixty one in-depth interviews were analyzed. Interviewees were representatives from the central management agencies (Municipal Secretariat for the Environment, Brazilian Institute for Environment and Natural Resources and Forest State Institute), park administrators, and representatives from a range of groups of parks stakeholders (specially managers of different companies, NGOs, trade organizations, etc.) Data was also obtained by means of bibliographic and documentary research, as well as ample direct observation in the parks studied. The data collection phase lasted from November 2005 to December 2006, with a final follow-up between January and March of 2007. Treatment of the data was eminently qualitative, and ATLAS.ti 4.2 content analysis software was used based on elaborated conceptual categories.

RESEARCH RESULTS

Five Municipal Natural Parks (MNP)

The duties of the Rio de Janeiro Municipal Secretariat for the Environment (SMAC) include “to plan, promote, coordinate, inspect, license, execute and implement the execution of the municipal environmental policy, in coordination with other Municipal agencies” (SMAC, 2005, p.2). At the time of the research, one of its areas, the Conservation Units Management Administration (GUC) was responsible for the management of the municipal conservation units in Rio de Janeiro. GUC had one manager, six administrative employees and twelve park managers, a number insufficient considering all of the activities to be performed. Park managers' duties include seeking partnerships with the sectors of society and submitting these suggestions to GUC for a final decision. Thus, it can be seen that the manager has limited autonomy with respect to this duty.

Municipal Natural Park Professor Mello Barreto: MNP Professor Mello Barreto is a small park, about 6.5 ha in size, located on the banks of Tijuca Lagoon, close to the residential area known as Peninsula, and across from Rio's largest mall, Barrashopping. The history of the creation of the park by the builder Carvalho Hosken Engenharia e Construções S. A. is rooted in the occupation of the strip on the banks of Tijuca Lagoon by a small favela (slum) in 1990. A group of companies - builders who owned lots in the area - signed an agreement with the city to remove the houses in the area and Carvalho Hosken assumed control of the design of the park with environmental features at the site, aiming to recuperate the 3.5 ha of mangrove along the banks of the lagoon. More recently, in 2003, Carvalho Hosken sought the help of the Environmental Secretariat in order to form an official partnership that might enable the firm to continue taking care of the park while, at the same time, capitalizing on the investment in terms of corporate image. After some years of negotiations and bureaucratic holdups a renewable five-year Term of Cooperation was signed between the two parties for the revitalization, conservation, and maintenance of MNP Professor Mello Barreto. This partnership is informally referred to by SMAC as a park "adoption". Carvalho Hosken commits to performing a series of interventions in the sense of revitalizing the park, and others, at its own expense, with the objective of conserving and maintaining it. For its part, SMAC is committed to providing technical orientation, supervision, and inspection of services provided by Carvalho Hosken, as well as supporting environmental education initiatives by providing human resources and materials. Carvalho Hosken's initiative might be the beginning of a trend to more frequent simple partnerships, as espoused by Wondoleck and Yaffee (2000), between SMAC and private enterprise, where the logic of the private capital profits might be manifest in a greater concern with environmental and social issues. According to information provided by the GUC representatives, SMAC has the intention of extending this type of partnership to other parks. However, there exist internal impediments, such as an excess of

bureaucracy and a lack of human resources to carry out all of the necessary studies and to negotiate the partnerships. Meanwhile, the actions of Carvalho Hosken have met some criticism. According to an environmentalist, the Península Project only became environmentally adequate after much pressure from society, by means of conflicts and lawsuits. In the words of the interviewee, "the impact of the Carvalho Hosken undertaking is not so great because they are more conscientious or because they have a more refined environmental sensibility than other companies: It was based on a lot of heavy handedness".

From the above it can be concluded that despite being in the beginning stages, the collaborative strategy of creating formal partnerships for purposes of "adoption" and shared management, in the form of a "cooperation agreement" with companies is a viable alternative for SMAC. However, the success of such an initiative shall depend on the degree of political pressure and organizational mobilization, as stated by Barbieri (2004) and Morsing and Schultz (2006), and planning by SMAC (especially GUC), in order to overcome the institutional and structural barriers identified by Wondolleck and Yaffee (2000). In order to achieve this, more trained human resources and informal partnerships with other internal agencies must be prioritized.

Municipal Natural Park Marapendi: MNP Marapendi runs through two districts: Recreio dos Bandeirantes, where it is based, quite close to MNP Chico Mendes, and Barra da Tijuca, in a series of fragmented areas along the banks of the Lagoon and Marapendi Canal. This geographic dispersion makes efficient management of the park somewhat difficult. As in the other municipal parks, in MNP Marapendi there lacks adequate organizational structure. The administrator is the only permanent SMAC staff person working to manage the park. The main companies that act in the area of the MNP Marapendi are the construction companies, who have been the mainspring for the urban growth of the Barra da Tijuca and Recreio dos Bandeirantes districts. The majority of the large construction companies have adopted a "green" sales pitch, pronouncing their ecological concern with their undertakings in these regions, something which does not correspond with reality, most of the time. Some of the builders do seem to be concerned about the environmental issue in their undertakings, even though the final objective is profit. This is due to the fact that the perception regarding the environmental issue has increased among potential buyers of real estate in these regions, as well as the growing pressure from environmental NGOs. The construction companies have, however, a strong lobby at City Hall and the state assembly and are constantly trying to get approval for the construction of large hotels along the beach inside the Marapendi Environmental Preservation Area, something which generates local conflicts. Regarding collaborative actions between the park manager and local businessman, the locally designed initiative of a publicity company was identified. At the end of 2005, the initiative had developed at a campaign entitled "Preserve", meant to popularize the natural beauties of the area among the residents and raise their awareness of the importance of preserving nature. The campaign was financed by clients of the company, whose business names and brands were displayed during its execution. The campaign was a success and improved the relationship between the company and park management, but it did not sustain. One of the company officers complained about the excessive bureaucracy within SMAC to get projects approved. With the exception of this initiative and the leaflets distributed to visitors, no other practical initiatives were identified at the park. A lack of continuity in the efforts of the manager to find partners to help popularize the park was felt, especially in the face of the interest from local companies, characterizing the presence of informational and cultural barriers to collaboration (Wondolleck and Yaffee, 2000).

Municipal Natural Park Chico Mendes: MNP Chico Mendes occupies an area of 40 hectares in the middle of the Recreio dos Bandeirantes district, in the West Zone of Rio de Janeiro. The park began to be revitalized in 1995, mainly through the acts of Rio-Zoo Foundation, which managed the park at the time. Even after responsibility for the park passed over to SMAC, in 2003, it was maintained by a co-agreement between both of them, which brought benefits for park Management. There is also a permanent partnership between the park and the Estácio de Sá (private) University veterinary school, which guarantees treatment to sick animals taken to the park. This partnership was organized by the park manager. Several regional businessmen associated with voluntary actions in conjunction with MNP Chico Mendes were interviewed. The perception of the interviewees is that despite the efforts of the manager to create partnerships with companies, these initiatives get stymied by city bureaucracy and the lack of decision-making power of the park manager in relation to such initiatives. For the most part, strategic decisions relative to park management are made in a centralized form at GUC or other SMAC sectors. The interviewees also view their own participation as merely complementary, by means of donations of materials, organization of events. However they reiterate the basic responsibility of the city agency in providing necessary resources to the park manager in order to be able to carry out his job adequately. According to them, resources are currently scarce and the park is frequently mired in difficulties with respect to its maintenance. It is also common for the park administrator to request help from neighboring parks who have maintenance contracts in effect. Notably, the city's rules currently disallow charging for entry or

the presence of food kiosks within the park. Also, according to the businessmen interviewed, the environmental awareness of the businessmen in Recreio dos Bandeirantes is low and many of them do not even know about the park (which, moreover, is also the case with the region's residents). Some companies in the region also contribute to the pollution in the park lagoon. At the beginning of 2005, the manager of MNP Chico Mendes and the coordinator of the Marapendi Environmental Education Center designed and implemented an ecological corridor linking Chico Mendes Park and Marapendi Park. Work began in March 2005. More than 8000 seedlings were planted and some species of exotic vegetation were removed. The area has recovered quite well and the project is ongoing, a highlight being the formation of a multiple partnership involving different City agencies, community associations, a private university and a research institute. Despite the requests made, however, the participation of local companies in the undertaking was practically nil. Incompatibility of purposes was identified as one of the main local barriers.

Municipal Natural Park Bosque da Barra: MNP Bosque da Barra is located in the Barra da Tijuca district, occupying 50 ha next to one of the two most important and busiest thruways in the area. The main companies acting in the area close to the park are construction companies, Carvalho Hosken prominent among them with its regional Peninsula project, the Barrashopping, Casashopping and Via Parque malls and Carrefour and Makro hypermarkets. There are also recreational clubs, amusement parks and restaurants very close to the park. All of these companies are potential partners for MNP Bosque da Barra. Several simple partnerships were identified that were set up in a centralized way between the manager of MNP Bosque da Barra and companies and NGOs. These partnerships combined sports, leisure and environmental education activities, thereby ensuring a good turnout of visitors during weekends. According to the park manager, some local companies have partnered with the park in organizing cultural and sports events. The counterpart to the partnership was manifested in terms of donations of cleaning materials and other items for the park in order to help with the maintenance, especially during times when there was no maintenance contract. Another important partnership reported by the manager was with the Ineptus Clã theater troupe, which has been specializing in works of an environmental education nature since 2001. The group offers eco-theater workshops and performs for free on Sundays. In exchange, the company uses the park as its headquarters and as a showcase to the public and to companies. From the reports, the existence of an enormous potential for collaboration between surrounding companies and park management was noticed. However, the number of companies which effectively engage in these partnerships is still very small. This fact is caused as much by indifference on the part of local businessmen as it is by the operational incapacity of SMAC and the manager to contact them and raise their awareness of the park.

Municipal Natural Park Bosque da Freguesia: MNP Bosque da Freguesia is located in the Freguesia district in the Jacarepaguá region. The area of forest, close to 31 ha, has been impacted by human activities almost throughout and includes many non-native species (PCMRJ, 1998). As a result of the negotiations in 1992 and the consequent donation of part of the land for the creation of Bosque da Freguesia, the businessman who owned part of the land there constructed a car dealership and a shopping mall, which abuts the park. The park manager related several problems caused by the shopping center, among them excessive noise due to a go kart track installed in the parking lot, right next to the mall, as well as the above-mentioned parties. The Rio Shopping manager is also president of the Commercial and Industrial Association of Jacarepaguá and represents this entity in the Park Advisory Council. In relation to partnerships formed during park management for the purpose of providing support to a range of leisure and ecotourism activities or participation, these are, in general, informal. According to information provided by the manager, no partnerships have been formed with companies for the purpose of recuperation and conservation of flora and fauna, but she has in mind to have areas within the park – paths, for example – adopted by companies. However the manager admits to not having autonomy for this type of partnership – the potential sponsor must be identified and the process submitted to upper management, where it will be decided and negotiated. Undoubtedly, the proactive actions of the MNP Bosque da Freguesia's search of partnerships, combined with private initiatives, seem to be the most effective among the municipal parks studied. It seems that the existence of an Advisory Council, the only one functioning among the municipal parks at the time, fostered mutual confidence as advocated by Wondoleck and Yaffee (2000) and facilitated contact with companies and enabled the formation of an informal network of park partners, something confirmed by the park manager herself.

Tijuca National Park

Tijuca National Park is Rio's most famous natural park basically due to the Christ the Redeemer statue on the top of Corcovado peak. However, the park is surrounded by dense urban area, increasing human pressure and threatens over it. The annual number of park visitors reaches one million. The park belongs to federal administration, represented by the Brazilian Institute for Environment and Natural Resources - IBAMA. In order to host the huge number of tourists, the park administration has developed a formal and multiple partnership (Wondolleck and Yaffee, 2000; Presas, 2001; Petrobras Ambiental, 2008)) with the Municipal administration, enterprises that operate at the Corcovado site and other interested companies. According to the park manager this partnership encompasses conservation and cleaning of that park site and a visitor's center operation including a parking area. Although satisfied with the partnership, the manager was revising it in order to include further demands to the companies. Another important partnership was developed in 2005 between the park and the environmental NGO "Terra Azul Institute" in order to plan and implement a two year project named "Water in Conservation Unit". This project has been financed by Brazilian largest company, Petrobras, under the umbrella of "Environmental Petrobras" Program, which has already invested approximately US\$ 70 million since 2003 in several environmental projects in the country, all of them seeking to promote consciousness about the rational use of water resources. Fortunately, the project has been renewed and is still operating after four years. For Tijuca National Park project it was adopted a systemic and integrated approach seeking to help implement a participative management (Petrobras Ambiental, 2008). Its main lines of action were: 1. Water quality monitoring; 2. Protection, management and restoration of soil and vegetation; 3. Environmental Education integrating Schools and Communities; 4. Planning and management for economic sustainability; and 5. Formation of an Advisory Council through a democratic and participative methodology applied by NGO Ibase. The first mobilization of potential members of the Council occurred in 2005 and after several meetings it officially started working in early 2007. Based on the identification of problems, conflicts, sustainable activities and potential partnerships an action plan was conceived to attract local stakeholders to the project. As a consequence of the "Water in Conservation Unit" project some important achievements were accomplished in 2005 and 2006 such as restoration of the local ecosystem (vegetation, animals and water springs) and reforestation of more than ten hectares.

Pedra Branca State Park

Pedra Branca State Park contains the world's largest urban Forest spread along its 12.500 ha. Its extension and central location in the city creates borders with 17 districts of Rio, some of them growing at fast pace towards the park limits. The agency responsible for planning and managing the park is the State Forest Institute (IEF) which delegates local functions to the park manager and its team. The main threat to the park ecosystem comes from six mining companies that illegally extract stones from the park, since SNUC Law does not allow the direct use or extraction of natural parks resources. They are being prosecuted, but three of them keep expanding their operations. Based on SNUC Law, recent funding mechanisms were created for state parks to maintain their infrastructure ecosystems. One of them is the Conduct Adjustment Term (TAC) through which any company, having caused damage to the state, might compensate for it by ceasing the damage and paying a fine that may be applied directly on any conservation unit. Pedra Branca had already benefited from TAC receiving a US\$ 2 million compensation from Company Eletrobrás from 2001 till 2003. The amount was invested in the park by means of a multiple partnership formed by IEF, Roberto Marinho Foundation, Enron and NGO WWF-Brasil. The main objectives were to revitalize the park main attractions, rescue the environmental and cultural values and preserve the park ecosystem. The infrastructure works were accomplished but WWFBrasil failed to develop the Park Management and Ecotourism Plans, due to the fact that its headquarters were located in Brasília, creating a series of operational and structural difficulties that acted as barriers to collaboration, as identified by Wondolleck and Yaffee (2000). Nevertheless, the partnership was partially successful in restoring the Park main site and making it possible to initiate environmental education activities inside it. This partnership was still operational at the end of this research.

CROSS CASE ANALYSIS AND CONCLUSIONS

The situation regarding the majority of municipal parks is troublesome with respect to the objective of recuperating and conserving their ecosystems, as had already been noted in the Municipal Audit Court in 2005 (TCMRJ, 2005). The persistent lack of financial and human resources, combined with excessive bureaucracy for new contract tenders or renewal of existing contracts makes the efficient management of municipal parks

excessively difficult. Common to almost all of the municipal parks studied were complaints by businessmen predisposed to collaborate regarding an apparent lack of interest or excessive bureaucracy on the part of government central agency to approve partnerships. With few exceptions, partnerships with private companies are ad hoc and decentralized affairs, usually amounting to providing park managers with supplies or minor repairs to infrastructure – yet always on a reactive basis. However, this does not occur in a consistent way, since it depends on the initiative of the managers themselves, the quality of their communications with the community, and their degree of familiarity with environmental problems (since some of the municipal managers are not specialists in this area). On the other hand, the experience with the adoption of Prof. Mello Barreto Park is very promising and shows a new path to be followed in order to include private or public companies in the sustainable management of natural parks. Both federal and state parks here studied also present a partnership pattern better tuned with modern trends in managing natural parks in a participative and professional way. Another aspect common to all seven cases is the extremely low utilization of the enormous ecotourism potential of municipal parks through partnerships with the private sector.

In relation to which collaborative strategies are used by the responsible agencies and by the seven park managers to attain the SNUC objectives, it was seen that, with the exception of the cases of Tijuca National Park and Pedra Branca State Park, where multiple partnerships were formed, and MNP Professor Mello Barreto, where a permanent simple partnership was implemented, all of them in a centralized way, in the remaining cases collaborative strategies are almost always decided upon in a decentralized/ad hoc way by the parks' own managers. In general, the simple partnerships formed are intended to supply the manager with small infrastructure repairs and supplies or to organize events of a recreational or educational nature. This kind of strategy is reported as very common by Wondolleck and Yaffee (2000) and Presas (2001). As a function of the reports, interviews and observation, it is understood that the lack of human resources, in both the central agencies as well as in the parks, slows down the decision-making processes, except for Tijuca National Park. On the other hand, the existing bureaucratic mechanisms in the government level impede the search for more flexible management instruments. And when such instruments do exist, there lacks the personnel to implement them, making a vicious circle. The bureaucracy and the cultural differences between government and private companies constitute barriers to collaboration, as identified by Wondolleck and Yaffee (2000). In this sense, Tijuca National Park appears as the successful model to be copied. This is due to its partnership with an environmental NGO supported by a large public company that led to the implementation of a series of infrastructural improvements as well as the establishment of a democratic and fully participative advisory council. A more sophisticated form of partnership should be studied and should include ecotourism, underexploited in all parks of the sample. In relation to the attitudes of the companies vis-à-vis park management and partnerships, an ambiguous attitude can be discerned in the business community. Such ambiguity ranges from a serious commitment to the concept of park conservation to utterly criminal responsibility, threatening the very parks themselves, a point confirmed in the literature (Richers, 2000, Barbieri, 2004). But perhaps the most common attitude is indifference to the issue, an attitude which points to the need for a centralized strategy for promoting the nature parks and their importance to the Rio de Janeiro business community. In relation to the strategic configuration resulting from the interaction between companies and park managements, this has varied from full cooperation (MNP Mello Barreto, Tijuca National Park and Pedra Branca State Park) to more or less continuous partial collaborations (MNP Bosque da Freguesia and MNP Bosque da Barra) or non-collaboration (MNP Chico Mendes and MNP Marapendi) – partly due to the difficulties of businessmen in dealing with the government's bureaucracy – and partly due to their own lack of awareness.

As another common point to most parks in Rio is that their financial resources are few. But, perhaps, more importantly, they lack personnel. On the other hand, since many of the parks are highly visible to the population, there is a greater possibility for them to be the object of partnerships with local companies or NGOs. We strongly recommend a broadening of the strategy of adoption and the search for partners with Civil Society Organizations in the Public Interest - OSCIPs. Also, the search for partners across other spheres of government could help to strengthen the position of governmental agencies in negotiations with companies. At the same time, for the management of the parks to be successful we recommend that the collaborative strategies with companies be based on a combination of environmental education with ecotourism and recreation, following successful cases reported by several authors mentioned above.

AN EXAMINATION OF A FIRM-LEVEL MODEL OF GREEN MARKETING STRATEGIES

Deborah Y. Cohn, Touro College, USA
Elaine Sherman, Hofstra University, USA
Leon G. Schiffman, St. John's University, USA

ABSTRACT

Businesses are increasingly concerned with their strategic options in effectively meeting the challenges of a global environmental crisis. Marketers, in particular, are addressing these issues by formulating product and marketing messages (i.e., green marketing strategies) that communicate their responses to the environmental dilemma. In response to this challenge, this paper presents the findings of an exploration of the Ginsberg and Bloom Matrix Model of Green Marketing. Based on a global sample of online postings of professional marketers, the research reveals that the online discussions of marketers fit or match three of the four strategic categories proposed by the Ginsberg and Bloom Model.

INTRODUCTION

Concurrent with a nearly global economic crisis, businesses are also facing global environmental issues created by excessive and unsustainable consumption and a disregard for the global environment. For their own benefit, as well as in response to a sense of their social responsibility, marketers from all over the world are increasingly responding by exploring their options in search of suitable *Green Marketing* strategies (Marketingcharts.com 2008).

Apropos to this crisis, Ginsberg and Bloom (2004) have proposed a matrix of green marketing strategies that provide a typology of how firms may differ in terms of the degree and nature of their embracing green marketing. More specifically, their typology is based on high and low differentiability on greenness, as well as high and low substantiality of green market segments. Inspired by Ginsberg's and Bloom's Green Marketing Strategy Matrix, our research sets out to examine whether their Matrix model accommodates and/or represents the current or proposed green-related marketing strategies or commitments of businesses.

In terms of organization, we will first present a brief review of the green marketing strategy literature. Second, we will set out and discuss our research methodology and procedure. Next, we will present and discussion our findings. We will end the paper with conclusions focusing on the examination of the marketing and global managerial implications of our research.

LITERATURE REVIEW

While it is unrealistic that all firms would achieve a competitive advantage by implementing a green marketing strategy; it is nevertheless realistic, that some firms will elect to be entirely dedicated to being "better corporate citizens," by "silently" implementing a strong internal green or environmental business policies, *without* incorporating this strategy as part of their consumer marketing communications strategy. They might rightfully be convinced that some other positioning strategy (e.g., "high value for the price") might better differentiate their products and services within the minds of their target consumers. Along these lines, Reinhardt (1998) suggests that external contingencies, such as the structure of the industry and characteristics of the market, as well as the nature and scope of competition will contribute to whether a firm can be successful with a green marketing

strategy. Similarly, Ginsberg and Bloom (2004) suggest that the size of the market and the ability to differentiate based on aspects of being green determine a company's success with green marketing. Furthermore, a firm needs to take into account its own resources and capabilities in order to gain competitive advantages from a green marketing strategy (Christmann 2000).

The Ginsberg and Bloom Matrix of Green Marketing Strategies

Ginsberg and Bloom (2004) suggest (but do not test) a matrix of four types of Green Marketing Strategies. These strategies vary by the size of the firm's green consumer segment and the ability to differentiate their products/services based on green strategy.

The four types of firms in the Ginsberg and Bloom Green Marketing Strategies Matrix are outlined in Table 1. They point out that firms must ask themselves questions about the sustainability of the market, as well as whether the brand can and/or should be differentiated based on in terms of a specific green strategy before deciding on their level of commitment to green marketing. To this end, Extreme Green firms fully integrate environmental issues into the business and its product life-cycle processes. Still further, being green is seen as a major driving force behind the company; a force that is sometimes emanating from the founder of the business. Moreover, it can be said that companies that are Extreme Green are passionate about their "greenness." In contrast, Ginsberg and Bloom (2004) envision Shaded Green firms that "invest long-term, in system-wide, environmentally friendly processes that require a substantial financial and non-financial commitment." Although they can differentiate themselves in terms of a green strategy, they choose **not** to because they expect that they can be more successful stressing other product benefits. Defensive Green firms begin greening their position as a precaution or a response to government, competitors, or a crisis. Finally, Lean Green firms are aiming to be good corporate citizens by being green; however, they are reluctant to publicize their greenness for fear of being held to a standard that they are not going to be able to achieve.

In recent research, Wong (2008) applied the Ginsberg and Bloom matrix to a case study of a software firm and recommends that the firm implement a Defensive Green strategy. Inspired by the Ginsberg and Bloom (2004) Green Strategy Matrix, our goal is to examine and further delineate characteristics of these four types of firms. Moreover, we seek to determine whether marketing strategists are examining their own commitment to green, and if their marketing strategy choices can place them into one of the four matrix cells.

RESEARCH METHOD

We sought to identify an online forum or discussion group where marketing practitioners talk to each other on a variety of strategic topics, including their green marketing strategy. As a source of researchable insight from marketing practitioners, it is reasonable to assume that forums and discussion groups provide advantages to researchers over other forms of computer mediated communication (e.g., email and chat rooms). In particular, we anticipated that online forums and discussion groups, where marketing strategists come together to examine aspects of their marketing challenges would provide us with a great deal of available and preserved material to analyze, for it is common that such postings are archived for days, weeks, months and even indefinitely (e.g., Ridings and Gefen, 2004; Nelson and Otnes, 2005; Tsang and Zhou, 2004). Given these characteristics, we elected to review and analyze message board posts. Our research method follows, in part, the convention of Netnography (Kozinets, 2002) that was utilized in previous qualitative message board research (e.g., Nelson and Otnes, 2005; Schiffman, Cohn and Sherman, 2006). In particular, we employed a systematic content analysis framework that stresses recurring themes and issues. Furthermore, this method is an unobtrusive, passive observation method, making it unnecessary to notify and obtain consent from the participants (Gavin, Rodham, and Poyer, 2008).

Selecting Data Source and Collecting Our Sample

First, we sought to identify an appropriate marketing practitioner forum or Web site. After a search and a systematic examination of the content of various marketing practitioner discussion groups or forums, we decided on the "MarketingProfs" (<http://www.marketingprofs.com>). It is important to note that MarketingProfs is a reference to "Marketing Professionals," and **not** "Marketing Professors," as the name could be confusing. It was

our sense that the MarketingProfs range of discussion of green marketing would make this site a suitable option for our investigation.

In terms of its profile, the MarketingProfs website had 3,164 members from across the world listed in the membership directory. Furthermore, the MarketingProfs media kit suggests that there are more than 300,000 marketing professionals who visit the website. Still further, the media kit breaks down the international reach with 71 percent of the readers in North America, 10 percent in Asia, 9 percent in Europe, 6 percent in Australia and New Zealand, and 4 percent listed as “other.” We have found on this forum a rich discussion about green marketing strategies. We sought to unobtrusively examine these discussions in order to identify and classify marketers and their thoughts and actions in terms of Ginsberg’s and Bloom’s (2004) Green Marketing Strategy Matrix.

After deciding on the Marketing Profs site we set out to develop our procedure for capturing and analyzing our data (i.e., relevant posts) from the MarketingProfs forum. More specifically, our first step was to identify all discussion topics or postings that dealt with “green marketing.” We used the Google search tools in the MarketingProfs forum. We chose the key term “green” for our search. On November 17, 2009, the search returned 411 results. We examined the 411 hits for relevancy to our question. We determined that 116 threads were relevant. In these threads there are a total of 1,152 postings included in the qualitative data set. The discussion forum was launched in January 2004. In terms of the date range of the data, the first relevant post is dated May 3, 2004 and the most current post is dated November 17, 2008.

FINDINGS

Our systematic examination of the compiled threads on green marketing reveals that marketers can usefully be classified into Ginsberg’s and Bloom’s (2004) Marketing Strategy Matrix. The following is a discussion of the green strategy categories and corresponding verbatim examples in the form of contributing marketers’ posts, and a designation of the particular cells of the Ginsberg and Bloom (2004) model that is being illustrated.

Extreme Green

As stated above, Extreme Green companies are passionate about their green positioning. They often start out with a green vision that they infuse into all aspects of their marketing strategy. The following two verbatims from a PVC manufacturer and a store that sell used children’s clothing were chosen to illustrate this category from the pool of marketers’ responses in the database:

As a manufacturer of...flexible PVC we are looking for a "green" tag line. It seems like an oxymoron since PVC companies have such a poor reputation but as a company we truly do care about the environment.

I am opening a children's clothing store. All the items are slightly used, but I want to incorporate the whole REDUCE, REUSE, RECYCLE. My store is very "GREEN".

I need to come up with a name that introduces the kids, slightly used clothing, helping the environment with the whole "REDUCE, REUSE, RECYCLE."

Both of these marketers can be classified as Extreme Green because green is explicitly and fully integrated into their business vision. In the case of the PVC manufacturer, the poster implies that the firm has always been green. In contrast, the retail clothing marketer is green; in fact, green from the start, and she is passionate about her green position.

It is interesting to note that not all the marketers’ postings agreed that the woman starting the green clothing store should promote the business in terms of a green strategy. For instance, one poster suggested that she should focus on the core benefit (i.e., savings) and keep green in background and therefore following a Shaded Green Strategy:

I don't know how to tell you this, but most people put in the position of having to buy even slightly used children's clothing couldn't care less about how doing so might slightly and coincidentally save the environment...My suggestion: Focus on building your resale business and let others take care of the environment.

Another response, agrees, when he/she suggests:

Promise and deliver against the primary benefit and let the secondary benefit just "be there."

As these two responses suggests, the used children's clothing retailer might be more profitable adopting a Shaded Green strategy for her new business. In contrast, another poster recommended that she should stay with her Extreme Green Strategy choice:

People do buy recycled clothes because of reuse. There are many—MANY people striving toward zero or lessened waste. Don't let anyone tell you otherwise.

Are there really "many many" consumers who are making consumption choices based on environmental concerns? As an Extreme Green marketer, this clothing store, as suggested by Ginsberg and Bloom (2004) would be appealing to a niche market of consumers who are "*striving toward zero or lessened waste*".

Shaded Green

As already defined, Shaded Green firms actively pursue and are committed to comprehensive environmentally friendly policies; however, they elect to use a business positioning strategy that stresses customer benefits other than their comment to the environment.

The following posting represents the thinking of Shaded Green strategy:

I started a new real estate company in February. Our name is Cascadia Homes. We are in Portland, Oregon. We like to work with people who share our progressive or green (eco-friendly) values. We want them to recognize themselves in our tagline, to say, "oh--their talking about me." I probably don't want to use the word "green" in the tagline, because some people don't understand it. We have lots of experience and we are very good listeners. We are never pushy and pride ourselves on following the client's lead in terms of timing and process. We give a percentage of every dollar earned to progressive organizations, like Friends of Trees, KBOO Community Radio, Oregon Natural Resources Council, the Human Rights Coalition, etc. We feel that building a relationship and rapport with our clients based on mutual respect and shared values means the client will have a better experience and better results. And we and the client will both enjoy the process more. We frequently work with urban clients who love city life, and they often prefer older homes with character. We also like to work with newer homes if they have charm or beautiful settings. We also would like to link up soon with a green builder whose homes we could list and sell. Our clients like bicycles, gardening, recycling, etc. They are offended by aggressive or obvious sales techniques.

We do a newsletter that is mostly about community events, arts, music, with a little bit of real estate news and information thrown in. We need a name for the newsletter, as well as a new tagline for the company.

Although it was suggested that company's executives viewed the company as green (e.g., working with green builders, giving money to green charities), they did not want a tag line that used the word "green." One suggestion for their newsletter was, '*The Neighbourly News*.' They are shaded green because they are green, but their promotional efforts will not stress green.

Defensive Green

While intuitively, we are quite certain that a good number of firms follow a Defensive Green strategy; that is, they elect a greening positioning strategy as a safety measure or safeguard against actual or potential response to government, competitors, or a crisis. Nevertheless, the current database failed to reveal any examples of firms following this strategy. We expect that a likely explanation for the failure to identify any examples corresponding to the Defensive Green strategy in our database of postings is that posters are unintentionally

failing to describe their proposed green strategies as **temporary in nature**---which is a defining characteristic of a Defensive Green strategy. Instead, they are leaving the inappropriate conclusion that they are proposing a dedicated and sustainable long-run strategy. Following this line of thinking, it is reasonable to imagine that some other research methodologies, such as cases histories, or focus groups would provide more insights about Defensive Green strategies.

Lean Green

The fourth and final green strategy that is part of the Ginsberg and Bloom model is the Lean Green strategy. Firms that adopt this strategy are aiming to be good corporate citizens by being green to a limited degree, or in a specialized domain, of their business activities. An example of a Lean Green strategy follows:

We are working with a client that manufactures collapsible, reusable shipping crates designed as an alternative to traditional, one-way shipping systems. The crates are made of wood and each is customized to the customer's specifications (whether they order 1 or 500)....Features and benefits of the product include: Reusable – financial and labor savings.

This marketer is looking for a tag line and marketers suggest a green promotion because the crates are reusable. The shipping crate manufacturer responds that they do not want to focus on a green promotion:

I'd explore the environmental angle a bit more. Aside from those benefits you mentioned... being "GREEN" is obviously something that their marketers have found to be a talking point and others might take note...An additional selling point to that marketing concept is that it gives whoever buys the product 'green bragging rights'. Value added....You might also tell customers that you will include them in your press releases about who is shipping green these days, and let them display some sort of "We're GREEN" seal of greenness. It could be quite a marketing coup to have the buyers actually advertising for their suppliers.

The response from the shipping crate marketer about the green idea:

We actually mention the fact that it is recyclable in the marketing materials. However, (we)... did not think this was a major selling point and none of the customers mentioned it as a benefit...I think the...product strengths lie in customization, easy of use and labor/space savings...

Although the marketer could create a green promotion, the major benefits of the shipping crates are that they are cost effective and efficient. As suggested, marketers that are good corporate citizens (e.g., market a reusable product) but choose to focus their promotion on their cost savings and efficiencies (which may stem from a greener product) are classified as Lean Green. This firm is just one example of the many that we found evidence of choosing a lean green marketing strategy.

CONCLUSIONS AND FUTURE RESEARCH

This paper represents an effort to empirically examine whether each of the cells in the Ginsberg and Bloom Matrix Model of Green Marketing exist in the world of business practice. In this paper we have considered all postings on the marketingprofs.com discussion forum dealing with the topic of *green marketing* (corresponding to the beginning of the forum in 2004 until November 17, 2008, when we stopped the data collection phase of the research). The postings on green marketing collected during the specified period served as the data to examine whether or not the Ginsberg and Bloom Matrix Model of Green Strategies could be empirically substantiated. The research revealed that the postings of both established and new or start-up business executives indicate that there are participants who are currently following or are interested in evolving green marketing strategies that correspond to three of the four cells of the Ginsberg and Bloom Matrix Model of Green Marketing. The exception is the Defensive Green strategy. In the case of the Defensive Green strategy, none of the postings seem to adequately substantiate the occurrence of this green strategy. It is our feeling that in the case of this particular strategy, it would be necessary for posters to explicitly state their motive for the strategy (i.e., as a safeguard or response to government, competitors or a crisis), rather than “simply” describing the elements or nature of the green strategy (e.g., establish the firm's green orientation, or to be green, or some other green orientation). However, although the postings do not reveal a Defensive Green strategy, we are

nevertheless quite confident that this strategic option exists; and that some other research gathering approach (e.g., surveys or focus group research, in-depth case histories), would reveal applications of the Defensive Green strategy.

Overall, the findings are encouraging. First, the results suggest that additional research is needed to ascertain whether the current findings can be replicated. Second, it would be important to extend the current research by identifying any additional green marketing orientations that build-on the Ginsberg and Bloom model. As we see it, additional research should, in part, consider more “micro” issues of how business executives evaluate the options of green vs. non-green strategies, as well as two or more alternative green strategies. We need to know more about the motivations of business executives when it comes to embracing one particular green policy over other green policies. As part of such research, we also imagine examining when a particular green strategy comes from inside the firm (e.g., the conviction of top management), and when it comes from outside the firm (e.g., pressure from the marketplace that want greener options). As already touched on, we also see the need to expand the study to use a wider range of research methodologies; including surveys, depth interviews and focus groups, experimentation, and a systematic approach to capturing in-depth insights by preparing case studies. Still further, it has been suggested that green marketing strategy employs these marketing mix variables: (1) green product design, (2) distribution with green criteria, (3) pricing of green products; and (4) green publicity and green sponsoring (Rivera-Camino 2007). Our findings indicate that marketers are concerned with these marketing mix variables and seek advice on how to implement green strategies within each of these variables either individually or as a whole. Future research can examine ways in which the Green Four P’s are developed by marketers in each of the cells of Ginsberg’s and Bloom’s (2004) Green Marketing Strategy Matrix.

Finally, it is our expectation that such a systematic approach to examining firms’ consideration of and employment of green marketing strategies will provide important new insights as to how to encourage businesses to identify and adopt appropriate green strategies.

DIRECT AND INDIRECT EFFECTS OF BRAND KNOWLEDGE ON PURCHASE PREFERENCES: A CASE IN DÜZCE

Ruziye Cop
Abant İzzet Baysal University, Turkey
Yeliz Bas
Düzce University, Turkey

ABSTRACT

Today's 'companies' are competing with their brand rather than their products in the light of understanding of global marketing. Here, the term "brand" is used because the product gains its meaning together with the brand. Product is considered with its name, logo, identity and image, a slogan which displays its difference and company's reputation. The existence of each part of this inseparable whole is based on a long term strategical decision. So we can say that, brand is a formation and all necessary equipment must be ready in company to build it.

When we look at the consumer's side of the concept "brand", it can be argued that whatever a company explains about itself is just what a consumer can understand. Perceptions which are mainly based on human psychology but differ according to the age, education, career, region, hobbies and culture of an individual make brands change according to target consumers.

In this study, the effect of brand knowledge on consumer preferences in the direction of consumers perception of brand. It is shown that to what extent brand image, its subcomponents and brand awareness which are components of brand knowledge have an effect on brand trust and brand satisfaction and moreover it shows that to what extent these elements have an effect on preferences.

In this study the sample is composed of 400 consumers who live in Düzce and are chosen by random sampling method. In the research of a group of people who wears sport shoes. Adidas is handed as the most known brand from this product group by pre-testing with 50 people in Düzce. In the study, SPSS 15.0 and AMOS 7.0 programs are used to bring out the effects of brand knowledge on preferences.

INTRODUCTION

A product is a whole with its name, logo, specific identity and image, its slogan which demonstrates its uniqueness and the reputation of the enterprise. Each part that constitutes a whole requires strategic decisions that are planned over the long period. One of these decisions is brand. Brand is a promise of differentiating a product from a competitor product and provide a guarantee to the consumer about certain characteristics, decisions and continuous quality. Brand is a vague symbol and formation (Kotler, 2000:404). Elements of brand knowledge comprise of two main pieces, brand awareness and brand image. Brand Awareness is the existence of the name of the brand during brand perception in the short-termed memory and the process of retrieving such memory (automatic/assisted remembering) and transfer of such knowledge from long-termed memory to short-termed memory (Franzen, 2005: 49) Whereas this awareness provides a supportive competitive differentiation, in some cases this has a long-run remembrance of the brand and a dimension of proximity (Aaker, 1995: 2008). Brand Image is the perception of the brand involving all identifying elements such as persons, emotions and associations formed in the memory. As a result of experienced lived directly or indirectly linked to the brand these perceptions occur over time (Perry and Wisnom, 2003:15). Brand image undertakes a significant role in the market where it is hard to create service or product awareness depending on the physical quality

characteristics (Cretu et al., 2005). Brand image comprises of the perceived quality, perceived price, brand identity, symbolic and functional characteristics and attitudes of consumers against the brand (Aaker et al, 1992: 204).

As a result of the awareness and image of the elements of reliability and satisfaction arise in from consumers brand. Trust to the brand is the guarantee expectation of the consumers. Brand satisfaction inclines makes the consumers, who is satisfied from the brand he/she used, inclined to purchase the brand again.

Brand loyalty and the long time brand success depends the number of customers who purchase the brand regularly not on the number of customers that purchase the brand for the first time, (Jacoby and Chestnur, 1978: 149). Attitudes towards the brand is a general assessment of the consumers towards the brand and a view of the brand as the main target of impressive communication efforts. The concept of attitude, which is directly related to marketing communication, advertising in particular, is a broad and abstract interpretation and a brief assessment related to cognitive, emotional and behavioral elements (Engel and Others, 1995: 83). Three types of assessment could be mentioned of in the minds of the consumers. One of these is the emotional reaction that expresses the emotional orientation towards the brand. The second is the cognitive assessment which comprises of beliefs and derivations about the brand. The third is the, behavioral intention that defined together with habits (Cretu et al. 2005: 3).

Consumers develop an attitude towards the brand based on, inter alia, brand awareness and brand image. Consumers assess and use the brands and products by taking into account the experiences they have obtained from the brands throughout their lives, and this creates an attitude towards the brand.

Briefly, brand knowledge comprises of the union of brand awareness and brand image elements. Knowing the brand recalls the brand name when encountered with any of is elements (logo, slogan, quality, price, identity..).

IMPLEMENTATION

Brand has undertaken a significant role in the life of enterprises in terms of enabling them to survive under the strict competitive environment brought by changing economies. This study deals with the sneaker products as the scope of the research. The study tried to emphasize the points of view of consumers towards brand knowledge elements, brand reliability and brand satisfaction elements, namely their perceptions towards sneakers, and to identify which of these factor is more effective and to what extent important in the preferences for sneakers. From this, a brand knowledge and brand relationship model has been created. It has been assumed that brand knowledge is more impressive in purchasing preferences.

The purpose of the study is to investigate degrees of direct and indirect impact of brand image and brand awareness on brand preferences, which have been demonstrated in previous studies as brand knowledge elements, and to create a model by demonstrating the perceptions of consumers towards brand reliability and brand satisfactions which are affected from brand knowledge elements as well as sub-elements of brand image such as brand identity, brand attitude, perceived quality, perceived price and symbolic characteristics.

The significance of this study is presenting the issues to be focused on in terms of consumer perceptions in creating awareness and brand image for the enterprises under the light of new data obtained, and to assist the enterprises in their strategic decisions by showing them the direct and indirect ways of being impressive in order to be a preferred brand. The main target comprises of individuals residing in Duzce, a province that located in the north-west part of Turkey.

Study Model

Main Problem

What is the direct and indirect impact of brand knowledge on purchasing preferences?

Sub-Problems

- H1:**Brand Awareness is effective on Brand Image .
- H2:**Brand Awareness is effective on Brand Preference .
- H3:**Brand Image is effective on Brand Preference .
- H4:**Brand Awareness is effective on Brand Reliability .
- H5:**Brand Image is effective on Brand Reliability .
- H6:**Brand Awareness is effective on Brand Satisfaction.
- H7:**Brand Image is effective on Brand Satisfaction.
- H8:**Brand Satisfaction is effective on Brand Preference .
- H9:**Brand Reliability is effective on Brand Preference.

Before testing hypotheses using maximum probability method in AMOS program, frequency charts are formed regarding the demographic characteristics of respondents who participated in our survey. The existing factors are also analyzed in order to establish a healthier model.

METHOD

The survey has been carried out through face-to-face survey method carried out with 400 people living in Duzce. All survey questions comprise of brand knowledge elements that are effective on the brand preference of consumers, and the close ended questions demonstrating the perception impacts of brand reliability and brand satisfaction elements which are influenced by these elements.

This study, which aims to develop a model by demonstrating direct and indirect impacts of brand knowledge elements (brand awareness and brand image) on brand preference, involves a small pre-test work. "Adidas"

which is accepted to be the best well-known brand as a result of pre-test survey is considered as the brand name in the next main study.

Maximum probability method is applied under AMOS program in order to demonstrate what kind of way the brand knowledge elements follow in product purchasing preferences of consumers. Factor analysis has been implemented in SPSS program in order to create a correct model for AMOS application, and factors of the research model are determined.

FINDINGS

Factors that are effective on brand preference are listed under eight titles. These are brand knowledge factors (brand image and brand awareness), brand image factor satisfaction, user/brand identity, attitudes, awareness, symbolic and functional characteristics, reliability, perceived quality, perceived price and brand reliability and brand satisfaction factors. There are 21 questions about these factors; Cronbach Alpha reliability test has been applied in the study. According to the result of this test, the reliability of data was found at a high value such as 0,80.

One by one reliability and covariance of factors are as follows:

Table 1: Factor Reliabilities and Covariance Matrix

| FACTOR | ALPHA | ATTIT. | PER.Q UAL. | PER.PRICE | IDENT. | RELIA. | AWARE. | S. / F. CHAR. | SATIS. |
|-------------|-------|--------|---------------|-----------|--------|--------|---------|------------------|--------|
| ATT | 0,67 | 0,629 | | | | | | | |
| PER.QUALITY | 0,52 | 0,337 | 0,841 | | | | | | |
| PER.PRICE | 0,56 | 0,086 | 0,028 | 0,454 | | | | | |
| IDENTITY | 0,78 | 0,188 | 0,056 | 0,099 | 0,815 | | | | |
| RELIABILITY | 0,66 | 0,158 | 0,038 | 0,075 | 0,189 | 0,905 | | | |
| AWARENESS | 0,62 | 7,695 | 1,627 | 3,045 | 7,363 | 5,574 | 963,317 | | |
| SYM. / FUNC | | | | | | | | | |
| CHAR. | 0,76 | 1,632 | 0,088 | 0,336 | 1,297 | 1,76 | 47,481 | 24,702 | |
| SATIS | 0,82 | 1,576 | 0,66 | 0,487 | 1,043 | 1,809 | 56,187 | 16,869 | 30,053 |

In order to implement the factor analysis, the adequacy of the sample should be measured. KMO Barlett's test has been applied to measure the sample adequacy. The result of KMO 0,82 Barlett's test is 0,000.

The following elements accrued as a result of factor analysis:

Satisfaction factor: This expresses the satisfaction that consumers feel against their expectations from the brand they purchase.

User/ Brand Identity Factor: Each brand has a unique identity. Consumers have some accusations against the brands within their own mental perceptions and this places the brand in a position in the mind of the consumer. Consumers decide on whether the brand is suitable for them or not according to this brand identity they perceived.

Attitude Factor: This is the first preference of consumers against a brand, which is related to what they think about that brand.

Awareness Factor: This is explained by the ability of the consumers to remember the brand when they see the logo or slogan of that brand or to differentiate this brand from other brands.

Symbolic /Functional Characteristics Factor: Each brand has some functional characteristics presented to the consumer. When we consider the sneakers product group, characteristics such as the footbed of the sneakers being in good condition orthopedically, having ventilation holes against sweating of the feet etc. are considered

as functional factors. Using the brand sneakers by providing a unique image, social class or prestige to the consumer constitutes symbolic characteristics.

Reliability Factor: This is explained by the facts that consumers find the relevant brand in any place they go or every shop they visit, and that they show that the price of the product will be the same everywhere.

Perceived Quality Factor: Quality is expressed as satisfying needs and desires of consumers in line with their requirements.

Perceived Price Factor: Price perception is a factor that changes depending upon the income level of consumers or the importance they feel about quality. Price of each brand is assessed by consumers as being worth or not worth the characteristics it presents.

Factor loads of questions asked in factor analysis and under which factor these loads are complied are explained below:

| QUESTION | FACTOR | | | | | | | |
|--|----------|-----------------|--------------|---------------|---------------|-----------------|-----------------|---------------|
| | SATIS. | C/B IDENTITY | ATTITU DE | AWAREN ESS | S/F. CHAR. | RELIABIL ITY | PER. QUALITY | PER. PRICE |
| This brands satisfies all of my expectations functionally | 0,796507 | | | | | | | |
| I recommend this brand to people around me | 0,785241 | | | | | | | |
| This brand satisfies customer expectations all the times | 0,691615 | | | | | | | |
| People tend towards brands that would reflect their personality | | 0,856845 | | | | | | |
| There is a similarity of personality between the brand and those who use the brand | | 0,852825 | | | | | | |
| For each brand, there are special characteristics unique to the user of such brands | | 0,698825 | | | | | | |
| I would have preferred this brand even if other brands had had identical characteristics with this brand. | | | 0,817876 | | | | | |
| This is the only brand that I will prefer. | | | 0,706218 | | | | | |
| I would have preferred this brand among competitive brands | | | 0,641747 | | | | | |
| I recognize the logo of this brand wherever I see it | | | | 0,80379 | | | | |
| I could easily distinguish this brand from competitive brands | | | | 0,70932 | | | | |
| I recall this brand wherever I hear the slogan of this brand | | | | 0,64231 | | | | |
| This brand is suitable for every type of feet | | | | | 0,72917 | | | |
| Footbed of these sneakers is comfortable | | | | | 0,677795 | | | |
| This is suitable for every use (running, volleyball, jogging etc..) | | | | | 0,585145 | | | |
| I am sure that I could find this brand in any store I visit | | | | | | 0,84102 | | |
| I am sure that the price of this brand will be the same in any place I visit | | | | | | 0,820243 | | |
| Sneakers' brands are almost the same in terms of quality | | | | | | | 0,85837 | |
| There is no continuous progress in brands of sneakers products | | | | | | | 0,657 | |
| There is an excessive price difference among sneakers brands. | | | | | | | | -0,8273 |
| The fact that the prices of sneakers' brands are different is acceptable considering the characteristics of the brands | | | | | | | | 0,61632 |

Structural Modeling Analysis

This study which examines direct and indirect ways that the brand knowledge trace on purchasing preferences has been analyzed with maximum probability method using AMOS 07. program.

Model estimation results in the following adequate statistics :

Table 2: Model Adequacy Values

| Model Assessment Criteria | Our Model | Independent Model |
|--|-----------|-------------------|
| Chi-square (χ^2) value (CMIN) | 76,526 | 666,78 |
| Degree of Freedom (SD) | 22 | 45 |
| p-value | 0,000 | 0,000 |
| χ^2 / SD (CMINDF) | 3,478 | 14,817 |
| Normalized Fit Index (NFI) | 0,885 | 0,000 |
| Relative Fit Index (RFI) | 0,765 | 0,000 |
| Incremental Fit Index (IFI) | 0,915 | 0,000 |
| Comperative Fit Index (CFI) | 0,912 | 0,000 |
| Tucker-Lewis Index (TLI) | 0,821 | 0,000 |
| Root Mean Square Error of Approximation (RMSEA) | 0,079 | 0,186 |

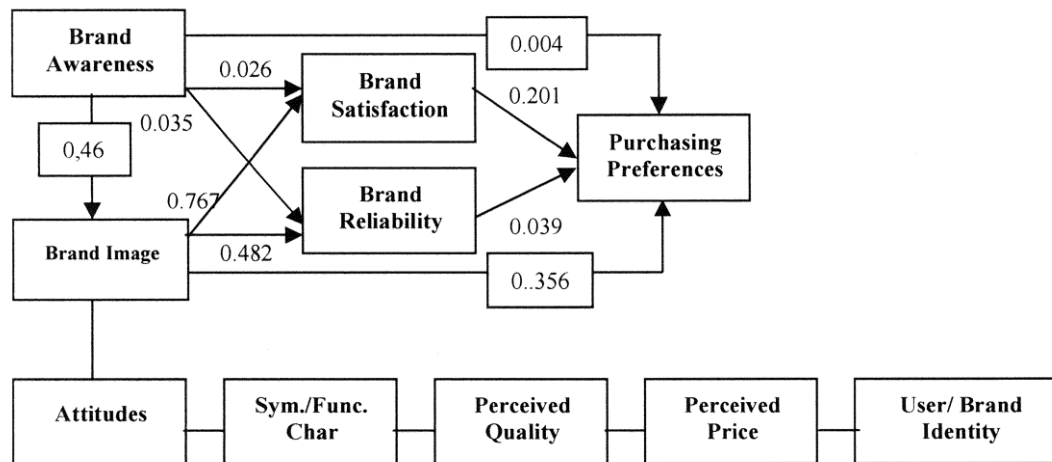

According to the above table, the chi-square fit value derived is 76,526. This value was small since the sample of the research was large. Whereas the fact that the figure which is obtained by dividing the ki-square fit value to degree of freedom is higher than 3 demonstrates a good fit, those which are higher than 5 demonstrate only a sufficient fit. The value obtained in ,478 and the data is in compliance with the model, that is, our model is a valid model. Another assessment criteria, Root Mean *Square* Error of Approximation (RMSEA) has been found as 0,079. RMSEA value being smaller than 0.05 demonstrates a perfect fit, and value up to 0.08 demonstrates that there is only a good fit. Again according to this result, the model is in good fit with the data. RFI, IFI, CFI, TLI and NFI values range between 0 to 1, and the perfectness of fit increases as these values approach 1.

Table 3: Standard Regression Rates

| Hypothesis | Factor | Relation ship | Factor | Standard Coefficient | Meaningfuln ess |
|------------|--------------|---------------|------------------|----------------------|-----------------|
| H1 | AWARENESS | → | IMAGE*** | 0,464 | P < 0,001 |
| H6 | AWARENESS | → | SATISFACTION | 0,026 | P=0,629 |
| H7 | IMAGE | → | SATISFACTION *** | 0,767 | P < 0,001 |
| H4 | AWARENESS | → | RELIABILITY | 0,035 | P=0,532 |
| H5 | IMAGE | → | RELIABILITY*** | 0,482 | P < 0,001 |
| H8 | SATISFACTION | → | PREFERENCE | 0,201 | P=0,024 |
| H9 | RELIABILITY | → | PREFERENCE | 0,039 | P=0,46 |
| H2 | AWARENESS | → | PREFERENCE | 0,004 | P=0,943 |
| H3 | IMAGE | → | PREFERENCE | 0,356 | P=0,006 |

*** P<0,05; H₀=Rejected

According to the results of regression, demonstration of the model is as follows together with the Standard rates of hypothesis:

When we consider the model in terms of standard total effects, whereas, according to the result obtained, the direct impact of brand image on purchasing preferences is 0.356, direct impact of brand awareness on purchasing preferences is 0.004. Impact of brand awareness on purchasing preferences through brand image is 0.82. A high portion of this arises from the impact of brand awareness on brand image.

Whereas the indirect impact of brand image on purchasing preferences through brand reliability is 0.52, its indirect impact on purchasing preferences through brand satisfaction is 0.968. Whereas the indirect impact of brand awareness on purchasing preferences through brand reliability is 0.074, its indirect impact on purchasing preferences through brand satisfaction is 0.227. This being the case, direct and indirect impact of brand image on purchasing preferences is higher than the direct and indirect impact of brand awareness, that is, brand image plays a central role on the purchasing preferences of the consumer.

CONCLUSION AND RECOMMENDATIONS

This study, carried out based on the impact of brand knowledge on purchasing preferences, demonstrates how consumers perceive the elements of brand knowledge. Adidas brand, which has a high level of brand reputation among sneakers, was analyzed as a case study.

According to the results of structural modeling analysis, it has been demonstrated that brand awareness and brand image, which are considered as brand knowledge elements, have direct and indirect impacts on purchasing preferences. However, considering the quantitative values of the existing impacts, it is determined that the impact of brand image on purchasing preferences is higher compared to brand awareness.

Enterprises which act on sales strategies focused on growth with an understanding of marketing should emphasize and develop brand images for a successful sale. As it became apparent from the results of this analysis, the enterprises should be careful in terms of taking into account the needs and requests of the customers while determining the identity characteristics to the products in addition to their symbolic and functional characteristics, perceived quality and perceived prices, and to have an attitude that would address the personal characteristics of their customers. Because, brand image is a whole with its sub-elements and plays a significant role in purchasing preferences.

Knowing the brand, trusting in the brand or being satisfied by the brand are very important in brand preference. According to the results of the analysis, it could be seen that preference could not be created only by ensuring brand reliability or brand awareness. It is also not possible to create brand satisfaction and preference without first having brand awareness.

There are two decision categories in the way of purchasing preferences in the decision course of consumers. One of these is brand satisfaction, and the other is brand reliability. While purchasing a product for the first time, the consumer makes a decision based on the feeling of reliability. The ability of enterprises to create a brand that is worth trying is a significant precondition for shifting to brand loyalty and brand dependence stages. The only way to satisfy the reliability condition is a good brand image to be created. Taking into account the regression results of the study, it could be seen that brand image has an impact on brand reliability more than that of brand awareness.

In order to ensure that the consumer purchases the same product or brand following the first one accomplished with brand reliability, the feeling of satisfaction should be created as a second reason for preference. Brand satisfaction is related to the ability of the brand to fulfill what is expected from it.

According to the results of the study, whereas brand image creates a direct reason on purchasing preference, it also is an indirect reason for preference with the impact it creates on developing the brand reliability. With a good brand image, enterprises may have an advantageous position in purchasing preferences of consumers.

The first step in creating a brand image is to create a good awareness. The consumer will not prefer a brand which he/she does not know, has not seen or has no knowledge about. Whereas brand awareness is not effective on its own in product preference, it has an indirect impact on consumer's purchasing preference. Whereas brand image has a very high direct and indirect impact on purchases, brand awareness doesnot have direct impact on preferences and its indirect impact is on brand image. Enterprises should identify in the best way the targets and ways to create a brand that could mobilize the purchasing preferences of consumers in line with their intentions within this interconnected chain of concepts.

STRATEGY & TRUST

Gerard Danford
Haaga-Helia University of Applied Sciences, Finland

ABSTRACT

There is a growing consensus that strategy implementation partially fails because of poor communication at lower levels in the organization. However, successful communication can only succeed when there is trust between all parties. When trust is absent, parties are perceived as attempting to exploit others vulnerabilities. Furthermore, when trust is absent, expectations regarding acceptable behavior are eroded and unfairness becomes a surrogate for more honorable principles. Information asymmetry and low levels of trust are bedfellows, however, without trust even the best communication will encounter a deaf ear. Trust is the confidence between everybody in the organization that the intentions of others in the organization are good and that there is no reason to be protective or fearful in the organization (Lencioni 2002).

INTRODUCTION

Why is it that employees feel management do not trust them? In 2007 the U.S. National Retail Federation (Grannis 2007) reported that the majority of retail shrinkage in the previous year was due to employee theft (\$19.5 billion). This represented almost half of all retail theft. Retail shrinkage is not only a North American phenomenon. The Global Retail Theft Barometer (Bamfield 2008) reports that in the 32 countries studied, shrinkage costs 98.6 billion dollars per annum. Furthermore, disloyal employees accounted for 32.5% of losses (employee theft levels are lower in Europe). According to the United States Association of Certified Fraud Examiners (ACFE 2008) the incidence of occupational frauds occurs more by employees (rather than managers, executives or owners). ACFE estimate that the typical organization loses 7% of its annual revenues to occupational fraud. It's no wonder that employees perceive that management do not trust them (Cardone 2003).

Should employees trust management? A recent study on employee trust in management reported that less than half (49 percent) of employees said they have trust and confidence in the job senior managers are doing (Watson Wyatt 2007). Furthermore, a study by Mercer Human Resource Consulting (2007) in the UK and USA found that fewer than 40% of employees had high levels of trust in management. The ACFE (2008) report quoted earlier found that management, executives and owners are responsible for a higher value of fraud cases than employees. Over 50% of financial statement fraud, 37% of corruption cases and 22% of asset misappropriation cases are directly linked to executives and owners. The median loss caused by fraudulent financial statement schemes was \$2,000,000. The Edelman Trust Barometer report (Edelman 2009) showed that a global average of 62% of those surveyed in 20 countries said they trust corporations less than in 2008 (77% in USA, 73% in Germany)

Positioning Of Paper

Breaking the viscous circle of mistrust is the first major hurdle when attempting to build trust. The responsibility lies with senior management. However, there are risks when taking this first giant step towards building trust. Penalties rather than benefits may be the outcome. *Can we trust in trust?* However, trust based management should not start with the assumption that all parties can or should be trusted. The opposite is true! Trust should be constructed brick by brick. Building trust brick by brick results in trust which is supported by a foundation of shared experiences along with confidence in the skills and willingness of others (Hagel and Brown 2002).

Has management's altitude in the organizational hierarchy influenced their attitude? (Neilson and Fernandez 2008). This altitude might explain senior managements focus on building safeguards against the abuse of trust. Furthermore, management seem to be preoccupied with auditing performance against objectives, possibly

because management find it difficult to manage a group of individuals who make multiple trade-offs every day, some of which are not aligned with the overall strategic goals of the corporation. Thus, the current architecture of trust does not support the emotional or cognitive engagement of employees. Therefore, management must recognize that they cannot dictate strategic success. They can only create the necessary conditions for success. How well management execute a given strategy in combination with the buy-in of every employee will determine the outcome.

The good news is that the mind-set of expectations regarding trust can be altered. Over a considerable amount of time, as each party shares experiences and develops confidence in the will and capability of others, the fruits of trust will be harvested (Hagel and Seeley Brown 2002). Trustworthy behavior is the antecedent of trust, however this reciprocal relationship is not balanced. Therefore, trust must be continuously demonstrated and supported. Building trust is a mutually reinforcing process during which each party has expectations about another's behavior. During this process internalized norms and principles emerge and over time these are embedded in the organization. Thus, management needs to move from a fixation on compliance towards a fixation on building commitment. Information should be used to teach rather than to control, intimidate and manipulate. Higher levels of trust lower the need for governance mechanisms.

Trust and Strategy

Trust can be defined in two ways (Chua, Morris and Ingram 2009). Affect-based trust is built on experiences with others. Socio-emotional exchanges and mutual support are the building blocks of affect-based trust. Affect-based trust is associated with friendly relationships. Measures of affect-based trust might include: comfort in approaching another party, sharing problems with another party and expressing hopes and dreams to another party (McAllister 1995). These measures are emotion-oriented and suggest a willingness to be dependent and vulnerable to another person. Cognition-based trust is built more on competence, dependability and reliability. Measures of cognition-based trust might include: level of reliance on another to carry out an agreed task and the belief that another has the knowledge and competence to complete an agreed task.

Regarding strategy, research has demonstrated that most employees feel they do not know the decisions and actions for which they are responsible. '95% of a company's employees are unaware of, or do not understand, its strategy' (Kaplan and Norton 2005). Therefore, for those employees at a distance, the value and meaning of strategy is blurred and often irrelevant. However, the root causes of failed strategic communication and strategy execution are invisible to management. Senior management understands strategy because they are the architects of strategies. However, strategy myopia is prevalent in many levels of an organization.

Strategy has witnessed a Moore's (Moore 1965) type curve in its complexity trajectory. As the everyday language and tools of the strategist advance on this complexity trajectory, the alignment between employee and organizational objectives are eroded. The result is that individual employees do not understand the big picture, their roles and performance goals. This is due to a lack of clarity and understanding. A shared mindset, capacity for change, motivation, satisfaction, responsibility, and recognition do not result from strategy myopia thus a lack of trust by employees and strategy monologue prevail (Saks 2006).

Monologue is the predominant form of strategy communication because the architects of strategies encourage non-facilitative authority structures (Smythe 2007). Because engagement in the strategy process is necessary but voluntary, strategy monologue does not support voluntary engagement. Strategy monologue is a process whereby strategists craft the strategy message of the few and support this messages propagation and replication, however, creating a shared mind-set within every employee and supporting their capacity for change is the responsibility of management. Monologue does not support that goal. What is missing is a common definition of strategy which is shared and understood by everybody in the organization. For the purposes of this paper that definition of strategy is: *knowing where we are going, why we are going there, how we are getting there and what is different about how we are getting there*. This definition also incorporates mission statements, vision statements and corporate values. A great strategy in the absence of trust is fruitless.

The Fateful Road to Moscow

Throughout history there are many examples of strategic failure due to a lack of trust. Napoleon Bonaparte fought, conquered, and dominated much of continental Europe during the end of the eighteenth century and the beginning of the nineteenth (Chan, Mauborgne and Van Der Heyden 2006). Napoleon is credited with being the greatest military strategist of his time. One of the greatest innovations by Napoleon was the creation of corps units. These units were coordinated and controlled by Marshals who were the primary and direct link with Napoleon. Marshals were rewarded for loyalty. Each corps had a clear mission defined by Napoleon. Due to the enormous flexibility of this system, Napoleon was able to implement a more dynamic and evolutionary battle strategy.

Napoleon recalled his ambassador and declared war on Russia in 1812. When the French army crossed the French-Russian border, however, problems began to take place. Soldiers began throwing away supplies, including ammunition. Napoleon had overestimated his soldiers' commitment and limits. Furthermore, all of Napoleon's marshals argued against the campaign. Confident in his intellect and vision, Napoleon persisted with his strategy and refused to trust anyone. Not even the smallest decision or order was made without his approval. Power and success had increasingly corrupted Napoleon's leadership. One of Napoleon's mottos was "there are only two levers to truly move people: fear and interest; every great revolution must proceed through fear, as interest is insufficient to yield great results"

Trusting Communication

Many strategies deliver sub standard financial performance because of poor communication, unclear actions for execution, and lack of accountability. In the Mercer survey referred to earlier (Mercer 2005) only 49% of workers agreed with the statement that "senior management communicates a clear vision of the future direction of my organization." . Furthermore, only 43% of employees reported that their firm's senior management takes an active, visible role in communicating to employees. It appears that a common language for successful dialogue is absent. Highly abstract concepts and confusing language go hand in hand with mistaken priorities. Therefore, management need to recognize that better articulation and reinforcement of important values, such as trust, can support the communication agenda and effective strategy implementation. Such efforts should not only be seen as transitory public relations reactions to contemporary scandal ridden business behavior (Boswell and Bourdreau 2001).

Communication is one key organizational characteristic explaining employee satisfaction. Furthermore, there is a direct link between employee satisfaction, customer satisfaction and financial performance (Yankelovich 2005, Sako 1997). Furthermore, employee satisfaction and organizational culture are drivers of engagement. Without trust, non-reciprocal information sharing is present. Therefore, information transparency needs to be harnessed in order to gain and sustain trust. To communicate successfully organizations should open up businesses practices to scrutiny and discussion. Doing so means more than supporting a system based on compliance. Strategic dialogue, training, counselling, and appraisal help in building trust. Moreover, clarification and feedback during the trust building process accelerates learning. Thus, management need to develop trust metrics which reflect the drivers of business performance. The outcome of the above efforts should be a stronger sense of psychological ownership by every employee to the strategy.

When building trust, communication should not only reflect the personal preferences and personalities of top management. Furthermore, communication should clearly explain the invitation (opening up of power sharing) which is being extended to all employees. In addition, management should think like marketing professionals and communicate in a way which the audience understands, and is credible. Companies who communicate effectively have been shown to achieve superior financial returns and higher levels of employee engagement (Luthans and Petersen 2002).

The Unknown Soldier

Vino Linna (1954) is best known for his portrayal of trusting relationships during war in his bestselling novel *Tuntematon sotilas*. This novel tells the story of a machine gun rifle company fighting between Finland and Russia in World War Two (1941-1944). The soldiers are tough and cynical; they hold their own officers in

nearly as much contempt as they do the Russians. Few have any clear idea regarding the aims of the war, and most fight merely because they have no alternative. Yet there is always a consciousness of their own worth.

Unlike Napoleon (The Fateful Road to Moscow) second lieutenant Koskela (the main character in the novel) speaks to his men as equals. At first the enlisted soldiers find it strange that an officer should deal with them on such terms, as most officers kept their distance as a means of retaining their authority. Feeling closer to the man on whom they all depended for the answers to all the problems ahead, lowered their level of anxiety. Koskela had the unbounded admiration of his men. Throughout the war Koskela's platoon were growing ever closer together. The taciturn second lieutenant's authority over his men had become so absolute that he had only to hint at a task for it to be done. His platoon had very few casualties. Not once did he expose a machine gunner to danger unless absolutely necessary, and when he did so, he was there himself to instruct and advise. When the platoon was not in action, no one would have taken him for an officer unless they happened to see his stars, so completely did he identify himself with his men down to the smallest detail. Says one exhausted survivor when the fighting is over and the politicians take command: "Speeches aren't going to help anything".

Some corporations have recognized the value of trust in their organizations. Novo Nordisk (Novonordisk.com) understand that trust is an essential ingredient. Due to this recognition managers regularly communicate with employees about the company's direction and future plans. Furthermore, they solicit employee ideas. The role of communication in Novo Nordisk is to clarify how each employees work relates to the companies goals. All communication is supported by action. Trust in Novo Nordisk is also built on respect. Respect means that each employee is supported in order that they can do their job efficiently and effectively. Collaboration within a safe and healthy environment is part of the respect expressed by management. Novo Nordisk also recognize that work/life balance is also an important ingredient in building respect. Furthermore, fairness is practiced through individual recognition and treating every employee justly.

Trust ROI

Senior management must demonstrate that they care as much about their employees as they care about themselves. When there exists a consensus on the principle of fairness, trust is present. The rewards for trust (return on investment) are less vertical integration and lower transaction costs in the organization (Loren 2003). Collaborative processes also support learning, innovation and efficiency. Commitment levels, caring for the future of the organization and a will for the organization to succeed are enhanced when trust is present. Furthermore, employee retention rates can also be improved. Because trust multiplies with use, it is a renewable resource. Therefore, trust can be the base for sustainable competitive advantage. Organizations who value and practice trust-based management achieve superior financial performance. However, one should recognize that there are limits to the levels of trust which can be achieved:

- *Absolute trust is not possible*
- *Management must be clear about what is and is not negotiable*
- *Belief may be more attainable than trust*
- *Expressions of trust will vary by culture, individual, functional area, and level in the organization.*
- *Levels of trustworthiness and trust are socially and historically grounded at the individual level*
- *Everybody will not have the same understanding of success, achievement, satisfaction, responsibility, recognition and motivators.*

The successful execution of a strategy lies within the hundreds, even thousands, of individual decisions made by employees every day. Collectively these decisions drive execution. Therefore, building organizational capability to support decisions from the inside out is essential. The result of doing so can achieve a better alignment between employees and the organizations strategic objectives. Perceived alignment and role clarity positively influences employee attitude (Wildermouth and Pauken 2008). However, management should recognize that job engagement and organizational engagement are distinct. Top management should establish the minimum benchmark levels for trust at the organizational level. Unfortunately, it has been estimated that up to 70% of employees are checked-out, sleepwalking or present-but-absent from their job (Yankelovich 2005). A minority of employees are even acting out their unhappiness or undermining the good intentions of others. It is important,

therefore, that every employee understands how they contribute to the strategic objectives and goals. Moreover, every employee should be aware of their decision rights (actions for which she/he is responsible).

Employees are motivated by the need to achieve, intrinsic satisfaction, responsibility, and recognition. The outcome from deeper engagement is greater psychological presence in tasks and a complete focus on tasks. Employee commitment, productivity, and safety lead to growing revenues and increased profits. Greater customer satisfaction is the reward from employee engagement. Engaged employees feel that they can positively impact quality, customer satisfaction and costs (Neilson, Martin and Powers 2008).

Engaged employees are even rarer than trusting employees. In many organizations fewer than 25% of employees are fully engaged (Yankelovich 2005). No organization can rely on only a subset of brainpower while ignoring the thought and abilities of the majority. However, the dilemma is that employees cannot be ordered to engage. Furthermore, an individual's level of engagement varies from one role to another. The alignment of individual's roles during the strategy development process will support greater employee engagement. However, in order to achieve this alignment, employees need empathy towards and awareness of their individual role and mission. Furthermore, empathy and awareness from management creates a positive spiral within the attitudes of employees. Moreover, the result of greater strategy/role alignment is increased psychological ownership for the outcomes of an individual's work/task. However, four conditions for greater employee engagement must be addressed (Thackray 2001):

- How can we grow: Opportunities to learn and grow
- Do I belong: My opinions count, Mission and Vision of company fit my values
- What do I give: Do what I do best every day
- What do I get: I know what is expected of me at work

Building The Strategy Dialogue

Realizing the benefits of trust during the strategic development and implementation processes will not be achieved before everybody in the organization understands the meaning of strategy. A dialogue on strategy will not occur before there is a common vocabulary. Therefore, strategy education for everybody in the organization is essential. Framing the strategy concept in terms that everybody understands is crucial. Not doing so will only support strategy monologue. The trust mind-set can be altered, however, management needs to recognize that actions must be taken at the organization and job level (Townsend and Gebhardt 2008. Hagel and Brown 2002).

Organizational Level Actions

- Top management commitment to trust
- leadership (share power)
- Information & communication
- measurement (early warning systems)

Job Level Actions

- training (capability building)
- communication (expectations of each individual must be shared by all)
- 100% employee involvement (authority) within a structure
- motivation, recognition, gratitude and celebration

Managerial Implications

This article began with a definition of trust. Trust was defined as 'the confidence between everybody in the organization that the intentions of others in the organization are good and that there is no reason to be protective or fearful in the organization'. The basic premise of this article was: strategy implementation partially fails

because of poor communication. However, it was argued that successful communication only succeeds when there is trust on the organizational level and the job level.

"The leaders who work most effectively, it seems to me, never say "I." And that's not because they have trained themselves not to say "I." They don't think "I." They think "we"; they think "team." They understand their job to be to make the team function. They accept responsibility and don't sidestep it, but "we" gets the credit. This is what creates trust, what enables you to get the task done" (Wisdom Quotes).

The late Mr. Drucker's writings are marked by a clear focus on relationships among human beings. His many books and articles were filled with lessons on how organizations can bring out the best in people, along with how workers can find a sense of community and dignity in large institutions. Leaders, managers and employees should never say 'I'. Through building trust everybody should begin to think in terms of 'we'. Everybody should understand their primary role, which is to support the organizations strategy and make it function. Everybody should accept responsibility for strategy implementation and everybody should get credit for success. When trust is embedded in the DNA of the organization, there will be greater harmony between organizational goals, individual goals and strategy.

AN EMPIRICAL INVESTIGATION OF AGRICULTURAL PRODUCE CLUSTERS IN TURKEY

Elif Dayar

Atılım University, Ankara, Turkey

ABSTRACT

A recent scan of literature reveals four main stages regarding the emergence and development of clusters both in the developed and developing countries. These are respectively, the significance of entrepreneurs at cluster formation stage, the spontaneity of collective efficiency coming up later on, the voluntary sharing financial hurdle as the cluster grows and finally the magnetic power of a mature cluster as it draws new firms into the region. Gödence, Bademli and Gedelek, three different regions in Turkey are examined in this paper via in depth interviews with residents. Gödence and Bademli are found to be growing clusters and Gedelek is deemed as a mature cluster. This exploratory study reveals that astonishing success stories are witnessed in rural areas in Turkey simply due to the formation and development of clusters. Yet, this study presents the void in the literature in this area and poses further research questions that should be studied in order to learn more about the matter.

INTRODUCTION

A recent scan of literature reveals four main stages regarding the emergence and development of clusters both in the developed and developing countries. These are respectively, the significance of entrepreneurs at cluster formation stage, the spontaneity of collective efficiency coming up later on, the voluntary sharing of financial hurdle as the cluster grows and finally the magnetic power of a mature cluster as it draws new firms into the region. The aim of this paper is to identify some agricultural produce clusters in Turkey following these four marks depicted in the literature as stages of cluster development.

In the first section, a review of the literature regarding each of these concepts will be presented. The second section will cover the methodology and data collection. Research results will be presented in the third section. The fourth section will present an analysis of the data and the conclusion will follow in the final section.

Literature Review

Khan (2004) attributes the emergence of clusters to local demand, prior existence of natural resources, innovative firms and chance events. On the other hand, Ritvala and Leyman (2007), Nadvi (1999), Anderson and Schmitz (1997) claim entrepreneurs play a vital part in the emergence of clusters. Sometimes as visionary individuals, sometimes as private firms and at other times as mere business associations, entrepreneurs are observed in numerous cases as the triggering force of the cluster formation. Mangematin et. al. (2005) attribute the rise of certain clusters among others to the efforts of cluster-institutionalizing-entrepreneurs who 'redefine tactics and rephrase the formulation of existing activities to nurture the cluster and increasingly validate its constitution through progressively enrolling and locking partners'.

McCormick(1999), Altenburg & Stamer (1999), Weijland (1999), assert that there is a core individual that starts a business around which the cluster forms. Feldman and Francis (2006) cite Kargon, Leslie and Schoenberger (1992) indicating the influence of Frederick Terman in the foundation of Silicon Valley. "He orchestrated the creation of a world class research institute with strong ties to the business community and an environment that encouraged students to become entrepreneurs or at least be actively involved in corporate research programs." George Kozmetsky is reported as being instrumental in the development of Austin Texas. "Georges Freches's vision is found to be the driving force of the high tech development of Montpellier, while Neel, Merlin and Dubedout played the same role in the development of Grenoble". (Voyer 1998)

Sturgeon (2001) provides a historical view of the development of firms well in advance of the renowned spinoffs originating from Fairchild Semiconductor and argues that the strength of aeronautical and electronics industries championed by a small group of people with a vision for the development of the region created the high technology conurbation. Nadvi (1999) describes the role of 'business associations' in the strengthening of clusters as lobbying on behalf of their members, performing coordination and regulation within the cluster and providing services such as technical and managerial advice, information on markets, prices, competitors, and linking members to research and development institutions. Furthermore Nadvi (1999) claims that joint action of business associations is a must for developing countries that are heavily populated with SMEs to confront the increased global competition. Citing the example of the Association of Fruit Producers as the driving force behind the agricultural cluster in Eastern Poland, Szymoniuk (2003) emphasizes the importance of co-ops in the development of clusters. Seeing 'farmer associations' as a means towards employment generation and poverty alleviation, Birchall (2008) asserts that clusters provide an environment for the prospering of these associations.

Altenburg & Stamer (1999) point out three passive benefits in locating in a cluster: Semi-skilled labor force availability, easy access to raw material and machinery and lower search costs for customers. However, Schmitz and Nadvi (1999) indicate, the significance of 'shifting gears from passive to active collective efficiency' when a local area turns into a cluster. Examples of active joint action could be counted as search of international markets, attendance to trade fairs, establishing links with several research institutions in order to move up in a value chain. Schmitz and Nadvi (1999) cite Knorringa (1999) proposing joint action is a distinguishing characteristic of clusters. Knorringa (1999) specifies the sharing of market information with residents of the cluster as a form of joint action. Weijland (1999) states that a significant feature of rural clusters is the 'sharing of financial hurdle' in the cluster. Gertler and Wolfe (2006) underline the interesting structure of financial relationships in Canada. The biotechnology firms in Canada are reported to rely heavily on local sources of investment capital from private sources (angel investors, family, friends) and are likely to have been born from another local company or research institution at some time in the past.

Gertler and Wolfe (2006) cite Maskell 2001 indicating that following the emergence of a cluster in a region, the cluster acts like a magnet drawing other firms to the region either due to their need to access existing knowledge base or to complement it in a certain way. The drawing of firms into the region is a sign of maturity of the cluster, because in order for these firms to be coming to the region there must be increased specialization needs and a ready market for these needs. Thus it is the opinion of this author that a cluster that is able to draw new investment into the region is a mature one.

Methodology and Data Collection

Using different Internet media sources to select candidates for potential, developing and mature clusters three regions in Turkey were decided upon. These regions are Gedelek, Gödence and Bademli. After collecting the available material on the Internet for contact details on significant leaders such as co-operative founders or entrepreneurs in these regions, telephone interviews were conducted with them. The interview questions consisted of open ended ones. With the permission of the interviewee, the interviews were recorded on tape and also notes were taken during the telephone interviews to back up the tapes in case recording failed to take place for some technical reason.

Findings

Gödence, a village of Izmir, western Turkey is renowned for its branded products of olive oil, and olives. They have started the branding process in 1993, but the president of the Gödence Agriculture Cooperative indicates that it took 10 years to establish the brandname. Today their brand is known from Gümüşhane, a province in northeastern Turkey to as far away as Finland (Tuduk 2008). The distinguishing feature of Gödence is their joint action with several research institutes and Ege University for research and development. They employ an agricultural engineer as a manager in-charge. In 2005 they invested heavily in a project partially financed through a loan from the ministry of agriculture. They do not use bank loans as they see them too risky. The first collective action of this village has been the foundation of the cooperative under the leadership of Mr. Abdullah Duran. The goal was to end the monopoly power of two olive oil mills in the village. Although the

cooperative enabled them to bypass the mills, their next confrontation was with wholesalers in the industry. To fight this bigger battle in 1993, they founded their own brand to reach the final consumer directly. But this time, they faced challenges such as finding the right customers, using the right packaging, warehousing, and right amount of working capital. Having no prior professional managerial experience, they learned through trial and error and created their own goal in the form of five years' development plans.

People of Gödence believe that trust is an essential element in running a cooperative. In Gödence's agricultural cooperative trust is established via wide participation in decision making. A decision is made by the consent of the majority of the administrative board members and once the decision is agreed upon, no one defies the decision. However, the people in the board are specially selected for their knowledge and wisdom so their contributions to the decisions are much valued and respected. The wider the expertise of these people, the better decisions are made and disputes minimized.

Gödence enjoys semi-skilled labor power because children are born into a world of olives. In 1992-1996 the cooperative held training in the villages in cooperation with Ege University. Gödence residents value both vocational training and traditional training. By traditional training they mean instilling local values and tacit rules to the youth. They resort to peer pressure to instill these tacit rules and they believe in open communication in the resolution of disputes between both the elderly and the young or any conflicting group for that matter. (Personal Interview with Özcan Kokulu, 2008)

Bademli, a village of Izmir is famous for its ornamental plants, and fruit saplings. Their local co-op has been founded on 1.1.1971 and the founding president M. Selçuk Bilgi has been in charge ever since. Bademli is quite an innovative village. Mr. Bilgi proudly states that Bademli is the first village in Turkey to establish an olive oil processing plant in the year 1975. They are again the first to apply budding. Towards the end of the 1970s they initiated a relationship with Ege University and applied the technology of budding developed by the university researchers. In 2001 they have organized the first National Sapling Conference. The co-op has 300 members, and produces 10 million saplings a year and employs about 10 agricultural engineers. The members have a cellular phone network upon which they receive market information from the co-op. Almost all the members have personal computers and they are planning to communicate over the Internet in the coming years. (Personal Interview with M. Selçuk Bilgi, 2008) Mr. Bilgi claims that they provide employment to 500-600 people every day. (Tuduk 2008)

The main role of the cooperative is to do the marketing of sapling and olive products. Bademli and Potemia are the two patented brands of the co-op. The co-op attends international trade fairs to find new markets. Among their consultants and research partners are agricultural faculties of various universities. One interesting feature of Bademli is their preference of commercial loans rather than governmental loans. A distinguishing feature of Bademli is that Bademli sends 45 individuals every year to France, Italy and Holland for agricultural training. Mr. Bilgi states that they have tremendously benefited from these training trips. The international links of Bademli is not limited with Europe. Every year Bademli hosts students from Arizona University in the U.S.A who visit the village to observe production techniques and local products. The co-op also provides scholarship to the children of the members, but those who attend agricultural studies are supported more than the others so that an incentive mechanism is initiated to lead the coming generation to agricultural studies. The current aim of Bademli is to invest in Bulgaria in order to overcome the customs barriers.

Gedelek, a village of Bursa, Northwestern Turkey is famous for its pickles. Gedelek's story dates back to 1929 when an entrepreneur has brought pickling business to the region. After seeing this entrepreneur's success in selling pickles to luxury hotels, a local resident has started his own firm. Later on, the villagers have followed suit in the pickling business. Today rather than raising vegetables for pickle production themselves, Gedelek residents organize surrounding villages as suppliers for their pickle production. More than 50 villages in the region work as suppliers to Gedelek producers generating about 50 million YTL per year. (Tuduk 2008)

Gedelek residents claim their local spring's water is especially suitable for pickling. Besides this natural competitive advantage, specialization and generation of a value chain is what enables Gedelek to command more than 50% of the domestic pickle market in Turkey. Two tin manufacturing plants owned by local residents provide for the packaging needs of the pickle producers. Established as a partnership between an investor from

Istanbul and one from Switzerland, Zeytursan, is a company that directly exports pickles to fast food giants such as Burger King in Europe, and Middle Eastern countries.

An interesting feature of Gedelek is that the residents claim they do not need to work with research institutions or universities to generate innovation because innovation demand comes into the region through hard-to-please foreign customers. Those who comply with the demands of these customers do perform remarkably innovatively. As far as financial sources needed for innovation or production are concerned Gedelek residents prefer to use commercial loans rather than governmental loans.

Analysis of the Findings

It is the opinion of this author that Gödence is a true cluster because the cooperative acts as the founding father that sets the rules of the olive oil business in the region. The collective efficiency is observed via the patented brandname: 'Gödence'. The financial burden of new investment is shared by all members of the co-op while government aid and training are also facilitated by the co-op. Research and development efforts are undertaken in cooperation by the universities and other research institutes. The distinguishing feature of the Gödence co-op is its trust-based relationship with all the residents in the village. It seems that the governing board of the cooperative is made up of much respected individuals of wisdom who are consulted in all matters in the village. These people are so powerful that they can even lay new rules without facing much resistance. Gödence also boasts to host the annual Agricultural High Achiever competition which has been expanded to a national scale this year.

The founding father of Bademli is the local co-op which in a sense is a business association. Throughout a history of 37 years, this co-op has established two brandnames in the market, and now is in the process of helping its members' brands to be launched. The co-op finds international markets and allows its members to serve these markets. The relationship of the co-op with various universities provides the members the advantage of benefiting from the research outputs of these institutions, which is certainly a result of collective efficiency. Training trips to European countries are also a distinguished service of the co-op, without which the Bademli residents cannot make on their own. Ownership of the olive oil and hygienic milk processing plants, the efforts to make direct investment to Bulgaria all indicate sharing of the financial hurdle by the members of the cluster. The fact that the co-op is now targeting region-specific sapling raising is a sign of specialization which is another feature of clusters frequently mentioned in the literature. The lobbying activities at the capitol and the provision of higher amounts of scholarship to the children who study agricultural science is a strategic investment in the future of the cluster. As such, the co-op acts as a local strategic business association which has turned Bademli from a small village to a growing cluster with quite a promising future.

The cluster in Gedelek was initiated by the efforts of an ordinary entrepreneur who realized the suitability of the local spring's water for pickle production. Upon his success local residents followed suit and thus was born the Gedelek pickle cluster. Later on through collective action, villagers started organizing other villages in the vicinity to produce vegetables for them and eventually the number of villages depending on this business reached about fifty. In terms of number of heads making their living in this cluster, an estimated figure is 10,000. Half of Turkey's pickle consumption is provided by Gedelek. The demanding customers are a motivating force for producers in Gedelek to move upwards along the value chain. They do not feel the need to establish relationship with research institutions simply because keeping up with the international demand is enough for them as a source of research and development.

The presence of Zeytursan, a large exporter established by an investor from Istanbul distinguishes Gedelek from the other clusters, as Gedelek is able to draw investment to the region. Furthermore the presence of two packaging plants also indicates specialization that has taken place in the cluster. Thus Gedelek deserves to be called 'a mature cluster'.

Conclusion

In this exploratory work, we looked for signs of clustering in three regions of Turkey. While Gödence and Bademli seemed to be growing clusters, Gedelek with the oldest history and established forward and backward linkages to the market and suppliers and power to attract investment into the region seemed to be a mature cluster. A common point of concern mentioned in all regions except for Gedelek was the problem of finance. Notwithstanding the undisputed success of some of these clusters, the interviewees complained from the high risks involved with bank loans and the ignorance of the government officials when approached for financing request. As far as crisis management and financial growth is concerned these clusters are literally on their own and as crisis insurance they have only accumulated savings.

Another significant factor that was present in all the studied regions was their links with international markets. Except for Gedelek, the other regions were quite positive in attempting to cooperate with universities but Bademli seemed to be the champion in this respect. There seems to be a reluctance in creating relationship with universities and other research institutes.

What is revealed as a result of this research is that there is a need to work on these clusters and present their potential capacity and problems to the policy makers. In that sense a follow up work could include a quantitative survey in these regions. Some of the research questions to be pursued could be :

How can these clusters be facilitated so that horizontal cooperation between similar ones can be generated? How come Gedelek never felt the need of a co-op all these years until last year while Gödence and Bademli have been acting through their co-ops? Will the newly founded Gedelek co-op really add value to the cluster or will it merely be a nuisance? How similar or different are their ways of investing into the education and training of future generations so that the future of the clusters are ensured in safe hands? What are the reasons behind the reluctance towards cooperation with universities or other research institutions? There are many more questions that arise as we probe into the topic, but what is definitely certain as the outcome of this research is that this area in Turkey is totally untapped and calls for research, preferably both quantitative and qualitative.

SOCIAL SUSTAINABILITY IN GROCERY RETAILING: PERSPECTIVES AND GUIDELINES FROM A TURKISH SAMPLE

Nigar Demircan-Cakar, Duzce University, Turkey

**Derya Erel and Ismail Erol
Abant Izzet Baysal University, Turkey**

ABSTRACT

The aim of this study is to understand and to present a picture of food retailers' social sustainability practices. In order to analyze social sustainability indicators, data obtained from high level managers of Turkey's top 36 grocery retailing companies are used. Our findings indicate that, the majority of the firms recognize the impacts their businesses have on employees, customers and the community. Retailers are willing to collaborate with community actors; they are against allowing child labor in their organization; they do not pay attention to transparency issues; they are less willing to reshape their policies considering unions' ideas; only half of the retailers have inventories dealt with work accidents; labeling, service personnel and product variety seem to be the most important customer complaints.

INTRODUCTION

Although it remains difficult to express the concept of business sustainability in concrete operational terms, it can be defined as “adopting business strategies and activities that meet the needs of the enterprise and its stakeholders today while protecting, sustaining and enhancing the human and natural resources that will be needed in the future” (Labuschagne et al., 2005). Accordingly, sustainable development has been defined as “development, which meets the needs of the present without compromising the ability of future generations to meet their own needs” (Report of the World Commission on Environment and Development, 1987).

For many organizations, there is a strong desire for the comprehensive assessment of changes in economic, environmental, and social conditions. Businesses are increasingly paying more attention to the social dimension of sustainability (Böhringer et al., 2007; Holiday et al., 2002). Accordingly, socio-economic and socio-cultural linkages have become increasingly prominent (Lehtonen, 2004; Robert et al., 2002), and social concerns have crept into the terminology of policy makers (George and Kirkpatrick, 2006; OECD, 2001). To better understand and define sustainability, organizations should take into account – over and above their economic performances – their social and environmental performances. “However, far less work has been done on social sustainability, as it applies to business” (Viesser and Sunter, 2002).

Global vertical integration of the food chain and increasing environmental concerns, have raised critical voices towards the mainstream retailers. In this context, grocery retailing which is a crucial part international food chain has been blamed (See e.g. Scialabba & Hattam, 2002; Flora, 1995; Reganold et al., 2001; Allen, 1999) for causing various kinds of damage to the social welfare, for its failure to provide wholesome and nutritious and safe food, inability to supply food for low-income people, as well as for various other social problems (Nousiainen et al, 2005).

In grocery retailing, retailers need to respond to the varied, intersecting demands of many groups of society such as producers, consumers, competitors, shareholders and regulators. Each group concerns different environmental and social facets of a retailer's business activities and require measures, requests information and monitors company activities. Retailers also may need to respond to intra-firm demands of workers regarding sustainable development (Jones, 2005b). Therefore, social sustainability issues including labor practices, customer and societal concerns were the earliest and are now the most commonly reported set of sustainability agendas among the leading grocery retailers (Jones, 2005a).

Considering this importance of establishing a framework to evaluate the social sustainability performances of operational initiatives, the aim of this paper is to understand how food retailers operate social sustainability and establish such activities to respond to society's expectations. In order to descriptively analyze social sustainability indicators, data obtained from top managers of retailing companies are used.

THEORETICAL BACKGROUND

Although it is not possible to fully define the social dimension of sustainability, it is concerned with the company's impacts on the social environment, as well as the company's relationship with its various stakeholders. The essential point of the concept can be recognized in the voluntary undertaking of a commitment that goes beyond the legal obligations (Longo, 2005).

In 1997, the United Nations Environment Programme (UNEP) together with a United States nongovernmental organization, Coalition for Environmentally Responsible Economics (CERES) launched the Global Reporting Initiative (GRI) with the goal of "enhancing the quality, rigor and utility of sustainability reporting" (GRI, 2002). Reporting is therefore the strong focal point of the guidelines and the sustainability dimensions that should be considered at various levels within the company are indicated by stating reporting principles. These principles constituted a framework for the measures of social sustainability used in this study. Besides, the determination of these measures has also been achieved on the basis of studies and models already covered in existing literature, as well as on the basis of the analysis of social audit and sustainability reports drawn up by important businesses and associations (Labuschagne et al, 2003; Briassoulis, 2001).

According to many researchers, labor practices, customer and society concerns are the core of social sustainable development of an organization (Labuschagne et al., 2005; Longo et al., 2005). In other words, the social dimension of sustainability is about the impacts an organization has on labor practices, customers and society. In this study, these three dimensions are operationalised. First, twelve indicators are defined in terms of labor practices, namely training and career, employee participation, relationships with the unions, personnel turnover and layoffs, equal treatment, discrimination, harassment, violence, occupational health and safety, grievances, complaints and discipline, child labor, compensation management, performance management /performance related compensation, personnel recruitment and selection. Second, customer complaints, consumer awareness, consumer health/safety and private brands were the four measures of social sustainability related to customer concerns. Finally, in terms of society concerns, this study considers participation in local activities, local community, transparency, and supporting local communities as measures. The indicators to measure all three concerns of social sustainability are summarized in Table 1.

Table 1: Social indicators and references in question

| Sustainability dimension | Selected Indicator | Author(s)-Source(s) |

METHODOLOGY

The aim of this study is to present a picture of social sustainability performance of grocery retailers' in Turkey by analyzing labor practices, customer and societal concerns of each grocery retailer. Therefore this study is descriptive in nature. We used descriptive research design since to our knowledge, there is no research deeply exploring grocery retailing and environmental indicators by providing empirical support. Besides it determines the best research design, data collection method and selection of subjects by reviewing available literature and using qualitative and quantitative approaches such as informal discussions with consumers, employees, management or competitors, in-depth interviews, focus groups and surveys (Neuman, 2006).

PROCEDURE, QUESTIONNAIRE, AND DATA

Data for this study was derived from Turkish grocery retailing sector since it constitutes % 20.97 of GDP in 2007, and in the whole retail sector, the grocery retailing is growing rapidly in Turkish economy. The grocery retailing is also crucial in terms of employment. For example, the number of organized workers employed in the sector was 231,000 in 2001(Celen et al., 2005) and 300,000 in 2006 (TCSCR & PriceWaterhouseCoopers Turkey, 2007).

In this research, in order to assess the extent of social sustainability performance of retailers, a questionnaire containing three dimensions of social sustainability was constructed. In developing the questionnaire items, reference was first made to the researchers as mentioned in Table 1. The items in the questionnaire were then pilot tested on a sample of five retailers to ensure that these items meet required criteria regarding selected indicators. The conclusions presented in this study are based upon this questionnaire which is conducted via face to face interactions with top level managers of grocery retailers.

To collect data, top level managers from preceding forty retailers in the industry were informed about the study. After eliminating four of them due to mergers and acquisitions, thirty six top managers agreed to participate in the study. In reporting on environmental indicators, reporting retailers are encouraged to keep in mind the principle of sustainability context. With respect to the labor practices, customer and societal concerns measures in the

questionnaire, top managers are encouraged to relate their performance to the broader societal systems within which they operate. The approach taken to scoring in this study was based on an unweighted method which means that all information were equally valued regardless of their importance or relevance to any particular user group (Cooke, 1989; Chau and Gray, 2002). In order to facilitate statistical analysis, most of the questions were prepared as 5-point likert type measures; however, such indicators as existence of child labor, private brands, and customer complaints were measured by nominal scales, including yes/no answers. The number of items in the questionnaire for each social sustainability indicator, means, standard deviations and frequencies of nominal measures are demonstrated in Table 2 and 3.

Table 2: Descriptive Analysis of Likert Type Measures

| Social Sustainability aspect | Indicators | Number of measures | Means | Std.dev. |
|------------------------------|---|--------------------|-------|----------|
| Labor Practices | Training and Career | 6 | 4,32 | ,90 |
| | Employee Participation | 6 | 4,34 | ,65 |
| | Relationships with the Unions | 2 | 1,11 | ,39 |
| | Personnel Turnover and Layoffs | 2 | 4,03 | 1,57 |
| | Equal Treatment | 2 | 4,43 | 1,16 |
| | Discrimination, Harassment, Violence | 6 | 4,34 | ,78 |
| | Grievances, Complaints and Discipline | 3 | 4,52 | 1,05 |
| | Performance Management / Performance Related Compensation | 5 | 3,55 | 1,48 |
| | Personnel Recruitment and Selection | 4 | 3,87 | ,96 |
| Customer concerns | Consumer awareness | 1 | 4,14 | 1,57 |
| | Consumer health and safety | 11 | 3,82 | ,49 |
| Society | Supporting local communities | 4 | 3,35 | 1,21 |

Table 3: Frequencies Of Nominal Measures

| Social Sustainability aspect | Indicators | Yes % | No % |
|------------------------------|--|-------|------|
| Labor Practices | Occupational Health and Safety | | |
| | Inventory of work accidents | 52,8 | 47,2 |
| | Policies preventing work accidents | 83,3 | 16,7 |
| | Inventory of work-hours loose due to work accidents | 40 | 60 |
| | Child Labor | | |
| | Principles of non-employment of child labor | 72,2 | 27,8 |
| | Considering non-employment of child labor in choosing suppliers | 42,4 | 57,6 |
| | Compensation Management | | |
| | Use of a compensation policy | 82,4 | 17,6 |
| | Considering sector averages in determining salaries | 91,4 | 8,6 |
| | Considering performance evaluation reports in determining salaries | 71,4 | 28,6 |
| | Considering inflation rates in determining salaries | 88,6 | 11,4 |
| Customer | Customer complaints | | |
| | Product quality | 25,7 | 74,3 |
| | Labeling | 64,7 | 35,3 |

| | | | |
|---------|--|------|------|
| | Packaging | 32,4 | 67,6 |
| | Service personnel | 67,6 | 32,4 |
| | Physical conditions | 35,3 | 64,7 |
| | Product variety | 41,2 | 58,8 |
| | Private brands | | |
| | Customers preference | 70,8 | 29,2 |
| | Negative effects on firm image | 47,6 | 52,4 |
| Society | Participation in local activities | | |
| | With civil community organizations | 86,1 | 13,9 |
| | With public organizations | 62,9 | 37,1 |
| | With universities | 62,9 | 32,1 |
| | Transparency | | |
| | Indicating social, economic and environmental strategies and policies | 34,3 | 65,7 |
| | Periodically announcing social, economic and environmental performance | 22,9 | 77,1 |
| | Local community | | |
| | Working with local suppliers | 66,7 | 33,3 |
| | Social investments in local area | 85,3 | 14,7 |
| | Considering local employment opportunities in new investments | 60 | 40 |
| | Considering local growth rate in new investments | 82,9 | 17,1 |

SCOPE AND LIMITS OF THE STUDY

The scope and limits of this research are determined as follows:

- 1) The research is limited to grocery retailers in Turkey
- 2) Grocery retailers included in this study are the top forty grocery retailers of Turkey. That is, local and small-sized retailers are excluded.
- 3) This questionnaire items concern managers' evaluations on their countrywide stores. It focuses on descriptive analysis in the headquarters of the retailers.
- 4) This study was conducted from the perspective of retailing managers due to the fact that top managers are well-informed about social activities, performance, control and the overall process of social sustainability.

CONCLUSION

This study aims to analyze descriptive properties of Turkish grocery retailers in terms of social sustainability. Considering three aspects of social sustainability, our findings indicate that, the majority of the Turkey's top 36 retailers recognize the impacts their businesses have on employees, customers and the community. It appears that they are seeking to measure and benchmark their performance in addressing social sustainability agendas. The results of this descriptive analysis show that the development of such measures of social sustainability allows organizations to describe their relative progress over time and to compare their social sustainability performance with industry wide standards.

This study has several important findings. In terms of labor activities, the results of descriptive analysis show that retailers are less willing to reshape their policies considering unions' ideas. They are also not willing to exchange ideas with employee unions and contact them about non-work issues. Almost all retailers are against allowing child labor in their organization however, they are not that responsive to working with suppliers allowing child labor. Besides only half of the retailers have inventories dealt with work accidents. Labeling, service personnel and product variety seem to be the most important customer complaints. In terms of society concerns, retailers do not pay attention to transparency issues which publicly demonstrate their social, economic

and environmental performance. The results also reveal that retailers tend to collaborate with civil community organizations.

FACTORS AFFECTING JOB SATISFACTION AND ETHICAL PERCEPTION OF TRAVEL AGENCY EMPLOYEES

Hilal Demirel, Semra Güney and Özge Tayfur
Hacettepe University, Turkey

ABSTRACT

Although ethical misconducts influence the perceived quality of services provided, little attention has been paid to ethics and ethical misconducts in tourism sector. This study hopefully fills this gap by investigating whether gender explains differences in ethical perceptions of travel agency employees and whether job satisfaction and its facets (Pay, Promotion, Supervision, Fringe Benefits, Contingent Rewards, Operating Procedures, Coworkers, Nature of Work and Communication) predicts the ethical sensitivity. According to the results of this study, three facets of job satisfaction, namely promotion, supervision and the nature of work predict ethical perceptions of travel agency employees. In addition, overall job satisfaction felt by agency employees significantly predicts their ethical perceptions (i.e. ethical sensitivity). Empirical results also supported the existence of gender influence by showing that female salespersons are more likely to have higher scores of ethical perceptions.

INTRODUCTION

Tourism, as one of the largest industries in the world, plays a key role in achieving the socio-economic goals of a nation. It can be a vital source for development by stimulating economic growth and employment. Realizing the importance of tourism, businesses and public organizations are increasingly interested in the economic impacts of tourism at national and local levels.

As an important social phenomenon, tourism is exerting great influence on society. The number of tourists today is nearing one billion, with every sixth inhabitant of the globe classified as a tourist (Holjevac, 2008). Tourism industry is based on service rather than a physical good and success of service providers in tourism sector depends on activities, behaviors, beliefs and thoughts of their employees like other firms operating at service sectors.

Over the years, Turkey has emerged as a popular tourist destination for many Europeans. According to travel agencies, 31 of the 100 best hotels of the world are located in Turkey. In the year 2005, Turkey hosted 21 billion tourists and earned 18.2 billion dollars in total and around 680 dollar per tourist. The latest figures indicate that the tourism is the most dynamic and fastest growing sector in Turkey (Kaplan, Çelik, 2008).

According to "The Association of Turkish Travel Agencies", travel agencies are the main actors of tourism sector in Turkey and offer wide range of products to satisfy the demands of market. Turkish travel agencies gained valuable experiences through decades. Their dynamic entrepreneurial nature and success in understanding the market have enabled them to establish successful business relations. Yet still there are areas of improvement. Building long-term relationship with customers and promoting the image of country necessitate quality service and honest approach to customers.

Ethical behavior is an important part of the travel agency salespersons' job as sales profession has many opportunities and temptations for ethical misconduct (Dawson, 1997). Previous studies indicated that high ethical standards result in higher levels of customer commitment to organization and higher job

performance of employees. For example, Schwepker and Ingram (1996) reported a positive relationship between moral judgment and job performance of salespeople. Considering the results of previous studies, we chose to collect data from travel agency salespeople. We aim to investigate how people working at tourism sector perceive ethical dilemmas, and whether job satisfaction has a role in these perceptions.

JOB SATISFACTION: A PREDICTOR OF ETHICAL PERCEPTION

“Job satisfaction is an employee’s general attitude toward the job. For many years, most managers believed that satisfied employee is necessarily a good employee. In other words, if management could keep all employees happy, good performance will automatically follow.” (Byars, Rue, 2004) After years of research, job satisfaction is believed to increase commitment to the organizations and prevent problems like turnover and absenteeism. Considering the positive effects of job satisfaction, it is still one of the most important work-related attitudes to investigate.

Marshall (1999) defines ethics as “guidelines to influence human social behavior in a manner intended to protect and fulfill the rights of individuals in a society” (Ergeneli, Arkan, 2002) “Business ethics is an example of applied ethics; it involves taking the pure theories, principles and concepts of formal ethics and applying them to the world of work, which presents business professionals with any number of ethically charged but real-life situations” (Hartman, 2002) “Good ethics is also good business because it allows businesses to avoid outside restrictions. If a business is not self-regulated it will be regulated by others. Unethical conduct brings about those things that businesses least desire: government regulations and restrictions, hostile employee relations resulting in an unproductive work force, and consumer rejection of its products and services.” (Stewart, 1996)

In recent years the ethical perception studies have increased rapidly as the “ethics” became one of the most popular issues. But there are only few studies investigating whether job satisfaction predicts ethical perception of employees. In one of these studies, Pettijohn et al. (2007) examined the perceptions of salespeople regarding business ethics, and the relationship between these perceptions and two important variables, namely job satisfaction and turnover intentions. The results showed the existence of a positive relationship between ethical perceptions and job satisfaction and a negative relationship between ethical perceptions and turnover intentions. Severinsson et al. (2001) examined the factors influencing job satisfaction and ethical dilemmas in acute psychiatric care. Results showed that the factors that contribute to job satisfaction or dissatisfaction can be related to the ethical values of nurses. Valentine and Fleischman (2008) studied the relationship between ethics programs and job satisfaction. Results indicated that corporate social responsibility fully, sometimes partially mediated the relationship between ethics program variables and job satisfaction. Considering the results of previous studies mentioned above, following hypotheses are suggested in this study:

H1: Job satisfaction predicts ethical perception of the salesperson working in travel agencies.

H2: Each facet of job satisfaction (Pay, Promotion, Supervision, Fringe Benefits, Contingent Rewards, Operating Procedures, Coworkers, Nature of Work and Communication) predicts ethical perception of the salesperson working in travel agencies.

In addition to exploring the effects of job satisfaction on ethical perceptions, we aim to examine whether there are differences between male and female employees regarding ethical sensitivity (i.e. perception). Previous studies reported conflicting results regarding the effect of gender on ethical perception and decision making. Based on the data collected by salespeople, Dawson (1997) found significant gender based differences in ethical decision making regarding relational issues. In the same study, observed differences were found to vary with age and years of experience, which makes it difficult to explain the main effect of gender. In contrast to the findings of Dawson; Ergeneli and Arkan (2002) found no significant differences in ethical perceptions based on gender. In this study, however, we expect a similar result reported by Dawson, that is:

H3: Female salespersons are expected to have higher scores of ethical perception.

METHOD

Sample

A total of 150 questionnaires were distributed to the salespeople working at travel agencies located in Ankara, Turkey. A total of 100 questionnaires were returned. Majority of the respondents were women (59 %), aged between 20 and 29 (%37), well educated (% 40 with B.A. / B.S. degrees), with an income level between 300 and 600 dollars (% 40) and work experience more than 5 years (71 %).

Measures

In this study Job Satisfaction Survey of Paul E. Spector (1997) is used. This survey has nine subscales which assess employee attitudes about the aspects of the job and job in general. Each subscale measures the facets of job satisfaction with four items. Overall satisfaction score reflects the employee's general attitudes about job and it is computed by taking the mean score of all items in satisfaction survey. A summated rating scale format is used in this scale, with six choices per item ranging from "strongly disagree" to "strongly agree." Items are written in both directions, so about half are reverse scored. The nine facets are "Pay" (e.g. *"I feel I am being paid a fair amount for the work I do"*), Promotion (e.g. *"There is really too little chance for promotion on my job"*), "Supervision" (e.g. *"My supervisor is quite competent in doing his/her job"*), "Fringe Benefits" (e.g. *"I am not satisfied with the benefits I receive"*), "Contingent Rewards" (performance based rewards) (e.g. *"When I do a good job, I receive the recognition for it that I should receive"*), "Operating Procedures" (required rules and procedures) (e.g. *"Many of our rules and procedures make doing a good job difficult"*), "Coworkers" (e.g. *"I like the people I work with"*), "Nature of Work" (e.g. *"I sometimes feel my job is meaningless"*), and "Communication" (e.g. *"Communications seem good within this organization"*) The reliability of the scale was tested in U.S. sample by Spector and the Cronbach alpha coefficient was found to be .91, well above acceptable limits. In Turkish sample, reliability again was found to be satisfactory as .95 (Sun, 2002). In this study the reliability of the job satisfaction survey is also found to be satisfactory (Cronbach Alpha = .88).

To measure the ethical perceptions of travel agency employees, a modified version of Dawson's survey (1997) was used. This survey consists of 20 ethical scenarios "describing possible ethical misconduct on the part of salespeople or sales manager." Considering the study conducted by Ergeneli and Arıkan (2002) in Turkey, the number of ethical scenarios was reduced to 14, which are more proper for the business life in Turkey (Ergeneli, Arıkan, 2002) Those 14 scenarios reflect the majority of the ethical behavior described in the literature like; industrial espionage (e.g. *"Clothing sales manager tries to get some information about the marketing and sales plans of the competitor firm, from a newly hired salesperson who once worked for that company"*), lies and deception (e.g. *"Medical equipment salesperson does not inform the doctors about the competitor's prosthetic product which is more functional and cheaper"*), unfair trade practices (e.g. *"Salesperson manipulates the contest rules of the one of his relatives who really needs money win the prize"*), to bribe (e.g. *"Sales manager of a company invites male customers on a cruise and provides drink and a prostitute to keep good relations and maximize the sales profits"*), employee theft (e.g. *"Salesperson works at jewelry shop. She keeps a demonstration sample and reports it as lost"*), stealing trade secrets (e.g. *"Salesperson of a big company finds someone confidential marketing plans of its competitor on the table in a fair and keeps a copy of them"*) and insider trading (e.g. *"Sales manager of a computer programming company tries to persuade a talented employee of a competitor firm by offering a very high salary"*). Respondents were requested to indicate their reactions to the situations presented in each scenario. Scores were examined by using a 5-point Likert type scale ranging from (1) "strongly agree" to (5) "strongly disagree". Higher scores indicate greater sensibility towards ethical dilemmas. The reliability of the scale is tested in this study and found to be satisfactory with Cronbach Alpha Value of .85.

Results

The data were analyzed by using SPSS 11.5 program. The factor analysis conducted by Sun (2002) demonstrated the construct validity of Turkish version of job satisfaction survey before. Therefore, we did not conduct a factor analysis for this scale. However, reliabilities of all scales used in this study were examined

separately. Reliabilities of job satisfaction facets; pay, promotion, supervision and nature of work were acceptable because they are above the satisfactory level, which is .70. Reliabilities of fringe- benefits, coworkers and contingent reward subscales were not acceptable (<.70), therefore we did not analyze the effects of these job satisfaction facets on ethical perceptions. One of the items measuring communication satisfaction (*"Communications seem good within this organization"*) was eliminated in order to increase the reliability.

After testing the reliabilities of scales, several analyses were conducted. In order to evaluate the attitudes of participants, mean scores were computed for each scale. Participants have high scores of ethical perception with a mean of 3.69 which is more than the moderate level "3.00". This means travel agency employees are sensitive about ethical issues presented in scenarios. Mean satisfaction scores turned out to be higher than the midpoint of the scale, suggesting that participants are satisfied about their jobs. (see Table 1 for descriptive statistics)

Table 1: Descriptive Statistics of Variables of Interest

| | Mean | Median | Std. D. |
|--------------------|------|--------|---------|
| Ethical Perception | 3,69 | 3,71 | ,71 |
| Pay | 2,84 | 2,75 | ,93 |
| Promotion | 3,38 | 3,38 | ,87 |
| Supervision | 3,80 | 4,00 | ,85 |
| Communication | 3,64 | 3,67 | ,95 |
| Nature of Work | 4,16 | 4,25 | ,72 |
| Overall | 3,36 | 3,32 | ,49 |

Note: Dimensions of job satisfaction (i.e., pay, promotion, supervision, communication and nature of work), overall job satisfaction and ethical perceptions were measured with 5 point scale. High scores indicate high satisfaction and high ethical sensitivity.

The relationship between the facets of job satisfaction, overall job satisfaction and the ethical perceptions were investigated through regression analysis. Table 2 shows the results of the regression analyses in which ethical perception is dependent variable, the overall job satisfaction and its facets (pay, promotion, supervision, nature of work and communication) are independent variables.

As seen in Table 2, Hypothesis 1 ("job satisfaction predicts ethical perception of the salesperson working in travel agencies") is supported ($\beta = .17, p < .05$.) The result pointed out that, employees with higher levels of job satisfaction are more sensitive about ethical issues.

Hypothesis 2, "Facets of job satisfaction predict ethical perception", is partially supported. The effects of three satisfaction facets (i.e., Fringe benefits, coworkers and contingent reward satisfaction) were not analyzed because the reliabilities of relevant subscales were not satisfactory (<.70). As facets of job satisfaction, pay, communication and nature of work are not found to be significant predictors of ethical perceptions. ($p < .05$) However, promotion and supervision satisfaction predicted the ethical perception significantly. ($p < .05$) When employees are satisfied about promotion and supervision aspects of their jobs, they tend to be more sensitive about ethical dilemmas and problems.

Table 2: Summary of Regression Analysis: Predicting the Effects of Job Satisfaction on Ethical Perceptions

| | F-value | t-value | B | Std. Error | β |
|-------------|---------|---------|-------|------------|---------|
| Pay | 1,234 | 1,111 | ,085 | ,077 | ,111 |
| Promotion | 4,377* | 2,092* | ,171* | ,082 | ,207* |
| Supervision | 9,570* | 3,094* | ,251* | ,081 | ,298* |

| | | | | | |
|----------------|--------|--------|-------|------|-------|
| Communication | 0,23 | -1,50 | -,011 | ,076 | -,015 |
| Nature of Work | 3,530 | 1,879 | ,184 | ,098 | ,186 |
| Overall | 6,183* | 2,487* | ,354* | ,142 | ,244* |

Note: $p^* < .05$; $p^{**} < .01$ (N: 100)

Hypothesis 3 (“Female salespersons are more likely to have higher scores of ethical perception”) is tested with One –Way ANOVA. When the mean ethical perception scores were compared, it was seen that female salespeople have higher scores of ethical perception than their male counterparts (mean ethical perception scores of female salespeople =3.76 versus ethical perception scores of male salespeople=3.59). However, the observed difference of women and men, regarding ethical perceptions is not statistically significant ($F= 1,437$, $p > .05$). Despite this insignificance, female salespeople seem to be more sensitive about ethical dilemmas, and this is in line with our expectations.

Table 3: Mean Scores of Ethical Perception

| EP | N | Mean | Std. Deviation |
|---------------|-----|--------|----------------|
| Female | 59 | 3,7647 | ,62257 |
| Male | 41 | 3,5909 | ,82700 |
| Total | 100 | 3,6934 | ,71470 |

Discussion

The tourism industry is one of the largest industries in the world. Despite the importance of tourism, little attention has been paid to ethical dilemmas confronted tourism managers (Hudson, Miller, 2005). Ethics is an important element of the tourist trade and hotel and catering industry, which referred to as the Hospitality Industry. The ethical components of the tourism and hotel industry are also important due to the industry’s great international importance. Billions of people travel and that “traveling humanity” are served by millions of people. Traveling tourists expect a welcome and pleasant stay everywhere they go-the well being that creates the feeling of happiness (Holjevac, 2008).

Therefore, this study investigated the ethical perceptions of the travel agency employees, which are the key elements of tourism sector. We have seen that there is a significant relationship between the job satisfaction and ethical perceptions of travel agency employees. Promotion and supervision satisfaction significantly predicted the ethical perceptions of employees. Employees who are highly satisfied in their works in terms of promotion and supervision, seems to be more sensitive to ethical dilemmas. Results showed that three job satisfaction facets (i.e., pay, communication and nature of work) were not significant predictors of ethical perceptions. Finding regarding pay satisfaction deserves special attention, because employees who are dissatisfied with wages or salaries do not seem to be insensitive about ethical problems and dilemmas. This could prevent the ethical misconducts, which would result from employees’ desire to obtain extra payment.

In this study, gender related differences in ethical perceptions are also examined. Mean ethical perception scores of female salespeople were higher than those of male salespeople. This difference, however, was not turned out to be statistically significant, contrary to the findings of past studies. This unexpected finding could be due to sample size. Therefore we suggest researchers to replicate this study with larger sample.

The study findings highlight the significant role of job satisfaction on ethical perception. Greater job satisfaction has also been generally related to reduced intent to leave the organization (Brayfield & Crockett, 1955; Mowday, Koberg & McArthur, 1984) and with reduced rates of absenteeism (Porter & Steers, 1973). In

addition, job satisfaction has been shown to be strongly related to organizational commitment (Porter, Steers, & Mowday, 1974) and to organizational citizenship behaviors (Smith, Organ, & Near, 1983; Organ, 1988, cited in Turner and Brown, 2004). Despite the fact that many studies on job satisfaction have been done till now, these studies focused on particular consequences of the job satisfaction such as intention to leave, absenteeism. There are limited number of studies investigating the relationship between job satisfaction and ethics. This study hopefully filled this gap by examining these two concepts.

To the knowledge of the authors, this study is the first study that reveals job satisfaction as a significant predictor of ethical perception. According to the findings of this study; job satisfaction increases the sensitiveness of salespeople to the ethical dilemmas, in addition to its other important contributions to the employee performance. Ethical behaviors are indispensable for the long term success of businesses. Unethical behaviors corrupt the market operations, cause ineffective distribution of the resources therefore they adversely affect the job performances of the employees in the long run (Fritzsche, 2005). Employers could promote the ethical behaviors of their employees and increase their ethical sensitiveness through increasing their satisfaction about promotion and supervision.

Limitations and Future Research Directions

The most important limitation of this study is related to data collection. The data were gathered from the salespersons of the travel agencies, which would not be a representative of the salespersons of other sectors and businesses. Sample consisted of respondents only from the tourism sector. In other sectors, norms, procedures, methods, and beliefs regarding sales ethics could be different. So any generalization without data gathered from other service sectors would be inappropriate and tentative. The second limitation of the study is that the scenarios used in the study were not real business situations. For this reason, the first thing to suggest for further studies would be to investigate the salesperson behavior in the real business situations (Ergeneli, Arıkan, 2002).

The third limitation of the study is the way the data obtained. As the data of this research figured on the self reports of the employees, we could not expect the respondents to behave in the same way they answer to the questionnaire. Another limitation of the study is related to sample size. We have no information about the travel agencies and the employees of travel agencies that did not accept to respond to the questionnaire. As the more employees participate to the study, results will be more proper for the generalization to the whole travel agencies. Therefore, future research needs to investigate the same issue, but with a greater sample size.

This study revealed the relationship between the job satisfaction and the ethical perception of travel agency employees, but future research is also needed to examine the process mechanism by which job satisfaction predicts the ethical perception.

TO HONOR OR NOT TO HONOR: AN EMPIRICAL ANALYSIS OF EXPLANATIONS FOR TRUST VIOLATIONS IN ORGANIZATIONAL SETTINGS

**Kristen Bell DeTienne, Ryan Gottfredson,
James C. Phillips and Brian Reschke
Brigham Young University, United States of America**

ABSTRACT

Trust in organizations is important as it improves employees' job attitudes, increases employees' commitment to their jobs, and can improve performance (Dirks and Ferrin, 2002; Kramer, 1999). Researchers have examined the use of apologies and denials in repairing trust violations (Kim et al., 2004) and have shown that repairing trust is difficult (Slovic, 1993). Using Probit regression, the authors analyzed a data set consisting of 508 surveys filled out by full-time employees at a Western U.S. office of a large financial services firm. This research extends the literature by analyzing five types of accounts, two of which are new to the literature. Also, the analysis shows that time violations should be added as a new type of trust violation along with competence and integrity violations.

INTRODUCTION

Relationships are the “lifeblood of organizations,” and research has shown that when relationships in an organization are harmed there is a loss of productivity, performance, and employee satisfaction (Ren & Gray, 2009; Kidder, 2007; De Dreu & Weingart, 2003; Jehn, 1995). Previous research has indicated that employee-employer relationship violations are common (Rousseau & Robinson, 1994; Conway & Briner, 2002) and that violations of trust, whether intentional or inadvertent, are a frequent occurrence (Ferrin et al., 2007). As such, it is necessary to explore how one can restore relationships when a violation occurs.

Dirks et al. (2009) state that relationship repair is a fundamental but surprisingly understudied problem. Relationship repair is a process that occurs when a transgression causes the positive state that constitutes the relationship to disappear and/or negative states to arise, as perceived by one or both parties, and activities by one or both parties substantively return the relationship to a positive state (Dirks et al., 2009).

Relationship Repair Process

Previous research has designated a process for relationship repair (Dirks et al., 2009; Ren & Gray, 2009; Schonbach, 1990). The process we model starts with a violation, where someone feels an explanation is needed. The violation is followed by a reproach, where the person asks why the failure event occurred. Then, the offending party offers some kind of an account. Then, it is evaluated (typically either honored/accepted or not honored/not accepted). An example is someone walking in late to a meeting (the violation). The boss might ask why the employee is late (the reproach). The employee then offers an account for being late (such as the excuse of heavy traffic). Then, the boss honors the account (“It’s okay. I heard there was a big accident on the freeway”) or does not honor the account (“Don’t let it happen again. You should know to leave home earlier in case of heavy traffic”).

Our research builds on previous research in the following ways: first, our research seeks to confirm previous research done in a lab setting in an actual work environment, which has yet to occur in this literature; second, our research proposes that time violations should be added as a trust violation along with competence and integrity violations; third, our research extends previous research by looking at excuses and justifications as alternative means to repair relationships.

The following section will describe the relationship repair process. This will provide the context for these three aims and our hypotheses.

Violation. A violation is a breach in a relationship caused when the trustee's actions do not support the trustor's expectations (Ren & Gray, 2009; Goffman, 1967), and are identified when one creates a social disequilibrium by calling into question the relative standing of the parties or the norms that govern the relationship (Dirks et al., 2009; Ren and Gray, 2009). Our research looks specifically at those violations that affect trust. Kim et al. (2004) said that a trust violation invalidates the "trustworthy until proven otherwise" assumption and that such violations cause trust to plunge to a level that may be below the initial trust level.

Previous studies (Kim et al., 2004; Kim et al., 2006; Ferrin et al., 2007) focused on trust violations have typically looked at two types of violations: competence and integrity. We will define these two violations and propose that time violations be included in the trust violation literature. The reason for distinguishing different types of violations is because different violations break different rules of conduct, threaten different needs, and lead to different types of offence taken (Ren & Gray, 2009), and are therefore repaired differently. These differences will briefly be described as we describe each type of violation and further detail the different responses used to repair the violations.

Competence. In the trust violation literature, competence-based trust has been defined as the trustor's perception that the trustee possesses the technical and interpersonal skills required for a job (Kim et al., 2004; Butler & Cantrell, 1984). Violations of this type include clerical errors, inadequate performance, and not following processes. Our data set includes these and other various types of competence violations. This adds breadth to the current literature because previous empirical research in this field has only looked at one type of violation in a lab study: incorrectly filing a tax return (Kim et al., 2004, 2006; Ferrin et al., 2007). By looking at a variety of different competence violations, we have been able to more effectively observe what can repair relationships when this type of violation occurs.

Integrity. Integrity-based trust, on the other hand, is defined as the trustor's perception that the trustee adheres to a set of principles that the trustor finds acceptable (Mayer et al., 1995; Kim et al., 2004). Once again, previous empirical research in this field has only looked at one type of violation: incorrectly filing a tax return (Kim et al., 2004, 2006; Ferrin et al., 2007). Violations of this type include lying, stealing, talking too long at the water cooler, and taking credit for work not performed.

Time. Kim et al. (2006) stated that many violations of trust may be ambiguous enough to be framed multiple ways and that this opportunity to frame violations differently receives very little attention. We propose that a new type of violation should be added to the literature: time violations. Time violations are those violations that involve being late to work or meeting, missing work or meeting, or causing scheduling conflicts or problems, such as leaving work early. Time violations could be considered integrity violations because when an employee causes a time violation, that employee breaks a set of principles that the trustor finds acceptable, causing the trustor to view the employee as not acting in a fair manner; time-related violations can either be the breaking of a promise or contractual obligation.

But there are two main reasons why time violations should be considered separately from integrity violations. First, our data set shows that time violations are extremely common. We asked a variety of employees to describe a situation in which they had to explain themselves, thus leaving it open for the trustee to talk about any type of violation. As such, 426 employees out of 508 who completed the survey wrote about a trust violation, and 167 of those trust violations were time violations (40%). We posit that the reason why time violations are so common is because, not only do they occur frequently, but they are easily remembered. If they are easily remembered, time violations may not be easily forgotten or forgiven. The second reason why time violations should be considered separately is because common logic says that time violations should be repaired differently than normal integrity violations. For example, if an employee were to come to work 15 minutes late and pass the

manager's office, which had a large clock hanging on the wall, the employee probably would not deny the violation if the manager asked why the employee was late because the employee would then be seen as a liar.

Thus time violations appear to be a hybrid violation type because they contain elements of both competence and integrity violations. Being late for work could be more of an issue of competence because someone did not properly plan for traffic conditions and left for work too late, or it could be more of an integrity issue because someone did not care enough about being on time and putting in "an honest day's work."

Proposition 1: Time violations should be considered as a new type of trust violation.

Reproach. Once the violation has taken place, the second step in the relationship repair process is that the trustor recognizes the violation in the relationship by offering a reproach. A reproach occurs when the trustor expresses his or her negative reaction and draws the trustee's attention to the conflict. This involves labeling the offense; attributing responsibility for the harm; and voicing the grievance (Felstiner, Abel & Sarat, 1980-1981). A reproach allows for the trustor to signal that an offense has occurred and allows relationship repair to proceed (Ren & Gray, 2009). It is also necessary to note that there are some situations in which a reproach is not essential for relationship repair to proceed. For example, the trustee can approach the trustor, explain that a violation has taken place, and seek relationship repair before the trustor knows or acknowledges the violation. There are different types of reproaches that the trustor can use: no reproach, friendly reproach, direct reproach, and rude or hostile reproach.

Accounts

An account is a common approach to repair a relationship. Previous research has indicated that accounts can have the following influences: first, they alter the negative consequences produced by the violation and show they show the trustor that the violation does not reflect the trustee's true nature (Dirks et al., 2009); second, they remove negative impressions, feelings, severe sanctions, aggression, and hostility (Ren & Gray, 2009; Braaten, Cody, & DeTienne, 1993); third, they allow the trustee to avoid blame, penalties, conflict, and negative evaluations and attributions (Bobocel & Ferrell, 1996; Snyder, Higgins, & Stucky, 1983); and fourth, they have been proven to raise the perceived trustworthiness of the trustee following the violation (Kim et al., 2004).

Research in the trust literature has provided research on such accounts as apologies, denials, and reticence (Ferrin et al., 2007; Dirks et al., 2006; Dirks et al., 2004). We seek to add to this literature by adding two other accounts, which have also been researched in different types of literature. These accounts are excuses and justifications. Descriptions of all five of these types of accounts will follow.

Apology. An apology, also known as a concession, is a statement used to fix a violation through acknowledging responsibility and regret for a violation (Tomlinson & Mayer, 2009; Ferrin et al., 2007, Kim et al., 2004; Tedeschi & Norman, 1985; Schonbach, 1980; Goffman 1971). Apologies are unique because in using them the trustee takes ownership for the violation, signals that the violation is not an accurate reflection of the trustee's identity, and conveys a sincere intent to avoid such violations in the future (Ren & Gray, 2009; Ferrin et al., 2007, Kim et al., 2004; Lewicki & Bunker, 1996; Ohbuchi et al., 1989; Schlenker, 1980; Goffman, 1967; Heider, 1958). Kim et al. (2004) then hypothesized and their research supported that when trust violations concern matters of competence, trustors will exhibit more positive trusting beliefs in the trustee if that party responds with an apology than a denial. We test this in a real work setting and with added account types.

Hypothesis 1: When a competence-based trust violation occurs, apologies, more than any other type of account, will do best at repairing relationships through reducing negative affect and restoring positive exchange.

Denial. A denial, also known as a refusal, is a statement that is used in attempt to restore a relationship following a violation by explicitly declaring the allegation to be untrue (Ferrin et al., 2007; Braaten et al., 1993). The purpose of a denial is to assert that the trustee's ability, benevolence, and integrity are intact and should not be impugned, and is accomplished by showing that the trustee was not the perpetrator and therefore should not be held accountable, and may possibly attempt to shift the blame elsewhere.

Reticence. Reticence was introduced into the trust literature by Ferrin et al. in 2007 to compare its effectiveness against apologies and denials when a trust violation occurs. Ferrin et al. (2007) defined reticence as a response to a trust violation in which the accused party explains that he or she cannot or will not confirm or disconfirm the veracity of an allegation. A common example of reticence is when the trustee remains silent in response to allegations. The purpose of reticence is to let culpability remain uncertain, avoid implicating an ally, protect sensitive, personal, or confidential information, and further keep from implicating oneself (Ferrin et al., 2007).

Reticence is different from apologies and accounts because it does not admit or deny guilt, but instead asks the trustor to withhold judgment (Ferrin et al., 2007). Reticence is difficult to strategically use because it has been shown to be less effective in restoring relationships compared to apologies and denials when either competence or integrity violations occur. When considering whether reticence will repair a time violation, we posit that reticence will work just the same as during a competence violation because the trustee does not acknowledge guilt and show remorse. Therefore, we hypothesize the following:

Hypothesis 2: When a trust violation occurs, reticence will not do any better at repairing relationships through reducing negative affect and restoring positive exchange than any other type of account.

Excuse. An excuse is a statement used in attempt to fix a violation by mitigating or relieving responsibility when conduct is questioned (Kim et al., 2006; Scott & Lyman, 1968). In other words, excuses acknowledge participation in an act that was problematic or wrong but allow the trustee to reject responsibility based on the influence of situational factors partially or wholly beyond control, thus attempting to annul culpability (Braaten et al., 1993). Excuses are similar to apologies in that they acknowledge that a violation takes place, but differ because in using an excuse, the trustee, doesn't show regret or show intentions to avoid the violation again. They are also similar to denials in that they deny full responsibility, but differ because they show that the trustee played a part in the violation. For these reasons, we feel that excuses will be less effective than apologies in repairing relationship when a competence violation occurs and less effective than denials for integrity violations. On the other hand, we posit that excuses are designed to repair relationships in the presence of time violations because they do not deny that the violation has taken place, but they give a reason why the trustee was not responsible for the violation. Therefore, we hypothesize the following:

Hypothesis 3: When a time-based trust violation occurs, excuses, more than any other type of account, will be most effective at repairing relationships through reducing negative affect and restoring positive exchange.

Justification. A justification is a statement used by a trustee to fix a violation by acknowledging responsibility for the act in question, but denies the pejorative quality associated with it (Kim et al., 2006; McGraw, 1998; Scott & Lyman, 1968). The purpose of a justification is to allow the trustee to validate the perceived breach by its acceptable nature within a particular context (DeTienne et al., 2008). This can be done in a number of different ways including denial of injury, condemnation of the condemners, and appeal to loyalties (DeTienne et al., 2008). Justifications act similarly to excuses as compared to apologies and denials in the presence of competence and integrity violations; therefore, we hypothesize similarly. Before we do, it is important to note that we think that justifications will not be effective as excuses in the presence of time violations because justifications admit a sense of responsibility for the violation and trustors are unlikely to approve being late or going home early on purpose.

Hypothesis 4: When a time-based trust violation occurs, justifications will be effective, but less effective than excuses, at repairing relationships through reducing negative affect and restoring positive exchange.

We feel that the contribution of excuses and justifications to the literature is a significant contribution because they appear to be the most common approach that trustees use to repair relationships. In fact, there were 415 employees out of the 426 trust violations that used an account. Of those 415, 122 (29.4%) used an excuse and 148 (35.7%) used a justification. So combined, over 65% of the accounts used we either excuses or justifications, both of which were previously not included in the literature.

Evaluation

Following the trustee's account, the trustor closes the relationship repair process by evaluating the account to decide whether to accept the account, extend forgiveness, and revise his or her negative impression of the offender. The evaluation of the trustor can take many different forms including honoring, retreat, retraining, reprimand, and rejection. Our research looks specifically at whether or not accounts were honored or not honored.

Honoring is the highest form of evaluation. It means that the trustor has accepted the account and signals to the trustee that he or she has reduced the negative affect and restored positive exchange to a greater degree than what it was following the violation. In other words, honoring is a signal that the relationship has been improved and repaired to a certain degree. Honoring is the first step towards full and complete trust after a violation because it shows that the trustor has positive intentions to trust the employee in the future (Dirks et al., 2009).

Not honoring can take several forms. First, retreating is when the trustor either withdraws the original objection, makes excuses for the trustee's offensive behavior, or merely accepts the account. Second, retraining entails acknowledging that a violation has been caused, but extending forgiveness for such things as lack of experience. Third, reprimanding is recognition by the trustor of the full consequences of the violation. Fourth, rejecting is a refusal to honor the account in any way.

METHODS

A two-part questionnaire was completed by 508 employees of a large financial institution. The average respondent worked at the institution 4 years, 20% for more than 10 years, 18% for 1 year or less. There was a variety of over 14 ethnicities, of which 25.4% were Caucasian, 23.0% were Hispanic, 23.0% were Filipino, and 14.0% were African-American. Of the sample 38% were male.

The first section of the questionnaire asked the participants to recall any specific event that required them to explain themselves to other organizational members. Participants were asked to answer four open-ended questions about the event:

1. What happened that made someone ask you to explain yourself? (Or, if you weren't asked to explain, you felt a need to explain yourself? missed meeting? clerical error? missed opportunity? failed responsibility? Etc.).
2. Were you asked to explain, or did you give an explanation without being asked? We also want to know if the other person was polite or impolite, even rude. Try to write both what you said in the other person said and how the person said it.
3. In the space below, please write out what you said to the other person(s). Try to recall exactly what you said and did and how it was said.
4. In the space below, please write what the other person said to you after you offered your explanation.

Part 2 of the questionnaire asked a series of closed-ended questions concerning the nature of the trustor-trustee relationship (status level of the trustor, whether the relationship was typically a friendly one), and the trustee's perceptions and reactions (whether the account-giver felt guilty, responsible, angry, whether the account-giver felt satisfied with the outcome, expressed stress because of the event, and desired to complain to another member of the organization). The final set of questions asked participants to indicate how long they worked for the organization, how long ago the recalled event occurred, and whether they considered the recalled event a significant or an unimportant event in their employment at the institution.

Two coders each read half of the open-ended sections of the questionnaires and coded for violation type, reproach type, account type, and evaluation. After which, 93 surveys were found to be unusable resulting in 425 usable surveys.

When coding for the violation type, coders found 164 examples of competence violations, 112 examples of integrity violations, and 139 examples of time violations. Two coders independently read and coded all cases

and then met intermittently in the coding process to discuss and compare the coding of these two variables and disputes were resolved through negotiation.

Four types of reproach types were coded. Five general types of accounts were coded. Evaluations of accounts were originally coded as either honored (N = 137) and not honored (N = 262). The coders of the account episodes read 10% of the cases and coded them for types of reproaches, accounts, and evaluations. Cohen's kappas were .82 (reproach form), .82 (accounts), and .77 (evaluations). The remaining cases were equally distributed to the two coders who independently coded the account episodes. Four meetings were held to discuss and compare the coding of the account episodes and disputes were resolved through negotiation.

RESULTS AND DISCUSSION

PROBIT binomial regression on Stata 10 was applied to test the hypotheses. The evaluation variable (honored or not honored) was used as the independent variable and the main dependent variable was the five different types of accounts. Other variables, such as gender, status, friendliness, duration of employment, and reproach were controlled for in these regressions.

We were able to use regressions to evaluate competence, time, and integrity violations. For each of these, we ran regressions on six different models: one for each of the different account types and then a combined model with all of the accounts. Results supported the proposition that time violations should be considered as a new type of violation. Hypotheses 1 and 2 were supported. Hypotheses 3 and 4 were not supported.

We examined the effectiveness of multiple types of accounts in repairing relationships that were broken by a variety of violations in a field setting. Our results add to the accounts and trust literature in four ways.

First, these results confirm the findings of Kim et al. (2004) that apologies work best for repairing relationships for competence violations in a field setting, such as performance errors, clerical errors, and missing or late work, rather than just an incorrect tax return. Second, our results build on the work of Kim and colleagues (2004) to explore the possibility that there are more ways to seek to repair a relationship than just three types of accounts (apologies, denials, and reticence). This is especially significant because excuses and justifications combined (N=270) are used significantly more than the other three types of violations combined (N=145).

Third, we present initial findings that time violations should be considered as a new and different type of trust violation. Based upon Kim et al.'s (2004) definition of integrity, time violations should fall under the umbrella of integrity violations; however, our data suggests that time violations may be considered as a new type of trust violation. There are three main reasons for this. First, time violations are extremely common in our data set and seem to be a major cause of damaged relationships in the work place. In fact, out of 415 trust violations, 33.5% were time violations, as compared to 39.5% competence violations and 27.0% integrity violations. Second, the results show that damaged relationships caused by time violations are not likely to be repaired with an account. Third, variables that were significant for time violations was not identical to the variables that were significant for either competence or time and integrity violations. Our analysis shows that whether or not a relationship is repaired in the presence of a time violation is determined more by the relationship between the two parties than the type of account given.

Fourth, this study answers previous researchers' calls (Kim et al. 2004) for accounts research in a field setting. By doing this we were able to analyze different demographic information that played a role in relationship repair. We found that gender, status, tenure, friendliness, and reproach all play a role in relationship repair. Interestingly, for certain violations some variables played a significant influence, but then for other types of violations, they don't play a significant role.

These findings point to a couple of different areas of organizational and managerial implication. First, these results provide a framework for repairing the relationship amongst employees, employers, and potentially amongst coworkers when a violation occurs. This is important because when a violation occurs, the overall trust and effectiveness of a business unit decreases. If employees can become aware of what they can do to repair relationships when a violation occurs, then hopefully the overall trust and effectiveness can be restored as well.

But even if that original level of trust and effectiveness is not reached, at least the level of trust and effectiveness can reach a higher level than when the violation occurred. It is also apparent that there are certain accounts that employees can give that can actually lower the overall trust and effectiveness even after a violation has occurred. It would be wise to train employees to not use certain accounts for certain types of violations (i.e., justifications for integrity violations). The knowledge that there are accounts that are more effective for certain types of violations, and that there are accounts that are less effective for certain types of violations, if used appropriately, should improve the interpersonal relationships, increase the trust, and enhance the overall effectiveness of a department, division, and/or organization.

Second, these results show that employers and coworkers need to be aware of their own personal dispositions towards others in order to avoid perceptions of procedural injustice. These dispositions include how friendly they are, how one comes across when rebuking, and how they respond to people who match or do not match their gender, who are of lower or equal status, or who have worked at the company for a long or short time. For example, the results showed that friendliness was a control variable that was significant in predicting whether or not the relationship would be repaired for two of the three types of violations. This shows that the disposition for being friendly to employees may enable trust to stay at an overall higher level even when a violation occurs. This is similar to the effect that the type of reproach has on whether or not the account is honored. It seems to be that the more severe a reproach, the less likely the employer is to allow the relationship to be repaired.

Severe reproaches may also reflect poor manager-worker relations, poor training in supervisory skills, or reflect a goal of the manager to create an intimidating style of management (Braaten et al., 1993). So if employers could learn to control their reproaches, the level of trust in their department or division is likely to be higher. Also, the results showed that certain gender similarities/differences effect whether or not an account is honored. If the gender is the same for the trustor and trustee when a time violation occurs, the relationship is less likely to be repaired. Also, it is likely that if managers became more aware of their disposition to accept or reject accounts based upon gender relationships, they would have greater ability to keep the level of trust in their sphere of responsibility at a higher level.

Likewise, managers need to be careful to treat all employees the same and not give preferential treatment to employees who have worked longer at the company or who are similar in status to the manager (account receiver). In all, by making employers and coworkers more aware of their dispositions and biases, we are confident that more relationships can be repaired when a violation occurs and that the overall trust level of an organization will increase.

Future research should examine the ways in which cultural differences impact trust violations and the most effective ways to repair these breaches in cross-cultural settings.

CAPITAL STRUCTURE DECISIONS OF TURKISH MANUFACTURING FIRMS

Burcu Dincergok
Atılım University, Turkey

ABSTRACT

In this study the effect of firm specific factors and macro economic factors on capital structure decisions of Turkish manufacturing firms are analyzed. Using panel data analysis I analysed 79 manufacturing firms which are traded on the İstanbul Stock Exchange over 2000-2007 period. My results shows that, profitability and risk have negative impact on all of the debt ratios. Tangibility, interest rates and Euro volatility have negative impact; growth opportunities, firm size, banking sector development, government debt and dolar volatility have positive impact on short term total debt ratios. Tangibility has a positive impact on long term debt ratio. Stock market development has negative and tax has positive effect on short term debt ratio.

INTRODUCTION

Capital structure is one of the most important issues in finance because capital structure decisions effects cost of capital, capital budgeting decisions and firm value. Theoretical literature has developed alot after the work of Modigliani- Miller (1958) which states capital structure is irrelevant to firm value. These studies generally aims to bring capital structure theories assumptions to a more realistic world and tries to explain capital structure decisions of firms, tries to find if there is an optimal capital structure and if there is how can firms have that type of structure. Academicians developed many theories and models to find the answer. Trade off theory states that in order to have an optimal capital structure firms have to balance the costs (bankruptcy and agency costs) of debt with the benefits (tax benefits) of debt. Pecking Order theory generally seem as a competitor of Trade off theory and according to Myers (1984) and Myers and Majluf (1984) capital structure is designed to minimize the inefficiencies in the firm investment decisions. Due to asymmetric information costs, firms prefer internal finance to external finance and when outside financing is necessary, firms prefer debt to equity because of the lower information costs. According to pecking order theory there is no optimal capital structure, because debt ratio occurs as a result of cumulative external financing requirements. According to Ross (1977) and Leland and Pyle (1977) who are the founders of Signalling theory, firm value and debt ratios are positively related. The logic behind this idea is; because of the asymmetric information problems, if the firm is undervalued, firm management can increase the share prices by increasing debt. Debt forces firms to make fixed payments and when a firm increases its debt ratio, investors think that this firm expects more future cash flows. Agency theory is another theory which based on two types of conflicts. Conflicts between managers and shareholders and conflicts between creditors and shareholders. According to Jensen and Meckling (1976) optimal capital structure occurs in the point on which agency costs of debt and benefits of debt are balanced.

Lots of empirical studies have been made in order to determine the factors that effect capital structure. Most of them made to analyze the capital structure of developed countries firms and again most of them is only interested in firm specific factors. There were some comparative studies which compares the determinants of capital structure in developed and developing countries and also within developed countries. These studies had been made long time ago. The same problem exists in Turkey. My aim is to analyze two types of determinants; firm specific and macroeconomic together in one of the developing countries.

I analyzed 79 firms and made 632 observations using the manufacturing firms that are quoted on İstanbul Stock Exchange over 2000-2007 time period using panel data analysis. Following part is literature review, third part explain the relationship between factors and leverage ratios. Fourth part belongs to data and methodology and the last part consists of results.

LITERATURE REVIEW

Huge amount of empirical studies have been made on the determinants of capital structure. Most of them took place in United States. Other studies were generally made in order to determine whether the determinants that effect capital structure in United States effects the capital structure of other countries.

Titman and Wessels (1988) analyzed the effects of profitability, size, uniqueness, industry classification, volatility, non debt tax shields and growth opportunities on leverage on United States manufacturing firms. They couldn't find any supportive proof for tangibility, growth opportunities, non debt tax shields, volatility and leverage relationship but found a strong negative relationship between market value leverage and profitability. For size variable they found that smaller firms short term debt ratio is greater and firm size and book value leverages are inversely related. Debt levels are negatively related to the uniqueness factor. Rajan and Zingales (1995) analyzed the capital structure decisions of G-7 countries (United States, Japan, United Kingdom, Germany, France, Italy and Canada). The aim of the study is to investigate whether the determinants that effect capital structure choices in United States are relevant in another developed countries. Taking in to account the institutional differences they found positive relationship between tangibility and leverage ratios , and found negative relationship between market to book ratio and leverage ratios. Profitability and leverage is negatively related for all countries except Germany and France and again except for Germany size and leverage are positively related. Demirgüç-Kunt and Maksimović (1995) analyzed the effects of stock market development on firms financing choices using data from thirty developed and developing countries, as a result they found that initial improvements of stock markets increases debt ratios, but in already developed stock markets further development results in firms using equity instead of debt. Banking sector development generally have a positive relationship with debt- equity ratios and generally stock market development have an insignificant but negative relationship with debt-equity ratios. Real GDP growth and inflation have a significant negative impact on total debt ratios and short- term debt ratios. Booth et al. (2001) analyzed the determinants of capital structure across ten developing countries, namely; Brazil, India, Jordan, South Korea, Malaysia, Mexico, Pakistan, Thailand, Turkey and Zimbabwe. They found negative relationship between tangibility and total debt ratios especially for Brazil, India, Pakistan and Turkey but the relationship was positive when they used long term debt ratio. Profitability has a strong negative relationship with leverage. Market to Book ratio (Growth opportunities) sign is generally positive but for market long term ratios the relationship is negative. But they couldn't use this ratio for some of the countries including Turkey. Risk has negative relationship with leverage in Brazil, South Korea, Pakistan, Thailand, Turkey and Zimbabwe but has positive relationship for Mexico, India, Jordan and Malaysia. Generally tax rates is negatively related with leverage. They also denoted that there could be significant institutional differences affecting the importance of independent variables. Deesomsak et al. (2004) investigated the relationship for Thailand, Malaysia, Singapore, Australia. They found that the relationship between tangibility and leverage is statistically insignificant except for Australia. In Australia there is a positive relationship. Profitability and leverage is negatively related in Thailand, Singapore, Australia but again they are not statistically significant. All of the countries except Australia have negative relationship between growth opportunities and leverage ratios. Firm size is positively related to leverage. Again firm risk is not statistically significant in all of the countries. But non debt tax shields has a strong negative impact on leverage ratios. Huang and Song (2005) found that for Chinese firms tangibility and firm size positively effects leverage ratios. Profitability, future growth opportunities and non debt tax shields have significant negative effect on leverage ratios, firm risk has also have a negative impact but it is not statistically significant.

In Turkey Gonenc and Aslan (2003), Guney, Ozkan and Yalciner (2006) found the same relationship between tangibility and leverage ratios. For total debt ratio the sign of tangibility is negative but not statistically significant. Acaravci and Dogukanli (2004) who investigate only manufacturing firms and found tangibility is negatively related to short term debt ratio. Profitability found to have a negative relationship with leverage in all of the studies. For growth opportunities and firm size the results are not consistent. Gonenc and Aslan (2003) denoted growth opportunities and firm size had a negative relation with only short term leverage ratio. Acaravci

and Dogukanli (2004) found no significant results for growth opportunities. Guney, Ozkan and Yalciner (2006) found negative relationship for firm size, growth opportunities and all of the leverage ratios. According to Gonenc and Aslan (2003) firm risk is negatively related with short term debt ratio.

RELATIONSHIP BETWEEN FIRM SPECIFIC FACTORS, MACROECONOMIC FACTORS AND LEVERAGE RATIOS

Tangibility: General theoretical expectation of the relationship between tangibility and leverage is positive. According to pecking order theory when firms need external financing they would prefer whichever price is farthest away from managers' information. Pricing debt would be easier when tangible assets are pledged as collateral (Shleifer and Vishny, 1997). Myers (1984) stated that expected cost of financial stress is related to the value that would be lost when faced with difficulty. Tangible assets lose less value than intangible assets when faced with bankruptcy. As a result tradeoff theory expects a positive relationship. Acquiring debt would also reduce the agency costs of debt. One of the most important problems between shareholders and creditors is asset substitution problem which is a result of overinvestment. Shareholders have a tendency to make riskier investments when a firm is highly levered (Jensen and Meckling, 1976). In this case when the investment fails creditors would bear the result, but when it succeeds shareholders take all of the residual amount after the fixed payments to creditors. But according to the agency theory; negative relationship could also be expected. Debt can discipline managers and force them to make fixed payments, so if a company has more intangible assets than tangibles, it needs more debt to divert managers from investing in non-pecuniary items (Titman, 1988). In this study tangibility is defined as TANG: TANGIBLE ASSETS/TOTAL ASSETS.

Profitability: Tradeoff theory mentions that if profitability is low, expected costs of financial stress will rise. But if profitability is high, tax advantage of debt will be higher, as a result positive relationship between profitability and leverage ratios are expected (Fama, French 2002). Pecking order theory states that external financing requirements are determined by the difference between retained earnings and investments. So more profitable firms need less external financing; so less debt (Myers, 2001). Jensen (1986) from agency theory denoted that debt forces managers to use free cash flow to make fixed payments, so free cash flows couldn't be used for managers' personal expenditures. Again positive relationship is expected by agency theory. Signalling theory expects positive relationship because profitable firms can give the signals of their profitability by increasing their debt ratios (Haris, Raviv, 1991). Profitability is defined as PROF: EBITDA/TOTAL ASSETS

Growth Opportunities: Growth opportunities can not be used as collateral and in case of bankruptcy they lose more value than tangible assets (Haris and Raviv; 1990, Shleifer and Vishny, 1992; Alderson, Betker, 1996). Expected relationship by tradeoff theory is negative. Pecking order theory expects positive relationship because external financing needs will be higher when growth opportunities rise (Frank, Goyal, 2003). Since asset substitution problem rises with growth opportunities, it is expected that growth opportunities would negatively affect debt ratios. Signalling theory expects positive relationship because asymmetric information related to growth opportunities are high, so increasing debt will send signals about the realistic value of the firm (Megginson, 1997). Growth opportunities are represented by GROW: MARKET/BOOK ratio.

Firm Size: Pecking order theory and tradeoff theory expects positive relationship between size and leverage. Because large firms are generally more diversified than smaller ones, and this feature decreases their failure probability (Fama, Jones, 1979). Also when smaller firms face financial stress, the probability of liquidation is higher than larger firms (Güney, Özkan, Yalçiner, 2006). But since asymmetric information is fewer in larger firms negative relationship can also be expected by the theories that are based on asymmetric information (Rajan, Zingales, 1995). Agency problem between creditors and shareholders can be reduced by monitoring and bonding activities but these costs are higher for larger firms and since agency cost of equity is higher for smaller firms. Agency theory expects negative relationship. SIZE: NATURAL LOGARITHM OF SALES (2000 prices) is used as a Proxy of firm size.

Firm Risk: According to tradeoff theory, when volatility of earnings or market value of assets are high, firms should use less debt. Because when higher operating risk is combined with higher financing risk the

probability of bankruptcy will be higher (Myers, 1984). Complicated version of pecking order theory states that if a firm doesn't want to pass up profitable projects in the future it should use less debt now. So there should be a negative relationship between leverage and firm risk (Fama, French, 2002). RISK: STANDARD DEVIATION OF EBIT/ AVERAGE TOTAL ASSETS is used as a Proxy of firm risk.

Nondebt Tax Shields: De Angelo and Masulis (1980) states that if a firm has significant non debt tax shields such as depreciation, amortization, research and development expenditures, investment tax credits etc, it will need less interest tax shield. Tradeoff theory expects negative relationship between nondebt tax shields and leverage but, this expectation can change if marginal tax rate expected from interest tax shield is higher. Some advocates of agency theory assumes that if a firm get huge benefits from investment tax credits, it means it has large amount of tangible assets and high profit, in this case positive relationship will be expected (Mackie-Mason, 1990). Non debt tax shields are represented as NTS: DEPRECIATION AND AMORTIZATION/ TOTAL ASSETS.

Tax Rates: Since interest payments are tax deductible, tradeoff theory expects positive relationship between corporate tax rate and debt ratios. But of course this expectation can be valid if firm will have positive earnings before taxes and interest. TAX: TAX RATES is a proxy of tax rates.

Stock Market Development: Stock markets provide information about firms and this makes giving loans less risky for creditors. Also in liquid stock markets there are more incentives to inform investors and this makes monitoring of firms easier (Wanzenried, 2002). Stock market development helps the firms to find long term financing and increases the number of accepted investment projects. Demirgüç-Kunt and Maksimovič (1995) found that initial improvements of stock markets increases debt ratios, but in already developed stock markets further development results in firms using equity instead of debt. Since Turkish stock market is a developing one, my expectation is to find positive relationship between stock market development and leverage ratios. Stock market development is represented as TRNO: TOTAL TRADING VOLUME/MARKET CAPITALIZATION

Real GDP Growth: Economic development would effect growth of firms, because it will cause to an increase in investments. Since these investments have to be financed, positive relationship may be expected between leverage and GDP growth. But finance theory suggests to finance growth with equity (Demirgüç-Kunt and Maksimovič, 1995). So negative relationship can also persist. RGDP: REAL GDP GROWTH RATE

Banking Sector Development: In developing countries financial intermediation is generally held by banking sector, because stock and bond markets do not developed as in developed countries. So banking sector development has a direct impact on capital structures of firms. Positive relationship is expected between banking sector development and leverage ratios. BSD: BANKING CLAIMS ON PRIVATE SECTOR/GDP is the proxy of banking sector development.

Government Debt: An increase in government debt is expected to decrease the amount of credits provided by banks to firms. Especially this effect which is known as crowding out, generally persist in developing countries. Other effect of a rise in government debt that it would also cause an increase in interest rates. As a result negative relationship is expected between government debt and leverage ratios. GOVD: BANKING TOTAL CLAIMS ON GOVERNMENT/GDP

Interest Rates: Interest rates has a direct effect on the cost of debt. An increase in interest rates will increase the cost of capital and it can also decrease firms credit ratings because it reduces the collaterals value and reduces final demand of firms. A negative relationship is expected (Bernanke, Gertler, 1995). Interest rates are real interest rates that are calculated by Fisher's Formula. INT: Real deposit interest rates is the Proxy of interest rates .

Exchange Rate Volatility: Reduction in value of national currency has two different effects (Bleakley, Cowan, 2002). If revenues of a firm are stated in foreign exchange and costs are in national

currency, a rise in exchange rate can increase the profitability of investments and firms debt ratio. But it can also increase firms debt if the debts are in foreign currency, this would deteriorate the balance sheets. This would result with a ease in debt ratios (Aghion, Bachetta, Banerjee, 2000, Bleakley, Cowan, 2002). Volatility of exchange rates are represented by VOL 1: STANDART DEVIATION OF EURO , VOL2: STANDART DEVIATION OF DOLLAR.

DATA AND METHODOLOGY

The variables explained in the previous section were analyzed over the 2000 through 2007 time period. The sources of firm specific is Datastream. International Financial Statistics Data (IFS) and Euromonitor data were used for macroeconomic variables. 79 manufacturing firms that were quoted on İstanbul Stock Exchange were analyzed using panel data analysis, numbers of observation was 632. Panel data method was used because the observations in this study have two dimensions: cross section and time series dimension. In this study, fixed effects regression were used because data covers most of the publicly traded manufacturing firms that are quoted to İstanbul Stock Exchange.

3 types of leverage used in this analysis so 3 models were analysed:

Model 1: In this model; Leverage 1: Total Long Term Liabilities / Total Assets is used as dependent variable.

Model 2: In this model; Leverage 2: Total Current Liabilities / Total Assets is used as dependent variable.

Model 3: In this model; Leverage 3: Total Current Liabilities + Total Long Term Liabilities / Total Assets is used as dependent variable.

Model is specified below:

$$(1) L_{ait} = \beta_1 TANG_{it} + \beta_2 PROF_{it} + \beta_3 GROWTH_{it} + \beta_4 SIZE_{it} + \beta_5 RISK_{it} + \beta_6 NTS_{it} + \delta_7 INT_{it} + \delta_8 TRNO_{it} + \delta_9 BSD_{it} + \delta_{10} RGDP_{it} + \delta_{11} TAX_{it} + \delta_{12} GOVD_{it} + \delta_{13} VOL1_{it} + \delta_{13} VOL2_{it} + \varepsilon_{it}$$

a: 1, 2, 3 (Leverage 1, Leverage 2, Leverage 3)

i: 1, 2, 3, N number of firms

t: 1, 2, 3, T time.

THE RESULTS

Tangibility negatively effects both short term debt ratio and total debt ratio, but its impact on long term debt ratio is positive. This result is not consistent with what the tradeoff and pecking order theory expects, but it can be explained simply by matching principle. Myer's (1977) stated that in order to reduce underinvestment problem maturity of assets should be matched by the maturity of equities. Profitability has negative impact on all of the leverage ratios. This result is consistent with pecking order theory expectations, since profitability decreases external financing needs, there is a negative relationship between profitability and leverage ratios. Growth opportunities have positive impact on short term and total debt ratios, but the relationship is not statistically significant for long term debt ratio. This result is again consistent with what the pecking order theory expects. Growth opportunities increase the need of external financing and the first external financing method that is used by firms is acquiring debt. Firm size positively effects short term and total debt ratios. Pecking order theory and trade off theory expectations are valid. Because of diversification, probability of bankruptcy for large firms is low. Firm risk negatively effects short term and total debt ratios. As tradeoff theory suggests Turkish manufacturing firms don't have any tendency to add financing risk to their operating risk. Non debt tax shields has positive effect on total debt ratio. This is consistent with the expectations of agency theory which states; more depreciation can imply more tangible assets.

From macroeconomic variables interest rates have negative effect on all of the leverage ratios. Banking sector development has positive effects on leverage ratios as expected. Stock market development has no significant effect on total debt ratio but has negative effect on short term debt ratio. Turkish Stock Exchange is a developing stock Exchange, but interestingly it can be a substitute for short term debt. Real GDP growth has positive impact on all of the leverage ratios, economic growth causes to firm growths but this is generally financed with debt. Tax rates don't have any significant effect on total debt ratio but positive effect on short term debt ratio, which is an expected result by trade off theory. Government debt also interestingly have positive

impact on leverage ratios, which means crowding out effect doesn't exist in Turkey over the period studied. Euro volatility has negative effect but dolar volatility has positive impact on debt ratios. This result implies that the firms that are analyzed in this study has more foreign currency debt in Euro and has more foreign currency revenue in dolar on the average.

CONCLUSION

In this study my aim was to analyze firm specific factors and macro economic factors together in one of the developing countries, Turkey. Firm specific factors such as tangibility, profitability, firm size, growth opportunities, firm risk has significant effects on leverage ratios as suggested by different capital structure theories. From macroeconomic variables interest rates negatively effect leverage ratios. Banking sector development have positive impact on leverage ratios but stock market development has negative effect on short term debt ratios which means that they are substitutes to each other. Real GDP growth increases leverage ratios. Economic growth increases firms investment opportunities and they are generally financed with debt-especially short term- in Turkey. Interestingly government debt doesn't prevent banks to give loans to private sector. Tax rates don't have any significant effect on debt ratios except for positive effect on short term debt ratios. Euro and dolar volatility's opposite effects on capital structure can be explained by export and foreign currency debt composition of the firms that were used in the study. The effects of most of the factors (except for tangibility, profitability and interest rates) on long term debt found to be insignificant can be explained by firms tendency to use short term debt as long term debt.

PROBLEMS FACING SOUTH AFRICA IN THE ALLEVIATION OF POVERTY AND UNEMPLOYMENT

Ora Dippenaar
Tshwane University of Technology, South Africa

ABSTRACT

Nation states are keen to be perceived by the international community as leaders in the advancement of fundamental human rights. However, problems they encounter in the implementation thereof may annul the noble intentions that existed when those instruments were ratified. The international community, as represented by the United Nations, has recognised that the guarantees provided by first generation rights, unaccompanied by enforceable socio-economic rights, are not effective – especially in developing countries – in order to achieve global peace and economic advancement, as well as the important goal of the advancement of democratic values: For example, the right to vote cannot, in such countries, be equated with the provision of shelter, food, education, or employment. Against this background, this paper investigates the global standards set by the United Nations in order to alleviate poverty and unemployment, its ratification or accession by the South African government, including its management.

This paper asks whether the goals set by the international community, aimed at eradicating or alleviating poverty and unemployment could be achieved in South Africa. In response to this question, attention will be given to the state of unemployment in South Africa, as well as the progress made in order to alleviate poverty.

INTRODUCTION

Unemployment and poverty are linked and is a definite reality in South Africa. Addressing unemployment will reduce poverty, but the government alone does not have the necessary resources and infra structure. The government needs help from the international community and businesses. Although underemployment and unemployment are related, it is necessary to draw a clear distinction between the two. Underemployment has three manifestations. The first manifestation is where a person is working, but his qualifications are underutilised. Highly skilled workers are placed in low-wage jobs that do not require their skills, for example a qualified teacher works as cashier in a grocery store. Another manifestation of underemployment is workers who want to work a full work-week, are employed involuntary part-time workers. The last indicator of underemployment is overstaffing. Due to the global economic crisis the last mentioned form of underemployment is less common. Unemployment and underemployment go hand in hand. Many people are forced to choose underemployment because the alternative is worse. Under- and, especially unemployment, leads to poverty.

One definition of poverty is the shortage of common things such as food, clothing, shelter and safe drinking water, all of which determine our quality of life. It may also include the lack of access to opportunities, such as education and employment, which aid the escape from poverty and allow one to enjoy the respect of fellow citizens. In this regard, it should be mentioned that the protection and advancement of human dignity is a foundational value which the South African Constitution seeks to promote (Wikipedia, 2009).

The United Nations has, over a long period, addressed the issue of poverty alleviation. On 21 December 1993 the General Assembly proclaimed 1996 the International Year for the Eradication of Poverty. The eradication of poverty was one of three major themes of the World Summit for Social Development in Copenhagen. On 20 December 1995 the General Assembly proclaimed the first decade for the eradication of poverty (1997-2006) and appealed to donor countries to give greater priority to the eradication of poverty in their budgets. The main objective was to eradicate scornful poverty and to reduce overall poverty in the world through decisive national action and international cooperation. Their target was to reduce by one half, by 2015, the proportion of people living in extreme poverty (Ozmánczyk & Mango, 2003).

The Universal Declaration of Human Rights of 1948, the International Covenant on Economic, Social and Cultural Rights of 1966 and the United Nations Millennium Declaration, 2000 are set standards and goals, designed to alleviate global poverty. The South African Government has associated itself with these United Nations standards aimed at alleviating or eradicating poverty. This paper investigates the implementation by South Africa of these international law measures. A question that can be asked is to what extent the South African Government applies resources to reach international guidelines.

The discussion starts off with an overview of the international instruments that were initiated by the United Nations with the aim of alleviating poverty and unemployment. This is followed by a discussion of poverty and unemployment. Thereafter, the problems facing South Africa in alleviating poverty and unemployment is explored after which a conclusion will be given. This is a theoretical paper and literature study of the relevant concepts.

THE UNITED NATIONS

On 10 December 1948 the General Assembly of the United Nations adopted the Universal Declaration of Human Rights. This Declaration is not a legally binding instrument, but is important as authoritative guide and has considerable indirect legal effect (Brownlie & Goodwin-Gill, 2006). It has been convincingly argued that its principles have attained the status of customary international law (Patel & Watters, 1994). Some of the most important articles in the Universal Declaration of Human Rights regarding poverty alleviation and unemployment are:

Article 23:

- 1. Everyone has the right to work, to free choice of employment, to just and favourable conditions of work and protection against unemployment.*

Article 25:

- 1. Everyone has the right to a standard of living adequate for the health and wellbeing of social services and the right to security in the event of unemployment.*

Article 26:

- 1. Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages.*

On this view, the provision of work, adequate health care, food, clothing, shelter and basic education, are rights that “everyone” is entitled to.

The International Covenant on Economic, Social and Cultural Rights, 1966 came in force on 3 January 1976. Articles 6, 7 and 8 of this Covenant deal with rights of employees and trade unions (Brownlie & Goodwin-Gill, 348). In my view, the South African government (with pressure from workers unions) adheres to these articles, although it definitely was not the situation when this Covenant was ratified.

Article 6

The States Parties to this Covenant recognize the right to work, which includes the right of everyone to the opportunity to gain his living by work which he freely chooses

Article 11

- (1) *The States parties to the Covenant recognize the right of everyone to an adequate standard of living for himself and his family, including adequate food, clothing and housing, and to continuous improvement of living conditions. States Parties will take appropriate steps to ensure the realization of this right*
- (2) *States parties shall take measures, including specific programmes,*
 - (a) *To improve methods of production, conservation and distribution of food by making full use of technical and scientific knowledge*

The United Nations Millennium Declaration 2000 was adopted by 189 nations and signed by 147 heads of state and governments during the UN Millennium Summit in September 2000. The UN Millennium Declaration has eight goals, called Millennium Development Goals. The first goal it seeks to achieve is the eradication of extreme poverty and hunger (Brownlie, Goodwin-Gill, 237).

Section 12:

We resolve therefore to create an environment – at national and global levels alike – which is conducive to development and to the elimination of poverty.

Section 19:

We resolve further:

- *To halve, by the year 2015, the proportion of the world's people whose income is less than one dollar a day and the proportion of people who suffer from hunger and, by the same date, to halve the proportion of people who are unable to reach or afford safe drinking water.*
- *To ensure that, by the same date, children everywhere will be able to complete a full course of primary schooling and that girls and boys will have equal access to all levels of education.*
- *By the same date to have reduced maternal mortality by three quarters, and under-five child mortality by two thirds, of their current rates.*
- *To have, by then, halted, and begun to reverse, the spread of HIV/AIDS, the scourge of malaria and other major diseases that afflict humanity.*
- *To provide special assistance to children orphaned by HIV/AIDS.*
- *By 2020, to have achieved a significant improvement in the lives of at least 100 million slum dwellers.*

South Africa and the Millennium 2000

For South Africa, the achievement of the Millennium Development Goal of halving the number of people living in poverty by 2015, will be a long term project. It is important to be realistic about what can and what cannot be done. In other words, the issue is what is feasible from a pragmatic point of view. Many projects have been adopted by the South African government with a loud fanfare, despite indications that they could not meet their envisaged goals. In a frank assessment of how government has gone wrong in trying to bring marginalised people into formal economy, the Development Bank of Southern Africa concludes as follows (Frye, 2006):

- a) There has been a failure to disaggregate and quantify what the nature of the problems are that we are dealing with and to appreciate that the poor and marginalised are not one homogenous group, but require many different types of interventions and programmes
- b) There has been a disregard and neglect for people's existing skills and knowledge
- c) There has been a lack of proper consultation to understand what the real constraints are facing people struggling to move out of poverty
- d) There has been a failure of our government to learn from past lessons

POVERTY

Measuring poverty

Absolute poverty refers to a set standard which is consistent over time and between countries. An example of an absolute measurement would be the percentage of the population eating less food than is required to sustain the human body (approximately 2000-2500 calories per day for an adult male). The World Bank defines extreme poverty as living on less than US \$1 per person per day and moderate or relative poverty as less than \$2 a day (Frye, 2006).

Global poverty

The costs of global poverty are multiple, for example, poor countries do not have sufficient resources to detect, treat and prevent the spread of deadly diseases. According to the World Health Organization, low- and middle-income countries suffer 90 percent of the world's disease burden. Poor countries are not at means to protect important forests and watersheds, either because of poverty, or the inability of governments to effectively enforce the law. As a result, criminal activities often flourish in such countries. In short, poverty concerns the rest of the world. The United States committed itself to establish an effective global health infrastructure by 2020 (Obama, 2007).

Poverty in South Africa

It is common knowledge in South Africa that a substantial percentage of the South African population between ages 30 and 40 dies of HIV/AIDS, leaving their children behind. It is not uncommon to find children raising their younger siblings. These families live in extreme poverty and the older children work or beg in order to take care of their family. The elderly also often lives in poverty. Improved medical science gave rise to a higher life expectancy and older people often have to rely on old age pension to survive, which is simply not sufficient. In many instances the children of old people died of HIV/AIDS and their parents are left behind with no one to take care of them. More than 15 years after the end of apartheid, nearly half of South Africa's population continue to live in poverty (Luyt, 2008).

According to Makiwane, chief executive of South African Social Security Agency, social aid is one of our government's main poverty alleviation programmes. South Africa's social grants target the elderly, disabled people and children. Over 6.2 million South African children currently benefit from social grants. Child support grants have been extended to 1.9 million children under 11 years and more or less 1.2 million children between 11 and 14. He continues to report that before any child may benefit from social grants, the South African Social Security Agency must ensure that the beneficiaries are indeed attending school (SA's social security agency, 2009).

However, Archbishop Ndungane of Cape Town claims he met communities affected by poverty across the country and that South Africa is in "a state of emergency". He claims that never before in the history of South Africa have so many people said "we have no food". He challenged government ministers to go from village to village with him (Ndungane, 2009).

Problems facing the South African Government

The government has been losing an estimated R1.5 billion per year to fraud, committed through social grants. Paypoints are frequently robbed and a substantial number of staff members in social welfare departments are involved in fraud and corruption. There have been claims that clerks refuse to process applications unless money is included with the prescribed form; and bribes have been demanded as a precondition for appointments. Pensioners often travel long distances to pay points, only to find that no money is available, without any reasons being given. Government social grants are inadequate in the face of the high cost of living - especially food and paraffin. More often than not, people that are frustrated with their lack of prospects, resort to stealing (SA's social security agency, 2009).

Mthethwa (2009) reports the South African government's land reform programme is failing miserably, and as a result, South Africa's food supply is seriously threatened. Thousands of once-productive farms now lie abandoned and South Africa is forced to import more and more food. Food prices soar as there is

restricted supply and increasing demand. Despite this, Mthethwa argues, the South African government still refuses to admit that the land reform programme is failing.

Public hospitals in South Africa lack enough workers, medical equipment, ambulances, linen and medicine to provide proper care to the poor. Doctors cancel surgery because they lack sterile towels and sheets. Equipment is not replaced when it breaks. Hospital wards and bathrooms are filthy (Swarns, 2009). Hospital nurses are of the lowest paid professionals in South Africa and hospitals as a consequence are forced to employ unqualified and unmotivated nurses.

A major obstacle to poverty alleviation in South Africa is poor governance, which includes corruption as well as poor performance by government officials in their management of public resources. It seems as if there is a lack to act against underperforming officials. The poor management of public resources results in poor public service delivery implementation and undermines poverty alleviation policies. The governance of most provincial and local governments is without any consideration of public resources. The government at all levels, but especially provincial and local governments must be held accountable for efficient planning, budgeting and implementing policies relating to economic and social rights, especially poverty alleviation (Luyt, 2008).

The Pretoria News reported that The Tshwane Metro Council (previously known as Pretoria) and the Gauteng department of housing have both failed to reach their Reconstruction and Development Programme (RDP) housing targets for 2008/2009. This failure increases the waiting list which already stands at 89 5000 applicants. The Gauteng Department of Housing built only 7 410 from the target of 20 724 houses in the 2008/2009 financial year (Magome, 2009).

Poverty has many dimensions and causes and different actions are needed at different levels to significantly reduce poverty. Good governance alone will not end poverty, but we also cannot reduce poverty without good governance at all levels, from global to the local governance (Luyt, 2008).

The South African government is the sole shareholder of The South African Airways (SAA). The SAA has suffered enormous losses during the last couple of years and the South African government bailed them out with billions of rand. It is reported that for the 2009/2010 tax year, the SAA requested more than R5 billion from the government (Business Day, 2009).

Approval amongst all South Africans of the way the government handles the economy declined from 71 % in 2006 to 34 % in 2008. Less than half of all South Africans (down from two-thirds in 2004) believe they can trust the country's leaders to take appropriate decisions (Boye, 2008).

UNEMPLOYMENT

Global unemployment

According to the International Labour Office 2009 annual Global Employment Trends Report (GET), the global economic crisis is expected to lead to a dramatic increase in the number of people joining the ranks of the unemployed, the working poor and those in vulnerable employment (ILO, 2009).

On 30 January 2009 the Director General of the United Nations, Juan Somavia, warned that global unemployment will increase “dramatically” in 2009 as a consequence of the worldwide economic crisis. He warned that the number of unemployed worldwide this year could well be 30 to 50 million more than in 2007. This would mean a global unemployment rate of 6.5 % in the first scenario or 7.1 % in the second. According to Somavia, we are facing a global job crisis. Many governments are alive to its impact and are taking effective measures to avert it, but more decisive and coordinated international action is needed to avert a global social recession. The International Labour Organization (ILO) also predicted that the deteriorating global economy would result in more “working poor”, namely workers that earn less than \$2 per day (ILO, 2009).

Unemployment in South Africa

South Africa has a history of chronic unemployment. Social security in South Africa is based on European models developed after the Second World War, where unemployment was considered a short term predicament. South Africa's Unemployment Insurance Fund is available only to former employees and provides relief for a maximum of 6 months. The Unemployment Insurance Fund gives no relieve to the millions of chronically unemployed (Frye, 2006). Research done by the Development Bank of Southern Africa indicate that from 1995 to 2002 unemployment rates for people with a grade 12 certificate increased from 16 % to 32.3 %. However the unemployment rate for people with diplomas increased from 4.7 % to 14.6 % and for people with degrees from 2.4 % to 6.6 %. According to this research, the number of years one has spent in education does not increase your chance of finding employment, which questions the argument that so many people in South Africa are unemployed due to their low levels of education (Luyt, 2008).

The current overemphasis on capital-intensive methods of production contributes to high unemployment. For South Africa to achieve its sustainable development potential, it should consider a re-orientation of the economy. This would mean, for example, changing the labour market structure to one that specifically provides incentives for labour-absorbing modes of production. Public works could provide a short-term employment solution, but industrial policy should also aim to increase labour intensity through the withdrawal of subsidies that favoured capital-intensive or large-scale enterprises (Frye, 2006).

Problems facing the South African Government

A question writer asks is how much unemployment in South Africa is voluntary? Most statistics writer hereof studied indicates only the narrow definition of unemployment in other words people that actively seeks employment. Employment indicators showed that during September 2006 unemployment in terms of the broad definition was 37.3 % and unemployment in terms of the narrow definition 25.5 % (Global Poverty Research, 2005).

South African students show exceptionally low levels of literacy and numeracy. According to a research report of the 2003 round of the Trends in International Mathematics and Science Study, South African grade 8 students performed worse in the science and mathematics tests than every other country that participated and most young South Africans leave school with limited skills”(Frye, 2006). It seems as if the Department of Education is unable to resolve the issue. It is well known that the morale of teachers in South Africa is very low. They are overworked and confronted with rude, undisciplined scholars. When it comes to salaries, teachers in South Africa is at the bottom of the food chain with the result that most skilled people choose teaching only as a last resort.

Global policies to address unemployment

According to the ILO a huge labour potential worldwide remains untapped. They listed a few policy measures applied by some governments, namely (ILO, 2009):

- a) Wider coverage of unemployment benefits and insurance schemes, re-skilling redundant workers and protecting pensions from devastating declines in financial markets
- b) Public investment in infrastructure and housing, community infrastructure and green jobs
- c) Support to small and medium enterprises
- d) Social dialogue at enterprise, sectoral and national levels

Policies to address unemployment in South Africa

A few suggested policies for South Africa that are in line with international strategies are (Frye, 2006):

- a) The government should improve the poor level of teaching experienced by the majority of poor learners
- b) It is important to try to move employment opportunities closer to communities of unemployed people

- c) Innovative studies of the impact of current and recent trade agreements need to inform the development of new skills to meet the requirements as they develop
- d) Recognise that high levels of poverty act as a brake on addressing unemployment, as they effect domestic demand and especially demand for cheaper, locally produced goods and services. South Africa imports at a higher rate than it is exporting
- e) Expand the cover of social security. After all, adequate social security is a constitutional right

CONCLUSION

The paper investigated the South African Governments commitment and ability to address poverty alleviation and unemployment strategies in line with international standards.

The United Nations has made significant attempts at alleviating global poverty and unemployment. This is evidenced by the numerous Declarations and Conventions it proclaimed. South Africa has constitutionally entrenched the protection of socio-economic rights, which can be directly enforced in a court of law. However, the justiciability of socio-economic rights will not transform poverty and unemployment in South Africa. Poverty and unemployment can only be alleviated by the collective will of the people appointed by government to implement the values espoused by the South African Constitution. Having said that, one can only but concludes that corruption is one of the major problems obstructing South Africa in achieving its goal of alleviating these problems.

In addition, poverty and unemployment cannot be addressed successfully only by government. The international community and local as well as international businesses will have to redistribute resources to help address this problem successfully. The international community can help by means of sustainable partnerships between international businesses and South African links and local employment by foreign companies. Due to global poverty it is understandable that the international community feels charity begins at home and first must alleviate poverty in its own borders.

Local businesses can help to alleviate poverty and unemployment with social initiatives focusing on employees and the local community, training initiatives and by not reverting to retrenchment strategies as a first resort. Another option might be to return to labour intensive rather than capital intensive production. Local businesses and government should consider more partnerships in social upliftment schemes. Local businesses and non government organisations can also form more partnerships to initiate alleviating schemes.

CHINA'S ECONOMY: GROWTH, RECESSION AND THE STIMULUS PLAN

A. Noel Doherty and F. Victor Lu
St. John's University, New York, U. S. A.

ABSTRACT

This article reviews the factors responsible for China's extraordinary growth rate. The effect on China of the world's recession and the effectiveness of its stimulus package is also studied. Finally, consideration is given to R & D expenditure and technology on past and future Gross National Product (GNP).

INTRODUCTION

This study focuses on the underlying causes of China's extraordinary growth rate. The importance of exports and investment is explained. The effect of the current world recession and China's fiscal policy response to encourage growth and minimize unemployment is considered.

Since 1979, China has achieved and maintained an extraordinary high level of economic growth. From 1879 to 2008, China achieved a remarkable 27-year sustained average annual growth rate of 8.6% (See Table 1) for Gross National Product (GNP). There were only three years (1981, 1989 and 1990) when the growth rate fell below 7 percent.

The world's largest and highest GNP growth rates belong to Taiwan and South Korea, 8.3 percent and 9.5 percent, respectively, over a 40-year period (R. Kojima).

On a purchasing power parity (PPP) basis, China's GNP is second only to the United States, followed by Japan and Germany. But on a per capita basis, China does not even make the list of the top hundred.

GROWTH RATE CAUSAL FACTORS

There are many factors that contributed to the astonishing growth of China's GNP, not the least of which was the decision to switch from a centralized, command economy to a free market, profit-oriented economy. Three of the more important factors responsible for China's rapid growth are (1) achievement of a high export rate; (2) attracting foreign investment; and (3) a high domestic investment rate.

Exports

Table 2 shows that since 1996, China's exports increased fivefold while imports increased almost as much. China's trade surplus ranged from 12.2 billion and 44.3 billion dollars. In 2005, the trade surplus jumped to 102 billion dollars. The only other trading group to have achieved relatively consistent positive trade balances is the EU15 group. China is now referred to as the world's factory. China's largest export markets are U.S. (\$205 billion, 2005), EU15 (\$170 billion), Japan (\$102 billion) and other Asian countries (\$151 billion). Table 4 and Figure 2 depict the large source of investment trends for infrastructure and foreign investment available to China.

Imports

China is a heavy importer of fuels and metals. In 2005, China imported \$64 billion of fuel of which \$45 billion were for purchases in the Middle East. Iran, Angola and Saudi Arabia are the largest suppliers of oil to China. In 2000, China formed the China-Africa Development Fund (\$55 Billion) to support Chinese entrepreneurial

projects in Africa. Sixty percent of Sudan's oil output is imported by China. China's foreign policy is understandably influenced by its need for critical resources.

Table 3 list the data for exports, imports and balance of merchandise trade, and the services trade balance of the five largest economic entities: OECD, EU15, US, UK and China. Table 3A shows the astonishing growing trade imbalance between China and the U.S.

CHINA and the WTO

China became a member of the World Trade Organization (WTO) in December 2001. This membership opened the door to even greater trade expansion for China. Tariffs and quota restrictions were removed (or lowered). However, as China became the world's factory and provided the world with low price goods, trade balances of many western countries, particularly the U.S., became exacerbated. Western countries have accused China of "dumping," and using governmental subsidization policies to support local industries. These complaints allow the complaining country to institute emergency tariffs and quotas. China is working toward achieving "market economy" status which would require a complaining country to provide proof that China is violating WTO rules. In 2006, WTO completed its first Trade Policy Review of China. The report found that in many industries and markets there were substantial barriers to entry, e.g., local authorities favored local producers. Also, WTO found weak enforcement of intellectual property rights. Indeed, Microsoft changed its business model and opted not to sue over patent infringement but rather chose a policy of working more closely with the central government to develop software systems that solved current problems.

Foreign Investment

Since 1980, China's foreign direct investment (FDI) has grown by leaps and bounds from a mere \$57 million in 1980 to \$40.7 billion in 2000. China's growth in FDI compared with other countries is presented in Table 3. China is not the only destination for FDI. U.S., U.K., Germany and France have exceeded or maintained FDI levels comparable to that of China. It should be noted that after January 2008, foreign corporations will no longer receive preferential corporate profit tax incentives. Consistent with WTO requirements all companies (foreign and domestic) will pay a standard 25 percent tax rate.

Beginning in 2002, China's domestic investment (fixed asset investment) soared, reaching 51.2 percent of GDP in 2005 (Kojima, p. 40). China invested in large scale projects, such as Three Gorge Dam, gas and oil pipelines in Kazakhstan and Russia, expressways extended by an additional 30,000 km, building of power plants and western development housing projects.

THE GREAT RECESSION AND CHINA

The world's demand for China's exports fell significantly in Q4/2008. In 2007, China's exports were \$1.22 trillion which represented 37 percent of GDP. Gupta and Wang estimate that 58 percent of China's exports were processed or assembled products, the components of which were imported into China. Value added within China is estimated to be about 12 percent. Thus, exports contribute about 12 percent of China's GDP or about 3% of the 12 percent growth rate in GDP., (Business Week; April 20, 2009). Thus, the effect of the world slump will have a significant but not a disastrous effect on China's GDP. In Q4, 2008, GDP grew at a seven-year low of 6.8 percent. Although the official unemployment rate is 4.2 percent (a 30-year high), more realistic estimate of unemployment put the jobless rate above 9 percent (Business Week; February 4, 2009). Those workers most affected work in export-oriented factories, construction sites and factory cleaning crews.

China's Stimulus Plan

In November 2008, China launched a \$586 billion stimulus package. China is promoting consumption spending to compensate for the drop in exports. For example, the government has offered a 13 percent subsidy to rural residents and farmers to purchase household appliances such as low-end televisions and refrigerators from domestic manufacturers.

China's housing market has also declined as buyers await further falling housing price. Housing accounts for 25 percent of fixed investment and consequently plays a critical role in the growth of GDP.

The government has lowered the mortgage interest rate from 6.6 percent to 4.3 percent. These reductions are already showing a positive response rate. For example, the most recent data shows substantial increases in demand in Shanghai and Chongqing for housing.

In November, 2008, China's central bank reduced the benchmark lending rate by 108 basis points to 5.58 percent. They also cut reserve rate requirements. However, rate policy tends to be a marginal factor in China since most transactions are based on cash and not credit.

Technology in China

China is investing heavily in Research and Development spending, \$136 billion in 2007; second only to the U.S. China is making great progress in the development of environmentally friendly cars. In December 2008, China's Science and Technology Ministry signed an agreement with the U.S. Energy Department to collaborate on battery technology.

In December 2008, BYD Auto introduced the F3DM, the first mass-produced plug-in hybrid that Warren Buffet rated as the best hybrid in the world. The F3DM has a selling price of \$23,000 and can travel 60 miles on one charge; its battery life is about 100,000 miles. (Unfortunately, it takes seven hours for a full re-charge.) More significant breakthroughs in battery technology could provide the road out of the recession.

EARNINGS MANAGEMENT AND INCOME TAX UNCERTAINTIES

Nina T. Dorata
St. John's University

ABSTRACT

FIN 48 requires companies to disclose their tax reserves amounts starting in fiscal years after December 15, 2006. FIN 48 requires that uncertain tax positions meet the more-likely-not recognition threshold for the tax benefit to be recognized in the financial statements. Management is afforded much judgment in determining the more-likely-than-not threshold for recognizing uncertain tax positions thereby making the decision a rich area to explore earnings management. This study uses hand collected data and finds a positive association between prior year cushions for uncertain tax positions and discretionary accruals in the first year of implementing of FIN 48. The findings suggest that managers used uncertain tax provisions to manage their earnings.

INTRODUCTION

FIN 48 is a controversial accounting standard. Beginning in 2007, public entities disclosed the intricate details of accounting for uncertain tax positions. The standard provides explicit guidance for the recognition and measurement for uncertain tax positions. Although the accounting still requires use of expert judgments, the disclosure of these judgments eliminates an earnings management tool not only for managing disclosures but also for managing earnings. Prior research has shown that managers did adjust income tax cushions in anticipation of implementing FIN 48 (e.g. Blouin et al. 2008).

Using a cross-sectional sample of entities and their income tax cushions in the third and fourth quarters of 2006 and discretionary accounting accruals for the year of 2007, the empirical evidence in this study shows that managers used income tax cushions of 2006 as a source of income-increasing discretionary accounting accruals in 2007. The rest of this paper is organized as follows: part 2 presents the literature review, and part 3 presents the research design. The results are presented in part 4 and part 5 presents the summary and conclusion.

LITERATURE REVIEW

FIN 48 Impact

FIN 48, which was effective for years beginning after December 15, 2006 for public entities, requires that a tax benefit is recorded only if the tax benefit is more likely than not to be sustained upon examination by the taxing authority. Prior guidance for tax uncertainties or “tax cushion” followed the loss contingency rules of SFAS 5, which unlike FIN 48 requires a reasonable estimation and highly probable approach with no required disclosures in the tax footnote. FIN 48 requires a cumulative effect adjustment for uncertain tax provisions prior to its effective date. The entity must assume that the tax position will be examined by a taxing authority that has full knowledge of all relevant information and that the tax position will be resolved in the court of last resort.

Each tax position requires a two step analysis. The recognition step requires the determination if the tax position is more likely than not (MLTN) sustainable upon audit. If the determination is no, then the initial tax benefit is not recognized. The MLTN threshold means that the weight of the taxing authority tips in the taxpayer's favor or in other words, a likelihood of more than 50 percent that the entity is entitled to the tax benefit. Once the recognition threshold is met, then the taxpayer proceeds to the measurement step for each

uncertain tax position. The tax benefit that is recognized is measured at the largest amount of the tax benefit that, in the entities judgment, is greater than 50 percent likely to be realized. The calculation of the greater than 50 percent probability is based on a cumulative-probability approach of possible outcomes.¹

Compliance with FIN 48 could be costly. A high degree of judgment is necessary to evaluate the facts and circumstances of a tax position, at times requiring the assistance of experts. FIN 48 recognition and measurement criteria require complex and sophisticated assessments to comply with tax law and financial reporting guidance. Audit firms and tax professionals can assist their clients with research, guidance, and recommendations but cannot solely determine tax positions, estimations or calculations of tax liabilities or provide any services that would impair independence standards.

The most controversial aspects of FIN 48 are in its disclosure requirements. FIN 48 requires a tabular reconciliation of unrecognized tax benefits from beginning to ending balances for each annual period. Included in the reconciliation are changes in uncertain tax positions taken in prior and current periods, changes due to settlements with taxing authorities and changes due to lapse of statute of limitations. Additional disclosures include the impact on the effective tax rate from unrecognized tax benefits, classification and amounts of interest and penalties recognized for uncertain tax positions, and the total amounts of unrecognized tax benefits that will significantly change within 12 months of the reporting date.²

Empirical Studies

Earnings management and tax accounting studies have mainly focused on using the effective income tax rate to manage earnings (e.g. Cook et al. 2008, and Northcut and Vines 1998), using deferred tax provisions (e.g. Ettredge et al. 2008, Phillips et al. 2004, Phillips et al. 2003, and Visvanathan 1998) and using income tax expense (Dhaliwal et al. 2004). Generally, these studies find firms will manage tax accounts to meet quarterly earnings forecasts.

There are limited studies of using tax cushion for earnings management. Blouin, Gleason, Mills and Sikes (2007) examine a sample of 200 firms and find that small firms were less likely to discuss the effect of FIN 48 in the year before mandated implementation. In the first quarter of 2007, the implementation date for calendar year firms, reserves both increased and decreased. Most small firms did not decrease reserves. They found in each of the last three quarters of 2006, the overwhelming majority of firms decreased their reserves. Firms cited settlement with the IRS as the main reason for decreases in reserves.

(Blouin & Tuna, 2006) finds that firms who pay less tax have more cushion activity. The authors find some evidence that income tax cushions are used to smooth earnings to satisfy interests of consumers through research and development expenditures and employees through capital expenditures. Although prior empirical research finds evidence that tax cushions are used to meet management objectives, there is little evidence that there is an association between tax cushions and discretionary accounting accruals. This research paper aims to examine the association between tax cushions and management's use of discretionary accounting accruals.

RESEARCH DESIGN

I test the research question by using the following cross-sectional regression model:

$$DAC = \beta_0 + \beta_1 (\text{Cushion-3q}) + \beta_2 (\text{Cushion-4q}) + \beta_3 (\text{ETR}) + \beta_4 (\text{Assets}) + \varepsilon \quad (1)$$

Where, the dependent variable is:

DAC = Discretionary Accounting Accruals using the Modified Jones Model for the year ended December 31, 2007 (Dechow et al. 1995).

The test variables are:

Cushion-3q = Cushion in the income tax payable account during the third quarter of 2006. The cushion is calculated as the change in the income tax payable account between the second and third quarter

adjusted for the current income tax provision, income taxes paid, and the excess tax benefit from exercised stock options all divided by net sales for the third quarter of 2006,

Cushion -4q = Cushion in the income tax payable account during the fourth quarter of 2006. The cushion is calculated as change in the income tax payable account between the third and fourth quarter adjusted for the current income tax provision, income taxes paid, and the excess tax benefit from exercised stock options all divided by net sales for the fourth quarter of 2006.

The control variables are:

ETR = Percentage change in the effective tax rate from 2006 to 2007.

Assets = Log of total assets at December 31, 2007.

β_0 through β_4 are the coefficients and ε is the error term.

Sample Size, Data Collection, and Hypothesis

The sample is initially drawn from Compustat, excluding financial firms for the years 2006 and 2007 active companies. Companies with calendar year ends are only selected. The year 2006 is selected because it is the year before the implementation of FIN 48. Quarterly income tax cushions are calculated for the third and fourth quarters of 2006 using an analysis of the income tax payable account as described above. All financial data is collected from Compustat. After deleting observations for missing data, the final sample is 58 firms. Descriptive statistics are found in Table 1 and definitions of variables are found in Table 2. Table 1 shows that the mean discretionary accounting accrual (DAC) is negative for the sample. The mean value for third quarter cushion in 2006 (Cushion-3q) is also negative (decreasing to earnings) but positive in the fourth quarter of 2006 (Cushion-4q).

In the year before FIN 48 implementation, Blouin et al. (2008) find that firms adjusted their 2006 quarterly tax cushions in anticipation of FIN 48 implementation. Through adjusting 2006 tax cushions before implementation in the first quarter of 2007, firms would soften the cumulative effect adjustment to opening retained earnings for unrecognized tax benefits through the year 2006 and therefore minimize the disclosure effects of uncertain tax positions at the opening of 2007. In doing so, the year 2007 could present the first time that firms will reverse the effects of 2006 tax cushion adjustments through discretionary accounting accruals. Firms are precluded from reversing 2006 tax cushion adjustments through 2007 tax cushion adjustments due to extensive tabular disclosure requirements for uncertain tax benefits under the guidance of FIN 48. Therefore, the following hypothesis is set forth:

H1. There is a positive association between tax cushions recorded in the third and fourth quarters of 2006 and discretionary accounting accruals in 2007.

RESULTS

Table 3 presents the Spearman Rank Correlation Coefficients. The results show that there is a positive correlation between the tax cushion for the third quarter of 2006 (Cushion-3q) and the 2007 discretionary accounting accruals (DAC) and a negative correlation between the tax cushion for the fourth quarter of 2006 (Cushion-4q) and 2007 discretionary accounting accruals (DAC). However, neither correlation is significant.

Table 4 presents the regression results. White T statistics are presented for heteroscedastic error terms. The regression results show that there is a significant positive association between the 2007 discretionary accounting accruals (DAC) and the 2006 third quarter income tax cushion (Cushion-3q) with a significance level of $p = 0.001$. The association between DAC and Cushion-4q, however, is negative, but not significant. Results for the control variables indicate a significant positive association between DAC and the change in the effective tax rate between 2006 and 2007 (ETR) with a p-value of 0.044 and a negative association between DAC and the log of total assets at 2007 year end (p value = .018). The results for the control variables suggest that as the

effective tax rate increases so do discretionary accounting accruals and larger firms have lower discretionary accounting accruals. Robust tests using the log of net sales do not change the results described above.

SUMMARY AND CONCLUSION

FIN 48 requires controversial disclosures of sensitive income tax accounting and taxation matters that were previously not explicitly reported. Past guidance allowed income tax cushions be a tool for earnings management while providing for inevitable resolutions of income tax contingencies. Now that FIN 48 requires disclosure of the undisclosed, the years of 2006 and 2007 provide an opportunity to study how managers adjusted tax cushions before (Blouin et al. 2008) and after the implementation of FIN 48. This study shows that in 2007, managers used the prior year income tax cushions as a source for current year discretionary accounting accruals. In summary, managers used income tax cushions not only to manage FIN 48 disclosures and adjustments, but also used prior year income tax cushions to increase earnings in the current year.

EVALUATION OF THE APPLICABILITY OF THE JAPANESE HUMAN RESOURCES MANAGEMENT SYSTEM IN PORTUGAL

Felipa Lopes dos Reis, António Eduardo Martins
Open University, Portugal

ABSTRACT

This article arises from the investigation carried out in PHD Thesis, in which the main objective was to evaluate the applicability of the Japanese human resources system in the corporate environment in Portugal.

It was intended to evaluate the competitiveness results in companies with and without Japanese capital, when the Japanese human resources system is used. To carry out this investigation it was used two databases: one with an economic perspective, dealing with the performance of the corporate productivity within the economic, salary and technological; the other database was based on the patterns of human resources management used by the companies, using a questionnaire as an investigation tool.

Based on statistical testing, it was verified that companies with Japanese capital, act using competitive strategies based on costs, human resources qualification, and technological progress.

INTRODUCTION

The objective of the investigation focused in the study of the evaluation of the niponic human resources management system, in the companies with and without Japanese capital operating in Portugal, in the five-year span 1998-2002, and also to evaluate the outcome of competitive prowess in these businesses.

This investigation sought, from the formalization of hypotheses tested by statistical methods, to respond to the principal objective “Evaluate the relation between the niponic human resource management system and business competitive prowess, in companies with and without Japanese capital operating in Portugal”.

The hypotheses that were tested and which sought to establish a relation between the niponic human resource management system and the outcome of competitiveness, are as follows:

Hypothesis 1: The niponic human resource management system relatively to the traditional human resource system leads to a more accentuated improvement of business prowess induced by economic productivity.

Hypothesis 2: The niponic human resource management system relatively to the traditional human resource system leads to a more accentuated improvement of business prowess induced by salary productivity of the human factor.

Hypothesis 3: The niponic human resource management system relatively to the traditional human resource system leads to a more accentuated improvement of business prowess induced by technological progress.

These hypotheses were tested in the evaluation of casual relations between the variable dependents: Economic Competitive (CE), “Workonomic Index” (WI), Technological Progress (PT), and the independent variable Human Resources (RH).

METHODOLOGY

In this investigation, we used a proper model, with indicators of economic nature adjusted to the observed data.

The management system and its enveloping context were explained, in an analytical model, though a conceptual tool composed by an independent variable (qualitative) – Human Resources. And three dependant variables (quantitative) – Economic Competitive, “Workonomic Index” and Technological Progress.

The first step in methodology was the selection of companies from the electronic and automobile sectors whose economical data were in the public domain, in the period ranging from 1998 to 2002, from the information treated by IF4- Information Processing and divulged by Diário de Notícias in the magazine DN – Empresas “As 1000 Maiores”.

The second step was the elaboration of an integrated model of evaluating competitive business which served as a support to the dependant variables of the model. In these variables, the methodological approach treats the performance of business productivity in three perspectives, which are as follows:

- Economic perspective of productivity
- Salary perspective of productivity
- Technological perspective of productivity

Based on this model it was calculated the indicators of business competitiveness, of each company, by year, in the period from 1998 to 2002.

Lastly, it was established an average of each of the business competitiveness indicators, by company, of the period being studied, which are the end results of competitiveness.

The third step was taken in the form of a questionnaire, so as to evaluate the level of qualitative performance of the niponic human resources management system. It was submitted to those companies that, in all years from that period 1998-2002, integrated the list of 1000 greatest companies, so as to obtain a database containing information about the most relevant human resources management practices in companies with and without niponic capital.

The numbers of participant companies were of 55 out of 172 companies that satisfied the selection criteria. Of those, 20 were without niponic capital and 35 with niponic capital. The accomplished response rate is in line with the results obtained in international projects in which the participation of Portuguese companies was verified (Hegewisch & Brewster, 1993:28), that present response rates for different European countries, varying between 10% and 42%.

To that effect, it was calculated the performance-importance gap of those questions posed in the questionnaire, in a numerical scale of 1 through 6 points, (6 attributes regarding the niponic human resource management system and 6 attributes regarding the traditional human resource system). From the answers to the questionnaire I obtained two indexes of qualitative performance, one regarding the attributes vector of the niponic human resource management system e another regarding the attributes vector of the traditional human resources management system, in companies with and without niponic capital.

The independent variable Human Resources measures the degree to which the company adopts active training and formation policies to improve the efficiency of the personnel planning process.

Questions placed in the questionnaire sought to investigate the evaluation of performance and the degree to which the company adopts active formation and training policies; and management techniques such as total productive maintenance, empowerment and outsourcing.

The exploration of data in the questionnaire (Charts 1a and 1b) show that companies with niponic capital place strong importance in advanced internal formation that allows the spontaneous adjustment of different labour posts one to another without higher hierarchy intervention. The average level of quantitative performance is of 55.74 points in companies without Japanese capital and of 72.41 points in companies with niponic capital. Companies with niponic capital value more than companies without Japanese capital, the group work process rather than promoting solely individuals, with 73.91 and 65.33 points, respectively.

The value system based on seniority is also more valued in companies with niponic capital (99.81 points), than in those without Japanese capital (61.77 points).

In the total management techniques productive maintenance, empowerment and outsourcing the companies with Japanese capital value at 65.43, 56.65 and 65.54 points and those without Japanese capital at 60.73, 72.88 and 64.44 points, respectively.

Companies with niponic capital place a greater level of importance and performance to those specific niponic management practices, than those companies without Japanese capital.

After gathering and treating all this data we utilized the statistical technique of the correlation coefficient (r from Pearson), which allows us to determine the associating strength between two variables. Thus allowing the analysis of causality mechanisms between the qualitative level of performance of the niponic human resources management system and the traditional human resource management system, (resulting from the questionnaire), and the quantitative performance of competitiveness of those companies (resulting from the integrated model of evaluation of corporate competitiveness).

The correlation matrix, translated in chart 1a, shows the causality relations between the niponic human resources management system and the performance of industrial competitiveness.

CHART 1

Results from the correlation coefficient between the niponic human resource management system and the indicators of corporate competitiveness.

| | Enterprises with niponic capital | Enterprises without niponic capital |
|----|----------------------------------|-------------------------------------|
| CE | 0.36 | 0.34 |
| WI | 0.46 | 0.34 |
| PT | 0.37 | 0.32 |

Source: Reis, Felipa Lopes (2007)

CONCLUSIONS

This study ensures substantial evidences that the niponic human resource management system exerts an effective influence over corporate competitiveness, in companies with and without niponic capital. The Japanese have fomented organizational models in accordance with their cultural background, creating a merger of management techniques, many of them extracted from the West, with their own cultural values and traditions.

Principal conclusions are as follows:

Hypothesis 1 is valid for companies with niponic capital, because the association between the niponic human resource management system and the economic competitiveness indicator is higher than the association between the traditional human resource management system and the same indicator. Meaning, companies with Japanese capital compete using competitive strategies based on cost.

Hypothesis 2 is valid for companies with niponic capital, because the association between the niponic human resource management system and the “workonomic index” indicator is higher than the association between the traditional human resource management system and the same indicator. Meaning, companies with Japanese capital compete using competitive strategies based on the qualification of human resources (workonomic index).

Hypothesis 3 is valid for companies with niponic capital, because the association between the niponic human resource management system and the technological progress indicator is higher than the association between the traditional human resource system and the same indicator. Meaning, companies with Japanese capital compete using competitive strategies based on technologies.

In conclusion, in companies with Japanese capital, there exists always a causality relation between the niponic human resource management system and the indicators of corporate competitiveness.

Even though many management gurus claim that companies need to focus on one unique basis of competitive advantage, the Japanese by tradition adopt multiple bases of competitive advantage, a talent they’ve been using to outflank western competitors.

Future investigations may approach the same correlation between the niponic human resource system in companies with and without Japanese capital, operating in the Iberian Peninsula. Another hypothesis to investigate is to seek out other indicators for corporate competitiveness that may rectify those same hypotheses.

THE NIPONIC MANAGEMENT OF HUMAN RESOURCES IN THE PERFORMANCE OF THE ENTERPRISES IN THE IBERIAN PENINSULA

Felipa Lopes dos Reis and António Eduardo Martins
Open University, Portugal

ABSTRACT

This article had as objective study the niponic management of human resources in the performance of the enterprises that work in the Iberian peninsula.

The search was to evaluate the competition in this enterprise when the niponic management of human resources is used.

There were used two data base: one with a economic nature treating the performance of productivity in a enterprise economic view, of salary and technologic, and one other about the niponic management of human resources adopted by the enterprises using a list of questions.

Through statistic evaluations it was verify that the competition between enterprises whith niponic capital, it's not induce by the economic competition, and the same enterprises used competitive strategies based on the qualification of the human resources and technological process.

INTRODUCTION

How is it possible for a country to be stripped of its natural resources, defeated and destroyed in the Second World War, and yet by 1968 to be the second greatest economic power in the world? Many of the answers lie in the functioning of its companies and especially its human resources, which effectively played the central role in promoting social and economical development.

Only after knowing the traces of niponic culture and society which have a very peculiar importance in the Japanese managerial system, can we understand the dimension of the relevance of human resources in the niponic management system.

Niponic culture is always associated with the city of Kyoto, which was the imperial capital 794-1868, being a mixture of tradition and contemporary. And where you can find the most famous Buddhist temples (1600) and shintoist sanctuaries (250) of Japan, representing the two great religions practiced by the Japanese. Without knowing Kyoto, where Japan's feudal atmosphere still lives, it is very difficult to understand true Japan.

When I was there I appreciated how they mix millennial traditions with the most advanced technology, and how the success of their developments came from the quest for that constant merger. An illustrative example is the respect and the devotion with which upon entering the Buddhist temples and Shintoist sanctuaries, the same computer-savvy Japanese person reveres his gods and forefathers like his forefathers did a thousand years ago. The complexity and the integrity before supreme values helps to understand the behaviour in several levels of the Japanese businessman, the technological wizard, and the intellectual.

Japan is the paradise of technology but it has not forgotten its ancestors and its traditions, indeed, it's a country where the highest technology lives side-by-side with ancestral traditions. In Tokyo, next to the neon signs lighting up the metropolis, I saw the *ukyo-e*, wooden blocks carved with images of the daily life of the Japanese people of centuries past, constantly mixing millennial traditions with the most advanced technology.

Japanese historical context is very peculiar. In the Land of the Rising Sun, there is a solid base that does not occur in other Asian countries, which consists in a set of values introduced into companies after the Meiji revolution (1867-1868): respect for the hierarchy, the duty of loyalty, capacity to take decisions in a concerted

fashion between employee syndicate management, team spirit, and the demonstration of exceptional discipline and energy.

Niponic business culture constitutes a link between all members of the organization, promoting a spirit of familiar union. The word *shain* (company member) reflects that sense of integration of the individual into the group, sharing both responsibilities and benefits.

Japanese business systems therefore have a deeply humanistic character, acknowledging the primacy of people over material factors of production and income. Management of niponic organizations reflects the relative importance of human resources through the attribution of a privileged status to the personal function.

The system ensuring life-long employment (*Shushin Koyô Seid*) and the system for seniority valorisation (*Nenkô Joretsu*) as criteria for setting wages begins to progressively fade away when faced with the necessity to reform manpower and improve individual companies' training and performance. Managers have begun, in this fashion, to privilege the merit of human resources as opposed to the criteria of seniority, not hesitating to promote young people and to seek out more capable individuals in other companies.

In Japan, the main responsibility of the human resources department is to coordinate and control the evolution of all managers and workers, managing their careers in tune with the company's needs. The decisions of human resources managers can thus decisively influence the internal balance of power and market growth path. In opposition to the decentralized nature of most operations in Japanese corporations and corporate groups, the function of human resources is done with an elevated degree of centralization. This duality, operational decentralization- human resources centralization, constitutes one of the most distinctive characteristics of niponic companies. Decisions regarding recruitment, training, career management and retirement are the exclusive responsibility of the personnel department, so as to ensure the complete integration of members of the organizational culture. In time, the identification of individual objectives with the group's objectives promotes operational efficiency and strengthens the company's competitive assets.

Another of the most important functions of the human resource department is the management of cross-training of their work force, a critical factor of competitive advantage in the Land of the Rising Sun. The best executives are those who are best able to fully use everyone's talents, based on their skills. Open communication is facilitated by the Japanese custom of open-space offices. Silence is not used to intimidate, but rather to gain time to solicit and develop resolution strategies for any sudden problem. The performance of each member is taken into consideration, but it's the performance of the group, that is, the strong culture of group that is combined with an elevated sense of loyalty by the human resources, such that individuals are motivated to work towards a common goal, sharing information and doubts. And the development of careers includes passing through several functions so as to make niponic managers best understand different perspectives of the several functions within the company.

The central element to Japan's regular work force is the salary man (*sarari-man*). People are hired according to their academic "*curriculum*" or personal qualities and also because they promise to be loyal employees whose talents can be adapted to the particular needs of the organization without the vices of previous experience. In many cases, the company's emblem is worn on the suit's lapel, reinforcing the identification of the individual with the organization.

The work of the *sarari-man* is contextual, requiring cooperation, teamwork and participation in countless meetings. Individual functions are not clearly defined, so it falls on each member to identify the tasks to perform within their section or department. The spirit of cooperation reinforces the group's morale and effectiveness. The *sarari-man* can work more than 30 hours overtime per month without pay, including weekends and holidays.

The guarantee of job stability is compensated by the total dedication of the *sarari-man* to the company. Emotional security associated with the sense of belonging to the organization and profit-sharing in the way of bi-annual bonuses reinforce the identification of the *sarari-man* with the company.

The hiring of retirees from units of greater dimension makes it possible to introduce new work methods and technologies coming from those same units and at a reduced cost, for it's needed only to compensate them from the partial reduction in their retirement pension. In Japan, the company's social responsibility towards its workers prevails over economic or financial considerations. The humanistic spirit of niponic companies constitutes one of the more distinctive factors of human resource management in Japan.

A management model must respect the values of the environment in which it's incorporated. Japan is an example of a successful economy, given that it has managed to find an organizational model with the specifics of its culture.

OBJECTIVES

The objective of the investigation focused in the study of the evaluation of the niponic human resources management system, in the companies with and without Japanese capital operating in Iberian Peninsula, in the five-year span 2002-2006, and also to evaluate the outcome of competitive prowess in these businesses. This investigation sought, from the formalization of hypotheses tested by statistical methods, to respond to the principal objective “Evaluate the relation between the niponic human resource management system and business competitive prowess, in companies with and without Japanese capital operating in Iberian Peninsula”. The hypotheses that were tested and which sought to establish a relation between the niponic human resource management system and the outcome of competitiveness, are as follows:

Hypothesis 1: The niponic human resource management system relatively to the traditional human resource system leads to a more accentuated improvement of business prowess induced by economic productivity.

Hypothesis 2: The niponic human resource management system relatively to the traditional human resource system leads to a more accentuated improvement of business prowess induced by salary productivity of the human factor.

Hypothesis 3: The niponic human resource management system relatively to the traditional human resource system leads to a more accentuated improvement of business prowess induced by technological progress.

These hypotheses were tested in the evaluation of casual relations between the variable dependents: Economic Competitive (CE), “*Workonomic Index*” (WI), Technological Progress (PT), and the independent variable Human Resources (RH).

METHODOLOGY

In this investigation, I used a proper model, with indicators of economic nature adjusted to the observed data. The management system and its enveloping context were explained, in an analytical model, though a conceptual tool composed by an independent variable (qualitative) – Human Resources. And three dependant variables (quantitative) – Economic Competitive, “*Workonomic Index*” and Technological Progress.

The first step in methodology was the selection of companies from the electronic and automobile sectors whose economical data were in the public domain, in the period ranging from 2002 to 2006, from the information treated by Dun&Braadstreet/Exame.

The second step was the elaboration of an integrated model of evaluating competitive business which served as a support to the dependant variables of the model.

In these variables, the methodological approach treats the performance of business productivity in three perspectives, which are as follows:

Economic perspective of productivity.

The indicator of the company’s competitiveness rate is the relation between its economic productivity and operational costs *per capita*, which is expressed thusly:

$$g = \frac{(1+r) - 1}{1+m} \times 100$$

being,

$$r = \frac{p_n - p_o}{p_o} \quad e \quad m = \frac{z_n - z_o}{z_o}$$

g = The company’s competitiveness tax

r = Variation of economic productivity

m = Variation of operational costs “per capita”.

p = Economic productivity of work

z = Operational costs “per capita”

VAB – Added brute value (the difference between the business volume and intermediate costs)

CO – Operational costs (being the sum of the costs of materials, supplies and external services, personnel costs and mortgages)

T – Human labour

n – Year of competitiveness evaluation

o – Base year for competitiveness evaluation.

Salary perspective of productivity

The salary perspective is translated in the VAB value by personnel costs (S). In the perspective we used for our investigation, the salary productivity is evaluated based on the “workonomic index” indicator (WI) which evaluates the quota of added value generated in the business that is free to remunerate capital factors intervening in creation the VAB. It’s translated by the following indicator:

$$WI = \left(\frac{VAB}{S} - 1 \right) \times 100$$

Technological perspective of productivity

This perspective evaluates the technological progress tax (Pt). This indicator measures the efficiency with which the economy combines the work and capital factors, and assumes the following expression:

$$Pt = gVAB - gT.c - g.K (1-c)$$

being,

gVAB – Variation tax (g) of added value

gT – Variation tax (g) of work posts (T)

gK – Variation tax (g) of immobilized capital evaluated by the economic factor of mortgages.

c – Factor of labour and work, translated by the indicator of salary weight (Salaries/VAB)

Based on this model it was calculated the indicators of business competitiveness, of each company, by year, in the period from 2002 to 2006.

Lastly, it was established an average of each of the business competitiveness indicators, by company, of the period being studied, which are the end results of competitiveness.

The third step was taken in the form of a questionnaire, so as to evaluate the level of qualitative performance of the niponic human resources management system. It was submitted to those companies that, in all years from that period 2002-2006, integrated the list of 1000 greatest companies, so as to obtain a database containing information about the most relevant human resources management practices in companies with and without niponic capital.

The numbers of participant companies were of 55 out of 172 companies that satisfied the selection criteria. Of those, 20 were without niponic capital and 35 with niponic capital. The accomplished response rate is in line with the results obtained in international projects in which the participation of Portuguese companies was verified (Hegewisch & Brewster, 1993:28), that present response rates for different European countries, varying between 10% and 42%.

To that effect, it was calculated the performance-importance *gap* of those questions posed in the questionnaire, in a numerical scale of 1 through 6 points, (6 attributes regarding the niponic human resource management system and 6 attributes regarding the traditional human resource system). From the answers to the questionnaire I obtained two indexes of qualitative performance, one regarding the attributes vector of the niponic human resource management system e another regarding the attributes vector of the traditional human resources management system, in companies with and without niponic capital.

The independent variable Human Resources measures the degree to which the company adopts active training and formation policies to improve the efficiency of the personnel planning process. Questions placed in the questionnaire sought to investigate the evaluation of performance and the degree to which the company adopts active formation and training policies; and management techniques such as *total productive maintenance*, *empowerment* and *outsourcing*.

The exploration of data in the questionnaire (Charts 1a and 1b) show that companies with niponic capital place strong importance in advanced internal formation that allows the spontaneous adjustment of different labour posts one to another without higher hierarchy intervention. The average level of quantitative performance is of 69.1 points in companies without Japanese capital and of 73.4 points in companies with niponic capital. Companies with niponic capital value more than companies without Japanese capital, the group work process rather than promoting solely individuals, with 75.1 and 73.2 points, respectively. The value system based on seniority is also more valued in companies with niponic capital (97.2 points), than in those without Japanese capital (63.3 points). In the total management techniques *productive maintenance* the companies with Japanese capital value at 68.2 points and those without Japanese capital at 60.7 points.

Companies with niponic capital place a greater level of importance and performance to those specific niponic management practices, than those companies without Japanese capital.

After gathering and treating all this data we utilized the statistical technique of the correlation coefficient (r from *Pearson*), which allows us to determine the associating strength between two variables. Thus allowing the analysis of causality mechanisms between the qualitative level of performance of the niponic human resources management system and the traditional human resource management system, (resulting from the questionnaire), and the quantitative performance of competitiveness of those companies (resulting from the integrated model of evaluation of corporate competitiveness).

The correlation matrix, translated in chart 1a, shows the causality relations between the niponic human resources management system and the performance of industrial competitiveness.

CHART 1

Results from the correlation coefficient between the niponic human resource management system and the indicators of corporate competitiveness.

| | Companies with japanese capital | Companies without japanese capital |
|----|---------------------------------|------------------------------------|
| CE | .42 | .44 |
| WI | .47 | .40 |
| PT | .39 | .37 |

Source: Reis, Felipa Lopes (2006)

CONCLUSIONS

This study ensures substantial evidences that the niponic human resource management system exerts an effective influence over corporate competitiveness, in companies with and without niponic capital. The Japanese have fomented organizational models in accordance with their cultural background, creating a merger of management techniques, many of them extracted from the West, with their own cultural values and traditions.

Principal conclusions are as follows:

Hypothesis 1 is not valid for companies without niponic capital, because the association between the niponic human resource management system and the economic competitiveness indicator is higher than the association

between the traditional human resource management system and the same indicator. Meaning, companies with Japanese capital don't compete using competitive strategies based on cost.

Hypothesis 2 is valid for companies with niponic capital, because the association between the niponic human resource management system and the "*workonomic index*" indicator is higher than the association between the traditional human resource management system and the same indicator. Meaning, companies with Japanese capital compete using competitive strategies based on the qualification of human resources (*workonomic index*).

Hypothesis 3 is valid for companies with niponic capital, because the association between the niponic human resource management system and the technological progress indicator is higher than the association between the traditional human resource system and the same indicator. Meaning, companies with Japanese capital compete using competitive strategies based on technologies.

Even though many management *gurus* claim that companies need to focus on one unique basis of competitive advantage, the Japanese by tradition adopt multiple bases of competitive advantage, a talent they've been using to outflank western competitors.

Future investigations may approach the same correlation between the niponic human resource system in companies with and without Japanese capital, operating in the Europe. Another hypothesis to investigate is to seek out other indicators for corporate competitiveness that may rectify those same hypotheses.

THE PERFORMANCE OF NIPONIC MANAGEMENT OF RESRAECH AND DEVELOPMENT IN COMPANIES IN THE PORTUGAL

Felipa Lopes dos Reis and António Eduardo Martins
Open University, Portugal

ABSTRACT

This article concerns one of the suggestions for future research that we put forward in my doctoring thesis, and has as its objective to research the existing relation between the niponic management system and productivity in companies with activity in the Iberian Peninsula.

The methodology was as follows. For the gathering of information about the patterns of Management Innovation in companies, we elaborated a questionnaire. The financial information used in the creation of a data panel on a 5-year basis for each company was gathered through the Dun & Bradstreet/Exame database.

Through statistical tests we verifies that competitiveness in companies with niponic capital is not induced by economic competitiveness, and that they use competitive strategies based on the qualification of human resources and technological progress.

INTRODUCTION

The history of Japan's modern science and technology dates back to the last part of the 19th Century, when recently-opened country began actively studying the knowledge that Europe had to offer. The Land of the Rising Sun was poor in terms of material resources and the only way through which it could progress in the social and economic fields was through technological advances obtained by its people, its sole valuable resource. The great strategic flexibility of niponic industries originated their rapid ascension. Japanese industries conquered positions in international markets by introducing new products of higher quality at lower prices. Sony managed to reinforce its competitive position in all segments of the audiovisual industry, it being one of the most successful companies in terms of Japanese corporate strategy. It used to be a domestic business specialized in audiovisual equipment until it bought Colombia Pictures, this complementing its production of audiovisual equipment with thousands of movies. When the new CD technology replaced video cassettes, Sony was already in a position to determine the CD-Video standard.

The technological capacity of niponic companies constitutes one of its chief competitive advantages in the business market. From oil tankers to watches, from industrial robots to microwaves, from semiconductors to compact discs, Japanese competitors have reached a status of leadership by introducing a succession of innovative products of higher quality at lower prices, which promoted the rapid expansion of market s and sales and the results of the company in particular.

When the base industry is in recession, niponic companies seek to identify other growing industries that may constitute good business opportunities for the future. The creative use of technologies from new businesses may benefit the company's base activity. Kanebo (textiles) entered the cosmetic field of industry in the 1960's based on their knowledge of chemical components. In the 1990's, the company's new clothing lines included pieces with exotic fragrances, an intelligent combination of its diversified base technology.

The Japanese have traditionally placed education and science at the top of their national concerns and the Meiji period was devoted mostly to catching up with the West.

Resorting to robotics and automation has allowed the niponic industry to overcome its scarce labour problems without destroying the base social harmony and avoiding resorting, as other industrialized countries tend to do, to foreign workforces.

Niponic industrial productivity is on the rise and Nissan is an illustrative example, when it doubled its automobile factories in Tokyo by using a highly sophisticated assembly method with recourse to automation, requiring only a fourth of the normal time and a third of the cost to man a full automobile assembly line.

The use of robots in niponic companies represents an extension of the machine automation process and the liberation of the work force. And they advantageously replace human labour, where in determined processes the productivity of a robot is at least 50% greater than that of a human worker. The use of robots is ever more advantageous due to their reduced prices and that of computers, when weighed against the constant increase in salary costs.

Robots and computerized production systems promote automation. Its introduction must therefore be set in an environment that is prepared to enjoy its benefits without the loss of human control. Many of the great niponic companies have adapted to the appreciation of the Yen, introducing new technologies, adding value to products and constant restrictions to the work force. This approach explains why Japanese facilities placed in markets outside the Land of the Rising Sun can equally apply approaches adapted to the exports in foreign markets.

An example of that is the case of environmental technology. In the 1970's, Japan was a pollutant industrial country, with no environmental policy and an economic growth at the expense of its natural environment. Only a decade later it became a potential world leader in the application of environmental technology, due to changes in the nation's social values. Thus, it starts developing exportable products and services.

The driving engines of technology are companies in the private sector, very competitive in global markets. Beyond the Land of the Rising Sun we find the full weight of Asia, the enormous developing markets of Southeast Asia (the so-called Asian Dragons) and China.

Although the United States of America began the development of technology sooner, Japan moved faster in replacing its factory technologies. Sophisticated construction methods, relying heavily on computers and information, produced assets whose quality could hardly be matched in the world market.

The management of research and development (R&D) assumes a strategic role in corporate development due to the constant introduction of new products in the marketplace that constitutes the main source of profit and sales growth in Japanese companies. With the impossibility of importing foreign goods in a large scale in the post-war period, several small domestic companies developed their own in-house technologies and products.

The R&D cycle in niponic companies is made up of three phases: copying initiatives of more advanced competitors, through the licensing of their products of mere reproduction of their products, services or processes. The second phase is the improvement of acquired technologies, adopted processes and characteristics of commercialized products and services. And lastly the phase of innovation, where new technologies are conceived and new products, services and processes are created. Throughout this whole process, there's a constant concern in integrating basic investigation with applied research, so as to maintain an elevated rhythm of introduction of innovations into the market and reinforcing the company's competitiveness.

The successive development of new products at a fast rate is one of the secrets for success "made in Japan". The developed technique of *quality function deployment* is a good example. It works in two stages: the first is to choose a rival brand of reference (benchmarking), in relation to which the company asks its users what features they like and don't like. The second phase is the complete reversal of this process, in which engineers try to associate to the developing item the characteristics that customers liked in the performance of the rival brand.

The Japanese have always had a great concern in getting all the company involved in solving quality issues and for long they have believed that the strategy leading to an improved quality of their products is the most important strategy and the one more promising of success. The production of high quality goods at a reduced cost has become the key to Japanese success relative to international competition and companies have systematically mobilized their human and physical resources to reach that goal. In this way they have introduced, on the one hand, new technological and managerial know-how and on the other hand, proceeded to invest considerably to rationalize their production.

Technical boards (engineers, managers) were sent to Europe and the USA to familiarize themselves with the new techniques. To quote only a few examples of technological transfer, we can call to memory the cases of General Electric to Toshiba, of Austin to Nissan and of Philips to Matsushita.

Techniques learnt in other countries, in and by themselves, didn't help to improve productions: it's important how those same techniques were applied. Car manufacturers, for example, developed a unique system to supply parts and materials, globalizing external suppliers and internal departments, with the objective of reducing stocks to a minimum. The system works according to the principle of *Just-in-Time* (minimization of stocks) which has as its symbol the production method of Toyota. The basic principle of stock minimization isn't just about a new production management technique. Japanese car makers have devised a very complex social and technical system, involving sub-contracted companies for supplying parts and several internal departments, according to management practices that take into account the characteristics of local conditions.

OBJECTIVES

The object of the investigation fell upon the performance of niponic management of research and development in companies operating in Portugal, in the five-year span of 1998-2002. The central objective was to assess results of corporate competitiveness in these companies, when using the niponic management of research and development system.

The hypothesis that we tested in the study and with which we sought to establish a relation between the characteristics of the niponic research and development management system and the results of corporate competitiveness, are as follows:

Hypothesis 1: The niponic research and development management system in relation to the traditional management system leads to an improved corporate competitiveness induced by economic productivity.

Hypothesis 2: The niponic research and development management system in relation to the traditional management system leads to an improved corporate competitiveness induced by the salary productivity of the human factor.

Hypothesis 3: The niponic research and development management system in relation to the traditional management system leads to an improved corporate competitiveness induced by technological progress.

These hypothesis were tested in the evaluation of casual relations between the dependent variables: Economic Competitiveness (EC), "Workonomic Index" (WI), Technological Progress (TP) and the independent variable Research & Development (R&D)

METHODOLOGY

In this investigation we used a proper model, with indicators of an economic nature adjusted to the observed data, in the companies indicated in the researched panel.

The management system and its context were explained, in an analytical model, through a conceptual tool composed by an independent variable (qualitative) – Research & Development, and by three dependent variables (quantitative) – Economic Competitiveness, "Workonomic Index" and Technological Progress.

The first step of the methodology was the selection of the panel of companies from the electronic and automotive sectors that was chosen through the Dun & Bradstreet/Exame database, in the period spanning 1998 through 2002. This panel was so chosen because it's a universe representative of the companies operating in the Iberian Peninsula.

The second step was the elaboration of an integrated model of evaluation of corporate competitiveness that served as a support to the dependent variables of the model.

In these variables, the methodological approach treats the performance of corporate productivity in three main components: economic, salary and technological.

- Economic perspective of productivity.

The indicator of the company's competitiveness rate is the relation between its economic productivity and operational costs *per capita*, which is expressed thusly:

$$g = \left(\frac{1+r}{1+m} - 1 \right) \times 100$$

being,

$$r = \frac{pn - po}{po} \quad e \quad m = \frac{zn - zo}{zo}$$

g = The company's competitiveness tax

r = Variation of economic productivity

m = Variation of operational costs "per capita".

p = Economic productivity of work

z = Operational costs "per capita"

VAB – Added brute value (the difference between the business volume and intermediate costs)

CO – Operational costs (being the sum of the costs of materials, supplies and external services, personnel costs and mortgages)

T – Human labour

n – Year of competitiveness evaluation

o – Base year for competitiveness evaluation.

- Salary perspective of productivity

The salary perspective is translated in the VAB value by personnel costs (S). In the perspective we used for our investigation, the salary productivity is evaluated based on the "workonomic index" indicator (WI) which evaluates the quota of added value generated in the business that is free to remunerate capital factors intervening in creation the VAB. It's translated by the following indicator:

$$WI = \left(\frac{VAB}{S} - 1 \right) \times 100$$

- Technological perspective of productivity

This perspective evaluates the technological progress tax (Pt). This indicator measures the efficiency with which the economy combines the work and capital factors, and assumes the following expression:

$$Pt = gVAB - gT.c - g.K (1-c)$$

being,

gVAB – Variation tax (g) of added value

gT – Variation tax (g) of work posts (T)

gK – Variation tax (g) of immobilized capital evaluated by the economic factor of mortgages.

c – Factor of labour and work, translated by the indicator of salary weight (Salaries/VAB)

Lastly, we established the average for each of the indicators of corporate competitiveness by company, in the period ranging from 1998 through 2002, which are the final results of corporate competitiveness.

The third stage was translated in the construction of the independent variable, through the elaboration of a questionnaire, so as to best assess the level of qualitative performance of the niponic research and development

management system, and was submitted to the previously-selected panel of companies, to obtain a database containing information on the practices of the research and development management system that re more relevant to companies operating in the Portugal.

To that end, we calculated the performance-importance gap (percentage of the division of the level of performance by the level of importance) of the questions asked in the questionnaire, in a numerical scale of 1 through 6 points. That was measured through an index composed by six items referring to the traditional research and development management system, seeking to know the intensity of its usage, by the company of different instruments of that nature.

From the answers to the questionnaires we obtained two indexes of qualitative performance, one corresponding to the niponic research and development management system and the other to the traditional research and development management system, in companies with and without niponic capital.

After gathering and treating these data we used the statistical technique of the correlation coefficient of R for Pearson, which allows us to determine the associative strength between the two variable, thus allowing the analysis of causality mechanisms between the qualitative performance level of the niponic research and development management system (resulting from the questionnaire), and the quantitative performance of competitiveness in companies (resulting from the integrated model of evaluating corporate competitiveness) in companies with and without niponic capital operating in the Portugal.

Chart 1 presents causality relations between the niponic research and development management system and the performance of corporate competitiveness. The association of the niponic research and development management system and economic competitiveness is stronger in companies without Japanese capital, and the association between the same management system and the indicators of “workonomic index” and technological progress is stronger in companies with niponic capital.

Chart 1

Correlation average between the niponic research and development management system and the indicators of economic competitiveness.

| | Companies with japanese capital | Companies without japanese capital |
|----|---------------------------------|---------------------------------------|
| CE | .43 | .44 |
| WI | .48 | .43 |
| PT | .49 | .46 |

Source: Reis, Felipa (2006).

CONCLUSIONS

This study ensures substantial evidences according to which the niponic research and development management system exerts an effective influence on corporate competitiveness, in companies with and without niponic capital.

Main conclusions are as follows.

Hypothesis 1 was not verified because there is no causality relation between the niponic research and development management system and companies with niponic capital. Meaning, companies with niponic capital do not compete by devising competitive strategies based on cost.

Hypothesis 2 was verified because there is a causality relation between the niponic research and development management system and companies with niponic capital. Meaning, companies with niponic capital compete by devising competitive strategies based on the qualification of its human resources (workonomic index).

Hypothesis 3 was verified because there is a causality relation between the niponic research and development management system and companies with niponic capital. Meaning, companies with Japanese capital compete by devising competitive strategies based on technologies (technological progress).

The three phases of the R&D cycle in Japanese companies doesn't necessarily follow the copy-improvement-innovation sequence. In most cases, the technological innovation requires a paralleled licensing of its external complementary know-how. Equally, after the introduction of an innovative product, subsequent upgraded models are released, more functional, of higher quality and at lower prices.

The R&D cycle in Japan is extremely dynamic, supporting the constant introduction of innovations into the marketplace. The satisfaction of consumer needs is undertaken as a challenge to the company's creativity, an imperative design to reach new technological solutions. Commercial success is above all the consequence of introducing the right product at the right price before competitors do.

Typically, the Japanese company will develop new ideas or perfect concepts in the expectation that they are pleasing to the targeted segment of the population. Machines to serve meals at required times to house pets when the owners are on vacation. Shirts made of fabrics that never crumple or wrinkle. Hair-style simulation monitors in ladies hair salons, eggs enhanced with vitamins, anti-bacterial sanitation ceramics for hospitals and public spaces or electric guitars with inbuilt player constitute some examples of products or services released in the niponic market that have later proven to be successful.

The management of R&D is crucial for the success of niponic companies in global competition. The constant introduction of new products and services expands its commercial presence and the restructuring of industries. From robots to videogames, from semiconductors to cameras, from cars to fax machines, Japanese manufacturers have ascended to positions where they stand up from the crowd by continuously innovating and upgrading not only their products, but they productive processes as well. The integration of R&D management with production management constitutes in Japan the vehicle of simultaneous consolidation of technological leadership and cost.

COMPETITIVENESS GROWTH IN THE RECESSION PERIOD /COMPARATIVE ANALYSIS OF CROATIA AND SLOVENIA/

Mirjana Dragičević and Velibor Mačkić
University of Zagreb, Graduate School of Economics & Business, Croatia

ABSTRACT

Although, the global recession becomes the threat to future competitiveness growth in both developed and undeveloped countries throughout the globe, it could be the challenge, too. It could be the challenge, especially in the case of the countries that should re-invent their economic growth paths, because in the global competitiveness rankings they are lagging behind the countries with similar economic heritage and growth level. And that is the case of the two small neighbouring countries: Croatia and Slovenia. Both countries, twenty years ago, started different transition paths, and reached different competitiveness growth levels. Today, they are faced both with the recession and, at the same time, the problems of re-inventing their competitiveness growth in uncertain economic surrounding. The purpose of this paper is to carry out the deep comparative analysis of competitiveness growth in both countries and to research their strengths and weaknesses and their ability to cope with the recession and to re-invent their future competitiveness growth and economic development. The research will start with the short, but comprehensive, explanation of the economic heritage /before the transition/ and the analysis of the transition paths. The competitiveness analysis will be based on some competitiveness indicators, like GCI /global competitiveness index/, BCI /business competitiveness index/, on twelve «pillars» that could explain both indexes in detail, and, on SWOT analysis for both countries. SWOT analysis will be created by the authors. The proposals for future competitiveness growth, in the circumstances of the global recession, in both countries will be explained in the last part of the paper.

INTRODUCTION

Competitiveness is the driving force of the prosperity in any country. In the global economy, comprehensive approach should be made to make the country more competitive. According to the global competitiveness indicators, countries differ in various pillars that constitute the competitiveness. The post-transition countries are, generally, in the weaker position according to the competitiveness growth and, compared with the developed ones. Although, the competitiveness level was the prior question of the future development, and was the priority agenda to economic growth, in recent global recession period, the problems of surviving in the recession, or crisis, or, how to less painfully overcome the recession, became the priority academic and pragmatic questions in the developed and less developed countries. Paul Krugman recently said (www.spiegel.de): “Some people say that our economic problems are structural, with no quick cure available; but I believe that the only important structural obstacles to world prosperity are the obsolete doctrines that clutter the minds of men.”. Following these thoughts, we tried to re-think the two processes: the competitiveness growth and the recession, and found out the possibility that recession could, not only be the threat, but the challenge, too. The purpose of this paper is to re-invent the possibility for the competitiveness growth in the risky and uncertain recession period in the two neighbouring post-transition countries: Croatia and Slovenia. In the first part of the paper, the economic heritage and different transition paths are shortly explained. The second part will be focused on the competitiveness analysis in both countries, based on the global competitiveness indicators, and followed by the SWOT analysis. At the end of the paper, some basic proposals for the future competitiveness growth, in the recession period, according to the two cases that are in the focus of the analysis, are recommended.

THE ECONOMIC HERITAGE AND TRANSITION PATHWAYS

Before the dissolution, of former Yugoslavia Croatia and Slovenia had been the most developed industrial republics with a per capita GDP which was a third higher than the Yugoslav average. Unlike other countries in Central and Eastern Europe that had to operate behind «the iron curtain» and had command economies, Croatia and Slovenia as the republics within the Yugoslav confederation (from the Constitution of 1974) were moving along a so-called «mixed path». The path was marked by self-government and social ownership, but also by the market as a factor of allocating goods and services. Even back in 1989, Croatia and Slovenia had the highest liberalization index (0, 41 and 045) of all socialist CEE countries (EBRD, 2000). About 50% per cent of production was export oriented. The most prominent in Croatia was the complex of metal processing, shipbuilding, part of the food industry, the construction industry, and tourism that earned an average of \$5-6 billion a year. In Slovenia the export oriented manufacturing were: ferrous metallurgy, lead and zinc smelting, electronics, truck production, electric power production, wood production, textiles and machinery tools.

According to everything that Croatia and Slovenia had stood for up 1990, it might be assumed that both countries could have been the models for sustainable transition to a full market economy and democratic societies.

The case of Croatia

The circumstances of transition in Croatia produced much more serious consequences for the Croatian economy that had been previously anticipated. The decision to create state, initiated a five-year war, which gave rise to the need to provide assistance for about one million displaced people and refugees, and was marked by huge direct destruction and indirect economic damage, particularly within the tourism sector. Croatia entered transition with the huge disadvantages: the loss of the former Yugoslav market which included 18 million people; large costs caused by war damage, amounting to about \$50 billion /this was two and a half times the GDP of 2001/, and the lack of a system of international assistance and support, such as Phare etc.

Instead of exploiting the advantages of heritage, Croatia had engaged in a struggle to survive. A dramatic fall in production and the high demand of budgetary expenditure in the first years threw the economy into a widening budget deficit and increased money supply which led to growing inflation. In the period of 1990-93, GDP fell by 40 per cent, and the high inflation rate was 25 to 30 per cent. In such conditions government decided to reform the economy towards a free market economy. The macroeconomic stabilization program (1993) succeeded in fighting hyperinflation so that in 1994 the economy experienced the inflation rate of 3 per cent. Although the economy started to recover, and GDP growth rate was 5, 9 per cent in 1994, the economic transition was lagging behind.

The choice of the fast privatization model and the lack of transparency in its implementation allowed for the direct transfer of the ownership of firms based on political affiliation and nepotism that resulted in, "privatization robbery" The lack of public control and the sluggishness of the judicial system were characteristic for the first stage of the transition, when the government had the crucial influence on the new ownership structure through the Privatization Fund. As the consequence, the unemployment rate exceeded 23 per cent in 2001. (CRO STAT, 2001). FDI were low, too. The economic power was concentrated in the hands of privatization profit-seekers. Reforms were externally initiated (USAID, 2000, WB, 2002), because they were opposite to the governance praxis. In the year 1999 GDP achieved only 82 per cent of the GDP of 1990 level, with an unfavourable structure for quick economic recovery and the share of the foreign debt in the budget was about 50 per cent (CRO STAT, 2001). The consequences of the fast and non-transparent privatization and the predominant political government influence on the economy are present in Croatia still today. All the reforms are externally driven, mainly by the EU bodies. Since 2000, Croatia improved slowly with moderate but steady GDP growth, led by a rebound in tourism and credit driven consumer spending. Structural reforms are lagging due to the lack of strong support from politicians

The case of Slovenia

Contrary, in Slovenia, the whole transition was carried out gradually and in a transparent way. The whole economic and political situation was different to the situation in Croatia from the beginning of the transition due to the facts that: first, Slovenia in its path to independence was not hit by the war, and, second, the government continued the economic strategies that it had started to create before the independence of the state. The social-democratic government started the transition following the strategy of re-inventing new economic advantages based on the inherited ones.

Slovenian government did not choose the fast, but gradual privatization model, based on the vouchers. Workers' councils in the firms were then empowered to allocate the remaining 40 percent to either firm insiders (through insider buy-outs) or outsiders (through a public tender). One of the main features of this process was the transition from workers' self-management rights over the "social" capital into majority insider-owned enterprises, through the redistribution of shares among managers and employees, and management-labour buy-outs. Hence, Slovenia's privatization brought about two large groups of owners: inside owners (employees, including managers, former employees and their relatives) and outside owners (Pension and Restitution Funds, Privatization Investment Funds). As a consequence of the gradual privatization model, most inherited sectors and companies were restructured and many of them continued to export their product.

Slovenia also succeeded in building up the entire institutional infrastructure that is supporting the competitiveness growth of the companies and the whole state sector. In 2004, Slovenia became the EU member state.

COMPARATIVE ANALYSIS OF SOME KEY MACROECONOMIC DATA

Croatia and Slovenia are small countries, that started its transition to a free market economy at almost the same starting position, but, according to the aforementioned different transition pathway, today they greatly differ in the level of economic development and the global competitive position, that could be seen from the data on GDP per capita level.

Some macroeconomic indicators demonstrate the huge differences in the economic development level of Croatia and Slovenia, which could be explained not only by the different (graduate or fast) privatization model, but, also, by the different economic development strategies (one, in Croatia based on the political influence on the whole process, and the other, in Slovenia, based on the comprehensive economic strategies that, from the beginning of the transition looked upon the social consequences of the economic transformation.)

One of the basic indicators is the level of GDP per capita. Slovenian GDP per capita is more than two times bigger than it is in Croatia.

Source: Authors calculation according to the EBRD data series

The huge difference in the unemployment rates, is significant during the whole period of the transition, and, it is obvious from the following figure (Figure 2.) still exists. High unemployment rates are present constantly in Croatia and they do not create only economic but huge social costs too.

In Slovenia, the gross external debt has increased from 4.3 mil € in 1995 to 19.6 mil € in 2005. The percentage rate related to GDP jumped over the 70% mark in 2005. During the same time period Croatia also followed the trend of increasing external debt to GDP percentage that reached 70% (22.9 mil €) in 2004. In the last couple of years the trend continued in the case of Slovenia and reached 105,3% (39.09 mil €) in 2008. Since 2005 Croatia started borrowing more intensely on the domestic market thus slowed down the increasing external debt to GDP ratio to 82,6% (39.1 mil €) in 2008 (www.hnb.hr). According to the World Bank classification (external debt / GDP > 80%) both countries are considered highly indebted.

COMPARATIVE ANALYSIS OF THE GLOBAL COMPETITIVE POSITION

Evaluation of competitiveness became an important instrument for balancing the development process of the economy. The world economy is not a zero-sum game and many states can improve their prosperity if they can improve their productivity. The challenge for any economy is to create the conditions in which companies and employees throughout the economy can upgrade their productivity (Porter, 2008:44.) Theory and empirical evidence suggest that there is a need for comprehensive approach to competitiveness measurement. While measuring competitiveness, and comparing its competitiveness with other countries with similar economic characteristics, each country could be faced with its weaknesses and strengths.

Global Competitiveness Indexes

Both, Croatia and Slovenia are included in the in international competitiveness's yearbooks, such as the *The Global Competitiveness Report (GCR)*. This index is a combination of data obtained from secondary sources (quantitative weight) and through primary survey (survey weight) on various macro- and micro-economic dimensions of the economy of a country or pillars. Porter (1990, 2008), introduced the elements of the New GCI that will include social infrastructure and political institutions.

In the following table we can notice the differences not only in overall ranking position of Croatia and Slovenia /where Croatia is lagging behind Slovenia/, but, especially dealing with some pillars that could illustrate us the vulnerable or weak sides, or some strengths of the competitiveness structure in both countries.

The Croatia lags behind Slovenia in overall GDI ranking for 19 ranks 2008-2009, 18 ranks 2007-2008 and 16 ranks 2006-2007. The gap in competitiveness ranking between Croatia and Slovenia from year to year is widening. Considering pillars, it could be noticed that the weakest pillars in Croatia are the goods market efficiency /76/, institutions /74/ and business sophistication /72/ and in Slovenia: market size /70/, labour market efficiency /61/ and goods market efficiency /50/. The ranking in the forth pillar: Health and primary education, in fifth pillar: Higher education and training, and in ninth: Technological readiness, is much better than the overall ranking in both countries. In Slovenia, the pillars that demonstrate the strengths in competitiveness growth are also obvious on ranking position dealing with: Macroeconomic stability, Innovation and sophistication factors, Business sophistication and Innovations.

If the most problematic factors for doing business are considered (WEF, 2008:142), then it could be noticed that in Croatia these factors are: tax regulations, inefficient government bureaucracy, high tax rates, corruption, policy instability and crime and theft. In Slovenia, these factors are: inflation, tax regulation and access to financing.

Although, these rankings should be important indicators to policy makers, contrary to Slovenes Ministry of economy various initiatives on developing competitiveness strategies, and many other non-governmental institutions that both on research and empirical level foster competitiveness growth, in Croatia, there is only one non-governmental organization: "National council for competitiveness building", that is focused on the Croatian competitiveness growth, but still, this organization has no influence on policy makers.

Table 2 Global Competitiveness Index

| | CROATIA | SLOVENIA | CROATIA | SLOVENIA |
|---|-------------------|-------------------|-------------|-------------|
| | Rank /out of 134/ | Rank /out of 134/ | Score /1-7/ | Score /1-7/ |
| GCI 2008-2009 | 61 | 42 | 4,2 | 4,5 |
| GCI 2007-2008 /out of 131/ | 57 | 39 | 4,2 | 4,5 |
| GCI 2006-2007 /out of 122/ | 56 | 40 | 4,2 | 4,5 |
| Basic requirements | 49 | 38 | 4,7 | 5,1 |
| 1 st pillar: Institutions | 74 | 49 | 3,8 | 4,4 |
| 2 nd pillar: Infrastructure | 51 | 36 | 4,0 | 4,5 |
| 3 rd pillar: Macroeconomic stability | 61 | 33 | 4,1 | 5,5 |
| 4 th pillar: Health and primary education | 41 | 21 | 5,9 | 6,2 |
| Efficiency enhances | 62 | 37 | 4,1 | 4,4 |
| 5 th pillar: Higher education and training | 48 | 22 | 4,4 | 5,1 |
| 6 th pillar: Goods market efficiency | 76 | 50 | 4,1 | 4,5 |
| 7 th pillar: Labor market efficiency | 68 | 61 | 4,4 | 4,4 |
| 8 th pillar: Financial market sophistication | 63 | 46 | 4,4 | 4,5 |
| 9 th pillar: Technological readiness | 47 | 30 | 3,7 | 4,5 |
| 10 th pillar: Market size | 66 | 70 | 3,6 | 3,4 |
| Innovation and sophistication factors | 62 | 33 | 3,7 | 4,2 |
| 11 th pillar: Business sophistication | 72 | 34 | 4,0 | 4,5 |
| 12 th pillar: Innovation | 50 | 33 | 3,4 | 3,7 |

SWOT analysis

SWOT analysis could be an important tool for policy creation. In this, sense, based on the research or the different recent analysis of the competitive position of Croatia and Slovenia (WEF, 2008, WB, 2005, 2008), and some expert interviews, the SWOT analysis of both countries demonstrate their specific strengths, weaknesses, opportunities and threats.

Table 3: SWOT analysis of Croatia:

| Strenghts (Internal / Current) | Weakness (Internal / Current) |
|--|--|
| Geo-traffic position of the country Adriatic coast and islands with specific global attractiveness Inherited industrial culture, especially in technical educated labor force Availability of agricultural land Tradition of tourism, both at sea-side and the continental part of Croatia Unexploited and rich natural water resources Bio diversity and perserved environment Good infrastructure (motorway networks) Internationalized banking sector | High burden of external debt and persistent budget deficit Low level of investment: both foreign and domestic entry barriers High level of taxes and public spending Unexploited agricultural land potential Political dominance over economy: red tape Structural unemployment affecting unskilled and older workers Unreformed public sector |
| Opportunities (External / Future) | Threats (External / Future): |
| EU and NATO membership Growing demand for bio- agriculture products Growing demand for holiday homes and residences Trans-european corridors for energy supplies Growing demand for food and water supply | The impact of global recession with delayed recovery Ongoing and growing lack of foreign direct investments Reduction of international credit sources International protectionism Unstable regional market and low level of regional economic cooperation Vulnerability of international tourism market |

The main weaknesses of Croatian economy, especially in the light of the current economic crises, are in the high burden of public and foreign debt, and on the political dominance over economy. The unreformed public sector is the main barrier to further competitiveness growth. The governments efficiency is very low and all the reforms are driven by the external bodies (EU, mainly).

In Slovenia, SWOT analysis demonstrates different situation.

Table: SWOT analysis: Slovenia

| Strenghts (Internal/Current) | Weakeness (Internal/Current) |
|---|---|
| Stable macroeconomic environment Stable political environment Low country risk Low corporate income tax Modern basic information technology and telecommunication infrastructure Developed public research and technology infrastructure Availability of good health care services and broad coverage of social welfare system Excellent geographic location and connections Bio-diversity, forests and water resources | High level of taxes Unflexible labour market size Dependence on traditional industries Low industrial productivity Low level of FDI |
| Opportunities (External/ Future) | Threats (External/Future): |
| EU and NATO membership Growing demand for water supply | Exogenous recessionary shock A decline in export demand Low capital inflows |

Despite structural changes, the Slovenian economy remains disproportionately dependent on traditional industries. The relatively low share of labour and capital deployed in industries considered to be the twenty-first-century vehicle of economic growth – computer and office equipment, communication equipment, semiconductors and biotechnology – hinders long-term development and weakens the long-term competitive prospects for the economy. Thus, Slovenia's industrial productivity lags far behind most advanced economies and, the export competitiveness of its manufacturers remains low. In 1998, gross value-added per Slovenian employee remained nearly three times lower than in comparable industries in the EU countries (Petrin, *et al.*, 2002).

After European enlargement, Slovenia has increased the location attractiveness for business sector and also improved the institutional competitiveness. Harmonization with EU legislation has improved the institutions and the legal system. On the other side, Croatia stayed outside the first enlargement process, it has to work much more on its less competitive position in comparison to Slovenia.

COMPETITIVENESS GROWTH FACED WITH THE GLOBAL RECESSION

Croatia and Slovenia have high external debt-to-GDP ratios, well above those in other emerging market regions. Given today's global risk aversion, sharply slowing economic growth, and Croatia and Slovenia's high external vulnerability indicators, these high external debt-to-GDP ratios seem unsustainable.

The extent of external imbalances is not the only determinants of the probability of getting into a financial crisis. The SWOT analysis does show that both countries are extremely vulnerable to the drying-up of foreign capital inflows. Moreover, given the similar vulnerabilities in both countries, a crisis in one country has the potential to blow up into a regional financial crisis.

The most significant impact in both countries will be on consumers and businesses in the real economy: Weakening demand from key export markets in Western Europe will reduce demand for both countries goods, according to the fact that they relied on commodity exports, particularly on chemicals and plastics, machinery tools, wood products (Croatia) and on lead and zinc smelting, trucks, wood products, textiles and machinery tools (Slovenia), whose value plunged in the second half of 2008 thanks to falling global demand; Unemployment is likely to rise in both countries. It is already at high levels in Croatia (9, 7 per cent 2007), and is rising significantly from the end of 2008 till now (<http://www.hnb.hr>).

SOME PROPOSALS FOR FUTURE COMPETITIVENESS GROWTH

Since foreign demand is the driving force behind the growth, increasing in competitiveness of Croatian and Slovenian industries is extremely important to participate in the international markets. Diversification of export flows and increases in the volume of exports calls for introduction of improved production programs and innovation in products and processes. Moreover, investments in human capital and technological development will increase labour productivity and strengthen the international competitiveness of both countries the country.

Both countries should re-invent their future competitiveness strategies and policies, taking into the consideration their recent strengths and weaknesses, the same as their future opportunities and threats. As the main threat for Croatia and Slovenia is the global recession, they should pay special attention to their future opportunities on the global market.

CONCLUSION

Although, Croatia and Slovenia, two small neighbouring countries, started the transition to a free market economy, at the similar economic development level, in global competitiveness comparison they greatly differ in their achievements. Today, Slovenia is the EU member country with stabile macroeconomic situation and with the respective global competitive position, and, Croatia is highly lagging behind Slovenia. The brief research on the transition path demonstrated that in Croatia from the beginning until now, there is a huge influence of politics on economy development. Most reforms were externally driven in Croatia, In Slovenia the reforms emerged from the insider's knowledge, government competence and comprehensive strategies.

Slovenia developed the institutions necessary for the competitiveness growth, and this structure in Croatia is still not completely developed. Some basic measures on competitiveness, like GCI, demonstrate the huge differences between two countries. The SWOT analysis of both countries also confirms, that even today, the main weaknesses in Croatia emerge from the huge influence of political interests over economy.

Today, both countries are faced with the challenges and threats of the global recession. The important task for Croatia is that in spite of the significant macroeconomic problems, it should re-invent its further competitiveness strategies, policies and focus on the opportunities from the global economy that could be found out even in the recession period. Slovenia should continue its competitiveness growth and building up new competitiveness policies and pay special attention on its weak economic sides. In both cases, it is necessary that all the stakeholders, decision-makers, in the economy cooperate and follow the comprehensive approach in future competitiveness growth.

VARIATIONS IN THE PERCEPTIONS OF LATINOS OF NON-BASED MEDICAL HEALTHCARE COMPARED WITH THE PERCEPTION OF WHITES

James P Driscoll Jr., Capella University, USA
Luis Eduardo Rivera-Solis, Dowling College, USA

ABSTRACT

This article was based on a study that was conducted in the Latino enclaves of Chicago Illinois, representing the different patient perceptions between Latinos and Whites in the U.S. healthcare system. This article looks at perceptions of soft issues (emotional and spiritual care) not medicinal treatment received within the Latino community compared to Whites. Hospitals, clinics, and physician offices that do not take into account cultural and ethnic differences are aligning themselves to provide a disservice to the Latino population as well as to the public. Without meeting the needs of the Latino population, healthcare organizations are missing an opportunity to address healthcare needs of a particular large segment of the population.

INTRODUCTION

The American healthcare system is dealing with an enormous problem of how to curtail expenditures. The problem is coupled with declining patient satisfaction ratings among healthcare consumers. The uninsured population in America is rising in conjunction with the large numbers of illegal immigrants entering the country who are seeking medical care. Healthcare administrators are facing a dangerous situation of either treating this uninsured population or refusing them treatment. The Medicaid and Medicare systems are becoming increasingly overburdened. As a result, traditional health management organization officials and fee for service plan officials are failing to keep hospitals financially secure.

Continuously improving system quality within the healthcare organization is a key factor in improving overall healthcare quality (Marley, Collier, & Meyer-Goldstein, 2004). Additionally, the use of service recovery methods need to ensure that all individuals who use the healthcare system realize and experience the same level of service excellence regardless of ethnicity. Effective service recovery is an intricate aspect of system quality that involves ongoing development of a strategy to settle customer complaints and dissatisfaction with the ultimate goal of motivating the valued customer to continue to use the service (Schweikhart, Strasser & Kennedy, 1993).

With the American healthcare system under tremendous strain, the administrators of more hospitals are focusing on perceptions of patient care. This perception of care goes far beyond what medical staff can provide for a patient medically. The patient seeks a healthcare provider who understands and knows what the patient is feeling. Perceptions of care vary among cultures, races, sexes, religious groups and even with age may be difficult for a healthcare practitioner to understand. Catering to individuals that fall into different groups can be very difficult as many healthcare practitioners are not aware of the spiritual and emotional needs of their patients. Without addressing the patient's fundamental needs, the health practitioners are at risk of losing their current patient base as well as building upon the patient base to gain more patients.

Based on the increasing Latino population in the United States who have access to healthcare, a large number of Latinos will choose to seek alternative avenues for their healthcare needs rather than use the traditional U. S. healthcare system. Researchers have suggested that an immigrant's location choice (whether in or outside an enclave, within the destination country) depends on his or her human capital characteristics (Toussaint-Comeau, Rhine, & Rhine, 2004).

Many times healthcare practitioners who are sought out within the Latino community or enclave are not licensed to practice medicine in the U. S. or they do not hold a valid medical degree from any institution. Many times these medical practitioners provide a more holistic based method of medical care. This approach can often further complicate the physical health of Latinos based on the lack of proper medical treatment needed for an ailment. Furthermore, these alternative practitioners may not be diagnosing the illness or disease correctly.

An immigrant who chooses to live in an enclave tends to have less education, shorter periods of residency in the U. S., less general experience in the country, and poorer English (Funkhouser & Ramos, 1993). Immigrants with fewer incentives to invest in learning to speak a new language, such as those who plan to repatriate in the future, would prefer to live with those who speak their language and share a similar culture (Toussaint-Comeau & Rhine, 2004). For Latinos, seeking medical care within their particular group is more important to them than seeking recent medical advancements. Yet more importantly for Latinos, there needs to be a bond established between the healthcare practitioner and the patient.

In order for the staff of health systems, hospitals and clinics to provide the best non-medically based care, practitioners and administrators need to understand their populations' basic needs. The study of demographics will not disclose why certain groups of individuals place more emphasis on the magnitude and type of compassion that is often perceived to be a requirement by the patient. Understanding comes from knowledge and acceptance of a culture.

As the migration patterns of the people in the world shift, there is a necessity within the American healthcare system for discreet services that cater to the needs of the individual. Providing healthcare services that serve the Latino population can ensure a healthier status among these individuals, and aid in lowering the incidence of communicable disease within communities and enclaves (Toussaint-Comeau & Rhine, 2004). Additionally, by catering to these Latino groups (assuming they have the means to pay for services rendered), the staff of health organizations will expand the market share of their organizations, enabling them to become more financially stable. It is believed that having consistent care that meets the perception of care will increase regular visits with a physician for preventative care by Latinos. From a financial point of view, it is more cost effective to prevent an illness at the onset of the symptoms than to treat the illness in full onset.

PROBLEM

Latinos perceive a lack of care compared with Whites in the healthcare sector. The prevailing perception of Latinos concerning the quality of the healthcare they receive is far lower the perception of care by Whites. According to the researchers at the Institute of Medicine, even when holding access-related factors, such as the degree of insurance coverage and the ability to pay, the care experienced by minorities is of lower quality (as cited in Reynolds, 2004).

In order to curtail immigrant healthcare costs, there have been initiatives from federal government officials that restrict the amount of expenditures and access to care for these individuals on the federal government level, as well as initiatives with individual hospitals. Programs such as Medicaid and the State Child Health Insurance Program (SCHIP) were developed to ensure access to healthcare among low-income children and families (Kaiser Commission on Medicaid and the Uninsured, 2000). However, the access by Latino immigrants to public insurance has been affected by public policy (Kaiser Commission), and policies that bar public coverage among recent immigrants, target a group that already has limited access to the healthcare system (Carrasquillo, Carrasquillo, & Shea, 2000).

A large number of members the foreign-born population have had almost no contact with the formal healthcare system (Goldman, Smith, & Sood, 2006). One quarter of the members of the population has never had a medical checkup, and one in nine never visits a doctor; these rates are twice those of the native-born persons (Goldman et al.). Women were more likely to seek out healthcare, primarily for pregnancy related conditions; however, the frequency was less than normally expected from pregnant women. If the health status of the Latino immigrant were to improve then there would be an improvement in the health of children, a decline in emergency room expenditures, and a decline in the spread of communicable diseases within both the Latino immigrant population and the Latino nonimmigrant population

Physicians have two major concerns when treating Latino immigrants: (a) the severity of their illness, and (b) the costs associated with that illness. Many times when Latino immigrants present themselves to the emergency room, which is their primary source of healthcare, their initial complaint, is actually secondary to their primary illness. This is due to the lack of available primary care for this group of individuals. Hospitals cannot refuse to treat someone who is ill, but that is not the type of care most of the Latino immigrants need;

they need ongoing and preventative care (Guest, 2002). Consequently, identifying and treating communicable diseases in the early stages requires that undocumented Latino immigrants be able to access services for all health conditions, not just those conditions that have advanced to an emergent level or include symptoms of infectious disease that endanger others in the community (Kullgren, 2003).

The implementation of the Federal Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA) of 1996 greatly restricted the provision for many federal, state, and local publicly funded services to undocumented immigrants (Kullgren, 2003). Many administrators of public health institutions and healthcare institutions have wrestled with the legal, administrative, and ethical conflicts generated by these limitations (Kullgren).

Instead of fulfilling their intended purpose of reducing Latino, immigration and conserving public resources, the wording of the PRWOR placed restrictions on access by undocumented immigrants to publicly financed health services. This has unduly burdened healthcare providers and threatened the health of the community at large (Kullgren, 2003).

To complicate issues further for Latinos, in studies researchers strongly indicated that minorities have fewer choices relative to where they can obtain healthcare and they confront quality-of-life problems that expose them to greater health risks (Minorities bear brunt of healthcare obstacles, 1995). One of the primary reasons for this perceived contrast in care received is the cultural aspect of seeing a physician. In the Latino community, it is crucial for the patient to feel a bond with and form a relationship with their physician. Because of this shifting demographic need, healthcare providers are openly tackling increased challenges in addressing the fundamental obligation to care for patients with varying cultural and ethnic backgrounds (Reynolds, 2004). Language barriers, ethnic backgrounds and beliefs systems, disparities in educational levels, use of folk medicine, discontinuous or uncoordinated care and other factors compromise the probability for mutual trust and cooperation in provider-patient relationships (Worrell, 2002).

The escalating fear of deportation is another barrier that some Latino immigrants face. It is this fear that prevents some Latino immigrants from seeking medical care at hospitals and private practices that are regulated by the U. S. officials. Therefore, these undocumented individuals will either forfeit the care they need or seek underground resources. Under welfare reform, the extremely restrictive eligibility rules for many programs that applied historically only to Latino immigrants also apply to legal immigrants until they become citizens or to refugees 5 to 7 years after their arrival in the U.S. (Huang, Yu, & Ledsky, 2006). According to Huang et al., any child born in the U. S. to Latino immigrant parents still has difficulties accessing care. However, the situation for the child is not as difficult as the one that a Latino immigrant faces. These combined factors have created a poor healthcare experience, which leaves both the patient and healthcare provider dissatisfied with the interaction (Reynolds, 2004).

Another aspect of the perception of care received by Latinos and how it is perpetuated comes from data obtained from the officials at the Institute of Medicine cited by Reynolds (2004), which listed three possible provider mechanisms that may contribute to disparities: “(1) prejudice against minorities, (2) higher levels of clinical uncertainty in communication to ethnic populations, and (3) stereotypes held by providers about, the behavior or health minorities” (p. 239).

An important step in eliminating racial disparities in healthcare is to elucidate the mechanisms influencing the health of minority people (Gee, 2002). A variety of mixed interpretations have been offered, from financial factors such as differences in rates of insurance coverage and economic status to non-financial factors such as culturally based attitudes toward healthcare and barriers presented by language (Schur, Albers, & Berk, 1995). Patient satisfaction could also be influenced by perceived treatment costs (Andaleeb, 1998). Even with insurance coverage, patients may consider some costs to be excessive (Andaleeb). With administrators at insurance companies challenging what they feel are unnecessary claims, costs and operating procedures (Schlossberg, 1990), and employers requiring larger employee contributions to offset rising insurance premiums (Wong, 1990), healthcare consumers may have become much more sensitive to the price issues (Andaleeb).

Latinos seek out medical care at various levels, which complicates the understanding of why they only use the U. S. healthcare system for clinical treatment of certain ailments. It is important to understand that among such communities there is an intense desire by individuals to use Western medical services in the cases of broken bones, vaccinations and pregnancy screenings, but those individuals rely on traditional treatments for ailments such as asthma, backaches, and colds (Worrell, 2002).

Although there are some uncontrollable barriers that prevent Latino immigrants from accessing medical care, in some instances, the Latino has decided not to obtain the necessary medical care. Cultural issues are a leading cause for why some Latinos choose not to receive care. In the Latino community, it is especially important that there is a very personal, yet professional bond with the healthcare practitioner and the patient.

Without this connection, many Latinos feel they are not taken seriously which results in the absence of trust and understanding. When there is a gap in cultural competency patients feel like they are not being understood, respected or valued (Burt, 2006).

Nearly one third of Latinos have reported that they do not have a regular source of care. Latinos were twice as likely as Whites to report long wait periods for care and that the healthcare provider failed to listen and to provide them with needed information (Phillips, Mayer, & Aday, 2000). Anderson (1995) commented about the access of care through a healthcare access model, stating service utilization affected outcomes, population characteristics, health behavior, and health practices determined service utilization. Outcomes also affect access determinants. The healthcare system and the external environment affect health behaviors, health outcomes, and some population characteristics, such as income and education (Anderson, p. 5).

Members of the growing Latino populations centered in large urban areas like New York, Miami, Chicago and in the states of Texas, Arizona, New Mexico, and California that are near the perimeter of Mexico feel the burden of the influx of Latino immigrants. Within these regions, access to and knowledge about primary care is limited. Many Latino immigrants who come to the U. S. are unaware of the valuable resources available to them or of how the U. S. healthcare system functions. New Latino immigrants or U.S. born Latinos residing within an established Latino community often lack any knowledge, have only limited knowledge of the existence of, or function of primary healthcare services. Most Latinos will choose to go to a healthcare practitioner within their own community or to someone that has been recommended from a member of their community.

The healthcare arena is an industry in which customer satisfaction is critical to building a satisfied customer franchise; word of mouth recommendations are crucial (Plymire, 1991; Reichheld & Sasser, 1990). It has been estimated that the role of loyal patients is equal to two or three times their own value as customers based on word-of-mouth networking (MacStravic, 1995; Rubin, Gandek, Rogers, & Kosinsky, 1993; Winston, 1998).

Today hospital administrators must compete in a market based on quality, price and product just as any business owners would who provide goods and services to the public (Panko, 1996). More pressure is falling on healthcare providers to give better service with more options. This is in part because patients are paying more for their healthcare coverage and as a result are demanding more in return. Healthcare providers are aware of this situation and realize that cost effective and efficient care is a necessity, not an option.

Healthcare administrators are not alone in experiencing the rise in healthcare costs. Because patients are feeling the increase in their healthcare costs also, they expect more in terms of services from their healthcare providers. When hospital administrators need to reduce expenditures, this affects not only patients in the hospital but members of the community also feel the impact.

Community health orientation refers to the organization-wide generation, dissemination and use of community intelligence to address present and future health needs (Ginn, Lee, & Ellis, 2006). Hospitals that are community health oriented have the following attributes: (a) a community-oriented mission statement, (b) resources committed for community benefit activities, (c) community health status assessments, (d) use results of assessment to design or modify services, and (e) perform long-term planning for the improvement of health in the community (Seay & Sigmond, 1989).

PAST RESEARCH FINDINGS

In past studies, researchers suggested that the administrators of healthcare organizations could develop a community organization by generating, disseminating and adeptly responding to market information, resulting in better identifying and satisfying customer needs (Proenca, 1998). Proenca, Rosko, and Zinn (2000) examined community orientation in hospitals from an institutional and resource-dependence perspective using 1994 and 1995 American Hospital Association (AHA) survey data and found that the nature of environmental pressures and hospital administration interests influence the degree of community orientation (Ginn, et al, 2006).

The community health of Latinos can also affect the health of individuals of non-Hispanic descent that have direct contact with the members of the Latinos community. To provide complete services for the Latino community, healthcare practitioners who work in hospitals and health systems need to develop outreach programs that incorporate an understanding of the Latino community's origins and characteristics including the beliefs, institutions and expectations regarding healthcare (Stevenson et al., 2002). Jose Moreno, Director of Public Affairs, and Hispanic Marketing for GCS public relations in San Diego California stated that understanding the values and mindset of the people of a minority community is critical to any effective marketing campaign to such groups (Worrell, 2002).

The spoken language barriers are causing the discrepancies in perceptions between Latinos and Whites. Language and cultural barriers have become such a challenge that in 1999 the officials of the U. S. Department of Health and Human Services Office of Minority Health developed standards of care within these areas (Reynolds, 2004). Furthermore, researchers suggested from the data that the lower the education level, misperceptions that are more prevalent exist. This is especially significant during the birthing experience.

Many hospital administrators are implementing service excellence initiatives to increase patient satisfaction among the patients and the staff. Soft issues are those initiatives or patient experiences not related directly to the medical treatment received, but more how the physicians and staff treat the patient. Patient satisfaction initiatives are becoming increasingly popular as hospital administrators realize the vulnerability to shifts in market share as more healthcare services become available in communities. Many people can now choose where to receive their medical treatment. Patients not only select for the medical treatments provided, but for the services and amenities that are offered to the patient and to the patient's friends and family. By transforming the attitudes of the healthcare providers and hospital staff toward Latino patients and providing staff training, hospital administrators increase the likelihood that the facility will become the provider of choice when the Latino market share matures (Stevenson et al., 2002).

Kurz and Wolinsky (1985) and Heistand (1986) found customers are relying less on doctors to select the right hospital. This reflects the importance of the patients' point of view. It does not matter who is right or wrong. What matters is how the patient felt during their experience, even though the caregivers' perception of their experience may be quite different (Pettersen, 1998). Often the patient's perception is that the treatment from hospital staff is not reflective of the respect and dignity they deserve. If this is the case, the hospital staff is actually performing a disservice to the patients and the patient will most likely not return to that particular hospital. Although most of these healthcare facility administrators offer staff translation services and bilingual signage, they often have ceased to make the changes necessary to become accepted by the Latino community (Stevenson et al., 2002). The reduction in these changes can be very costly to a hospital as word of mouth within community members can have devastating results to the hospital's market share. These issues are likely to exacerbate medical problems that require high quality of care provided (Reynolds, 2004). An academic study cited by the National Management Healthcare Congress (as cited in Reynolds) estimates that if healthcare disparities were eliminated in the state of Pennsylvania, dollar savings to the U.S. healthcare systems would total \$30 million annually for diagnoses that are common to minority patients.

Communication is as important as respect and dignity. Healthcare managers must gradually develop strategies that promote respect for individuals and cultural dissimilarities, incorporating a trust-promoting method of inquiry (Riddick, 1997). Not only can an absence of communication have a detrimental effect on a patient's perceptions, but also the misinterpretation of verbal language and body language can be equally damaging. The better the quality of communication perceived by the patient, the greater will be his or her level of satisfaction (Andaleeb, 1998).

The delivery of excellent service will help ensure that all patients receive treatment equally with compassionate and respectful care. Good demographic data relative to the relationship between racial and ethnic composition and care is a necessary first step in identifying successful models for health plans to reduce healthcare gaps (Wechsler, 2003). Without this element, Latino patients will feel that they do not receive the best care possible. Since the spoken language barrier and the translation of English into Spanish is such a crucial aspect, hospital staff needs to shift their focus onto this area. When translating from English to Spanish, it is important not to lose the true meaning of the translated message for the patient.

Cleary and McNeil examined the relationship between quality and satisfaction and found that better care, along with good communication skills and empathy, lead to greater patient satisfaction (Marley et al.). Goldstein and Schweikhart empirically tested the relationships between the six dimensions of the Baldrige model (leadership, strategic planning, focus on patients, other customers and markets, information and analysis, staff focus and process management) and their efforts on organizational performance results (Marley et al., 2004).

In light of the increasing pressures on the administrators of healthcare organizations to cut costs, three factors can be used to judge their performance: change readiness, quality improvement and cost management (West, 1998). Measuring quality in healthcare has taken on a new dimension as quality measures for clinical outcomes have now moved into the patient satisfaction realm. Clinical quality outcomes are important as in measuring the quality of care. Clinicians need to address issues that may arise from certain protocols and methods of treating patients. Using this crucial information allows the clinicians to determine better quality outcomes and to develop new treatment protocols.

Responsiveness to customer needs is a relatively new topic of discussion for personnel in healthcare industry. As hospital facilities become overburdened with patients, and hospital administrators are burdened with

financial constraints, maintaining staff responsiveness to patients can be a difficult target to meet and to measure. This is because the degree of responsiveness is most often a patient's own perception of time. Unless the healthcare staff is using a measure that is both qualitative and quantitative, the results can vary and be invalid.

The hospital staff's responsiveness to medical needs is no more important than the ability to be empathetic to the patient's emotional needs. Empathy is difficult to measure because it deals with a patient's feelings and fears. When patients enter the hospital, their emotions can range. Some patients experience relief, as in the case of many elderly and terminally ill patients who are mentally prepared to die. Some patients also experience anxiety and fear.

Administrators of healthcare institutions are realizing that in order to meet patient expectations and gain market share, there needs to be a measure of how well the healthcare institution's staff is performing, not only from a clinical standpoint, but from the patients' standpoint also. Many healthcare institutions administrators now have set up patient satisfaction or customer service staff that report findings using a balanced score card or dashboard report (Curtright et al).

Measuring the patient experience, healthcare providers can learn where deficiencies occur in their delivery of healthcare services. A thorough understanding of the patients' needs and what must be accomplished to meet those needs has a positive impact on the patients and the overall success of the hospital. Healthcare is an industry that relies heavily on word of mouth to convey how the organization's staff meets the needs of the patients, both from a spiritual perspective and medical perspective.

In order to meet the demands of the changing demographics within the healthcare industry, healthcare providers are examining models to ensure the direction they are moving meets patient needs.

RESEARCH FINDINGS

To determine exact perceptions a study was conducted in local Latino enclaves in Chicago, Illinois. The target population was any Latino and White adults (18 years of age or older) who were patients seeking non-emergent medical treatment at physicians' offices and local clinics in the enclaves of Chicago, Illinois.

To accurately measure the perception of participants of non-medical based care that they received from healthcare practitioners, all eligible participants were asked to assess 10 aspects of quality of care in English or Spanish, these 10 aspects were:

1. Ease of speaking with your primary care provider (*La facilidad de hablar con su proveedor de atención primaria*).
2. Friendliness and courtesy shown to you by the receptionist and other front desk staff (*La amabilidad y la cortesía se muestra a usted por el recepcionista y otros recepción de personal*).
3. Explanations about prescribed medicines (*Las explicaciones acerca de los medicamentos prescritos*).
4. Explanations of medical procedures and test results by primary care provider (*Las explicaciones de los procedimientos médicos y los resultados de las pruebas por proveedor de atención primaria*).
5. Friendliness and courtesy shown to you by your primary care provider (*La amabilidad y la cortesía se muestra a usted por su proveedor de atención primaria*).
6. Friendliness and courtesy shown to you by nurses and other medical staff (*La amabilidad y la cortesía se muestra a usted por enfermeras y otro personal medico*).
7. Training, skill, and experience of the nursing staff (*La capacitación, la habilidad y la experiencia del personal de enfermería*).
8. Your primary care provider's concern for your mental health or emotional well-being (*Su proveedor de atención primaria de la preocupación por su salud mental o el bienestar emocional*).
9. How well your care meets your needs; (*Cómo así su cuidado se ajuste a tus necesidades*).
10. Overall quality of care (*En general la calidad de la atención*).

Each question was scored using an ordinal scale of 1 (*very poor*), 2 (*poor*), 3 (*fair*), 4 (*good*) and 5 (*very good*).

When evaluated by race, the gender distribution changes little, males continued to comprise the largest number of participants within the Latino population ($n = 69$, 54.3%) and dropped slightly below the majority ($n = 65$, 47.4%) within the White race.

The question "Overall quality of care". From these descriptive showed that participants are satisfied overall with the care they have received; this pertains to both Latinos and Whites who participated in the study.

The question that caused the most concern was "Your primary care provider's concern for your mental health or emotional well-being". When compared with the other mean scores this question had the lowest mean

with a standard deviation of 23.2329 ($n = 233$). This was also the most unanswered question in the study that related to the care that participants received. Two of the most answered questions, both with a response rate of 264, were “Ease of speaking with your primary care provider” with a mean of 80.4976 and a standard deviation of 20.5040 and “Explanations of medical procedures and test results by primary care provider” with a mean score of 85.5167 and a standard deviation of 19.7383.

Looking at the correlations for both Latinos and Whites, there were three definite correlations. First, it can be said that the question of “Friendliness and courtesy shown to you by nurses and other medical staff” has a direct influence on how the patient scored “Training, skill, and experience of the nursing staff”. This was an interesting point especially when looking the correlation between “Explanations of medical procedures and test results by primary care provider” and “How well your care meets your needs”, and the relationship between “Explanations of medical procedures and test results by primary care provider” and “Friendliness and courtesy shown to you by your primary care provider”. The results of these correlations confirmed a relationship to the communication between the patient and the medical staff.

The following questions: (a) “Friendliness and courtesy shown to you by the receptionist and other front desk staff”, (b) “Friendliness and courtesy shown to you by nurses and other medical staff”, (c) “Your primary care provider’s concern for your mental health”, (d) “Ease of speaking with your primary care provider”, and (e) “Training, skill, and experience of the nursing staff” all produced a negative relationship indicating that as the Latino age group matures their experience or perception of quality in these areas decreased.

When compared to the Latino group, the result for the White group shows stronger positive relationships. This indicated that as the Whites age, their perception of the quality of care received is higher than the same perception by the Latinos. In all the cases that showed a positive correlation, it was evident as a person grows older more emphasis is placed on the quality of care received. Having a personal relationship with healthcare providers, especially among the Latinos, was important to perception of care.

In order to understand why this perception relative to care exists among members of the Latino population, it would be necessary to survey the healthcare staff as well to determine why certain patients feel this difference in perceived care. One common element that has been mentioned previously in other academic studies is the amount of time that the healthcare staff spends with the patient. This element could identify a correlation to negative patient experiences or could be a possible reason for the negative experiences.

Members of the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) have acknowledged that patients’ “psychosocial, spiritual, and cultural values affect how they respond to their care” (p. RI-8) and has addressed spirituality and emotional well-being as aspects of patient care (Clark, Drain & Malone, 2003).

Healthcare providers are not spending enough time (extensive communication) with the patients. The patients interpret this situation to mean that the healthcare provider lacks interest in the patient. This situation was not to be interpreted that the quality of medical treatment given to the patient population participating in this study was of poor quality, but the emotional care was less than desirable.

When a patient questions a physician’s methods of practice, the patient will often doubt the physician’s abilities. Several different outcomes can arise from this situation within the medical field. First, the patient may ignore the physician’s advice or treatment protocol and choose to go to another physician. Second, the patient may elect to just stop seeking treatment, and third, the patient may choose alternative methods of care. The last two scenarios put the health status of the individual at risk.

The strong correlation between the survey questions regarding “Explanations of medical procedures and test results by primary care provider” and “How well your care meets your needs” suggested that some component of the care given failed to meet the patient’s expectations (Clark et al., 2003).

The amount of time a physician spends with the patient can determine how a patient perceives the care he or she has received. With the current trend of physicians spending less time with each patient due to patient volume, the patient may at times feel the visit was rushed. This can also make the patient feel or believe that the physician does not care about his or her needs.

When a patient communicates with their physician, frequently the patient may not know the specific questions to ask about his or her health or treatment programs. There often exists an assumption that the physician will communicate all information and address all concerns and treatment protocols without the patient having to prompt the physician. With the decreased amount of time a physician spends with the patient, the physician may address only those concerns and questions brought up by the patient.

It is possible that the communication between the physician and the patient is less than satisfying for both parties involved. The physician may assume that the patient understands completely what the physician is

trying to communicate about the patient's health. The physician may feel frustrated based on the inability of both parties to effectively communicate and as a result, discourage any dialogue about the patient's condition

Patients who do not understand their medical condition rely on trained medical professionals to help them understand their condition and any appropriate medical treatment. If this source of information is lost, Latino patients feel more isolated as compared to their White counterparts. Lacking the capabilities to communicate in multiple languages is a detriment to the medical practice.

When a physician cannot communicate effectively about a disease and treatment, or when a patient cannot describe an illness or symptom, it can be difficult to build the trust and rapport needed in the physician-patient relationship. Even more importantly, the patient and physician will lack the basic connection needed to result in appropriate care. This; appropriate communication is necessary for ensuring quality and safety in healthcare (Joint Commission on Accreditation of Healthcare Organizations, 2005).

Unmet patient emotional needs have been associated with patient's desires to discontinue patronizing a specific hospital as patients can become confused about the services provided (Kent, 1996). Poor interpersonal care increases malpractice risk, (Hickson, 1994), and good interpersonal care reduces it (Levinson, 1994). Testimonials from persons involved in medical error lawsuits have suggested that lawsuits are filed not just for financial reasons but because people feel abandoned, aggrieved, and better physician-patient communication and acknowledgement might alleviate this (Levine, 2002).

CONCLUSION

A breakdown in communication creates a *snowball* effect that can harm the patient and the healthcare institution. The physician has a responsibility to inform the patient of the best treatment plan for his or her health. The physician also has a responsibility to inform the patient when there is an error, even when the error is due to communication.

It has been shown that if a patient is satisfied in an emergency department they will be more likely to recommend that hospital to others (Karpiel, 2000). The significance of one patient admission that is either gained or lost per day can make the difference of \$3.65 million in annual gross revenue (Karpiel, 2000). Therefore, the significance of only affecting merely one patient's satisfaction can prove to be overwhelmingly profitable.

In order to increase gross revenues the patient base needs to increase in addition, the culture within the organization needs to change. When employees embrace the knowledge and power to perform their jobs, employee loyalty increases, which can lead to higher productivity, and in turn greater customer value. A mere 5% jump in customer loyalty can boost profits 25% - 85%. (Heskett J.L., Jones T.O., Loveman G. W., Sasser Jr W.E., Schlesinger L. A., 1994).

Further research that is directly related to the Latino patient experience would prove to be very valuable to members of the healthcare industry. With the rapid growth of Latino populations and Latinos becoming prominent users of the U. S. healthcare system, Latinos not only contributes to the financial success of healthcare organizations, but they also influence the care they receive.

Studies conducted in areas that have a large population of Latinos but a small the number of Latino healthcare providers will have different results when compared to areas with a higher number of Latino healthcare providers. This would be true for any study conducted based on the perceptions of care by an ethnic group. The results of this study cannot be generalized across the U. S.; therefore, careful consideration is needed to ensure that the results of future studies are not specific to one region, and that studies of the Latino perception of care identify the same issues across the nation. Recognizable patterns may emerge in terms of how Latino perceptions of healthcare are viewed with respect to emotional care received.

CUSTOMER EXPERIENCE AS STRATEGIC DIFFERENTIATOR IN RETAIL BANKING

Adri Drotskie
University of Johannesburg, South Africa

ABSTRACT

The challenge that retail banks face is to find a sustainable strategic differentiator that will give the organization a competitive advantage. This paper investigates the possibility of customer experience as strategic differentiator through a literature review on customer experience as a concept and its elements and comparing it with the marketing mix. Measuring the total customer experience quantitatively and qualitatively adds value to organizations through the interpretations of the results and therefore understanding the customer.

INTRODUCTION

Within a period of some 25 years retail banks moved from offering simple loans and receiving deposits to providing a wide range of lending and savings products. Retail banking became dependent on technology and entered into real competition with other banks and other companies. All this meant rapid change within a powerful ethos (Croxford, Abramson & Jablonowski, 2006:9).

The financial services industry (of which retail banking forms an integral part) is continuing its dynamic change. Dibb and Meadows (2001:169) argue that the major players in retail banking are becoming increasingly blurred as the effects of mergers, flotations and new market entrants are felt. More than ever before, retail banking managers need a detailed understanding of their customers, their current and potential profitability, how to meet the needs of their best customers successfully by providing an appropriate range of financial services, and how to prevent these valuable customers from switching to other service providers.

Obtaining and sustaining a competitive advantage in banking - and specifically in retail banking today - sets the challenge to determine one thing that will differentiate one bank from another. Retail banks worldwide are trying to find that sustainable competitive advantage and it currently seems possible by strategically focusing on customer experience as the key differentiator.

Using the total customer experience as the differentiator is critical in that it takes the total customer offering into account as well as emotional and behavioural aspects of the actual experience. The experience is considered from the customer's point of view and not only from the organisation's point of view.

The following research question is based on this problem: "Is customer experience a strategic differentiator in retail banking?"

CUSTOMER EXPERIENCE AS A CONCEPT

This study focuses on customer experience as a differentiator. This section describes and analyses the concept of customer experience.

Introduction to customer experience

Over the past few years, there has been an increasing trend towards creating “experiences” for customers, particularly for those in the services sector. Because of this trend, authors such as Pine and Gilmore (1999:ix-x) are of the opinion that the service economy has been transformed into an attention economy, an entertainment economy, a dream society, an emotion economy or an experience economy. As the commoditisation of many service offerings continues, organisations have to devise new ways to achieve a competitive advantage, and in particular by focusing on the design and management of customers’ experiences. Experiences are inherently emotional and personal (Pullman and Gross, 2003:215).

To compete successfully in the customer experience territory, a growing number of organisations are systematically applying the principles and tools of total customer experience (TCE) to generate, strengthen and sustain enduring customer loyalty. Marketers today believe that engineering TCE and lasting customer loyalty are important in maintaining a customer focus and in creating customer preference (Mascarenhas, Kesavan and Bernacchi, 2006:397).

Organisations that apply total customer experience principles have the following features in common (Mascarenhas, Kesavan and Bernacchi, 2006:398-399):

- Anticipating and fulfilling customer needs and wants better than competitors do
- Providing real customer experiences
- Providing a real emotional experience
- Providing experience as a distinct market offering
- Utilising experiences as interaction
- Changing experiences into engaging memories

These principles listed above imply the customer experience is applied throughout the organisation. The customer experience is in the DNA of the organisation – its people, processes and architecture.

The evolution of a total customer experience

The concept of a total customer experience as utilised in this study evolved over time. Figure 1 shows this evolution from a service quality focus during the 1980s to a customer service focus during the 1990s and recently a total customer experience focus. This shift in focus is found in strategies of organisations where “quality” was a well-known concept in vision statements during the 1980s, moving to “customer focus” or “customer centric” being utilised in vision statements during the 1990s. It is important to note in Figure 1 that customer experience includes the concepts of customer service and service quality.

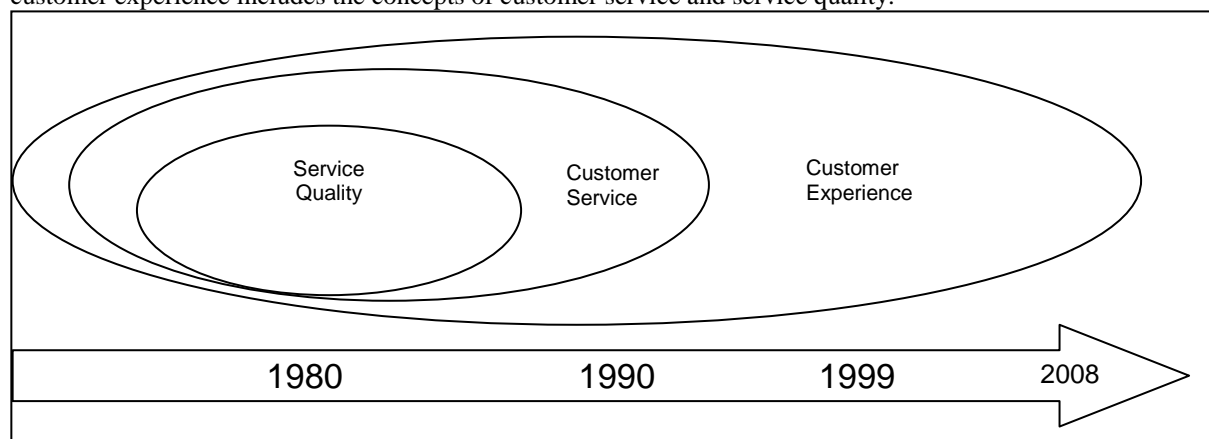

Figure 1: The evolution of customer experience

The modern concept of customer service has its roots in the craftsman economy of the 1800s, when individuals and small groups of manufacturers competed to produce arts and crafts to meet public demand. The advent of mass production in the early twentieth century, followed by an explosion in the demand for goods after World

War II, increased the power of suppliers at the expense of consumers and reduced the importance of customer service. A shift in this balance began in the 1970s, as international competition increased and the dominance of Western manufacturing was challenged, first by Japan, then by Korea, China and other developing economies. Producers responded by improving the quality of their products and services (Berry, 1999, in Zeithaml and Bitner, 2003:11-12).

A good example of the evolution of customer experience is the mobile phone market in Europe. According to Shaw (2007:5), this industry enjoyed massive growth during the late 1990s and early 2000s and effectively could not care less about customer experience.

DEFINING TOTAL CUSTOMER EXPERIENCE

Customer experience has been defined by many authors. It is a holistic concept and comprises various elements. Total customer experience is a concept that evolved over time to become a systemic and holistic concept focused on the customer. It is about a “human” interaction and therefore the emotions of customers are a vital part of an experience.

The researcher believes that the definition by Seybold (2002:108) namely “a total customer experience is a consistent representation and flawless execution, across distribution channels and interaction points, of the emotional connection and relationship you want your customers to have with your brand” encompasses all the most important aspects of the total customer experience and is therefore adopted for this study.

The customer experience is felt in all interactions with an organisation and therefore it is important to understand that customers interact with an organisation through various means and the experience must always be the same.

Comparison between the elements of the marketing mix and the elements of the total customer experience

The elements of a total customer experience have been described in the paragraphs above.

Figure 2 below illustrates the comparison between the two lists of elements. There is a strong correlation between the elements of the customer experience and those of the marketing mix. The difference between the two lies in the more strategic and holistic approach to customer experience and more focus on looking at the interaction with the customer from the customer’s point of view which includes elements such as customer expectations, measurement and strategy.

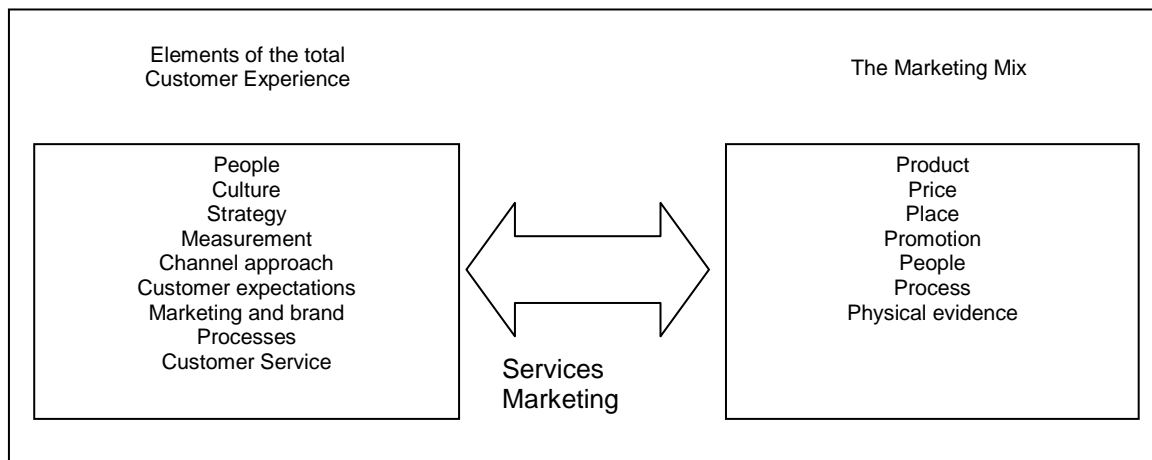

Figure 2: Comparison: Elements of a customer experience and the marketing mix

Source: Adapted from Shaw (2005) and Zeithaml and Bitner (2003)

The total customer experience incorporates all the elements of the marketing mix in a direct or indirect manner.

TOTAL CUSTOMER EXPERIENCE AS DIFFERENTIATOR

Product, price, service and customer experience are described as possible differentiators in retail banking. The researcher showed through literature study how product, price, service and customer experience were identified as differentiators in retail banking over time. In this paper the focus is on customer experience as differentiator.

Product, price and service have all been utilised as possible differentiators in the retail banking industry over time. This paragraph depicts the total customer experience as differentiator in retail banking inclusive of product, price and service.

In the discussion below, the researcher attempts to illustrate through literature studies that total customer experience could be a strategic differentiator:

- (i) The traditional differentiators of product, price and quality are becoming less important every day. Differentiating in terms of price, quality and delivery is no longer a sustainable business strategy. Products and services have become too similar and, as Shaw (2005:xix) says, we suffer from “the blight of the bland”. Customer experience is the next competitive battleground to provide a source of sustainable differentiation.

In the modern commoditised economy, customer experience is the only differentiator. Product, price, people and technology are all similar. The meaningful aspects customers remember, over and above products, are the feel for and the perception of the organisation and the brand. “It is therefore the customer experience that makes you different” (Shaw, 2005:1-2).

- (ii) Organisations compete best when they combine functional and emotional benefits in their offerings. Emotional bonds between organisations and customers are difficult for competitors to sever. A growing number of organisations are systematically applying principles and tools related to customer experience management to strengthen customer loyalty. Unlike many product or service enhancements, the holistic nature of these experiential designs makes them very difficult for competitors to copy (Berry, 2002:89).

The arguments by the various writers and experts on customer experience in the literature studies above illustrates that the total customer experience which includes product, price and service can differentiate one organisation from a next, leading to a competitive advantage.

MEASURING THE TOTAL CUSTOMER EXPERIENCE

Quantitative measurement

An integrated service measurement (ISM) framework was developed to measure the total customer experience. To align customer experience being defined as more than customer service, but including service, the basic service needs of customers were included in the framework. Customer experience is also defined as including the emotions and behaviour of customers and therefore the framework includes a measurement on an attitudinal and on a behavioural level as well as loyalty of customers towards a retail bank. The ISM framework is illustrated in Figure 3 below.

The ISM framework was populated with all the research findings acquired through questionnaires. The findings were categorised as information for a retail bank or for a particular segment, product or channel related business unit. A five-point Likert scale was used for the framework due to the fact that a Likert scale is the only summated rating scale that uses a set of agreement/disagreement scale descriptors and it collects only cognitive-based or specific behavioural beliefs (Hair, et al., 2006:393).

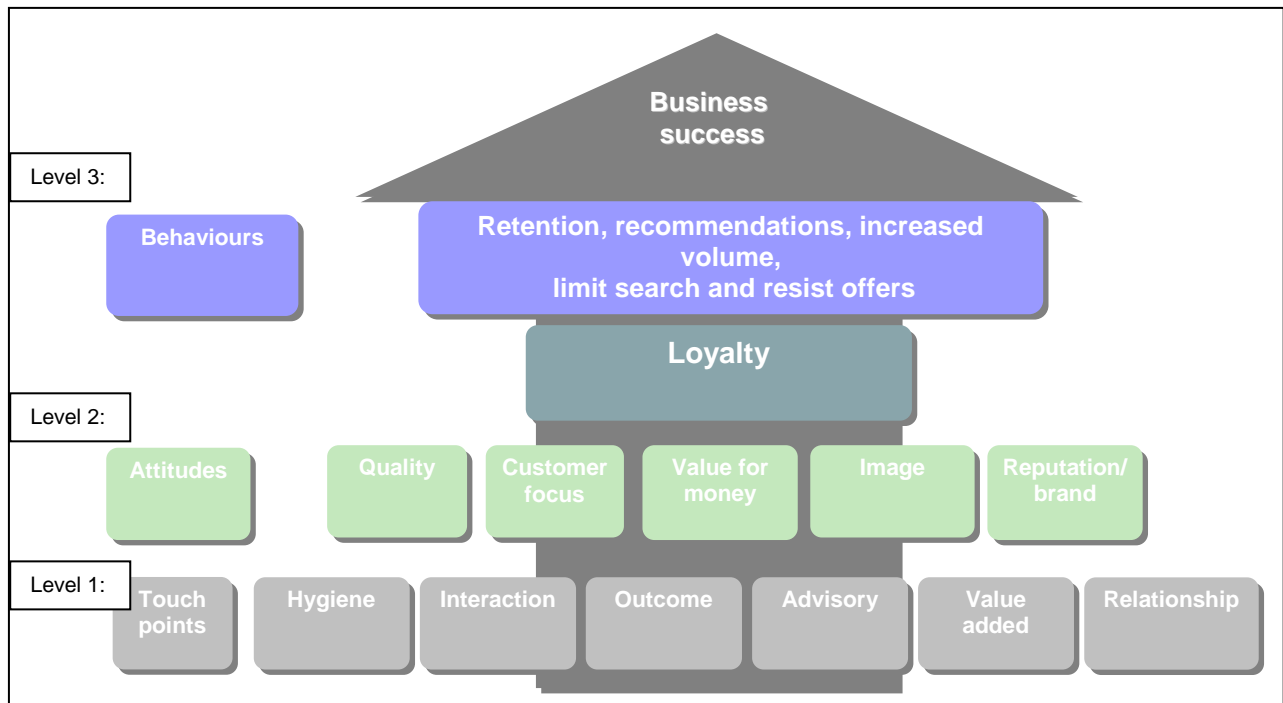

Figure 3: The ISM framework

Qualitative measurement

Through the literature study the researcher identified the fact that customer experience is about the customer's feelings, emotions and tangible experiences.

The need arose to add a qualitative dimension of measuring customer experience. The researcher formulated a technique or methodology that was based on story telling and quantifying the stories into themes, values and behaviour.

Collison and MacKenzie (1999:38-40) argue that stories are one of the earliest forms of communication from tales forming myths to legends. Stories often have the power to convince members of an organisation of a new perspective. This means of passing on knowledge has seen a developing interest with business and retail organisations recognising the importance of stories in organisations.

The story telling approach often relies on pictorial material such as cartoons, photographs or drawings. The methodology used in this study was developed by IBM and is called Cynefin. The researcher worked with Cynefin consultants to identify the specific needs of Bank X and develop a process through which Cynefin can add value to measuring total customer experience in a qualitative manner.

Cynefin is based on the principle that exploring issues through multiple perspectives allows one to see things from all sides. The most effective technique for understanding experience is story telling. Stories in organisations reveal the patterns of culture, behaviour and ideas. When people tell stories about their experiences, they do so in a manner that reveals "the moment of truth" that cannot be manipulated. Thus, the power in stories is their ability to provide real insight in an uncontaminated manner. Story telling allows one to reach a wide range of different people (Collison & Mackenzie, 1999:38-40).

SUMMARY OF CUSTOMER EXPERIENCE MEASUREMENT RESULTS (QUANTITATIVE AND QUALITATIVE) AT A RETAIL BANK

It is evident from the analysis of the research results that customer experience is a holistic concept with many dimensions, namely service needs, attitudinal, behavioural and loyalty and elements, namely people, culture, strategy, measurement, channel approach, customer expectations, marketing and brand, processes and customer service. It should therefore be measured by using a holistic approach.

Qualitative as well as quantitative measurements are necessary because a figure or score cannot explain the emotions that accompany an experience. Qualitative research depicts something of the emotional side of the experience, in this case by using a story-telling method.

It is also important to measure quantitative data holistically and this was done by means of the different levels of measurement in the ISM framework.

At the attitudinal level, the results indicate more than basic needs. Some emotions are beginning to show, and the quality of the organisation, its customer- focused approach, its reputation and its brand now come into play.

The third level in quantitative measurement is behavioural data. This information is crucial to the organisation with respect to customer acquisition and customer retention.

The qualitative measurement through the Cynefin framework adds a “personal” touch to the numbers obtained through the ISM framework. It adds the emotions and feelings of customers leading to a measurement of the total customer experience.

CONCLUSION

This paper provides highlights from a PhD study. The purpose of the study is to investigate if customer experience is a strategic differentiator in retail banking.

The researcher depicted in this paper the literature study conducted and quantitative and qualitative measurement frameworks applied to emphasise total customer experience as differentiator and therefore illustrating the value of understanding the total customer experience and what it encompasses.

HEALTH CARE SPENDING IN CROATIA AND SELECTED EU COUNTRIES – A PANEL UNIT ROOT ANALYSIS

Ivo Družić, Šime Smolić and Marija Penava
University of Zagreb, Croatia

ABSTRACT

In the past four decades there is a sharp increase in the total health care spending, especially in developed countries. A rise of the share of health care spending in GDP is mostly driven by the ageing population, a progress of medical technology and the expectations of the increase in population, namely patients. In this paper the health care spending and the outcomes of the health care system will be analyzed with respect to Croatia and 11 selected countries of the European Union (EU). We shall investigate the link between per capita health care expenditures and GDP per capita using panel data unit root tests. The outcomes of the health care resources' usage and the effectiveness of the health care systems will be observed using the data on infant mortality, life expectancy and standardized death rates.

INTRODUCTION

In the past decades, numerous studies and papers examined the relationship between health care expenditures and its drivers. As in some countries the escalation of the medical care spending continues, the pursuit for alternatives that try to slow the named growth has focused on the supply side. According to Getzen (2006), the studies of the national level health care costs clearly show that costs rise with an increase in per capita income. However, the relationship between income and expenditures is often not found in studies that examine individual health care costs. This was explained by disparities in variations between national and individual costs. Furthermore, Henderson (2007) highlights that a demand for medical care is derived from the individual's desire for good health. Individual patient factors (health status, demographic characteristics) play a key role in determining the demand for a medical care. Policymakers are more interested in economic factors that affect demand since the individual incomes, the level of the out-of-pocket spending, and the availability of medical insurance are more easily manipulated. Dreger and Reimers (2005) presented the cointegration relationship among health care expenditures, a GDP, both real and in per capita level, and a medical progress. They also found that the income elasticity in the panel models is not different from unity which implies that health care expenditures are not a luxury good. In that study, the income is not the only determinant of the health care expenditures but rather a medical progress. Blomqvist and Carter (1997) investigated a health care-income relationship by testing for a presence of an independent time trend in the health expenditure series. Their conclusion indicated that the demand for a health care is predominantly affected by technological progress in medicine. Technological progress shifts out the demand curve for health services, which increases that total spending, regardless of the price elasticity being smaller than one. They also estimated income elasticity with respect to the institutional differences among the countries in the sample; the estimation being around one. Otherwise the result was a much higher elasticity estimate.

In this paper a different set of countries, primarily Transition countries, are observed. Like in a chosen set of developed countries of the EU, the health care systems in Transition countries are going through numerous reforms in the attempt to adapt to the new conditions. Firstly, there is a pressure for higher private expenditure due to the rising costs of health care services, especially pharmaceuticals. For the long period of time the GDP growth rates in selected countries were lower than the growth rates of health expenditures; hence, the increase in

the share of the total health care expenditure in GDP. That disparity can definitely be confirmed in some health care systems where the countries, such as Croatia, are struggling to reduce the fiscal pressure. The reasons for the cost-containment policy in Croatia are maybe different of those in Slovakia or Hungary, or even in Sweden, but they all have the same denominators – increasing the share of elderly in the total population, new and sophisticated medical equipment, high pharmaceutical expenditures and rising expectations of patients. In attempt to control the growth rate of public health care expenditures, many countries introduced or increased co-payments over time, especially for inpatient care and pharmaceuticals. Recent results of cost-containment policies suggest the mixed successes of implementation of these policies.

HEALTH EXPENDITURES

According to OECD (2007), the expenditure on health care measures the final consumption of health goods and services (current health expenditure) plus capital investment in a health care infrastructure. This includes spending by both public and private sources, public health and prevention programmes and administration. Hence, it is thought that a health spending to GDP ratio and a health spending per capita should be considered jointly. Countries having a relatively high health spending to GDP ratio might have relatively low health expenditure per capita; the conversely also applies. In accordance with the available data, our analysis includes Croatia and a set of eleven countries of the European Union, namely Austria, Czech Republic, France, Germany, Hungary, Poland, Slovenia, Slovakia, Spain, Sweden and UK over the 1990 - 2005 period.

Figure 1: Health Spending to GDP (%) vs. GDP p.c. at PPS, (constant 2005 international \$)

Figure 1 shows a positive correlation between the GDP per capita at purchasing power parity and a health spending to GDP ratio. Richer countries typically spend a greater share of their GDP on health care services while some, like Germany and France in 2005, spent more on health care than it anticipated given their GDP per capita. These two countries are also the greatest outliers in our analysis. The population ageing effect is one possible reason for high health care expenditures, as given by per capita public health expenditures' indicator. Although the indicator was weak in the past, today it is assessed as strong in developed and numerous Transition economies. This assessment is based on the combined effect of the projected increase in the share of older people in the population (65 and over) and a tendency of increase of health expenditures per capita with age. Another driver of health expenditures is certainly the income growth. According to Oliveira and de la Maisonneuve's (2006) study, public health spending grew by 3.6% per year in OECD countries in the period 1981 till 2002. They consider that the named increase is attributed to the income effects in the amount of 2.3 percentage points. The factors underlying the residual expenditure growth are thought to lie in technology, pure

demographic effects and relative prices of health care services. It is proven that the relationship between income and health care is strong, but the nature of that relationship is far from clear.

Effectiveness and efficiency

Getzen (2007) emphasized that wealthier countries are also healthier. These countries also tend to spend more on a medical care. However, higher spending does not necessarily buy better health. Other numerous factors associated with higher incomes, such as education, nutrition, and sanitation, are also known to improve health. Furthermore, over past decades the life expectancy has significantly increased in many poor countries, even when the availability of doctors and GDP per capita declined. Although, as previously mentioned, it is difficult to clearly demonstrate that medical care has an independent effect on the average life expectancy, there is a strong relationship between mortality and income. The infant mortality rates are among the most commonly cited in international comparisons of health status. These rates measure much more than differences in health care across countries, and are affected by the socioeconomic factors. Filmer and Pritchett (1999) found that the impact of public spending on child health (under-5 infant mortality) is quite small, while other factors, such as income per capita, inequality in income distributions and female education are the more influential determinants.

When compared to countries at a similar level of income, Croatia has performed well in terms of health outcomes. Croatia's standardized death rate of 886 per 100,000 (2005) is very close to the average EU rate of 678. Infant mortality rate of 5.7‰ (2005) is also low, lower than in Poland, Hungary and Slovakia, but still above the average of 4.7‰ in the European Union. The costs of achieving satisfying health outcomes in Croatia come at a moderate price in terms of per capita spending. However, Croatia spent 8.1 per cent of GDP on health in 2005 and 8.4 percent in 2007, which is far above 6.9 percent of GDP in new member states and close to 8.8 percent spent on average spent by the EU15 (World Bank 2008). We can state that Croatia is one of the top spenders on the health care when compared to the EU member states; close to the health care spending of Spain, the UK and Sweden. Figure 2 depicts the rising trend in a health care spending in the given set of countries, except in Croatia where we observe the negative trend. In the Figure 2 we can note a stable convergence of health spending in Transition countries to the health spending in the developed EU countries. This figure can be explained by the higher GDP growth rates in Transition countries which lead to a larger increase in total health expenditures, and a higher private health spending, especially for pharmaceuticals (Czech Republic, Slovakia and Poland). The exception is health spending in Croatia which fell around 2.5 percentage points in the observed period. High health care expenditures in Croatia at the beginning of the 1990s can be justified by the increased health demand due to Homeland war (1991-1995).

Further increase in national and personal income, life expectancy, ageing population and dependency ratios, may lead to unsustainable growth in demand for health services and over-proportional growth in health spending. In order to address the problem, particularly to eliminate demand, incentives will have to be changed and they do not lead to the increase in health output.

PANEL DATA UNIT ROOT ANALYSIS

Literature review

Testing for unit roots in the time series studies has recently become a common practice among applied researches. Many panel unit root tests are developed for time series studies – Levin Lin Chu test (LLC), Im-Pesaran-Shin (IPS) test, Breitung test, Residual-Based LM test, Augmented Dickey-Fuller (ADF) test, Maddala-Wu (MW) test. It is known that for the panel data analysis, the data consists of $i = 1, \dots, N$ cross sections, and several points of time series for each group $t = 1, \dots, T$, or a cross section of N time series each of length $T(i)$.

Considering $y_{it} = \rho y_{i, t-1} + e_{it}$, $i = 1, 2, \dots, N$ for N countries the test for a unit root for country “A” is based on

$$\begin{aligned} H_0: \rho_1 &= 1 \\ H_1: \rho_1 &< 1 \end{aligned} \tag{1}$$

The low explanatory power of this test has been argued. In the LLC’s test, null hypothesis means that each individual time series has a unit root whereas the alternative states that each time series is stationary. LLC suggested using their panel unit root test for panels of moderate size with N between 10 and 250 and T between 25 and 250. The null hypothesis in the IPS test means that each series in the panel contains a unit root, i.e. $H_0: \rho_i = 0$ for all i and the alternative hypothesis states that each series in the panel allows for some (but not all) of the individual series to have unit roots. This test was applied for testing the unit root for per capita national health expenditures (HE) and gross domestic product (GDP) for a panel of 20 OECD countries by McCoskey and Selden. They rejected the null hypothesis which states that these two series contain unit roots (Baltagi, 2005). IPS propose test where $H_0: \beta_i = 0$ and $H_1: \beta_i < 0$. This test is called t-bar statistic and is defined as the average of the individual Dickey-Fuller (DF) or augmented Dickey-Fuller (ADF) (Aslan, 2009).

Choi (2001) analyzed the LLC, the IPS and the augmented Dickey-Fuller (ADF) tests. The LLC test gained much popularity in applications and has often been used in international finance and macroeconomics. This test assumes that all groups (countries, firms etc.) have the same AR (autoregressive) coefficient under both the null and alternative hypothesis which is common in the panel data analysis. The IPS and the ADF tests are based on more general assumptions than the LLC’s test and seem to outperform the LLC’s test in finite samples. Several common features are shared by these tests. Firstly, there is a requirement of the infinite number of groups N , implying that the number of groups should be infinite for the asymptotic normality results to hold and, at the same time, small enough relative to the number of time series. This means that the tests may not keep nominal size well either when N is small or when N is large relative to T . When N is infinite, the number of groups which do not have a unit root should grow at the same rate as N for the tests to be consistent. When N is finite, tests are consistent against the alternative that at least one group does not have a unit root.

McCoskey and Selden (1998) explained why it is necessary to check for unit roots in each of the time series used to estimate a model. Having two nonstationary series, i.e. containing a trend which can be of two types – deterministic and stochastic; the series tend to drift away from their starting points. Regressing one on the other gives the appearance of a significant positive or negative relationship depending on a drift direction of the series. Moreover, a non accurate specification can also arise, if only one of the two series has a unit root. When the non stationary series can be transformed to the stationary series by differentiating to the first degree, the series are integrated by the order one – denoted $I(1)$. A series which is $I(1)$ is also said to have a ‘unit root’. If the series need to be differentiated k times in order to achieve stationarity then the series is said to be $I(k)$. A series which is $I(k)$ is also said to have k unit roots. They employ the Augmented Dickey-Fuller (ADF) test in their research to include the time trend

$$\Delta y_t = a + b_t t + \gamma y_{t-1} + \sum_{j=1}^{p-1} \phi_j \Delta y_{t-j} + \varepsilon_t \quad (2)$$

where $\Delta y_t \equiv y_t - y_{t-1}$ and t indicates time. The null hypothesis is $\gamma = 0$. As under the null hypothesis the t -statistic for $\hat{\gamma}$ does not have the familiar mean-zero t -distribution, some methods employ and develop the tables of critical values (Monte Carlo methods). Baltagi (2005) states that IPS t -bar statistic is defined as the average of the individual ADF statistic as

$$\bar{t} = \frac{1}{N} \sum_{i=1}^N t_{\rho i} \quad (3)$$

where $t_{\rho i}$ is the individual t -statistic for testing $H_0: \rho_i = 0$ for all $i = 1, 2, \dots, N_i$. In case the lag order is always zero ($p_i = 0$ for all i), the IPS test provides simulated critical values for \bar{t} for different number of cross-sections N , series length T and Dickey-Fuller regressions containing either only intercepts or intercepts and linear trends. In the general case where the lag of order p_i may be nonzero, the IPS test shows that a properly standardized \bar{t} has an asymptotic $N(0, 1)$ distribution. The advantage of the IPS method is that it allows the data generating processes to vary across countries with respect to ADF coefficients and error structures. The lag length can also vary across countries rather than imposing a uniform lag length. The Fisher ADF test essentially combines the p -values of the test statistic for a unit root in each residual cross-sectional unit. The test is non-parametric and can be computed for any arbitrary choice of a test for the unit root. The test has a chi-square distribution with $2N$ (where N is the cross section) degrees of freedom. An important advantage of this test is that it can be used regardless whether the null hypothesis is one of the integration or stationary (Narayan, 2007).

RESULTS AND DISCUSSION

We use data for the health care expenditure given as a percentage of GDP and log-levels of per capita GDP for 12 selected countries (Austria, Croatia, Czech Republic, France, Germany, Hungary, Poland, Slovakia, Slovenia, Spain, Sweden and United Kingdom) from WHO Health for All Database spanning the years 1990 to 2005. We also employed log-level data for life expectancy measured in years, and the percentage of people aged 65 and over in the overall population that are sometimes used as proxies for the medical progress. All series enter in logs, except the share of elderly in the overall population and health care expenditures.

The results from the LLC, Breitung, the IPS and the Fisher-ADF tests for the four series are reported in the Table 1. A unit root is detected for the level variables in a large number of series, while the first differences appear to be stationary. The result is less reliable only for the variable population of 65 and over. Our main finding from the LLC, Breitung, IPS and Fisher-ADF tests is that for the two series – health care expenditures and life expectancy, for each of the twelve countries – we were unable to reject the unit root null hypothesis, and we rejected the null hypothesis for the series of per capita GDP and population of 65 and over. However, when we conduct the unit root tests by differentiating to the first degree the series GDP and population over 65, we are able to reject the unit root null hypothesis. Hence, we can conclude that the series GDP and population of 65 and over are integrated to the order one.

Table 1: Results of the Panel Unit Root Tests

| LEVELS | LLC | Breitung | IPS | ADF - Fisher |
|--------------------------|---------------|---------------|---------------|---------------|
| Health care expenditures | -3.39* | -0.17 | -2.13* | -1.46* |
| GDP | 0.41 | 2.77 | -1.67 | 1.96 |

Source: own calculations

A * indicates rejection of the null hypothesis of nonstationarity at least on the 0.05 level of significance.

We also examined the relationship between per capita GDP in purchasing power parity, a health spending to GDP ratio, life expectancy and infant mortality. Both health spending to GDP ratio and per capita GDP have a statistically significant and positive impact on infant mortality for the panel of 12 countries. The elasticity on per capita GDP and infant mortality is 0.26, implying that an increase of 1 per cent in per capita GDP (at PPS) leads to a decrease of 0.26 per cent in infant mortality rate, *ceteris paribus*. The effect of per capita GDP (at PPS) on life expectancy is moderate. Furthermore, health spending to GDP ratio generates a positive effect on infant mortality rate, and in this panel the elasticity on health spending to GDP and infant mortality is about 0.12, but there is a weak effect of health spending to GDP on life expectancy. This illustrates that health spending, as the share of GDP, is not a key determinant of longer life expectancy, both at birth and at the age of 65.

CONCLUSION

There are several implications that can be found in this paper. We initially approved the findings of previous researchers regarding the existence of a unit root for the level variables and the first differences to be stationary. Subsequently, we examined the relationship between the health care spending to GDP ratio and per capita GDP, infant mortality rate and life expectancy, both at birth and at the age of 65 for 11 EU countries and Croatia. The increase in health spending to GDP ratio has a positive effect on infant mortality rate, but the effect on life expectancy is not very strong. Higher income per capita has greater positive impact on the infant mortality rate decrease. We cannot confirm that per capita GDP, both in purchasing parity and real terms, strongly influences the health spending in the countries observed in this analysis. Regarding the health outcomes in selected countries, those with lower per capita income and per capita health spending can obtain good health care system performance. We demonstrated that Croatia, with relatively low per capita GDP and per capita health spending, achieves better health outcome than comparable countries of the European Union. The gap between the effectiveness (outcomes) of the health care systems observed in this analysis is relatively narrow compared to observations available from the data for GDP per capita and per capita health spending.

FUZZY DATA ENVELOPING ANALYSIS AND PERFORMANCE OF BANKS: AN APPLICATION TO TURKISH COMMERCIAL BANKS

Ilhan Ege, Nevsehir University, Turkey

ABSTRACT

Data Enveloping Analysis (DEA) has become an increasingly popular management tool since 1978. However publications on Fuzzy DEA are widespread. This paper measures efficiencies of Turkish Commercial Banks with fuzzy observations. As a result foreign banks more efficient than the state-owned and privately owned banks in Turkey.

INTRODUCTION AND PREVIOUS RESEARCH

Data Enveloping Analysis (DEA) is a new data oriented method to measure the performance and efficiency of firms. It evaluates the performance of a set of peer entities. These peer entities are called Decision Making Units (DMUs) and convert multiple inputs into multiple outputs (Cooper, Seiford and Zhu, 2004, 1). DEA is a non-parametric and linear programming method developed by Charnes, Cooper and Rhodes (1978). This model is called the CCR model. CCR ratio model yields an objective evaluation of overall efficiency and identifies the source and estimates the amounts of the thus identified inefficiencies. Other DEA models are the BCC model (1984), the multiplicative models (1982, 1983) and the additive model (1985, 1987). These models may focus on increasing, decreasing, or constant returns to scale as found in economies that are here generalized to the case of multiple outputs (Charnes, Cooper, Lewin and Seiford, 1994: 24).

In the literature, there are many studies which deal performance and efficiency of banks. In these studies different methods have been used for measurement of performance and efficiency. DEA is a widespread method. Saha and Ravisankar (2000) measured ratings of efficiency of public sector banks in India. They took the data from annual reports for the period 1991-92 to 1994-95 of 25 public sector banks. The results of this study indicate that, with a few exceptions, the public sector banks have in general improved their efficiency scores over the years 1992 to 1995.

Taylor et al. (1997) evaluated the efficiency and profitability potential of Mexican banks between 1989 and 1991. In addition to DEA, linked-cone assurance region (LC-AR) models were used to measure efficiency and profitability. Thus, the DEA and profitability potential analyses show some interesting examples of the effects of changes in the mix of operations (such as the mix of interest and non-interest income and expenses, or international services) or size, on bank efficiency and performance relative to its competitors.

Studies by Gilbert (1984), Charnes et al. (1991), Luo (2003), Bauer et al. (1993), Brockett et. al. (1997) investigate aspects of the performance and efficiency of U. S. Banks. Other banking studies include: Sherman and Gold (1985), Schaffnit, Rosen and Paradi (1997) Charnes et. al. (1990), Rangan et al. (1988), Aly et al. (1990), Berg et al. (1991, 1993), Berger and Humphrey (1992), Berger et al. (1993), Elyasiani and Mehdiian (1990a,b), English et al. (1993), Ferrier and Lovell (1990) and Wykoff (1992).

An other examples conducted in Turkey is Inan (2000) who evaluated the measurement of banking performance methods and literature for the Turkish banking sector. Altunbaş and Moyneux (1995), Karamustafa (1999) used ratio analysis, Ozkan and Günay (1996, 1998), Cilli (1995), Mahmud and Zaim used parametric methods, Yolalan (1996), Mercan and Yolalan (2000), Cingi and Tarım (2000) used non-parametric methods for measurement of banking performance and efficiency.

Yıldırım (1999) who studied performance of Turkish bank between 1988-1996 period by using DEA method. Atan (2003) measured the efficiency and productivity of Turkish Banking Sector and of 44 banks in Turkey for

the period 1999-2001 with 7 inputs and only 1 output by DEA. Kılılı and Atan (2005) analyzed Turkish banks performance by different DEA methods and compared results of these methods. Oral and Yolalan (1990), Oral, Kettani and Yolalan (1992) measured bank performance of 20 branches in Turkey. They used input-oriented production and input-oriented mixed models.

The studies But any study used fuzzy data envelopment analysis for measurement bank performance and efficiency. This paper analyses the performance of Turkish banks using fuzzy data envelopment analysis.

METHODOLOGY

In DEA, decision making units and input and output data must be measured rightly and precisely. Therefore, Fuzzy Data Envelopment Anaysis is recommended by using Fuzzy Theory. Thus, better efficiency scores are obtained and imprecise cases can be analyzed. Guo and Tanaka (2001) suggested fuzzy CCR model for measurement efficiency. The efficiencies of decision making units (DMUs) are measured with fuzzy observations.

Initially, “n” basic banking inputs and “m” basic banking outputs were considered for each bank and the Charnes, Cooper and Rhodes (1978) input-oriented model, CCR were applied. This model to the Fuzzy DEA model is transformed. Upper and lower bounds were added to the original CCR model. Values $x_{ij}^L > 0$ and $y_{rj}^L > 0$ and they were known to be between $[x_{ij}^L, x_{ij}^U]$ and $[y_{rj}^L, y_{rj}^U]$ bounds (upper and lower bounds). In this case, the mathematical formulation of this Fuzzy DEA model is (Apaydın and Güneş, 2008):

$$\max \theta_k^U = \frac{\sum_{r=1}^S u_r y_{rk}^U}{\sum_{i=1}^m v_i x_{ik}^L}$$

$$\theta_j^U = \frac{\sum_{r=1}^S u_r y_{rj}^U}{\sum_{i=1}^m v_i x_{ij}^L} \leq 1, \quad j = 1, \dots, n$$

$$U_r, v_i \geq \varepsilon, \quad \forall r, i$$

$$\max \theta_k^L = \frac{\sum_{r=1}^S u_r y_{rk}^L}{\sum_{i=1}^m v_i x_{ik}^U}$$

$$\theta_j^L = \frac{\sum_{r=1}^S u_r y_{rj}^L}{\sum_{i=1}^m v_i x_{ij}^U} \leq 1, \quad j = 1, \dots, n$$

$$U_r, v_i \geq \varepsilon, \quad \forall r, i$$

where y is the matrix of the output-vector; x is the matrix of the input-vector. $\max \theta_k^U$ yields best efficiency for the upper bound and $\max \theta_k^L$ gives best efficiency for the lower bound.

DATA AND EMPIRICAL SETTING FOR EFFICIENCY

The primary source of data for the empirical analysis are balance sheets, income statements and other data of each bank in the www.tbb.org.tr web page provided by the Banks Association of Turkey (BAT). The sample of this study includes twenty three commercial banks operating in Turkey during the 2001-2007 period (Given in Table 1). However, ten banks are omitted because of data problems. These ten banks are generally foreign subsidiaries. 92 observations are used in the analysis for each year, and total panel data consist of 644 total observations.

Table 1: A Sample of Turkish Commercial Banks Listed

| State- owned Banks | | Foreign Banks | |
|-----------------------|---|----------------------|------------------------|
| S1 | Türkiye Cumhuriyeti Ziraat Bankası A.Ş. | F1 | Arap Türk Bankası A.Ş. |
| S2 | Türkiye Halk Bankası A.Ş. | F2 | Citibank A.Ş. |
| S3 | Türkiye Vakıflar Bankası T.A.O. | F3 | Denizbank A.Ş. |
| Privately-owned Banks | | F4 | Eurobank Tekfen A.Ş. |
| P1 | Akbank T.A.Ş. | F5 | Finans Bank A.Ş. |
| P2 | Alternatif Bank A.Ş. | F6 | Fortis Bank A.Ş. |
| P3 | Anadolubank A.Ş. | F7 | HSBC Bank A.Ş. |
| P4 | Şekerbank T.A.Ş. | F8 | Oyak Bank A.Ş. |
| P5 | Tekstil Bankası A.Ş. | F9 | Turkland Bank A.Ş. |
| P6 | Türk Ekonomi Bankası A.Ş. | Foreign Subsidiaries | |
| P7 | Türkiye Garanti Bankası A.Ş. | FS1 | ABN AMRO Bank N.V. |
| P8 | Türkiye İş Bankası A.Ş. | FS2 | Bank Mellat |
| P9 | Yapı ve Kredi Bankası A.Ş. | | |

In the literature, two different approaches are used to measure the efficiency of banks. One is the “intermediation approach”, the other is “asset approach”. Intermediation approach is used in this study. Total Bank Deposits/Total Assets and Interest Expenses/Total Assets ratios are inputs and Total Bank Credits/Total Assets and Interest Revenues/Total Assets ratios are inputs in the fuzzy CCR model. Inputs and outputs of the model are given as follows:

Table 2: Inputs and Outputs of the Model

| Inputs | Outputs |
|--|---------------------------------------|
| Total Bank Deposits/Total Assets Ratio | Total Bank Credits/Total Assets Ratio |
| Interest Expenses/Total Assets Ratio | Interest Revenues/Total Assets |

DEA has two limitations for the study of the reliability. If the number of inputs is m and number of outputs p , the number of DMUs will be at least $m+p+1$. Number of DMUs is at least twice as high as the total numbers of variables (Boussofiane, 1991). This study has two inputs and two outputs. $m+p+1$ is equals 5. The number of DMUs is higher than 5 ($23>5$). In addition the number of DMUs is higher than the double total variables ($23>8$).

RESULTS

The technical efficiency scores for the upper and lower bounds are given in Table 2. Banks efficiency scores are generally decline between 2001 and 2003 years in the upper bound. These scores increase between 2003 to 2005. However in 2007 scores declined. Similar changes are observed in the lower bound.

In the upper bound Arap Türk Bankası A.Ş. (2002, 2003), Eurobank Tekfen A.Ş. (2001), HSBC Bank A. Ş., ABN AMRO Bank N. V. (2002 and 2004) and Bank Mellat (2001, 2002, 2004, 2005 and 2006) are efficient. All of these efficient banks are foreign banks or foreign subsidiaries. It is important to note that this situation is valid all foreign banks in the sample of not for the national ones. In the lower bound Akbank T.A.S. (2001),

Arap Türk Bankası A.Ş. (2001), Citibank A.Ş. (2006), HSBC Bank A. Ş. (2001, 2002, 2003, 2005 and 2006) and Bank Mellat (2002, 2004, 2005, 2006, 2007) are efficient. These results are similar to the ones in the upper bound. Only Akbank T. A. S. is a privately-owned bank, the others are foreign banks or foreign subsidiaries in efficient banks, too.

In 2001 HSBC Bank A.Ş, in 2002, 2004, 2005 and 2006 Bank Mellat are fully (relative) efficient because both the upper and lower bound scores are 1.

Table 3: Technical Efficiency Scores (Upper and Lower Bounds) (CCR-I)

Models for each inefficient DMUs are made using the data in Table 3. Below, inefficient banks for the year 2001 are classified. The same method is applied to classify the other years. As can be seen in 2001, DMU F7 (HSBC Bank A.Ş) is fully efficient. The remaining 22 banks are not efficient. These banks efficiency scores are measured fuzzy in bound values.

S1: [0.5269 , 0.3649]
S2: [0.4215 , 0.2764]
S3: [0.5345 , 0.4384]
P1: [1.000 , 0.8993]
P2: [0.7531 , 0.5031]
P3: [0.7145 , 0.4795]
P4: [0.3572 , 0.2615]
P5: [0.7825 , 0.5423]
P6: [0.6543 , 0.5756]
P7: [0.6552 , 0.6150]
P8: [0.6549 , 0.5876]
P9: [0.4162 , 0.3855]
F1: [1.000 , 0.8643]

 F5: [0.7295 , 0.5537]
 F6: [0.5704 , 0.4547]
 F8: [0.4178, 0.3474]
 F9: [0.6532 , 0.4965]
 FS1: [0.9240, 0.7332]
 FS2: [0.5987 , 1,000]

We can classify these banks according to regret approach. Below is the application of the model on one bank using bound values for the year 2001.

$$R(S1) = \max [\max (0.2764, 0.4384, 0.8993, 0.5031, 0.4795, 0.2615, 0.5423, 0.5756, 0.6150, 0.5876, 0.3855, 0.8643, 0.6784, 0.4515, 1.000, 0.5537, 0.4547, 0.3474, 0.4965, 0.7332, 1,000) - 0.5269, 0] \\ = 0.4731$$

$$R(S2) = \max [\max (0.3649, 0.4384, 0.8993, 0.5031, 0.4795, 0.2615, 0.5423, 0.5756, 0.6150, 0.5876, 0.3855, 0.8643, 0.6784, 0.4515, 1.000, 0.5537, 0.4547, 0.3474, 0.4965, 0.7332, 1,000) - 0.4215, 0] \\ = 0.5785$$

$$R(S3) = \max [\max (0.3649, 0.2764, 0.8993, 0.5031, 0.4795, 0.2615, 0.5423, 0.5756, 0.6150, 0.5876, 0.3855, 0.8643, 0.6784, 0.4515, 1.000, 0.5537, 0.4547, 0.3474, 0.4965, 0.7332, 1,000) - 0.5345, 0] \\ = 0.4655$$

$$R(P1) = \max [\max (0.3649, 0.2764, 0.4384, 0.5031, 0.4795, 0.2615, 0.5423, 0.5756, 0.6150, 0.5876, 0.3855, 0.8643, 0.6784, 0.4515, 1.000, 0.5537, 0.4547, 0.3474, 0.4965, 0.7332, 1,000) - 1.000, 0] \\ = 0$$

$$R(P2) = \max [\max (0.3649, 0.2764, 0.4384, 0.8993, 0.4795, 0.2615, 0.5423, 0.5756, 0.6150, 0.5876, 0.3855, 0.8643, 0.6784, 0.4515, 1.000, 0.5537, 0.4547, 0.3474, 0.4965, 0.7332, 1,000) - 0.7531, 0] \\ = 0.2469$$

.....
 P1 has the lowest score and thus is accepted as having the high efficiency in the group (22 banks). Because of this P1 is excluded from the list. The same method is applied for the remaining 22 banks, excluding the bank with the lowest score each time until two banks remain. The 23 banks are classified through CCR-I in 2001 and the following efficiency classification is obtained:

P1 > S1 > FS1 > F4 > FS2 > F2 > P5 > P2 > F5 > P3 > P7 > P8 > P6 > F9 > F6 > S3 > S1 > F3 > P9 > F8 > S2 > P4

This Fuzzy DEA model is applied for all the years (2001-2007). As a result of this analysis, classification of these banks is shown in Table 4.

Table 4: Classification of Turkish Commercial Banks

| | 2001 | 2002 | 2003 | 2004 | 2005 | 2006 | 2007 |
|----|------|------|------|------|------|------|------|
| 1 | P1 | F7 | F7 | F7 | F1 | F7 | FS2 |
| 2 | S1 | F9 | F1 | F1 | F7 | F2 | F7 |
| 3 | FS1 | FS1 | FS2 | FS1 | F5 | F1 | P2 |
| 4 | F4 | F1 | F9 | F5 | F2 | F5 | F3 |
| 5 | FS2 | P6 | F5 | P1 | P5 | F3 | F5 |
| 6 | F2 | F6 | F2 | F2 | P6 | P2 | P5 |
| 7 | P5 | P9 | F6 | P5 | F3 | P4 | F1 |
| 8 | P2 | F5 | P6 | P6 | P2 | F6 | P7 |
| 9 | F5 | F2 | P5 | F3 | P7 | P5 | F9 |
| 10 | P3 | P8 | F8 | F9 | F8 | P6 | P4 |
| 11 | P7 | P1 | P9 | F6 | F6 | P7 | P6 |
| 12 | P8 | P7 | P1 | P7 | P1 | P1 | F6 |
| 13 | P6 | P5 | F3 | P8 | F9 | S3 | P3 |
| 14 | F9 | F8 | P2 | F8 | P8 | P3 | F8 |
| 15 | F6 | P3 | P7 | P4 | P4 | S1 | P9 |

| | | | | | | | |
|----|----|----|-----|----|-----|-----|-----|
| 16 | S3 | F3 | P3 | P2 | P9 | P9 | P1 |
| 17 | S1 | S3 | P8 | F4 | F4 | FS1 | S3 |
| 18 | F3 | P2 | FS1 | P3 | P3 | F8 | F2 |
| 19 | P9 | S2 | S1 | S3 | S3 | F4 | P8 |
| 20 | F8 | F4 | F4 | P9 | S1 | P8 | S2 |
| 21 | S2 | P4 | S2 | S1 | S2 | F9 | F4 |
| 22 | P4 | S1 | S3 | S2 | FS1 | S2 | FS1 |
| 23 | | | P4 | | | | S1 |

In 2001, the highest efficient bank is P1 (Akbank) and the lowest efficient bank is P4 (Sekerbank). However in 2002 the highest efficient bank is F7 (HSBC Bank) and the lowest efficient bank is S1 (TC Ziraat Bankası). In 2003, 2004 and 2006 the highest efficient bank is F7 (HSBC Bank) again. In 2005 and 2007 the highest efficient bank is respectively F1 (Arap Turk Bankası) and FS2 (Bank Mellat).

CONCLUSION

This study measured the efficiency of banks with using Fuzzy DEA. In the result foreign banks were efficient than the state-owned and privately owned banks. Generally state owned banks are the lowest efficient bank. In this paper fuzzy DEA method and CCR model was used for measurement of bank efficiency. Fuzzy DEA models can play an important role for perceptual evaluation problems comprehensively existing in the real world, finance sectors, for example banking sector. Other DEA models will be applied in other studies.

ACTIVITY BASED COSTING (ABC) METHOD APPLICATIONS IN HOSPITALS: CASE OF PRIVATE HOSPITAL IN KAYSERI, TURKEY

Ilhan Ege, Nevsehir University, Turkey

Azize Esmeray and Murat Esmeray, Erciyes University, Turkey

ABSTRACT

Today, traditional cost accounting systems are subjected to criticism because they are insufficient. The activity based costing (ABC) method, which is one of the new cost accounting methods, can be considered as an alternative method. In this study, the operation cost of a department of a private hospital will be calculated firstly and then ABC method and the traditional costing methods will be compared. Whereas only one distribution key is used in the traditional method, in activity based costing method a different cost driver is used for each activity.

INTRODUCTION

Since there are many and complicated operations and different output definitions, and also, the human factor is prior importance in hospitals and these institutions have many different disbursement policies, hospitals, by their nature, are to be considered separately from other service enterprises. For this reason, calculating the cost of the hospital services is more difficult when compared to other enterprises. However, despite this difficulty, it is obligatory that the hospital costs are determined correctly and completely; as the hospitals are also the places where the resource extravagance rate is very high.

Today, traditional cost accounting systems are open to criticism because they are inadequate and under these circumstances, the activity based costing method which is one of the new cost accounting methods, can be considered as a different alternative method.

Emmett and Forget's study (2005) concerned with the of costing methods, specially activity based costing accounting. Only 71.8% of managers were aware of it and only 4.7% had implemented it. In addition, only 52% of all hospitals report using any cost accounting systems. ABC was designed, tested and compared with conventional costing by Laurila and others (2000). The allocation of overhead costs was greatly reduced by the introduction of ABC compared to conventional costing. Paulus, van Raak and Keijzer (2002) used ABC and integrated care pathways provides the best information possible for decision-making by health care managers, insurers, care suppliers and governments. Arnaboldi and Lapsley (2004) studied of the introduction of a modern costing technology (ABC) into a health care organization which is undergoing change.

Ridderstolpe and others (2002) described the implementation of a model for process analysis and ABC at a Heart Center in Sweden as a tool for administrative cost information, strategic decision-making, quality improvement, and cost reduction. Waters, Abdallah and Santillan (2001) described the application of ABC to calculate the unit costs of the services for a health care provider in Peru. Rautio, Keski-Nisula and Paakkala (2003) analyzed the costs of the interventional radiology unit and to identify the cost factors in the different activities of catheter-based angiographies and interventional radiology by using ABC analysis. According to them ABC system is suitable for analysing costs in interventional radiology.

Baker and Boyd (1997) gave example of how one hospital reports the results of ABC for a particular procedure in the operating room (OR). Canby (1995) used ABC method to determine costs associated with the x-ray process in a mid-sized outpatient clinic. Yereli (2009) compared traditional and ABC approaches which using a cost analysis of gall bladder surgeries in the general surgery department of one university hospital in Manisa, Turkey.

In this study, the operation cost of a department of a private hospital will be calculated in the first place and then the activity based costing method and the traditional costing methods will be compared.

ACTIVITY BASED COSTING METHOD IN HOSPITALS

This method was put into practice at a private hospital in Kayseri, which was established in 2004. At the hospital, departments of internal diseases, ENT, eye, orthopedics, infantile diseases, pediatrics and gynecology, In Vitro Fertilization (IVF), skin diseases, dental and cardiovascular diseases are available. Along with angiography devices for cardiovascular diseases, echo, effort and holter's systems are also available.

The objective of this study is to calculate the operation costs of the Cardiovascular Surgery (CS) department, using activity based costing method and traditional costing methods, to make a comparison between these methods. Basic financial tables of the hospital were used in this study. Additionally, directors of the accounting department and the purchasing department, officers and doctors of the CS department are personally interviewed. The lists of fixed assets of the CS department were also used in the study.

Cost Allocation of the Patient Admission Activity Costs (F1)

Total costs of the patient admission activity is given below:

| F1 | Total Cost (TL) |
|-------------------|-----------------|
| Patient Admission | 23.109,10 |

The costs of the patient admission activity will be distributed according to the "number of patients" and the operation types which are considered to be the output of the CS department. In order to do this, first of all the cost allocation rate will be calculated.

$$\text{Cost Allocation Rate} = \text{Patient Admission Activity} / \text{Number of Patients} \\ = 23.109,10 / 1031 = 22,4143$$

Table 1: Cost Allocation of the Patient Admission Activity Costs (F1)

| Type of Operation | Number of Patients (1) | Cost Allocation Rate (2) | (1)x(2)=(3) |
|------------------------------|------------------------|--------------------------|------------------|
| Coronary By Pass | 324 | 22,4143 | 7.262,22 |
| Valve Disease | 85 | 22,4143 | 1.905,21 |
| Congenital Heart Disease | 74 | 22,4143 | 1.658,65 |
| Angiography | 421 | 22,4143 | 9.436,41 |
| Peripheral vascular diseases | 127 | 22,4143 | 2.846,61 |
| Total | 1031 | | 23.109,10 |

As can be seen in Table 1, the highest patient admission rate is performed by the angiography with 421 patients, which is the highest number of patients. This activity is followed by the congenital heart disease operations with 74 patients.

Cost Allocation of the Activities of Pre-operative Care Cost (F2)

Among the activities of pre-operative care, before the operation there are some pre-examinations done after the patient admission process is completed. For this reason, allocation will be made according to the number of laboratory tests.

Table 2: Number of Laboratory Tests

| Operation | Number |
|------------------------------|-------------|
| Coronary By Pass | 324 |
| Valve Disease | 85 |
| Congenital Heart Disease | 74 |
| Angiography | 421 |
| Peripheral vascular diseases | 127 |
| Total | 1031 |

The total amount of the activity of pre-operative care is as such :

| F2 | Total Cost (TL) |
|--------------------|-----------------|
| Pre-operative Care | 125.649,89 |

“Number of laboratory tests” will be used as the cost driver for the activity costs (Table 2) in question to be disturbed to operations and the calculation of the cost allocation rate will be as such:

$$\text{Cost Allocation Rate} = \text{Pre-operative Care} / \text{Number of tests} = 125.649,89 / 8137 = 15,4418$$

Table 3: Cost Allocation of the Activities of Pre-operative Care Cost

| Type of Operation | Types of Laboratory Tests (1) | Number of Patient (2) | Number of Tests (1)x(2)=(3) | Cost Allocation Rate (4) | Total (TL) (3)x(4)=(5) |
|------------------------------|-------------------------------|-----------------------|-----------------------------|--------------------------|------------------------|
| Coronary By Pass | 11 | 324 | 3564 | 15,4418 | 55.034,56 |
| Valve Disease | 9 | 85 | 765 | 15,4418 | 11.812,97 |
| Congenital Heart Disease | 11 | 74 | 814 | 15,4418 | 12.569,62 |
| Angiography | 5 | 421 | 2105 | 15,4418 | 32.504,98 |
| Peripheral vascular diseases | 7 | 127 | 889 | 15,4418 | 13.727,76 |
| Total | 43 | 1031 | 8137 | | 125.649,89 |

The cost allocation is very high (55.034,56 TL) for the Coronary By Pass operation, which means that the number of patients and types of laboratory tests are both high. On the other hand the lowest cost allocation is seen in valve disease, although the number of laboratory tests is almost high as coronary by pass the number of patients was low.

Cost Allocation Anesthesia Activity Costs (F3)

The costs of the anesthesia activity will be distributed to the operations according to drug costs. However, while the anesthesia costs are distributed to operations, no costs will be allocated to angiography. The reason for this is that during the interviews made with anesthetists, it is learned that during the angiography process, drug is only given through the inguinal and it is concluded that this can not be regarded as anesthesia.

Also, under the light of the information received from the same doctors, the amount of the cost of the drugs used in each operation type is acknowledged. As a result of the calculation based on the drug costs, the operation kinds are given the coefficient proportionate to the drug costs used, which are shown in Table 4.

First of all, anesthesia cost amount is as such:

| | |
|-------------------|------------------|
| F3 | Cost (TL) |
| Anesthesia | 91.106,24 |

Cost Allocation rate is calculated by dividing the stated anesthesia cost into 1095,2.

$$\text{Cost Allocation Rate} = \text{Cost of Anesthesia Activity} / \text{Allocation Rate}$$

$$= 91.106,24 / 1095,2 = 83,18685$$

Table 4: Cost Allocation Anesthesia Activity Costs (F3)

| Type of Operation | Usage Coefficient for Anesthesia Based on Cost (1) | Number of patient (2) | Coefficient x Number of patient (1)x(2)=(3) | Cost Allocation Rate (4) | Total (3)x(4)=(5) |
|------------------------------|--|-----------------------|---|--------------------------|-------------------|
| Coronary By Pass | 2 | 324 | 648 | 83,18685 | 53.905,08 |
| Valve Disease | 2.2 | 85 | 187 | 83,18685 | 15.555,94 |
| Congenital Heart Disease | 1.8 | 74 | 133,2 | 83,18685 | 11.080,49 |
| Angiography | - | 421 | - | 83,18685 | - |
| Peripheral vascular diseases | 1 | 127 | 127 | 83,18685 | 10.564,73 |
| Total | | 1031 | 1095,2 | | 91.106,24 |

The highest number of patients who take up the largest share of anesthesia activity cost is seen in Coronary by pass. It was assumed that the angiography is not included in this activity cost because there is no coefficient specified for this operation.

Cost Allocation of Operation Costs (F4)

The fourth activity is the operation itself. The average operation time of each operation is taken as the basis while distribute the cost of this activity to operations (Table 5). Total costs of the operation activity are shown below:

| | |
|------------------|------------------------|
| F4 | Total Cost (TL) |
| Operation | 116.263,20 |

$$\text{Cost Allocation Rate} = \text{Cost of Operations Activity} / \text{Total Operation Duration}$$

$$= 116.263,20 / 1741 = 66,77955$$

Table 5: Cost Allocation of Operation Costs (F4)

| Type of Operation | Average Operation Duration (One Operation) (1) | Number of Operation (2) | Total Operation Duration (1)x(2)=(3) | Cost Allocation Rate (4) | Total (3)x(4)=(5) |
|------------------------------|--|-------------------------|--------------------------------------|--------------------------|-------------------|
| Coronary By Pass | 2.5 hour | 324 | 810 | 66,77955 | 54.091,44 |
| Valve Disease | 3 hour | 85 | 255 | 66,77955 | 17.028,79 |
| Congenital Heart Disease | 2 hour | 74 | 148 | 66,77955 | 9.883,37 |
| Angiography | ½ hour | 421 | 210.5 | 66,77955 | 14.057,09 |
| Peripheral vascular diseases | 2.5 hour | 127 | 317.5 | 66,77955 | 21.202,51 |
| Total | | 1031 | 1741 | | 116.263,20 |

Although the largest number of operations appears under angiography category, it doesn't take a huge part in the total cost as this kind of operation takes only half an hour.

Cost Allocation of the Intensive Care after the Operation and Post-Operative Care Processes of the Patients (F5)

This activity includes the intensive care after the operation and post-operative care processes of the patients. The patients who receive angiography stay under care at the hospital for one day only, while the patients who undergo other operations are kept under intensive care for one day and under care service for four days. The costs relevant with these activities will be distributed to operations in accordance with the number of days the patient stayed at the hospital. The amount of the activity costs in question are given below.

| F5 | Total Cost (TL) |
|---|------------------------|
| Intensive Care after the Operation and Post-Operative Care Processes of the Patients | 100.619,80 |

The patients of CS stayed at the hospital for a total of 3471 days. Accordingly, the cost allocation rate will be calculated as shown below:

Cost Allocation Rate = Cost of Intensive Care after the Operation and Post-Operative Care Processes of the Patients / Duration of patients stayed = 100.619,80 / 3471 = 28,9887

Table 6: Cost Allocation of the Intensive Care after the Operation and Post-Operative Care Processes of the Patients

| Type of Operation | Duration of patients stayed (1) | Number of Operation (2) | Duration of patients stayed x Number of Operation (1)x(2)=(3) | Cost Allocation Rate (4) | Total (TL) (3)x(4)=(5) |
|------------------------------|---------------------------------|-------------------------|---|--------------------------|------------------------|
| Coronary By Pass | 5 days | 324 | 1620 | 28,9887 | 46.961,70 |
| Valve Disease | 5 days | 85 | 425 | 28,9887 | 12.320,20 |
| Congenital Heart Disease | 5 days | 74 | 370 | 28,9887 | 10.725,83 |
| Angiography | 1 day | 421 | 421 | 28,9887 | 12.204,25 |
| Peripheral vascular diseases | 5 days | 127 | 635 | 28,9887 | 18.407,82 |
| Total | 21 days | 1031 | 3471 | | 100.619,80 |

Calculating the Overhead Costs

The next step is to find the overhead costs distributed to the operations in question. For this, the costs of all activities relevant to the operations are put together.

Table 7: Calculating the Overhead Costs

| | Coronary By Pass | Valve Disease | Congenital Heart Disease | Angiography | Peripheral vascular diseases | Total |
|--|------------------|---------------|--------------------------|-------------|------------------------------|-------------------|
| Patient Admission Activity (Table 1) | 7.262,22 | 1.905,21 | 1.658,65 | 9.436,41 | 2.846,61 | 23.109,10 |
| Activities of Pre-operative Care (Table 3) | 55.034,56 | 11.812,97 | 12.569,62 | 32.504,98 | 13.727,76 | 125.649,89 |
| Anesthesia Activity (Table 4) | 53.905,08 | 15.555,94 | 11.080,49 | - | 10.564,73 | 911.06,24 |
| Operation (Table 5) | 54.091,44 | 17.028,79 | 9.883,37 | 14.057,09 | 21.202,51 | 116.263,20 |
| Intensive Care and Pre-Operative Care Processes of the Patients after | 46.961,70 | 12.320,20 | 10.725,83 | 12.204,25 | 18.407,82 | 100.619,80 |

| the Operation (Table 6) | | | | | | |
|----------------------------|------------|-----------|-----------|-----------|-----------|------------|
| TOTAL | 217.255,00 | 58.623,11 | 45.917,96 | 68.202,73 | 66.749,43 | 456.748,23 |

As can be seen in Table 7, almost half of the Overhead Costs belongs to Coronary by pass operations. All operation types apart from the congenital heart disease operations used up almost the same amount of Overhead Costs. The least overhead cost was seen in by congenital heart disease operations. Depreciation cost in overhead costs was direct costs and other costs were indirect costs.

Comparison of Calculating the Overhead Costs with Traditional Method and Activity Based Costing Method

Between the traditional method and activity based costing, there are no differences in terms of direct material and direct labor costs, so the total overhead costs are the same. However there is a difference in the distribution with respect to the types of operations. After the overhead costs of the operations are calculated according to the activity based costing method, the total overhead costs formerly calculated according to the traditional costing are compared below.

Table 8: Comparison of Calculating the Overhead Costs with Two Methods

| Type of Operation | Number of Operation | Overhead Costs (Traditional Method) (TL) | Overhead Costs (Activity Based Costing) (TL) (Table 7) | Difference (TL) |
|------------------------------|---------------------|--|--|--------------------|
| Coronary By Pass | 324 | 212.502,05 | 217.255,00 | 4.752,95 |
| Valve Disease | 85 | 66.898,79 | 58.623,11 | (8.275,68) |
| Congenital Heart Disease | 74 | 38.827,54 | 45.917,96 | 7.090,42 |
| Angiography | 421 | 55.224,30 | 68.202,73 | 12.978,43 |
| Peripheral vascular diseases | 127 | 83.295,55 | 66.749,43 | (16.546,12) |
| Total | | 456.748,23 | 456.748,23 | |

As can be seen in Table 8, in ABC method, an excess of 4.752,95 TL in Coronary by pass operations, 7.090,42 TL in congenital heart disease operations, and 12.978,43 TL in angiography are observed when compared to the traditional method. Also, a deficient of 8.275,68 TL in valve diseases and 16.546,12 TL in peripheral vascular diseases are seen.

Coronary by pass: This operation has taken the largest share from the operation overhead costs in both methods. The reason for this is that in terms of the traditional method, the operation time is long and the number of operations is many, and in terms of ABC, it might be because this operation is the one that most requires the activity and thus it is the operation with the highest cost. The reason for a difference of 4.752,95 TL between the traditional method and ABC is that the traditional method is solely indexed to direct labor costs, whereas in ABC method, different cost drivers are used.

Valve diseases: The cost of this operation is 66.898,79 according to the traditional method, whereas it is 58.623,11 TL according to ABC. ABC made a deficient loading of 8.275,68 TL to this operation because this operation is one of the operations that require the least activity. Thus, it is appropriate that it is given less share in the overhead costs.

Congenital heart diseases: The cost of congenital heart disease operations is 38.827,54 TL according to the traditional method, and 45.917,96 TL according to ABC. ABC has laid an excess of 7.090,42 TL on this operation.

Angiography: ABC has laid an excessive of 12.978,43 TL to this operation, whose number is the highest and duration is the shortest, yet second only to coronary by pass operations the total cost. Despite the assumption that anesthesia activity is not used here, the reason for the excess can be understood if it is taken into consideration that angiography takes up 41% of the patient admission activity, 26% of pre-operative care activity, 12% of operation and intensive care activity. As the traditional method solely focuses on the working hours directly, the cost of angiography which lasts an average of ½ hours is calculated as lower.

Peripheral vascular diseases: The cost of this operation is calculated as 83.295,55 TL by the traditional method, whereas it was calculated to be 66.749,43 TL by ABC. For this reason, ABC made a deficient loading of 16.546,12 TL. That this cost is high according to the traditional method is because the number of operations is high and the duration of the operation is long. However, when activity consumptions are taken into consideration, it is observed that this operation consumes the activities other than operation and intensive care less than Coronary by pass and angiography. As a result, the difference is understandable because it requires less activity.

Calculating the Overhead Costs According to Activity Based Costing

According to activity based costing, the calculations of the overhead unit costs are made as shown below:

Table 9: Calculating the Overhead Unit Cost According to Activity Based Costing

| Type of Operation | Overhead Costs (TL) (1) | Total Operation Duration (Hour) (2) | Cost of Operation for one hour (1)÷(2)=(3) | Average Operation Duration (One Operation) (4) | Overhead Unit Costs (TL) (3) X (4)= (5) |
|------------------------------|----------------------------|--|---|---|--|
| Coronary By Pass | 217.255,00 | 810 | 268,22 | 2.5 hour | 670,55 |
| Valve Disease | 58.623,11 | 255 | 229,89 | 3 hour | 689,67 |
| Congenital Heart Disease | 45.917,96 | 148 | 310,26 | 2 hour | 620,52 |
| Angiography | 68.202,73 | 210.5 | 324,00 | ½ hour | 162,00 |
| Peripheral vascular diseases | 66.749,43 | 317.5 | 210,23 | 2.5 hour | 525,58 |
| Total | 456.748,23 | 1741 | | | |

Comparison of Overhead Unit Costs

The unit operation costs of CS department can be shown as follows, both according to the traditional method and activity based costing method:

Table 10: Comparison of Unit Cost of Overhead Costing

| Type of Operation | Number of Operations (1) | Traditional Method (TL) (2) | Activity Based Costing (TL) (3) | Difference (TL) (2)-(3)=(4) |
|------------------------------|-----------------------------|--------------------------------|------------------------------------|--------------------------------|
| Coronary By Pass | 324 | 655,87 | 670,55 | 14,68 |
| Valve Disease | 85 | 787,05 | 689,67 | (97,38) |
| Congenital Heart Disease | 74 | 524,70 | 620,52 | 95,82 |
| Angiography | 421 | 131,17 | 162,00 | 30,83 |
| Peripheral vascular diseases | 127 | 655,87 | 525,58 | (130,29) |
| Total | 1031 | | | |

Taking Table 10 into consideration, we can list the operations from the highest cost to the lowest as shown below:

Table 11: Ordering of Overhead Unit Cost

| | Activity Based Costing (TL) | Traditional Method (TL) |
|----------|--|--|
| 1 | Valve Disease 689,67 | Valve Disease 787,05 |
| 2 | Coronary By Pass 670,55 | Coronary By Pass 655,87 |
| 3 | Congenital Heart Disease 620,52 | Peripheral vascular diseases 655,87 |
| 4 | Peripheral vascular diseases 525,58 | Congenital Heart Disease 524,70 |
| 5 | Angiography 162,00 | Angiography 131,17 |

As can be seen, the unit costs of the two operations with same durations (Coronary by pass and peripheral vascular diseases) are the same in the traditional method. However, ABC calculated the unit cost of Coronary by pass operation as 670,55 TL, and the unit cost of peripheral vascular diseases as 525,58 TL. According to both methods, the highest unit cost belongs to the valve disease operations. The traditional method calculated the unit cost of valve disease operations as 787,05 TL, whereas ABC calculated it as 689,67 TL. The lowest unit cost belongs to angiography according to both methods. However, ABC made an excess of 30,83 TL.

According to the traditional method, the overhead costs of the hospital are distributed to CS department by using direct distribution method.

Activity based costing method focuses on activities instead of departments. When starting the application of ABC method on departmental basis, the traditional distribution results are used as department cost. Afterwards, the activities that form the starting point of activity based costing are determined as such: patient admission, pre-operation care, anesthesia, operations, intensive care and post operative care. The costs are distributed to these activities through first step cost drivers. After this, the activity costs were loaded to cost targets (operation types) by way of second step cost drivers.

During the selection of first and second step cost drivers, it was not possible to apply much flexibility. One of the reasons of this is that labor cost is still at the foreground in hospital enterprises, and the other is that sufficient registration and document archiving is not being done at the hospital within the existing system.

CONCLUDING REMARKS

As it is well known enterprises are organizations established to meet people's needs and to make profit. That the main activity fields of hospital enterprises are to improve and protect human health separates the hospitals from all other enterprises, including other service enterprises. However, this quality of hospitals is not an obstacle for the hospitals to be perceived like other enterprises.

In parallel to the technological developments, the cost profile of all enterprises has changed in time. The share of the direct material and direct labor costs within the total costs has decreased, whereas the overhead costs have become dominant within the total costs. As a natural result of this, the problem of the overhead cost distribution arises. The decrease in the relationship between labor costs and the overhead costs (the increase in automation and decrease in direct labor costs), which are the classical distribution keys used to distribute overhead costs to products, caused labor costs to be no longer a proper distribution key.

Activity based costing (ABC) is a cost distribution method developed against the traditional method. This method aims at calculating the indirect costs of the enterprise through activities. According to this method, the cause of the costs arising in enterprises is the activities; that is, the activities cause the costs. The goods and the services that constitute the output of the enterprises and that are called the cost targets come out as a result of the consumption of these activities. Thus, there are two stages at the core ABC: First is Activity resources and second is Activity consuming cost targets.

The distribution keys used in the calculation of resource consumption by activities are called the first stage cost drivers, and the distribution keys used in the calculation of resource consumption by cost targets are called the second stage cost drivers.

Whereas only one distribution key is used in the traditional method, in activity based costing method a different cost driver is used for each activity and in this way, a more correct cost information is derived; however, a cost driver that is incorrectly chosen can cause incorrect costing and also bring along additional loads to enterprises. The most laborious part of ABC is the selection of cost drivers and the measurement of these drivers. An incorrectly chosen cost driver can cause incorrect costing and incorrect costing can cause financial loss in enterprises.

THE LINKAGE BETWEEN ORGANIZATIONAL JUSTICE, CREATING FACADES OF CONFORMITY AND JOB ENGAGEMENT: WHAT ALL THESE RELATIONS MEAN FOR THE ORGANIZATIONAL CHANGE MANAGEMENT?

Ash Erim, Istanbul Commerce University, Istanbul
Sezer Günaydın Çalışkan, Haliç University, Istanbul

ABSTRACT

Within this research model the impact of organizational justice variables (procedural, interactional and distributive justice) on two important organizational behavior variables will be investigated namely: creating facades of conformity and job engagement. These two dependent variables of the research model are relatively new constructs in OB literature and they have important effects both on individual and organizational level outcomes especially during an organizational change, therefore, investigating the degree of creating facades of conformity and job engagement is worthwhile to search.

LITERATURE REVIEW

Organizational Justice

In recent years, increasing attention has been given to justice constructs resulting in a literature that is flourishing (Colquitt and Greenberg, 2003) and it is currently one of the most researched topics in industrial psychology with over 300 studies having been published in the last 25 years (Nowakowski and Conion, 2005).

Organizational justice refers to staff perceptions of fairness of treatment received from an organization and their behavioral reaction to such perceptions (James, 1993). In organizational justice theory, perceptions of fairness in organizations are explained by categorizing employees' views and feelings about their treatment and that of others within the organization (Greenberg, 1987). The methods used to make the perceptions and the treatment of those affected through three related theories. The first relates to employee perceptions of outcome fairness, which Homans (1961) labeled distributive justice. The second is procedural justice (Thibaut and Walker, 1975), which focuses on employee perceptions about the fairness of procedures used to make decisions (Folger and Cropanzano, 1998). The third is interactional justice (Bies and Moag, 1986), which focuses on perceptions about the fairness of the interpersonal treatment that employee receive during implementation.

Previous studies in the area of organizational justice have suggested justice to be consistently related to employee work attitudes and behaviors (Folger and Konovsky, 1989; Greenberg, 1990). That is, if employees perceive the outcomes of their evaluations to be fair or perceive the process by which outcome allocation decisions are made to be fair, they will be likely to achieve higher performance, will display more extra role behaviors, will be more committed to their organizations and their supervisors, will have higher levels of trust and will display less counterproductive work behavior and harmful political behaviors. Also, organizational justice has been a cornerstone in organizational change as it has been shown in many studies to be predictive of higher levels of openness to change, cooperation with change and satisfaction with change. Today, it is

unquestionable that addressing justice issues is the key to successfully implementing organizational change. Effective change is not simply a matter of clearly articulating an energizing vision and getting people to “buy in” to the desired outcome of the change; it is crucial to focus on the justice aspects of the change process. So, within this article, as the main purpose, addition to the impact of perceived justice on creating facades of conformity, also the effect of the interaction of perceived justice and creating facades of conformity on “job engagement” - on an important employee attitude will be searched.

Creating Facades of Conformity

Hewlin (2003) recently introduced theoretically the concept of facades of conformity (FOC). It means false representations created by employees to appear as if they embrace organizational values. Creating facades of conformity is a theoretical concept coined to describe employees who act as if they embrace an organization's values when they really don't in order to survive and/or succeed within that organization. Facades of conformity are a possible consequence of value incongruence. The decision of whether to create facades of conformity rather than openly express personal values, may reflect a range of fears and concerns such as “Will I be passed over for a promotion if I show my true feelings?”

Major organizational changes, such as a corporate merger or acquisition, redefine the work environment for employees (Ahuja and Katila, 2001). These changes might cause a degree of misfit between the relatively stable personal work values (of the employee) and those of the changing work environment (Bordia et al., 2004). When an environment of rapid, sometimes unpredictable organizational change is coupled with individuals who do not necessarily embrace the change, a perception of misfit between employee and organization may arise. Because of personal and organizational antecedents such as job insecurity, subjective reward systems, employees can not express their true opinions and feelings about the change, the result of which an employee creates facades of conformity instead of resisting to survive in this new work environment. A facade is the face, especially an artificial or false front. During the change process, employees present facades of conformity that is usually crafted specifically to create a favorable impression such as following the change missions or programs. By pretending that they support the change, employees would have pursued the goal of satisfying change agents in a way that will not create unnecessarily bad impressions of their public image in that organization. However emotionally or cognitively they experience something disturbing as they are acting as a real self. Therefore, a person may behave in a certain way to convey a certain impression, yet feels an entirely different emotion. This contradiction between inner self and outside face will cause stress for those individuals. When behaviors are incongruent with values, individuals will feel tremendous discomfort, emotionally and physically. They will not function optimally.

Within this context, it can be hypothesized that when the justice perceptions of employees is high, creating facades of conformity will decrease; because, in fairness environments, employees will get adequate and necessary explanations and information for the organizational decisions and their level of trust to their managers and the organization as whole increase as they will be treated in respect and dignity. In this justice and trust environment, employees will be able to express their feelings without fear and they don't need to make any manipulations in their behaviors, attitudes and words. The impact of organizational justice and creating facades of conformity is connected to a very important attitude of employees namely “job engagement” as the dependent variable of the study.

H1: Organizational justice has a positive explanatory power on “creating facades of conformity” behavior of the employees.

Job Engagement

In recent years, there has been a great deal of interest in employee engagement. Although employee engagement has become a hot topic among practitioners and consultants, there has been practically no empirical research in the organizational behavior literature. Instead of traditional organizational structures and a strong emphasis on economic principles, the focus in modern organizations is on the management of human capital. This means that- in the words of Dave Ulrich (1997) “Employee contribution becomes a critical business issue because in trying to produce more output with less employee input, companies have no choice but to try to engage not only the body but the mind and soul of every employee.” Instead of just “doing one's job”,

employees are expected “to go to the extra mile.” Thus, employees are needed who feel energetic and dedicated and who are absorbed by their work. In other words, organizations need engaged workers (Schaufeli and Salanova, 2008). Maslach and Leiter (1997) define engagement as the antipode of burnout. Conversely, Schaufeli et al. (2002) view engagement and burnout as two independent but closely related states. These researchers define engagement as a positive, fulfilling, work-related state of mind that is characterized by vigor, dedication and absorption. The possible consequences of work engagement pertain to positive job-related attitudes, individual health, extra-role behaviors and performance. Many have claimed that employee engagement predicts employee outcomes, organizational success and financial performance (Harter et al., 2002).).

Within the context of this article, we can hypothesize that in organizational justice environments “job engagement” attitudes of the employees can easily prevail. Previous research in the literature approves that justice perceptions increases the extra-role behaviors and performance of the employees. When employees perceive that they are treated fairly with respect and dignity they will be more inclined to their job and organizational goals. In terms of social-exchange theory and “the norm of reciprocity”, employees will show more extra role behaviors to compensate this fair environment. So the second hypothesis of the article is that:

H2: Organizational justice has a positive explanatory power on job engagement attitude of the employees.

With this theoretical background, theoretical research model of this article can also be exhibited as in Figure 1:

Besides the expected direct impact of organizational justice on creating facades of conformity and the impact of organizational justice on job engagement, the mediating role of “creating facades of conformity” on the impact of organizational justice on job engagement will also be tested. Organizational justice may have a direct impact on job engagement attitudes of the employees, but creating facades of conformity can increase this effect and also creating facades of conformity may have more explanatory power on job engagement comparing organizational justice. So the third hypothesis of the article is:

H3: Creating facades of conformity mediates the impact of organizational justice on job engagement.

METOD

Sampling and Procedure

Participants: With convenience sampling method, chosen on convenience of access, participants completed the study’s instruments on a voluntary basis. The sample of this study will include white color employees working full time in private organizations in wide range of industry sectors (manufacturing, education, including, computer services, accounting and customer relations), experienced an organizational change over the last one year in Istanbul, Turkey.

Procedures: Questionnaires are distributed to those volunteered to participate in this study by visiting the companies and taken back within 15 working days. The surveys were also accompanied by a letter explaining the focus of the study. It was reminded the participants that their responses were completely confidential.

Measures

Creating facades of conformity scale which is developed by Hewlin (2003) for her own dissertation is used to measure facades of conformity variable. The scale is composed of twelve items. The 5th, 7th, 8th, 9th and 12th items were reversed.

Job engagement scale used in this study, namely, “Utrecht Engagement Scale” was developed by Schufeli et al. (2002). It consists of seventeen items which were designed to assess three components of engagement; vigor, dedication and absorption. Some sample items are for vigor “I feel vital and strong when I work”, for dedication “My work still inspires me” and for absorption “Time flies when I am working”. There is no reverse item in this scale.

Organizational justice scale developed by Moorman (1992) was used. There are six items measuring distributive justice and twelve items measuring procedural justice (including interactional and informational justice). There is no reverse item in this scale.

FINDINGS AND RESULTS

To be able to test the impacts of model variables, factors are computed and the reliability analysis were done to all of the factors by SPSS 17.0 version. Creating facades of conformity scale was computed two factors. The KMO measure of sampling adequacy revealed a value more than .50, which means that it is statistically appropriate to rely on the sampling to see if the correlations are meaningful. In addition, loadings under each factor were examined and those items that have low factor loadings were excluded from the analysis. Thus, the 4th, 6th and 11th items were discarded due to low loadings and contextual misfit with the two main factors. Two factors yielded a KMO value of .773 and the Bartlett’s test of sphericity yielded a significant result with a $p=.000$. Therefore, it was concluded that the data is appropriate for carrying out the factor analysis and that the factor analysis results are valid. Two factors were named as “masking true feelings” and “being free of hypocrisy” in this study.

Secondly, all of the items of “job engagement scale” were entered to the factor analysis. At first, SPSS computed 3 factors but the third factor is only composed of Q8. Therefore this one item is excluded from the analysis and the factor analysis repeated. Q12 and Q5 were also excluded from the analysis because of their low factor loadings. SPSS computed two factors but again the second factor has only one item therefore this factor (composing Q13) was excluded from the analysis. At the end, one factor composing of 11 items was calculated as “job engagement” factor. Cumulative variance, reliability scores and factor loading are exhibited in Table 2.

Lastly, organizational justice scale items were entered to factor analysis. SPSS computed 2 factors as it is in Moorman’s original scale. One factor is “distributive justice” and second factor is “procedural justice”. Only one item (Q1) in distributive justice factor is excluded from the analysis since it decreases the reliability of the factor structure. In the literature, some researchers define “informational” and “interactional” justice as a separate factor from procedural justice whereas in this study informational and interactional justice is unified in one factor as “procedural justice”.

To test the explanatory power of independent variables on the dependent variable a series of multiple regression analysis were conducted. In the first analysis to test H1 (*organizational justice has a positive explanatory power on “creating facades of conformity” behavior of the employees*), procedural and distributive justice variables were regressed on first “masking true feelings” and secondly “being free of hypocrisy” factors of the facades of conformity behavior, so two regression models were tested. As the results indicate (see Table 1), procedural justice has a meaningful explanatory power on masking true feelings. The Beta co-efficient .549 which indicates a moderate to high impact of procedural justice on masking true feelings. The total explanatory power of the model (R square) is 30.2 %. These results verify the important contribution of procedural justice on creating facades of conformity. When it comes the second sub-component of creating facades of conformity “being free of hypocrisy” as it seen in Table 2, distributive justice has a meaningful explanatory power on this variable. The impact of distributive justice on being free of hypocrisy is (Beta coefficient) .348 whereas the explanatory power of the model is .113 (low-to moderate). These analyses proved the explanatory power of justice on creating facades of conformity and H1 is accepted.

Table 1: The Explanatory Power of Organizational Justice on Masking True Feelings

| VARIABLES | R SQUARE | F | SIGNIFICANCE F | BETA | T | P |
|--|-------------|--------|-------------------|-------------|-------|------|
| <i>VARIABLES THAT ENTERED IN TO THE REGRESSION</i> | .302 | 46,276 | .000 | | | |
| <i>PROCEDURAL JUSTICE</i> | | | | .549 | 6,803 | .000 |
| <i>INDEPENDENT VARIABLES: Procedural and distributive justice</i> | | | | | | |
| <i>DEPENDENT VARIABLE: Creating facades of conformity: “Masking true feelings”</i> | | | | | | |

Table 2: The Explanatory Power of Organizational Justice on Being Free of Hypocrisy

| VARIABLES | R SQUARE | F | SIGNIFICANCE F | BETA | T | P |
|--|-------------|--------|-------------------|-------------|-------|------|
| <i>VARIABLES THAT ENTERED IN TO THE REGRESSION</i> | .113 | 14,877 | .000 | | | |
| <i>DISTRIBUTIVE JUSTICE</i> | | | | .348 | 3.857 | .000 |
| <i>INDEPENDENT VARIABLES: Procedural and distributive justice</i> | | | | | | |
| <i>DEPENDENT VARIABLE: Creating facades of conformity: “Being free of hypocrisy”</i> | | | | | | |

In the second regression model, the explanatory power of organizational justice on “job engagement” was tested and distributive and procedural justice was regressed on job engagement. As it is exhibited in Table 3, procedural justice entered to the regression equation as the independent variable. The impact of procedural justice on job engagement is .348 and the total explanatory power of the model is 47%. Distributive justice together with procedural justice has no meaningful impact on job engagement; therefore, H2 is supported. That is organizational justice has a positive explanatory power on job engagement.

Table 3: The Explanatory Power of Organizational Justice on Job Engagement

| VARIABLES | R SQUARE | F | SIGNIFICANCE F | BETA | T | P |
|---|-------------|--------|-------------------|-------------|-------|------|
| <i>VARIABLES THAT ENTERED IN TO THE REGRESSION</i> | .469 | 97,994 | .000 | | | |
| <i>PROCEDURAL JUSTICE</i> | | | | .348 | 3,587 | .000 |
| <i>INDEPENDENT VARIABLES: Procedural and distributive justice</i> | | | | | | |
| <i>DEPENDENT VARIABLE: Job engagement</i> | | | | | | |

At last, mediating role of “creating facades of conformity” between organizational justice and job engagement was tested. According to Baron and Kenny’s regression model, mediating analysis is done in 3 steps with a hierarchical regression analysis. First the impact of independent variable (organizational justice) on the dependent variable (job engagement) has to be tested. Secondly, the impact of mediating variable (creating facades of conformity) on dependent variable is tested and in the third step independent and mediating variables entered into the model together. If mediating variable has more impact than independent variable or the impact of independent variable decreases with the inclusion of mediating variable, we can say that there is a mediation effect. The steps of the hierarchical regression analysis were presented in Table 4. Creating facades of conformity especially masking true feelings sub-component has a very high explanatory power on job engagement and the explanatory power of the model is quite high (R Square: .621). Comparing the effect of organizational justice variables on job engagement, this impact is larger. In the last step of hierarchical regression, organizational justice and creating facades of conformity were entered to the analysis together. The variables which have a meaningful impact on job engagement are “procedural justice” and “masking true feelings”. When entered to the analysis together with creating facades of conformity variables the impact of procedural justice does not change dramatically. The Beta impact of masking true feelings is larger than procedural justice, but the impact of procedural justice also protects its explanatory power. Without the contribution of creating facades of conformity, procedural justice still has a good explanatory power on job

engagement. This result shows us that creating facades of conformity doesn't have a mediating role on the impact of organizational justice on job engagement, therefore, H3 is rejected. However, organizational justice and creating facades of conformity can be taken as two important determinants of job engagement attitude.

Table 4: The Mediating Role of Creating Facades of Conformity between Organizational Justice and Job Engagement

| VARIABLES | R SQUARE | F | SIGNIFICANCE F | BETA | T | P |
|--|-------------|---------|-------------------|-------------|--------|------|
| <i>VARIABLES THAT ENTERED IN TO THE REGRESSION</i> | .621 | 84,442 | .000 | | | |
| <i>MASKING TRUE FEELINGS</i> | | | | .771 | 12,718 | .000 |
| <i>BEING FREE OF HYPOCRISY</i> | | | | .178 | 2,942 | .004 |
| <i>INDEPENDENT VARIABLES: Creating facades of conformity</i> | | | | | | |
| <i>DEPENDENT VARIABLE: Job engagement</i> | | | | | | |
| VARIABLES | R SQUARE | F | SIGNIFICANCE F | BETA | T | P |
| <i>VARIABLES THAT ENTERED IN TO THE REGRESSION</i> | .672 | 101,298 | .000 | | | |
| <i>MASKING TRUE FEELINGS</i> | | | | .564 | 8,297 | .000 |
| <i>PROJEDURAL JUSTICE</i> | | | | .367 | 5,398 | .000 |
| <i>INDEPENDENT VARIABLES: Creating facades of conformity sub components, Organizational justice sub-components</i> | | | | | | |
| <i>DEPENDENT VARIABLE: Job engagement</i> | | | | | | |

Above all, the most important point is that what all these relations mean for the organizational practitioners and what the managerial implications of this study findings. One of the important finding is that the employees' fairness perception increases the level of job engagement is proved. Job engagement may be the last sustainable competitive advantage that post modern organization seeks and is an important social capital for the companies which create extra role behaviors and this performance can be reflected in the bottom-line results of the companies. It is an emerging psychological construct that purports to measure individuals' level of psychological presence at work. As it is stated in the literature part, engagement means more proactive, dedicated, creative and collaborative employees and companies need such employees to run their business especially in change processes. Employee contribution becomes a critical business issue because in trying to produce more output with less employee input, companies have no choice but to have engaged employees: energetic and dedicated employees who are absorbed by their work. It is clear that companies have to create justice climates for their employees in order to increase their engagement level and to take advantage of their human capital. For the future studies, some other variables such as the personality factors (self-efficacy, political skill, and core self evaluations) can be included into the research model.

In today's business world, employers and managers seek for trustworthy and reliable employees that they can count on, especially in difficult times such as organizational change; additionally they value effective workplace communication which is very important for smooth and efficient functioning of any organization; however, by creating facades of conformity, employees hide their true feelings from their colleagues. This action might be accepted as a negatory behavior. Additionally, by not expressing true opinions and feelings about their value incongruence or other personal concerns about the change might cause serious problems in the organization prospectively and abrogates the opportunity to fix the related problems and stimulate a healthy debate over the validity of the decisions. If employees create facades of conformity, their behaviors also signal some important and critical issues regarding to their work environment such as poor communication and mistrust

to others. Also, masking true feelings takes its toll on individual work related outcomes such as job engagement. The impact of creating facades of conformity on job engagement is also empirically proven in this study. If employees have an attitude to mask their true feelings, their level of job engagement decreases. Additionally, organizational justice also has a good explanatory power on creating facades of conformity. As no previous studies had tested the empirical associations between *perceived fairness*, this study is the first attempt to search this impact and found that perceived fairness has an effect on masking true feelings. Resistance to change literature explains that how people are treated and how the change is implemented can have considerable influence on employees. Research in organizational justice also has shown that when employees see themselves as being treated fairly, they develop attitudes and behaviors required for successful change - even under conditions of adversity and loss (Cobb et al., 1995). In contrast, when organizational decisions and managerial actions are deemed unfair, the affected employees experience feelings of anger, outrage and a desire for retribution (Greenberg, 1990). In our study it was expected to find a negative impact of perceived fairness on creating facades of conformity. Contrary to what has been previously explained for fairness in literature, this study found that perceived fairness has a positive impact on masking true feelings. It can be explained that if an employee was treated fairly or change was implemented equitably in their organization in the past, he or she would not express his or her contrariety by resisting and instead be patient and keep his or her silence by masking their real intention believing that things can change in a positive way or they can benefit from change one way or another without drawing any attention.

We believe that our study findings will have substantial importance for managerial roles within employee relations, human resources and management strategies. This study adds to the evidence the crucial importance of organizational justice in organizational change processes and employee attitudes towards change. The findings of this research will suggest that necessary footsteps should be taken prior and after the change in order to have a less confusing and more peaceful workplace and also to establish more supportive and trustable relationships between employees and managers.

STRATEGIC CONTROL IN INTERNATIONAL COMPANIES: A CASE STUDY

Nikolay Filinov, Nadezda Bek and Nina Vladimirova
State University – Higher School of Economics, Moscow

ABSTRACT

Globalization forces companies to look for new markets for their business. On one hand international operations enable companies to use their resources more effectively. But on the other hand, internationalization brings about number of problems associated with the strategic control of subsidiaries. In order to gain competitive advantage from the multinational scope of business, firms should secure the effective implementation of corporate-level strategies and policies while at the same time allow for the right degree of subsidiaries' autonomy. The paper presents the main results of an empirical research of forms and mechanisms of strategic control with respect to market and cross-cultural peculiarities.

INTRODUCTION

The strategic aspects of international development, globalization and the opening of new markets attracted remarkable interest of researchers. The problem of adjusting the firm-level strategy while entering a foreign market to the cultural peculiarities of the company's home and foreign cultures has been extensively studied (Barlett and Ghoshal 1995, Kogut 1985, Kogut and Harbir 1988, Levitt 1983, Ohmae 1990, Prahalad and Doz 1987, Duning 1993). The finding of this research was that international expansion strategy depends on several factors, both pertaining to the international context and company specifics.

Another research question that has been studied is "what occurs after the international strategy has been chosen and a company has already entered a new market?" A number of factors which influence behavior of companies after entering foreign markets have been identified (Ghoshal and Nohria 1993, Li 1995; Sharma 1998; Harzing and Noorderhaven 2008; Soledad and Mody 2004, Morrison, Ricks and Roth 1991). At the same time, the problem of executing strategic control of foreign subsidiaries in its relation to cross-cultural issues has not got appropriate attention in the literature.

Thus, the aim of this paper is to analyze, what forms and mechanisms of strategic control become more effective depending on the chosen strategy of international expansion, business environment, culture and market specifics.

THEORETICAL UNDERPINNINGS

Analysis of existing literature has shown that two aspects of company's international strategy dominate the interest of researchers: choice of international market entry strategy, including its organizational forms, and choice of company's strategic control of its international operations.

International expansion strategy

The decision on foreign market entrance strategy is made at the corporate level. International expansion is usually expected to promote profitability growth in the long-term. The use of advantages offered by operations on foreign markets may be favorable for the attainment of company's strategic goals. These advantages, which are unavailable to the companies working only in their domestic markets, are: economies of scale due to higher production and sales volumes and placing manufacturing facilities in the regions with lower costs. Nevertheless

not all companies make attempts to enter foreign markets. This is because such a strategy requires substantial sophistication of the company's management to handle the political and economic risks of working in foreign markets and of cross-cultural differences in management practices.

There are two main alternatives at the ends of the spectrum (with a number of intermediate options in-between) may be examined from the perspective of standardization of company's operations:

1. *Multinational strategy*, based on accounting for and using of peculiar national features of particular segments of the world market on which the company operates;
2. *Globalization Strategy*, based on application of standardized approach towards particular segments of the world market on which the company operates with only minor changes in products, services, policies and procedures.

The choice of strategy is determined by two major economic factors: the possible degree of standardization of the world market and the economies of scale for the product or service in question. The choice of one of these strategies is also based on the company's decision concerning the degree of core competences' centralization. This requires considering of opportunities for the coordination and management of administrative costs (Morrison, Ricks and Roth 1991).

On one hand, the strategy of the parent company can be focused on centralization of the basic functions in the head office, while delegating some authority to foreign subsidiaries. This approach requires accurate specification, what areas of responsibility need to be delegated to foreign subsidiaries.

On the other hand, the head office can distribute functional areas of responsibility between various countries in such a way that the competitive advantages of each subsidiary can be used in the most effective way. This approach involves the highest administrative costs. Moreover it requires a high level of complex integration mechanisms and also the sharing and supporting of the same organizational culture in all international divisions of a company.

The evolutionary approach to the study of international expansion strategies has been suggested by Birkinshaw and Hood (2001). According to this theory one can distinguish three stages of development of a company: paternalism, expansionism and liberalism. The paternalism stage (according to Birkinshaw and Hood this was typical for the first half of the twentieth century) presumes that a company innovates in the home country and then distributes new products and services to foreign subsidiaries. The expansionism stage presumes that innovation also occurs in selected foreign countries, but the task of identification and promotion of these innovations is assigned not to foreign subsidiaries, but rather to special "scanning units." Finally, the liberalism stage corresponds to the situation when valuable ideas can emerge anywhere in the world. The more distant is the subsidiary from the headquarters (HQ), the more their employees become less constrained by norms and belief structures of the parent company and thus more open to innovation.

Forms of strategic control

Companies may implement strategic control through Corporate Centers (CC), which in different markets play different roles. There are many publications, describing and analyzing roles of CC. Most of them, however, do not cover cross-border aspects of control (Goold and Campbell 1987, Johnston and Gill 1993, Simons 1994).

We are basing our further study on the work of Nathaniel Foote, David Hensley, Max Landsberg and Roger Morrison (2003). In their paper "Role of the corporate center" authors have suggested a set of distinguished roles that CC may play in the international activity of companies. These roles constitute a certain continuum.

On one pole there is the "Financial holding" role. A "Financial holding" type company consists of a set of independent business units that have weak communications with the corporate center. In this model the functions of the corporate centre include first of all of the financial control through the tasks of budgeting and careful profit and cash flows management. The role of the CC also includes hiring, performance evaluation and firing unit managers. Thus a head office does not attempt to co-ordinate activity of business units or to attempt to create any synergism between units.

On the other pole we find so-called "Operator" who usually develops only one line of business, but has some profitable divisions that either work in different regions, or produce different goods. Between these poles there are "Strategic architect" and "Strategic controller". Corporate center as a "Strategic architect", realizes two basic functions. First, it generates the general strategy while business units have freedom for development of their own initiatives. Second, it monitors the subsidiaries businesses, periodically initiating discussions concerning general strategy of divisions. The head office as "Strategic controller" focuses on careful and often functional analysis of business units' strategy and undertakes more efforts in achieving a synergy effect.

The choice of form of strategic control is influenced by set of both internal and external factors. First of all, the company, making the decision on the form of strategic control, appreciates international strategy as a vector of foreign subsidiaries' development. There are also other significant factors, such as market structure, power distribution between players, and general industry dynamics. However it is necessary to consider cross-cultural issues as they influence control implementation directly. In practice, it is usually not easy to specify a company as one belonging to the certain type as combined forms are often used. Moreover, forms of strategic control differ across the set of subsidiaries. In order to diagnose the form of strategic control one needs to analyze a company's internal processes and especially the mechanisms of control used with respect to a company's subsidiaries.

Mechanisms of strategic control

There are four different (although complementary) mechanisms by means of CC can assure that activities of different (included foreign) subsidiaries are in line with the strategy, targets, and standards of the mother company. These are: centralization of procedures (decision-making in the first place, but not only), formalization of procedures, output control and socialization of employees in different subsidiaries (Björkman, A., Piekkari, R. 2009).

Centralization means that certain processes are carried out exclusively at the parent company (in case of management — decisions are taken only at headquarters). This creates a number of advantages. First, CC may be sure that decisions and processes are in line with standards. Second, centralization may lead to higher efficiency of resources' utilization, as far as from the mathematical point of view, under conditions of perfect information any allocation of resources may be only equally efficient as centralized decision and never higher. Third, if there is a need to change the procedure in question, it may be done faster and cheaper. Fourth, centralization is an effective remedy against stealing resources, information drain and so on because it limits the number of employees involved. At the same time, centralization leads to longer decision-making cycles. It may lead to a lower quality of decisions due to the fact that not all information is available at CC and it is difficult, if ever possible, to take into account the entire specific circumstances of problem situations in each subsidiary. Centralization decreases the diversity of the company operations and thus makes it more vulnerable to certain risks.

Formalization stands for imposing of formal (written) rules, policies and procedures. Of course centralization may also be implemented through formalization (there is a document, stating that particular decisions have to be made by the CC exclusively). But there are numerous instances when the CC allows subsidiaries to make decisions by themselves but prescribe them how to act. So we have a distributed execution of standardized procedure. This creates the opportunity to take decisions faster and base them on more reliable information.

Output control means that subsidiaries are obliged to report certain numerical indicators to the CC. It differs from formalization also in the sense that while formalization attempts to control the process, output control concentrates on results. Generally speaking, subsidiaries are given more degrees of freedom. There is minimal need in training (what has to be reported and when, and what does it mean).

Finally, the CC may not want to decide everything, or to strictly prescribe how to act, or to control the results. Instead, it may attempt to encourage all employees to share the same goals, values and attitudes. This is in the long-run the most efficient way to assure the uniformity of operations across subsidiaries. It eliminates the need for strict control and extensive training not to speak about lengthy instruction manuals. Two-way information flows between HQ and subsidiaries are typical for this mechanism. But the reliability may vary and is always a problem. It is also time-consuming at the implementation phase: usually it is much easier and faster to issue another instruction rather than obtain changes in employees' behavior as a result of socialization. That is why it is usually combined with other mechanisms.

We have summarized different elements of international expansion strategy in Table 1.

Table 1: Different Elements of Company International Strategy and its Implementation

| Types of international strategy | Stages of international operations development | Forms of strategic control | Mechanisms of strategic control |
|---------------------------------|--|----------------------------|---------------------------------|
| | | | |

| | | | |
|------------------------|---|--|--|
| Multinational / Global | Expansionism / Liberalism / Paternalism | Financial holding Strategic architect Strategic controller Operator | Centralization Formalization Output control Socialization |
|------------------------|---|--|--|

If a company chooses multinational strategy, most likely geographical expansion will have more features of liberalism, i.e. giving subsidiaries more freedom in decision-making. Consequently, a corporate center will play a role of “Financial holding” and strategic control will be carried out by certain indicators (output control). Otherwise, choosing globalization as company’s basic strategy, type of its international operations more likely will referred to as paternalism. In this case CC will act as “Strategic controller” or “Operator”, and operations will be centralized. Moreover, different aspects of subsidiaries’ activity may be controlled through various mechanisms. Certainly, there are cases when companies combine various strategies and forms of control to achieve competitive advantages through more flexibility on one hand, and alignment to internal processes on the other.

METHODOLOGY

In our research we have used various methods of data analysis. A methodology of this research is based on the single case-analysis (Yin 1994). Specific research tools included structured in-depth interviews with top and middle management, based on 60-questions questionnaire covering various aspects of the company activity and study of company primary documents.

COMPANY IN QUESTION

The object of this research is a multinational company (MNC), based in Finland and operating in some European countries including Russia. We have focused our research on the specific issue of strategic control of MNC’s Russian subsidiaries. The company has been working for 5 years on the Russian market through the set of subsidiaries registered under the Russian law. The company has significantly expanded its operation during this period. The MNC operates in a growing market sector which has not been impacted by cyclical effects. Even in the times of financial crisis the company has not does not stop its operations and even expects total profit growth, especially in Western Europe. The MNC operates on both the business to business (B2B) and business to government (B2G) markets. The main customers in Russian are business organizations and municipalities. One of the company’s clear advantages is its brand as an experienced, responsible and innovative expert in ecological services.

RESEARCH FINDINGS

In order to characterize the cultural peculiarities of the two nations concerned, we have applied Hofstede’s (Hofstede, 1980) cultural dimensions approach. According to Hofstede’s research of culture characteristics Russia and Finland are described by the following indicators

Table 2. Hofstede’s Estimates for Finland and Russia

| | PDI | IDV | MAS | UAI |
|----------------|------------|------------|------------|------------|
| Finland | 33 | 63 | 26 | 59 |
| Russia | 93 | 39 | 36 | 95 |

Source: http://www.geert-hofstede.com/hofstede_dimensions.php

where PDI - Power Distance Index, IDV – Individualism, MAS – Masculinity and UAI - Uncertainty Avoidance Index. Both national cultures demonstrate high levels of uncertainty avoidance (UAI). Russia has presumably higher level of power distance (PDI) and masculinity (MAS).

The Russian market may be described in the following terms. While in the US and Western Europe the interest of enterprises and organizations in environmental certification is high, as it is a tool for gaining leadership in markets, Russian companies do not have a significant stimulus to acquire environmental certification of their production systems. The environmental legislation in Russia differs substantially from that in EU countries. In Russia the business of environment protection is concentrated basically in big cities and there are different rules in each region.

In order to identify particular features of the company's market environment that influence control implementation we have used Porter's Five Forces Model (Porter 2008). This model appears the most relevant for our analysis as it covers the most significant factors of the business microenvironment.

Consumers of service are basically municipalities. Although the MNC has corporate clients, the largest share of services falls on municipal bodies, such as housing service companies and city authorities. This influences company business processes, in particular processes of external communication with representatives of authorities.

Service quality significantly depends on subcontractors. In Russia the network of subcontractors in this sector is poorly developed. Basically these are former state enterprises which were fragmented during privatization. At the same time the small business sector on which the MNC interacts with in Finland has not yet developed in Russia. Therefore the mechanisms of interaction with suppliers needed to be adapted to existing Russian conditions. The MNC is compelled to make internal hires of employees instead of outsourcing services, which has been the MNC's common practice in other foreign markets.

There are significant *entry barriers* for potential competitors since there are close relations and trust on between the municipalities' top administrators and the MNC. The main customers of the MNC are city government where it provides services. Therefore it is very difficult for a newcomer to enter this market and to compete with companies that have entered it earlier.

It is difficult to name any *substitute of providing services*. Environmental services are peculiar enough by their nature. Therefore it is difficult to find services which could be regarded as substitutes. At the same time, power of this market force is insignificant.

The main *competitors* are municipal organizations. The MNC faces competition from other organizations having close connections with city authorities, but so far it is superior in its quality of services provided.

The MNC has an extensive document management system (DMS) including procedures for making all essential decisions that indicates timeframes, decision-makers, their discretion and their responsibilities. The MNC faces the problem of transfer of the DMS, originally developed in Finland, to Russia. Every mechanism of the DMS taken alone has both advantages and disadvantages, thus suggesting reasonable combination of them. This constitutes the first foundation for the subsequent analysis of DMS: we attempt to attribute every component of the DMS as a manifestation of our research framework regarding centralization, formalization, output control or socialization.

As far as the document is organized in line with such areas of the MNC activities such as management, DMS itself, finance, human resources, purchasing, communications and customer relations, it provides the opportunity to understand the application of various mechanisms in various areas. We have found that the use of mechanisms was not proportional across these areas. Some of them were better centralized, other — better formalized and so on (see Table 3).

Table 3. Mechanisms of Strategic Control, Used by MNC Across Areas

| Area of activity | Dominant subsidiary control mechanisms |
|--------------------------------------|---|
| General management | Centralization, Formalization (in part) |
| Risk management | Centralization |
| IMS maintenance | Centralization, Formalization (in part) |
| Internal audit | Centralization |
| Control of documentation and records | Formalization |
| Finance | Output control, Formalization |
| HR | Formalization |
| Purchasing | Formalization |
| Communication | Centralization |
| Sales | Centralization |
| Brand management | Centralization |

DISCUSSION AND CONCLUSION

One can clearly see from the table 3 that although formalization appears to be the very approach on which Finns and Russians are most prepared to agree and act together, it is definitely underused at the expense of centralization. This is not in line with the cultural peculiarities of the two nations. We have noted that in terms of CC-subsidiary relationships peculiarities of the Russian culture preclude lower tolerance to centralization but favors formalization. Output control appears to be underused as well.

High level of UAI means that in both countries employees have needs for rules and instructions. Thus there is a favorable outlook for the implementation of all types of formalization. At the same time, features of the Russian culture preclude Russian employees to focus on career development rather than quality of life to greater degree than their Finnish counterparts. Higher levels of remuneration are more important to Russians. Assertiveness is valued higher than intuition. Along with high PDI this means that an ideal manager is a kind of — “good father”, demanding, but caring. This implies high level of concentration of power in the hands of the subsidiaries’ CEOs. In terms of CC-subsidiary relationships it precludes lower tolerance to centralization.

The MNC operates Russian subsidiaries as its own internal divisions. But according to the Russian law the General Director of a Russian subsidiary possesses full sovereignty in his or her decisions. But according to the procedures adopted by the MNC the rights and responsibilities of the GD are considerably limited.

The general understanding from the series of interviews and documentation analysis is that the MNC is currently operating on the first stage of development in terms of geographical scope: the *paternalism stage*, at least with respect to Russian subsidiaries. In other terms, the MNC adheres to *globalization strategy* that means that the company adheres to centralization of its basic functions with certain account of local features, and also to distribution of elements of a value chain in various countries. This strategy requires coordination and integration of the overall value chain. If this requirement is realized successfully effective business processes can become a steady competitive advantage of the MNC. To keep the MNC’s strategy in line with its internal business-processes the CC likely plays a role of “*Strategic controller*”. The “strategic controller” is responsible for major investments, allocates resources, and coordinates subordinates to gain synergy.

This method of operation can be justified by the requirements of the initial phase of entering the Russian market. On the other hand, environmental services are characterized by strict legal requirements. Moreover the quality of service is difficult to determine. Consequently, a MNC which aspires to keep its reputation as reliable partner needs to supervise constantly both its own subsidiaries and external subcontractors. This provides additional justification for the choice of the globalization strategy.

The mechanism for decreasing administrative costs and transfer of resources and control over them was necessary for implementation of the MNC’s strategy. Therefore it is logical that the company aspires to document its internal processes to a greater degree. This is also in line with the role of the CC as “Strategic controller”. Nevertheless, in our opinion, some functions such as relations with municipalities (government relations) and marketing should be delegated to local managers as they understand the country and market specificity better than representatives of the head office (CC).

U.S. CHAMBERS OF COMMERCE: MERELY SOCIAL NETWORKS OR VENUES FOR PROMOTING BUSINESS ETHICS?

Patrick Flanagan and Frank Paul Le Veness
St. John's University, New York

ABSTRACT

Chambers of Commerce will celebrate their centennial in America in 2012. William Howard Taft, the 27th president of the United States of America, spearheaded the foundation of this association of business people throughout the nation whose membership in 2009 numbers three million businesses, 3000 state and local chambers, and American Chambers in some ninety locations throughout the world. While Chambers of Commerce are well known for its promotion of social engagement, its role in the promotion of business ethics is not that clearly understood. There is no present research to indicate the Chambers' role in this important endeavor. This paper will study the history of the Chamber of Commerce in America and consider if, in fact, their important gatherings are strictly for social ends or also include ethical ends. If the former is the case, the paper will seek ways to enhance the Chambers' role in building upon its concern for ethics promotion.

INTRODUCTION

On a rather regular basis, business representatives throughout the world gather in public spaces to share in solidarity building corporate alliances. These gatherings might be seasoned with a speaker engaging the assembled in a particular topic and generally include some kind of hospitality to nourish body and mind. This is not the G-7 summit where world leaders come together to strategize on how to tackle pressing global economic problems. The meetings referred to here are assemblies of Chambers of Commerce, a group of committed women and men that meet in an agreed upon location “over a meal” for the sake of discussing critical issues effecting the local business environment.

Chambers of Commerce are legion; the numbers of cities that have a chamber of commerce are astounding. Yet, for the most part, the public assessment of this important civic group is suspect and their appreciation is minimal. Often, a given community's regard is a disinterested disposition for Chambers of Commerce have been reduced primarily to repasts and venues not necessarily for problem-solving or strategic planning. This paper seeks to rectify the popular image of the chamber of commerce. It will do this in three ways. First, it will review the history of the Chamber of Commerce highlighting some of the original purposes that Chambers were founded. Then it will isolate efforts presently underway by Chambers of Commerce. While the paper contends that Chambers of Commerce have gone awry when they veered off-course from their original navigation and somehow earned their rather unpopular designation as a lunch club, it will not focus attention on this issue. A cursory review of Chambers of Commerce websites can substantiate this in their advertising of afternoon meal or *social* networking opportunity. Finally, the paper will suggest ways in which to retrieve the foundational tasks of Chambers of Commerce and restore it to its rightful place as an unelected representative civic body that can attend to both domestic and international corporate concerns. This paper restricts itself to dismantling the popular notions of Chambers of Commerce being mere social networks in the United States, but with obvious deference to other countries for informational purposes.

HISTORY OF CHAMBERS OF COMMERCE

History records that the first chambers of commerce were founded in the late sixteenth century in Marseille, France and Brugge, Belgium. Across the Atlantic, an English-speaking chamber was being chartered in 1768 in the States in New York. By 1870, close to fifty Chambers of Commerce would be formed in this nascent land. Subsequently, others would be established in America all with the purpose of promoting free enterprise and assisting the public in expressing their economic concerns to the federal government. This advocacy role of Chambers of Commerce became particularly important after the Civil War. It was the New York Chamber of Commerce that took leadership in circulating a petition to repeal the income tax associated with the aforesaid war. In April 1871, Roscoe Conkling, a senator from New York, presented the New York Chamber's roster of signatures to the Senate while James Brooks, a representative from New York, did the same in the House. (Eddlem)

In the United States of America, the formation of a national chamber of commerce surfaced in 1911. In a December 1911 speech to Congress, the then-President William Howard Taft (1857–1930), early on in his term, expressed his concern for a "central organization in touch with associations and chambers of commerce throughout the country and able to keep purely American interests in a closer touch with different phases of commercial affairs." Taft's hope was realized the following year when in April 1912, over 700 representatives from commercial enterprises and trade organizations assembled in Washington, D.C. to form a cohesive group that would represent business interest. Thus, the beginning of the U.S. Chamber of Commerce, with its own headquarters, sanctioned by the federal government as a central force to encourage, extend, and defend rallying point for promoting and defending free enterprise and individual opportunity." The building, originally owned by early American pioneer Daniel Webster, has the words of a speech Webster gave in 1825, commemorating the fiftieth anniversary of the battle of Bunker Hill, Charlestown, Massachusetts, affixed to its wall:

Let us develop the resources of our land, call forth its powers, build up its institutions, promote all its great interests, and see whether we also, in our day and generation, may not perform something worthy to be remembered.

Some, like Eddlem, have suggested Taft's move to centralize Chambers of Commerce into a singular clearing house signaled the beginning of the end of the Chamber's role in challenging government and deferring to big business' strong arming tactics and efforts to lobby. They trace this evolution to Franklin Delano Roosevelt's "New Deal" that celebrated big government, grand deficits, and greater scrutiny of business. Part of Roosevelt's "New Deal" was the National Industrial Recovery Act which gave rise to the National Recovery Administration. It was disapproved by Congress, but the U.S. Chamber of Commerce supported the NRA built on Benito Mussolini's "corporatist economic plan" of state control. Henry I. Harriman, then-president of the National Chamber of Commerce at the time acknowledged the NIRA as a piece of legislation whose "sincere and probably effective efforts to coordinate and rationalize American industry along democratic lines and to assure economic security." (DiBacco, 225)

MEMBERSHIP AND STRUCTURE OF CHAMBERS

In 2009, the Chamber's membership includes over three million businesses, three thousand state and local chambers, 830 associations, and over ninety American chambers abroad all seeking to promote and extend democracy, individual opportunity, and free enterprise. Essentially a chamber of commerce is a networking vehicle for businesses, but more than just a lively exchange for the purpose of fostering individual corporate interest. In an ideal Chamber of Commerce configuration, all interested businesses parties would seek to build a dynamic corporate environment where all flourish. In this environment then, Chamber members would assemble on a regular basis to raise immediate and long-term business and consequent concerns and plan favorable responses. Ideally, they would not only attend to their important interests but serve as advocates for more economic just society..

Even with the large number of chambers and membership, the size of a chamber is not fixed. It can have a handful of people and extend to a magnificent group like Paris' which boasts over 300,000 and ones in China's which claim even larger membership. The composition of a chamber can be city or town, county, or regionally based, leading up to an international chamber of commerce. Chambers of commerce can work synergistically with local governments for economic development of area, for example in promoting tourism or establishing visitors' bureaus. There are also amalgams of chambers of commerce on state, national, and

international levels. For example, there is the Eurochambre, the International Chamber of Commerce (ICC), and American Chamber of Commerce Executives (Worldchambers).

With regard to structure, there is a hierarchy in Chambers that include a board of directors or executive council. This latter group of business people is charged with setting the agenda and outlining policy for a chamber. In turn, the board or council hires a staff to run the day to day operations. Staff responsibility involves assisting the board or council in setting agenda to tackle common economic concerns that effect the local and surrounding community. The board or council hosts the aforesaid networking opportunities to lead membership in a sensible about viable action steps to forge a hopeful economic future. This can involve engaging government officials and, where necessary, even involve overt political action. In some countries, Chambers of Commerce can assume an arbitrating role commonly the served by a “Better Business Bureau,” but this is not the case in the United States.

Chamber s are generally one of the following models: compulsory (public law), continental (private law), or bilateral. The United States and other English-speaking countries such as the United Kingdom and Canada are examples of the continental or private law model. Unlike in the compulsory or public law model, where corporations are legally bound to participate in the Chamber of Commerce, businesses in countries that subscribe to the continental or private law archetype are not obliged to join their Chambers of Commerce. In the interest of economic development, however, they are strongly encouraged. In this continental or private law arrangement, the relationship between government and corporations is consultative, at best. Often those with the loudest voice or largest membership are attended to.

The aforesaid model differs from the other two operative models. Those businesses in nation states that hold a compulsory or public law model, such as those countries that are part of the European union, have no choice but to become part of the Chamber of Commerce. The role of these Chambers is attentiveness to foreign exchange, mentoring, and offering some services to companies. Unlike the continental or private law model, businesses *must* be consulted whenever a change in legislation or alteration in commerce is considered.

Lastly, the bilateral Chamber of Commerce is comprised of both corporations and individuals from two different countries who seek to enhance the quality of business in each of their respective countries. Such is achieved through consideration of professional interests, bilateral trade agreements and investment prospectuses. This arrangement is often regarded as a “win-win” situation in an ideal relationship.

RECOVERING ORIGINAL PURPOSES

On paper, Chambers of Commerce seem like an ideal venue for not only assembling businesspersons but also strategizing how to respond to the pressing economic concerns of the local economy. The national Chamber of Commerce website (<http://www.uschamber.com/issues/default>) does list several critical timely issues that they are dealing with including counterfeiting and piracy; economy and taxes, health care; homeland security and defense issues; immigration; labor and workplace reform; and, retirement and pension issues. They attend to these and other areas closely linked to the American business by establishing policy committees, councils, and task forces. These groups formulate policy and lobby the federal and state government to support legislation that resolves pertinent issues. If a national Chamber can do such yeoman work, how can a local chapter be comfortable being a mere “lunch club?” This is not to say that some Chambers of Commerce have not done significant work. All is not in vain. Some Chambers have had more than just lunch at their meetings. Mark Van Fleet (18-19) notes some of the outstanding work of some of America’s Chambers in the last twenty years:

Among its various areas of focus, the Rochester Chamber has formed the International Business Council. Its backbone is the seminar program series. These seminars include topics such as doing business in Canada or the EC, foreign sales corporations, etc., as well as basic exporting seminars. The Chamber has gained recognition for its promotion of export services from many organizations, including the U.S. Department of Commerce’s “E” Certificate for Excellence, and the Governor’s Award for Achievement for Export from the state of New York.

The Greater Detroit Chamber of Commerce, in addition to its endeavors within the city of Detroit, is extremely active in developing international activities and trade promotion at the local level. Among the projects which it offers to members is the export leads program. The Chamber's Export Promotion Program has assisted hundreds of area companies with trade leads. For several years, the Chamber has been trying to identify foreign markets for their goods. Chamber research, trade missions, and access to the U.S. Department of Commerce's Trade Opportunities Program, or "Hot Tops," have served as valuable tools in identifying leads. The Chamber shares leads, free of charge, to help companies gain access to the international marketplace.

The US&FCS San Diego District Office cosponsors seminars and other trade-related activities with the Greater San Diego Chamber. The San Diego area has been pro-active in promoting international trade and in conducting surveys and innovative studies.

The World Trade Division of the Chicagoland Chamber of Commerce organized five committees to pursue international business activities in specific geographic markets, including Canada, Eastern Europe and the Commonwealth, Europe, Mexico and South America, and the Pacific Rim. The Chicago District Office is represented on all five committees and assists the groups in hosting trade delegations, sponsoring special trade events that highlight foreign markets, and educating local companies about the legal, economic, and cultural aspects of international markets.

These are positive signs that Chambers of Commerce can have a considerable effect on the economy and, in turn, the worker and workplace. More needs to be done. In reviewing the history of the Chamber of Commerce in America, its structure, and some of the moves already in place to make economic policy more just, it is hoped that more local and state Chambers take their own roles seriously and move from making meals to making moves.

THE DYNAMIC EFFECTS OF ADVERTISING EXPENDITURES AND FIRM VALUE: AN APPROACH FOR THE CONSUMER DISCRETIONARY SECTOR

**Graziela Fortunato, Fucape Business School, Brazil
Walter Ness and Paulo Cesar Motta
Pontifical Catholic University of Rio de Janeiro, Brazil**

ABSTRACT

This study has as its principal objective to analyze the relation among advertising expenditures, the business cycle and firm value. It is important to consider the dynamic effect of advertising expenditures. Data of American companies from the consumer discretionary sector from 1998 to 2007 were employed to test the relation through panel data technique. The results indicate a positive relation of advertising expenditures with firm value and their dynamic effects explain some aspects of the behavior of the consumer discretionary sector. The multidisciplinary character of this study points out congruence between marketing and finance disciplines.

INTRODUCTION

Nearly all marketing activities aim to increase sales and profits (Ambler et al., 2004). Many authors claim that expenditures on advertising are the most effective way to achieve such goals (Dekimpe e Hanssens, 1995; 2000; Gruca and Rego, 2005; Mela et al., 1997) for two reasons: First, advertising expenditures are generally greater than expenditures for other marketing activities (Aaker and Jacobson, 1994); second, its purpose of publicizing companies' goals and products fits a specific time period. This way, it can be considered as tangible (Graham and Frankenberg, 2000; Zinkhan and Verbrugge, 2000). Furthermore, advertising expenditure information is disclosed by publicly traded companies in their financial reports (Shah and Saeed, 2008).

Nevertheless, measuring contributions of advertising expenditures poses challenges to marketing executives who are constantly under pressure not only to perform those activities (Day and Fahey, 1988; Doyle, 2000; McNaughton et al., 2001; Rust et al., 2004; Zinkin, 2006) but also to demonstrate, as the pertinent literature demands, that advertising expenditures can be linked to firm value (Lehmann, 2004). Whatever else these pressures may mean, they definitely highlight the inadequacy of traditional performance measures such as market share and sales revenue to shed light on this question. The implication of this article is that finance literature ignores the contribution of marketing activities in the creation of company value. The financial approaches to advertising expenditures rarely involve trying to evaluate their benefits (Srivastava et al., 1998). However, Zinkhan and Verbrugge (2000) defend that marketing and finance have different lines of research, but the approaches are complementary. Lehmann (2004) adds that there is a gap being filled. Published material, particularly from the Marketing Science Institute (MSI) and from the Journal of Business Research (JBR), underlines the growing attention that this problem has been receiving.

This article intends to evaluate the marketing assets and activities from a financial perspective, hoping to reduce the lack of interaction between marketing and finance disciplines. It specifically analyzes the relation between advertising expenditures and firm value through an evaluation of dynamic effects of advertising expenditures on firm cash flow. It also considers the macroeconomic conditions that may influence the decisions of how much is to be spent in advertising.

By way of a multiple linear regression model using panel data, the article tests the relation between the advertising expenditures and their dynamic effects and the GDP (Gross Domestic Product) with firm cash flow. Quarterly data—from 1998 to 2007—are used, extracted from Capital IQ's database, which provides business accounting data on a quarterly basis. It uses a sample from the Consumer Discretionary sector of North American Companies, which is in line with what Chauvin and Hirschey (1993) indicate: Firms, in the consumer discretionary sector, have a greater advertising intensity than firms from other sectors. Being so, they are more appropriate for this research.

This article is presented as follow: In the next part we discuss relevant studies about advertising expenditures and firm value. In the third part we describe the methodology followed by the results. At the end of this article, we present the final considerations.

OVERVIEW OF THE THEORETICAL FRAMEWORK

The literature in the marketing and finance disciplines has an important role in determining the contribution of advertising expenditures to firm value. On one hand the marketing evaluates the contribution of demand to firm results and highlights factors that are important. On the other hand, finance concentrates on quantifying the impact of demand.

Research over the last decades indicates that to achieve superior performance, firms need to obtain a competitive advantage (Barney, 1986). According to Rao and Bharadwaj (2008) and Srivastava *et al.* (1998;1999) the marketing expenditures related to marketing assets, such as brand, client loyalty and new product development can create competitive advantage since they are difficult to replicate and the benefits last long. Erickson and Jacobson (1992) go beyond questioning how a company can obtain a competitive advantage over its competitor, for example, increasing advertising or research and development expenditures. In fact, many studies show that advertising expenditures are more important and effective in obtaining a competitive advantage (Dekimpe and Hanssens, 1995; 2000; Gruca and Rego, 2005), since they increase the potential gains of the marketing assets; (Mela *et al.*, 1997); they are generally greater than expenditures for other marketing activities (Aaker and Jacobson, 1994), and allow that marketing aspects become more tangible, since the expenses are apparent, disclosed, and defined in a specific time frame (Graham and Frankenberg, 2000; Shah and Saeed, 2008; Zinkhan and Verbrugge, 2000).

Doyle (2000) and Luo and Donthu (2006) stated that advertising produces multiple and simultaneous results, such as visible sales and positive product performance results; and non-visible impacts in client behavior and brand reputation. If applied together with research and development expenditures, advertising can accelerate cash flow, reduce its volatility and increase the residual firm value (Srivastava *et al.*, 1998; 1999). According to Vakratsas and Ambler (1999), advertising induces two effect types: the persuasive effect and low involvement effect. The first effect is more aggressive and can be perceived by the increase in sales through consumer purchase behavior. The second effect is defensive, since the idea of advertising is to maintain the product in the consumer's mind. In this case, the brand is preserved and the sales do not decrease. According to the authors, in the long term, both effects tend to generate firm value.

Finance literature that deals with marketing contributions emphasizes the quantitative techniques that allow an empirical investigation of its actions and activities (Zinkhan and Verbrugge, 2000). For example, Little (1979) presents a complete analysis of concepts and models. On one hand, marketing is concentrated on the client, brand and/or product, evaluated by market shares and sales growth. On the other hand, finance emphasizes the efficiency of marketing assets in working capital management, inventory, stock market prices, stockholder's equity, among others (Dekimpe and Hanssens, 2000; Zinkhan and Verbrugge, 2000). The data also influence both disciplines: marketing commonly examines a specific company at *firm-level* through time series analysis; finance commonly aggregates data by sector and/or activity or *industry-level* through cross-section or panel data techniques. Concerning the variables used in this study, finance research commonly selects advertising expenses as a proxy for marketing activities.

The phenomenon of advertising expenditures, according to Molinari and Turino (2006), has been traditionally analyzed in both microeconomic and macroeconomic contexts. Recent studies show that aggregating advertising

form and determining its effects on aggregate demand and on the economy can be evaluated by business cycle models. Molinari and Turino (2007) concluded that advertising affects aggregate demand and presents procyclical behavior and high volatility. Dixit and Norman (1978) stated that advertising affects consumer welfare and increases sales. In this case, advertising can be evaluated with respect to its effects on the matrix of consumption, leading to greater work force intensity. This work force involvement is triggered by consumption level dissatisfaction, when advertising is intensified. To reach a higher level of consumption, consumers tend to work more (Molinari and Turino, 2007). The effect of economic recession is highlighted in various papers. Picard (2001) indicated significant reductions in advertising expenditures during economic recession. During this period, print media are even more affected than electronic media, which appears to be intuitive, since the latter requires less investment. This author also shows that the tendency is to cut advertising expenses in recession time, however, those that kept or increased advertising during a recession period experienced sale increases in the short term. The literature is vast and controversial when discussing the causality between aggregated advertising, demand and the economy.

Among the studies presented above, methodology is determinant when evaluating marketing actions and firm value, especially advertising expenses. Economic aspects are also taken into account in the models. This kind of investigation is growing and currently is characterized by the demand for improved and sophisticated models of analysis.

DATA AND METHODOLOGY

The sample in this article was non-probabilistic, defined by the criteria of accessibility, comprised of North American companies listed on the *NYSE* or on *Nasdaq Capital Market*, of the *Consumer Discretionary* sector. The sample was extracted from Capital IQ's database (a division of *Standard & Poor's*) and totaled 545 companies from 1998 to 2007, on a quarterly basis. From the total of 545 companies, we worked with those that had complete and consistent available data for advertising expenditures for 10 years, that is, without missing values. Taking these criteria into account, the sample included 29 companies.

The financial variables in the model were: (i) Gross Profit; (ii) Advertising Expenditures; (iii) Total Assets and (iv) United States Gross Domestic Product. The variables were expressed in real terms, adjusted by the Consumer Price Index with base date of 4Q2007. In addition, to neutralize the effect of the firm size, the procedure presented the financial firm values (except for the GDP) as a percentage of the firm's total assets.

The quantitative data treatment includes multiple linear regression models using panel data. Panel data consider the variable in both time and space dimensions, highlighting some advantages: (i) it conjugates a diversity of individual behaviors, with the existence of dynamics of adjustment and (ii) it works with more quantity and variability of data. The panel data technique also separates the non-observed effect that affects the dependent variable. In this case, one estimates the fixed effect model. When the non-observed effect is not correlated with independent variables, it becomes a random effect model (Wooldridge, 2003). According to Wooldridge (2003), in applied studies, it is possible to decide about the fixed and random models without evaluating the correlation of the non-observed effect with independent variables, or even by the *Hausman Test*. When we consider the data collected as a non-random sample, it is normal to think of the non-observed effect as a parameter to estimate, using the fixed effect model, found in this study. The regression assumptions were tested to assure unbiased estimators. In case of violations, proper adjustments were made.

Hypotheses

Based on the difficulty of evaluating the contribution of marketing expenditures on firm value, the current concern among professionals in this area, the hypothesis of the model can be stated as follows: that marketing expenditures, represented by the advertising expenses, have a positive relation with firm value, considering the dynamic effects of those expenditures and business cycles.

Model Specification

The study first assumed that cash flow, a parameter employed to calculate firm value, is based on the value of net revenues less the costs of goods sold and advertising expenses, following Nguyen (1985):

$$\pi = pQ - cQ - Adv \quad (1)$$

where: π - cash flow ; p - unit price; Q - units sold; c - variable costs; Adv - advertising expenses.

The equation (1) defines the cash flow (π) as being represented by net revenue (pQ), excluding the variable costs (cQ) and the advertising expenditures (Adv) during the period. We highlight that the inclusion of fixed costs is not necessary in this case, since the main goal is to capture the effect of advertising on sales, excluding the effects that generate them.

Feichtinger et al. (1994) and Molinari and Turino (2006; 2007) state that marketing activities are designed to generate demand for the firm's products, while production policies are created to satisfy this demand and minimize variable costs. Being so, the first change suggested in this study is that cash flow has two effects: first according to Nguyen (1985) and Feichtinger et al. (1994), is the internal effect of advertising expenditures to increase the volume of sales. The second is the effect of business cycles, given by the gross domestic product, considered as an external factor that affects sales without control by the firm. To analyze these effects, we assume that price is constant. The relationships of advertising expenditures and business cycles with firm cash flow is first presented as:

$$\pi = f(Adv, GDP) \quad (2)$$

According to Little (1979), Molinari and Turino (2006;2007) and Nguyen (1985), the effect of advertising expenses has a dynamic characteristic, it means that, spending an amount today, the effect can last into future periods. One can notice the dynamic effect through lags. Being so, it is possible to analyze the relation of the lagged advertising effect in a firm's cash flow, together with the suggested internal and external effects, mentioned above. Therefore, the relationship can be expressed by a dynamic model:

$$\pi_t = \alpha + \sum_{n=0}^{\infty} \delta_n Adv_{t-n} + \sum_{n=0}^{\infty} \nu_n GDP_{t-n} + \sum_{i=2}^4 \phi_i Saz_i + u_t \quad (3)$$

where: Saz_i - seasonal *dummy* as $i=2, 3$ and 4 , representing the 2nd, 3rd and 4th quarters, respectively; u_t - idiosyncratic error or error term.

ANALYSIS AND RESULTS

To obtain evidence about the relation of the advertising expenses impacts on firm value, considering the dynamic effect of these expenses and the business cycles, a multiple linear regression model was applied with panel data according to equation (3). The obtained results are:

$$\pi_t = -0.0147 + 0.166Adv_t + 0.136Adv_{t-1} - 0.104Adv_{t-2} + 0.678Adv_{t-4} + 0.010GDP_t \quad F_{statistic} = 81.323 \quad R^2_{ajust} = 0.7174$$

(0.009) (0.003) (0.002) (0.005) (0.000) (0.004) (0.000)

An initial analysis refers to the significance of the model ($F_{statistic}=81.323$; $p_{value}=0.000$ e $R^2_{ajust}=0.717$). The results were analyzed at a significant level of 5%. The model was adjusted for heteroskedasticity. The *Durbin Watson* = 1.99 shows the no residual autocorrelation. The p_{values} are shown in parentheses, below the constant term and variable coefficients.

The regressions indicate that the effects of the advertising expenses of the same period ($+0.166Adv_t$) are positive on cash flow, as well as same period gross domestic product ($+0.010GDP_t$). The one period lagged advertising effect ($+0.136Adv_{t-1}$) and the four period lagged advertising effect ($+0.678Adv_{t-4}$) are also positive. However, the two period lagged advertising effect is negative ($-0.104Adv_{t-2}$). The dynamic effect of three period lagged advertising expenses, as well as those of the seasonal *dummies*, is not significant.

The positive effect of advertising expenses in the same period is intuitive and can be even stronger depending on the advertising content. For example, if there is a price promotion, this effect is strong in the short run, meaning that the cash flow effect can be observed in the same period that the expenses occur (Dekimpe and Hanssens 1995; Mela *et al.*, 1997). The persuasive effect can also be observed (Vakratsas and Ambler, 1999). The one period lagged advertising effect ($+0.136Adv_{t-1}$) is also intuitive, especially in that the coefficient value is lower than that of same period expenses ($+0.136Adv_{t-1} < +0.166Adv_t$). This result accompanies the *goodwill* theory (Clarke, 1976, Dekimpe and Hanssens, 1995; Little, 1979; Mela *et al.*, 1997). The four period lagged positive advertising effect ($+0.678Adv_{t-4}$) can be explained by the fact of the repetitive main dates of consumption such as Christmas, Thanksgiving, birthdays, commemorative dates like Mother's, Father's and Valentine's Day. If the advertising was really effective, it will have a repetitive effect in the following year's quarterly consumption. The effect can be even stronger, or have a double effect, highlighting the magnitude of this coefficient, since it is a result of a positive image provided by the company's advertising expenditure as well as on positive experiences clients in a previous year, adding to the fact that today the company still has a positive image (*Feedback Effects*) (Bass 1969). On the contrary, even having a positive experience in a previous year, if the company does not keep a positive image today, the consumption may not repeat itself. This result also presents evidence about client repetitive purchase behavior and a low involvement effect (Vakratsas and Ambler, 1999), where the intention of advertising expenditures is to keep the product's image in the client's mind for a longer period.

The two period lagged negative advertising effect indicates that it is really an expenditure without a two period lagged contribution to firm cash flow. This result denotes that advertising campaigns can have a promotional character, with an immediate effect in the current and next quarters linked to price promotion. If this short term character is true, the longer lagged period effects appear to be negative (two quarters) or insignificant (three quarters). The positive four quarter lagged effect reflects the repetitive major dates of consumption and a positive image effect.

SUMMARY AND CONCLUSIONS

Though the regression analysis stated, we found evidence of the relationship between the advertising expenditures and firm value in the Consumer Discretionary Sector. The results indicate a positive effect of advertising expenditures and GDP in the same period on firm cash flow. A first period lagged effect showed to be positive; however, a two period lagged effect showed to be negative. The positive effects in the same and next period showed that the advertising expenditure has a promotional character and a short term impact. The explanation of the four periods lagged positive effect may be found in the positive image provided by the firm advertising expenditures as well as on positive experiences clients may have had in a previous year. It also includes the effects of shopping on special dates such as Christmas, Thanksgiving, Mother's Day, Father's Day and Valentine's Day. But the two periods lagged negative effect needs further explanation. In this time frame, previous advertising expenditure can be seen as a real expense that did not contribute to cash generation. This may result from the fact that the advertising expenses, if promotional, caused positive effects basically in a very short term, changing into a negative effect after two quarters. Even if the character of the advertising was taken to be institutional, the negative effect could be explained by higher than necessary advertising expenditures.

In sum, the results indicate that advertising expenditures bear a positive relation to firm value through their impact on cash flow. The dynamic effects observed explain some characteristics of the consumer discretionary sector. Consequently, this study provides support to a more convergent view of both marketing and finance as disciplines. It is also expected that the marketing executives may benefit from the results presented and find a different and more appropriate alternative to justify their advertising expenditures over time.

The objective of this study was to highlight evidence of the relation of advertising expenditures to firm value. The results also could help to answer some questions raised by marketing executives related to this issue. This study aimed to corroborate the relevance highlighted at the beginning of the work, especially concerning the

dynamic effects of those expenditures and the uncertain variations of economic activity. Finally, the study attempted to improve the interface between the marketing and finance disciplines.

AN APPLICATION OF FUZZY SETS IN ORKUT USABILITY

**Diego Castanheira Chester Franco, Rafael Machado Neves,
Rodrigo Costa dos Santos, Walter Gassenferth and
Maria Augusta Soares Machado, Faculdades IBMEC/RJ, Brasil**

ABSTRACT

Nowadays, This paper presents a methodology using Fuzzy Sets aimed at future comparison studies of statistical packages. Such methodology was applied in order to obtain the usability of the Orkut Social Network Website. Users' opinions were collected through questionnaires, which provided the preliminary values of the usability of this site. In order for the initial result of our research to be scientifically achieved, the universe of users to be studied was limited. So, the research was centered on the graduate student users of the business administration course of IBMEC-RJ. The methodology employed hereby is innovative as was developed by a 25-member study group at Ibmecc-RJ in 2006 using the fuzzy logic to process the information collected and to present a final result for usability.

INTRODUCTION

The need for information quality makes software tools an underlying part of information systems. Such tools are a great means of production of both academic and non-academic papers.

Currently, Teaching and Company using information technologies take part in people development and, therefore, in the development of nations. Nevertheless, their implications, limitations, possibilities and specificities must be considered.

The impact prompted by computers onto the Teaching system and the Society is imminent. Over the past twenty years, the computer is known to have become an ever-integrating part of everyday life Brazilians. On a daily basis, more and more computerized devices are launched in the market – just remember what certain appliances, vehicles, telephones and even the computer itself were like some years ago.

This paper is intended to assess the operating system of Orkut website from the viewpoint of its usability, that is, its ease of use, the efficiency and effectiveness in performing its tasks as well as in the final satisfaction the system provides its users with.

SYSTEMS USABILITY

Usability is aimed at designing systems interfaces that allow for easy, pleasant, efficient and effective interaction. Such interaction must provide the skills for building transparent interfaces so as not to render the use of it difficult, thus enabling users to have full control of the environment without becoming a hindrance during interaction.

When a system has a user-friendly interface and enables the user to use it intuitively, usability may become a factor of motivation and have its user as an ally; whereas in case such motivation is not achieved, that situation might revert and become a factor of rejection on the part of the system (PRESSMAN, 1992)

Several techniques exist for assessing systems usability: those based upon questionnaires applied to the users, those based upon formal models, knowledge basis, checklists, interaction essays or monitoring systems (CYBIS, 2003).

In the case of software already existing and being used, the most adherent technique is that of questionnaire application, since nobody else is better qualified than the users themselves to give an opinion about the usability of the system. They are the ones who keep an everyday contact with the system.

THE FUZZY LOGIC

The first notions of the Fuzzy Logic were developed by Jan Lukasiewicz (1878 – 1956) in 1920. Instead of using rigid rules and a line of logic thinking based upon premises and conclusions, Lukasiewicz attributes levels of pertinence $\{0, \frac{1}{2}, 1\}$ to classify vague and inaccurate concepts. A short time later, he expanded that set to all values contained in the interval $[0,1]$. Yet, the first publication on Fuzzy Logic dates back to 1965 by Lotfi Asker Zadeh, a professor at the University of Berkeley, California (CEZAR, MACHADO and OLIVEIRA JR., 2006).

The power of the Fuzzy Logic stems from its ability to infer conclusions and generate replies based on vague, ambiguous and qualitatively incomplete and inaccurate information. With this regard, the fuzzy systems have the ability to ‘think’ in a very similar way to humans (OLIVEIRA JR., 1999).

The fuzzy logic is based upon the theory of the Fuzzy Sets. This is a generalization of the Traditional Sets theory to solve the paradoxes generated from the “true or false” classification of the Classical Logic. Traditionally, a logical proportion has two extremes, namely: either “completely true” or “completely false”. Nevertheless, in the Fuzzy Logic, a premise ranges in the ‘true’ level from 0 to 1, causing it to be partially true or partially false. Upon the implementation of the “true level”, the Fuzzy sets theory expands the Traditional Sets theory. The groups are labeled qualitatively (by using such linguistic terms as: high, warm, active, small, near etc.) and the elements of these sets are characterized by varying the level of pertinence (a value that indicates the level at which an element belongs in a set). For example, temperatures between 30° (thirty degrees) and 40° (forty degrees) belong to the “high temperatures” set, although the 40° temperature has a higher level of pertinence in this set (OLIVEIRA JR. et al, 2007).

In a way that is not well understood, humans have the capability to associate a level of pertinence to a certain object without understanding consciously how to reach it. For example, it would not be difficult for a student to assign a level to the teacher in the “good teachers” set. Such level is achieved immediately with no conscious analysis on the factors that influence such decision (CEZAR, MACHADO and OLIVEIRA JR., 2006).

The level of association is not probability! Basically, it is a measure of the compatibility between the object and the concept represented by the Fuzzy Set. For instance, number 0.7 is the compatibility of the 35° temperature with the definition of the Fuzzy Set for high temperatures. That figure (0.7) is not the probability of 35° being a high temperature, for it is already defined as 35° (CEZAR, MACHADO and OLIVEIRA JR., 2006).

The conventional systems theory is based upon algebraic, differential or difference equations (“crisp” mathematical models). For some types of systems, mathematical models can be obtained such as the electromechanical models, since the laws of physics behind the process are well-understood and well-defined. However, on a daily basis, we come across countless practical problems, whereby an acceptable level of information required for the physical modeling to be made becomes difficult to obtain. Moreover, such task is time-consuming and costly. These systems can be found in chemical and food-processing industries, in financial institutions, in biotechnology, amongst other areas. A large part of such systems can only be obtained through the knowledge of specialists who directly take part in the process under consideration. That knowledge, very often, may be vague or inaccurate to be expressed by mathematical models (BARRETO, 2001).

METHODOLOGY

This paper carries applied research characteristics, since it aims at using an actual case to base its analysis upon. The applied research is prompted by the need to solve concrete problems with a practical purpose (VERGARA, 2000).

The system chosen was that used in the Orkut social network website. That website is a virtual space that allows for interaction of millions of people through many different media such as texts and pictures. Since it gathers millions of people in that virtual network space, studying it becomes important as a way to better assess the quality of that virtual networking.

A questionnaire was applied in order to assess the usability of the Orkut in a sample of 18 student users of the second term in the Business Administration and Systems Administration of Ibmecc-RJ in late 2006.

In order to assess usability, the first step was to refer to the ISO (International Organization for Standardization), which establishes that standardization is one of the items considered with regard to software quality through its standards 9126 and 9241.

The ABNT (Brazilian National Standards Organization) is the official agency in Brazil accountable for the discussion and edition of technical standards in the country. It is the representative of ISO in Brazil.

However, the ISO standards do not carry a set of criteria or metrics to assess systems usability. For that reason, the metrics used in this study will be those presented by Santos (2007), who established a set of metrics to assess system usability on the basis of a review in the Brazilian literature of scientific bases between 1995 and 2006.

According to Santos (2007), the metrics considered for usability assessment as well as those to be used in this research are as follows:

- Ease to learning
- Ease to remembering
- Error control
- Efficiency
- Effectiveness
- Satisfaction

Ease to learning or intelligibility, according to the ISO 9126 (2003), is the capability of the software to enable the user to learn how to handle it.

Such metrics is being assessed in accordance with the following constructs:

- A) User's ease to complete a task for the first time;
- B) The user's first impression upon using the system;
- C) The number of attempts into learning how to complete a task;
- D) The time required to learn how to accomplish a task successfully;
- E) User's ease to learn a task;
- F) The number of different possibilities the system provides in order to accomplish the same task; for example: standard path versus shortcut keys, shorter paths, macros, specific keys etc;
- G) Productivity gain in relation with the quickest way whereby the user manages to accomplish a task in comparison with the standard way the system offers by default;
- H) The flexibility of the system to carry out tasks in different ways such as: shortcut customization, values, menus, macros etc.;
- I) The capability of the system to guide through its execution with hints, help, warnings etc;
- J) The speed to accomplish a task successfully in the system for the first time.

The ease to remembering, according to Nielsen (1993), assesses the functionalities of the system so they are easy to remember, even after their not being used after some time and without the need for new coaching.

This metrics is being assessed according to the following constructs:

- A) Remembering how to perform a task after some time without using the system;
- B) Ease to remember how to use the system;
- C) Agility to remember the system's use after some time without using it.

Error control, or operability, according to the ISO 9126 (2003), is the capability of the software to enable the user to operate and control it.

This metrics is being assessed by the following constructs:

- A) The amount of errors provoked by the system;
- B) The time elapsed before the system resumes normal operation when an error occurs;
- C) The feeling regarding the amount of errors provoked by the system;
- D) Re-work due to the amount of errors provoked by the system, which causes some loss of information;
- E) The time spent until the task is resumed from the point it stopped when an error occurs;
- F) Satisfaction regarding recovery from error on the part of the system undo, redo, return, save before shutting down etc.;
- G) Clarity of error messages presented by the system;

Efficiency, also called operability, according to the ISO 9126 (2003), is the capability of the software to enable the user to operate and control it.

This metrics is being assessed by the following constructs:

- A) System performance;
- B) Swiftness to accomplish tasks;
- C) System productivity;
- D) Keeping the system under control.

Effectiveness, according to Quesenbery (2001), assesses how the tasks were exactly accomplished and how often they produce errors.

This metrics is being assessed by the following constructs:

- A) Amount of steps required to accomplish a task;
- B) The time required to accomplish any task in the system;
- C) The appropriate number of steps required to accomplish a task in the system.

Satisfaction, or attractiveness, according to the ISO 9126 (2003), is the capability of the software to attract the user, to be pleasant.

This metrics is being assessed by the following constructs:

- A) Interaction with the system's interface;
- B) Accomplishment of tasks in the system regarding the clarity of the messages, error recovery etc.;
- C) User's feeling upon using the system as whole.

After collecting the data and consolidating users' opinions, a methodology was applied using the Fuzzy Logic in order to find a fuzzy triangular figure resulting from the frequencies of users' opinions for the set of constructs making up the metrics being assessed.

The fuzzy triangular figures are special fuzzy numbers with two very important characteristics, namely: MODA and AMPLITUDE. Moda represents the value of the fuzzy number the pertinence of which is equal to 1 (one). Amplitude is half the base of the fuzzy number and represents the interval of confidence of that number. Amplitude is inversely proportional to the confidence in the value of the pertinence function (BRAGA, BARRETO & MACHADO, 1995).

The Likert scale was used for the reply to each question (MATTAR, 1997). The size of the Likert scale used to measure usability was five points: (from Very Low to Very High).

RESULTS

The statistics to the opinions answered in the questionnaire filled out by the 18 users as well as the description of the basic statistics a presented below. After that, the resulting fuzzy triangular numbers for each metrics and the interpretation for them are presented.

Statistical Description of the Sample

For the 'ease to learning' metrics, as per Table 1, considering this system is used for teaching statics to beginners, it can be noticed that the system's interface has one discreet 'ease to learning'.

Table 1: Sample results for the 'ease to learning' metrics

| Construct | 1 (Total Dissatisfaction) | 2 | 3 | 4 | 5 (Total Satisfaction) |
|-----------|---------------------------|-----|-----|-----|------------------------|
| A | 0% | 4% | 14% | 50% | 32% |
| B | 0% | 0% | 39% | 57% | 4% |
| C | 0% | 4% | 25% | 50% | 21% |
| D | 0% | 7% | 32% | 46% | 14% |
| E | 0% | 4% | 14% | 64% | 18% |
| F | 4% | 39% | 18% | 21% | 18% |

| | | | | | |
|----------|----|-----|-----|-----|-----|
| G | 0% | 11% | 39% | 39% | 11% |
| H | 4% | 18% | 39% | 36% | 4% |
| I | 4% | 21% | 39% | 25% | 11% |
| J | 0% | 18% | 29% | 50% | 4% |

For the ‘ease to remembering’ metrics, according to Table 2, by observing that Table separately, the users show certain ease to remember actions accomplished by the system, but it is still very little.

Table 2: Sample results for the ‘ease to remembering’ metrics

| Construct | 1 (Total Dissatisfaction) | 2 | 3 | 4 | 5 (Total Satisfaction) |
|------------------|----------------------------------|----------|----------|----------|-------------------------------|
| A | 0% | 0% | 14% | 36% | 50% |
| B | 4% | 4% | 11% | 43% | 39% |
| C | 0% | 0% | 7% | 39% | 54% |

For the ‘error control’ metrics, according to Table 3, apparently, the users have a mean level of satisfaction.

Table 3: Sample results for the ‘error control’ metrics

| Construct | 1 (Total Dissatisfaction) | 2 | 3 | 4 | 5 (Total Satisfaction) |
|------------------|----------------------------------|----------|----------|----------|-------------------------------|
| A | 4% | 32% | 50% | 14% | 0% |
| B | 0% | 43% | 39% | 18% | 0% |
| C | 18% | 43% | 29% | 11% | 0% |
| D | 7% | 29% | 29% | 18% | 18% |
| E | 7% | 36% | 46% | 11% | 0% |
| F | 7% | 32% | 36% | 25% | 0% |
| G | 4% | 14% | 61% | 21% | 0% |

For the ‘efficiency’ metrics, as per Table 4, apparently, the users have a mean level of satisfaction. The disproportionality amongst the analyzed constructs can be further observed: construct A tends to total dissatisfaction, construct B tends to total satisfaction and construct C lies in an exactly mean position. This demonstrates that, with regard to efficiency, the software is not very coherent, with a great variance in relation with the queries assessed.

Table 4: Sample results for the ‘efficiency’ metrics

| Construct | 1 (Total Dissatisfaction) | 2 | 3 | 4 | 5 (Total Satisfaction) |
|------------------|----------------------------------|----------|----------|----------|-------------------------------|
| A | 0% | 14% | 50% | 29% | 7% |
| B | 0% | 11% | 43% | 43% | 4% |
| C | 0% | 11% | 14% | 71% | 4% |
| D | 0% | 14% | 11% | 64% | 11% |

For the ‘effectiveness’ metrics, as per Table 5, the users have a mean level of satisfaction.

Table 5: Sample results for the ‘effectiveness’ metrics

| Construct | 1 (Total Dissatisfaction) | 2 | 3 | 4 | 5 (Total Satisfaction) |
|-----------|---------------------------|-----|-----|-----|------------------------|
| A | 0% | 11% | 43% | 43% | 4% |
| B | 0% | 11% | 14% | 71% | 4% |
| C | 0% | 14% | 11% | 64% | 11% |

For the ‘satisfaction’ metrics, as per Table 6, apparently, the users have a mean level of satisfaction. A chief issue is stressed out here concerning construct B, which tends to total dissatisfaction. The size of the sample must be increased before stating that the software should be improved with regard to this item.

Table 6: Results for the ‘satisfaction’ metrics

| Construct | 1 (Total Dissatisfaction) | 2 | 3 | 4 | 5 (Total Satisfaction) |
|-----------|---------------------------|-----|-----|-----|------------------------|
| A | 0% | 7% | 25% | 61% | 7% |
| B | 11% | 29% | 43% | 14% | 4% |
| C | 0% | 7% | 4% | 71% | 18% |

Fuzzy Numbers

The calculations required for the analysis, using the fuzzy logic as from the results of the metrics, were made through the MatLab mathematical software, which generated the graphical results for each metrics under study. The graph presented for each metrics represents two sets. The first set, typified by a line with square-shaped markers, represents the fuzzy number (FN) for the mean of all frequencies found for the questions in the metrics. The second set, typified by a line with asterisk-shaped markers, represents the fuzzy number (FN) in the triangular shape more similar to the first set, which is the final result for the assessed metrics.

a) *Ease to learning*: The triangular fuzzy number obtained to measure the ease to learning is represented in Figure 1. It can be noticed that the mean opinion is 6 (high satisfaction) with amplitude 3, thus pointing to considerable dispersion according to the interviewees’ opinions. The results consider the ‘ease to learning’ metrics as good, but it is recommended to increase the sample and redo the calculation in order to achieve higher reliability in the result.

Figure 1 – Graph for the ‘ease to learning’ metrics Figure 2 – Graph for ‘ease to remembering’ metrics

b) *Ease to remembering*: The fuzzy triangular number obtained for measuring the ‘ease to learning’ metrics is shown in Figure 2. It can be noticed that the mean opinion is 8 (very good satisfaction) with amplitude 3, thus pointing to high dispersion according to the interviewees’ opinions. This was the best assessed metrics by the users of that software. The software can be said to be excellent regarding the ‘ease to remembering’ metrics. However, even with this result, the sample size has to be increased in order to reduce the result amplitude.

c) *Error Control*: The fuzzy triangular number obtained for measuring error control is shown in Figure 3. As opposed to the ‘ease to remembering’ metrics, it can be noticed that the mean opinion for Error Control is 4 (mean satisfaction) with amplitude 3, thus pointing to high dispersion according to the interviewees’ opinion. This was the metrics with the worst performance.

The system can be said to moderately adequate regarding error control and this item should get a greater focus for future improvements in the system. Even with such result, the sample size should be increased in order to reduce the result amplitude.

Figure 3 – Graph for ‘error control’ metrics

Figure 4 – Graph for the ‘efficiency’ metrics

d) *Efficiency*: The fuzzy triangular number obtained for measuring the ‘efficiency’ is shown in Figure 4. It can be noticed that the mean opinion is 6 (high satisfaction) with amplitude 2, thus pointing to low dispersion according to the interviewees’ opinions.

The system can be said to be well adequate regarding the efficiency.

e) *Effectiveness*: The fuzzy triangular number obtained for measuring ‘effectiveness’ is shown in Figure 5. It can be noticed that the mean opinion is 6 (good satisfaction) with amplitude 2, thus pointing to small dispersion according to the interviewees’ opinions. The system can be said to be adequate regarding the effectiveness. Moreover, since dispersion was small, this result can be assumed as having quality and being adherent to the universe of the research.

Figure 5 – Graph for the ‘effectiveness’ metrics

Figure 6 – Graph for the ‘satisfaction’ metrics

f) *Satisfaction*: The fuzzy triangular number obtained for measuring ‘satisfaction’ is shown in Figure 6. It can be noticed that the mean opinion is 6 (good satisfaction) with amplitude 3, thus pointing to high dispersion

according to the interviewees' opinions. The system can be said to be adequate regarding satisfaction. Even with such result, the sample size should be increased in order to reduce the result amplitude.

CONCLUSIONS

The results achieved through this study aim at presenting a new criterion for assessing systems usability. Depending on the system under analysis, that result can be interpreted as customer retention, profit increase, productivity increase, employee satisfaction, amongst other benefits.

In the case of Orkut, an easier system to use means fewer frustrations in the first few accesses to the website, thus leading to greater user retention as well as longer periods of connection at each access. These are contributing factors for the website to have even more users who interact better and better and more often.

After analyzing the partial results of this research, an assessment of Orkut usability was achieved, as per below:

- Users have a mean ease to learn how to use the Orkut;
- The users have excellent ease to remember how to use the Orkut, even after a given period of time has passed without them using it;
- The users appear to be dissatisfied regarding error control;
- The users found Orkut has good efficiency;
- The users found Orkut has good effectiveness;
- In general, the users were satisfied with using the Orkut.

With an aim at broadening the research, new opinions will be collected in the internet for other users of the Orkut throughout Brazil. In that case, there is an interest in segmenting the user samples by time of experience in using systems to verify whether the final satisfaction increases or not.

IDENTIFICATION AND ELIMINATION OF CRITICAL COMPROMISES AS A PROGRESSIVE BUSINESS DEVELOPMENT STRATEGY IN UKRAINE.

Leonora Fuxman
St. John's University, USA

ABSTRACT

This paper develops a strategic framework for progressive business development in Ukraine based on a concept of identification and elimination of compromises. In some industries in Ukraine, particularly in highly competitive mobile services, low-cost strategy is a predominant competitive strategy. Although the industry evolved since its early days, the fundamental compromises of cost, service, and coverage have not been addressed by service operators. Authors suggest a strategic framework process consisting of four stages that would allow managers to focus on systematically identifying industry's critical compromises (or trade-offs) and on developing new business models to eliminate those critical compromises.

INTRODUCTION

Ukrainian business environment can safely be described as undergoing initial stages of formation. Market is still characterized by the basic process improvements aimed at developing better working relationships with customers and more comprehensive offerings of products and services to the customer. Methodologies for improvements (in processes, products, and services) are mostly copied from the Western business practices. For many companies it is a constant struggle to generate innovative ideas for developing new products and services, to find and establish new markets, to discover what customers want most.

Traditional understanding of the competitiveness was based upon assumption that a company would make their customer willing to accept a compromise in exchange for either better pricing, or faster delivery, or better quality. For the most part, companies have difficulties managing all three factors (price, time, and quality) and typically would offer their customer a choice of a compromise. Customer would select one of the three priorities they are willing to sacrifice, and the company would deliver on the remaining two. In their quest to find what customer really desires, most companies focus their innovative process improvement on finding compromises their customer is willing to accept.

Business strategies in many Ukrainian markets today could still be characterized by slogans of "Faster", "Stronger", "Higher", or "Cheaper". Companies would target one of the competitive priorities within their industry and focus their process improvements on achieving comparatively better results compared to the competition along the chosen priority. This leads to compromising the remaining non-targeted competitive priorities and ultimately, the customer must choose which competitive priority they must sacrifice in order to obtain product or service.

Few companies, however, are interested in finding out which types of compromises customers are not willing to accept. With the development of the global information networks, the necessity to compromise is becoming more of the past. Thus, progress could be described as moving beyond the limitations created by compromises. Progress in business development would be considered as the removal of the barriers created by compromises. In order to achieve such progress, critical compromises must be identified with the industry and eliminated through the development of new business-models or systems.

Progress cannot always be a one-way street to success. Progress may be associated with mistakes and losses. However, the primary difference between those companies that purposely pursue the strategy of progressive development vs. those companies that simply undergo intensive development is the ability of the former companies to turn their mistakes into new winning solutions.

Firstly, progress creators have the ability to learn from their mistakes and find new possibilities via systematic screening of their own mistakes and those of their competitors. This process is not just confined to the accumulation of an experience and enhancement of the knowledge-base. Rather, it is a process of developing new competences based on the analysis of the past mistakes.

Secondly, progress creators are capable of finding new possibilities that contribute to formation of company's improved competitiveness. These new possibilities often involve the identification of critical business's or industry's compromises followed by their systematic elimination. Identification of compromises is typically approached through answering a question of what customer is willing to deny themselves in order to obtain product or service. Thus, the process of identifying and eliminating compromises creates an additional value for the customer. Considering that the price customer pays no longer reflects the cost of the product or service, but rather their added value, companies that are capable of identifying and then eliminating compromises in their business model find themselves at a competitive advantage.

The process of elimination of a compromise requires a system-wide approach. It does not just involve replacing one element of the system with a different one. The process has to lead to a creation of new systems or business models. For instance, American company CarMax that sells used cars, changed used-car buying experience by switching to a fixed price no-negotiation strategy. Sales associates now receive bonuses based on volume of cars sold, which leads to an increase in the number of cars sold instead of increased selling price of the car, as it is widely accepted in the industry.

In this study, we build a strategic framework that should help managers in a process of developing a systematic approach to identification and elimination of business and industry compromises based on the specifics of Ukrainian business environment and consumer behavior.

NATURE OF UKRAINIAN MARKET

Ukrainian market generally is not ready to pursue the progressive business strategy associated with the identification and elimination of critical business or industry compromises with all its consequences. In some ways, Ukrainian business environment has a tendency to convince itself of the winning in a way of the progressive business development, while in reality, only few battles have been won. Thus, e.g., it can be seen everywhere, when Ukrainian companies claim they successfully created the "brand", while customers never heard of such a "brand"; when interview with one employee upon completion of a project is referred to as a systematic evaluation of the entire personnel; when change in the competitive tactic is referred as strategic elimination of compromises. Until companies start referring to their actions based on the reality, not on the complex fancy names borrowed from the Western business practices, it will not be possible to distinguish between the true progressive business strategy aimed at the removal of compromises and the various competitive tactics aimed at improving business development.

Table 1.

| Intensive Growth | Elimination of Compromises |
|--|---|
| <i>System of knowledge Management</i> | <i>Management of successes and failures</i> |
| <i>Overly complex names of approaches, systems, processes, methods</i> | <i>Simple names, corresponding to realities of implementation</i> |
| <i>Trade-off between time, price, quality</i> | <i>Satisfying critical necessities, no tradeoffs</i> |
| <i>Discrete improvements</i> | <i>Systematic process of improvements</i> |

| | |
|-----------------------------------|--|
| <i>Offerings of best products</i> | <i>Offerings of different concepts and business-models</i> |
|-----------------------------------|--|

In practical terms, it is not hard to see the difference between the strategy of elimination of compromises and the strategy of the growth through tactical actions aimed to promote business development (see Table 1). Consider, for example, a 16-year old teenage who gets a cell phone as a present with the contractual obligation for service with a mobile service operator X. Parents determine budget for the mobile phone. The budget is not big enough to allow the teenager to communicate with friends without restrictions. Thus, customer would have to choose among several compromises in order to be able to talk more:

- 1) Use phone only in emergencies and instead use text-messaging for communication purposes.
- 2) Sign up with several providers at favorable prices and exchange mobile cards all day long.
- 3) Economize elsewhere in the daily budget and save extra money to pay for the additional cell phone minutes.

Mobile service providers for the pre-paid customers focus on increasing ARPU (average revenue per user). They tend to entice customers to sign up with the services by offering lower prices, then attempt to sell them more content. Thus, along with the mobile service, customer often gets bundles of additional services, which are constantly being updated via new offers and new actions from the service provider. Although this strategy would promote growth, it is hard to agree that this approach would lead to the elimination of fundamental industry compromises for a mobile service customer (such as a teenager mentioned above), as well as to a progressive business development for the service provider.

HOW TO FIND WHICH COMPROMISE TO ELIMINATE?

With the increased competitiveness in most industries, the challenge of identifying which of the compromises to eliminate (or how to identify a critical compromise) becomes a major task in the progressive business development process. Below in Figure 1, four stages (which could be considered as guidelines) are proposed.

First stage: Internal focus – there is always a choice. Both the company and the customer have choices. Besides the three mentioned earlier priorities of cheaper product, faster delivery, and better quality, there are many other factors that account for customer’s selection of the product they choose to buy or the service provider they choose to buy it from. Among those are the factors of reliability, sincerity, impressiveness, novelty, etc. In addition, customers are often bound by the selection of “better among the worst”, or “the only attainable”, or “the first able to find”. By asking a question of what customer denies themselves when buying a particular product or service from the provider, company can identify those compromises that should be targeted for the elimination.

The development of the mobile services in Ukraine went through three phases of changes in the nature of the industry’s compromise:

- 1) Only one choice of service provider for a customer;
- 2) More than one service provider, all are expensive, but may be the service is better;
- 3) Many service providers, cheaper, but less coverage.

This process illustrates the first stage of the progressive compromise elimination process. Service providers simplify and optimize customer priorities by offering customers a choice of how to talk cheaper, with added convenience of a service and having an optimal coverage. Thus, the strategy of the progressive compromise elimination must be a winning strategy for both the company and the customer.

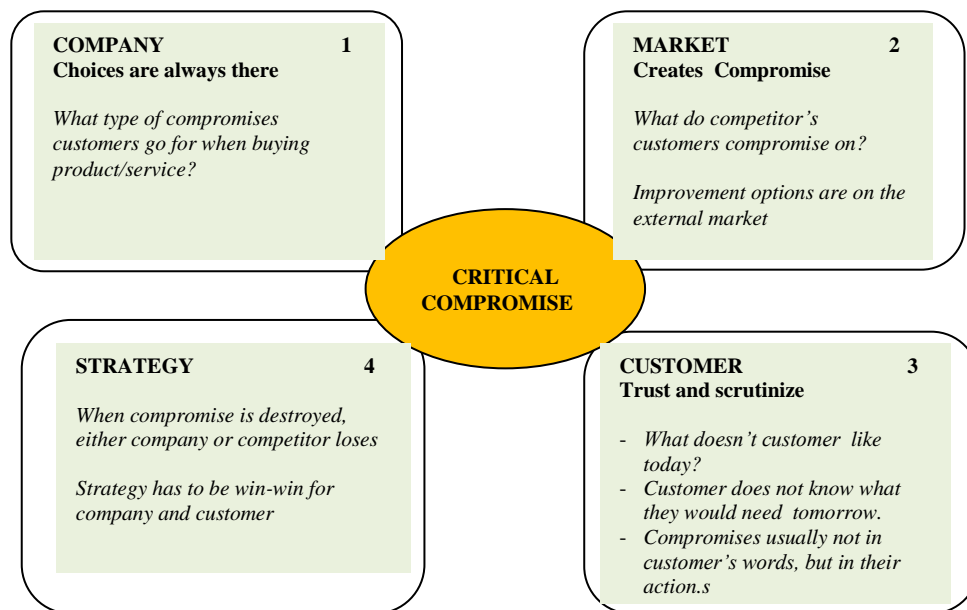

Second stage: External focus - compromises are created by the market. In Ukrainian mobile services, for example, the next critical compromise after the establishment of the mobile connections came in a form of a price for calls: “How much to pay for the calls?” Competitors, competitor’s product offerings, competitive struggles in the industry all create compromises. Consequently, search for the critical compromise to eliminate

should focus on external factors. In mobile services in Ukraine, for example, with the substantial increase in the number of service providers, the next attempt to eliminate a compromise became the price of calls to other service providers at the same rates. This could hardly qualify as elimination of the compromise since customer still has to choose what to spent money on and how to optimize expenses for their mobile services.

Third stage: trusting the customer but keep scrutinizing customer's choices. This strategy is really aimed at understanding customer's most intimate wishes that ultimately drive customers to their choices of product/service providers. Electrolux, for example, company known as a global leader in home appliance and electronics, asks their customers to install video cameras in their homes in order to observe how they use the appliance and what kind of compromises they make in using a particular piece of equipment.

Mobile service operators in Ukraine, for instance, achieved considerable progress in working with their customers. There are call-centers now, centers for servicing subscribers, and around-the-clock support. Operators discovered new possibilities in selling mobile content and banked on the new technologies to teach customers how to use these technologies and thus generate more revenues. This in itself does not represent an elimination of a critical compromise, rather a new direction in the strategy of generating new market demand.

Figure 1.

Fourth stage: win-win strategy. When the critical compromise is eliminated in the industry, someone has to lose. Every company would prefer if the loser is a competitor. Customer could become a loser if, for example, he/she accepts a compromise and decides to spend more money to talk more. Company might become a loser if it decides to partially sacrifice profits in order to increase market share or achieve status of the industry leader. However, not all strategies have to lead to losses. Win-win strategies are possible and the development of such strategies is the most crucial step in the successful industry development.

WAYS TO ELIMINATE COMPROMISE – MOBILE INDUSTRY SOLUTIONS.

In the mobile industry example, money seems to be the most critical compromise. Operators try to design their services with the goal of generating the most revenue from their customers, while customers try to optimize (or minimize) mobile services expenses. The two sides seem to be on the opposite sides, while the win-win strategy implies that the two sides are on the same side. How can a mobile operator earn money from the customer and at the same time partially reimburse the customer for the minutes used, while gaining a competitive advantage?

Ukrainian mobile operators started offering bonuses to customers for incoming calls. As it was mentioned above, elimination of business or industry compromises involves modifying existing systems and creating new business systems. While bonuses that Ukrainian mobile operators pay their customers for incoming calls are certainly an element of the system, they do not destroy the fundamental compromise. For instance, one possible scenario for eliminating the compromise between lowering company's expenditures vs. increasing ARPU is mobile advertising. Customer agrees to receive advertisement messages and is compensated by having an additional bundle of services. Thus, profit from advertising is shared between the operator and the customer. This would be an example of a new business-process.

Few companies in Ukraine are willing to look for the critical compromise either in their business or in the industry, and even fewer are willing to eliminate one. Unfortunately, long term strategies for business development do not prevail in the mobile service industry. Most mobile service providers are focused only on short-term profits, thus eventually losing customer's loyalty and trust. One mobile service operator in Ukraine, for instance, sends advertising messages to customers without customer agreeing to it. Profit from the advertising is not shared with the customer. The value system of this operator is clearly focused on short-term profit gains and completely ignores any possibility for developing long term relationships with the customer. Bad word-of-mouth about such advertising messages sent to people's phones at 3 am. spreads very quickly.

Scenario that would lead to progressive elimination of fundamental compromise in the industry would not involve a new set of actions or promotion from the company. It would have to involve creation of a new business system, system based on principals other than principles of compromise. This would be a new development process and being first always carries risks, however, benefits could be substantial.

STRATEGIC DECISION MAKING IN TIMES OF GLOBAL FINANCIAL CRISIS

Remigiusz Gawlik
Cracow University of Economics, Poland

ABSTRACT

The presented paper is a brief presentation of findings based on research lead on a group of small and medium businesses. The study has been made in conditions of global financial crisis and its effects, such as fall of production volumes in numerous companies. A number of indexes describing the actual economic situation and short – term prospects of discussed businesses has been presented to their medium- and high level executives in order to point out those most useful when taking strategic decisions. The sample structure consisted of companies with Polish and foreign capital operating locally and internationally. Obtained answers have been grouped in two sets accordingly to the actual situation of a given enterprise. The first group contains indexes preferably used by managers in times of economic instability, whereas the second group shows possible changes in preferences of economic indexes utility in times of prosperity. Research methodology included Delphi method and expert questioning for data gathering and Pareto – Lorenz analysis for interpretation of findings. The study ends with proposals of applications of research outcome into further research directed towards elaboration of a synthetic index facilitating strategic decision making in international companies.

INTRODUCTION

The ongoing financial crisis affects most of economies in the World. The effects of past investments into disputable financial instruments, such as subprime mortgages happened to be disastrous for various industry branches. Many companies, both operating locally and internationally, face serious problems – falling sales, lack of liquidity and personnel reduction being not the only ones to deal with. Additionally, fluctuating currency exchange rates in some Central- and Eastern European countries, i.e. Poland, cause strongly growing costs of foreign debt servicing. Together with lower income from taxes this causes higher budgetary deficit and social tensions. In such an instable situation any economic predictions or forecasts cannot be taken as a credible base for mid- and long – term strategic planning. As a result, decision making became much more difficult than in times of prosperity. This is the reason for which the author of the present paper has questioned decision - makers on various managerial positions which of the indexes describing the level of actual development of their businesses they take into account when making decisions in their everyday work. The present paper is a presentation of recent research led between medium and high level managers in chosen Polish and foreign companies operating internationally. The principal goal of this study was to find some common patterns and reasoning behind strategic decision making in times of economic instability in the World.

1. RESEARCH METHODOLOGY

The research methodology consists of two methods. The classical Delphi method is the first one, devoted mainly to data gathering and can be further divided into two stages. A brief description of Delphi – type questioning can be found below.

Literature studies provide various definitions of the Delphi method. Adler & Ziglio (1996) understand it as “...a structured process for collecting and distilling knowledge from a group of experts by means of a series of questionnaires interspersed with controlled opinion feedback”. Duval, Fontela and Gabus (1975) underline the value of expert opinions for decision – makers in a situation of permanent lack of full scientific knowledge in their daily routine. Helmer (1977) adds that “*Delphi represents a useful communication device among a group of experts and thus facilitates the formation of a group judgment*”.

The Delphi method is a tool of group evaluation of a given complex problem or task by a panel of independent experts, based on a set of criteria, common for all the questioned people. The problem is usually defined in form of one or more questionnaires. Several scientists described its main characteristics as “*anonymity, controlled feedback and statistical response*” (Adler & Ziglio, 1996, Dalkey, 1972, Fowles, 1978, Helmer, 1977). These features allow the experts to make their own independent evaluations, minimizing the risk of external influence. According to Fowles (1978) the classical Delphi process consists of following phases: 1. Team formation; 2. Panel and experts selection; 3. Development of first round Delphi questionnaire; 4. Questionnaire tests (formulation of questions, proper wording, etc.); 5. Expert answers for first round questionnaire; 6. First round response analysis; 7. Preparation and testing of second round questionnaires; 8. Expert answers for second round questionnaires; 9. Second round response analysis and repetition of steps 7 to 9 – if necessary; 10. Final report elaboration. It should be noticed that experts’ role is not to present the common statement based on a majority vote. The outcome of Delphi questioning comes in form of statistics, preferably presented in a graphical form.

A question about the number of experts to be involved into questioning seems to be crucial for obtaining stable and reliable results. Hanson & Ramani state that “*respondents to the questionnaire should be well informed in the appropriate area*”. Although some contrary opinions can be found in the literature, the author grants the reason to Hanson & Ramani. Scientific praxis allows ascertaining that a higher degree of expert knowledge allows the limitation of number of experts. Depending on the nature of study it can be even downsized to 5 highly qualified respondents, because any increase in number of completed questionnaires is not bringing meaningful changes in obtained responses.

The applications of Delphi method vary from academic research and education, through public health issues and economic forecasting understood as help for decision making, up to an exploration technique for forecasting of directions and trends of technological innovation as well as a tool enhancing discussions between experts (Cornish, 1977, Fowles, 1978 and Wissema, 1982). Recent applications focus on cross – impacts of analyzed events, which is also the case of the present study.

The second stage of data gathering is an evolution of Delphi method. It had a form of direct interviews with chosen experts in economic forecasting, business management and decision – making. The reason for additional questioning came from the specificity of research based on questionnaires. Although it proves to be very useful and an undisputable economic tool widely applied in various types of research, it limits the possibilities of answers to questions included in the questionnaire. Another reason is that an important part of questioned people tend to mark questionnaire answers only, without going into deeper explanations, despite the presence of “another” field meant for providing answers that have not been included in the questionnaire itself or for writing larger explanations.

The second method has been used for presentation and analysis of acquired data. As graphical form of presentation of results seems to be the most transparent, a modified Pareto – Lorenz Diagram has been chosen for this purpose. The Pareto – Lorenz diagram, known also as the ABC method, is based on a discovery of

Vilfredo Pareto stating that 80% of results is comes from only 20% of causes. According to Szumnarska (1996) *“The Pareto – Lorenz diagram [...] is applied to identify and measure the importance of analyzed issues. Only these problems will be identified, which although being in minority towards the rest (20%), bear a dominant influence on analyzed issue (80%).”* The 20 – 80 proportion should not be seen as dogmatic, but it is the most likely to happen. In fact we can state for sure that 100% of efforts will never cause 100% of effects. The Pareto – Lorenz rule applied to the present study can be transposed into a proposal to managers of using only these indexes of economic condition of an enterprise that bring the highest certainty of optimal decision - making. Analyzing a bigger number of factors – including these less relevant – proves to be much less efficient and will not bring expected higher quality of taken decisions.

The method structure is built of the following steps (Szumnarska, 1996):

- identification of type of analyzed problems (i.e. economic indexes);
- determination of time span of analysis (day, shift, year, etc.) for later evaluation of decision - making effects;
- finding the frequency of occurrence of particular categories (i.e. reasons of wrong decision - making);
- setting data in diminishing frequency of occurrence order, calculation of proportional and cumulated frequencies;
- assigning scales for axes: horizontal – categories and vertical – frequency of occurrence (absolute value) and cumulated proportional value;
- putting values onto the graph in increasing order – frequencies of occurrence for each category (Pareto diagram) and curve of cumulated proportional values (Lorenz curve).

The questions of the questionnaire for the discussed study cover the following issues: region of operation of analyzed companies; years of experience on the market; legal form; territorial coverage (regional, national, international, global); percentage of foreign capital involvement; number of employees and employment structure (size of employment, type of contract, language skills, education); income from local, regional, international and global markets; level of profit / loss in past time periods; willingness of consulting services use; which indexes describing the actual economic situation and short – term prospects of respondent’s business are being used by company’s management at times of crisis; how would their preference towards applied indexes change in a situation of economic prosperity. The core of presented research has been included in the last two questions.

2. INDEXES DESCRIBING THE DEVELOPMENT LEVEL OF INTERNATIONAL ENTERPRISES

Literature studies revealed the existence of more than 100 indexes describing directly or indirectly the level of actual development of an enterprise. Initial talks with small- and medium – enterprise managers that took place before Delphi questioning and expert interviews, resulted in limitation of indexes number to 18. The reasons for rejecting such an important number of indexes at early stage of research provided by questioned managers we can be divided into five groups:

- mathematical complexity of several indexes – complicated equations difficult to apply without sophisticated mathematical knowledge;
- lack of data necessary for calculation or evaluation of some indexes;
- lack of time – a group of economic indexes created mainly for comparison purposes could not be used when quick decision – making is needed;

- lack of credible data from past time periods – a part of indexes required for application non – available or non – credible historical data;
- non – conformity with analyzed profile of the enterprise.

Finally the set of 18 indexes has been chosen by the managers for further evaluation:

1. Product life cycle – *“A new product progresses through a sequence of stages from introduction to growth, maturity, and decline. This sequence is known as the product life cycle and is associated with changes in the marketing situation, thus impacting the marketing strategy and the marketing mix”* (Gorchels, 2000). For the purposes of the present study this index should be seen as percentage of company products in each of the stages of product life cycle (introduction, growth, maturity and decline).
2. Product diversification – this index shows the size of product portfolio of the given enterprise. Although in general opinion wider range of products provides sales continuity in case when a product or a group of products stop bringing satisfying profits, Ramírez – Alesón and Espitia Escuer (2002) state that *“firms with intermediate levels of product diversification have the highest performance, while the firms with low and high levels of diversification show significantly lower performance, which performance is not significantly different between them.”*
3. Flexibility – from the economic perspective this index shows the aptitude and reaction time of enterprise towards changes in its market environment. Growing *innovativeness* level and immediate technology development of modern industry branches force companies to adapt to new market trends very quickly.
4. Level of cash on bank account – easy check of enterprise short – term financial liquidity. If used as an index, it should focus on constant analysis of capital inflows and outflows instead of checking its momentary levels. The supervision should also include trend check, i.e. seasonal peaks and shortages in bank account position.
5. Innovativeness – *“An innovation is an idea that creates a measurable economic value. Any innovative activity has to be preceded by an “invention”, which is not directly meant to bring profit in terms of money. However, an innovation should at least imply a hope for creating net income”* (Gawlik, 2009). This index presents the importance of innovations in strategy of the analyzed company.
6. Capitalization – value of an enterprise based on equity price. Provides information on available capital levels for operational activities and further development.
7. Equity price – especially watched by stock owners. Often limited to being a tool for assessment of management efficiency. Unfortunately its ability of revealing alarming changes in condition of the enterprise is too often neglected.
8. Number of clients – the analysis of portfolio of clients can provide some information on enterprise dependence on key contracts. Although a lower number of purchasers can enhance specialization towards their specific needs, a bigger number increases the level of enterprise independence and stability in times of recession or trouble on buyers' side.
9. Investment / income ratio – the percentage of funds reinvested into enterprise development. Reveals the approach of key stakeholders towards future development of the enterprise.
10. Level of income – general level of enterprise net profit after taxes.
11. Level of employment – number of people employed in the enterprise.

12. Structure of backlog of orders – popularity of particular products, directions of trade, size and type of clients, dominant payment methods and order volumes plus other information relevant for the composition of business partners portfolio.
13. Survival ratio – income to fixed costs ratio – index presenting the relation between costs that need to be covered on a regular basis (wages, leasing, office rent, administration, etc.). This index shows directly the minimal level of money needed yearly by the company to survive neither without creating liabilities nor realizing profits.
14. Parts Per Million (PPM) - ratio of complaints / faults in each million of produced parts. Used mainly in production companies.
15. Return on capital – measure of company effectiveness in managing the money invested in its functioning.
16. Floating assets level – amount of accounts receivable, cash, inventor and outstanding shares. Generally, an index showing company aptitude of maintaining a proper development (sales) / working capital ratio, i.e. growing sales require higher stock levels, which require increase of financing capabilities. An appropriate level of floating assets allows the company to operate without taking costly bank loans or instantaneous sales of assets to finance its regular operational activities.
17. Geographical range of activity – field coverage of company operations and market presence.
18. Operating profit – Earnings Before Interest and Taxes (EBIT) – measure of enterprise earning derived from its activities before deducting the payments of interest to stakeholders and income taxes to the government.

Please note that in the above group of indexes both qualitative and quantitative coefficients can be found. This comes from the fact that regular every – day planning involves an entire set of activities based rather on experience acquired during years of operation and managerial routine than on scrupulously prepared mathematical calculations. Simplicity of an economic index does not necessarily mean low utility. Sometimes it can be even the opposite, which will be proven – at least in some cases – in the following chapter.

3. SYNTHESIS OF STUDY RESULTS

The questionnaires accompanied by an introduction letter have been sent to more than 100 small and medium enterprises which resulted in 31 received answers (29 in electronic form, 3 on paper). The questionnaire return ratio level reaching nearly 30% seems quite high for this type of questioning. The reason probably can be found in the fact that electronic and paper dispatch has been preceded by phone conversations with targeted people.

It should be noticed that the research presented in this paper have been made in times of advancing global financial crisis (first quarter of year 2009). This could be one of the explanations of low manager's assessment of utility of such indexes as *equity price*, *capitalization* or *innovativeness*, typically very closely watched by managerial boards. The questionnaire included also the question "*How would your answers differ if asked in times of prosperity?*" Responses varied, accordingly to enterprise profiles, but a general trend towards enhancement of product related indexes (*product life cycle*, *structure of backlog of orders*), innovation (*innovativeness*, *investment / income ratio*) and income level (*equity price*, *return on capital*) could have been observed. Also *geographical range of activity* and *number of clients* gained some points. Few respondents stated that their competitive advantage has been even strengthened by crisis and recession. Although differences in respondents' crisis – prosperity answers proved to be very interesting, they will not be interpreted here and remain, a vast field for possible further research.

Table 1: Aggregated values of expert evaluations for significance rank: 1 – 4

| RESPONSES IN TIMES OF RECESSION | | | Significance Rank: 1 - 4 | | | |
|---------------------------------|--------------------------------|--------------|--------------------------|-----------------------|-------------------------|------------------------------|
| Expert Ranking | Index | Average Rank | Number of Answers | Percentage of Answers | Cumulated No of Answers | % of Cumulated No of Answers |
| 1 | Flexibility | 4,47 | 18 | 15% | 18 | 15% |
| 2 | Level of income | 5,21 | 15 | 12% | 33 | 27% |
| 3 | Number of clients | 6,57 | 13 | 10% | 46 | 37% |

Source: Gawlik, R., own elaboration based on research

The above given table 1 shows aggregated values of expert evaluations of utility of all 18 indexes of international companies actual development. *Number of answers* values represents the number of experts that attributed highest ranks to a cumulated group of four indexes with highest average rank (significance rank 1 – 4). *Percentage of answers* says about the percentage share of *number of answers* in a total of 100%. *Cumulated number of answers* can be calculated by adding the current *number of answers* to preceding position from the same column with its percentage value marked in the last column – *percentage of cumulated number of answers*.

Research outcome presented in Table 1 indicates that 47% of decisions made by managers of international enterprises can be made on basis of 22% of indexes only. This percentage represents 4 indexes out of 18 that in most expert evaluations obtained highest ranks (between 1 and 4). These were namely *flexibility*, *level of income*, *number of clients* and *survival ratio*. The resulting Pareto – Lorenz diagram can be found below:

Fig. 1: Pareto – Lorenz diagram for aggregated values of expert evaluations for significance rank: 1 – 4

Source: Gawlik, R., own elaboration based on Table 1

Although the *reasons ratio* level (22%) is close to the value from Pareto – Lorenz method, the other side of proportion, the *effect side* appears to be less satisfactory (47%). This is why the author decided to perform a second Pareto – Lorenz analysis focused on each index separately. Its results show that most of experts agreed that between indexes describing the actual state and development level of international companies *flexibility* plays the crucial role (average percentage of votes above 20% for each significance rank from 1 – 4). Also *level of income*, *number of clients* and *survival ratio* were declared as relatively important (average percentage of votes above 10%). Clearly irrelevant were factors such as *parts per million*, *capitalization*, *level of employment*, *investment / income ratio*, *geographical range of activity*, *product life cycle*, *equity price*, *floating assets level*, *return on capital*, *innovativeness*, *level of cash on bank account* and *structure of backlog of orders* (average percentage of votes lower than 5%). The problem arises with a small group of factors with average percentage of votes between 5% and 10%, namely *operating profit* and *product diversification*. Their importance seems too high to neglect them during decision – making, but their influence does not seem to be extremely high. This issue will be commented in concluding remarks.

The expert evaluations of utility of examined indexes for each of the significance ranks from 1 to 4 have been presented in an aggregated form on Fig. 2 below.

Fig. 2: Share of significance ranks 1, 2, 3, and 4

CONCLUDING REMARKS

The synthesis of study results indicates that at this stage of research it is difficult to build one synthetic index of actual condition and development level of international companies. The analysis resulted in finding some indexes of wider utility, regardless of company profile. It seems though that making decisions only on their basis could prove too simplistic. Thus the author proposes to explore further this field, particularly in the area of multicriterial decision – making in turbulent environments. The idea of expert questioning itself seems to bring satisfactory results, but there is a need of applying more sophisticated scientific apparatus for analysis. The Analytic Hierarchy Process seems to be an appropriate method for pair – wise comparisons of various types of economic indexes by group of independent experts under a pre – adopted set of criteria. Should external circumstances or criteria importance change, the method offers the possibility of adapting the hierarchy of indexes in form of a simulation in new business environment. The research outcomes in this area will be published in subsequent scientific works.

PROFILING CORRUPTION PERCEPTION IN NIGERIA: ROLE OF RELIGION AND GENDER

Gbolahan Gbadamosi, University of Worcester, UK
Moshood Bello, Yaba College of Technology, Nigeria

ABSTRACT

This study investigates attitude towards corruption and the role of gender, religion, education and age using a Nigerian survey data. It also seeks to establish how attitudes towards corruption relates to some other reported ethical measures such as Islamic work ethics, money ethic and corruption perception. Over 3800 questionnaires were administered with 1833 or about 48% response rate. Results revealed no significant gender differences in corruption but women reported being more religious. Also Christians rated the incidence of corruption as higher than Muslims although the sample size skews significantly in favour of the former. Older and more educated people also rated corruption incidence higher.

INTRODUCTION

To claim that corruption is African is to quip about a serious universal issue that is pervasive and endemic afflicting all parts of the world in different forms and varying degrees. Corruption is a predicament that has afflicted many societies at one time or the other in the course of their history and that still bother them to some degree presently. In western economies where corruption no longer appears to play a major role, no one would claim that it has been totally defeated (Merz, 2004). What is, perhaps, true is that corruption is pronounced in Africa, perhaps more acknowledged in Africa and expected more in Africa and the rest of the developing world. However, it is perpetuated by people of all countries perhaps more in Africa, with the connivance of Africans, and hence Africa has an unfavourable reputation for corruption. Hope (2000) claims the pandemic has reached cancerous proportions and become a matter of global concern in sub-Saharan Africa. It has permeated virtually all institutions, both public and private, governmental and non governmental, and has become a way of life and a principal method for the accumulation of private property afflicting all groups and people from all levels of life including professionals (Mulinge & Lesetedi, 2002).

Some writers (e.g. Osoba, 1996; Mulinge & Lesetedi, 1998) have argued that corruption is a by-product of traits of fraudulent antisocial behaviour derived from British, French and other colonial rulers. Mulinge & Lesetedi (1998) further explained that, among others, the introduction of monetary economy, the use of divide and rule technique, the faulty and inappropriate constitutions, and the centralisation of power entrenched in many African countries accounted for laying the foundation for corruption. They, however, conceded that corruption in Africa cannot entirely be attributed to colonialism. After all, self-determination since the late 1950s allowed African leaders the opportunity to choose what was good for their people. In some African countries a decent level of good governance with relatively transparent and non-systemic corruption has been provided and this is widely acknowledged, for example in the case of Botswana but in many others such as Nigeria and Kenya this does not seem to be the case (Mulinge & Lesetedi, 2002; Gbadamosi, 2006a).

Corruption is one of the most written about concept in academia. The literature on the subject is intimidating as all aspects of this social ill have been well documented, its nature, extent, causes, measurement, and consequences among others. Interestingly, it is a subject that has cut across nearly all disciplines. It has been the domain of political science, economics, philosophy, history, sociology, anthropology, psychology, management, and law among others. Political scientist often discusses political corruption (as it relates to good governance and development) while economists often discuss economic corruption (as it relates to cost of corruption and development) and between the two disciplines the output has been most dominant. In the behavioural sciences,

much less of the behavioural dimension of corruption has been reported in the empirical literature. This paper will focus on the behavioural dimension of corruption using sample from Nigeria. How do people generally understand and perceive corruption in behavioural terms?

Defining Corruption: A variety of corruption definition available in the literature has been well captured (for example, Jain, 2001; Svensson, 2005; Sampford et al, 2006) and will not be dwelt on in this paper. Nevertheless, we find the definition of Osoba (1996) instructive and adopted it for our purpose: ... *a form of antisocial behaviour by an individual or social group which confers unjust or fraudulent benefits on its perpetrators, is inconsistent with the established legal norms and prevailing moral ethos of the land and is likely to subvert or diminish the capacity of the legitimate authorities to provide fully for the material and spiritual well-being of all members of society in a just and equitable manner (p. 372).* It is the cumulative of this socially undesirable behaviour that we refer to as corruption and it is people's attitude to such behaviour that is the interest of this paper.

Recently, Linder and Linder (2008) distinguished between corruption leading to personal enrichment and a second type aimed at increasing the competitive ability of the company. They further argued that corruption in some cases is not lack of honesty; rather depending on competition, market conditions and considerations it can be a requirement for surviving in the market. A similar question that research into corruption seeks to know is whether certain behaviour that people manifest is morally wrong (which is the domain of ethics, philosophy and morality); whether such behaviour is economically expensive (covered by economists, business and financial analysts); and whether it is legal (covered by lawyers). In this paper we refer to corruption as something 'negative' / 'bad' and thus seek to understand its behavioural manifestation better. In a global sense, we attempt to capture the attitude of people towards corruption. Attitude towards corruption may play a critical role in the persistence of corruption and thus understanding and being able to measure it may provide useful addition to the retinue of knowledge already in the public domain.

Gender, Age & Corruption

Some studies have shown that women tend to be less corrupt than men (Dollar, Fishman & Gatti, 2001; Swamy, Knack, Lee & Azfar, 2001; Torgler & Valev, 2004). Swamy et al (2001) found that women are less involved in bribery, and are less likely to condone bribe taking. Using cross-country data, a larger proportion of women than men believe that illegal or dishonest behaviour are never justifiable and that corruption is less severe where women hold a larger share of parliamentary seats and senior positions in government and comprise a larger share of the labour force (Swamy et al, 2001). Similarly, Collier (2000) in his corruption reduction argument noted that in fighting against corruption Africa need learn the value of decentralised government and the need to include more women in the political process from other societies.

Noting the seeming neglect of the relationship between age and corruption in the economics literature, Torgler and Valev (2004), using the World Value Survey data, found that the variable 'justifiability of corruption' is significantly lower for the age group 30 to 65+ than for the reference group below 30. They noted that the age effect becomes stronger for each higher age group and is substantial in magnitude. Recent findings of Alatas, Cameron, Chaudhri, Erkal and Gangadharan (2006) seem more interesting. They found that while women in Australia are less tolerant of corruption than men, there are no significant gender differences in attitude towards corruption in India, Indonesia and Singapore. This suggests that the gender differences found in the previous studies (e.g. Swamy et al, 2001) may not be nearly as universal as stated and the relationship between gender and corruption may be more culture-specific. These evidence, taken together, provides some support for the idea that, at least in the short or medium term, increased presence of women in public life will reduce levels of corruption (Swamy et al, 2001) and more elderly people in political and public administration positions will likely reduce the incidence of corruption (Torgler & Valev, 2004). However, these evidence remains inconclusive, at least outside of Western countries, hence the need to engage in more comparative international studies especially in Africa and other developing countries. Our study contributes to bridging this gap.

Corruption in Nigeria

Corruption in Africa is well documented including its causes, symptoms, and consequences (see for example, Collier, 2000; Hope, 2000; Mulinge & Lesetedi, 2002). Collier (2000) argued that corruption persists in Africa because it becomes acceptable; because it becomes safe; and because people expect it to continue and these are

the most difficult forces to tackle. Moral norms, risks of punishment and inherited reputations all tend to perpetuate honesty in honest societies and corruption in corrupt societies (Collier, 2002). Poor pay has been indicated as another major reason for public sector corruption in Africa (see for example Van Rijckeghem & Weder, 2001; Mulinge & Lesetedi, 2002). Empirical evidence in this respect is however inconclusive. In cross-country studies, Rauch and Evans (2000) and Treisman (2000) find no robust evidence that higher wages deter corruption, while Van Rijckeghem and Weder (2001) find that it does. Svensson (2005) thus argued that while the systematic evidence on the relationship between pay and corruption may be ambiguous, most findings generally provide convincing evidence that paying higher wages can deter corruption under certain circumstances. Nevertheless, the argument that higher wages may reduce corruption ignores the other problems related to the general level of underdevelopment in many of these countries. These problems increase the financial outlay requirement of citizens in many respects including: poor infrastructure, poor or absent pension scheme, poor public schools and hospitals, and absence of other basic utilities such as electricity, water, telecommunication etc.

There is no dearth of writing on corruption in Nigeria as the country has notoriety for this vice with most authors agreeing that it will be difficult for the country to develop if corruption within the system continues at its present level. A Google search with the two words “corruption” and “Nigeria” generated 2,030,000 hits and a Google scholar search reduced it to 46,000 hits (March 2009). In Nigeria, corruption manifests itself in a variety of ways and in all sectors from the social, political and bureaucratic to the educational and cultural. A man’s source of wealth is of no concern to his neighbours, the public or the government. In Nigeria (and some African countries), this decay in socially acceptable behaviour is palpable. The behaviour that used to be completely unacceptable – a taboo of sort – some four decades ago, modified to become tolerated or sometimes ignored two decades ago and recently over the last decade have actually become celebrated and applauded. Using four scales that measures corruption across countries, Svensson (2005) reported Nigeria as the only country to appear in the bottom 10 percent of the most corrupt countries on all four lists. Perhaps if we start our investigation from a country visibly high in corruption perception we may learn some lessons as future studies replicate the investigation in other African countries.

Hypotheses: The primary objective of the study is to investigate attitude towards corruption and corruption perception in Nigeria. Specifically, the study attempts to test three hypotheses:

1. There is no relationship between corruption perception, on the one hand, and religion, gender, education, and age on the other
2. There is no relationship between attitude towards corruption, on the one hand, and religion, gender, education, experience and age on the other
3. There is no relationship between attitude towards corruption, corruption perception, Islamic work ethics, and money ethics

RESEARCH METHODOLOGY

Sampling and Respondents’ Characteristics

The study is a cross-sectional design and data was collected from employees from the private and public sector in Lagos, Nigeria. About 3,800 questionnaires were administered in Lagos (which is the commercial hub of Nigeria) to randomly selected employees in several organisations. A total of 1842 were returned with 1833 being usable representing 48.24 percent response rate, 9 questionnaires were omitted from analysis for various types of incompleteness.

Over 62 percent respondents were males, with majority of them between 21 and 40 years old (about 78%), about 50 percent were married and most worked either in the private sector (45.9%) or were self employed (15%). About 67 percent had more than a high school qualification with about 41 percent possessing university degrees and 60 percent have worked for more than 5 years. Over 74 percent were Christians and about 24 percent being Muslims, only 26 (1.5%) did not indicate their religion. About 99 percent of respondents were Nigerian citizens, the remaining 1 percent either did not answer the questions or they were citizens of neighbouring countries.

Measuring Instrument and Reliability

Attitude towards corruption: was measured using a 20-item scale on a 5-point Likert-type scale ranging from 'strongly disagree' to 'strongly agree' developed for the purpose of this study. Face validity was established using a cross-section of African academics and it was also pilot tested with a small group of Africans at a management development workshop to clean up ambiguity and other related issues. Cronbach alpha obtained for this sample is .62. Some examples of the items include: (1) Corruption can never be eliminated in this country and (2) Prayers can help reduce and remove corruption.

Work ethics (Islamic): was measured using a 17-item measure of Ali (1988) cited in Yousef (2000) on a 5-point Likert-type scale ranging from 'strongly disagree' to 'strongly agree'. The Cronbach alpha obtained in this sample is .78. Some example of the items include: (1) Life has no meaning without work and (2) Creative work is a source of happiness and accomplishment.

Money ethic scale (MES): was measured with the six-item measure of Tang *et al.* (2002). The Cronbach alpha for this scale in our sample is .62 which is slightly lower than the reported .68 in an earlier African sample (Gbadamosi & Joubert, 2005). The scale has however been examined in many different countries in Asia, Europe and the USA (Tang *et al.* 2002). Some example items are: (1) Money is the root of all evil and (2) Money is a symbol of success.

Corruption perception: a 5-item measure on a five-point scale from 'always' to 'never' was used for this purpose (Gbadamosi, 2006b). It measures aspects of corruption perception and some items are included in Table 1. The Cronbach alpha obtained for this scale is .64.

DATA ANALYSIS AND FINDINGS

Table 1 reports result on the corruption perception measures. This finding indicate that bribes and tips are (at least) sometimes required to get things done (up to 83%) and that organisations (at least) sometimes have to pay bribes and tips to get things done (up to 80%). It is also discouraging that it is difficult to get help elsewhere when faced with a potentially corrupt situation; with about 33 percent reporting there is 'rarely' help to there is 'never' help. Similar poor results were reported for the same measures in both Swaziland and Botswana, with the percentage required for tips and bribes being up to 79 percent in Swaziland (Gbadamosi & Joubert, 2005) and up to 69 percent in Botswana (Gbadamosi, 2006b). With respect to whether help can be obtained elsewhere those reporting 'rarely' to 'never' in the two countries is closer to the findings in Nigeria (31% in Swaziland and 24% in Botswana).

Table 1: Corruption perception

| Item statements (This is the case in this country): | Always | Frequently | Sometimes | Rarely | Never |
|--|----------------|----------------|----------------|----------------|---------------|
| 1 Individuals pay bribes and tips to get things done. | 253 [14.6%] | 315 [18.2%] | 879 [50.7%] | 173 [10.0%] | 115 [6.6%] |
| 2 Organisations pay bribes and tips to get things done. | 161 [9.3%] | 279 [16.1%] | 821 [47.5%] | 311 [18.0%] | 157 [9.1%] |
| 3 If a public official acts against rules, help can be obtained elsewhere. | 159 [9.4%] | 218 [12.8%] | 756 [44.5%] | 423 [24.9%] | 144 [8.5%] |

Using a single item respondents were asked to rate corruption in the country using the options high, medium and low: 'how would you rate the incidence of bribery and corruption in the country?' A total of 1439 (84.5%) rated corruption as high, 233 (13.7%) rated it as moderate and a mere 30 (1.8%) rated it as low. There is no doubt that Nigerians are highly critical of their own country, recognise the problem and do not pretend it does not exist. How does this rating compare along the lines of respondents' religion, gender, education and age? Crosstabulation results show no significant differences between men and women on the rating of the incidence of bribery and corruption. However, Christians rated the incidence as higher than Muslims (chi square 25.726, d.f. = 4, $p < 0.000$); the more educated respondents rated corruption incidence higher (chi square 29.932, d.f. = 10, $p < 0.001$). The older respondents rated it as higher than the younger ones (chi square 48.960, d.f. = 10, $p < 0.000$) with respondents under 20 years being generally more tolerant of corruption and this finding supports Torgler and Valev (2004).

The 20-item attitude towards corruption scale was subjected to confirmatory factor analysis (CFA) and details of the result are reported in another paper (Gbadamosi and Bello, 2009). Prior to this the suitability of data for factor analysis was assessed. The correlation matrix revealed coefficients of 0.3 and above; the KMO value was good (0.74) and the Bartlett's Test of Sphericity reached statistical significance ($p < .000$), supporting

the factorability of the correlation matrix. The result reveals further that the scale is a multidimensional measure loading on 4 factors and showing very strong internal consistency among the factors. The percentage of total variance of all 20 items explained by the four factors is about 40%. In all the factor analysis shows some evidence of construct validity and with a reliability coefficient (Cronbach's alpha) of 0.62 the scale is good.

Further analysis of data – crosstabulation – was performed. Selected items of the attitude towards corruption scale items against religion, education, gender and age are reported hereafter. On whether '*corruption can never be eliminated in the country*', significantly more women than men hold this view ($p < 0.30$) and respondents with lower education ($p < .000$) also supports this view. There are no significant differences in religion or age for this item. *Can a good and committed government reduce corruption?* There were no significant differences in the religious affiliation and gender for this item. However, significantly more educated ($p < .014$) and younger respondents ($p < .017$) agree with this statement. There are no significant gender differences in opinion on '*the use of an effective anti-graft agency to eliminate corruption*', but significantly more Christians ($p < .012$), more educated ($p < .000$) and younger respondents ($p < .012$) are in agreement with this statement. Results on whether '*lack of sanctions for corrupt practices is likely to increase corruption*' showed significant differences for all comparison groups. Significantly more Christians than Muslims ($p < .000$), more men than women ($p < .002$), more educated people ($p < .000$) and younger people ($p < .000$) agree with this statement. We have selected to present another three items that can be deemed religious statements. Results on whether '*prayers can help reduce and remove corruption*' revealed that no significant differences as it relates to education and ages of respondents. However, significantly more Christians than Muslims agree ($.000$), and significantly more women than men ($p < .024$) agree with this view. The result for the item '*I am a very religious person*' showed significant differences for all groups. Even though there are significantly more Christians than Muslims in this sample but it is rather interesting that significantly more Muslims agree ($p < .003$) with this statement. Also significantly more women than men ($p < .000$); less educated people ($p < .000$); and younger people ($p < .004$) agree with this view. Finally, investigating the opinion of respondents on the corruption label that seems to stick with Nigeria internationally with the item '*the level of corruption in this country is exaggerated by the international community*'. There were no significant gender differences on this item, but significantly more Muslim than Christians ($p < .003$), older ($p < .003$) and less educated people ($p < .000$) support this statement.

The descriptive statistics and intercorrelations among the study variables are presented in Table 2. Attitude towards corruption was significantly and positively correlated with both the money ethic scale ($r = .286$, $p < 0.01$) and Islamic work ethics ($r = .384$, $p < 0.01$), which is not unexpected as all three scales measure some form of ethical conduct which gives construct validity support to the attitude towards corruption scale. We also found a significant correlation between the money ethic scale and Islamic work ethic ($r = .266$, $p < 0.01$). There was, however, no significant correlation between corruption perception and any other variable in addition to being inversely correlated with attitude towards corruption. This is perhaps an indication that it measures something different from the other variables. Another plausible reason for the corruption perception scale standing out is that responses were anchored on a different kind of scale from the other measures (see table 1).

Table 2: Mean, standard deviation and intercorrelations of study variables

| Study variables | Mean | SD | 1 | 2 | 3 | 4 |
|-------------------------------|------|-----|---------------|---------------|-------------------|-------------------|
| 1 Attitude towards corruption | 3.48 | .41 | (0.62) | -.033 | .286 ^a | .384 ^a |
| 2 Corruption perception | 2.97 | .66 | | (0.64) | .040 | .008 |
| 3 Money ethic | 3.43 | .72 | | | (0.62) | .266 ^a |
| 4 Work ethics (Islamic) | 3.96 | .48 | | | | (0.78) |

Notes: N = 1833; $p < 0.01$ level ^a (2-tailed); Cronbach's Alpha (α) in parentheses and bold

In order to investigate whether there are significant gender differences in attitude towards corruption, corruption perception, money ethic and Islamic work ethic independent t-test were also conducted. The result of t-test indicates that there were no significant gender differences on attitude towards corruption (see Table 3). Contrasting Swamy et al (2001) which reports gender differences in a Western sample, the present findings supports Alantas et al (2006) who found no gender differences in India, Indonesia and Singapore, but only in Australia. Similarly there were no significant gender differences on corruption perception and Islamic work ethic. For money ethic however, women score significantly higher than men [$t(1757) = -2.091$, $p < .037$].

To test if religious differences affect attitude towards corruption, corruption perception, money ethic and Islamic work ethic, independent t-test was also conducted. The result of t-test (see Table 4) indicates significant religious differences for attitude towards corruption, money ethic and Islamic work ethic. Christians scored

significantly higher than Muslims on the attitude towards corruption scale and more interesting on the Islamic work ethic scale. Muslims however scored significantly higher on the money ethic scale.

Table 3: T-test of study variables by gender with means and standard deviation

| S/N | Study Variables | Male | | Female | | Levene's Test for Equality of Variance | | t | d.f. | Sig. (2-tailed) |
|-----|-----------------------------|------|-----|--------|-----|--|------|-------|------|-----------------|
| | | Mean | SD | Mean | SD | F | Sig. | | | |
| 1 | Attitude towards corruption | 3.49 | .40 | 3.45 | .42 | 1.060 | .303 | 1.73 | 1592 | .084 |
| 2 | Corruption perception | 2.97 | .67 | 2.97 | .66 | .032 | .858 | -.12 | 1670 | .900 |
| 3 | Money ethic | 3.40 | .73 | 3.48 | .49 | .084 | .772 | -2.09 | 1757 | .037 |

DISCUSSION AND IMPLICATIONS

This study provides useful information about attitude towards corruption and corruption perception from an aspect of relatively unexplored respondents' profile: religion, gender, education and age using African data. In many African nations, relative to the West, citizens are generally very religious, gender inequality high, level of education low and age a very important distinguishing factor among people. All of these are especially true for Nigeria. The literature, however, offers very little information in these respects, yet such information remains important to understand better these aspects of corruption as a socially undesirable behaviour. The present findings on corruption perception suggest that in at least four out of five times people are likely to pay tips and bribes to get things done as individuals or as an organisation. This statistics is close to that earlier obtained from Swaziland and Botswana. What is more worrying is that the machinery in place for citizens to seek redress is ineffective. It appears that the recurring appearance of Nigeria at the bottom of CPI list can easily be more attributable to the absence of an effective corruption combating strategy. Moreover, Nigerians rate the incidence of corruption in their country as very high, over 84 percent. Such rating further reinforces the CPI of Transparency International (TI) and is perhaps also reinforced by it.

It would be useful to engage the respondents in future studies perhaps using focus groups or in-depth interview to establish their awareness of TI ratings and thereafter establish to what extent this awareness may affect their personal rating. The findings further reveal that Christians rated the incidence of corruption as higher than Muslims although the sample size skews significantly in favour of the former, a situation which might have been different if data collection was spread nationally. Older and more educated people also rated corruption incidence higher. It is discouraging that respondents under 20 years are generally more tolerant of corruption. The results also reveal that respondents generally agree that a good and committed government can reduce corruption; an effective anti-graft agency can help combat corruption and that the absence of effective sanctions serve to increase corruption in Nigeria although there were variations in religion, gender, education and age.

Nigerians generally profess religion and it is almost a 'taboo' of some sort to proclaim to be a non-believer. It is, therefore, not a surprise that over 74 percent of the respondents agree or strongly agree with the statement 'prayers can help reduce and remove corruption'. Interestingly, women more than men and Christians more than Muslims hold this view. The view of respondents was divided (40% disagreeing and 45% agreeing) on whether the international community exaggerates the level of corruption in the country, but Muslims more than Christians support this view.

The managerial and policy implications of these results could be very interesting and challenging. First, effectively combating corruption is perhaps a major key to winning the anti-graft 'war' in Nigeria as it may perhaps be for most of Africa. While so much attention has been devoted to the incidence of corruption itself and some to its reduction, these results suggest much more need to be done in providing a people generated corruption reduction strategies and identifying which are workable strategies. Secondly, concerted effort needs to also be directed at the re-orientation of the younger age group, for whom these results appears are more tolerant of corruption. Thirdly, a combination of both an effective anti-corruption agency and effective sanctions for offenders might prove valuable in the anti-graft effort. Finally, more effort at corruption prevention as opposed to the over-concentration on its control could prove more effective in a country like Nigeria. It is disappointing that these results mostly confirms extant literature in most respects but encouraging that it fills some gap on what needs to be known about the role of religion, gender, age and education on attitude towards corruption.

As with all studies, the limitations of this research include the use of a self-report instrument. Social desirability effect is a major potential limitation here as respondents may answer questions according to their perception of social desirability. However, given the complete anonymity guaranteed in the research process it is hoped that the effect, if at all, would be minimal.

CONCLUSION

This paper attempted to examine corruption perception and attitude towards corruption in an African context using behavioural indicators rather than from an economic or political science perspective. It investigates the role of religion, gender, education and age in an African society (Nigeria) where all these are important. It also commences the process of developing instruments which, when fully validated, may offer fresh insights into our understanding of corrupt practices as an unethical, immoral and socially undesirable behaviour. There is little doubt that corruption is difficult to study empirically, because of its very nature: rarely does it leave a trail, often no witnesses, disclosure is at the pleasure of the actors involved, and making it public knowledge is considered negative. There will therefore always be something that can and, perhaps, should have been done differently when critiquing a corruption paper. Nevertheless, this paper establishes no significant gender differences in corruption and that both younger people and less educated people are more tolerant of corruption. It is a truism that corruption is nether a new nor under researched area of academic investigation, yet very few studies have focused on demographic profile of respondents in corruption studies. This study contributes to filling this gap.

MEASURING ORGANISATIONAL COMMITMENT AND EFFECTING CULTURAL CHANGE AT A UNIVERSITY OF TECHNOLOGY

Vanessa van Graan, Sonia Swanepoel and Jannie Liebenberg
Tshwane University of Technology, South Africa

ABSTRACT

Legislation for higher education has changed dramatically. A changing South Africa has brought a changing educational landscape and brings a need for a single higher education system. Various tertiary institutions were merged and change became inevitable. The study has indicated so far that with the merger, internal structuring, cultures and commitment were compelled to change, these variables changed and that these variables are interrelated and interdependent which has tremendous influences on each other, affecting all the staff of the merged institutions changing staff commitment, levels of trust and morale.

INTRODUCTION

The South African government wanted a single higher education system with shared goals, values and principles in the country. Mergers were proposed for a number of South African institutions. The announcement by the Government (Education Whitepaper 3: A framework for the transformation of Higher Education, July 1997) that was suggested elicited mixed responses from various facets of society. The strongest negative sentiments were expressed by people in the disadvantaged communities, and shared by many in the advantaged communities which include the business sector. The fundamental motive of the government was to bring about the necessary structural changes and establish solid and sustainable institutions as dictated by legislation.

Institutions and the employees of tabled institutions inevitably had to merge. Departing with what was known as their workplace, their ways, cultures, policies, rules and even in some instances their colleagues. The merger in itself brought about enormous changes to the structures, policies and processes, these ultimately affecting organisational cultures and, in turn, the morale and commitment of the staff. While the merger is systematically taking place, it can be assumed that employees have different predetermined ideas of where the university is going. These could include possibly resisting change, and indirectly adapting a culture that has an impending ruinous impact on the success of the merger, affecting commitment, compensation satisfaction, perceptions on funding for training, career development and many other aspects of corporate life.

MERGERS AND THEIR IMPACTS

Lawler and Worley (2006: 110) state that mergers are particularly difficult to manage due to misalignment of the different cultures, and the lack of skill for cultural management by the merging parties. Conner (1998:175) underlines Lawler and Worley's findings by stating "*when cultures are misaligned and poorly managed, change inevitably fails*". All too often mergers are accompanied by statements that they are "a merger of equals" and that the best people and practices from the merging organisations will feature in the new formed organisation. Robbins (2003:530) points out that cultural compatibility and employee commitment have become primary concerns in recent years around mergers. Most leaders and managers assume that the culture after the merger will take care of itself. It is also taken for granted that staff will switch over their commitment to the new organisation and its newly appointed leaders.

Nearly all mergers, regardless of size or industry, have similar human dynamics which have ubiquitous unknown or hidden barriers. These hidden barriers being the most valuable asset – also becomes the most costly (Sherriton & Stern, 1997:12). To assist the human dynamics of an organisation the following points can be taken into consideration prior and during the merger (Kotter & Heskett 1992:201):

- Integrating different cultures;
- Identifying clear lines of command;
- Rethinking work roles;
- Reducing a workforce either through attrition or reassignment; and
- Combining common but separate business systems

Researchers such as Kotter and Heskett (1992:213) and O'Reilly and Chatman (1986:465) describe these merger changes as drastic and dramatic. One study on mergers in the USA describes a merger as the most extreme form of inter-institutional organisational solution and as an *'irreversible totality – the legal death of one or both parties in the creation of a new one'* (Mulvey, 1993:10). There is also widespread agreement that the process seldom occurs without disruption to organisational change in cultures, employee commitment, productivity and performance (Mulvey 1993:10).

It is human nature for people generally, to have a strong attachment to the way their organisation was run; therefore they fight to have that way adopted. The result is often conflict and the adoption of a set of practices and policies that really do not form a coherent whole. A merger is an extremely stressful process for those involved: job losses, restructuring, the imposition of a new corporate culture and identity can create uncertainty, anxiety and resentment among the company's employees (Appelbaum, Gandell, Jobin, Proper & Yortis, 2000:9-10).

Research shows that an organisation's productivity can drop by between twenty-five and fifty percent while the organisation is undergoing such an intrusive change. Demoralisation of the workforce is a major reason for this, says Tetenbaum (1999:20-29). Companies often pay undue attention to the short term legal and financial considerations involved in a merger while neglecting the implications related to corporate identity, communication and staff commitment.

ORGANISATIONAL COMMITMENT

Organisational commitment has also been identified as an individual's identification with and the involvement in an organisation. Commitment is characterised by a strong belief in and acceptance of the organisational goals and values and a willingness to exert considerable effort on behalf of the organisation as well as a strong desire to maintain membership in the organisation (Ashkanasy, Wilderon & Peterson 2000:341). Organisational commitment reflects the extent to which one identifies oneself with an organisation and is committed to its goals, principles and values. These are very important work attitudes because committed people display a willingness to work harder, to achieve organisational goals and have a greater desire to remain in the organisation (Schein, 2004:400). Having a committed workforce is reviewed as an advantage to any organisation.

Organisational commitment that has been approached from various theoretical perspectives has been found to be related to job performance and turnover, as well as absenteeism, job satisfaction, commitment and employee attitudes (Mowday, Porter & Steers 1979:247 and O'Reilly & Chatman, 1986:465-317). These researchers all indicated that society as a whole benefited from employee commitment due to lower job movements, higher productivity leaving the organisations with more contented workers. Employees with high commitment are more willing to put more effort in a change project and are therefore more likely to develop positive attitudes towards organisational change. Mowday *et al.* (1979:247) claim that commitment often establishes an exchange relationship in which individuals attach themselves to the organisation and in return, for certain rewards individuals come to organisations with certain needs, expectations and skills. They hope to find a work environment where they can use these abilities and satisfy their needs. When an organisation can provide these, the likelihood of increased commitment is increased (Mowday, 1979:247).

Blanchard (2007:133) mentions that performance rarely declines due to staff incompetence. Changes in performance occur either because the job and necessary skill to perform it have changed, or because people have lost commitment. Management tends to avoid dealing with de-motivated staff, largely because lack of commitment is an emotionally charged issue and management need not know how. The core perception on the part of the de-committed employees is that either their manager or the organisation has treated them unfairly. Blanchard (2007:135) believes that the primary cause can be traced to the behaviour of management and, or the organisation. De-commitment has numerous other causes such as under or over supervision, lack of feedback, lack of recognition, lack of clear performance, poor communication, unfair standards, overworked staff, stress, or a gap between employee and employer expectations.

The foundation of commitment is trust

Recent evidence indicates that trust is the foundation of leadership, while good leadership builds commitment (Robbins, 2003:336). Unless followers trust their leaders, they will be unresponsive to a leader's influence or efforts (Covey, 2006:39 & Cooper, 2003:6). Trust or the lack of trust is an increasingly important component of leadership because it ultimately becomes a commitment issue in today's organisations. Trust according to Robbins (2003:336) is a historically dependent process based on relevant but limited samples of experience. Trust, which takes time to establish, accumulates and builds incrementally and underpins commitment. As trust is a core value associated with leadership, leaders need to show commitment. When trust is broken, it can have serious adverse effects on an organisation's performance, staff loyalty, commitment and trust in the leadership (Robbins, 2003:336, Covey, 2006:39 & Cooper 2003:6). These traits are very similar to the five trust dimensions identified by Covey (2004:33): integrity, competence, consistency, loyalty and openness. Covey (2006:37), strongly believes if any one of the dimensions is lacking, its surging outward effect will essentially affect each of the other dimensions. When followers trust a leader, they are willing to become vulnerable to the leader's actions – confident that their rights and interests will not be abused. Kouzes and Posner (2003:247) say if people are going to follow someone willingly, whether it be into battle in the boardroom or elsewhere, they first want to assure themselves that the person is worthy of their trust. The less trust there is within the organisation, the higher the level of political behaviour.

ORGANISATIONAL CULTURE

Organisational culture is a phenomenon that ultimately embraces everything that a group is concerned about, and what the group has to deal with. Organisational culture reflects deeper issues about the nature of truth, time, human nature and relationships. Many authors such as Schein (2004:273), Alvesson (2002:4), Senior (2002:108), Hofstede (1991:287) and Trompenaars (1993:22) mention that when people speak about organisational culture they refer to the importance of symbolism – rituals, myths, stories, and legends – and about the interpretation of events, ideas and experiences that are influenced and shaped by the groups within which they live.

A strong organisational culture is often characterised by employees who share core values who are committed. A strong culture is said to improve organisational performance. Peters and Waterman (1982:2) are well-known writers and consultants who claim to have found a recipe for cultures, which are presumed to link performance. They argue that the more closely an organisation sticks to its particular recipe, the greater the probability that it will be a high performer. It is debatable, whether a strong culture, even of the supportive kind is necessarily linked to increased competitive advantage. A weak corporate culture or a low performing organisation becomes evident when organisations become more diverse, through mergers and acquisitions and internal diversification (Kotter and Heskett, 1992: 24).

When people join an organisation willingly, they bring with them the values and beliefs they have acquired. Quite often however these values and beliefs are ineffective or inadequate to help individuals to succeed in the organisation. This is because, as Schein defines it, every organisation is unique in its basic values and beliefs, and more often than not is vastly different (Schein 2004:274). Conner (1998:161) states that culture is the frame of reference that helps to distinguish one group of people from another and establishes a unique set of formal and informal ground rules for its members. During periods of major change, cultural boundaries are seriously

strained. Careful planning with a sense of urgency is needed to aid employees to cope with the change. Because organisational culture involves shared expectations, values and attitudes, it exerts an influence on individuals, groups and organisational processes. Researchers Schein: (2004:28) and Kotter and Heskett (1992:8) suggest that the impact of culture on employees provides and encourages a form of stability, as well as a sense of organisational identity. As culture is significant and complex, it is difficult to understand and use in a thoughtful way. It is necessary to emphasise the significance of corporate culture for performance growth and success. When attempting to embrace acceleration change or reshaping organisational culture leaders must realise that it is an activity that requires a considerable amount of time (Alvesson, 2002:2). Knowledge and leadership are said to be crucial factors for sustainable advantage. Unfortunately people are unaware of their corporate culture until it is challenged, until they experience a new culture or until it is made overt and explicit through a framework or model rather by rules or personal observation.

LINKAGE/AFFILIATION

The link between corporate culture and committed leadership has been an important theme in management and business research for the past decades due to its potential to affect a range of organisations and employee-desired outcomes. There is also consensus that corporate culture is an outcome of management philosophy and a way to manage organisations to improve their overall effectiveness and performance.

Strength of culture as strength of commitment

The term commitment is widely used in sociology, psychology and organisational studies. In definitions and usage these terms, values, norms, effects, attachments and incidents are emphasised. This implies that commitment shares some of the referents of organisational culture (Ashkanasy et al. 2000:339). Ashkanasy *et al*, also argue that it is possible to integrate the different conceptual constructs of organisational commitment into organisational culture. They state that the concept of commitment can be linked to organisational culture, when commitment can be seen as an instrument of culture. Strength of culture can easily be conceptualized as strength of commitment. In the language of commitment, consistency of culture is the social symmetry of objects, bases, foci and consequences of commitment. A strong culture often enables an organisation to achieve excellent performance (Deal and Kennedy, 1983:146). Commitment is positively linked to job challenge, degree of autonomy, the variety of skills an employee is required to display and participation in decision-making (Drummond, 2000:72). Commitment is also linked to organisational loyalty, feelings of personal importance to the organisation and fulfilment of expectations (Mowday *et al*. 1979:245 and Meyer & Allen, 1997:25).

Management of commitment is also management of culture, because it is commitment that binds people to an organisation's ideas, norms, and rituals while culture is the glue that keeps it together, and makes all the aspects, be it people or non-tangible concepts 'fit' and tie in together. Research verifies that commitment is likely to be a product of leader actions, therefore leader actions are a result of organisational culture. What leaders do, prioritize and act upon, strongly influence employee commitment. The lack of full commitment to change is one of the prime reasons success stories are so rare. Steering commitment to change is not easy, and the process is something for which many are not prepared for (Conner, 1998:155).

METHODOLOGY

For the purpose of this research, descriptive and inferential statistics were used to analyse the data that was collected from staff at a University of Technology. The data was analysed using SAS. The response of the questionnaires was provided in its original format and was captured on Microsoft Access. It was then converted into SAS-format through the SAS Access module. The diagnostic measurement tool used is the reliability coefficient which was the Cronbach's Alpha.

A reliability test was applied to all the items (statements) in the questionnaire. According to the Cronbach's alpha coefficients 0.9382 was obtained for raw variables and 0.9385 for standardized variables, which are higher than the acceptable level of 0.70. Chi-square tests and cross-tabulation were used for determining the correlation

between biographical variables. Cross-tabulation and Chi-square-based entails a measure of association - a technique for comparing two or more classification variables.

The target population can be described as all academic/research, support and administrative staff of a recently merged tertiary institution. The unit of analysis is each employee regardless of their status within the respective departments and across all the participating campuses. No sample was actually selected from the overall population, thus the sample is made up of those who voluntarily responded to the survey. The organisational commitment questionnaire (OCQ) of Mowday, Porter and Steers was adapted to the circumstances and the biographical information of the university.

Analysis

A 60% return rate was achieved and all completed questionnaires were used in the analysis. The questionnaire as designed by Mowday *et al.* was adapted and was divided into the following sections:

- Commitment to the university.
- Compensation satisfaction.
- Training.
- Supervisor rating.
- Career development.
- Balance between work and personal life.
- Biographical information.

These variables were measured and analysed. All the statements used a 5-point Likert scale as a response method, thus an ordinal scale as well as descriptive and inferential statistics for continuous data was used.

Descriptive Statistics

The statements are reflected on a frequency table, showing the frequencies in each category as well as the percentage out of the total responses and indicating the means and standard deviations. Note should be taken that the number of respondents (N) may differ from variable to variable due to the fact that not all of the questions were answered by all the respondents.

FINDINGS AND CONCLUSION

Introduction

Readers have to realise that commitment and culture are not tangible commodities therefore they are extremely difficult to identify. All participants brought their own feelings and perceptions to bear on the questions put forward to them in the questionnaire. With the merger now finally concluded, employees have had to make extreme paradigm shifts and adaptations to new management, altered policies and procedures. However, the findings suggest that many other factors played a role in the commitment to the organisation and probably reflect clearly of how employees feel about leaders and the behaviours they exhibit. Research work done by Bowditch & Buono (2005:87), Ashkanasy *et al.* (2000:352), Collins (2001:37), Denison (1990:112), Kets de Vries (2001:95) and Kotter (1999:66) verifies and confirms that the feelings employees have towards their leaders, managers or supervisors are expected due to leader behaviours exhibited.

Staff commitment and turnover

When employees are dissatisfied with their jobs they may go through a process of withdrawal, which is likely to have a negative impact on their performance. This in turn makes it harder to motivate them and it means they are unlikely to remain committed to the organisation. There are many reasons for employees deciding to leave an organisation. These range from employee support, through the type of remuneration and reward, to the organisation not meeting the employees' expectations. It has also been found that organisational culture can

have a profound effect on whether an employee stays or leaves (Bloisi 2007:271). More than half of the university staff 67.4% reported that they have to remain at the institution wholly based on the fact of work scarcity in the South African market.

The cost of staff turnover can be substantial. Not only are there direct financial costs of replacing staff, but also other repercussions to deal with such as the potential loss of key skills, knowledge and experience, disruption to operations and negative effect on workforce morale. As indicated in the tables below 67.4% of the staff indicated that they would leave the employment immediately if there was another job opportunity, while 40% of the staff indicated that they will leave the institution within the next year.

Compensation

Despite the tendency in recent years to downgrade the importance of pay (Luthans, 2002:146) as an organisational reward, there is considerable evidence that money can be positively reinforcing for most people. A startling number of staff, 45.6% indicates dissatisfaction with the manner in which the university management provides information relating to pay issues. 41.4% indicate that there is perceived inconsistency in the application of the university's compensation policies.

Ratings of supervisors

One observation is that 40% employees have good relations with their direct supervisors and have therefore are sufficient comments, response and feedback. Generally the overall indication is that employees are satisfied with their direct supervisors on this variable.

Career development

The reactions to the questions are alarmingly negative especially in the positive light of the supervisors. Once again this negativity points to senior management, who set up policies relating to compensation, promotions and career opportunities.

Balance between work and personal life

The negative and costly consequences of uncontrollable imbalances in the workplace are reflected in the rising numbers of work-related accidents, increased turnover and higher absenteeism. The institution is at risk because there is the possibility of more staff having to leave due to the imbalance and stress they experience. One issue that management has to contend with is whether the institution is understaffed and whether the remaining employees are getting the necessary support from senior management.

The old cliché of employees being required to leave their troubles at the ‘factory gate’ is totally unrealistic. Events in employee’s private life can lead to stress which spills over into the work place and vice versa (Gibson *et al.* 2006:212). Cartwright and Cooper (1996:214) also argue that the relationship between home and work, more specifically job and family conflict can be conceptualized as a lack of fit at the interface of work and family roles. According to researchers (Cartwright & Cooper, 1996:219 and Nelson & Quick, 2005:127), organisations are able to reduce stress and its consequences by creating a climate which is conducive to trust, openness, transparency and direct communication.

Senior management

The actual amount of participation in making decisions ranges from no participation, where a manager makes the decision and asks for no help or ideas, to full participation (Luthans, 2002:376). In the survey, 63.1% of the respondents disagree that senior management style is characterized by team work and participation in decision-making. The question regarding individual innovation of the management style was met with an equal percentage of respondents (34.7%) disagreeing and remaining neutral. Staff also indicated indecisiveness regarding predictability in relationships with 43.9% indicating detachment. A question on leadership styles of senior management reflects that 48.7% of the staff feels that there is no achievement in the university management style, while 31.2% remain neutral. The less trust there is within the organisation, the less commitment employees feel towards the organisation (Covey, 2006:35).

Conclusions

Based on the inferential statistics, analysis and evaluation, it can be concluded that the merger may be successful on paper, but it can fail its employee component dismally. Employees at the university are not committed to the institution and remain in service because of necessity attributable to external forces.

The analysis of the results confirms an interdependence of commitment, leadership, trust, compensation factors, job satisfaction, job characteristics, supervisor’s ratings and the balance between work and private life in organisational change. The employees indicate various levels of negativity towards all aspects in the institution. All the stressors mentioned are related to negative attitudes towards the university.

The results showed a positive relationship between organisational commitment and positive attitudes to change, confirming evidence from the literature that organisational commitment is one of the most important determinants of successful organisational change (Ashkanasy *et al.* 2000:61). The more employees identified with their organisation the higher the commitment to the organisation and the greater the willingness to accept change (Lawler & Worley, 2006:243)

THE WAY FORWARD

“Leaders know that while their positions may give them authority, their behaviour earns them respect. Leaders go first. They set an example and build commitment through simple, daily acts that create progress and momentum”.

Kouzes and Posner (2003:524)

According to DiPiazza & Eccles (2002:173) the ‘spirit of transparency’ is the first key to restoring trust in organisations. Transparency usually establishes trust within a short time (Covey, 2006:154). Particularly when trust is threatened, people do not trust what they cannot see (Covey, 2006:154). Managers can execute organisational change in various ways. In many instances the change process occurs at the expense of short-term losses in exchange for long-term benefits (Gibson, Ivancevich, Donnelly & Konopaske 2006:465).

If this institution is to survive the merger and all the changes associated with it, the university needs to respond quickly to these changes. A leadership climate is created by the nature of the work environment and administrative practices of managers. The leadership climate generally affects any change effort; any change

programme that lacks managements support or commitment therefore has only a slim chance of success. One can understand that the style of leadership may itself be the subject of change.

Leaders with high levels of credibility are seen as trustworthy. They have a strong sense of right and wrong and stand up and speak up for that what they believe in. Credibility can be defined as the ability to engender trust in others. This quality is non-existent at the university. Credibility comprises two components: expertise and trust which also seems non-existent. The university and especially its senior management need to implement intensive intervention through effective and targeted coaching aimed for derailed managers.

Some leader's behaviours need to be changed (Huges *et al.* 2006:223). But changing behaviour, especially long-standing patterns, can be quite difficult. Learning to change these behaviours is a key leadership skill given that situations, technology, organisational structure, followers and employees seem to be in a constant state of flux. A longitudinal study done (Bloisi 2007:342) over a five year has found that the majority of people who were coached were able to change their behaviour. This study has so proved that long-term change needs long-term intervention.

The way forward entails rethinking. Management needs to rethink its strategy and the visions of the institution. Many organisations have found that they are able to develop new strategies from a financial or rational point of view. It is recommended that the university should aim for a deeper understanding of what it can be best at, to use as parameters for strategic choices.

Senior managers refer to employees as their most valuable asset as well as to the importance of empowerment and commitment for a competitive edge and long-term profitability. Based on research, Pfeffer (1998:3) argues that high-committed people practice building organisational cultures, increase productivity and performance. The ideas about high-commitment people-orientated management practices are not new. These have been seen in participative management, empowerment, total quality management, self-managed work teams and other management activities.

The importance, however is that the 'common-sense' people ideas in relation to the so called common-sense ideas on downsizing, cost-cutting, reengineering and technology as the saviours of all, cannot logically exist if the organisation wants to build commitment and an organisational culture. The university management cannot say they value people when they disregard their growth in the job and organisation. This disregard will damage the organisational culture and destroy the university employee commitment.

The university needs to coordinate people practices which are crucial for building and developing the university culture and sustaining commitment. Collins (2001:130) and Kotter (1999:2) have in their extensive studies found that one of the common success factors across all organisations researched, is the importance they place on their human resources. The university needs serious intervention that will embrace and cultivate a strong and proud culture by encouraging commitment and appointing knowledgeable and proficient leaders.

It has been reported that surveys of senior leaders who have experienced a merger, reflect a common belief that due diligence exercises underestimate the cultural aspects of the merger. These lead to tremendous integration issues after the deal has been completed. The impact of mergers on employees is so intrusive it creates uncertainty and anxiety among individuals in the merging organisation.

The university leader's and senior management need to adapt a policy of persistent repetition and consistency to create a fully aligned culture. Management needs to be unshaken in their belief that what they are doing is the right thing to do. This requires a certain degree of mental toughness, thoroughness, attentiveness and commitment. Being "tough" or "attentive" is often misinterpreted. Being tough is not about the fact that you can dismiss people during bad times, make budget cutbacks or win at negotiation. It means to stand fast on values and principles and bear in mind the human component at all times.

Commitment through words alone is not enough. As mentioned previously people in any organisation are "professional boss watchers". They will ultimately mimic the behaviours of leaders in those organisations. Along with passion and enthusiasm management at the university must demonstrate commitment through their actions.

Management at the university must be in control of things. They need to be totally aware of how the vision of the university is being implemented. This does not mean that management should micro manage, which is a major de-commitment factor. It means knowing enough to ask important and specific questions. It involves the skill to do this in a way that lets employees know management is in the lead and is taking an interest in what employees are doing while not infringing on employees' responsibilities or implying that they are incapable.

Management must hold people accountable, yet give them the appropriate authority, empower them. Being knowledgeable is critical to being effective. Leadership is a transaction between leaders and followers. Both have to coexist effectively. Leaders must pay attention as well as capture it. While leadership is about the motivation and inspiration of people, a leader still has to invoke many of the same skills that make an effective manager. Among these are a strong sense of focus, personal discipline and delegation skills and creating a high degree of accountability. While management can and should set themselves firmly on the path toward their organisation's future, it is obvious that success cannot come without the well-orchestrated efforts of the entire organisation. This coordinated effort is at the very heart of management's mission and the leaders need to hold people accountable for its effective implementation.

BUSINESS STRATEGIES INCORPORATING SUSTAINABLE DEVELOPMENT PRINCIPLES: TOWARD AN APPLICATION OF A FUNCTIONAL ECONOMY

Călin Gurău and Céline Pascual-Espuny
Montpellier Business School, France
Ashok Ranchhod
Southampton Solent University, UK

ABSTRACT

In the last century, the exploitation of natural resources for human benefits has increased its pace and has become more aggressive. Today, humanity is on the brink of an ecological crisis that endangers even the existence of life on this planet. As a response to this ecologic crisis, the paradigm of functional economy was recently introduced and developed in order to propose effective solutions for the sustainable development of the society and the economy. Considering the importance of integrating the sustainable development in the present economic, social and market system, this paper attempts to investigate what are the strategic approaches adopted by the British SMEs regarding sustainable development values and principles. The study adopts an exploratory approach, using only a convenience sample of firms that are specialised in production activities.

INTRODUCTION

For thousands of years, humans have exploited the resources of the environment, processing raw materials, consuming food, water and air, and then discharging the residues back into the environment. However, not only humans, but all living organisms are engaged in this cyclical process. The residues are used and recycled by the environment, something serving as food for other species, or being decomposed into their basic elements by natural forces. The planet, as a whole, represents a complex system which is capable to regenerate itself, keeping a dynamic balance among various elements.

However, in the last century, the exploitation of natural resources for human benefits has increased its pace and has become more aggressive. This trend was determined, on the one hand, by the rapid growth of world population, and on the other hand, by the increased standard of living, based on high levels of diversified consumption. Today, humanity is on the brink of an ecological crisis that endangers even the existence of life on this planet. This ecological crisis is determined by the quick depletion of the natural resources, as a result of human consumption and activity. In the present conditions of resource exploitation the ecological system of the plant does not have the necessary time to process and recycle the resulting residues. As a response to this ecologic crisis, the paradigm of functional economy was recently introduced and developed in order to propose effective solutions for the sustainable development of the society and the economy.

Despite the practical and theoretical importance of functional economy there are yet no paper investigating the managers' level of awareness regarding the principles of sustainable development in relation to the strategic orientation adopted by the firm in this direction. After a short discussion of the main principles and strategies of functional economy, the article presents the research methodology applied to collect secondary and primary data.

The analysis of the main results is realised in direct connection with the formulated research objectives. The article ends with the main limitations of this study, and with propositions for future research.

THE FUNCTIONAL ECONOMY

Sustainable development has been defined in many ways, but the most frequently quoted definition is from *Our Common Future*, also known as the Brundtland Report (1987: 43):

"Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. It contains within it two key concepts:

- the concept of **needs**, in particular the essential needs of the world's poor, to which overriding priority should be given; and
- the idea of **limitations** imposed by the state of technology and social organization on the environment's ability to meet present and future needs."

The visionary work of Stahel has introduced the concept of functional economy. Stahel (1997: 91) defines functional economy as 'one that optimizes the use (or function) of goods and services and thus the management of existing wealth (goods, knowledge, and nature). The economic objective of the functional economy is to create the highest possible use value for the longest possible time while consuming as few material resources and energy as possible. This functional economy is therefore considerably more sustainable, or dematerialized, than the present economy, which is focused on production as its principal means to create wealth and material flow'. Stahel (1997) identifies the main problems of the present ecological crisis, translating them in business and economic concepts: resource-use policies and oversupply. On the other hand, the existing solutions applied to reduce pollution and waste, such as recycling, are not capable to reduce the accelerated flow of resources, preserving the existing logic of the industrial system. The solutions envisaged by Stahel (1997) represent a paradigm change in terms of production and consumption (see Table 1). The implementation of a sustainable economy is based on reducing the use of natural resources, by increasing the product-life cycle and eliminating the forced obsolescence of products. From this perspective, changing the source of economic value depends upon enhancing product life through several key design strategies that should develop the following product qualities and features:

- durable and difficult to damage;
- modular;
- multi-functional;
- sub-components are standardized, self-repairing and easy to repair;
- easy to repair or upgrade;
- components can be reused in new systems;
- units or systems can be easily reconditioned and re-manufactured.

Table 1: Resource Efficiency and Business Strategies in the Service Economy (Stahel, 1997)

| | Implementation of Strategies | |
|--|---|---|
| | Closing Material Loops (technical strategies) | Closing Liability Loops (commercial/marketing strategies) |
| Resource Efficiency Strategies | | |
| Reduce the volume of the resource flow | Ecoproducts •dematerialized goods •multifunctional goods | Ecomarketing •shared utilization of goods •selling utilization instead |
| Reduce the speed of the source flow | Remanufacturing •long-life goods •product-life goods •cascading, cannibalizing | Remarketing •de-curement services •away-grading of goods and components •new products from waste |
| Reduce the volume and speed of the resource flow | System solutions •Krauss-Maffei plane transport system | Systemic solutions •lighthouses •selling results instead of goods •selling services instead of goods |

Another viable solution is the implementation of a service-based economy, in which the companies must re-focus their corporate mission on providing benefits and services rather than manufacturing goods. As a company moves from maximizing sales of material products to the delivery of customer satisfaction, its long-term source of competitive advantage will become the ability to provide services. Revenues could come from leasing long-life equipment, maintenance and service, upgrading and updating of systems, replacement of parts and supplies, or service provider training and licensing.

The feasibility of this new economic model is proved by a series of firms that have already implemented a service orientation. For example, Xerox's asset management program is focused on selling photocopying services instead of photocopies. Asset recycling is now part of a new business process that includes an asset-recycling management organization. Xerox is decoupling manufacturing volume from turnover and profits, regionalizing activities, and changing skill pools and employee responsibilities accordingly (Stahel, 1997: 96).

New business approaches in the context of a functional economy

The development of the functional economy requires a change of paradigm, and a transformation of the existing business models. This transformation should be based on an extended set of values that should guide both organisational activities and consumer behaviour (Jones, 2009). If until now the main goals to be achieved by business organisations were effectiveness (getting things done), and efficiency (getting things done with the lower possible costs), now, the sustainability dimension should also be added to this value system (getting things done with the lower possible costs, while preserving the long-term sustainability of the economic, social and natural environment).

On the other hand, the values determining consumer behaviour, which until now included mainly satisfaction (satisfying needs and wants) and convenience (satisfying needs and wants with the low possible costs), should be complemented by sustainability (satisfying needs and wants with the low possible costs, while preserving the long-term sustainability of the economic, social and natural environment). Finally, the main exchange process between consumers and organisations should be re-structured taking into account not only the transactional and the utility value of goods and services, but also the sustainability value.

Figure 1. The new system of values of the production-exchange-consumption system

These two aspects of the economic activity are interdependent and complementary, and both should be transformed and mutually adjusted by introducing at the core of the production- exchange-consumption system the sustainability imperative (see Figure 1).

This study attempts to define a series of business approaches that correspond to the principles of the functional economy and to verify their existence in a number of companies. The methodological approach is exploratory, the paper trying to identify a possible change of paradigm/perspective in the business orientation of modern

organisation, triggered by the adoption of sustainable development models. However, this study has no pretension of exhaustiveness or generalisation, the companies investigated being selected through a convenience sampling method.

Considering the features of the functional economy proposed by Stahel (1997) it is possible to identify three strategic approaches that can gradually determine the introduction of a sustainability orientation in business organisations:

1. Recycling: the organisation initiates internal programs for recycling waste. According to Stahel (1997), although recycling initiatives demonstrate concern for environment and for sustainable development, it does not represent a radical change of the present market philosophy. In addition, the implementation of effective recycling programs can create the illusion that progress is made for implementing sustainable development principles, when in reality the recycled waste may increase in quantity, fuelling the existing production/consumption system.
2. Increasing the sustainability of organisational/industrial processes: this second orientation requires the implementation of an integrated system which, on one hand increases the overall effectiveness of environmental protection (e.g. through selection of specific raw materials and suppliers, the application of more efficient and less pollutant technological processes, investment in ecologic product development, etc.), and on the other hand adopts recycling procedures for waste. This strategy creates the bases for a virtual circle of sustainable activities that reinforce each other both at the level of the organisation and of the industrial sector (Baumgartner, 2009). The implementation of these activities can determine the development of a new type of economic ecology, in which the application of sustainable development principles will represent an essential condition for survival and development.
3. Increasing the sustainability of consumption processes: in this phase, the organisation attempts not only to introduce sustainable development principles in the organisational and in the industrial environment, but initiates communication campaigns with the main stakeholders in order to modify their system of values and/or their consumption behaviour. This behaviour does not contradict, but rather completes the previous phase in which the firm attempts to actively transform the organisational and industrial environment.

Considering the importance of integrating the sustainable development in the present economic, social and market system (White and Lee, 2009), this paper attempts to investigate what are the strategic approaches adopted by the British SMEs regarding sustainable development values and principles. The study adopts an exploratory approach, using only a sample of firms that are specialised in production activities.

RESEARCH METHODOLOGY

The research objectives of this study are the following:

1. To identify the level of knowledge of the main entrepreneur/manager of the British SMEs regarding the definition and the main principles of sustainable development.
2. To analyse the situation of these firms regarding the adoption of sustainable development strategic orientations.
3. To identify the main real or perceived barriers for the implementation of sustainable development strategic orientations.

In order to investigate these research objectives, both secondary and primary data have been collected and analysed. In the first stage of the research process, a series of books, articles, market reports and statistics have been accessed in order to obtain a general image of sustainable development principles, functional economy models, and the development of specific business strategies that are related with these two new trends. In the second stage, primary data was collected from a sample of 68 UK SMEs, specialised in production activities. The data was collected between May and July 2008, through a series of telephone interviews with the CEOs of these firms. Initially 250 UK SMEs have been randomly selected from the Kompass database, and then contacted through telephone or email, inviting them to participate in this research project. 77 of these firms have answered affirmatively, but later, only the CEOs of 68 enterprises found the necessary time to participate in the telephone structured interview. The data thus collected was coded and introduced into the SPSS software. The level of data analysis is characteristic for exploratory studies, the paper presenting only frequencies, cross-tabulations and a chi square test that verifies the relationship between the CEOs' knowledge of sustainable

development definition and the business strategies implemented within the firm. On the other hand, a series of qualitative comments and information provided by respondents is presented in the paper in order to complement and explain in more detail the strategic approach of these firms in relation to sustainable development trends.

PRESENTATION AND DISCUSSION OF RESULTS

The CEOs level of knowledge is presented in Table 2. In order to evaluate this variable, the CEOs that knew to reproduce the definition and the principles of sustainable development, and to comment on its impact on business activities were considered to have a good level of knowledge; The CEOs that were able to reproduce either the definition or the principles of sustainable development were considered to have a medium level of knowledge, and finally, the CEOs that only knew a few vague notions about sustainable development trends, were classified in the low level of knowledge category. However, it is important to note that all the investigated CEOs had some knowledge about sustainable development, although this situation could be determined by the fact that only the CEOs familiar with or interested by sustainable development issues have declared their availability to participate in this study.

As it can be seen from Table 1 a large percentage of respondents CEOs have a low knowledge of sustainable development (45.6%), about a third of them have a medium level of knowledge (35.3%) and only about 20% of the CEOs had a good or a very good level of knowledge and interest regarding sustainable development – only one in five respondents could reproduce both the definition and the principles of sustainable development.

Table 2. The level of CEOs' knowledge regarding sustainable development

| Level of CEOs' knowledge | Frequency | Percentage |
|---------------------------|-----------|------------|
| Good level of knowledge | 13 | 19.1 |
| Medium level of knowledge | 24 | 35.3 |
| Low level of knowledge | 31 | 45.6 |
| Total | 68 | 100 |

Although the size of the sample and the research methodology applied do not permit the generalisation of findings, these results are far from encouraging. This situation indicates a possible need for training sessions, workshops, conferences on the topic of sustainable development and on its impact on future business activities organised either by the government or by professional associations, in order to increase the level of knowledge of managers about these issues, and provide a forum for development and exchange of new ideas.

Table 3: Cross-tabulation between the CEOs' level of knowledge about sustainable development and the range of strategies applied

| Level of CEOs' knowledge / Strategy applied | Good level | | Medium level | | Low level | | Total | |
|---|------------|------------|--------------|------------|-----------|------------|-----------|------------|
| | N | % | N | % | N | % | N | % |
| No strategy | 2 | 15.4 | 8 | 33.3 | 13 | 41.9 | 23 | 33.8 |
| Recycling | 4 | 30.8 | 10 | 41.7 | 18 | 58.1 | 32 | 47.1 |
| Transformation of organisational procedures | 7 | 53.8 | 6 | 25 | 0 | 0 | 13 | 19.1 |
| Transformation of marketing communication | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Total | 13 | 100 | 24 | 100 | 31 | 100 | 68 | 100 |

Chi square = 18.153 p = 0.001

The data displayed in Table 3 shows that there is a statistically significant relationship between the CEOs level of knowledge about sustainable development and the range/type of sustainable strategies implemented in their organisations, to a level of $p = 0.001$. It is not very encouraging that 33.8% of respondents did not implement any sustainable development strategy in their firms, although they were aware of these issues. This raises also the questions if an increase in the level of knowledge of the general population, and of business managers is enough to initiate positive action regarding sustainable development activities. The results of this study

obviously suggest that this is not the case. It is therefore important that the educational activities are also complemented by a change in the personal and social systems of values, which can determine an increase of individual and group responsibility regarding sustainable development issues.

A large percentage of respondents (47.1%) have already implemented in their organisation some form of recycling activity, sometimes determined by state legislation or initiatives. Finally, 13 respondents (19.1% of the selected sample) indicated that they apply more complex sustainable development strategies, working together with their suppliers to reduce the amount of waste and /or pollution, or to develop more ecological products. Unfortunately, none of the interviewed CEOs declared that they initiated also activities directed toward market and consumer behaviour transformation. In most cases, they considered that this type of activities might be too risky, and that it should not be the responsibility of firms to change and educate public opinion, but rather the role of the state. They feared that these activities can be misinterpreted by the target consumer segment, and irreversibly damage the image, reputation and competitive advantage of the business organisation. In addition, some CEOs declared that although there are many public declarations that support sustainable development activities, they feel that in many cases this is a superficial change, and that consumers continue to take the same purchase decisions based on routine, personal satisfaction, or price level.

Table 4: Problems experienced with the implementation of sustainable development strategies

| Problems experienced | Frequency | Percentage |
|--|------------------|-------------------|
| Lack of knowledge - top management team | 31 | 45.6 |
| Lack of knowledge - employees | 45 | 66.2 |
| Lack of knowledge – strategic group | 26 | 38.2 |
| Costs | 53 | 77.9 |
| Lack of clear benefits | 17 | 25 |
| Lack of market demand | 24 | 35.3 |
| Lack of government support | 37 | 54.4 |
| Lack of formal frameworks/best practices | 44 | 64.7 |
| Total | 68 | 100 |

A very important category of results are the problems indicated by the respondent CEOs in the implementation of sustainable development strategies (see Table 4). These answers synthesise both the problems really encountered, as well as the problems perceived by some CEOs that have not implemented any sustainable development strategy, maybe exactly because of this perception.

The problem indicated by most CEOs was the cost of initiating, developing and implementing sustainable development strategies. It is interesting to investigate further what are the strategic areas that determine these costs. In fact some of the other problems indicated by respondents can provide an insight about these barriers. The lack of knowledge of the employees about sustainable development can represent one of these – some CEOs feel that the training of employees to change their frame of mind can be quite expensive and it should be taken in charge by the state. A similar problem is related with the lack of formal frameworks or best practices about the sustainable development strategies adapted to SMEs – CEOs fear that being a pioneer in this area brings very few benefits, but potentially high costs.

More government support is required by 54.4% of respondents, while 45.6% recognise that their own level of knowledge and expertise is very limited regarding sustainable development issues. 38.2% of the CEOs perceive that the actors involved in their strategic group (partner organisations, competitors, governmental agencies) also lack the knowledge about these issue, and 35.3% consider that the market demand for sustainable products or services is not yet mature or stable, making this organisational transition very risky.

CONCLUDING REMARKS

The application of sustainable development principles in modern business strategies becomes slowly but surely an essential issue not only for the competitiveness of business organisations, but also for the survival of the

planet. Unfortunately, this study shows that there are relatively few companies that have already introduced a clear sustainable development orientation in their business strategy.

This paper has a number of limitations determined by its geographical scope and by its methodological approach. The data collected were only superficially analysed, and a series of other independent variables that might influence the adoption of sustainable development strategies have not been considered, such as firm size, firm age, or industrial sector. On the other hand, the low number of respondent firms makes the generalisation of results difficult, even for the UK population of SMEs. Similar research projects should be developed in other countries, in order to validate the research methodology developed in this study, and to compare the obtained findings.

PROFITABILITY AND M&As: AN ANALYSIS OF THE ISTANBUL STOCK EXCHANGE DATA

Yıldız Guzey, Kadir Has University, Turkey
Ozlem Tasseven, Okan University, Turkey

ABSTRACT

The objective of this study is to determine the financial indicators of the mergers and acquisition (M&A) that took place in İstanbul Stock Exchange (ISE) between 2002-2004. We also analyze the financial consequences (profitability) of these companies after an M&A re explained determine the financial factors affecting the profit levels of merging companies is important to evaluate the performance of companies. Our findings indicate that there are different financial indicators that are effective on the profit and for explaining the profitability of merging companies. Overall, for all companies which performed merger and acquisitions current assets are found to be significantly and commonly affecting the profitability of companies.

INTRODUCTION

In an M&A, whether a merger or an acquisition, two or more corporations decide to put their resources under one management. In an acquisition, one of the parties plays a dominant role. After combining the resources, while the weak parties disappear as an entity, this dominant company is the only one that continues to exist. In a merger, after the decision to put resources together, both parties continue exist as legal and economic entity.

Ultimately, the primary reason behind every M&A is the long-term profits for both parties of the transaction. Whether it is a merger or an acquisition both parties believe that they will be better off as a result of this transaction. In this study, we try to establish some of the significant determinants of these expectations by looking at the available M&A data from the Istanbul Stock Exchange for the period of 2002-2005. Our statistical analysis is based on panel regression analysis where dependent variable is net profits and independent variables are net sales, operational cost, equity, current assets, short-term debt, long-term debt and financial expenses.

There are numerous theoretical explanations why we have so many M&As. We are going to mention some of the most notable findings in this field. Goldberg (1983) determined that the expected increase in the value of shares, benefits of economies of scale are some of the primary reasons for an M&A. Pfeffer and Salancik (1978) have found out that only the vertical and horizontal mergers created a consistent explanation of M&As. The same study has also found the "Concentration" in the sector as an important determinant. Conn (1976) has determined that pre-merger firms in the sector have entered a growth period of 5 years prior to an M&A. Below is a list of research confirming findings of Pfeffer and Salancik:

- ❖ Gort (1962), Mueller (1969), Reid (1968), Meeks (1977), Mandelker (1974) and Lev and Mandelker (1972); have determined that an M&A no impact on profits and the increase in market share was insignificant.
- ❖ Firth (1969), (1976, 1980), Meeks (1977), Utton (1974), Kelley (1967), Utton (1974), Dodd and Ruback (1977) have also found that while shareholders of the surviving companies lost, the shareholders of captured firms tend to gain from an M&A.
- ❖ Dewing (1921), Firth (1975), Meeks (1977), Utton (1974), Kelley (1967) have found that earnings of merging companies have decreased after a merger.
- ❖ Dewing (1921), Firth (1976), Livermore (1935), Reid (1962) have found out that prior to a merger expected benefits of merger was exaggerated, Kelley (1967) has found that the profit stays the same.

- ❖ Comparing captured companies with those that are not captured, an increase of profit can not be seen. Moreover a decrease was determined: Reid (1962), profit is equal: Kelley (1967), Firty, it is profitable (1979).
- ❖ Hogarty (1970) found that share prices of merging companies did not show a significant difference when they are compared to non-merging companies

The rest of this paper is organized as follows. It begins with a brief review of the literature followed by the data source and methodology. Then the empirical results are presented. This is followed by the conclusion in the final section and future directions are discussed.

THEORETICAL FRAMEWORK

Financial Structure and Profitability

In the research, Ismail and Eldomiaty (2004), made on businesses making transaction in the Cairo Stock Exchange, have brought together various ratios being used in the model they have established with the Bayesian method, have researched the most appropriate variable being effective on the financial structure of profitability, and have expressed the tax exceptions, market risk, bankruptcy risk and growth rate the business owns are effective on the determination of the financial structure.

Durukan (1997), in ISE his research covering the years 1990-1995, has also defended that profitability is one of the most important factors affecting the financial structure of businesses. Lööf (2003) has examined different and similar aspects of factors affecting the financial structure of businesses operating in different economic systems and sizes in Sweden, the USA and England. He has put forward that, even if they are in different economic systems that there are common factors being effective in determining the financial structure of enterprises, and he has argued that these common variables of the sector are size, capital supply and taxation. As Profitability does influence the capital structure and internal resources of enterprises they have a critical role on the financial structure and in terms of businesses and investors is an indicator with strategic importance. Many studies being made on the relationship between financial structure and profitability according to the results and the direction of the obtained relation they are divided into two groups as negative and positive.

Negative Relationship Between Financial Structure and Profit

Demirguc - Kunt and Maksimovic (1995) in ISE, who examined the impacts on profitability, liquidity, capitalization, inflation, growth rates and different financial rates with the help of a multiple regression model, have claimed that in terms of large-scale companies there is a negative relationship between short-and long-term leverage ratio.

Megginson, (1997), Myers (2001) and Kester (1986), are researchers who claim that there is a negative relationship between profitability and the financial leverage showing the debt-way of businesses. Demirhan (2007), in ISE, in his research covering the years 2003 - 2006, has claimed that there is a negative relationship between profitability and liquidity and fixed assets. Chen and Zhao (2004), have tried to put the relationship of profitability and financial structure of manufacturing enterprises in the U.S.A in the period 1971-2001 by saying that "profitable business do prefer internal resources instead of external sources for financing new investments" and have said that "The negative relationship between profitability and leverage ratios cannot be explained with the dynamic theory" (Chen and Zhau, 2004). As the result of the investigation Huang and M. Song (2006) on the capital structure and profitability of 1200 enterprises in China in the 1994-2003 period, they have demonstrated that there is a negative relationship between the two variables (Huang and Song, 2006). Bevan and Danbolt (2002) have revealed that there is a negative relationship between the financial leverage ratios and profitability ratio supporting the financial hierarchy's theory.

Positive Relationship between Financial Structure and Profitability

When Uzunlar (1998) expresses that there is a relationship between the active profitability and capital structure according to the market value of assets (on equity, sales and profit per share) he is specifying that the relationship between the capital structures is not clear and saying that there is a strong relationship between profitability and capital structure.

Toy et all. (1974) have found out that there is a positive relationship between debt ratio and profitability. Abor (2005), has identified that there is a positive relationship between the ratio of short-term debt to total assets and profitability on equity (FVÖK / shareholders' equity), a negative relationship between the ratio of long-term debt to total assets and profitability equity and that there is a positive relationship between the ratio of total debt to total assets and profitability equity. Sueyoshi, claims that shareholders' equity profitability is an important financial factor in terms of financial problems and bankruptcy (Sueyoshi, 2005). While Chen and Zhau do explain that profitable firms are firms with high market value and book value, they point out that profitable firms have more growth potential (Chen and Zhau, 2004).

DATA SOURCE & METHODOLOGY

In this paper financial data belonging to merger and acquisitions performed by Turkish companies registered at ISE between 2002 and 2004 in Turkey is used. Data set covers the company performance before and after mergers and acquisitions by Turkish companies effecting transactions in ISE. In order to do this, three years before merger (1999-2000-2001) and the year 2002 merger and acquisition is performed and next three years (2003-2004-2005) financial values taken from ISE's balance sheet and income sheet. The analysis is made by using annual balance sheet and income tables of 45 companies between 1999 and 2007, which performed merger and acquisitions in 2002, 2003 and 2004. The following variables are used in the analysis. NP shows net profits, NS denotes net sales, OP denotes operational cost, EQ denotes equity, CA shows current assets, SD denotes short-term debt, LB denotes long-term debt, FE shows financial expenses.

The statistical models combining both the cross-section data, that record at a point in time the way an economic variable differs across different individuals and groups, and the time series data, as a sequence of measurements of a variable at different points in time, have become highly popular in the recent empirical papers of researchers and policy makers. A standard model of panel data set can be specified as follows;

$$y_{it} = x_{it}b_{it} + e_{it} \quad (1)$$

where $i = 1, 2, \dots, N$ refers to a cross-section unit and $t = 1, 2, \dots, T$ refers to time period. y_{it} and x_{it} are the dependent variable and the vector of non-stochastic explanatory variables for individual i at time t , respectively. b_{it} are unknown coefficients that are assumed to vary with respect to individuals and time, and e_{it} is the error term. For our analysis we estimate a model of panel data set given as follows:

$$M_{it} = X_{it}\beta_{it} + \varepsilon_{it} \quad (2)$$

where $i = 1, 2, \dots, N$ refers to a cross-section unit which are companies and $t = 1, 2, \dots, T$ refers to time period. In equation (2) M denotes profitability of the companies which performed the merger and acquisitions and trade on the stock exchange in Turkey, Istanbul Stock Exchange (ISE) in 2002 and X_{ij} is the j^{th} financial variable taken from annual balance sheet and income tables of firm i . We compute the conventional random and fixed effects models from the specification below (Asteriou and Hall, 2007):

$$y_{it} = \beta'x_{it} + \alpha_i + v_{it} \quad (3)$$

where $\alpha_i = z_i'\alpha$ for the fixed-effects model, and $\alpha_i = \alpha + \mu_i$, for the random-effects model. Hausman and Taylor (1981) specification test has been used to make a choice between the fixed effects and random effects models so that whether or not the regressors have been correlated with individual effects has been tried to be investigated. Kim and Maddala (1992) propose a random effect model of the form:

$$y_{it} = \beta'x_{it} + \varepsilon_{it} \quad (4)$$

where $\varepsilon_{it} = v_{it} + \omega_{it}$ with, v_{it} and ω_{it} independent normal, $\text{var}(v_{it}) = \sigma_v^2$ $\text{var}(\omega_{it}) = \theta_i^2$. That is, errors are assumed to be heteroskedastic, with firm- and time-specific components, but uncorrelated. Under the usual specification of the random-effects model, errors are homoskedastic and equi-correlated. That is,

$$\varepsilon_{it} = v_i + \omega_{it}, \text{ and } E(\varepsilon_{it}\varepsilon_{js}) = \sigma_v^2 + \theta^2 \text{ for } i=j, t=s, \quad (5)$$

$$E(\varepsilon_{it}\varepsilon_{js}) = \sigma_v^2 \text{ for } i=j, t \neq s, \text{ and } E(\varepsilon_{it}\varepsilon_{js}) = 0 \text{ otherwise.} \quad (6)$$

Given a panel data model where fixed effects would be appropriate the Hausman test investigates whether random effects estimation could be almost as good. The fixed effects model is estimated using a dummy variable for each firm. Fixed effects specification preserves the time series variation in net profit, but ignores most of the cross sectional differences among firms.

EMPIRICAL ANALYSIS

In this section the several panel regression explaining the profitability of the firms which performed the merger and acquisitions in 2002, 2003 and 2004 registered at ISE in Turkey. All regressions are undertaken using Eviews 6 program.

PROFITABILITY ANALYSIS OF COMPANIES WHICH PERFORMED M&AS IN 2002

The pooled ordinary least squares (OLS) results of estimating the profitability of the companies which performed the merger and acquisitions in 2002, using the explanatory variables such as net profits (NP), net sales (NS), operational cost (IE), equity (EQ), current assets (CA), short debt (SD), long debt (LD) and financial expenses (FE) are shown in Table 1 in the appendix. The period of the data set is between 1999 and 2005. For analyzing the profitability of the companies, we found that the Hausman test gives more support to fixed than to random effects model, since p -value of chi-square test statistics with 7 degrees of freedom is found to be 27.92. The null hypothesis of random effects model is rejected by our data set and fixed effect model is preferred. The Hausman specification test implies the non-existence of a significant correlation between individual specific effects and explanatory variables.

The cross sections have been estimated according to the fixed effects specification and related diagnostics are given in Table 1 in the appendix. We must specify that we have also estimated the random effects model and found that estimation results are highly similar to those from the fixed effects model. The goodness-of-fit statistics which are R square, sum of squared errors, durbin watson statistics for autocorrelation are reported in Table 1. R-square indicates that financial variables explain 91 % of the variation in the profitability of the firms. Sum of squared errors is found to be quite low. Durbin Watson statistics is 2.01 indicating no autocorrelation in our model. Equation (7) reports our estimation results for profitability of companies that merged in 2002.

$$NP = -1251419 + 0.019NS - 0.05IE - 0.09EQ + 0.15CA - 0.07SD + 0.048LD - 0.04FE \quad (7)$$

Considering the t -statistics, net sales, equity, current assets and short debt variables are found to be statistically significant at 5 % significance level. These determinants attempt to capture the effects of firm's environment on its profitability. We found insignificant results for operational cost, long-term debt and financial expenses. When looking at the estimation results from Equation (7), the coefficients of net sales, current assets and debt variables carry the expected signs. We found insignificant results for operational cost, long-term debt and financial expenses. Considering the significant variables, we found that net sales and current assets have positive influence on the dependent variable, whereas equity and short-term debt negatively affect firm's profits. We observe that the determinants included in our model affect the profitability of companies differently. According to model 1 current assets and equity have strong influences on profitability for the companies which performed the merger and acquisitions in 2002.

Profitability Analysis of Companies which Performed M&As in 2003

The pooled ordinary least squares (OLS) results of estimating the profitability of the companies which performed the merger and acquisitions in 2003, using the financial explanatory variables are shown in Table 2 in the appendix. Our data set covers the period between 2000 and 2006. For analyzing the profitability of the companies, we found that the Hausman test gives more support to fixed than to random effects model, since p -value of chi-square test statistics with 7 degrees of freedom is found to be 15.87. The panel regressions estimated according to the fixed effects specification and related diagnostics are given in Table 2 in the appendix. When we look at the goodness-of-fit statistics R-square indicates that financial variables explain 64 % of the variation in the profitability of the companies. Sum of squared errors is found to be quite low. Durbin Watson statistics is found to be around 2. Equation (8) reports our estimation results for profitability of companies that performed M&As in 2003.

$$NP = 4088181 + 0.04NS - 0.12IE - 0.02EQ + 0.16CA - 0.29SD - 0.103LD + 0.05CE \quad (8)$$

We found that net sales, operational cost, current assets, short-term and long-term debt variables are found to be statistically significant. We obtained insignificant results for equity, operational cost and financial expenses. Considering the significant variables, we found that net sales and current assets have positive influence on the dependent variable, whereas short-term and long-term debt affect firm's profits negatively. According to model 2 short-term debt and current assets have strong influences on profitability for the companies which performed the merger and acquisitions in 2003.

Profitability Analysis of Companies which Performed M&As in 2004

The estimation results of the profitability of the companies which performed the merger and acquisitions in 2004, using the financial explanatory variables are given in Table 3 in the appendix. Our data set covers the period between 2001 and 2007. For analyzing the profitability of the companies, we found that the Hausman test gives more support to fixed than to random effects model, since p -value of chi-square test statistics with 7 degrees of freedom is found to be 20.61. The null hypothesis of random effects model is rejected by our data set and fixed effects model is preferred. Looking at the goodness-of-fit statistics R-square indicates that financial variables explain 96 % of the variation in the profitability of the companies. Estimation results for profitability of companies that performed M&As in 2004 are given below:

$$NP = 457552.7 + 0.03NS + 0.04IE + 0.16CA - 0.107SD - 0.34LD - 0.16FE \quad (9)$$

We found that net sales, operational cost, current assets, short-term and long-term debt variables are found to be statistically significant. We obtained insignificant results for equity, financial expenses. Considering the significant variables, we found that net sales and current assets have positive influence on the dependent variable, whereas short-term and long-term debt affect firm's profits negatively. According to model 3 long-term debt and current assets have strong influences on profitability for the companies which performed the merger and acquisitions in 2004.

CONCLUSION

In this paper, we empirically examined the impact of key factors such as net profits, net sales, operational cost, equity, current assets, short-term debt, long-term debt and financial expenses on the profitability of companies which merged in 2002, 2003 and 2004. For the companies which performed the merger and acquisitions in 2002, the empirical analysis showed that net sales and current assets have positive influence on profitability of companies, whereas equity and short-term debt negatively affect firm's profits. We obtained that current assets and equity have strong influences on profitability for the companies for these companies.

For the companies that performed the merger and acquisitions in 2003, we found that net sales and current assets have positive influence on profitability of companies, whereas short-term and long-term debt affect firm's profits negatively. We conclude that short-term debt and current assets have strong influences on profitability for the companies which performed the merger and acquisitions in 2003. For the companies which

performed the merger and acquisitions in 2004, net sales and current assets are found to have positive influence on the dependent variable, whereas short-term and long-term debt affect firm's profits negatively. Long-term debt and current assets have strong influences on profitability for the companies for these companies. Overall, for all companies which performed merger and acquisitions current assets are found to be significantly and commonly affecting the profitability of companies.

Merger activity is full of contradictions; factors are of a wide variety. For future research it is necessary to use different determinants and statistical methods to find the answer for the discrepancies between the results with the initial objectives.

APPENDIX

GLOBALIZATION AND SOCIAL CAPITAL: AN EXPLORATORY INVESTIGATION

Gerald M. Hampton
New Mexico State University, USA

ABSTRACT

This paper is an exploratory investigation of the relationship between social capital and attitudes towards globalization. The study surveys a small sample of individuals who perceive themselves well positioned to compete in an increasing global environment. Four factors of globalization and two aspects of social capital were explored. The findings show that attitudes towards globalization and trust aspects of social capital are positively and significantly related.

INTRODUCTION

With increasing globalization there is a need to explore relationships between globalization and selected social and cultural aspects of nations. There are numerous works exploring the domestic consequences of globalization. Yet, there are few studies of globalization's impact on domestic social structures. Rodrik (1997) argues globalization can lead to national social disintegration. "The process that has come to be called globalization is exposing a deep fault line between groups who have the skills and mobility to flourish in global markets and those who either don't have these advantages or perceive the expansion of unregulated markets as inimical to social stability and deeply held norms," says Rodrik (1997). In essence, he argues globalization creates tensions between groups who have the skills and mobility to flourish in a global market environment and those who do not. This is similar to Mandel's (1999) contention that there are vast differences in wage growth between the New Economy and the Old Economy. If you are fortunate to work in the New Economy, it is globally focused, you have seen wage growth average 11 percent since 1994. If, on the other hand, you work in the Old Economy that is domestically focused, wages have declined by 4.5 percent. Consequently, globalization is raising pressure on workers and governments to respond to the impacts perceived to be the result of globalization.

To explore this problem, the concept of social capital is selected as the surrogate for the country's social structure. Fukuyama (2002) argues that social capital is vital to the efficient functioning of a nation's economy, is the fundamental basis of a stable liberal democracy, and constitutes the cultural component of societies. Therefore, it is an appropriate concept to explore the impact of globalization. While there is debate on the definition of social capital, one leading scholar, Putnam (2007), defines social capital as "social networks and the associated norms of reciprocity and trustworthiness." In an effort to understand the impact of globalization on social capital, this paper analyses the relationship between three social capital aspects of trust, three network forms, and mass attitudes toward globalization. A broad definition of globalization is accepted here and is kin to the views of Held, McGrew, Goldblatt and Perraton (1999). They view globalization as processes that transform social relations and transactions through transcontinental flows and networks of activity. Such a broad definition implies different types of processes, such as political, economic, social, and cultural factors of globalization and the transformational nature of these processes.

These globalization factors and their interactions with different types of transactions matter because they have the ability to change how people perceive themselves and their interests. In other words, globalization impacts and changes social capital, and in turn, social capital impacts and changes people's attitudes toward globalization. For example, Rodrik (1997) contends one can not expect to find broad support for international trade when it involves transactions that clash with and erode domestic arrangements. Then again, Trigilia (2001)

argues that social capital (trust, networks and cooperation) is a strategic resource that improves the global competitiveness of a community and assists in its positive integration into the global market. Because there are several components to both social capital and globalization, this study explores how the components are associated with each other.

This paper begins with a brief discussion of the major dimensions of social capital and globalization. Then it presents the results of a survey to measure social capital and attitudes towards globalization. Finally, the study reports the results of a correlation analysis to explore the relationship between social capital and global attitudes.

DIMENSIONS OF SOCIAL CAPITAL

The literature of social capital that investigates issues in various disciplines and different subject areas are vast and expanding. One of the difficult issues in the application of social capital is to identify a suitable definition for it. Adler and Kwon (2002) have identified twenty different definitions of social capital. A number of key researchers in this area see social capital associated with trust (social cohesion) and social networks (Coleman, 1988; Fukuyama, 2002; and Putnam, 2007). A common theme across applications of social capital research is a focus on social relations and the productive benefits that arrive from it. The benefits from social capital formation range from high levels of economic growth; more efficient functioning of labor markets; low levels of crime; and improvement in the effectiveness of government operations (Knack and Keefer, 1997; Putnam, 2000). The definition used in the paper is kin to Putnam's (2007) where he sees social capital as "social networks and the associated norms of reciprocity and trustworthiness." Therefore, for this paper, trust and networks are the key indicators of social capital.

Dasgupta (2002) says, "Trust as a key ingredient in transactions is not controversial." In a transaction trusting that the other party will honor their side of the exchange or trade is essential not only for that particular trade, but to economic activities in general. Trust between international trading partners is necessary if trade and investments are to take place. In O'Rourke and Sinnott's (2001) study of nationalism's impact on attitudes towards protectionism, they found that trust is an important determinant of attitudes toward globalization. If Rodrik (1997) is correct that globalization leads to social disintegration, then globalization should have a negative impact on trust leading to a growing unease with globalization. Hence, there should be a negative relationship between trust and globalization. But if people see trust leading to increased economic efficiency, such as lowering transaction costs, leading to global economic growth, there is likely a favorable view of globalization, and a positive relationship between trust and globalization.

Trust is often measured as generalized or specific. Generalized trust means the ability to trust people outside of one's own family and social groupings. Generalized trust in this study is measured using one statement: "In general I feel I can trust people" on a five point Likert scale ranging from one - "trust them," to five - "distrust them." Specific trust is the tendency to trust those within closed groups. Measure of two dimensions of specific trust includes social trust (people in your neighborhood, at work, stores where you shop, and people in local media,) and racial trust (trust of whites, blacks, Asians, and Hispanics). A five point Likert scale is used where one equals "trust them" to five equals "distrust them." Means for specific trust and racial trust are calculated as means of the means for each statement in the dimensions of specific and racial trust (see Appendix A). Measurements of social capital are developed following measures from the Social Capital Community Benchmark Survey (2000).

In addition to trust, Putnam (2000) emphasizes networks as a source of social capital. They are commonly represented by membership in associations or clubs. Networks are places for development of trust. Networks are efficient for information gathering, sharing, and creating social value. Networks, when viewed as a social resource, can assist a local community to adjust and prepare for a place in the new global economy (Trigilia). They do so by being the foundation for cooperation and community problem solving (Pollitt). However, not all networks are always constructive for the community. If networks become exclusive, members tend not to trust those outside the network. Such networks are slow to adapt to modernism, such as activities found in globalization (Pollitt). An exclusive network may develop into a special interest group lobbying against free-trade and other aspects of globalization. The most beneficial networks are those that have weak ties because they are non-exclusive and are open to adaptation and change from the economic impacts of globalization (Granovetter). Therefore, this study expects to find both positive and negative associations between different types of networks and aspects of globalization.

There are three measures of networks adapted from the Social Capital Community Benchmark Survey (2000): 1) civic participation, 2) formal group involvement, and 3) diversity of friendship. Diversity of friendship consists of asking respondents to respond yes or no to the question, “do you have a personal friend who” owns a business, is a manual worker, is on welfare, has a vacation home, is of a different religion, is white, is Hispanic, is Asian, is Black, is gay, or is a community leader. The mean for diversity of friendship ranges from 0 to 11 for respondents. Civic participation is measured by asking respondents to check yes or no to the question “have you done this” in the past 12 months: signed a petition, worked on a community project, participated in any demonstration, donated blood, and voted. The mean for civic participation ranges from 0 to 6 for respondents. Finally, formal group involvement was measured by asking respondents “have you been involved in any of the following groups in the past 12 months:” There are sixteen different groups that included a sports club, youth organization like the boy scouts, a neighborhood association and so on. The mean for formal group involvement can range from 0 to 16 for respondents.

DIMENSIONS OF GLOBALIZATION

Like social capital, globalization has several dimensions or factors including political, economic, cultural, and immigrants/labor. The section in the survey measuring attitudes toward globalization is adapted from past studies (Program on International Policy Attitudes, 2000; General Social Surveys, 2007; and National Opinion Research Center, 2008). The political factors refer to nations being willing to transfer certain political interest to a supra or global-state level. The survey contains ten statements pertaining to political aspects of globalization, such as “we should hesitate in establishing a world government.” Economic factors of globalization refer to markets that cross national boundaries and the impacts such global markets have on domestic consumers. The survey has eleven statements pertaining to economic aspects of globalization, such as “foreign investments are necessary and positive.” Cultural aspects of globalization refer to things like attitudes, values, and norms that can penetrate state boundaries advocating change that states might want to hinder or promote. The survey contains eleven cultural statements, such as “globalization does not threaten our identity.” The final factor of globalization measured in this study is called immigration/labor. The survey contains five statements: “immigrants do not increase crime,” “immigrants are good for America’s economy,” “immigrants take jobs away from Americans,” “immigrants make America more open,” and “the number of immigrants should be reduced.”

FINDINGS

The data presented is from a sample of 167 students in a College of Business at a University in the Southwest United States. This is data from the first wave of surveys. Based on focus group sessions, these respondents perceive their education positions them to compete in the new global business environment. One statement in the survey asked students, “As the world becomes more globalized, I see great opportunities for me personally.” Using a seven point Likert type scale where 1 = strongly agree and 7 = strongly disagree, eighty percent agreed with the statement, lending support to the idea that these business students see themselves well positioned for the global economy.

Social Capital

The means of the three dimensions of trust and networks are presented in Appendix A. Beginning with general trust, respondents exhibit high to medium levels of trust (mean = 2.34). Respondents also possess a high to medium level of social trust, especially exhibiting a high level of trust in people they work with (mean of 2.00) and the local community police (mean of 2.22). There is a high level of racial trust exhibited by respondents (grand mean of 2.45). Overall, respondents possess a moderately high level of trust in community institutions and people of different races. Examining networks in Appendix A, an average of 34.6% of the sample participated in some form of civic activity. For the formal group involvement network, the average is 17.8 percent. This low level of involvement is not surprising since eighty percent of the students work part-time, limiting the opportunities for participation. The diversity of friendship network shows respondents have a broad range of different friends. On average 73.3 percent have friends and contacts across the friendship classifications investigated.

Globalization

The 37 statements in the survey designed to measure attitudes toward globalization are subjected to a factor analysis. An unconstrained factor analysis using varimax rotation, estimated by maximum likelihood, results in four factors with items loadings of .45 or greater explaining 47 percent of the variance. The factor results contain those originally designed to be investigated, however, eighteen items did not load highly on any factor. These items were eliminated and the factor analysis repeated. The second solution produced the four factors under investigation: economic, cultural, political, and labor/immigrant factors. The results are shown in Appendix B. The reliability coefficients of all scales meets the recommended standard of .70 suggested by Nunnally (1978). The Alpha coefficients are: economic factor = .82, cultural factor = .76, political factor = .71 and labor/immigrant factor = .78.

The mean attitudes of globalization factors and items are displayed in Appendix B. The factor mean for economic aspects is 3.54. Overall, sample respondents hold favorable attitudes toward the economic impacts of globalization. Sample respondents are unsure if globalization can increase jobs in the US. Also, there is uncertainty regarding how prepared Americans are for globalization. However, respondents' attitudes toward impacts of globalization on culture are favorable (culture factor mean of 3.42). Attitudes toward the impact of globalization on politics are another matter. A political mean of 3.49 indicate respondents support that America's interest should come first. They exhibit support for policies benefiting America that national governments should put its own interest first, and nations should hesitate in establishing a world government. Yet respondents feel Americans should be educated to be global oriented. Finally the labor/immigrant factor has a mean of 3.74. Respondents hold a somewhat favorable view toward immigrants, in the sense that they feel immigrants do not increase crime and that immigrants do not take jobs away from Americans.

Relationship between Social Capital and Globalization Attitudes

With the variables briefly defined and discussed, a correlation analysis addresses what types of relationships exist between each variable. Table 1 shows the bivariate relationships between each of the social capital dimensions and attitudes toward the four factors of globalization.

Table 1 Correlations between Social Capital and Globalization Attitudes (Pearson's r)

| Social Capital Dimensions | Globalization Economic Factor | Globalization Cultural Factor | Globalization Labor/Immigrants Factor | Globalization Political Factor |
|---------------------------|-------------------------------|-------------------------------|---------------------------------------|--------------------------------|
| General Trust | .30*** | .25*** | .18* | -.12 |
| Social Trust | .26*** | .27*** | .15* | -.01 |
| Racial Trust | .37*** | .33*** | .24* | -.07 |
| Civic Participation | .06 | -.12 | -.08 | -.10 |
| Formal Groups Involvement | -.005 | -.04 | -.02 | -.005 |
| Diversity Friendship | -.09 | -.10 | .03 | -.01 |

Significant at the *.05, **.01 and ***0.001

Explored first is whether there exists a positive or negative, and a strong or weak relationship between social capital and globalization. As can be seen in Table 1, out of the twenty four correlations or relationships, only nine are statistically significant. The number of significant relationships is limited. The significant associations are restricted to three factors of globalization (economic, cultural, and labor/immigrants) and one aspect of social capital, trust. The correlations between the three trust dimensions and the three globalization factors range from a low of .15 to a high of .37. Thus, the relationship is a modest one, suggesting that scholars should be careful not to over play the influence of social capital on globalization. However, the relationships are positive indicating that the higher the level of trust in the nation the more support one finds for globalization in terms of attitudes toward its economic, cultural, and labor/immigrant factors.

Secondly, the question of why is there no significant relationship between networks and attitudes toward globalization needs to be addressed. The data from the sample in this study shows little or no association

(see Table 1). However, Putman (2000) believes that networks are places where trust is developed. Pollitt (2002) supports this view when he says, “that networks do not have to have an economic purpose for them to have economic value” because of their ability to build trust among members. In addition, respondents because of their low participation in civic activities and formal group involvement, exhibit what Granovetter (1983) calls “weak ties.” Consequently, avoided are the negative externalities of exclusion which often promote intolerance and distrust. The respondents high level of friendship diversity (73.3% - see Appendix A) suggests that they have a relatively wide radius of trust. A wide radius of trust is enhanced by higher levels of trust, making individuals more acceptable to economic modernization activities like globalization (Fukuyama, 2002).

Finally, Table 1 shows there are no significant associations between globalization’s political factor and any of the variables investigated. Trigilia (2001) has argued that social capital is growing in importance to the “territorial” dimensions of development. He suggests that since globalization is here to stay, social capital grows in importance by creating the opportunities and possibilities for local communities to affect the development of their region. If so, individuals probably perceive they are the ones who must adapt to globalization, not the political actors. Also if individuals perceive attempts by political actors to hinder development of globalization benefiting them, it is likely they will view such efforts in a negative way.

CONCLUSION

This study shows that attitudes towards globalization are positive toward the dimensions of economic, political, cultural and labor/immigration factors. The respondents in this study show a high level of social capital, especially in terms of the three aspects of trust: general trust, social trust, and racial trust. However, they exhibit lower levels of networking in civic participation and formal group involvements. In contrast, the respondents exhibit a high level of diversity in terms of friendship.

The findings support the contention that social capital is associated with attitudes towards globalization, specifically with social capital’s trust dimensions and the globalization factors of economic, cultural, and labor/immigrants. These associations are positive, but modest, varying between .18 and .37. The positive and modest correlations are considered good news for the proponents of globalization. The findings support that an increase in trust, and its positive association with the economic, political, and labor/immigrant factors, is one sign of growing support for globalization. This mirrors Bhagwati’s (2004) contention that trade is a friend to all and not the enemy of social structures. He believes that it is the elites who are most affected by globalization, and they are the ones likely to react against social change it brings.

Finally, networks are not associated with attitudes toward globalization. If this finding is supported in larger samples, then this should be good news to proponents of globalization. The networks examined here do not exhibit characteristics that create anti-social norms and distrust. However, keep in mind, there are low levels of networking in this sample.

Note that this study explores only bivariate correlations between the measures for social capital and globalization. Therefore, no causal relationships can be made. The sample is individuals who perceive themselves well positioned to compete in the globalized environment. They demonstrate high levels in diversity of friendship which enhances trust. Future studies need to explore models that will allow us the opportunity to robustly explore the positive and negative consequences of globalization.

APPENDICES

Appendix A – Social Capital Dimensions

| <u>Trust</u> | <u>Mean</u> |
|---|-------------|
| 1. General Trust: In general, I feel I can trust people. | 2.34 |
| 2. Social Trust: [Alpha = .75] | |
| Trust people in my neighborhood. | 2.37 |
| Trust people I work with. | 2.00 |
| Trust people in stores where I shop. | 2.57 |
| Trust people in the local news media. | 2.93 |
| Trust police in my local community. | <u>2.22</u> |
| Grand Mean or Mean of Means | 2.42 |
| 3. Racial Trust [Alpha = .85] | |
| Trust white people in general. | 2.36 |

| | |
|-----------------------------|-------------|
| Trust African Americans. | 2.53 |
| Trust Asian people. | 2.40 |
| Trust Hispanics. | <u>2.53</u> |
| Grand Mean or Mean of Means | 2.45 |

Networks

1. Civic Participation [done in the past 12 months]

| | |
|---|--|
| Signed a petition. | .25 [41 or 25% did out of 167] |
| Attended a political meeting. | .29 [48 or 29% did out of 167] |
| Worked on a community project. | .52 [87 or 52% did out of 167] |
| Participated in a demonstration, boycott, or march. | .07 [12 or 7% did out of 167] |
| Donated blood. | .22 [36 or 22% did out of 167] |
| Voted in the past elections. | <u>.73 [122 or 73% did out of 167]</u> |
| Grand Mean or Mean of Means | .35 [an average of 34.6% did this] |

2. Formal Group Involvement [involved in the past 12 months]

| | |
|---|--|
| Adult sports club. | .33 [56 or 34% involved out of 167] |
| Youth organization like the boy scouts. | .10 [17 or 10% involved out of 167] |
| A parents' association like the PTA. | .04 [14 or 8% involved out of 167] |
| A veteran's group. | .04 [7 or 4% involved out of 167] |
| A neighborhood association. | .10 [16 or 10% involved out of 167] |
| A charity or social welfare organization. | .34 [56 or 34% involved out of 167] |
| A professional, farm, or business association. | .25 [41 or 25% involved out of 167] |
| Service club or fraternal organization. | .25 [42 or 25% involved out of 167] |
| Ethnic or civil rights organization. | .05 [9 or 5% involved out of 167] |
| Public interest group, political party or action group. | .23 [39 or 3% involved out of 167] |
| Hobby, investment, or society club. | .35 [59 or 35% involved out of 167] |
| Any group that meets only on the Internet. | .20 [34 or 20% involved out of 167] |
| Clubs or organizations for senior citizens. | .06 [10 or 6% involved out of 167] |
| A literary, art, or musical, dancing or singing group. | .34 [56 or 34% involved out of 167] |
| A self help group. | .10 [16 or 10% involved out of 167] |
| A labor union. | <u>.02 [4 or 2% involved out of 167]</u> |
| Grand Mean or Mean of Means | .18 an average of 18.8% involved] |

3. Diversity of Friendship [do you have a friend who is?]

| | |
|-------------------------------------|------------------------------------|
| Owens own business. | .71 [119 or 71% who say yes] |
| Is a manual worker. | .76 [127 or 76% who say yes] |
| Has been on welfare. | .57 [96 or 58% who say yes] |
| Owens a vacation home. | .59 [98 or 59% who say yes] |
| A different religious orientation. | .93 [155 or 93% who say yes] |
| Is white. | .95 [159 or 95% who say yes] |
| Is Latino or Hispanic. | .95 [160 or 96% who say yes] |
| Is Asian. | .69 [105 or 63% who say yes] |
| Is black or African American. | .74 [123 or 74% who say yes] |
| Is Gay or Lesbian. | .71 [118 or 71% who say yes] |
| You describe as a community leader. | <u>.50 [84 or 50% who say yes]</u> |
| Grand Mean or Mean of Means | .74 [an average of 73.3% say yes] |

*Trust items rated as 1=trust them; 2=trust them some; 3=not sure; 4=distrust them some. 5=distrust them.

Appendix B– Globalization Factors

| <u>Economic Factors [Alpha = .82]</u> | Mean | Loadings |
|---------------------------------------|------|----------|
| Globalization is good for the US | 3.15 | .57 |

| | | |
|---|-------------|------------|
| The overall impact on me will be positive. | 3.28 | .50 |
| I see more opportunities for me personally. | 2.93 | .61 |
| Globalization will increase job in the US. | 4.13 | .53 |
| Globalization is good for the US consumer. | 3.10 | .62 |
| Foreign investments are necessary and positive. | 3.63 | .62 |
| Americans are prepared for globalization. | 4.40 | .54 |
| Globalization is highly positive for the US. | <u>3.44</u> | <u>.75</u> |
| Grand Mean or Mean of Means | 3.54 | |
| Cultural Factors [Alpha = .76] | | |
| American culture will be maintained with globalization. | 3.73 | .46 |
| Globalization does not threaten America's way of life. | 3.46 | .80 |
| I welcome the notion of cultural globalization. | 3.20 | .58 |
| Globalization does not threaten our identity. | 3.59 | .62 |
| It is possible others to become fully American. | <u>3.13</u> | <u>.51</u> |
| Grand Mean or Mean of Means | 3.42 | |
| Political Factors [Alpha = .71] | | |
| US citizens should support policies benefiting America. | 3.29 | .70 |
| National governments should put their interest first. | 3.44 | .71 |
| US students should be educated to be global minded. | 3.36 | .57 |
| We should hesitate in establishing a world government. | <u>3.50</u> | <u>.56</u> |
| Grand Mean or Mean of Means | 3.49 | |
| Labor/Immigrant Factor [Alpha = .78] | | |
| Immigrants do not increase crime. | 3.63 | .80 |
| Immigrants don't take jobs away from Americans. | <u>3.84</u> | <u>.71</u> |
| Grand Mean or Mean of Means | 3.74 | |

*Globalization statements rated as 1=strongly agree; 2=agree; 3=somewhat agree; 4=not sure; 5=somewhat disagree; and 7=strongly disagree.

MOTIVATIONS AND EXPECTATIONS AMONG OFF-ROAD 4x4 DRIVERS IN SOUTH AFRICA

CH Van Heerden and JJ Prinsloo
Tshwane University of Technology, South Africa

ABSTRACT

Few studies address motivations and expectations when examining consumers' behaviour in the context of adventure tourism activities. Hardly any research has been done on self-drive off-road experiences. This study investigates the differences between motivations and expectations of experienced and inexperienced drivers of SUV's (sport utility vehicles) and all terrain vehicles. An intercept survey was conducted at two off-road events in South Africa. Experienced drivers scored significantly higher on items relating to adventure, the thrill of the experience and the challenge of off-road driving. No significant differences were established in the motivations and perceptions of drivers of SUV's and all terrain vehicles. The results of the survey should assist marketers in formulating more effective advertising messages when targeting these different groups. This study may provide insight not only to the domain of off-road driving but also to adventure tourism in general.

INTRODUCTION

Few studies have been conducted on motivations and expectations in the context of adventure tourism in South Africa. This has been a growing industry in the country as more tourists have visited our country since the democratic elections in 1994. An opportunity exists to market South Africa as a destination where international tourists may do self-drive tours on off-road tracks and routes. This study provides insight into the cognitive processes through which local off-road experiences go when embarking on such an adventure seeking trip. An understanding of local driver's experiences serves as a base from which international tourists' motivations and expectations may be studied. A study on motivations and expectations has been done by Fluker and Turner (2000) on participants of white-water rafting in Australia. Through in-depth interviews and self-completion of questionnaires the authors shed light on the needs, motivations and expectations of such adventure seekers by dividing participants into groups labelled "inexperienced" and "experienced".

Studies of the measurement of expectations and motivations in the general field of tourism are also cited and applied to the study (Khan, 2003, Ryan & Glendon, 1998). Whilst many generic studies hold valuable information on outdoor recreational sport, literature on off-road self-drive experiences are limited. The aims of this study are to establish whether:

- There are any differences in the motivations and expectations between experienced and inexperienced drivers during a self-drive off-road experience.
- There are differences in the motivations and expectations between drivers of Sports Utility Vehicles (SUV's) and all terrain vehicles.

The latter has been added as there may be similarities in the first two groups and this will be valuable as marketers may find sales pitches to attract a huge dormant market, that is, those consumers that never leave the safety of tarred road. The study consists of a detailed discussion of motivations and expectations and previous research done in the field of tourism and sport. First conceptual definitions are provided, followed by an exposition of the constructs, motivation and perception. Ways in which to measure these constructs will be discussed and a breakdown of the hypotheses will be presented. The research design and data collection methods are explained. The study concludes with a discussion of the limitations, managerial implications and recommendations for future research.

Adventure tourism in the context of off-road driving

The Oxford School Dictionary (1994:8) defines an adventure as an exiting or dangerous experience and is often affiliated with the willingness to take risks. McArthur (1989:3) argues that an adventure requires three elements; freedom of choice, intrinsic rewards and uncertainty. Embarking on an off-road trip or adventure is obviously a personal choice. One undertakes these forms of adventure to fulfil certain needs. The sensation or adrenalin seeking of tourists are also seen as motivational factors to engage in dangerous sports such as driving down a gorge. This behaviour is described by Zuckerman (1990:313) as the willingness to take physical and social risk for the sake of obtaining complex sensations.

The driving of off-road vehicles is usually associated with the completion of challenging and risky landscapes. In their study of white-water rafting, Fluker and Turner (2000:380) define an adventure holiday as one that contains personal challenge, through controlled risk, daring and exciting, often in inaccessible environments. Hence, it can be inferred that off-road driving can be categorised as adventure tourism. The connotation of off-road originates from the fact that a vehicle has four wheels and that the power of the vehicle is distributed through all four wheels. To engage in off-road activities does not necessarily mean that one has to have a off-road vehicle. It all depends on the level of difficulty involved whereby hazardous terrains would require all terrain vehicles. Such vehicles have features such as higher ground clearance and suspension, differential-lock and high performance engines. More experienced drivers normally purchase these parts and accessories to attain a peak experience. According to Fluker and Turner (2000:381) these peak experiences are attained through correctly perceiving the risk involved in the activity as well as one's own personal competence.

Motivation

Why do people choose to do off-road driving? By attempting to find answers to these questions one firstly need to define needs within the context of purchase decisions, as the concepts needs and motivations are interrelated. Du Plessis & Rousseau (2007:170) define physiological needs as any physical or emotional body performance and are forces directed toward specific goals that can be achieved by purchase behaviour. These needs become wants when they are directed to specific products or services that might satisfy those needs. Du Plessis, Jooste and Strydom (2001:405) define motivation as the willingness to exert high levels of effort towards a certain goal to satisfy an individual's specific need. A person's inner-state (unobservable force) that energize, activate, motivate and direct behaviour towards taking an adventure holiday can be seen as the specific motive behind such actions (Du Plessis & Rousseau, 2007:217). A driver may want to belong to a off-road club to meet new friends (affiliation) or to participate in events to win, which is normally associated with achievement and esteem needs as described by Maslow's hierarchy of needs model.

Measuring motivations

Limited studies on motivation in tourism contexts have been done. Ryan and Glendon (1998:175) applied the shortened version of the Leisure Motivation Scale to a sample of 1127 British holiday makers. It asked respondents to indicate the importance of listed motivations. Todd (1999:1023) examined tourism motivations, by requiring respondents to write about positive and negative holiday experiences.

The first level of need that will be applicable can be defined as the need to belong, have friends and receive affection from them. The second level of needs which will be applicable is egoistic (esteem) needs which are an individual's psychological requirements of maintaining favourable images or impressions. This need is related to prestige, success, status and self – esteem. Other authors like Gouws (2001:77) also quoted Maslow in his studies of sport motivations. He stated that the appreciation of performance is an important aspect in sport. The highest level of need satisfaction applicable to this study is self – actualisation which can be defined as psychological requirements involving personal ambitions. Allyn and Bacon (1994:97-99) believe that generalized models such as Maslow's hierarchy cannot be applied to all motivational factors. They argue that in-depth interviews will be more accurate in determining the actual needs and motivations of consumers. They also state however, that such focus groups may be too small to apply to bigger populations and other products/services.

Expectations

Fluker and Turner (2000:381) state that an expectation is the perceived likelihood that a particular act will be followed by a particular outcome. Expectations are desires or wants of people, which represent what they feel, should be offered by a service provider (Parasuraman, Zeithalm & Berry, 1988:12–37). Fluker and Turner (2000:382) further state that to draw comparisons between expectations and the ultimate performance of the service, participants must have a perception of the service which can be defined as the process through which one select, organise and interpret information gathered by the senses. Closely related to the concept of perception is satisfaction which depends on the ability of an organisation to implicitly deliver on those expectations through a service delivery process in order to fulfil customer needs. This will be discussed later in the disconfirmation of expectations model. The author/s should briefly explain the gap model (disconfirmation paradigm here as the entire expectations process is located within the disconfirmation paradigm including the SERVQUAL instrument which has emerged from the Gap model as espoused by Parasuraman et al in 1995; 1998 and reformulated in 1994) Expectations are also adaptive and influenced by past experiences. Schreyer and Roggenbuch (1978:377) have come to the following conclusions with regard to expectancy research in recreation:

- People have a variety of expectations for participating in recreational activities.
- The expectations of different activities are not the same.
- People engaged in the same activity may seek different outcomes.
- Different types of recreationists using the same environment sometimes seek different outcomes.
- Demographics, socio-economic and environmental variables have seldom, by themselves, been useful in explaining and predicting peoples' motivations.

MODELS OF EXPECTATIONS

Disconfirmation of expectations model

Spreng and Dröge (2001:263) presented the disconfirmation of expectations model which propose that disconfirmation primarily determines a consumer's level of satisfaction with attributes, products or services. This refers to the extent which performance meets, exceeds or fall short of expectations. Confirmation results when predictive expectations matched with high performance or low expectations matched with low performance. Conversely, disconfirmation results when expectations and performance do not match due to low expectations and high performance (positive disconfirmation leading to satisfaction) or high expectations and low performance (negative disconfirmation leading to dissatisfaction). Fluker and Turner (2000:382) also argue that the disconfirmation model is responsible for determining a level of satisfaction with the service.

Servqual

This reliable measuring instrument developed by Parasuraman *et al.* (1988) measures five dimensions: Reliability, Assurance, Responsiveness, Tangibles and Empathy through a pair of 22 items, one for expectations and one for perceptions. Knutson and Beck (2003:31) have developed a model for the experience construct by using the SERVQUAL method to develop the Pre – Experience stage of their model. Pre-Experience is defined as anything and everything involved prior to the actual participation in the experience itself and encompasses expectations which are established by brand position, promotional activities of the organisation, word of mouth advertising and personal memories that have been “banked” from previous experiences. The other two stages are Participation and Post-Experience respectively. They argue that the expectations that the consumer has about the product or service will have an effect on value, level of engagement, emotional bond, degree of participation and amount of stimulation of an experience. Following is a representation of the Pre-Experience stage of Knutson and Beck's (2003:31) proposed experience model.

Figure 1: Pre – Experience stage

Source: Knutson and Beck

Promotional messages influence expectations of venues through adjectives like “adventurous and breathtaking”. Such messages graze the covers of magazines such as Getaway and South African 4x4. The brand image of a service results from the dialogue that takes place between the brand owner and the consumers or users (Pavitt, 2000:21). The current associations with a off-road experience also influence expectations as shown in the figure. Word-of-Mouth is when other customers or consumers of a service either favourably promotes or negatively “bad-mouths” a particular product or a service.

Measuring expectations

Many researchers including Khan (2003:115) in her study of ecotourists’ quality expectations use the SERVQUAL method to evaluate service expectations. This measure used a Likert-scale approach ranging from 1-7 consisting of six main categories measuring expectations. They were Ecotangibles, Assurance, Reliability, Responsiveness, Empathy and Tangibles. In Fluker and Turner’s (2000) study of white-water rafting, participants were asked to state their expectations before and after the trip. A six – point Likert – type scale was used as respondents had to indicate their level of agreement with a set of statements. (This same method was used to measure their motivations). The Likert scale is one of the best methods to use when measuring abstract constructs like expectations and motivations. These constructs normally consist of many underlying parts and need to be broken down into smaller parts to get the true feelings of respondents. Fluker and Turners’ (2000) study will be used to guide this study.

METHODS

Sampling

The target population for this study was off-road 4x4 drivers ranging from very inexperienced to very experienced, of all ages that use luxurious SUV-type vehicles or more specialised off-road “all-terrain” vehicles. A convenience sampling method of 200 respondents were used, collecting data at two different off-road events to give a broader perspective of different groups of drivers. The realised sample size was 193 respondents of which all were usable as fieldworkers were on hand to guide respondents through any uncertainty. The first survey was done at the Bosveld Rally in an area called Atlanta between Britz and Thabazimbi in the North-West Province of South Africa. The second survey was done in the Gauteng Province at Rust de Winter’s annual rally hosted by the All Terrain Vehicle club (ATV) of Pretoria. Respondents were approached while they were queuing to complete obstacles. This ensured willingness to participate as these drivers had nothing to do while waiting to compete in the events.

Data Collection

The questions used in this study were adapted from Fluker and Turner (2000:383). The scale was pre-tested using a convenience sample of 10 respondents who have previously taken part in off-road recreational activities. The researchers attempted to find as many experienced drivers as possible, as this assisted them in the refinement process of the scale. In the pre-test the participants were alerted that they are involved in a preliminary test of the questionnaire which made them collaborators of the refinement process. Data was collected by conducting a survey through using a self-completion questionnaire.

Measures

Demographic variables

The questionnaire comprised three multiple-choice single response scales which measured the number of times the respondent have driven an off-road vehicle in the last five years, experience of drivers and type of vehicle used.

Motivations and expectations

The questionnaire made use of a five point Likert scale adapted from Fluker and Turner (2000:383), to measure two constructs. The first 14 items measured the construct of motivators when undertaking a off-road endeavour and items 15-33 measured the construct of expectations when undertaking a off-road endeavour. The scale’s 33

items were all labelled from 1 (“Strongly disagree”) to 5 (“Strongly agree”). No scale items were reverse scored and the responses were averaged to give a score ranging from 1-5. Cronbach’s alpha coefficient was computed to assess internal reliability of the two constructs separately. The motivations and expectations dimensions reflected reliability values of 0.81 and 0.82 respectively. The reliability levels were found to be acceptable as they were above benchmark level of 0.70 (Nunnally: 1978). Since the two constructs measure different underlying motivators and expectations and not a specific motivation or expectation each item was tested separately during the testing of hypotheses.

ANALYSIS OF RESULTS

Descriptive Statistics

Table 1 provides a profile of the respondents in terms of their level of experience and the type of vehicle used for off-road driving and frequency counts for the type of vehicles respondents use. The results indicate that 9.3% of all respondent were at their first rally experience. However, 25.9% of respondents indicated that they have driven between one and three times before and 68.8% indicated that they have driven more than four times in the last five years. The first two groups namely, “Not once” and “1-3 Times” were combined in this study to form the inexperienced group while the respondents in the “4 or more” group formed the experienced group. The results further indicated that 48.2% of the respondents use SUV-type vehicles and 51.8% of respondents use all terrain vehicles. These results are shown in table 2 below.

Table 1: Frequency counts for the number of times respondents have driven on/off road terrain

| Number of times driven | n | % | Type of vehicle | n | % |
|------------------------|-----|------|---------------------|-----|-------|
| Not once | 18 | 9.3 | SUV’s | 93 | 48.2 |
| 1-3 Times | 50 | 25.9 | All terrain vehicle | 100 | 51.8 |
| 4 or more times | 125 | 64.8 | | | |
| Total | 193 | 100 | Total | 193 | 100.0 |

Cross tabulation of vehicle type and experience status

Table 3 shows a cross tabulation of vehicle type and experience status. The results reflect that 41.2% of inexperienced drivers indicated that they use SUV’s while 58.8% of experienced drivers indicated that they use all terrain vehicles. The table also indicates a slightly higher percentage (52%) of experienced drivers that indicated that they drive SUV’s. This may be due to the fact that experienced drivers trust themselves more with an expensive vehicle such as an SUV’s than inexperienced drivers.

Table 2: Cross tabulation of vehicle type and experience status (N=193)

| | | Type of vehicle | | Total |
|-------------------------|----------------|-----------------|---------------------|--------|
| | | SUV | All terrain vehicle | |
| Inexperienced (0-3) | Count | 28 | 40 | 68 |
| | Row percentage | 41.2% | 58.8% | 100.0% |
| Experienced (4 or more) | Count | 65 | 60 | 125 |
| | Row percentage | 52.0% | 48.0% | 100.0% |
| Total | Count | 93 | 100 | 193 |
| | Row percentage | 48.2% | 51.8% | 100.0% |

Hypothesis Tests

The hypotheses was tested at a 5% level of significance ($\alpha = 0.05$). The assumption of normality was assessed through the Kolmogorof-Smirnof test for normality, as well as through a visual inspection of histograms and normal probability plots. These tests indicated that the sample was not normally distributed for any of the

hypotheses tests and therefore the independent samples t-test could not be used. The non-parametric alternative namely the Mann-Whitney *U* test had to be used as it does not require the data to be normally distributed.

Hypothesis 1

The first hypothesis (H_1) focussed on differences in motivations between experienced and inexperienced off-road drivers. The null and alternative hypotheses of H_1 are stated below:

H_0 : There is no significant difference in motivations between inexperienced and experienced off-road drivers.

H_1 : Inexperienced off-road drivers have motivations that are significantly different from those of experienced off-road drivers.

The descriptive statistics in table 4 below shows that the null hypothesis could be rejected for items 1, 4, 5, 7, 8, 9 and 10. These are indicated with a (*). The mean ranks range from 1 (“Strongly disagree”) to 5 (“Strongly agree”).

Table 3: MANN-WHITNEY U TEST OF HYPOTHESIS 1

| Item | Mean rank of inexperienced | Mean rank of experienced | Mann-Whitney U | Wilcoxon W | Z | P (two-tailed) |
|--------------------------------------|----------------------------|--------------------------|----------------|------------|--------|----------------|
| 1. Escape daily routine | 4.00 | 4.29 | 3437.5 | 5783.5 | -2.370 | 0.018* |
| 2. To tell my friends about it | 3.50 | 3.74 | 3714 | 6060 | -1.510 | 0.131 |
| 3. To do something different | 4.32 | 4.35 | 3919 | 6265 | -0.993 | 0.321 |
| 4. To challenge myself | 3.84 | 4.26 | 3192 | 5538.5 | -3.060 | 0.002* |
| 5. To have fun | 4.65 | 4.82 | 3708 | 6054 | -2.116 | 0.034* |
| 6. For rest and recuperation | 3.90 | 4.14 | 3583 | 5929.5 | -1.955 | 0.051 |
| 7. To have an adventure experience | 4.43 | 4.62 | 3446.5 | 5792.5 | -2.531 | 0.011* |
| 8. To experience a thrill | 4.16 | 4.35 | 3537.5 | 5883.5 | -2.104 | 0.035* |
| 9. Because I enjoy off-road driving | 4.16 | 4.70 | 2443 | 4789 | -5.631 | 0.000* |
| 10. Close to the natural environment | 4.32 | 4.54 | 3488 | 5834 | -2.349 | 0.019* |
| 11. To experience danger | 3.25 | 3.14 | 4136 | 12011.5 | -0.313 | 0.754 |
| 12. Enjoy group experience | 4.15 | 4.20 | 4086.5 | 6432.5 | -0.479 | 0.632 |
| 13. The whole family can enjoy it | 4.15 | 4.28 | 4011 | 6357 | -0.704 | 0.482 |
| 14. It seemed adventurous | 4.09 | 4.05 | 3961 | 6307 | -0.832 | .406 |

The most significant motivation to participate in off-road driving for both inexperienced and experienced drivers was to have fun. The results suggested that inexperienced drivers did not participate to challenge themselves as much as experienced drivers and that experienced drivers enjoyed the sport significantly more than inexperienced drivers. This may be directly related to the level of experience of these drivers and that an experienced driver is motivated to improve one’s skills every time one participates. The findings suggest that marketers can formulate messages describing the challenge and adventure to experienced drivers. It can also be inferred that the reason for inexperienced drivers to score lower on the items with significant differences is that they are not as skilled or informed as experienced drivers. The lowest scores were recorded for item 11 as it seems that both groups had a neutral feeling towards wanting to experience danger.

Hypothesis 2

The second hypothesis (H_2) focussed on differences in expectations between experienced and inexperienced off-road drivers. The null and alternative hypotheses of H_2 are stated below:

H_0 : There is no significant difference in expectations between inexperienced and experienced off-road drivers.

H_2 : Inexperienced off-road drivers have expectations that are significantly different than those of experienced off-road drivers.

Table 5 below shows that the null hypothesis could be rejected for items 17, 18 and 20. These are indicated with a (*). The mean ranks range from 1 (“Strongly disagree”) to 5 (“Strongly agree”).

Table 4. MANN-WHITNEY U TEST OF HYPOTHESIS 2

| Item | Mean rank of inexperienced | Mean rank of experienced | Mann-Whitney U | Wilcoxon W | Z | P (two-tailed) |
|---|----------------------------|--------------------------|----------------|------------|--------|----------------|
| 15. I will get stuck | 3.47 | 3.29 | 3867 | 11742 | -1.069 | 0.285 |
| 16. I will get an adrenalin rush | 4.04 | 4.19 | 3710 | 6056 | -1.558 | 0.119 |
| 17. I will complete difficult obstacles | 4.13 | 4.39 | 3250 | 5596 | -2.970 | 0.003* |
| 18. I will get scared | 3.47 | 2.94 | 3244 | 11119 | -2.782 | 0.005* |
| 19. I will be physically challenged | 3.60 | 3.85 | 3553 | 5899 | -1.962 | 0.050 |
| 20. I will learn new skills | 4.21 | 4.49 | 3393.5 | 5739.5 | -2.571 | 0.010* |
| 21. Interact with other drivers | 4.31 | 4.34 | 3913.5 | 6259.5 | -1.005 | 0.315 |
| 22. Value for money | 3.74 | 3.82 | 3966 | 6312 | -0.801 | 0.423 |
| 23. I will not get injured | 3.85 | 3.90 | 4020 | 6366 | -0.649 | 0.516 |
| 24. Marshals to provide help | 3.97 | 3.90 | 4169.5 | 12044.5 | -0.229 | 0.819 |
| 25. Marshals will be competent | 3.96 | 4.13 | 3748 | 6094 | -1.439 | 0.150 |
| 26. Marshals will be friendly | 4.10 | 4.23 | 3694 | 6040 | -1.620 | 0.105 |
| 27. Facilities will be in good order | 4.24 | 4.15 | 4140 | 12015 | -0.320 | 0.749 |
| 28. Will have a wilderness experience | 4.15 | 4.26 | 3823.5 | 6169.5 | -1.245 | 0.213 |
| 29. I will see wildlife | 3.53 | 3.69 | 3839 | 6185 | -1.148 | 0.251 |
| 30. I will have fun | 4.44 | 4.66 | 3534.5 | 5880.5 | -2.303 | 0.021 |
| 31. I will take risks | 3.87 | 3.69 | 4108.5 | 11983.5 | -.398 | 0.691 |
| 32. I will be informed | 4.10 | 4.26 | 3773 | 6119 | -1.388 | 0.165 |
| 33. Drinks after the event | 3.22 | 3.26 | 4166.5 | 6512.5 | -0.232 | 0.817 |

The results indicate that inexperienced drivers are more prone to being scared than experienced drivers. This may be due to the uncertainty of a new adventure sport and that inexperienced drivers may have doubts about their capabilities. The lowest mean response of all the items tested in the four hypotheses is that of experienced drivers on getting scared and it is the only mean that is below the central point of 3, which is “Neither agree nor disagree”.

Hypothesis 3

The third hypothesis (H₃) focussed on differences in motivations between drivers of SUV's and those of “all terrain vehicles”. The null and alternative hypotheses of H₃ are stated below:

H₀: There is no significant difference in the motivations of drivers of SUV's and those of all terrain vehicles.

H₃: Motivations of drivers of SUV's will significantly differ from those of all terrain vehicles”.

Table 6 below revealed that there are no significant differences in any of the motivations; hence the null hypothesis was not rejected for all of the items.

Table 5. MANN-WHITNEY U TEST OF HYPOTHESIS 3

| Item | Mean rank of SUV | Mean rank of all terrain vehicle | Mann-Whitney U | Wilcoxon W | Z | P (two-tailed) |
|------------------------------------|------------------|----------------------------------|----------------|------------|--------|----------------|
| 1. Escape daily routine | 4.20 | 4.17 | 4363 | 9413 | -0.800 | 0.424 |
| 2. To tell my friends about it | 3.70 | 3.61 | 4309.5 | 9359 | -0.917 | 0.359 |
| 3. To do something different | 4.27 | 4.41 | 4540 | 8911 | -0.315 | 0.752 |
| 4. To challenge myself | 4.06 | 4.16 | 4507.5 | 8878 | -0.394 | 0.693 |
| 5. To have fun | 4.78 | 4.73 | 4267.5 | 9317 | -1.428 | 0.153 |
| 6. For rest and recuperation | 4.04 | 4.06 | 4633.5 | 9683.5 | -0.046 | 0.963 |
| 7. To have an adventure experience | 4.56 | 4.55 | 4452.5 | 9502.5 | -0.595 | 0.552 |
| 8. To experience a thrill | 4.32 | 4.25 | 4371 | 9421 | -0.788 | 0.431 |

| | | | | | | |
|--|------|------|--------|--------|--------|-------|
| 9. Because I enjoy off-road driving | 4.57 | 4.46 | 4187.5 | 9237.5 | -1.378 | 0.168 |
| 10. Closer to the natural environment | 4.47 | 4.45 | 4522 | 9572 | -0.377 | 0.706 |
| 11. To experience danger | 3.10 | 3.26 | 4366.5 | 8737.5 | -0.748 | 0.454 |
| 12. Enjoy group experience | 4.13 | 4.23 | 4318 | 8689 | -0.930 | 0.352 |
| 13. Something the whole family can enjoy | 4.25 | 4.22 | 4446.5 | 9496.5 | -0.573 | 0.567 |
| 14. Seemed adventurous | 4.02 | 4.10 | 4426.5 | 8797.5 | -0.615 | 0.539 |

From the findings it can be deduced that there aren't much different motivations between SUV and all terrain vehicle drivers. Both groups participate in such events in order to have fun and have a neutral feeling towards experiencing danger.

Hypothesis 4

The fourth hypothesis (H_4) focussed on differences in expectations between drivers of SUV's and those of "all terrain vehicles". The null and alternative hypotheses of H_4 are stated below:

H_0 : There is no significant difference in the expectations of drivers of SUV's and those of "all terrain vehicles".

H_4 : Expectations of drivers of SUV's will significantly differ from those of "all terrain vehicles".

In table 7 below the null hypothesis had to be accepted as there were no significant differences in expectations. The last column of the table shows that none of the items had a p-value of less than 0.05.

Table 6: MANN-WHITNEY U TEST OF HYPOTHESIS 4

| Item | Mean rank of SUV | Mean rank of all terrain vehicle | Mann-Whitney U | Wilcoxon W | Z | P (two-tailed) |
|---|------------------|----------------------------------|----------------|------------|--------|----------------|
| 15. I will get stuck | 3.33 | 3.37 | 4626 | 8997 | -0.064 | 0.949 |
| 16. I will get an adrenalin rush | 4.15 | 4.13 | 4565.5 | 9615.5 | -0.233 | 0.816 |
| 17. I will complete difficult obstacles | 4.37 | 4.24 | 4180 | 9230 | -1.334 | 0.182 |
| 18. I will get scared | 3.05 | 3.20 | 4354.5 | 8725.5 | -0.781 | 0.435 |
| 19. I will be physically challenged | 3.77 | 3.75 | 4447.5 | 9497.5 | -0.545 | 0.586 |
| 20. I will learn new skills | 4.42 | 4.36 | 4360.5 | 9410.5 | -0.831 | 0.406 |
| 21. Interact with other drivers | 4.37 | 4.29 | 4293.5 | 9343.5 | -1.018 | 0.309 |
| 22. Value for money | 3.72 | 3.85 | 4347 | 8718 | -0.817 | 0.414 |
| 23. I will not get injured | 3.87 | 3.89 | 4556.5 | 8927.5 | -0.252 | 0.801 |
| 24. Marshals to provide help | 3.84 | 4.01 | 4195.5 | 8566.5 | -1.234 | 0.217 |
| 25. Marshals will be competent | 4.12 | 4.02 | 4295 | 9345 | -0.973 | 0.331 |
| 26. Marshals will be friendly | 4.26 | 4.12 | 4330 | 9380 | -0.891 | 0.373 |
| 27. Facilities will be in good order | 4.18 | 4.18 | 4514 | 9564 | -0.379 | 0.705 |
| 28. Will have a wilderness experience | 4.20 | 4.23 | 4588.5 | 8959.5 | -0.172 | 0.864 |
| 29. I will see wildlife | 3.70 | 3.57 | 4292 | 9342 | -0.956 | 0.339 |
| 30. I will have fun | 4.63 | 4.54 | 4209 | 9259 | -1.357 | 0.175 |

DISCUSSION AND SUMMARY OF FINDINGS

The main objectives of this study were to investigate the differences in motivations and expectations of different groups of drivers within the context of adventure tourism. The respondents were divided into four categories namely inexperienced and experienced drivers and drivers of SUV's and "all terrain vehicles". This study contributes to adventure tourism literature by investigating different market segments of the off-road industry. It

is one of the first studies to research these specific objectives which will help marketers better understand the cognitive processes of adventure seekers in order to segment markets.

In the first two hypotheses there were very little differences between inexperienced and experienced drivers regarding their motivations and expectations. In measuring motivations (hypothesis 1) significant differences existed in 50% of the 14 items. Experienced drivers scored significantly higher on items relating to adventure, the thrill of the experience and the challenge of off-road driving. The reason for inexperienced drivers scoring significantly lower than experienced drivers may be due to their limited knowledge prior to the event. A logical explanation may be that experienced drivers obviously enjoy the sport which results in continued participation in such events.

Expectations between inexperienced and experienced drivers (hypotheses 2) revealed that significant differences exist in expectations to complete difficult obstacles and to learn new skills. The results suggest that experienced drivers score higher on these items which can be due to a higher level of competence and confidence. Supporting this statement is the fact that experienced drivers scored significantly lower on the “I will get scared” item. What is also noteworthy about this statement is that it is the only statement that scored below the neutral point of 3 which is “Neither agree nor disagree”.

Hypotheses 3 and 4 regarding differences in motivations and expectations between SUV and “all terrain vehicle” drivers showed no significance differences. The reason for this may be that the researchers did not classify the vehicle categories appropriately and some confusion may have existed. A better classification may have been to ask respondents to specify what model (year) their vehicle is. This seems logical as owners of older vehicles are more willing to do rugged off-road driving regardless of the vehicle type. Drivers of new “all terrain” vehicles may be less willing to use their vehicles just as SUV drivers may be. Thus, these new categories may reveal significant different motivations and expectations.

MANAGERIAL IMPLICATIONS

With the adventure and tourism industry steadily growing, it is important for marketers to be knowledgeable about customers’ perception of adventure sport. Because of increasing pressure from the South African government to minimise these activities, it is also very important to know what these drivers’ intentions are. With the overall high ratings to most of the statements on the scale, marketers can use these basic statements to formulate marketing and advertising messages to attract and inform potential and existing consumers of such off-road recreational experiences. In addition, due to the insignificant findings regarding the differences of vehicle types, marketers could market their products and services through similar messages which will save advertising costs. The statistical testing however did show some differences between inexperienced and experienced drivers. Adventure, thrill and challenge were some of the motivators that experienced drivers scored higher on. This result confirms that marketers should keep on advertising in adventure magazines like “Out there” or “Getaway” to attract these skilled drivers.

LIMITATIONS

It can be suggested that more qualitative and quantitative research should be undertaken to identify more specific motivations and expectations regarding off-road driving. In depth interviews could have been done to reveal other motivations and expectations. Only two events were used for the research and it can be suggested that more types of events need to be examined to make informed generalisations across the industry. The total sample size was also small and more respondents will give a better indication of true differences between groups. Other provinces may also have different motivations and expectations and thus limits the finding to the Gauteng Province.

RECOMMENDATIONS FOR FUTURE RESEARCH

An important issue of late is the impact that these drivers have on nature. Government officials are considering banning these off-road vehicles totally because of its negative impact on the environment. Such legislation has all ready been passed to prevent drivers from driving on beaches. Future studies can investigate drivers’ position

on nature conservation to reveal if they any negative implications. Various off-road trails of different ratings could also be studied to indicate differences as more skilled drivers often participate for different reasons. There are different types of settings in which the sport can be practiced and each one of these can be studied in the future to shed light on differences between them. One such other activity is a month long trip into Africa with portable equipment. The study could also be applied to different adventure tourism activities such as hiking, sky-diving and scuba diving.

MEASUREMENT OF THE ENTERPRISE LOGISTICS ACROSS QUALITY MANAGEMENT

José G. Hernández
Universidad Metropolitana, Venezuela.
María J. García and Gilberto J. Hernández
Minimax Consultores C. A., Venezuela

ABSTRACT

When speaking about enterprise logistics, special attention is always given to quality, this is why the Logistic Model Based in Positions (LoMoBaP [MoLoBaC, in Spanish]) was created: to explain enterprise logistics through the functions of positions relative to logistics in an organization, one of the first positions to consider was quality management. Because quality management intervenes during the whole logistic process, since the prime matter arrival to the final product delivery, including taking advantage of the products returning through inverse logistic. In this paper it was established as an objective: To show how a diagnostic of the logistic performance of an organization can be done through the functions performed by quality management.

INTRODUCTION

To achieve the objective of this essay: To show how a diagnostic of the logistic performance of an organization can be done through the functions performed by quality management, enterprise logistics subordinated to quality management are analyzed, emphasizing how each can interfere in the different stages of logistics and organization in general.

The used methodology, as has been done in previous researches (Hernández & García, 2006b; 2006c), was the scientific method adapted to Operations Research, which approaches decision making problems without going through formulating hypothesis, instead its steps are:

- a) Defining the problem, as presented in the objectives, it is diagnosing the logistic performance of an organization and the performance of the Enterprise as a whole, through quality management;
- b) Search data, centered in analyzing logistic and quality management;
- c) Establishing alternatives, that would be different models to measure logistic performance, through quality;
- d) Evaluating alternatives, according to the raised objectives, deciding which of the proposed alternatives is feasible;
- e) To select the best alternative, as product of previous evaluation process, and based on the secondary targets, tacit or explicit, being considered;
- f) To implement the alternative, that being a theoretical study consists of defining how would the analysis of the different stages from the logistics be made, knowing the quality subordinate functions subordinated and,
- g) To establish controls, or mechanisms that allows to recognize if the done diagnoses remain valid through time.

It is important to note that no field research had been made, or quality management of any enterprise had been analyzed, instead the possible measures of logistic performance through the quality management

subordinated functions from a theoretical point of view, mainly following an academic model for understanding logistic.

LOGISTICS: FOCUS AND MODELS

Before beginning the study of quality management and since enterprise logistic performance can be measured, through it, it is necessary to define logistic and to comment some approaches and models that can be used to explain it

Although in the literature a fair amount of assertive and complete definition of logistics, being among the principals the one from the council of supply chain management professionals (Cscmp, 2006), for adapting to the objective better, the definition used in previous researches would be used (Hernández y García, 2006b; 2008): Enterprise logistics is centered in searching and achieving a greater satisfaction, present and future of the final costumer, and includes legal aspects, organization planning, execution and control of all related activities related to the attainment, flow, gathering and maintenance of materials, products and services, since the prime matter source, including there the costumers through inverse logistics, to the sale point of the finished product local or international, massive or enterprise, in a more effective and efficient, minimizing the times and costs and using modern information technologies.

In spite of existing many accurate definitions of enterprise logistics, it does not occur the same with its teaching and models for its explanation, finding mostly focuses that permits its understanding. Among the focuses to explain enterprise logistics there are: a) Dornier et al. (1998) focus, centering in the study of logistics from four structural functions: Establishing the web structure and its connections. Choosing the technologies of the operational processes. Choosing the technology of logistics processes and Vertical integration of the supply chain and eight non structural functions: Work forces, Operational plans and controls, Distribution plans and controls, Quality management, Transportation policy, Customer service policy, Organization and Resources; b) The 7 R models (Díaz, Álvarez y González, 2004; Hernández y García, 2006a), which simply answer logistics in seven subjects: Right product, quantity, conditions, place, time, customer and price and c) The general focus of supply chain (SCM) (Hugos, 2003; Stadtler y Kilger, 2005), usually presented as a wider concept, covering logistics and understanding as all the logistic aspects that must be synchronized between the producers of the prime matters, finished products, and distribution mayor and detail, so the costumer would be attended in an adequate satisfying its real needs, the logistic in which SCM is generally centered are: Storage, inventory, localization and transportation, but to make a proper SCM work a high integration of information systems is needed.

On the other hand an amount of qualitative-quantitative models used in the academic medium to study logistics (Hernández y García, 2006a; 2006b; 2008): a) The Logistic of Supply, Production, Distribution and Inverse (LSPDI, [in Spanish, LAPDI]) model, studying organization logistics flow, signaling the materials flow, both direct and inverse, information and control; b) The Logistic Model Based on Positions (LoMoBaP [MoLoBaC, in Spanish]), supported in the previous model and studies logistics through functions relative to the positions; c) The Logistic Model Based on Indicators for Positions (LoMoBaIPo [MoLoBaCa, in Spanish]), measuring relative indicators to the individuals performing different logistic functions activities and d) The Logistic, Strategic, Tactical, Operational with Inverse Logistics Model (STOILMo [MoLETOI in Spanish]), studies logistics following the enterprise evolution through four stages: Strategic, Strategic-Tactic, Tactic-Operational and Operational, each one of them divided in four phases, making a total of sixteen phases.

From these models, for this research MoLoBaC stands out, which can be visualized through an flowchart (figure 1), and although not much would be said about it, it is notorious the presence of forty three positions, grouped in twelve areas, reunited in six stages: a) Supply, with an unique area, Procure; b) Production, conformed by two areas, Maintenance and Inventories; c) Distribution, with four areas, Order processing, Physical distribution, Transportation, and the area that conforms the reason of this model, Costumer service; d) Inverse, formed by one area, Inverse logistic; e) General of the enterprise, with three areas, Intrinsic to logistics, Supported by logistics and Supporting logistics and f) Information (General of Information), formed by one unique area, Information.

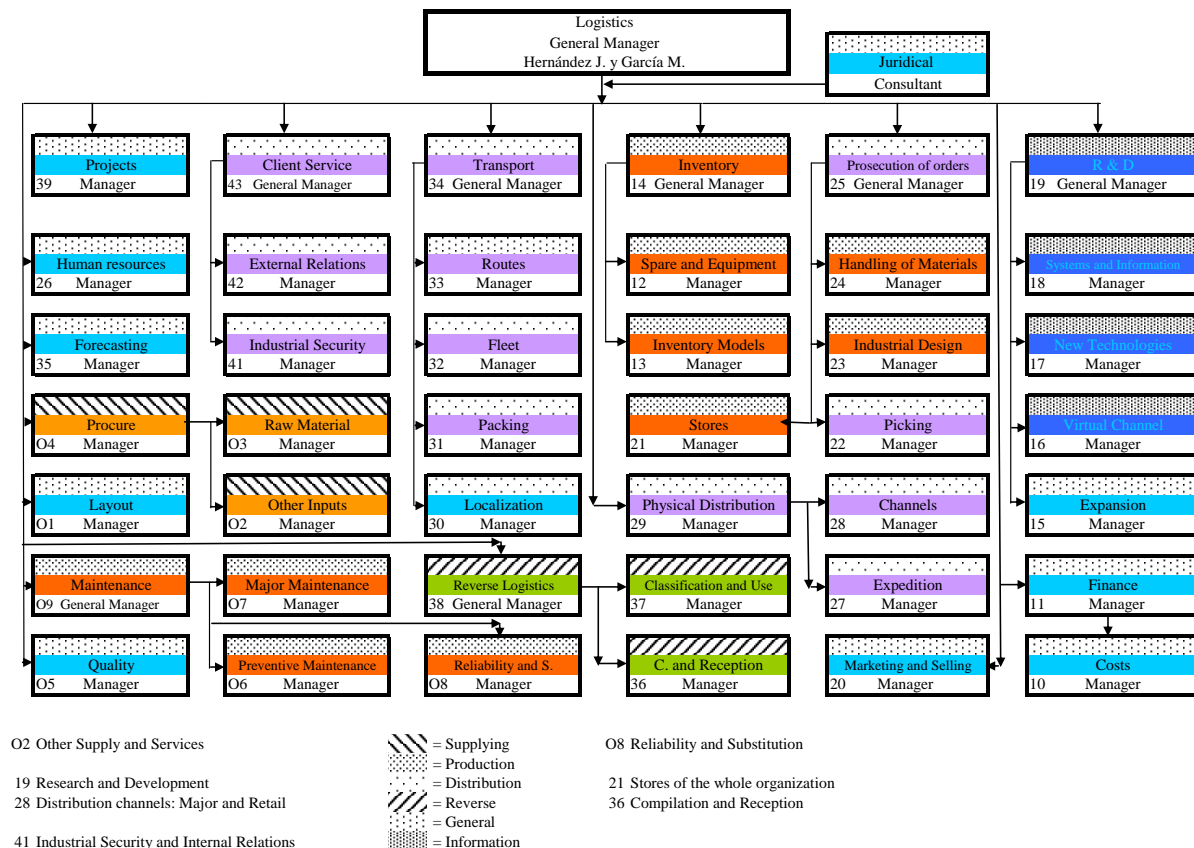

Figure 1: Logistic Model Based in Positions (MoLoBaC)

In particular brief details of the General of the Enterprise stage will be given, since its three areas are conformed, respectively, by the following positions, where the number in parenthesis is the identifier of the position in the flowchart: a) Intrinsic to logistics, three positions: Layout (01), Quality (05) and Localization (30) which is subordinated to the General of Transportation position from the area of Transportation, in the Distribution stage; b) Supported by logistics, to whom belongs: Expansion (15) (reporting to General manager of Research and Development), Forecasting (35) and Projects (39), and c) Supporting the logistics, formed by five positions: Finances (11) and its subordinated position: Costs (10), Marketing (and Sales) (20), Human Resources (26) and Juridical Consultant (40), which is the only position not distinguished as manager.

Following, understanding it as a MoLoBaC position, Quality Manager would be discussed and how through this position and its functions, a diagnosis of an organization logistics can be analyzed.

QUALITY MANAGER IN MoLoBaC

When doing a brief route by MoLoBaC, could be observed that of the forty three positions that the integrates it, Quality Manager has a relevant role, that when being located in the area Intrinsic to logistics, of the General of the Enterprise stage, implies that it is related to all the logistics operations of the company. But including quality, or total quality within the logistics is not a new concept, already in 1990, Martin Christopher and Richard Yallop (Christopher, 2002), published the article “Audit of the quality of the service to the client”, where besides considering quality as a tangible element of the product, presenting how measurements can be made of customer service, where between the key component of costumers service mention quality in sales representation, emphasizing in addition, the use of competitive Benchmarking to establish the relative importance of the components of costumers service.

When talking about quality, in addition to quality management (Foster, 2007; Hsu and Hu, 2009) and the quality-cost relation (Hammami, Burlat and Campagne, 2003; Isiklar, Alptekin and Büyükoçkan, 2007; Ketchen, Tomas and Hult, 2007; Wouters, Jarwaarde and Groen, 2007), there are two other aspects to consider: the quality of the product (Angerhofer and Angelides, 2006; Boyer and Hult, 2005; Gehin, Zwolinski and Brissaud, 2007; Hsu and Hu, 2009; Wouters, Jarwaarde and Groen, 2007) and the quality of the service (Boyer and Hult, 2005; Loudni, Boizumault and David, 2006).

That relevant role that quality plays (Donselaar et al., 2006; Gattiker, Huang and Schwarz, 2007; Huang and Keskar, 2007; Riezebos, 2006) in costumers service, is used as starting point to measure the logistic performance of the organizations, since as it was expressed in the enterprise logistic concept, good costumers service is the reason of being of logistics. Thus, the next step is to identify or to determine the functions of the Quality Manager and to make use of them to obtain the propose measurement.

Quality Manager subordinated functions

In MoLoBaC, when defining the functions of a position, among other aspects it is necessary to guarantee that them must be useful to characterize this position, and even serve to define the manager profile, but mainly that support logistics in all their stages, that is to say, in the supplying, the production, the distribution and if exist, in inverse logistics, and if it is possible in the general aspects of the company and information, thus, between the functions that a Quality Manager must carry out, according to the MoLoBaC, the ones indicated in tables 1,2 and 3 are emphasized, where, especially in the last one of these tables, functions related with the remaining positions of the models are included.

Table 1: Some functions relevant to the Quality Manager, associated to the SCM

| Identification | Subordinated function |
|----------------|---|
| 01 | Generate programs to improve quality integrating the supply chain. |
| 02 | Aiding providers to improve the quality of their services and products. |
| 03 | Developing programs to improve the suppliers quality. |
| 04 | Establishing programs to improve the quality of services and products. |
| 05 | Generate programs to integrate costumers to the improvement of quality. |
| 06 | Adding value through quality to the supply chain. |

It is evident that some of the subordinated functions of table 1, could also be classified as generals of the enterprise or associated to the positions that they integrate in the MoLoBaC.

In the set of subordinated functions of tables 1, 2 and 3, specially the last one, at least one can be found for each position of the MoLoBaC, as all these functions are of easy measurement, this would be the used mechanism to evaluate the performance of the respective position, which in general would be translated to an indicator between 0 and 100, where 100 would imply an excellent performance, this way a measurement for all positions is obtained, and in ascending form for the areas, stages and in general for the enterprise as a whole. That is to say, just by measuring the performance of the Quality Manager, the performance of the whole organization would be measured.

Table 2: Some relevant functions of Quality Manager, associated to the enterprise in general.

| Identification | Subordinated function |
|----------------|---|
| 07 | Establishing management programs for organization quality. |
| 08 | Designing quality measurement standards for the whole organization. |
| 09 | Establishing annual goals for the organization desired quality. |
| 10 | Establishing programs for quality improvement in the process. |
| 11 | Establishing programs to improve the performance of employees. |
| 12 | Establishing programs to improve quality through equipments. |
| 13 | Defining incentives programs for achievement in quality improvement. |
| 14 | Designing programs that allow improving the quality of information flows. |
| 15 | Designing programs that allow measuring and improving the matter flows. |
| 16 | Designing programs that allow measuring and improving quality of other flows. |

As in table 1, some functions of table 2 can be associated with positions integrating the MoLoBaC.

Table 3: Some functions relevant to Quality Manager, associated with positions in MoLoBaC.

| Identification | Subordinated function |
|----------------|--|
| 17 | Involving the organization layout in improving performance quality. |
| 18 | Establishing goals to achieve in quality improvement, through raw material. |
| 19 | Pay special attention to raw material quality. |
| 20 | Establishing goals to achieve in quality improvement, through other intakes. |
| 21 | Establishing goals to achieve in quality improvement, through procure. |
| 22 | Generate programs to integrate suppliers to quality improvement. |
| 23 | Establishing programs of preventive maintenance conducting to quality improvement. |
| 24 | Defining quality programs to implement with mayor maintenance. |
| 25 | Aiding to establish replacement politics that minimize costs and improve quality. |
| 26 | Integrate maintenance program with the continuous quality improvement. |
| 27 | Establishing programs of quality improvement oriented to minimize logistics costs. |
| 28 | Establishing programs allowing to measure financial management quality. |
| 29 | Aiding to define programs of continuous evaluation of equipment and spares quality. |
| 30 | Aiding to establish inventory models which potency quality improvement. |
| 31 | Aiding to establish quality measurement programs for different inventories. |
| 32 | Establishing strategies to guarantee quality in expansion projects. |
| 33 | Establishing programs that guarantee quality in operations by virtual channel. |
| 34 | Establishing programs to impulse quality through new technologies. |
| 35 | Establishing programs to impulse quality through information systems. |
| 36 | Coordinate programs of Research and Development to improve quality. |
| 37 | Aiding to define marketing strategies for each one of its products. |
| 38 | Aiding to define programs of quality improvement in the handling of all storages. |
| 39 | Aiding to define programs to improve quality in the handling of picking. |
| 40 | Establishing programs that allows to measure quality of industrial designs. |
| 41 | Aiding to design materials handling strategies, that potency its quality. |
| 42 | Aiding to establish guidelines, involving quality in processing orders. |
| 43 | Designing and establishing formation programs in quality improvement. |
| 44 | Establishing programs allowing the whole personal to be involved in quality improvement. |
| 45 | Establishing programs to improve delivery quality. |
| 46 | Aiding channels to define strategies guaranteeing the products quality. |
| 47 | Establishing programs that allow having control of physical distribution quality. |
| 48 | Aiding new localizations in potency quality. |
| 49 | Developing programs to improve packaging quality. |
| 50 | Developing programs that guarantee quality of the fleet. |
| 51 | Aiding in choosing distribution routes that guarantee quality. |
| 52 | Contribute establishing transportation politics that helps improving quality. |
| 53 | Contribute making prognostics that help improving quality. |

Table 3: Some functions relevant to Quality Manager, associated with positions in MoLoBaC. (Continuation)

| Identification | Subordinated function |
|----------------|--|
| 54 | Establishing programs, allowing to guarantee recollection and reception quality, of the products returning by reverse logistics. |
| 55 | Generate programs, allowing to guarantee classification and utilization, of products returning by inverse logistics. |
| 56 | Aiding establishing programs of quality reverse logistics. |
| 57 | Incentivize quality improvement in programs of benign inverse logistics. |
| 58 | Create programs of quality improvement minimizing adverse inverse logistics. |
| 59 | Establishing programs to guarantee quality in the management of new projects. |
| 60 | Establishing programs of quality measurement in legal aspects. |
| 61 | Establishing programs of internal relations that improve quality. |
| 62 | Establishing programs of external relations that improve quality. |
| 63 | Establishing programs of industrial security that improve quality. |

In practice the performance of each position would be measured and then the performance of positions of an area would be measured by average and with the average of the areas the performance of the stages would be had and these averages would allow the global evaluation of the company.

CONCLUSIONS AND RECOMENDATIONS

When observing tables 1, 2 and 3, in special 3, can be observed that it is easy to create subordinated functions of the Quality Manager, that can be related in direct form to each one of the positions of the Logistic Model Based on Positions (LoMoBaP, [MoLoBaC in Spanish]), which covers all the enterprise logistics, with the advantage, that besides analyzing the positions, simultaneously groups them in areas and these in stages, which in direct form allow to have a vision of the performance, not only of the enterprise logistics of an enterprise, but the whole of the enterprise.

As each one of the Quality Manager subordinated functions are valuables in direct form, at least through indicators, obtaining a measurement of each function and with them of each position, which as well allows evaluating the areas, the stages and the enterprise as a whole, being fulfilled therefore the objective raised in this work.

It is understood that only a representative set of subordinated functions of the Quality Manager appeared here, but that their number could grow considerably, thus it is recommended to work in this sense, in establishing new subordinated functions of the Quality Manager. On the other hand, the functions can be evaluated through indicators, thus is recommended to make a deeper study of each of the functions, present and future, to clearly define the indicators to use.

On the other hand in the MoLoBaC forty three positions converge, many of them with a general relation with the rest, thus it is recommended, to apply the analysis here done for the Quality Manager to other positions that can be conceived also have the capacity to analyze the logistics through its subordinated functions.

ACKNOWLEDGMENTS

This investigation would not have been possible without the support given by: The Universidad Metropolitana, specially its deanship of Research and Development, and the deanship of Engineering, through the Department of Technology Management and Minimax Consultores, C.A., through its Research Management.

INFLUENCE OF LOCATION MANAGEMENT IN SUPPLY CHAIN MANAGEMENT

José G. Hernández , Universidad Metropolitana, Venezuela.
María J. García and Gilberto J. Hernández
Minimax Consultores C. A., Venezuela

ABSTRACT

Given the daily relevance of the Supply Chain Management (SCM) and with it enterprise logistic, one must pay special attention to the integration of the Supply Chain Management, to even decide where the different operative centers from the different organizations who integrate it, will be located. On the other hand, when the locations of the different operative centers are analyzed is recommendable to consider the presence of the Logistic Model Based on Positions (MoLoBaC, in Spanish), which was created to explain enterprise logistic through the functions of the positions relative to logistics in an organization. From both before mentioned aspects the objectives of this work arises: To construct a model that based on improving the efficiency and integration of the Supply Chain Management of and on offering the maximum support to the greater amount of areas of the MoLoBaC, allows to determine the best location of the different operative centers from the different organizations who conform a SCM.

INTRODUCTION

The methodology used to reach the objective of this work: To construct a model that based on improving the efficiency and integration of the Supply chain of and on offering the maximum support to the greater amount of areas of the Logistic Model Based on Positions (Modelo Logístico Basado en Cargos [MoLoBaC], in Spanish), allows to determine the best location of the different operative centers from the different organizations who conform a Supply Chain Management (SCM), is the scientific method adapted to the Operations Research (Hernandez and García, 2006a; 2006b; 2007), which approaches decision making problems without going through formulating hypothesis, instead its steps are:

- a) To define the problem, as presented in the objectives, is to create a model to locate operative facilities of an organization, based on the SCM and MoLoBaC;
- b) Search data, centered in analyzing the SCM, logistics enterprise and the Location manager of the MoLoBaC;
- c) Establishing alternatives, that would be different models to evaluate the location of the operative centers;
- d) Evaluating alternatives, according to the raised objectives, deciding which of the proposed alternatives is feasible;
- e) To select the best alternative, as product of previous evaluation process, and based on the secondary objectives, tacit or explicit, being considered;
- f) To implement the alternative, that being a theoretical study consists of showing a hypothetical example of the created model and
- g) To establish controls, or mechanisms that allows recognizing if the created model continues being useful in the time.

As far as the reaches it is important to note that in this study no field research had been made, nor the management of location of the MoLoBaC in company some has been analyzed, only has appeared the model constructed and its validation from a theoretical point of view.

SUPPLY CHAIN AND LOCATION MANAGEMENT

In order to construct the model that allows to obtain the best location of any operative center, it is necessary to present some concepts that are immersed in it, for this reason the concepts of Supply Chain Management, enterprise logistic, and also the MoLoBaC appears, giving a brief explanation of its areas and the position Location manager.

Supply Chain Management (SCM)

Demeter, Gelei y Jenei (2006) offer their definition of Supply chain: “supply chain refers to all those activities associated with the transformation and flow of goods and services, including their attendant information flows, from the sources of raw materials to end users. Management refers to the integration of all these activities, both internal and external to the firm.”, taken from Ballou et al. of 2000, which coincides with Ballou (2004). On the other hand the supply chain (SCM) (Hugos, 2003; Lin et al., 2009; Stadtler and Kilger, 2005), is usually presented as an ampler concept than the enterprise logistic and it is understood as all those logistic aspects that must be synchronized between the producers of prime matter, finished products and the wholesale distributors and detail, so that the client is attended in suitable form satisfying their real necessities; the logistic aspects in which the SCM is centered generally are: Storage, inventories, location and transports, but to be able to work a good SCM high integration of the information systems is required.

Nevertheless this approach where the SCM involves logistics, is not shared by all authors, in individual Larson (2005), presents an evolution of both concepts where in addition to this approach in which the SCM involves logistics, are approaches where logistics involves the SCM, where both concepts are totally separated and a final approach, to which the authors of this work add themselves, where both concepts are independent, with a common intersection, that as indicated in the previous paragraph, it is shown in the warehouses, location, handling of inventories, transportation and information systems. On the other hand it is interesting to quote Ketchen and Hult (2007), who based in Boyer et al. of 2005; Ketchen and Guinipero of 2004 and Mabert and Venkataramanan of 1998, point that: A supply chain is a series of units that transforms raw materials into finished products and delivers the products to customers and add that some of the units in a chain are located inside a single organization's borders while others cross such borders in complex and evolving ways. Pointing out besides that effectively managing supply chains is vital to organizational success. Indeed, there is a growing recognition that modern competition is being fought “supply chain versus supply chain” rather than “firm versus firm”.

It is equally important to note Boone and Ganeshan (2007) in their short article an Introduction to a Special Issue on eBusiness and Supply Chain Management: “Since the supply chain usually involves more than one firm, it is important for managers to evaluate what every firm brings in terms of costs and benefits to the supply chain; and eventually how such benefits can be shared between supply chain partners. This often necessitates a different organizational structure-cross-functional and inter-firm teams that analyze, monitor, and improve supply chain processes”.

Enterprise logistics

For adapting better to MoLoBaC, and therefore to the objectives of this essay, although there is a great amount of very complete and asserted definitions in literature, it will be said that: Enterprise logistic one is centered in searching and achieving the greatest present and future satisfaction of the final costumer and includes the legal aspects, the planning, organization, execution and control of all the activities related to the obtaining, flow, storage and maintenance of materials, products and even services; from the source of the raw material, including here costumers through inverse logistics, to the sale point of the finished product whether local or international, massive or enterprise, in the most effective and efficient manner, reducing time and costs and making use of modern technologies of information (Hernandez and García, 2006a; 2006b; 2008).

The Logistic Model Based in Positions (MoLoBaC)

As a necessity, to teach enterprise logistic, a series of qualitative-quantitative models were created for the students of a private university of Caracas, Venezuela, to explain logistic (Hernandez and García, 2006a; 2006b; 2008), that presented in chronological order are: a) The Logistic of Supply, Production, Distribution and Inverse (LSPDI, [in Spanish, LAPDI]) model, that studies the logistic flows of the organization, emphasizing the flows of materials, as much direct as inverse, information and control; b) The Logistic Model Based on Positions (MoLoBaC), that leans in the previous model and which studies enterprise logistic through the functions relative to the positions; c) The Logistic, Strategic, Tactical, Operational with Inverse Logistics Model (STOILMo [MoLETOI in Spanish]), that studies the logistics following the evolution of the company through four stages: Strategic, Strategic-Tactical, Tactical-Operative and Operative, each one divided in four phases, being the model conformed by a total of sixteen phases and d) The Logistic Model Based on Indicators for Positions (LoMoBaIPo [MoLoBaICa, in Spanish]), that measures the indicators relative to the individuals that carry out the different activities and supply functions.

The MoLoBaC, represented through an organizational chart (figure 1), groups the positions in twelve areas integrated in six stages: a) Supplying, with a unique area, Procure; b) Production, integrated by two areas, Maintenance and Inventories; c) Distribution, with four areas, Order processing, Physical distribution, Transport, and the central area of the model, Customer service; d) Inverse, conformed by an area, Inverse logistic; e) General of the Company, with three areas, Intrinsic to the logistics, Supported by logistic and Supporting logistic and f) Information (General of Information), formed by a unique area, Information.

Of the twelve areas that conform MoLoBaC special attention will be given to: a) Transport, conformed by five positions: General manager of Transport, with its subordinated positions: Routes (33), Fleet (32), Packing (31) and Location (30), where the number between parenthesis is, for all the model, the identifier of the position in the organizational chart and b) Intrinsic to the logistics which is formed by three positions: Layout (01), Quality (05) and Location (30), as already it was already said, is the central objective of this investigation and which, is subordinated to the position General of Transport, of the area Transport, in the stage Distribution. The Location manager, as its name indicates it is the person in charge to locate all the operative centers of the organization, as much in the macro location, that is to say, the country, province or zone where the new facility will be located, as in the micro location, which corresponds to the land where the new seat will be constructed, or the building that will be occupied, if it were the case.

Following the organization in positions, areas and stages that MoLoBaC offers, but mainly the areas, the model will be constructed that allows evaluating the best location of the operative centers of the SCM.

MODEL FOR A BETTER LOCATION

Although when using the term localization associated to supply chain management logistics it is common to relate it with the economy (Demeter, Gelei and Jenei, 2006), the facility of costumer services (Karmarkar and Pitbladdo, 1995), with the correct localization (Lin et to the., 2009), the docking station (Zäpfel and Wasner, 2006), warehouse location (Sharma, Ammons and Hartman, 2007), but in general it refers to the localization of the producer plant (Dias, Captivo and Clímaco, 2007; Jung, Jeong and Lee, 2007), It must be clarified that for this work, in a way continuing the work of Lapierre and Ruiz (2007), three types of operative centers will be identified: a) Production centers, those will be the plants, factories or any other similar center, where materials are transformed into final products, or generating centers or service centers, if it is the case; b) Administrative centers, those will be offices, in which labors the personnel who directly or indirectly is in charge of the aspects of planning, organization, execution or direction and control, that is to say, administrative in general, of organization and c) Distribution and storage centers, are those where the products arrive for their storage, classification and grouping and later distribution or commercialization.

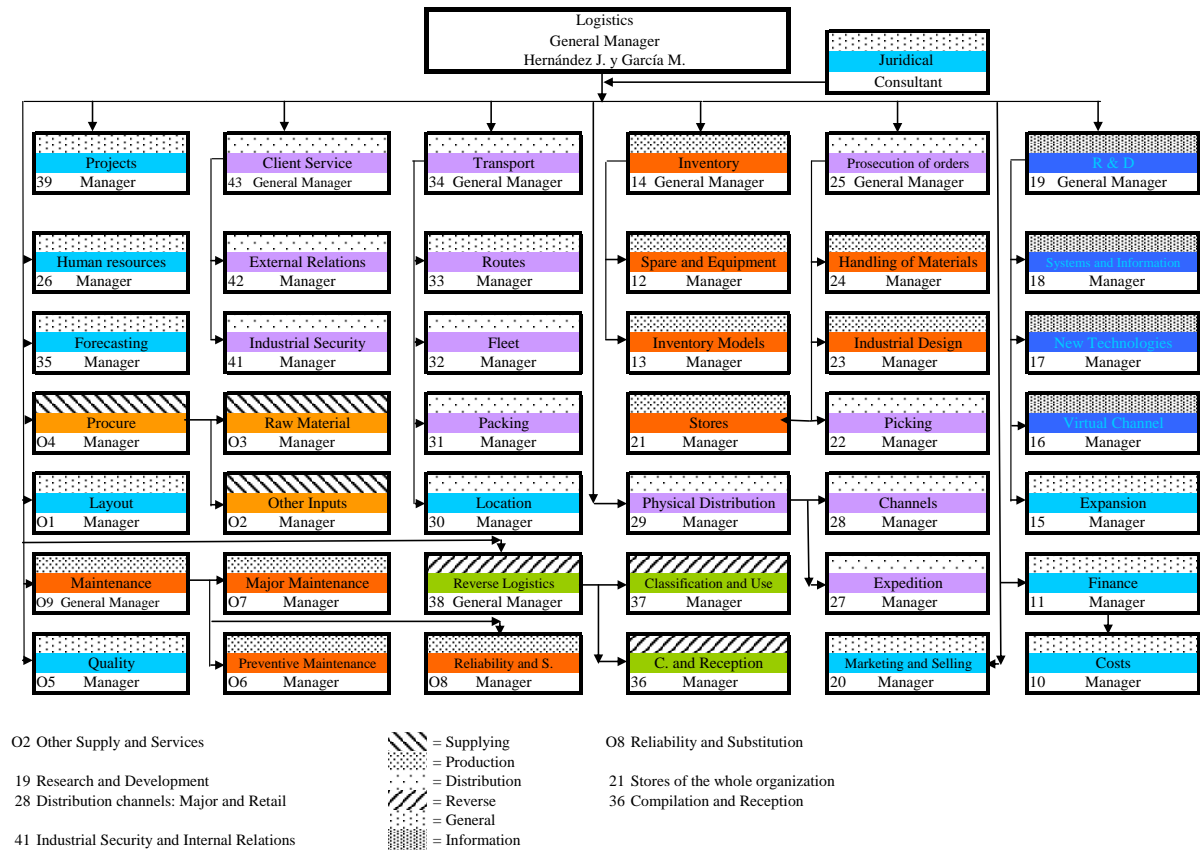

Figure 1: Logistic Model Based in Positions (MoLoBaC)

Evidently in all operative centers, the three mentioned types usually are present, thus the classification will be given by the dominant condition; that is to say, a company that has its warehouses, offices and producing plants in a single place, this operative center will be classified like production center. Also, in offices which share part of its space to store small amounts of soon to be distributed products, will be classified as an administrative center, as well as a warehouse that distributes its products to other centers of distribution, although in it is found personnel that administer these labors, it will be considered a center of distribution and storage.

According to commented in the previous paragraphs, the operative centers that will be less influenced by the SCM, are the production centers, since they are constructed and therefore located, in general, in independent form, before integrating any SCM, whereas those who will receive greater influence will be the centers of distribution and storage, since they would have to be constructed and located so that they offer a greater integration of the SCM. But independently of having established the SCM or no, and being any of the three types of operative centers, a series of aspects that must be evaluated to define their location will be listed.

Aspects to be considered by the location model

Of being possible, to choose the macro-location as much as the micro-location of a productive center is necessary to measure, for each locality candidate, the strengths that they offer:

01. In order to integrate from the point of view of the communications, the SCM.
02. In order to approach and to integrate the elements upstream (initial suppliers), of the SCM.
03. In order to approach and to integrate the elements downstream (final distributors and clients), of the SCM.
04. The surroundings, social, political and economic and its relations with the rest of the SCM.

05. For the member of the SCM, that will take the main responsibility in the administration of the productive center, as far as the administration itself.
06. For the remaining members of the SCM, aside from the administrator of the productive center, as far as the administration itself.
07. For the member of the SCM, that will support the greater impact in the operative costs of the productive center.
08. For the handling of the costs of other members of the SCM, aside from the person in charge of the operative costs.
09. For the member of the SCM, that will appear as owner and will support the construction of the productive center.
10. For the remaining members of the SCM, aside from the owner-constructor of the productive center, as far as the construction itself.
11. The climate, as much for the conservation of the operative center itself as of materials, equipment and products, as well as for the facility of integration of the SCM.
12. For the elimination of remainders produced by the different members of the SCM.
13. In facilitating the procure, as much of raw material, as of spare parts, services and other supply and services in general, considering, in any case, suppliers, integrated or not, to the existing SCM, as well as facilities to guarantee the product arrival and services.
14. In order to take excellent programs of total maintenance, specially considering the availability of personnel, space and spare parts that can be necessary.
15. In order to be able to maintain all the inventories necessary, in the suitable levels.
16. In order to carry out the processing of orders in an efficient and effective manner, guaranteeing among other aspects the freedom for the design, the facility to install new technologies of Picking, space for the handling of materials and its storage.
17. In order to facilitate the physical distribution of finished products, allowing an efficient and integrated delivery to the rest of the SCM.
18. In order to fulfill the transportation labors, as much of materials towards the productive center, as of finished products, getting them closer to the costumers, being done emphasis, in facilities for the choosing of the fleet, as in facilities to established different routes, as well as in the freedom to select the packaging.
19. In order to serve the costumer better, including the final, internal costumers and the remaining members of the SCM.
20. In order to make a suitable inverse logistic, harnessing the benign inverse logistic, allowing it to recover goods and to diminish costs to the organization, while diminishing the adverse inverse logistic, which causes monetary losses and dissatisfactions in the costumer.
21. For the area of MoLoBaC Intrinsic to the logistics, in particular those who facilitate a better Layout and harness reaching greater quality standards, as well as future locations of other operative centers.
22. For the area of MoLoBaC Supported by logistics, in the sense to facilitate the accomplishment of assertive prognoses, the management of new projects and the handling of future expansions of the organization, independent of the cause or the way that are being carried.
23. For the area of MoLoBaC Of Supporting logistics, paying attention to the handling of logistic costs and the financial aspects of the organization, as well as to carry out the labors of trade and sale, the easiness of having suitable human resources and where the legal aspects are not excessively complicated.
24. For the area of MoLoBaC Information, trimmed in guaranteeing excellent research and development laboring, with the handling of new technologies, easiness for virtual channels and the use of modern information systems.

These twenty-four aspects to consider by the model, where it can be seen that the first twelve are more closely associate with SCM, while the last twelve are extracted of each one of the twelve areas of the MoLoBaC, are converted in evaluation criteria, thus quantification could be done, expressed easier through one of the multi-criteria models and easier to handle Matrixes Of Weighing (MOW), as illustrated in table 1, where two hypothetical places are evaluated, following the twenty-four criteria of the model, here generated, which it denotes the influence Location Manager has on the MoLoBaC, with the SCM.

Illustration of the model for location of an operative center

In table 1, annexed after the conclusions, the valuation appears through developed model of a pair of hypothetical places, where it is hoped to locate an operative center, in this case it is the macro-location, that is where surely the model will have greater repercussion, since in the micro-location, more precise aspect could arise that would have greater relevance.

In table 1, after the conclusions, it is possible to see that Location A is favored by 1044 points as opposed to 1016 points of Locality B, but more than the points obtained by the Locality A or by the Locality B, that are hypothetical localities, the important thing it is to see that the evaluation of them allows the validation of the model, which aid to establishing the place in which an operative center must be located, taking into account the SCM and the MoLoBaC, and this way shows the influence of the SCM and the Location manager of the MoLoBaC, in the location of operative centers. After this comments conclusions and recommendations can be done.

CONCLUSIONS AND RECOMMENDATIONS

The established model takes into account twenty-four criteria, where twelve of them are related to the integration of the SCM, and the other twelve with the areas of the Logistic Model Based on Positions (MoLoBaC), with which it is achieved the objective of creating a new model, that taking into account the SCM and the MoLoBaC, aids the location of the operative centers of an organization.

In addition from the quantitative point of view the handled model is very easy to implement, since it makes use of the easier to work with multi-criterion techniques, the MOW.

Although here, it was only used the model for a macro-location of a productive center, is evident that it would be able to work, without no difficulty to aid in as much in the macro as in the micro-location, whether in productive, administrative or of storage and distribution centers.

From the last commentary, the recommendation arises to use the model in real cases, in organizations, who are deciding the location of new operative centers.

Table 1: Application of the model to two hypothetical locations

| Criteria | Range of the criteria | Location A | | Location B | |
|----------|-----------------------|------------|-------------|------------|--------|
| | | Condition | Points | Condition | Points |
| 01 | 1 to 80 | Few | 16 | High | 64 |
| 02 | 1 to 60 | High | 48 | Quite few | 12 |
| 03 | 1 to 60 | High | 48 | Medium | 36 |
| 04 | 1 to 60 | Quite few | 12 | Medium | 12 |
| 05 | 1 to 80 | Medium | 48 | High | 64 |
| 06 | 1 to 50 | Few | 20 | Quite high | 50 |
| 07 | 1 to 100 | Quite high | 100 | Few | 40 |
| 08 | 1 to 90 | Quite few | 18 | Quite few | 18 |
| 09 | 1 to 100 | Medium | 60 | Medium | 60 |
| 10 | 1 to 80 | Few | 32 | Few | 32 |
| 11 | 1 to 50 | High | 40 | Quite high | 50 |
| 12 | 1 to 90 | Medium | 54 | Quite Few | 18 |
| 13 | 1 to 80 | Quite high | 80 | Few | 32 |
| 14 | 1 to 70 | Few | 28 | Medium | 42 |
| 15 | 1 to 80 | Quite few | 16 | Quite few | 16 |
| 16 | 1 to 80 | Medium | 48 | Few | 48 |
| 17 | 1 to 100 | Quite high | 100 | Quite few | 20 |
| 18 | 1 to 90 | Few | 36 | Medium | 54 |
| 19 | 1 to 100 | Quite few | 20 | Few | 36 |
| 20 | 1 to 80 | Medium | 48 | High | 64 |
| 21 | 1 to 70 | Quite high | 70 | Quite high | 70 |
| 22 | 1 to 70 | Few | 28 | Few | 28 |
| 23 | 1 to 100 | Quite few | 20 | Medium | 60 |
| 24 | 1 to 90 | Medium | 54 | Quite high | 90 |
| Total | 1910 | | 1044 | | 1016 |

A COMPARISON OF NONGOVERNMENTAL ORGANIZATIONS' LOGOS IN POLAND, THE CZECH REPUBLIC, AND THE UNITED STATES: A CONTENT ANALYSIS

Joanna Hernik, West Pomeranian Technological University, Poland
Dana-Nicoleta Lascu, University of Richmond, USA

ABSTRACT

Logos constitute a communication tool that nongovernmental organizations (NGOs) use to reach stakeholders. NGOs do not have the marketing arsenal that private corporations use to communicate with stakeholders; but they do use logos effectively, to communicate corporate visual identity. Communication strategies differ across environments, and logo content varies as well. This study compares the use of logos by NGOs in Poland and the Czech Republic and in the United States. Logos are evaluated not only from the perspective of cultural differences, but also from the perspective of market experience: NGOs in the U.S. are established, in existence for over fifty years, whereas they constitute a more recent phenomenon in the Eastern European emerging markets.

BACKGROUND

Nongovernmental organizations use corporate visual identity to express their values, their ambitions, and their distinguishing traits. Logos are used in marketing communications to provide organizations with visibility and recognizability (Balmer and Gray, 2000; Dowling, 1993; Du Gay, 2000; Van den Bosch, Wim, and de Jong, 2006), providing individuals with additional cues to remember the organization (Van den Bosch et al., 2006). The logo also is a symbol of the organization and, as such, it directly contributes to its image and reputation (Schultz et al., 2000). Specifically, it is possible that NGO's choice of logo, color and font type may affect individuals' judgment and behavior relative to the organization (Doyle and Bottomley, 2002; Gabrielsen, Kristensen, and Hansen, 2000; Van den Bosch, De Jong, and Elving, 2005; Van den Bosch et al., 2006; Van Riel and Van den Ban, 2001). Another relevant function of nongovernmental organization logos is internal: it plays a symbolic role in helping employees identify with the organization (Bromley, 2001; Dutton, Dukerich, and Harquail, 1994; Kiriakidou and Millward, 2000; Van den Bosch et al. 2006).

An examination of logos in the Czech Republic and Poland, on one hand, and in the United States, on the other, will provide insights into the strategies used by nongovernmental organizations to communicate with their market. Specifically, such an examination will identify differences in how these organizations use logos strategically, to create visibility and recognizability, to create an image for the organization, and to create identification for employees with the organization.

METHOD

The present study uses a content analysis of logos from nongovernmental organizations in Poland, the Czech Republic, and the United States. The study to be presented will compare logo content of 100 organizations in each country. The organizations were selected from judgment samples provided by Internet sources in each country; organizations that did not have their own websites were excluded from the sample.

The organizations in the three samples are identified based on the scope of operations, as well as history. Content analysis was used as a method to identify and subsequently compare logo content in the different countries. A number of studies have pioneered the use of content analysis to study the international communication of multinational firms; in particular, three – Mueller, 1991; Whitelock and Chung, 1989; Seitz and Johar, 1993 – investigated the standardization of the advertising theme, slogan, headlines, subheads, body copy, color, and size differences, models and spokespersons, visual background scenes, products attributes, product packaging, product name, product portrayal, and claim type, among others (Harris and Attour, 2003). Two judges were used and their assessments were calculated and reported in the findings; the information provided includes inter-rater reliability information.

FINDINGS

We identified noteworthy differences in terms of the use of name, graphic symbols, letters, words, and colors, among others. We discuss these differences and address their relevance for logo design for marketing communications of nongovernmental organizations.

PARTISAN EFFECT, ELECTION CYCLE AND BUDGETARY PROCESS IN TAIWAN: EVIDENCE FROM ASYMMETRIC ADJUSTMENT

Yuan-Hong Ho and Chiung-Ju Huang
Feng Chia University, Taiwan

ABSTRACT

It is widely acknowledged that the adjustment between government expenditure and revenue could be asymmetric due to either partisan (ideological) reasons or election cycles. In this study we employ threshold autoregressive model (TAR), momentum-threshold autoregressive model (M-TAR), and asymmetric ECM techniques to investigate how election cycles and partisan ideology asymmetrically affect the dynamic behavior of government expenditures and revenues in Taiwan's budgetary process over the sample period of 1965:Q3-2006:Q4. Our findings revealed that government expenditures and revenues in Taiwan's budgetary process have characteristics of following an asymmetric adjustment process and the partisan and opportunistic political business cycle models.

INTRODUCTION

In the economics literature, interpretations of the relationship between government expenditures and revenues basically fall under three perspectives: tax-and-spend, spend-and-tax, and fiscal synchronization. Recent empirical studies on the expenditure-revenue relationship, including those of Koren and Stiassny (1998), Chang and Ho (2002), Payne (2003), and Ho and Huang (2006), have largely been based on the conventional cointegration and error correction model (ECM). Studies based on the ECM specification implicitly assume that the adjustment process of expenditures and revenues due to disequilibrium between the variables is strictly symmetric. However, Pippenger and Goering (1993), Balke and Fomby (1997), and Enders and Granger (1998) showed that tests for unit roots and cointegration all have low power in the presence of asymmetric adjustment. Recently, economists have been particularly interested in the study of cointegration with asymmetric error correction, and have generally reached a common interpretation and consensus with this area of study (Potter, 1995; Balke and Fomby, 1996; Enders and Siklos, 2001; Arestis et al., 2004; Ewing et al., 2006; Easaw and Garratt, 2006; and etc).

The asymmetric adjustments mean that the movement towards a long-run equilibrium do not necessarily happen every time period, but instead, follows the threshold autoregression (TAR) model. Tong (1983) first utilized the TAR model to show how movement towards a long-run equilibrium is affected in the situation that variables digress from their equilibrium values. Enders and Granger (1998) further introduced the momentum-threshold autoregression (M-TAR) model to allow the adjustment to depend on the direction in which variables digress from their equilibrium. Later in 2001, Enders and Siklos modified the TAR and M-TAR models into multiple variable models, and established a method for evaluating threshold cointegration. Ewing et al. (2006) later used the TAR and M-TAR models to estimate whether the deviation of the deficit or surplus from its long-run trend affected the decision making of the policymakers. The application of the TAR model indicates that revenues and expenditures respond to the long-run requirements of the budgetary balance only when the budget worsens. In addition, Ewing et al. used the M-TAR model to analyze whether improved or worsened budget surplus (or deficit) also affected the process in which government revenues and expenditures adjusted towards an equilibrium state.

Political economists have been interested in researching the relationship between political and economical variables ever since Nordhaus (1975) introduced the Political Business Cycle theory, which recognizes the direct relationship between political elections and economic development and explains how politicians are able to

obtain public support and votes by manipulating financial policies to create the illusion of a robust economy. Related studies on this phenomenon have been mentioned in the research of Rogoff and Siber (1988); Rogoff (1990); Alesina (1992); Hibbs (1992); and Alt (2005) etc. Studies on political business cycles focus on the ideology of the governing party, its management and control over the economy and its financial policies, and the performance of the economy itself. Related studies have been conducted by Hallerberg and Hagen (1999); Brender (1999); Alt and Lassen (2005); Alesina and Tabellini (2005); and etc. Empirical studies on the political budget cycles typically show government budget as being closely influenced by election cycles (from the perspective of the opportunistic theory) and ideology (from the perspective of the partisan theory). More specifically, if the political budget cycles display asymmetric characteristics, then the accompanying budgeting process would also display asymmetric characteristics. Meanwhile, Easaw and Garratt (2006) attribute the asymmetric adjustment process of budgeting towards a long-term equilibrium to the election cycles and partisan effects.

While previous studies focus most on the industrial and developing countries, this study attempts to make some contributions to this line of research by using the asymmetric modeling of time series techniques to investigate how election cycles and partisan ideology asymmetrically affect the dynamic behavior of expenditure and revenue in Taiwan's budgetary process over the period of 1965:Q3-2006:Q4.

DATA AND METHODOLOGY

Data

Our empirical analysis employed quarterly data on government revenues, government expenditures and GDP for Taiwan over the sample period of 1965:Q3-2006:Q4. All data were obtained from the website of the Directorate-General of Budget, Accounting and Statistics, Executive Yuan, Taiwan. Quarterly GDP was obtained from the Macro Statistics Data Base, and annual revenues and expenditures were obtained from the National Statistics Data Base. In order to increase the effectiveness of the empirical analysis, the annual data were converted to quarterly data through a transition method to increase the number of data used in the empirical analysis, and all the data series were transformed into logarithm forms to achieve stationarity in variance.

Methodology

To test for cointegration that recognizes the possibility of an asymmetric ECM of the government budgetary process, and to display the impact of the ruling party, political election cycles, and other elements regarding government budgetary decision making, the TAR and M-TAR models developed by Enders and Granger (1998) and Enders and Siklos (2001) are utilized. The two-step least square procedure of Engle and Granger (1987) is extended to incorporate the TAR and M-TAR applications to examine the possible asymmetric causality between expenditures ($\ln E_t$) and revenues ($\ln R_t$). The TAR model is estimated from equations 1 and 2.

$$\Delta \varepsilon_t = I_t \rho_1 \varepsilon_{t-1} + (1 - I_t) \rho_2 \varepsilon_{t-1} + \sum_{i=1}^p \gamma_i \Delta \varepsilon_{t-i} + v_t \quad (1)$$

where $v_t \sim i.i.d(0, \sigma)$. The residuals $\{\varepsilon_t\}$ recovered from the regression of $\ln E_t$ on $\ln R_t$, represent the disequilibrium between expenditures and revenues and signify the budgetary disequilibrium. The lagged value of the residuals ε_t and $\Delta \varepsilon_t$ are incorporated to capture the short run dynamic adjustment process that occurs while the budget disequilibrium approaches its long run balance. The model converges under the condition: $\rho_1 < 0$, $\rho_2 < 0$. The Heaviside indicator functions (I_t) are denoted as follows:

$$I_t = \begin{cases} 1 & \text{if } \varepsilon_{t-1} \geq \tau \\ 0 & \text{if } \varepsilon_{t-1} < \tau \end{cases} \quad (2)$$

The threshold τ is endogenously determined using Chan's (1993) method. As shown by the TAR model, when the previous period's budgetary disequilibrium ε_{t-1} is above the threshold value τ , the model adjusts towards long run balance with the adjustment of $\rho_1 \varepsilon_{t-1}$, and if ε_{t-1} is below the threshold value τ , the model adjusts towards long run balance with the adjustment of $\rho_1 \varepsilon_{t-1}$. In applying the TAR model, it is possible to examine whether the positive phase of the budgetary disequilibrium has different effects on the behavior of expenditures and revenues than does the negative phase of budgetary disequilibrium.

The M-TAR model is estimated from equations 1 and 3. The Heaviside indicator function is defined as follows:

$$I_t = \begin{cases} 1 & \text{if } \Delta \varepsilon_{t-1} \geq \tau \\ 0 & \text{if } \Delta \varepsilon_{t-1} < \tau \end{cases} \quad (3)$$

The M-TAR model allows the adjustment to depend on the previous period's change in ε_{t-1} , and it is possible to examine whether the positive phase of the changes in budgetary disequilibrium has different effects on the behavior of expenditures and revenues when compare to the negative phase. Generally speaking, when there is significant change in the time series data of the variables, the M-TAR model is more preferable than the TAR model, displaying the characteristics of the data more clearly.

Having established cointegration between $\ln E_t$ and $\ln R_t$ as well as asymmetric adjustment in the budgetary disequilibrium with the TAR model, the asymmetric version of the ECM with two asymmetric components of the error correction terms is estimated as follows:

$$\Delta \ln E_t = \alpha_{10} + \sum_{i=1}^k \alpha_{1i} \Delta \ln E_{t-i} + \sum_{i=1}^k \beta_{1i} \Delta \ln R_{t-i} + \sum_{i=1}^k \gamma_{1i} \Delta \ln GDP_{t-i} + \rho_{1E} Z_{t-1}^+ + \rho_{2E} Z_{t-1}^- + \varepsilon_{1t} \quad (4)$$

$$\Delta \ln R_t = \alpha_{20} + \sum_{i=1}^k \alpha_{2i} \Delta \ln E_{t-i} + \sum_{i=1}^k \beta_{2i} \Delta \ln R_{t-i} + \sum_{i=1}^k \gamma_{2i} \Delta \ln GDP_{t-i} + \rho_{1R} Z_{t-1}^+ + \rho_{2R} Z_{t-1}^- + \varepsilon_{2t} \quad (5)$$

where k represents the optimal lagged periods, which can be determined by either the Akaike Information Criterion (AIC) or Schwartz Bayesian Criterion (SBC). Meanwhile, Z_{t-1}^+ and Z_{t-1}^- represents the error correction terms of the model as it adjusts towards long term equilibrium, and is given as,

$$Z_{t-1}^+ = I_t (\Delta \ln E_{t-1} - \alpha - \beta \Delta \ln R_{t-1} - \Delta \ln GDP_{t-1}) = I_t \varepsilon_{t-1} \quad (6)$$

$$Z_{t-1}^- = (1 - I_t) (\Delta \ln E_{t-1} - \alpha - \beta \Delta \ln R_{t-1} - \Delta \ln GDP_{t-1}) = (1 - I_t) \varepsilon_{t-1} \quad (7)$$

ELECTION CYCLE AND PARTISAN EFFECT

The government budget adjustment process and the magnitude of the adjustments are affected by partisan factors and political election cycles. The partisan models focus on differences in policies and outcomes as a result of different governments' ideological orientations. On the other hand, the political election cycles models claim that every government behaves in the same way: opportunistically, to win re-election. During the time period analyzed in this study, the KMT (Kuomintang Party) won all presidential elections between 1966 and 1996, while the DPP (Democratic Progressive Party) governed from 2000 to 2008. Before the establishment of the DPP in 1986, the KMT had the largest majority of support. In order to accurately test whether partisan effect impacted the asymmetric adjustment process of the government budget, we set the Heaviside indicator function as follows:

$$I_t = \begin{cases} 1, & \text{if } \varepsilon_{t-1} \text{ occurred under a KMT Government} \\ 0, & \text{if } \varepsilon_{t-1} \text{ occurred under a DPP Government} \end{cases} \quad (8)$$

To examine whether political strategies do indeed have political election cycle characteristics, we need to consider the time lags associated with the policy outcomes. Therefore, we use the Heaviside indicator to test whether there is any change in the government budget adjustment process both before and after (after 4 to 8 quarters) the political elections. The Heaviside indicator can be written as follows:

$$I_t = \begin{cases} 1, & \text{if } \varepsilon_{t-1} \text{ occurred in a post election quarter} \\ 0, & \text{if } \varepsilon_{t-1} \text{ occurred in a pre election quarter} \end{cases} \quad (9)$$

EMPIICAL RESULTS

Table 1 reports the results of the non-stationary tests for $\ln E$, $\ln R$ and $\ln GDP$ using ADF, PP and KPSS tests. Each data series is non-stationary in terms of levels but stationary with respect to first differences, suggesting that all of the data series are integrated of order one. Having established that $\ln E$ and $\ln R$ are I(1) in their level form, the long run relationship is estimated using both symmetric and asymmetric models.

Table 1: Unit root tests

| | Level | | | Difference | | |
|-----------|----------|-----------|-------------|--------------|--------------|----------|
| | ADF | PP | KPSS | ADF | PP | KPSS |
| $\ln E$ | 0.606472 | -0.85537 | 0.36903*** | -16.64436*** | -7.147314*** | 0.12412 |
| $\ln R$ | -0.68636 | -2.472927 | 0.334012*** | -5.510574*** | -4.56655*** | 0.073309 |
| $\ln GDP$ | 0.844179 | 0.037554 | 0.392435*** | -4.190651*** | -18.4026 *** | 0.065225 |

Note: *** indicates significance at the 1% level.

From Table 2, the estimates of ρ_1 and ρ_2 indicate convergence in both the Engle-Granger, TAR and M-TAR models. We reject the null hypothesis of no cointegration under the Engle-Granger model at the 1% significance level. Follow the method of Enders and Siklos (2001), we reject the null hypothesis of no cointegration under the TAR and M-TAR at the 1% level. Therefore, regardless of whether the model has symmetric adjustments or asymmetric adjustments, the budgetary disequilibrium is stationary. $\ln E$ and $\ln R$ are cointegrated. However, the AIC and SBC values of the TAR and M-TAR models appear to be smaller than those of the Engel-Granger model. This means that the TAR and M-TAR models have a better goodness of fit. The Wald statistics value of F_a indicates that the null hypothesis of symmetric adjustment is rejected at 1% level for both the TAR and M-TAR models. Therefore, the asymmetric adjustment in the budgetary disequilibrium is established for Taiwan in both the TAR and M-TAR models.

In this study we consider two possible ways in which politics might impact government budgeting. Table 3 outlines the relevant results. The point estimates of ρ_1 (under KMT) and ρ_2 (under DPP) are consistent with convergence. Both the F_c value and the F_a value indicate that the null hypothesis of no cointegration and symmetric adjustment can be rejected at the 1% level. The results show that partisan effect causes the budgetary disequilibrium to have asymmetric adjustment, which means that the speed of adjustment of budgetary disequilibrium towards long run balance is different under KMT and DPP governments in Taiwan.

Table 2: Estimates for the budgetary disequilibrium: TAR and M-TAR models

| | Symmetric | TAR | Asymmetric |
|--|-------------------|-----|------------|
| | Engle and Granger | | M-TAR |

| Threshold(τ) | | -0.011883 | -0.049511 |
|-----------------------------|--------------------------|-------------------------|-------------------------|
| ρ_1 | -0.116430*** (-3.324) | -0.1248*** (-3.5215) | -0.0790*** (-2.7379) |
| ρ_2 | NA | -0.0369 (0.9335) | -0.1130* (1.8138) |
| $F_c : \rho_1 = \rho_2 = 0$ | NA | 6.9503*** | 6.3298*** |
| P_c | NA | 0.0013 | 0.0023 |
| $F_a : \rho_1 = \rho_2$ | NA | 10.0935*** | 8.8807*** |
| P_a | NA | 0.0018 | 0.0034 |
| AIC | -4.487156 | -5.5522 | -5.5447 |
| SBC | -4.4468332 | -5.4176 | -5.4102 |

Notes: The t-statistics are given in parentheses. ***, **, and * indicate significance at the 1%, 5%, and 10% levels, respectively. F_c is the F-statistic for null hypothesis that $\rho_1 = \rho_2 = 0$, and P_c is the P value. F_a is the Wald-statistic for null hypothesis that $\rho_1 = \rho_2$, and P_a is the P value.

Table 3 also shows that the point estimates of ρ_1 (post election) and ρ_2 (pre election), except the ρ_1 value of 4 quarters after the presidential election, are all negative, satisfying the convergence requirements. Based on five political election cycles, the model representing 6 quarters after the election is most compatible with the empirical data, suggesting that election cycles are in fact a significant element in the government budget adjustment process. In addition, the speed of adjustment of budgetary disequilibrium towards long run equilibrium is different during pre and post elections. More specifically, the speed of adjustment is significantly slower prior 6 quarters (18 months) after the election, where as the 6 quarters act as a turning point where the speed of adjustment begins to increase. We can clearly see that the model for the 6 quarters has the smallest AIC, and F_c and F_a values are all significant at the 5% level.

Table 3: Estimates for the budgetary disequilibrium: partisan effect and Election cycle models

| | Partisan | Election Cycles | | | | |

| AIC | -5.5981 | -5.4960 | -5.5046 | -5.5193 | -5.5086 | -5.4937 |
| SBC | -5.4635 | -5.3615 | -5.3701 | -5.3848 | -5.3741 | -5.3592 |

Table 4, 5, 6 and 7 present the estimates of the asymmetric version of the ECM which enable us to see if our findings are corroborated after information regarding the short run dynamics is accounted for. Across the models, the short term dynamics are significant at 1% level with a few exceptions. The point estimates of error correction terms of the TAR and M-TAR models are negative, meaning that the existence of an automatic adjustment mechanism allows the government budget to adjust from disequilibrium to equilibrium, regardless of

whether the imbalance is above or below the threshold value. The results of Table 4 show that the greater the budget imbalance, the faster the speed of adjustment towards budget equilibrium. The results also suggest that the TAR ECM is more compatible than the M-TAR ECM.

Table 4: Results of the asymmetric ECM: TAR and M-TAR

| | TAR | M-TAR |

Notes: The t-statistics are given in parentheses. ***, **, and * indicate significance at the 1%, 5%, and 10% levels, respectively.

The impact of partisan effect on the government expenditures and revenues under the TAR ECM model is displayed in Table 5. The impact of political election cycles on the government expenditures and revenues are shown in Table 6 and 7. Table 5 clearly shows that regardless of whether the KMT or DPP is the ruling party, the government will adjust expenditures to adjust the budget back towards equilibrium. However, in comparison, the speed of expenditure-adjustment (ρ_2 in absolute value) during DPP governance is slightly higher. Meanwhile, there is no significant evidence showing that the Taiwan Government has been adopting the revenues adjustment methods to cut back the budget disequilibrium.

The estimated results shown in Table 6 suggest that the rate of adjustment for government expenditures (displayed in absolute value) is significantly higher prior to the elections. The AIC and SBC values show that the model representing the 6 quarters after the election has the highest goodness of fit, meaning that typically government parties begin adjusting government expenditures to achieve long term equilibrium, 18 months after the major elections. These results coincide with the estimations on the adjustment process of the government budget shown in Table 3. The results of Table 7 show that the rate of adjustment of government revenues is lower during pre-elections and higher during post-elections. The exception is that the estimates for the 6 quarters after an election are not statistically significant. Similarly, as shown in Table 7, the AIC and SBC values are statistically significant and show that the model for the 5 quarters after the election has the highest goodness of fit. This tells us that governing parties typically begin adjusting the rate of adjustment for government revenues fifteen months after an election. In conclusion, the empirical results of this study show that partisan effect and election cycle do cause the government budget to stray from its equilibrium state. However, partisan effect and election cycle also causes the government to go through an asymmetric adjustment back towards long run budget equilibrium.

CONCLUSION

In this study we use the asymmetric model to study the budget adjustment mechanism/process of the Taiwan government over the sample period of 1965:Q3-2006:Q4. Estimations from the TAR and M-TAR models show that government expenditures and revenues share a cointegration relationship and an asymmetric adjustment process. We use the Heaviside indicator function to test different party and political election cycle settings to show that government expenditures and revenues are indeed affected by partisan effect and political election cycle elements and adjust towards long term equilibrium over time. The TAR ECM results suggest that Taiwan's government budgeting follows a TAR model, and satisfies the decisions of both partisan and opportunistic political cycle theories. Regardless of whether the KMT or DPP is elected, the governing party will use an asymmetric adjustment process to move government expenditures or revenues back towards long term equilibrium. However, the expenditures and rate of adjustment of government expenditures and revenues under the DPP governance is slightly faster than that of the KMT. The primary explanation for the different rates of adjustment under the two government parties is that during the DPP regime, the nation's budget imbalance and disequilibrium was more serious, forcing the DPP to commit to larger expenditure and revenue adjustments in order to achieve long term equilibrium. In terms of the political election cycle and its impact on the government budget, the rate of adjustment of government expenditures is significantly higher during pre-election periods, while the rate of adjustment for government revenues is significantly lower during pre-election periods. The explanation behind this phenomenon is that the ruling party typically adopts expansionary economic and political strategies including the expansion of public infrastructure, the increasing of public spending, the issuing of tax benefits, and the decreasing of taxes, in order to gain voter support. This explanation is compatible with the opportunistic political cycle theory and policy making approach. Empirical results show that the rate of adjustment for government expenditures and revenues speeds up in the 5 and 6 quarters after major elections, bringing the government budget back towards long run equilibrium.

FISCAL DEFICIT SUSTAINABILITY IN CHINA: NONLINEAR EVIDENCE

Chiung-Ju Huang and Yuan-Hong Ho
Feng Chia University, Taiwan

ABSTRACT

The fiscal deficit in China has grown rapidly over the past decade, increasing approximately 8 times as much between 1994 and 2005. In this paper, we examine the fiscal deficit sustainability in China, using government expenditures, revenues, and GDP data over the period of 1955 to 2005. Instead of using classical approaches based on linear models, this study utilizes a nonlinear model approach. When applying a nonlinear model, the result of model selection shows that the deficit-GDP ratio is better represented by the exponential smooth transition autoregressive model (ESTAR) when compared to the logistic smooth transition autoregressive model (LSTAR). The empirical results indicate that there is a non-linear mean reversion in the deficit-GDP ratio. This suggests that the fiscal deficit in China is sustainable and will shift towards equilibrium in the long run.

INTRODUCTION

Economic growth and the significant advancement of democracy in the late 20th century has lead several nations down the path of increased spending in hopes to sustain and satisfy growing infrastructure and public needs of the general public. Meanwhile, government revenues have not met the increased spending, resulting in significant budgetary deficits. A number of countries have turned to public loan as a measure to sustain government expenditures, further adding weight to their fiscal deficit. In response to this problem, economists and researchers began examining the role of intertemporal government budget constraints in nations' fiscal policies, paying special attention to the deficit sustainability.

In the international center of attention, the People's Republic of China has recently experienced rapid economic growth – approximately 10% per year – as it further develops into one of the world's largest economies. In fact, the amount of government expenditures in China has grown 11 times within 16 years, from 308.3 billion in 1990 to 3,393 billion in 2005. As expected, China's budgetary deficit has also significantly increased, from a barely visible amount in 1994 to approximately 8 times the amount by 2005. Since 2000, China's deficit problem became more and more visible and in two years the deficit came extremely close to 3% of the GDP, nearly surpassing the critical debt target amount determined by the International Monetary Fund (IMF) and the acceptable range established in the Maastricht Treaty.

As a result of wide-spread fiscal deficits, growing number of international organizations such as IMF and the European Union (EU) have become more and more involved in the attempt to control and return fiscal deficits to an acceptable portion of GDP. The purpose of this study is to gain a better understanding of whether the financial deficit in China can be characterized as being sustainable and is therefore not a serious concern or can be characterized as following a "No Ponzi-game" that ultimately leads to government's financial bankruptcy and other serious outcomes. This study applies a nonlinear model to examine whether China's fiscal policies and financial deficit is in fact, sustainable over time.

The traditional approach for examining fiscal deficit sustainability is to look at the stationarity of the deficit or the deficit to GDP ratio. Previous studies used unit root tests examine the deficit or debt to GDP ratio

(Flavin and Hamilton, 1986; Trehan and Walsh 1988; Wilcox, 1989; Quintos, 1995; Arghyrou, 2004). The unit root tests under a linear process for the deficit to GDP ratio implies that adjustments towards the long run equilibrium of the deficit to GDP ratio is continuous and has a constant speed, regardless of the amount of deviation from the equilibrium. However, this assumption conflicts with the growing evidence that governments respond more to primary deficit (surpluses) when its public debt is particularly high (low). To address this phenomenon, this study adopts a nonlinear model.

METHODOLOGY

Linear models are likely over restrictive and may not adequately capture asymmetries that may exist in the deficit to GDP ratio. Therefore, in this study, a nonlinear model is adopted.

Nonlinear Model

The nonlinear model for the deficit to GDP ratio (y_t) considered here is a smooth transition autoregressive (STAR) model, where adjustments take place in every period but the speed of adjustments varies with the extent of the deviation from equilibrium (Granger and Teräsvirta, 1993; Teräsvirta, 1994). A STAR model for y_t (Teräsvirta, 1994) may be written as follows:

$$y_t = \alpha_0 + \sum_{j=1}^{p-1} \pi_j y_{t-j} + \left(\alpha_0^* + \sum_{j=1}^p \pi_j^* y_{t-j} \right) F(y_{t-d}; \gamma, \tau) + \varepsilon_t \quad (1)$$

where $\varepsilon_t \sim iid(0, \sigma^2)$; p is the autoregressive lag length; $F(y_{t-d}; \gamma, \tau)$ is the continuous transition function, y_{t-d} is the switching transition variable, $d > 0$ is the delay parameter, $\gamma > 0$ is the smoothness parameter, and τ is the location parameter threshold. Equation (1) may be written, parameterized in the first difference form, as follows:

$$\Delta y_t = \beta_0 + \lambda y_{t-1} + \sum_{j=1}^{p-1} \delta_j \Delta y_{t-j} + \left(\beta_0^* + \lambda^* y_{t-1} + \sum_{j=1}^p \delta_j^* \Delta y_{t-j} \right) F(y_{t-d}; \gamma, \tau) + \varepsilon_t \quad (2)$$

Two types of transition function in equation (2) are considered. The logistic function and the exponential function are as follows:

$$F(y_{t-d}; \gamma, \tau) = \left\{ 1 + \exp[-\gamma(y_{t-d} - \tau)] / \sigma_{y_{t-d}} \right\}^{-1}, \quad \gamma > 0 \quad (3)$$

$$F(y_{t-d}; \gamma, \tau) = 1 - \exp[-\gamma(y_{t-d} - \tau)^2 / \sigma_{y_{t-d}}^2], \quad \gamma > 0 \quad (4)$$

Equation (2) with the transition function (3) is called the logistic STAR (LSTAR). When $\gamma \rightarrow 0$, the model reduces to AR(p) model. When $\gamma \rightarrow \infty$, $F(y_{t-d}; \gamma, \tau) = 0$ for $y_{t-d} \leq \tau$, and $F(y_{t-d}; \gamma, \tau) = 1$ for $y_{t-d} > \tau$, the STAR becomes a two-regime threshold model. Since $F(y_{t-d}; \gamma, \tau)$ is not symmetric about τ , the LSTAR is capable of generating the asymmetric short run dynamics in two forms.

Equation (2) with the transition function (4) is called the exponential STAR (ESTAR) in which the dynamics change symmetrically around τ with y_{t-d} . The ESTAR gives similar short run dynamics between an expansion and a recession period. As $\gamma \rightarrow \infty$, the ESTAR model becomes linear. If $\gamma \rightarrow 0$, one regime has probability one and the other probability zero on the boundary.

Model Specification

The requirements for applying the STAR model involves three steps. First, specify a linear autoregressive model for y_t and determine the lag length of autoregression, p . Second, test for linearity against STAR. For a given value of the delay parameter d , Granger and Teräsvirta (1993) and Teräsvirta (1994) show that appropriate tests for linearity against STAR may be based on the artificial regression:

$$y_t = \alpha + \sum_{j=1}^p (\beta_{1j} y_{t-j} + \beta_{2j} y_{t-j} y_{t-d} + \beta_{3j} y_{t-j} y_{t-d}^2 + \beta_{4j} y_{t-j} y_{t-d}^3) + \varepsilon_t \quad (5)$$

Equation (5) may be viewed as a reparameterization of equation (1), with an unrestricted third-order Taylor series expansion of the transition function. Test the null hypothesis of linearity against an alternative as the following against the alternative hypothesis of nonlinear adjustment that H_{0L} is not valid.

$$H_{0L} : \beta_{2j} = \beta_{3j} = \beta_{4j} = 0 \quad j = 1, 2, 3, \dots, p \quad (6)$$

The linear test is carried out for a range of values $d = 1, 2, 3, \dots, D$ to determine d if the null hypothesis is rejected. If there is a rejection of linearity more than one value of d , d is then determined by the lowest p value of the F statistic of the linearity test.

After deciding on d , the third and final step is to choose the appropriate STAR model – LSTAR or ESTAR. For this purpose, the following null hypotheses are considered.

$$H_{04} : \beta_{4j} = 0 \quad j = 1, \dots, p \quad (7)$$

$$H_{03} : \beta_{3j} = 0 \mid \beta_{4j} = 0 \quad j = 1, \dots, p \quad (8)$$

$$H_{02} : \beta_{2j} = 0 \mid \beta_{3j} = \beta_{4j} = 0 \quad j = 1, \dots, p \quad (9)$$

The LSTAR is selected if H_{04} is rejected. Alternatively, the ESTAR is adopted if H_{04} is not rejected while H_{03} is rejected. Accepting both H_{04} and H_{03} but rejecting H_{02} implies the selection of the LSTAR.

EMPIRICAL RESULTS

This study focuses on the ratio and percentage of government deficit in respect to the GDP and uses a nonlinear model to examine whether the observed deficit to GDP ratio is sustainable.

Data

The data period discussed in this study covers 1955 to 2005. The variables in the empirical model include government revenues, government expenditures, and GDP. The data were converted from nominal to real data using the GDP deflator. The applicable data and resources were obtained from the Chinese Statistical Yearbook of 2005 and AREMOS Economic Statistics Database.

Nonlinearity

This study adopts a nonlinear STAR model for y_t . The initial testing for the presence of nonlinearities in y_t is based on three stages. First, a linear AR model for y_t is specified. Second, test for the presence of nonlinearities. Third, choose the appropriate nonlinear STAR model – LSAR or ESTAR.

AR Model

In this study, we adopt the suggestion of Granger and Teräsvirta (1993), and use the partial autocorrelation function (PACF) to determine the lag order of $p=1$ (see Figure 1).

Figure 1: Partial autocorrelation function of the deficit to GDP ratio

Figure 1 indicates y_t is AR(1), as the following.

$$y_t = \alpha_0 + \beta y_{t-1} + \varepsilon_t \quad (10)$$

Furthermore, when we reparameterize the standard linear AR(1) model as a Dickey-Fuller regression as follows:

$$\Delta y_t = \alpha_0 + (\beta - 1)y_{t-1} + \varepsilon_t = \alpha_0 + \lambda y_{t-1} + \varepsilon_t \quad (11)$$

Table 1 indicates that the null hypothesis of $\lambda = 0$ will not be rejected, that is y_t is nonstationary. Although y_t is nonstationary, it does not necessarily imply that y_t is not mean-reverting. If the true process for y_t is nonlinear (of a form given by equation (2)) and $\lambda = 0$ (as above), then y_t is mean-reverting under the condition that $(\lambda + \lambda^*) < 0$. In other words, small deviations in y_t may follow a unit root or even explosive behavior, but for larger deviations the process is mean-reverting. While $\lambda \geq 0$ maybe admissible, one must have $\lambda^* < 0$ and $(\lambda + \lambda^*) < 0$ for y_t to be mean-reverting.

Table 1: Estimation of the deficit to GDP ratio in Dickey-Fuller regression

| Independent Variable | Coefficient | Std. Error | t-Statistic | Prob. |
|----------------------|-------------|-----------------------|-------------|-----------|
| y_{t-1} | -0.510486 | 0.124684 | -4.094252 | 0.0002 |
| Constant | -0.004763 | 0.001996 | -2.386632 | 0.0210 |
| R-squared | 0.258835 | Mean dependent var | | -0.000309 |
| Adjusted R-squared | 0.243394 | S.D. dependent var | | 0.013600 |
| S.E. of regression | 0.011830 | Akaike info criterion | | -5.997248 |
| Sum squared resid | 0.006717 | Schwarz criterion | | -5.920767 |
| Log likelihood | 151.9312 | F-statistic | | -5.968124 |
| Durbin-Watson stat | 16.76290 | Prob(F-statistic) | | 1.721710 |

Linearity Tests

In this study, the PACF of y_t in Figure 1 clearly suggests that $p=1$, whereas the optimal d is selected by performing equation (5) for $1 \leq d \leq 6$ and choosing the lowest p value of the F statistic of the linearity test. Table 2 reports the result of linearity test. At $d = 2$ we observe the lowest p value and the greatest F statistic. In addition, when $d = 2$, we can not reject the H_{0L} at 1% significant level. There is a strong evidence to support that y_t is nonlinear.

Table 2: Linearity tests on the deficit to GDP ratio

| d | F Statistic of H_{0L} | p value |
|----------|-------------------------|---------------|
| 1 | 3.155864 | 0.0338 |
| 2 | 4.693394 | 0.0063 |
| 3 | 0.176318 | 0.9119 |
| 4 | 4.175308 | 0.0113 |
| 5 | 2.018276 | 0.1263 |
| 6 | 3.782443 | 0.0177 |

Nonlinear Model Selection

Table 3 reports the result when H_{03} has the lowest p value at $d = 2$, indicating that the ESTAR model is the appropriate choice.

Table 3: Model specification of LSTAR vs. ESTAR

| d | H_{04} | | H_{03} | | H_{02} | |
|----------|-------------|---------|-----------------|---------------|-------------|---------|
| | F Statistic | p value | F Statistic | p value | F Statistic | p value |

ESTAR Estimation Results

The parameters of the ESTAR model are estimated by nonlinear least squares (NLS). Estimation results of the nonlinear ESTAR model and linear AR model are reported in Table 4. We observe the higher R^2 and lowest estimated variance under the ESTAR. The value of V is less than 1 and shows a 51% reduction of the residual variance from the estimated ESTAR compared to the linear regression (11). The results support the selection of ESTAR over the linear model. The estimated exponential transitional function is:

$$F(y_{t-d}; \gamma, \tau) = 1 - \exp[-0.542394291(y_{t-d} + 0.017768732)^2 / 0.00009] \quad (11)$$

The graph of estimated exponential transitional function is illustrated in Figure 2. In the ESTAR model, the crucial parameters for the stability of y_t are λ and λ^* . For y_t to be mean-reverting, $(\lambda + \lambda^*) < 0$ must be true. According to the estimation results in Table 4, we find that $(\lambda + \lambda^*) \approx -1.297 < 0$. It indicates that y_t is mean-reverting. Hence, there is supporting empirical evidence for deficit sustainability in China.

Table 4: Estimation of linear and nonlinear models

| Variable | Coefficient | Linear Model | ESTAR |
|---------------------------------|--------------|---------------------------|---------------------------------|
| constant | α_0 | -0.004763** (0.001996) | -0.001094878 (0.003092781) |
| y_{t-1} | λ | 0.489514*** (0.124684) | 0.286585421 (0.492606264) |
| constant | α_0^* | | -0.002768618 (0.004464288) |
| y_{t-1} | λ^* | | -1.583145416** (0.714734558) |
| | γ | | 0.542394291 (0.613998149) |
| Location Parameter Threshold | τ | | -0.017768732** (0.007002086) |
| Adjusted R ² | | 0.227298 | 0.416591 |
| $\sigma_{y_{t-d}}^2$ | | | 0.00009 |
| SSR | | 0.006717 | 0.0021276544 |
| V | | | 0.490462 |

- Notes: 1. SSR indicates the sum of the squared residuals from estimated models.
2. The figures in parentheses are standard errors.
3. ** and *** donate significance at the 5%, and 1% significance level, respectively.
4. V donates ratio of the residual variance from estimated ESTAR model to the residual variance from the estimated best fitting alternative linear model (an AR(1)).

Figure 2: Estimated exponential transition function of the deficit to GDP ratio

CONCLUSION

The concept of sustainability relies on the premise that a government needs enough resources to ensure their ability to carry out their functions, so analyzing sustainability helps determine whether a current fiscal policy can be maintained in the long run given a government's ongoing ability to generate fiscal resources. A nonsustainable fiscal policy potentially creates a risk of rising future interest rates that leads to a slowdown in economic growth.

This study focuses on the ratio of government deficit in respect to GDP and uses a nonlinear model and empirical analysis to examine whether the observed deficit to GDP ratio in fact displays patterns of sustainability. Based on the criteria set forth in this study, we propose the following conclusions. Results from linearity tests show a nonlinear relationship in China's deficit-GDP ratio and therefore encourages the use of nonlinear model analyses to properly address this observed behavior. Nonlinear modeling produces more significant results and has better explanation power when compare to linear modeling. The ESTAR model is applied in this study because while using a nonlinear model approach to examine China's deficit-GDP ratio, the ESTAR model is more appropriate than the LSTAR model. The ESTAR estimation results show that China's deficit to GDP ratio displays trend of a return to a state of equilibrium, suggesting that China's fiscal deficit has sustainable characteristics. This suggests that if the deficit increase can be sustained, the Chinese Government may prevent a potential financial crisis.

ABSTRACT

Compared with Japan, Europe, and the United States, the service of mobile phone in Taiwan is growing. The key point of the telecom company, therefore, aims to explore the needs of consumers, and improve the value of the mobile value-added service. The importance of perceived value in customer decision making is well known. However, few studies assess empirically the direct effects of various innovation characteristic on perceived value dimensions. This article examines the differences value creation perceptions between simple and sophisticated mobile content service users. This research uses a sample of 492 mobile service users; results are analyzed with multi-group structural equation modeling. The research findings support use of innovation characteristic and multidimensional value to identify differences between service user groups, and argue for the use of differentiated value-based marketing strategies for simple and sophisticated mobile services.

INTRODUCTION

Mobile devices have profoundly transformed the telecommunication industry and have become the new service frontier. For example, the growth in mobile data services has firmly established at 17% of total service revenues, offsetting the decline in prices for voice calls and extending mobile into multiple facets of users' daily lives (AT Kearney, 2008). With mobile commerce refer to use of mobile devices (mobile phone, PDA, etc.) to communicate and conduct transactions through public and private networks (Balasubramanian, Peterson, and Jarvenpaa, 2002) which can be used to effectively deliver value-added service (Nysveen, Pedersen, and Thorbjørnsen, 2005). Despite the widespread introduction of new mobile services, recent reports reveal that the success of mobile data services is still limited (Carlsson, 2006) in contrast to the tremendous success of mobile voice communication services.

For efficiently getting the target customers to use content services, theories for targeting and marketing are used (Pihlström and Brush, 2008) leading to lower prices or higher margins. The research prior to this research has been conducted on comparing the level of mobile service loyalty intention between generation Y and baby boomers (Kumar and Lim, 2008). Due to the diversity of mobile content services, consumers use them for different reasons (Nysveen et al., 2005). Pihlström and Brush (2008) suggests that it would be worthwhile to investigate the existence of differences in the various mobile services. Therefore, our first objective is that investigates the differences between simple service sample and sophisticated service sample in mobile service value creation to extent of which deeply understand mobile services user behavior. Simple services in this study based on base communication services include such content as voice communication and text message, while sophisticated services included entertainment services (games, numerology, ring tones, MMS) and information services (news, weather reports, search services, e-mail service, and transaction service). Second, we propose a

direct effects model of functional value, hedonic value and social value creation, all of which reflect the main costs and benefits associated with mobile service delivery. Customer perceived value is the difference between the prospective customer's evaluation of all the benefits and all the costs of an offering with the perceived alternatives (Kotler, 2006). However, previous study has largely estimated the effects of overall perceived value on behavior constructs such as loyalty (Pihlström and Brush, 2008). The antecedents of multi-dimension perceived value has received only limited attention. As a response to several calls for further investigation (Pihlström and Brush, 2008), we would like to examine whether there are differences between simple and sophisticated service sample in how their various dimension of perceived value.

Third, we explore the innovation characteristics to reflect the main costs and benefits associated with different service group. In order to attract more subscribers to use mobile service, the telecom company needs to understand the driving force behind consumers' perceived value (Kumar and Lim, 2008; Pihlström and Brush, 2008). To gain an understanding the antecedents of perceived value, prior research has often embraced Technology Acceptance Model (TAM) to affect perceived value (Kim, Chan, and Gupta, 2007), because it is a parsimonious model (Plouffe, Vandenbosch, and Hulland, 2001). Others argue that this parsimony represents its limited application, as the model does not fully reflect the variety of different contexts (Kleijnen, Ruyter, Wetzels, 2007). Furthermore, the innovation characteristic can be used to explain consumer's value perceptions (Plouffe et al., 2001; Kleijnen et al., 2007). From a consumer's perspective, the characteristic of m-commerce is ubiquity, that refers to engage in commerce anytime and anywhere, which can be explained through PCI (Perceived characteristics of innovations) framework, defined by Rogers (1995). As a result, we examine whether the PCI framework drive perceived value different from service group.

HYPOTHESIS DEVELOPMENT

Time convenience plays an important role in mobile service context, which can create the different value perception in customer mind via the benefit of time saving. The nature of mobile service highlights the ubiquitous "anywhere, anytime". It implies that consumer can perform task easily (Hourahine and Howard, 2004) and play games easily (Anckar and D'Incau, 2002) via mobile phone, which can create functional and hedonic perceptions in customer mind. Consumers can derive functional and hedonic value from efficient and timely interactive media technology (Chilers, Carr, Peck, and Carson, 2001). Also, using mobile service in public space can represent personal trait, social status, and personal image (Leung and Wei, 2000). As a result, we expect mobile services can immediately fulfill customer needs and enhance the functional, hedonic, and social value. However, time convenience is expected to be more influential in the sophisticated service users, where the immediate consequences of use are evaluated more important than in simple service users. We therefore hypothesize:

- H1: (a) Time convenience will positively affect functional value, and (b) it is significantly stronger for sophisticated service users.*
- H2: (a) Time convenience will positively affect hedonic value, and (b) it is significantly stronger for sophisticated service users.*
- H3: (a) Time convenience will positively affect social value, and (b) it is significantly stronger for sophisticated service users.*

According to Kleijnen et al. (2007), the authors examine compatibility of mobile channels with particular service needs, that is, service compatibility. Research on mobile services reveals that mobile channels enable consumers to fulfill service needs, and positively enhance functional value (Kleijnen et al., 2007). In addition, customization mobile services, for instance ring tone, voice communication, and pictures, can satisfy customer needs, fit with personal preference, and may to show off them to peers (Sigala, 2006), which will build hedonic value and social value in customer mind. Although, the service compatibility characteristic refers the basic needs to use mobile service, is not significant difference between simple and sophisticated services. Consequently, we suggest the following hypothesize:

- H4: (a) Service compatibility will positively affect functional value, and (b) there is no significant difference in this relationship for simple and sophisticated service.*
- H5: (a) Service compatibility will positively affect hedonic value, and (b) there is no significant difference in this relationship for simple and sophisticated service.*
- H6: (a) Service compatibility will positively affect social value, and (b) there is no significant difference in this relationship for simple and sophisticated service.*

Trialability is the degree to which an innovation may be experimented with on a limited basis (Rogers, 1995). Consumer tried out a new technology is a way to giving meaning to it, to understand how it works, and to reduce uncertainty about the new idea (Rogers, 1995). Then, these people are willing to share information of new product and new service to reduce others' uncertainty about the new product, and enhance social approval and self-image among other individuals (Sheth, Newman and Gross, 1991). Therefore, the authors propose that trialability will positively affect social value. However, the trialability is expected more important to simple services users of an innovation than to sophisticated services users, where the trialability characteristic can decrease uncertainty which is more important than heavy users. Hence, we propose the hypothesis as follows:

H7: (a) Trialability will positively affect social value, and (b) it is significantly stronger for simple service users.

Observability is the degree to which the results of an innovative are observed to others (Rogers, 1995). Previous research in broadband Internet technology context (Oh, Joongho, and Kim, 2003) shows that the results of using it can help individuals to obtain knowledge on how to use it and adopt it with less effort and time, and enhance efficiency of task accomplishment (functional value). Furthermore, customers may also receive hedonic value and social value through the results of using mobile service. For example, ring tone service is easily observed to user and other individuals, which can arouse the enjoyment perception (Babin, Darden, and Griffin, 1994) and represent the self-image (Weilenmann and Larsson, 2000). Therefore, we predict that observability will enhance functional value, hedonic value, and social value. Nevertheless, simple and sophisticated users may also view observability characteristic as the basic feature of mobile services which do not have significant difference between both users. As a result, we suggest the following hypothesis:

H8: (a) Observability will positively affect functional value, and (b) there is no significant difference in this relationship for simple and sophisticated service.

H9: (a) Observability will positively affect hedonic value, and (b) there is no significant difference in this relationship for simple and sophisticated service.

H10: (a) Observability will positively affect social value, and (b) there is no significant difference in this relationship for simple and sophisticated service.

Perceived risk means to the subjective expectation of a performance loss (Stone and Gronhaug's, 1993), which refers to the loss incurred when a product does not perform as expected (Horton, 1976). In recent research, the penetration of mobile phones has exceeded 100% in Taiwan, however, this growth do not represent the mobile service usage rate. It means that the diffusion of mobile service has limited by usage uncertainty (Rao and Monroe, 1989). When they are not familiar with new services, individuals are generally more concern about the possibility of losing money and information (Hourahine and Howard, 2004). It does not fulfill individuals' expectancy in mobile service and reduce the perception of functional value. In addition, Eroglu and Machleit (1990) indicated that customers have the bad mood when the products in the retail store can't satisfy their needs. According to impression-management theory, individuals will tend to make a more positive impression on others to derive social value (Iedema and Poppe, 2001). For example, in mobile service context, when perceived risk increases, individuals afraid to use it, and may make a negative impression on others, which decrease social value perception. Hence, we indicate that the relationship between perceived risk and three value categories are negative. However, the risk perception is different from simple and sophisticated services users, for example, heavy user more willing to use Internet because the www offers with a mix of risk relievers are evaluated favorably and can even challenge specialty store alternatives, on the contrary, the light users do not seem to consider that (Van den Poel and Leunis, 1999). Consequently, we propose the following hypothesis:

H11: (a) Perceived Risk will negatively affect functional value, and (b) it is significantly stronger for simple service users.

H12: (a) Perceived Risk will negatively affect hedonic value, and (b) it is significantly stronger for simple service users.

H13: (a) Perceived Risk will negatively affect social value, and (b) it is significantly stronger for simple service users.

METHOD

Mobile value-added service users were the target sample. The survey was conducted in Taiwan, and used purposive sampling method to collect data. A total of 492 self-administrated questionnaires were collected, of which 272 questionnaires were collected at online survey and 220 questionnaires were collected through personal networks. All answers were anonymous. To avoid demand effects, participants from the personal

network did not know the researchers personally. Responses did not differ by questionnaire source. This survey process generated 128 unusable responses, as the respondents either had not previously used mobile services or did not state the mobile service they had used. The characteristics of the respondents are as follows: In the simple services sample (173 respondents), there are 87 male and 86 female, both of them concentrates on 18~25 years old (54%), the pre-tax income is less than NT\$10,000 (49%), and mobile service billing is NT\$1~100 (85%); in the sophisticated services sample (316 respondents), there are 161 male and 155 female, both of than concentrates on 18~25 years old, the pre-tax income is less than NT \$10,000 (42%), and mobile service billing is NT\$1~100 (69%).

All measures were based on previous research, and 5-point scales were used throughout. All items were modified from previous studies by selecting items that apply to mobile services and by adapting the wording to fit the mobile service context. As a result, time convenience conducted three items modified from Kleijnen et al.(2007), service compatibility had three items from Meuter et al. (2005), trialability had two items (Moore and Benbasat, 1991), observability had three items (Plouffe, Vandenbosch, and Hulland, 2001), perceived risk had three items (Kleijnen et al., 2007), functional value had two items (Babin et al., 1994), hedonic value had three items (Wang, Baker, Wagner, and Wakefield, 2007), and social value had three items(Pura, 2005).

ANALYSIS AND RESULTS

Measurement Model Estimation

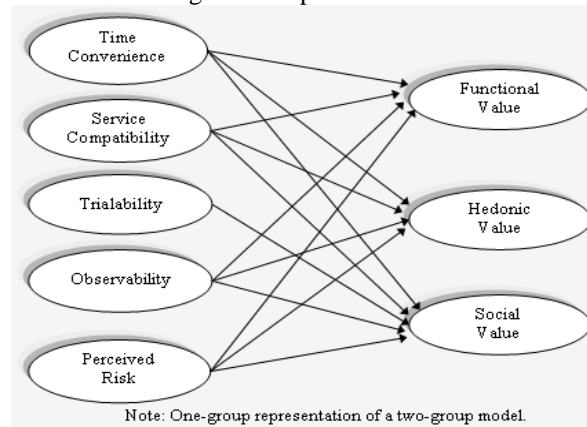

Exploratory factor analysis was conducted with SPSS in order to provide a preliminary examination of whether the items measure separate constructs. All variables were formed separate factors. Additional measurement development and estimation was performed with AMOS 6.0. A preliminary test of internal consistency indicated that all item-to-total correlations exceeded 0.50 (Churchill, 1979). The quality of the measurement model was assessed in two steps. First, confirmatory factor analyses (CFA) was used to assess the reliability and validity of each of the constructs in the model. All the factor loadings were significant statistically ($p < 0.01$). The standardized factor loadings for 21 items across both service samples exceeded the 0.60 standard that indicates that each measure is accounting for 50 percent or more of the variance in the latent underlying construct. Thus, these measures display adequate within-method convergent validity (Zaltman and Burger, 1985). Furthermore, the Cronbach alpha for most of the constructs in both samples was over 0.70, except for four constructs approximated to 0.70, significantly exceeding the 0.60 level advocated by Moschis and Churchill (1978) and supporting the unidiemsonality of the measures. Second, CFAs were also used to test the adequacy of the measurement model across groups. The equivalence of measurement across groups was assessed using the hierarchical method. This was undertaken to ensure that the measures could be used in cross-group comparisons. As a result, these analyses indicate that measurement models were invariant across groups at the factor loading levels, which was used in the structural model analysis.

The correlations between the composite variables are reported for each sample. Most of the constructs were correlated in the simple service sample, except for three constructs, supporting the nomological validity of the constructs. In the sophisticated sample 23/28 of the constructs were correlated. The convergent and discriminant validity tests suggested by Fornell and Larcker (1981) were conducted. The average variance extracted (AVE) approximated to 0.50 for all constructs, indicating that the constructs display a good degree of convergent validity. In addition, the square root of each construct's average variance extracted (AVE) was higher than the correlation between that construct and any other construct in the model. Therefore, the constructs are both theoretically and empirically distinct from each other.

Results

We tested the two-group model in figure 1. The results are presented in table 1. There are significant differences in the following relationships between the simple and sophisticated service groups: Time convenience → Hedonic value (H2b) and Perceived Risk → Functional value (H11b). In contrast to our expectations, other hypothesized differences were not significant and the relationships proved to be similar across service user groups.

Figure 1 Empirical Model

DISCUSSION AND IMPLICATIONS

This study contributes to contemporary research on new service delivery technology in two ways. First, we separated the sample into simple services users and sophisticated services users to investigate the differences between light users and heavy users in mobile service value creation. The analyses show a critical important support for this purpose, which identifies that functional value in simple service group, is primarily influenced by perceived risk, in contrast to sophisticated service group. However, previous research indicated that perceived risk do not play an essential role in mobile service use (e.g., Kleijnen et al., 2007), our results indicates that it is an important barrier for simple service users to use mobile services than sophisticated service users. In contrast, there are some relationships are not supported, time convenience and trialability has no significant difference effect on perceived value. Also, there is not positively relationship between time convenience and trialability and perceived value, only time convenience has a significant effect on social value in sophisticated service. One possible reason of this finding could be that time convenience and trialability are primarily the basic characteristics of mobile service and consumers frequently regard it as a hygiene factor.

Second, similar service compatibility and observability effect on three categories perceived value were found for both service groupings. The results indicate that functional value creation is significantly influenced by service compatibility, and hedonic value and social value is principally influenced by observability in both groups. This finding also confirms prior assertions about the importance of service compatibility in relation to technology-based services (Meuter et al., 2005). In addition, the results indicate that observability is a critical important factor in mobile service value creation which has a significant influence on hedonic value and social value. Although previous research indicates that only relative advantage, service compatibility and complexity relate consistently to innovation adoption (Agarwal and Prasad, 1997), researches should pay attention to the effect of observability, especially in mobile service context.

Managerial Implications

Our results also offer several implications for managers. We find that perceived risk negatively affect functional value and significantly stronger for simple service users, and our findings suggest several ways managers could emphasize on alleviate the risk perceptions. For example, companies are investing in mobile risk control by setting secure agreement and securing better mobile infrastructures and sophisticated data protection schemes (Kleijnen et al., 2007), also, they can employ some promotion methods to encourage consumers to use mobile services, such as offering more opportunity to trial mobile services, providing simpler service designs and reveal more mobile service information on the website, which can decrease risk perceptions.

In addition to these specific service enhancements, companies should consider more general promotional events, such as telecom company have launched a series activity to familiarize consumers with mobile service delivery. For example, Chunghwa telecom Company, the nation's largest mobile-phone-service operator, build a mobile service experience center to display new mobile phones and mobile services, which presents a diverse rangy of mobile service to create more consumer awareness of the impact of mobility.

Finally, research has suggested that service compatibility and observability are the most important factor to influence on three categories value in both simple and sophisticated service users. The producer of mobile devices should devote their attention to understand customer needs to design a set of service contents to fit their needs. Also, the results of mobile services are observable, therefore, managers could set up a community network platform to provide mobile services usage guidelines and more closely realize what consumers think about mobile services.

Table 1 Hypothesis Test Results

| Hypothesized Relationship | | Standardized Estimates (t value) | | χ^2 Difference | Hypothesis Supported | Simple vs. Sophisticated |
|-------------------------------|---|---|---------------------------|------------------------|-------------------------|-----------------------------|
| | | Simple services | Sophisticated services | | | |
| H1a(+) | Time convenience \rightarrow Functional value | -0.04 (-0.03) | 0.15 (1.58) | | NO | |
| H1b | Sophisticated < Simple | | | 1.352 | NO | Si = So |
| H2a(+) | Time convenience \rightarrow Hedonic value | -0.18 (-1.52) | 0.10 (1.09) | | NO | |
| H2b | Sophisticated > Simple | | | 3.344* | YES | Si > So |
| H3a(+) | Time convenience \rightarrow Social value | -0.02 (-0.17) | 0.16* (1.81) | | Partial | |
| H3b | Sophisticated > Simple | | | 1.664 | NO | So = Si |
| H4a(+) | Service Compatibility \rightarrow Functional value | 0.50*** (3.93) | 0.42*** (4.01) | | YES | |
| H4b | Sophisticated = Simple | | | 0.194 | YES | So = Si |
| H5a(+) | Service Compatibility \rightarrow Hedonic value | 0.30** (2.52) | 0.25** (2.86) | | YES | |
| H5b | Sophisticated = Simple | | | 0.096 | YES | So = Si |
| H6a(+) | Service Compatibility \rightarrow Social value | 0.23** (2.08) | 0.15 (1.51) | | Partial | |
| H6b | Sophisticated = Simple | | | 0.079 | YES | So = Si |
| H7a(+) | Triability \rightarrow Social value | -0.12 (-0.8) | 0.04 (0.40) | | NO | |
| H7b | Sophisticated < Simple | | | 0.746 | YES | So = Si |
| H8a(+) | Observability \rightarrow Functional value | 0.30** (3.28) | 0.15** (2.11) | | YES | |
| H8b | Sophisticated = Simple | | | 1.799 | YES | So = Si |
| H9a(+) | Observability \rightarrow Hedonic value | 0.39*** (4.05) | 0.35*** (5.08) | | YES | |
| H9b | Sophisticated = Simple | | | 0.232 | YES | So = Si |
| H10a(+) | Observability \rightarrow Social value | 0.46*** (4.11) | 0.33*** (4.63) | | YES | |
| H10b | Sophisticated = Simple | | | 0.308 | YES | So = Si |
| H11a(-) | Perceived Risk \rightarrow Functional value | -0.20** (-2.30) | -0.03 (-0.46) | | Partial | |

| H12a(-) | Perceived Risk \rightarrow Hedonic value | -0.01 (-0.12) | -0.02 (-0.39) | | NO | |
| H12b | Sophisticated < Simple | | | 0.013 | NO | So = Si |
| H13a(-) | Perceived Risk \rightarrow Social value | -0.24** (-2.73) | -0.20*** (-3.35) | | YES | |
| H13b | Sophisticated < Simple | | | 0.001 | NO | So = Si |
| Base line model | | GFI=0.88; AGFI=0.84; CFI=0.93; RMSEA=0.05; $\chi^2(373)=769.343$, p=0.000 | | | | |
| Simple services sample | | GFI=0.85; AGFI=0.80; CFI=0.92; RMSEA=0.074; $\chi^2(186)=362.97$, p=0.000 | | | | |
| Sophisticated services sample | | GFI=0.90; AGFI=0.86; CFI=0.93; RMSEA=0.061; $\chi^2(186)=406.137$, p=0.000 | | | | |

Limitations and Future Research Directions

Any study's contribution must be evaluated in light of its limitations, and this research is no exception. First, the cross-sectional nature of our research might create some confounds. Mobile service is still in its infancy, and as consumers' awareness with the mobile service field increases, our results should be reassessed to ensure the robustness of our model. Second, in this conceptual model, we only investigate the effect of value creation. Future research could examine the value creation effect on consumer intentions to use to deeply explain the mobile service use behavior. Finally, we compare simple and sophisticated service users and less considers other influence factors, for example how long does he use the specific mobile service. Further research could investigate the existence of differences in usage time of specific mobile service and usage patterns to better predict mobile service use behavior.

PALM OIL PRODUCTION AND ARMED CONFLICT IN COLOMBIA: EXPLORING THE CASES OF SAN ALBERTO AND SAN MARTÍN

Mónica Hurtado
University of La Sabana, Colombia

ABSTRACT

This article analyzes the relationship that exists between models of production of palm oil and armed conflict in Colombia. More specifically I compare two cases: the company Indupalma in the municipality of San Alberto, and a social project called 'Palma Campesina' in the municipality of San Martín. In both municipalities the production of palm oil has produced (in different degrees) economic growth and equality. At the same time, the two municipalities have been scenarios of political violence. This article argues that the implementation of particular horizontal models of production has partly helped to contain the violence. However, palm oil production has also spurred a violent dynamic in which different greedy actors fight for land.

INTRODUCTION

Consumer trends in Asia and the United States as well as the promotion of biofuels as a substitute (or complement) of conventional fuels have led to an increasing demand for palm oil in recent decades. Colombia has had exceptional natural conditions for producing palm oil. At present, Colombia is ranked as the first producer of palm oil in the Americas and the fifth in the world. President Alvaro Uribe has considered the expansion of palm oil production as a priority of his agenda.

Both government officials and entrepreneurs have praised the social impact of palm oil production in Colombia. Peasants that work in this sector receive a better salary than other rural laborers (FEDEPALMA, 2007: 45). In addition, arguably palm oil production has had a positive impact in terms of peacebuilding. In some drug-producing regions of Colombia, palm oil has served as a substitute to illicit crops. Additionally, several palm oil projects have provided jobs for forcibly displaced persons and even for demobilized members of the illegal armed groups.⁽¹⁾

At the same time, the palm oil industry has also been associated with political violence and human rights violations in some Colombian regions. A number of palm oil plantations are located in conflict-ridden zones where both, leftist guerrilla organizations and right-wing militias (the so-called paramilitary groups) have operated. Furthermore, there are some cases (such as *Urabá chocoano*, *Tumaco* and *South of Bolívar*) in which the illegal armed groups have forcibly displaced individuals and communities, and the grabbed lands were later devoted to the cultivation of oil palm.⁽²⁾

The palm oil industry in Colombia has had a variety of socioeconomic impacts, and has interacted in different ways with the armed conflict. While in some places the living conditions of local dwellers have improved, in others they have worsened considerably. And whereas some politicians, practitioners and scholars consider that the palm oil industry should be held responsible for human rights violations and environmental degradation, others defend this business as a solution to a number of development-related problems.

The palm oil agribusiness and its impact are complex issues that require a balanced analysis. This article focuses on two case-studies: the municipalities of San Alberto and San Martín, which show the complex relationship that

exists between the palm oil industry and armed conflict. In San Alberto, the company Indupalma first implemented a vertical model of production, and then switched to a mixed vertical-horizontal one. In San Martín, instead, palm oil production is associated with a peculiar horizontal model implemented through the *Palma Campesina* social project. Both regions are important centers of palm oil production and have been scenarios of armed conflict in Colombia.

This paper seeks to answer the following questions. To what extent did the two production models help generate welfare, growth and distribution in the two regions? Did these models help contain the armed conflict? Did the palm oil business generate violence and forced displacement, or were the palm oil entrepreneurs victims of illegal armed groups?

I. Models of Palm Oil Production in San Alberto and San Martín

The palm oil agribusiness was first established in Colombia more than forty years ago, but has experienced rapid growth during the past decade. In 2007, income from palm oil exports was estimated at U.S.\$ 350 million, which corresponds to 3% of Colombia's GDP. In 2008 Colombia produced 732,445 tons of crude oil, exporting 307,442 of them (FEDEPALMA 2008: 24). The palm oil industry is not labor intensive, but requires huge extensions of land. Reportedly Colombia has 316,000 hectares planted with oil palms. This industry has generated 75 thousand direct jobs and 150 thousand indirect ones.

San Alberto is a town with a population of 20,911 inhabitants and an area of 67,610 km². About three quarters of the population somehow depends upon the production of palm oil (PDSA, 2009). For its part, San Martín has a population of 17,592 inhabitants and an area of 90,555 km². This municipality also has a thriving palm oil industry, but displays a greater variety of economic activities including crops such as rice, sorghum, corn and cocoa (PDSM, 2009).

Both municipalities are located in Colombia's most productive palm oil zone. Currently, the area of oil palm plantations in these two municipalities approximates 20,000 hectares of which 11,000 hectares are already producing fruits, and each municipality has one extracting plant.

In San Alberto, Indupalma initially implemented a vertical model of production in which the company owned the land, controlled various links of the productive chain (the cultivation, harvest, extraction and refinement of palm oil), and also the trade of palm oil. This model led to strained labor-management relations until 1995, the year in which Indupalma was about to declare bankruptcy. In fact, due to unsustainable labor costs and declining international prices of palm oil, this business was no longer profitable.

Soon afterwards, Indupalma shifted to a mixed vertical-horizontal model of production. Due to the implementation of this new model, Indupalma has fared well. Perhaps other factors were at play besides the production of palm oil. In fact, Indupalma diversified its activities, and now provides services in investment banking, business operations, the marketing of other products and the like. It has also developed two major projects (*Palmar* and *Horizonte*) and its future plans include the purchase of 20 thousand hectares of land as well as an expansion to Central America (Lizarralde, 2009: 59).

But the point that I want to underscore is that since the mid-90s Indupalma has combined three different models of production. It has maintained a vertical model of production in the extracting plant. This is the place of the productive chain where less manpower is required, and where greater value is added to the product. But as regards the cultivation and harvest of oil palms, two different "horizontal" schemes function: cooperatives of associated work (in Spanish *Cooperativas de Trabajo Asociado* or CTAs) and Strategic Alliances (or SAs).

In the case of CTAs the palm oil companies subcontract workers through cooperatives. That is, they do not hire workers but rather, pay for a service provided by cooperatives. In the case of SAs, peasants become partners of companies through the development of productive projects (FEDEPALMA-IICA-Finagro, 2006: 48). Apart from companies and peasants, SAs usually involve various intermediaries such as operators, banks and other financial institutions that help develop the productive projects. Peasants involved in such productive

projects often receive a loan for the purchase of land and the cultivation of oil palms. The palm oil companies serve as guarantors of these credits, and after paying their debts, peasants end up owning the cultivated plots of land. At present, Indupalma works with 23 cooperatives and 12 SAs.(3)

In contrast, the *Palma Campesina* project of San Martín started in 2003 as a social enterprise led by Jesuit Father Francisco de Roux.(4) This project was conceived as part of the Program for Development and Peace of Magdalena Medio (PDPMM), and has received substantial aid from international sponsors. This project was originally conceived as a way to promote not only development, but also various political goals such as governability, participation, social justice and the protection of human rights (Villegas, 2008: 1).

The *Palma Campesina* project has been quite profitable. At present 110 families participate in this project, and each owns about 10hc of land. The productivity of these peasant farms has been remarkable. According to Villegas, these farms have harvested 18 tonnes of fruit/hc./year which corresponds to the national average.(5) In addition, peasants in San Martín cultivate other crops in order to ensure their own food security.

The *Palma Campesina* project somehow resembles the SAs models of Indupalma, in the sense that it relies on the intermediation of a third party for the production of palm oil. Peasants that cultivate oil palms must gain access to credit from both the government (through the ICR stimulus)(6) and banks in order to buy lands and make their plots productive. But in San Martín the intermediary function is performed by the PDPMM that has no economic interests of its own. Whereas in San Alberto Indupalma charges a fee for providing technical assistance and facilitating access to credit, in San Martín the intermediation costs of the PDPMM are negligible. As reported by Villegas, the reduction of transaction costs is clear, for example, in the price of seedlings, which are produced in nurseries run by partners of *Palma Campesina*. The seedlings used in the plots are produced at a significantly lower cost compared to what the palm consortia charge (Villegas, 2008:14).

With the *Palma Campesina* project, the bank loans are assumed by peasant associations instead of individuals. This has been a strategy to reduce the vulnerability of peasants. In fact, as peasants respond collectively (through their associations) if a credit is overdue, individual peasants are not forced to sell their lands in times of crisis (Villegas, 2008: 12). The *Palma Campesina* has also been involved in the development of infrastructure in San Martín, building bridges, roads and the like in order to facilitate the transportation of the fruits of oil palms.

The downside of San Martín is that peasants still depend upon the big palm oil companies for the transformation and commercialization of their crops. Even if peasants sign 12-year contracts with these companies for the sale of fruits, peasants merely plant, maintain, harvest and sell their product. The big companies still are in charge of the extraction and commercialization of palm oil and its applications, which add more value.

II. The Debate on Production Models

The debate concerning the impact of *vertical* and *horizontal* production models of palm oil has led to polarization. Until the late 90s, the prevailing model of palm oil production in Colombia was one of vertical integration. This model was adopted because, on the one hand, setting up a plantation is costly and requires a great deal of expertise, and on the other, it takes a long time before oil palms yield their fruits. However, once oil palms enter a productive stage, their life span reaches up to 25 years. In any event, for a long time palm oil production was associated with big businesses, and was considered out of reach of small producers.

In the late 90s, however, drawing from the Indonesian experience(7) the government of President Pastrana promoted new horizontal models of production in Colombia, specifically the SAs. From the government's perspective, palm oil projects had a tremendous potential as they helped to cope with some of the worst consequences of war and drug-trafficking in Colombia. In fact, they could provide an economic alternative to both the victims of violence (such as forcibly displaced persons), and former combatants of the illegal armed groups. They could also help replace illicit crops, as the government hoped to make peasants switch from a coca-based economy to palm oil.

There is little doubt that the SAs have attained some success, as attested by the fact that “between 1998 and 2005 25% of the area planted with oil palms corresponds to SAs” (FEDEPALMA-IICA-Finagro, 2006: 47). By

involving small and medium peasants in oil palm production, SAs have achieved both competitiveness and fairness. Not only have the big companies accrued gains, peasants have benefited from a better access to finance, technical services and marketing.

One should add that the structure of land property in San Alberto and San Martín is more democratic than in other areas of oil palm cultivation. And unlike other crops, the harvest occurs throughout the year, and the average life-span of oil palms is about 25 to 30 years. These peculiarities help associate palm oil production with economic growth and stability. Some peasants that I interviewed in San Martín mentioned that their hope was to get their children involved in this business (interview, San Martín October 2008).

Wages are also comparatively good in this sector. Workers on the payroll of palm oil industries receive 1.7 times the minimum legal wage, and those who work indirectly with the industry earn 1.4 times the minimum wage (FEDEPALMA 2008: 45). This underscores that palm oil production promotes equitable development.

One might add that according to a 2005 census, in 24 palm oil-producing municipalities the housing conditions and the education standards were higher than the national average. And in those municipalities in which palm plantations exist, formal employment relationships are common, as attested by the fact that they implemented a health scheme based on contributions (FEDEPALMA 2007: 41-53).

Although horizontal models of palm oil production, namely the SAs have been praised as mechanisms that foster social equality and contain the armed conflict, critics have pointed out that they allow instead the legal over-exploitation of workers. In fact, the owners of big companies have been able to reduce labor costs and also refrain from purchasing land (which is an important, considering that oil palm plantations require big extensions of land).

Furthermore, peasants that participate in the SAs must bear the costs of their own social security and they also have to assume the risks caused by volatility in international prices. Even if they expect to become landowners, these peasants have to work without receiving social benefits, without getting a higher wage for working overtime, and they do not receive pension benefits (Grupo Semilla, 2007: 61).

CTAs are even more problematic than SAs. Reportedly, various cooperatives have abused their own workers by e.g making irregular discounts in the paychecks and keeping volatile contracts. This has caused strikes of disgruntled palm oil workers, as the one of Puerto Wilches in 2008 (Vanguard, 02.02.2008).

In any event, peasants who work in either CTAs or in SAs have a small bargaining power vis-a-vis the big palm oil companies. Since only these companies have the means to buy and run extracting plants, they also set the prices accordingly to the international fluctuations. In the case of SAs, as the companies act as guarantors of loans to purchase land, peasants end up tied to the big companies until they pay back their credit (Villegas 2008). According to Salinas (2008: 9-11) and Villegas (2008: 11-12), peasants have often been misled about their obligations when they purchase land. Other critics have pointed out that most financial incentives provided by the government have ended in the hands of big investors (rather than the poorer sectors), in particular the intermediaries of the palm oil companies.

I would not argue that all horizontal models of production have merely exploited peasants. There are different experiences that make it difficult to generalize. I would conclude by saying that both in San Alberto and San Martín palm oil production has been a profitable economic activity. Perhaps the *Palma Campesina* project has demonstrated a greater concern for social justice, but both projects have entailed economic growth and equity.

III. Palm Oil Production and Armed Conflict

Both, San Alberto and San Martín have endured varying degrees of political violence since the late fifties. It was then that Indupalma and Palmas del Cesar started the palm oil business in the region, and many peasants settled in the two municipalities. Some of these peasants had been forcibly displaced from other Colombian regions,⁽⁸⁾ while others arrived due to the prospect of getting a job in the palm oil industry. Back then, the Colombian state

had a precarious presence in both municipalities. There were few (if any) state institutions that were able to provide collective goods to local dwellers (such as justice, security, and health services).

During the 1960s different communist guerrilla organizations emerged, seeking the overthrow of the Colombian state. These rebel groups (in particular the *Fuerzas Armadas Revolucionarias de Colombia* or FARC, *Ejército Popular de Liberación* or EPL, and *Ejército de Liberación Nacional* or ELN) for the most part settled in rural areas. Then, in the 1970s and early 1980s other rebel groups were formed such as the *Movimiento 19 de Abril* or M-19.

During the 1970s and 1980s the ELN and FARC arrived to the region and started obtaining illegal rents from various productive sectors. In particular, the rebel groups began kidnapping entrepreneurs, and extorting the palm oil industry, which was facilitated by the virtual absence of state institutions.

The rebel groups soon infiltrated the trade unions of the palm oil industry. As the labor conditions were precarious and there were no state institutions to enforce labor standards, polarization ensued. While the palm entrepreneurs were reluctant to make any concessions to the trade unions, the latter promoted a series of strikes and work stoppages that were backed by the rebel groups. The guerrilla organizations resorted to violence as a means to force the companies to make labor concessions, and this increased the rebel's influence upon the trade unions (Ospina, 2001: 125).

The increasing pressure from the rebel groups coupled with the strengthening of trade unions and the weakness of the Colombian state to provide security, led to the formation of the so-called right-wing paramilitary groups in the mid-1980s. In the beginning, these were private militias formed by the drug-traffickers to curb guerrilla extortion. Later on, some legal entrepreneurs and sectors of the Colombian army ended up supporting these militias that seemed to be effective in fighting against the guerrilla organizations. The paramilitary groups partly sought to prevent kidnappings and extortion by the guerrillas, and also to contain the influence of the rebel groups in several unions and social movements (OPPDH, 2006: 21).

The confrontation between rebel groups and paramilitary militias led to increasing levels of violence in the region. Between 1988 and 1991, paramilitary groups killed more than 70 trade union members of Indupalma (Ospina, 2001: 125), and the number of forcibly displaced persons (henceforth FDPs) increased significantly (OPPDH database, 2008). Beginning in 2000 the paramilitary groups started to prevail in the palm-producing areas of San Alberto and San Martín,⁽⁹⁾ and eventually the rebel groups were pushed out of these municipalities. Since then, the number of armed confrontations, kidnappings, extortion has decreased.⁽¹⁰⁾

Although the security situation has improved in the region, this does not necessarily mean that the paramilitaries have delivered peace. In fact, several indicators suggest that there is a weak rule of law in the region and that democratic institutions are far from consolidated. For instance, Aída Cecilia Lasso⁽¹¹⁾ who ran for mayor of San Alberto was murdered in 2000, and two union members were killed in 2001 and 2003. In 2004 the owner of the radio station *La Palma Estéreo* was also murdered, probably due to political reasons.⁽¹²⁾

In 2003 several paramilitary groups started peace negotiations with the Colombian government, and shortly afterwards about thirty thousand members of these armed groups turned in their weapons and demobilized. However, some analysts argue that the demobilization of paramilitary groups has only been partial (González, 2007). In fact, some former members of the paramilitary groups re-mobilized and formed new criminal organizations known as the *Águilas Negras* (or Black Eagles) that are primarily devoted to drug trafficking. Reportedly some *Águilas Negras* operate in San Alberto and San Martín (OPPDH, 2006: 6).

Even though San Martín and San Alberto are no longer territories disputed by the illegal armed groups (in particular, the guerrilla organizations and the paramilitary militias), one observes worrisome numbers of FDPs. In San Alberto, for instance, there were over 300 FDPs per year in 1997, 1998 y 2001, and over 200 in 2002, 2005 and 2007. Even though the number of FDPs decreased in the two years in which the paramilitary groups underwent a demobilization process (2003 and 2004), there were more than 150 FDPs in 2008. From the table below it is difficult to conclude that San Alberto is becoming a safe place to live.

Figure 1 – Forced Displacement in San Alberto and San Martín (1997 - 2008)

Source: OPPDH data base

San Martín, has displayed lower numbers of FDPs. While less than 50 persons had been displaced per year between 1997 and 2000, in 2001 and 2002 the number rose to approximately 150. And while the number of FDPs decreased between 2003 and 2004 (when the paramilitary groups demobilized), there has been an upward trend since then.

If the indicator concerning the number of FDPs suffices for deriving conclusions about the evolution of armed conflict in the two regions, and (presumably) the impact of models of production, one arrives at some puzzling conclusions. One would have expected to observe the following: In the case of San Alberto and Indupalma, the transition from a pure vertical model of production to a mixed one should have led to diminishing levels of violence. In fact, the mixed model implies giving stakes to peasants in the palm oil business. Due to the formation of SAs (but not the cooperatives) some peasants entered into a partnership with palm oil companies and acquired the prospect of becoming landowners. By becoming stakeholders, such peasants had no incentives to join or support the rebel groups and threaten the palm oil industry. In contrast, workers in a vertical model of production are more likely to enter a zero-sum relationship with companies (and so are the workers who belong to cooperatives).

The figure above shows a gradual, diminishing trend of FDPs in San Alberto. However, the available information does not allow us to compare the years corresponding to a pure vertical model of production (that is, before 1995), and the years following the adoption of a mixed model (after 1995). Still one might conclude that the mixed model has had a pacifying effect on the basis of the qualitative information provided before.

Apart from this, one would have expected the *Palma Campesina* project to provide a much more effective buffer vis-à-vis the armed conflict. By implementing a pure horizontal model of production and giving to all the peasants involved in this project a stake in palm oil production, *Palma Campesina* should have helped to keep San Martín peaceful –especially in comparison to San Alberto. Although the figure above confirms that the number of FDPs per year in San Martín has been lower than in San Alberto, there has been an upward trend in violence since 2003. This is a troublesome, unexpected finding, because this is the very year in which the *Palma Campesina* project started. In other words, setting up the palm oil business in San Martín has gone hand in hand with increasing numbers of FDPs. Actually the patterns of FDPs have tended to converge in San Martín and San Alberto since 2006.

How could one possibly explain this? It might be the case that the recent violent dynamic in San Alberto and San Martín is due to factors not related to the palm oil agribusiness as such. In fact, state institutions are still weak in this region, and the two municipalities have become strategic corridors for smuggling weapons and trafficking drugs (in fact, these regions provide an easy access to both Venezuela and the Atlantic coast).(13)

A more disturbing hypothesis is that due to the increasing profitability of this business and also the greater security in this region, some groups have started a deadly competition for grabbing lands, and this has caused the displacement of people. In other words, profit and greed related to palm oil production might partly explain why there has been an upward trend in FDPs since 2003. This would mean that, while the introduction of horizontal models of production in San Martín and (to a minor extent) San Alberto has helped to contain the influence of guerrilla organizations, it has not prevented the upsurge of a violent struggle for the profits related to the palm oil production.

CONCLUDING REMARKS AND POLICY IMPLICATIONS

This article has argued that horizontal models of palm oil production in San Alberto and San Martín (Colombia) have been sustainable in economic and social terms. Nevertheless, neither the project of Indupalma nor the one of *Palma Campesina* have been particularly effective in containing the violence.

And while both the Colombian government and the private sector have been promoting the expansion of oil palm plantations, apparently they have paid insufficient attention to the growing number of FDPs in the municipalities studied in this article. The increasing number of FDPs provides a warning sign about the continuing operation of illegal armed actors in the region, and about a growing violent dynamic concerning the possession of lands. If no measures are taken, violence might once again threaten the sustainability of this industry, which is an important source of foreign exchange. A great deal of state-building in San Alberto and San Martín would help to ensure that the palm oil industry promotes peaceful development.

SUSTAINABLE RETAILING: MARKETING INFLUENCE ON CONSUMER DECISIONS

Hilal Inan, Serap Çabuk and Deniz Zeren
Çukurova University, Turkey

ABSTRACT

Since the 1992 Rio Earth Summit, guiding concepts for a more sustainable future have been developed. Retailers arguably have a pivotal role in sustainable development, that they are intermediaries between primary products producers and manufacturers on the one hand and customers on the other. This paper examines how consumers' beliefs, as well as their exposure to influences, shape their behaviour and perceptions of sustainable retailing activities, with a particular focus on the influential role of marketing. To frame the pieces, this paper first reviews the literature on sustainable retailing and environmentally conscious consumer behaviour. Then it considers how consumers in Turkish market will be influenced by sustainable retailing practices of grocery retailers. With this purpose we draw hypotheses to test in a questionnaire-survey based empirical study.

INTRODUCTION

For over thirty years scientists, environmentalists and social activists have been pointing out the pitfalls of continued consumption of natural resources without regard to the harm being done to the environment (Hodges, 2005). Sustainability is no longer just the air we breathe, or the world we live in, it has become a requirement for businesses to address the environment in order to maintain customers, and exist in an ever more competitive global market (Chavan, 2005). As Kleiner (1991) stated large firms are finding big savings in waste management and seeing competitive advantage in promoting their products and themselves as environmentally sound (Mirvis, 1994). Realizing these advantages there has been significant awareness of sustainable management practices all over the world. With this increasing awareness comes the realization that the potential impacts of sustainable development activities need to be assessed and understood so that appropriate management and control strategies can be adopted (Chavan, 2005).

Just like in the early 1990s when the concept emerged, environmental concerns have attained substantial momentum and as Stisser (1994) stated, is continuing to alter consumers' basic habits (D'Souza, 2004). Several studies (e.g. Brooker, 1976; Du Preez *et al.*, 1994; Kassarian, 1971) have shown that environmentally conscious consumers are willing to change their consumption behaviour to preserve the environment. Being in one of the most diverse and dynamic sectors and offering a wide range of goods and services to their customers, retailers are required to integrate sustainability in its all possible activities more quickly than any other business settings.

There are only a few studies that focus on sustainable retailing in developing countries (e.g. Erol ve Özmen, 2008; Erol *et al.*, 2009). Therefore, considering the retail sector's crucial impact on the sustainable development, it is believed that findings from consumers of Turkey's grocery retailing sector would a contribution. This study also provides a guide to develop sustainability strategies for retailers which can be appreciated by consumers. In this paper, given the importance of retailers in sustainable development and the need for further investigation, we develop a questionnaire to measure the consumer perceptions about sustainable retailing activities of grocery retailers in Turkey. When the environmentally sustainable retailing is to become mainstream concern, it is important to look at what factors influence the consumer's selection process. This paper examines how consumers' values/beliefs and attitudes, as well as their exposure to influences and

information, shape their behaviour and perceptions of product performance, with a particular focus on the influential role of marketing. To frame the pieces, this paper first reviews the literature on sustainable retailing activities and environmentally conscious consumer behaviour. Then it considers how consumers in Turkish market will be influenced by sustainable retailing applications of grocery retailers. With this purpose we draw hypotheses to test in a questionnaire-survey based empirical study.

SUSTAINABLE RETAILING

Since the 1992 Rio Earth Summit, as Meijkamp (2000) suggested, guiding concepts for a more sustainable future have been developed (Van der Zwan and Bhamra, 2003). WECD (1987) has defined sustainable development as “development, which meets the needs of the present without compromising the ability of future generations to meet their own needs”. The concept was first mentioned during the emergence of interest in environmental issues and problems in the 1970s and since then it has attracted growing interest as both marketing practice and research. Most of the work concerning environmental sustainability has been targeted towards the industrial companies which manufacture products through the use of natural resources and energy (Van der Zwan and Bhamra, 2003). As a result academic attention focused on design for sustainability rather than services sector. Recently consequences and potential of the sectors like retailing are realized.

Retailers arguably have a pivotal role in sustainable development, that they are intermediaries between primary products producers and manufacturers on the one hand and customers on the other (Jones et. al, 2005a). Although retailers are not often designated as major polluters, they are recognized as having the power to induce change among manufacturers because they are a critical link in the supply chain (Bansal and Kilbourne, 2001). Also their tight bounds with manufacturers, consumers and government regulations, retailers are required to integrate sustainability in its all possible activities more quickly and easily than any other business settings.

Owing to these facts retailing started to attract attention in the field of sustainable development literature. First article about sustainable development handled within the retailing sector was published by Ifferhus *et al.* (1999) explaining the process towards more sustainable production in the retailing sector. Bansal and Kilbourne (2001) considered the practical implications of an ecologically oriented perspective, referred to as the new environmental paradigm (NEP), on the retailing sector. The British Retail Consortium (BRC) launched its “Towards retail sustainability” strategy in 2001, having a vision of “a sustainable retail sector which combines promoting a competitive sector with valuing the retail workforce and our local communities, improvement of our environmental performance and prudent use of natural resources”. Jones *et al.* (2005a) provide an exploratory review of how the major retailers in the UK are tackling the issue of sustainable development and explored retailers’ corporate social responsibility by selecting top 20 retailers in UK, based on 2002 sales figures. Iles (2007), compared how food retail industries in UK and the USA are facing sustainability today by examining what retailers are doing, how accountability systems can inform retailers and the business case for accountability. Erol *et al.* (2009) aim to establish the most suitable indicators for future evaluation of industrial sustainability performance for grocery retailing.

According to the related literature, retailers are being confronted by a wide range of ecological issues (see Table 1). Consumer awareness, government, investor and other environmental group pressures, media attention and developments in information and communication technologies have forced many retailers to focus environmental and social impacts of their activities (Jones *et al.*, 2005b).

Table 1: Ecological Impacts of Retailers

| Activity | Cause | Main Environmental Impact |
|--------------|--|----------------------------------|
| Distribution | Operation of motor vehicle fleet for distributing products | Burning of fossil fuels |
| | | Pollution and traffic congestion |
| | Cleaning motor vehicle fleet | Water depletion |

| | | |
|---------------|---|---|
| | | Water quality |
| Location | Out-of-town or edge-of-town hypermarkets | Burning of fossil fuels |
| | | Noise pollution and traffic congestion |
| | | Aesthetics |
| | Hardwoods on building sites | Reduction of bio-diversity |
| | Building on green field sites | Bio-diversity |
| | | Aesthetics |
| | | Forrest depletion |
| Processes | HVAC, lighting and other power usage in shops and offices | Burning and release of fossil fuels |
| | CFCs in refrigerant and packaging, insulation | Ozone depletion |
| | Disposable transit packaging | Landfill |
| | | Forrest, and oil and gas depletion |
| | Non-reusable plastic or paper bags | Landfill |
| | | Forrest, and oil and gas depletion |
| Merchandising | Excess packaging on private label products | Landfill |
| | | Forrest, and oil and gas depletion |
| | Excess stocking of perishables | Landfill |
| | | Excessive and ine\$cient use of agriculture |

CONSUMER PERCEPTIONS OF SUSTAINABLE RETAILERS

There is growing consumer concern regarding the implications of global warming and the currently unsustainable level of exploitation of Planet Earth's finite resources. This is driving increasing consumer support for "environmentally-friendly" products and practices (Harris, 2007). In this study marketing influence on consumer attitudes towards sustainable retailing and retailer decisions will be explored. Brief literature review environmentally conscious consumer behaviour will be summarized under the topics of consumer beliefs and behaviour, consumer response to marketing of being sustainable, trust in the retailer and consumer perceptions of sustainable retailers and their marketing practices. Hypotheses will be drawn accordingly.

As Hoyer and MacInnis (2004), consumers' values and beliefs need to be considered when examining the influences that affect purchasing decisions (Pickett-Baker and Ozaki, 2008). Ajzen's (1991) Theory of Planned Behaviour also shows that beliefs form attitudes towards behaviour, which is then translated into intention of behaviour. However, as we all know an individual concerned about the environment does not necessarily behave in a sustainable way in general, or in their purchasing. This is known as the value-action gap. A recent study finds that people who are environmentally conscious do not necessarily behave sustainable (Ohtomo and Hirose, 2007).

H₁: There is a gap between consumer beliefs and behaviours in relation to sustainable consumption.

Rokeach (1973) states values are principles that guide the formation of attitudes and actions, although values do not always lead to behaviour in real life. According to Hoyer and MacInnis (2004) it is people's attitudes affect their thoughts, feelings and thus influence behaviour such as purchasing behavior (Pickett-Baker and Ozaki, 2008). The Theory of Reasoned Action (Ajzen and Fishbein, 1980) suggests that marketers can influence consumers' attitudes and intentions by changing their evaluations through adding new beliefs and targeting normative beliefs. As Hawkins et al. (1998) suggested the purchase and consumption of products and services is often related to attempts to achieve, or maintain, ideals conceived either by the self or others (Pickett-Baker and Ozaki, 2008). Some consumers may have an ideal self-concept of being environmentally responsible, but the actual self-concept may fall far short of this ideal, with no significant change towards a sustainable lifestyle.

H₂: Consumers purchase more from retailers that are seen to be sustainable.

Word-of-mouth is a very powerful communication type that has a strong affect on consumer behaviour. More over, the main influence on food and household product purchases is word-of-mouth (Pickett-Baker and Ozaki, 2008). So, we can easily say that word-of-mouth and previous experience of the consumer play a very critical role on consumers' retailer related perception.

H₃: Consumers will judge sustainable retailers based on previous experience and word-of-mouth.

Marketing efforts like listening to consumers are mainly seen as efforts for controlling them. Paradoxically, consumers are increasingly sophisticated and principled. Marketing plays a key role in understanding and changing consumer behaviour and more generally in influencing attitudes and beliefs. As such marketing can be seen to recognize the key role of consumers as decision makers in moving towards sustainability (Jones et al., 2007), for example in shopping from sustainable retailers and adopting healthier lifestyles.

H₄: Better marketing activities will lead consumers to decide sustainable retailers.

EMPRICAL METHODOLOGY & FINDINGS

Retailing is a growing sector in Turkey with a total share varied between 17% and 21% in GDP. Grocery retailers, with their very fragmented structure, have the largest market share of the Turkish retailing sector (Erol *et al.*, 2009). Total turnover of the retail industry (non-food and food) was USD 136.9 billion in 2006 and is expected to reach USD 199 billion by 2010 (see Planet Retail). This figure in itself is self-evident of the actual and potential impact of the retail sector on the Turkish economy. Traditional retailers are known to have a 65% market share of the total Turkish retail market, while modern retailers have a 35% market share which amounts to some of USD 47.9 billion (PriceWaterhouseCooper Turkey, 2009). The most important segment of the market is grocery retailing, which accounts for 52.8% of total sales. According to Cushman & Wakefield's report Turkish retail sector is the 7th biggest retail sector in Europe and 10th in the world (TCSCR, 2009).

After deciding on the Turkish grocery retailers a questionnaire was developed after reviewing the extant literature on environmentally conscious consumption, sustainable retailing and consumer perceptions of sustainable retailing. The first part of the questionnaire contains items adopted from the HEP-NEP questions (Dunlap and van Liere, 1978), which is considered as an unofficial standard (Bachtel, 1997) to measure general environmental beliefs. And also the first part also includes RSW Green Gauge (Ottman, 1998) to measure consumers' past environmental behaviour and also their perceptions of retailers. Respondents were asked to rate their agreement level on 5-point Likert scale, from 1: completely agree to 5: completely disagree. In the second part of the questionnaire demographic data on age, gender, and income was also collected.

A total 430 respondents from fourth biggest city of Turkey, with almost 2 million population, were interviewed by a small team of professional interviewers in the biggest shopping mall of the city. Respondents verbally replied to a structured questionnaire their answers were recorded accordingly by the interviewers. The technique used was time-based shopping centre sampling method (Aaker et al., 1998). The research was conducted over a 3-day period and a total of 429 usable responses were included in the analysis. The high response rate was also attributed to the respondents' enthusiasm or willingness to participate obviously, to what they considered as an interesting subject to put their views across. There were two main advantages for prompting respondents. First, questionnaires were fully completed, thus reducing non-response items. Second, as collection of questionnaires was on the spot, no reminders were needed and, hence, time was considerably saved.

The sample size decisions were primarily based on cost considerations and in line with central limit theorem. The sample was not necessarily representative of the Turkish population as a whole as it ignored the large rural population. However, the target market for sustainable retailing activities are likely to be urban and

relatively educated so we have a sample which is potentially representative of the target population. Respondents were randomly selected customer that enters one of the three entrances.

The distribution of total population according to gender is 62 per cent male and 38 per cent female. Of the total population 24 per cent aged under 25, 41 per cent are aged 25-35, 21 percent are in the 36-45 age range, and 14 percent are at least 45 years old. The proportion of the total sample based on education is, 19 percent has at most upper secondary school degree, 39 per cent has a high school degree, 40 percent has college or bachelors degree and 2 percent has master's or PhD degree. The distribution of total population according to monthly average household income is 25 percent has at most 1000 TL, 20 percent are in 1001-1500 TL income range, 25 percent are in the 1501-2000 income range and 16 percent are in the 2001-3000 TL income range and finally 14 percent possessed more than 3000 TL income. Of the total population 44 percent are single, 56 per cent are married. Sample was mostly composed of salaried employees and senior managers (47 per cent). The high response rate coming from younger consumers indicated that they were more interested in sustainable retailing topics than older consumers and were willing to participate in the survey. Over majority of the respondents indicated that they were environmentally conscious consumers (84.6 per cent), among which were commonly males (60.1 per cent), with an age group between 26-35 years old (41 per cent), with a high school education (39.9 per cent).

Cronbach's alpha is presented as a measure of scales' internal consistency or reliability. Cronbach's alpha score for 40 items included in the questionnaire is 81.6 per cent which can help to interpret the scale as consistent. Descriptive statistics of the measurement tools are summarized in Table 2.

Table 2: Descriptive Statistics

| Variable | Mean | Std. Deviation | 95% Confidence Interval Lower – Upper |
|----------------------------------|------|----------------|--|
| General Environmental Beliefs | 3.67 | 0.438 | 3.63 – 3.71 |
| Environmental Behaviour | 3.19 | 0.539 | 3.13 – 3.23 |
| Retailer Related Perceptions | 3.66 | 0.640 | 3.60 – 3.72 |
| Sustainable Marketing Activities | 3.91 | 0.569 | 3.85 – 3.96 |
| Word-of-Mouth* | 2.54 | 0.764 | 2.47 – 2.61 |

*Word-of-Mouth items were evaluated under three topics which were 'agree', 'not sure' and 'disagree'.

Regression analysis was used to test the three hypotheses (Hypothesis 1, 2 and 4). Environmentally conscious behaviour (ECB) was regressed on general environmental beliefs (GEB) in the first hypothesis. Regression analysis results show that ECB is not significantly affected by GEB ($\beta = 0.041$, $t = 0.683$, $p = 0.495$) which supports the widely accepted gap between GEB and ECB. This finding is consistent with the results of Darnton's (1994), Kollmuss and Agyeman's (2002), Ohtomo and Hirose's (2007) and Pickett-Baker and Ozaki' (2008) value - action gap findings. As literature suggested, environmental beliefs do not guarantee environmentally conscious behaviour. However, it is likely that environmental beliefs lead to environmentally conscious behaviour.

Likewise, regression analysis results show that retailer related perceptions of the consumers (RRP) are not significantly affected by GEB so Hypothesis 2 is not supported ($\beta = 0.107$, $t = 1.516$, $p = 0.130$). This can be explained by consumers' lack of knowledge about sustainable side of the retailers. During the data gathering process respondents were observed and listened closely. It was seen that they have a very limited idea about what has been done for sustainability by their well known retailers. Most of the initiatives can not be easily recognized by consumer like rare shipping for overcoming the air pollution. By making these efforts visible with

marketing communication tools and positioning themselves as sustainable retailers, retailers can be frequently decided by environmentally conscious consumers.

Finally, sustainable marketing activities of the retailers (SMA) is positively affecting consumers' retailer related perceptions ($\beta = 0.649$, $t = 14.619$, $p = 0.000$). This supports Hypothesis 4 that suggests that the better the sustainable marketing activities established by retailers the more likely consumers prefer these retailers to their competitors. Although, marketing is often seen as the antithesis of the concept of sustainability (Jones *et al.*, 2008), it is also an inevitable tool to promote it. A focus on changing behaviours is one of the key elements in sustainable consumption. And the role of marketing in understanding and changing consumer behaviour and more generally in influencing attitudes and beliefs is very influencing. Clearly our finding is supported with the related literature.

ANOVA was used to test whether there is a significant difference of RRP between the groups of word-of-mouth. The results of ANOVA showed that there is a significant difference between the groups of word-of-mouth ($F = 67.523$, $p = 0.000$). Multiple comparisons between these groups are also significant and the mean of RRP is increasing with word-of-mouth. This supports Hypothesis 3 that suggests that the consumers' judgments about retailers based on previous experience and word-of-mouth.

CONCLUSION & OPPORTUNITIES

Realizing the necessity of integrating sustainable development into daily business activities, organizational environmental sustainability has been the mantra of many management theorists and forward thinking practitioners (Sarkis, 2001). Since retailing is a very dynamic sector for global economies, it did not take very long to realize the potential importance of sustainable retailing applications both for the sector and the societies. Retailers because of their very unique nature play a key role as a bridge between suppliers/producers and consumers which brings sustainable retailing in to a focal point of interest both in theory and practice.

The Turkish grocery retailers are at the different but mostly early stages of maturity in responding to sustainability. There has been a lack of empirical research in the sector. Therefore, in this paper, Turkish grocery retailers and their sustainable retailing practices were evaluated through the eyes of the consumers and marketing influences on consumers were explored. Based on our analysis nearly 85 percent of the respondents define themselves as environmentally conscious consumers, proving that there is a growing concern regarding especially the implications of global warming. This awareness is driving increasing consumer support for sustainable products and practices (Harris, 2007). According to our findings, a widely cited value-action gap was also confirmed. This result shows that the increasing consumer support for sustainable products and practices will not definitely mean these consumers also have an increasing demand for a sustainable retailer or make their purchases mainly on these types of retailers. Having a general environmental belief can only lead a consumer to prefer sustainable retailer to their competitors. The research also found that there is no significant relationship between environmentally conscious behaviour and retailer related perceptions of the consumers. This appears to be due to the consumers lack a means whereby they can be independently assured that a retailer is or not genuinely sustainable. Another problem is the difficulty of identifying sustainable practices. For example, digital labeling for reducing the paper consumption can be interpreted as an innovation of the retailer's inventory system. Different colored or recyclable packaging, naming the aisles as sustainable, promoting sustainable practices and environmentally responsible public relation programs could be very effective ways of minimizing the major knowledge problem.

As the responses show, consumers judge retailers depending on their sustainable practices based on their previous experience and word-of-mouth. Several studies have shown that word-of-mouth communications often exert a strong influence on consumer judgments (Herr *et al.*, 1991). Consumers frequently rely on word-of-mouth when selecting an automotive diagnostic centre (Engel *et al.*, 1969). Especially products and services for which performance is a significant perceived barrier like sustainable products and services, word-of-mouth is getting more and more important. The potential and opportunities must be recognized and consumer experience must be enhanced. The effect of emotions on influencing decisions, attitude formation and consumer response to brands must be taken in to consideration (Pickett-Baker and Ozaki, 2008). Marketing is a very efficient tool to influence emotions, attitudes and decisions. Although some think marketing is the principal driver of

consumption, satisfying customer's needs and wants have always been the main issue. Respondents in our research think better sustainable marketing activities will induce consumer to make purchases from sustainable retailers. Designing, packing, promoting, branding, pricing, shipping are all very important decisions to make.

Future research can bring retailer side and consumer side together to understand and contribute the concept better. Because of the constraints our question quantity and sample were limited. Following research can be use different scales on another sample with a unique nature. Also, further research is needed to evaluate and compare sustainable practices of different industries.

THE ROLE OF DESIGN IN NEW PRODUCT CONCEPT DEVELOPMENT

Makoto Isono
Kobe University, Japan

ABSTRACT

Design is defined as the 'creative' visualization of a concept by Walsh et al (1992). This paper clarifies the role of design in concept development for NPD (New Product Development) by comparing concept development conducted by design-oriented firms (those emphasizing and investing more in design) with general concept development conducted by firms that are not particularly design-oriented. A typology of concept visualization according to a firm's orientation is presented based on a literature review. There is then an analysis of cases involving NPD projects of two major Japanese firms in the beverage industry based on their concept development/visualization approaches.

The result shows the following: (a) A concept visualization has two types: one is linear visualization, which occurs in a general concept development process; the other is 'creative' visualization, which forms part of the concept development adopted by design-oriented firms. (b) 'Creative' visualization, or design, is the process that involves iteration between visualization-idea generation (or improvement) and market testing of these ideas in order to realize creativity (perceived novelty and meaningfulness) in a prototype. The implication is that, when a firm operates in a market where consumer perception of a product's appearance is crucial, applying design (the 'creative' visualization of a concept) in concept development by investing in it can help to realize consumer-perceived creativity in a product's appearance.

INTRODUCTION

Design as a set of particular activities in NPD has been frequently discussed in NPD related studies. Although design in NPD has multiple elements for discussion (Veryzer & Mozota, 2005; Perks, Cooper & Jones, 2005; Kotler & Rath, 1984), this paper addresses design in idea generation/concept development for NPD. Design is defined by Walsh et al (1992) as the creative visualization of a concept. Concept in an NPD context can be defined as a clear statement of (product) benefit for which we have either a form or a technology that promises to yield this benefit (Crawford, 1991). For example, a concept can be, "Slager beer: A double-strength beer that recaptures the taste enjoyment of the 1800s" (Crawford, 1991).

Researchers have argued that more effective use of design in NPD can lead to higher chances of success by referring to NPD management in firms such as Bang & Olufsen (Kotler & Rath, 1984), Dyson (Bruce & Cooper, 1997), OXO, Motorola (Cogan & Vogel, 2002), and Apple (Schmitt, 2003). These firms, often referred to in NPD related studies, can be characterized as emphasizing design in NPD management, investing more heavily in it than other firms, and having a history of project successes attributed to their design successes (Cogan & Vogel, 2002; Bruce & Cooper, 1997; Walsh et al., 1992; Kotler & Rath, 1984). These firms are classified as 'design-oriented firms' in this paper. Based on Walsh et al's (1992) definition, design-oriented firms are those firms investing in design, i.e. creative visualizations of concepts, in their NPD processes.

Although design-related NPD studies have highlighted the effective use of design for NPD success, it is still unclear *how* design-oriented firms make use of design for their concept development, or how their concept development differs from a more general concept development approach. In other words, what is the role of

design in concept development managed by design-oriented firms, and how is it different from the more general concept development managed by firms that are not particularly design-oriented? Finding an answer to these questions is important, as making more effective use of design is bound to require resource investment. In order to make a decision on resource investment in design, a firm has to know whether the required resources and its management are compatible with its strategy and orientation, and whether the expected outcome in return from investment in design supports the firm's goal and is required for the success of an NPD project. By finding an answer to the research question, it is then possible to make a decision on resource investment in design, taking into account the firm's goals, strategy, orientation and conditions of the market in which it competes.

After a literature review, there is a multiple case study of NPD in two firms operating in the Japanese beverage industry, one of which can be viewed as design-oriented while the other can be regarded as not particularly design-oriented. Implications are presented based on discussion of the findings.

LITERATURE REVIEW

First, findings from NPD studies dealing with design are summarized in terms of characteristics of design management contributing to business, which clarifies the problem this paper addresses. Then, representative NPD studies on concept development are reviewed, leading to characteristics of concept visualization in a general concept development approach, which is a linear visualization of a concept. Next, following the definition of design (the 'creative' visualization of a concept), studies on creativity are reviewed to clarify the nature of a creative process. This makes it possible to identify the distinctive characteristics of concept visualization in a concept development conducted by design-oriented firms, which is a 'creative' visualization of a concept.

Design is defined as the 'creative' visualization of a concept (Bruce & Cooper, 1997; McWilliam & Dumas, 1997; Roy & Potter, 1993; Walsh et al, 1992). Researchers have argued that more effective use of design in NPD can lead to higher chances of success by referring to NPD management by such firms as Bang & Olufsen (Kotler & Rath, 1984), Dyson (Bruce & Cooper, 1997), OXO, Motorola (Cogan & Vogel, 2002), and Apple (Schmitt, 2003). These researchers have shown that design-oriented firms have managers who are design-conscious and value its role (Jevnaker, 2000; Roy & Potter, 1993; Kotler & Rath, 1984). They fund design sufficiently (Cagan & Vogel, 2002; Jevnaker, 2000; Bruce & Cooper, 1997; Kotler & Rath, 1984), and have designers, marketers and engineers liaising frequently with one another (Cagan & Vogel, 2002; Jevnaker, 2000; Bruce & Cooper, 1997; Kotler & Rath, 1984). They also have their designers execute the design based on consumer understanding (Veryzer & Mozota, 2005; Schmitt, 2003; Cagan & Vogel, 2002; Kotler & Rath, 1984), and a focus on aesthetics or styles on top of utilitarian benefits or technologies (Schmitt, 2003; Cagan & Vogel, 2002). In addition, their designers are accountable for the design work (Roy & Potter, 1993; Kotler & Rath, 1984). The findings also conclude that design can contribute to product idea & concept development (Perks, Cooper, & Jones, 2005; Veryzer & Mozota, 2005; Cagan & Vogel, 2002; Bruce & Cooper, 1997; Roy & Potter, 1993; Walsh et al, 1992; Kotler & Rath, 1984). However, so far, no research can be found that clarifies how design contributes to concept development, *how* design-oriented firms are making use of design for their concept development, or how their concept development approach differs from a more general concept development approach.

Krishnann & Ulrich (2001), conducting a meta-study on NPD, identified Crawford (1991) as one of the most influential researchers in NPD literature in terms of concept development. The NPD process model introduced by Crawford (1991) is intended to be a general NPD management approach (Crawford, 1991). Therefore, to identify the distinctive feature of concept development conducted by design-oriented firms relative to the general concept development approach, this paper compares concept development conducted by design-oriented firms with the concept development in Crawford's NPD model (1991). Crawford (1991) argues that, while the development of concept ideas requires creativity and a process that facilitates it (Crawford, 1991), the visualization of a concept or development of a prototype should be done in order to meet a protocol, which is a list of attributes or benefits the concept intends to offer (Crawford, 1991; 1984). It is assumed that, as long as the prototype was developed according to the protocol and delivered the benefits defined by the concept, the resulting product would be sold profitably (Crawford, 1991) providing the concept, which is the subject of the visualization, had been confirmed as attractive to the market. Cooper & Kleinschmidt (1987) also emphasize the

importance of establishing a protocol for NPD success but do not place similar emphasis on consumer testing of prototypes. Likewise, Kotler (2003) discusses the creative process for concept idea development at great length, but does not mention the visualization of a defined concept. This indicates the assumption that a concept can be visualized without the need for any creative process. In this paper, this method of concept visualization where the development of a prototype delivers the protocol is described as a linear visualization of a concept. This is because the visualization is a linear process aimed at identifying a prototype idea that delivers a protocol, involving no iteration between idea generation, evaluation using market testing, or idea improvement. Figure 1 illustrates a linear visualization of a concept carried out by non-design-oriented firms.

Figure 1: Concept visualization by non-design-oriented firms: Linear visualization

Nevertheless, if it is carried out by design-oriented firms, the visualization of a concept or the development of a prototype may not only be conducted to deliver a protocol but also to realize creativity in a prototype. Design, which itself is a kind of concept visualization process, is by definition a creative process. Because creativity is a key component in this definition, it is important to understand how the nature of creativity differs from the linear visualization assumed by Crawford's NPD process model (1991).

Creativity in an outcome can be defined as one with meaningful novelty relative to conventional practice in the domain to which it belongs. This is the most widely used definition in social science research (Andrews & Smith, 1996; Hennessey & Amabile, 1988; Amabile, 1996; Gummings & Oldham, 1997, Stevens et al., 1999; Bharadwaj & Menon, 2000). According to Csikszentmihalyi (1996), the creative process which produces such a creative outcome is traditionally described as a sequence of five steps: Preparation, Incubation, Insight, Evaluation, and Elaboration. The elaboration step is constantly interrupted by periods of incubation and is punctured by small epiphanies. It is more recursive than linear. The number of iterations it goes through, the number of loops involved, and the number of insights needed, depends on the depth and breadth of the issues dealt with. During the incubation, seemingly irrelevant associations between ideas may occur as a result of a prior connection. While truly irrelevant connections dissolve and disappear from memory, ones that are robust survive long enough to emerge eventually into consciousness. The insight presumably occurs when a subconscious connection between ideas fits so well that it is forced to transform into awareness (Csikszentmihalyi, 1996).

To explain how a potentially creative idea is to be identified as truly creative, Csikszentmihalyi (1996) introduces the Systems Model. He maintains that creativity can be observed only in the interrelations of a system made up of three main parts: the domain, which consists of a set of symbolic rules and procedures, a field, which includes all the individuals who act as gatekeepers to the domain, and the individual person(s). Creativity occurs when a person, using the symbols of a given domain, has a new idea or sees a new pattern, and this novelty is selected by the appropriate field for inclusion into the relevant domain. Applying this Systems Model to an NPD context, it can be said that a potentially creative new product idea can be identified as creative by the interrelations within the market, which serves as the domain, consumers, who serve as the field, and the NPD members, including the firm's marketing department, engineers, designers, and management, who serve as persons. Therefore, the definition of creativity in a new product idea has to involve the market, the consumers, and the NPD members.

When applying the creativity theory to creative concept visualization in the NPD context, the process should be an iterative one, involving visualization-idea generation (Preparation, Incubation, Insight), idea evaluation from market testing with consumers as well as NPD members (Evaluation), and idea improvement based on the findings gained from market testing (Elaboration). The visualization process involves trials of association between seemingly irrelevant ideas. This process should continue until a visualization-idea is perceived as creative (new and meaningful) to consumers through market testing, as well as to the NPD members. This accords with the point made by Cagan & Vogel (2002) that design-oriented firms run the concept

development process by involving iterative circles from developing prototypes representing the concepts, testing them, getting feedback from users and expert advisors, and tuning feedback into a new generation of prototypes. As opposed to the linear visualization of a concept presented by Crawford's NPD process model, which is viewed as a general NPD process, the design process (creative visualization of a concept) can be a unique feature of the NPD process in design-oriented firms. Figure 2 illustrates the creative visualization of a concept carried out by design-oriented firms.

Figure 2: Concept visualization by design-oriented firms: Creative visualization

CHARACTERISTICS OF CONCEPT VISUALIZATION BY DESIGN-ORIENTED FIRMS

A review of the literature suggests that the differences between general concept development and concept development by design-oriented firms lie in their objectives (what they are trying to achieve with the concept visualization) and their processes of concept visualization (how they are trying to achieve the objectives).

Based on the Crawford's general NPD model (1991), the key characteristics of the concept visualization in a general concept development approach can be defined as follows:

- The primary objective of concept visualization is to develop a prototype - a visualized form of the concept - that delivers a protocol or a list of benefits defined by the concept, designated as ND-d.
 - In order to achieve the objective, the concept is visualized in a linear way, designated as ND-op.
- The linear visualization of a concept is aimed at identifying a prototype idea that delivers a protocol, involving no iteration between idea generation, evaluation with market testing, or idea improvement.

On the other hand, based on Walsh et al's (1992) definition of design, the creativity theory by Csikszentmihalyi (1996), and the NPD model presented by Cagan & Vogel (2002), the key characteristics of concept visualization in concept development conducted by design-oriented firms can be defined as follows:

- The primary objective of concept visualization is to realize creativity (perceived novelty and meaningfulness) in a prototype - the visualized form of the concept - as well as its development, designated as D-d.
- In order to achieve the objective, they visualize the concept in a creative way, designated as D-op.

The creative visualization of a concept is an iterative process, involving visualization-idea generation, idea evaluation from market testing with consumers as well as NPD members, and idea improvement based on the findings gained from market testing. The visualization process involves trials of association between seemingly irrelevant ideas. The process should continue until a visualization-idea is perceived as creative (new and meaningful) to the consumers through market testing, as well as to the NPD members.

MULTIPLE CASE STUDY OUTLINE

Multiple case study based on qualitative research was adopted as the research design for the following reasons: qualitative research is appropriate for theory generation and for understanding the social world through an examination of the interpretation of that world by its participants (Bryman, 2001). This research intends to generate theory regarding the role of design in concept development by comparing the concept development approach of design-oriented firms with a more general concept development approach. Case study is appropriate

for dealing with the complexity and particular nature of the case in question (Bryman, 2001), and in this research, an NPD case involving design for concept development and an NPD case not involving design in concept development are examined. Multiple-case study improves theory building, and by comparing two or more cases, the researcher is in a better position to establish the circumstances in which a theory will or will not hold (Yin, 2003; Bryman, 2001). In this research, it is assumed that, by comparing these two firms, it should become possible to understand in detail what roles design plays in concept development managed by design-oriented firms and how this differs from a general concept development approach. In addition, understanding the role of design in concept development should be associated with its effectiveness in NPD project performance. Therefore, the project cases selected include both a successful and an unsuccessful one.

The field selected for research should be one where consumer perception of a product is crucial for the NPD project's success. The field selected was Japan's unsweetened tea drink market during the 6 years from 2000 to 2006. The market during this period was characterized as follows: 1. Consumer perception of a product may determine whether a project will succeed or not within the context of a high product turnover rate due to intense competition. Unless the product was perceived as creative (new and meaningful) to consumers two to four weeks after its appearance on the retail store shelf, it was never able to draw purchase trials or purchase repeats (Hemmi, 2008; Mine, 2006). This would result in the product's elimination and replacement by other products with a greater momentum of purchase trials or repeats (Hemmi, 2008; Ito, 2004). On the other hand, prices in the market were, in general, set flat across products / brands (e.g. 150 yen per 500 ml at convenience stores), except for minor products or short-term promotional periods. The effect of pricing on consumer purchase trials and repeats is relatively small in this market. Therefore, as far as this market during this period is concerned, for a product to gain high purchase trials and high purchase repeats, it must be perceived by consumers as creative (new and meaningful to them) in retail stores (the purchase trials and repeats are influenced by TV-copy, promotion, yet they cannot be gained without consumer-perceived creativity in product appearance). In fact, in their NPD process, major firms in this market, such as the ones examined in this case study, conduct market testing with prototypes using criteria that includes whether the prototype is perceived as new and meaningful to consumers, along with their purchase intention. This is done in order to estimate whether the product to be launched can gain the expected purchase trials and repeats (Maeda, 2006; Nagasawa & Kawae, 2003). 2. The market had been growing rapidly, due mainly to the recent consumer trend of health consciousness. Unsweetened tea drinks were regarded as the next core market for Japanese beverage products, and establishing a core brand in this market was considered essential for every drinks firm seeking to grow their business. Drinks firms therefore put the highest priority on their NPD projects in this market. These features meet the research purpose.

The firms examined in the research should be a pair: a design-oriented firm, using design for their concept development, and a firm that is not particularly design-oriented and that employs a general concept development approach. For fair comparison, they should be operating within a similar field and have similar capabilities in terms of marketing activities, but different orientation as regards design in NPD processes. The firms selected were Coca-Cola Japan and Suntory. These are two of the major firms in the beverage industry in Japan. In 2004, Coca-Cola Japan had the biggest market share (34.6%), while Suntory had the second biggest market share (16.6%) in the Japanese beverage market (Nikkan Keizai Tsushin, 2005). They have almost the same distribution channels for tea drinks: convenience stores, supermarkets and vending machines. They also have similar levels of investment in marketing promotion, which includes TV media.

Suntory can be regarded as a design-oriented firm for the following reasons: (1) They place a strong emphasis on design, confirmed by their nomination for a number of design awards (for example, Nikkei Design, December 2003, pp.40-75) and remarks by top management (Nikkei Design April 2006; Suntory, 1999; Torii & Kagono, 1994). (2) They invest particularly heavily in their design management compared to other firms. For example, they have both design management capability and design execution capability in-house (Kato + Suntory Design, 2001). (3) They have a history of project successes attributed to their design (for example, Nikkei Design Dec 2003; Suntory, 1999; Brain, Sept 2005), which meets the definition of a design oriented firm in this paper. On the other hand, Coca-Cola Japan is not regarded as a design-oriented firm given that: (1) Any particular record showing that they constantly emphasize the importance of design as a corporate capability cannot be found. (2) They do not invest heavily in design - for example, they only keep their design management capability in-house while outsourcing design execution capability (Maeda, 2006). (3) Any particular record of them constantly achieving project successes through their design capability has not been found, although from

time to time their package designs have been viewed by design magazines as contributing to their respective businesses. In addition, as described in the later part of this paper, Coca-Cola Japan usually employ a standard approach which bears the same characteristics as the general concept development approach in terms of concept visualization.

The projects selected from Coca-Cola Japan were the 'Hajime' product brand development and the 'Karada-Meguri-Cha' development. 'Hajime' was not successful in generating purchase trials and repeats for three months after its introduction, the reason possibly being a lack of perceived creativity (novelty and meaningfulness) in the product in retail stores. 'Karada-Meguri-Cha', however, was successful in generating high trials in retail stores immediately after its introduction, and the trials and repeats continued for over a year, even after major competitive products were introduced. The projects selected from Suntory were the 'Juku-Cha' product brand development and the 'Iyemon' development. 'Juku-Cha' was not successful in generating purchase trials soon after its introduction, due to a lack of perceived creativity in the product, while 'Iyemon' succeeded in generating high trials in retail stores right after its introduction, and the trials and the repeats continued for over a year, even after major competitive products were introduced.

The qualitative research that followed was based primarily on analysis of secondary information related to NPD processes by Coca-Cola Japan and Suntory. First, the 'Karada-Meguri-Cha' development was reviewed with reference to Maeda (2006), where the project development is described in detail by a brand manager at Coca-Cola Japan. The 'Juku-Cha' and 'Iyemon' developments were reviewed with reference to Mine (2006), where the two project developments are described in detail following interviews with the team members of both projects. Next, the research followed this up with a review of Coca-Cola Japan's and Suntory's news releases. Finally, semi-structured interviews (Bryman, 2001) were conducted with members of the marketing, design and R&D team at Coca-Cola Japan and a design director at Suntory. The interviews followed a semi-structured flow with general questions about the subject: NPD project processes and their management of them, including their typical NPD processes, NPD processes conducted for the subject projects, their approaches to concept development and visualization, organizational management for NPD, and the project performances as an outcome of the NPD management. The interview flow was pilot-tested and subsequently modified. Interviews had an average duration of 1.5 hours. On each, special attention was paid to collecting data on these questions while not limiting them in order to make sure of capturing any unanticipated information that was potentially important for theory construction. All the interview description contents were checked by the interviewees after each interview to ensure accuracy and to confirm that what the interviewer had taken down accurately reflected what the interviewee had meant.

FINDINGS

The findings from the multiple-case study are summarized in Table 1.

For their 'Hajime' project, Coca-Cola Japan adopted their standard process which they normally used for other NPD projects. With 'Karada-Meguri-Cha', however, the NPD process was a unique one for them. The brand manager of Coca-Cola Japan called it the 'Left & Right Brain Combination Approach' (Maeda, 2006).

In their standard process, development of the concept idea involved iteration from concept idea generation/improvement and market testing of these ideas. This continued until the concept idea was confirmed as appealing to consumers. However, the concept visualization (prototype development) was conducted in a linear way. For the concept visualization, a list of targets was given to the design team, who then developed concept visualization ideas (prototype ideas) that addressed this list using the resources they had at their disposal. Here the objective was to develop a visualization idea that meets the list of targets, which supports ND-d. This visualization process did not involve visualization idea improvement based on findings from market testing, which supports ND-op. It is also noted that visualization started only after the concept idea was clearly defined and agreed in a management meeting called 'Innovation Committee' (Maeda, 2006).

For 'Karada-Meguri-Cha' development, the brand manager's strong belief was that employing the general NPD process for this project would not be sufficient to bring success. Therefore, what he called the 'Left & Right Brain Combination Approach' was taken. This approach consists of using both 'left and right brain

thinking’ in order to explore potential consumer needs, devoting more time to concept development, including concept visualization (Maeda, 2006). In this process, unlike the standard process, iteration from idea generation (using metaphors that facilitate associations between two different ideas to market testing) and idea improvement based on the tests were fully committed to both the concept idea development and the concept visualization. This was done in an attempt to achieve creativity in both the concept itself and the final product, which was tested and confirmed quantitatively at the end of the concept visualization process. This fits D-d and D-op1, not ND-d nor ND-op1, despite the fact that ‘Karada-Meguri-Cha’ was run by Coca-Cola Japan as a non-design-oriented firm.

Table 1: Summary of findings from the case study

| <i>Preceding arguments on characteristics of concept development approach taken by design-oriented firms and a general concept development approach</i> | ‘Hajime’ (Standard process) by Coca-Cola Japan | ‘Karada-Meguri-Cha’ (Left & Right Brain Combination Approach) by Coca-Cola Japan | ‘Juku-Cha’ (Process not aspired) by Suntory | ‘Iyemon’ (Process aspired) by Suntory |
|---|--|--|---|---|
| <i>Concept development/visualization by non-design-oriented firms</i> | | | | |
| (ND-d) Objective is to develop a prototype, which is a visualized form of a concept, that meets the protocol | Supported | Not supported | Not supported | Not supported |
| (ND-op) To achieve the objective, they visualize a concept in a linear way. | Supported | Not supported | Not intended, but consequently done | Not supported |
| <i>General concept development/visualization</i> | | | | |
| (D-d) The objective is to realize creativity in the prototype, which is a visualized form of the concept | Not supported | Supported | Supported | Supported |
| (D-op) To achieve the objective, they visualize the concept in a creative way. | Not supported | Supported | Intended, but Not supported | Supported |

A year and a half after the introduction of the two products to the market, Coca-Cola Japan was forced to change the concept and product appearance of ‘Hajime’ (Coca-Cola Japan News Release, 2007; Coca-Cola Japan News Release, 2006) due to its low purchase repeats (Coca-Cola CJ, 2007; Coca-Cola CJ, 2006). This was despite its highly recognized taste and the firm’s season-highest investment in marketing promotion including TV media (Coca-Cola Japan News Release, 2007; Coca-Cola Japan News Release, 2006). This suggests that the product in retail stores was not perceived as creative (new and meaningful) to consumers. Meanwhile, ‘Karada-Meguri-Cha’ proved very successful in generating higher purchase trials in retail stores over an initial two-month period. It maintained high purchase repeats, resulting in a 35% increase over the original sales estimate in these first two months after its introduction, and steady growth since its introduction (Maeda, 2006). This indicates that the product in retail stores was perceived as creative (new and meaningful) to consumers. Purchase trials and the repeats could have been generated by other factors such as TV-copy or marketing promotion activities, and in the case of ‘Karada-Meguri-Cha’, these factors would have contributed. However, in these market conditions, consumer-perceived creativity in a product’s appearance is a key factor, as without it, the purchase trials and repeats cannot be generated, as explained earlier. Figure 3 illustrates the concept development process, including the concept visualization, of ‘Hajime’ and ‘Karada-Meguri-Cha’ by Coca-Cola Japan.

In the case of Suntory, a design-oriented firm, the NPD process adopted for ‘Juku-Cha’ was the kind they wished to follow; the process for ‘Iyemon’ was closer to their aspirations. The process they wanted to use is one where designers are fully involved in the concept development; the designers ensure that the concept visualization ideas (design ideas) they develop are truly appealing to consumers. For this to be achieved, the designers do not just focus on concept visualization, but also attempt to influence concept idea development from a design point of view (Mine, 2006).

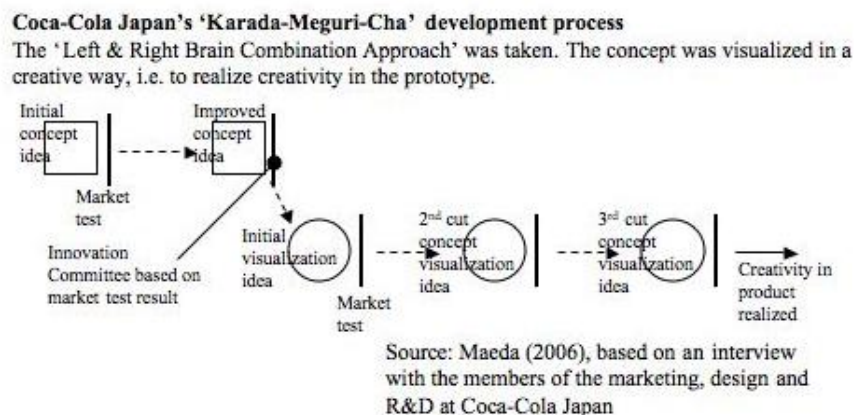

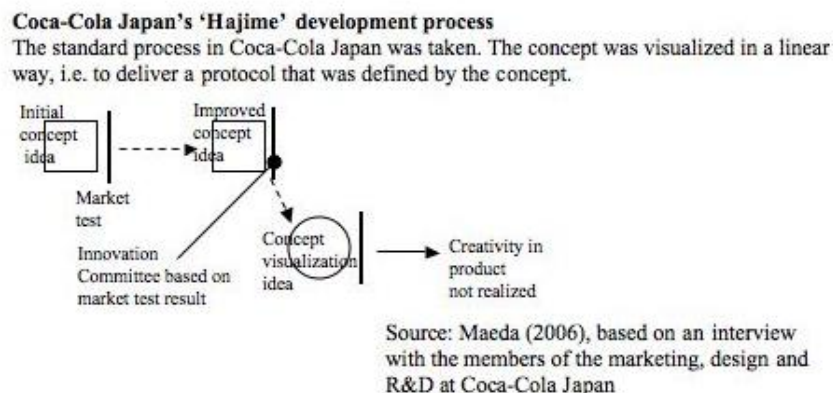

For the ‘Juku-cha’ development, due to the short period of time allotted to concept development and concept visualization, the team could not adopt their aspired process (Mine, 2006). They could not involve sufficient iteration from idea generation to market testing and idea improvement based on findings from the

testing for both concept idea development and concept visualization, while the concept visualization itself was geared more towards delivering a protocol defined by the concept. This means that D-op was not supported, and ND-op is a better fit for the case of 'Juku-Cha', despite the fact that this project was run by Suntory, a design-oriented firm. However, it was understood that they aimed at realizing creativity in the prototype in the concept visualization, which supports D-d.

However, based on the findings from the 'Juku-Cha' project, with 'Iyemon', Suntory made sure they adopted their aspired process. In this process, once the initial concept idea was developed by the marketing team, the design director got involved in the project and initiated concept visualization. Both the concept idea development and its visualization process applied iteration from idea generation (for concept and its visualization), often using metaphors that facilitate associations between two different ideas to market testing and idea improvement based on the findings from these tests, until a prototype that could be perceived as creative by consumers was identified. This supports D-d and D-op1. Moreover, as they had hoped, the project team used the findings from concept visualization and market testing against the visualization ideas in order to achieve concept improvement.

'Juku-cha' had to be discontinued soon after its introduction due to significant low purchase trials in stores, despite its highly recognized taste and the firm's season-highest investment in marketing promotion including TV media (Mine, 2006). The project team learned from retail observation that this was because the product was not perceived in retail stores as creative, new and meaningful to consumers (Mine, 2006). 'Iyemon' was very successful in generating the purchase trials and the repeats, resulting in a record high 2.6 million cases of shipment in seven months (Suntory News Release, January 20, 2005). The project team learned that consumer perceived product creativity is one of the key drivers for purchase trials and repeats. Figure 3 illustrates the concept development process, including the concept visualization, of Suntory's 'Juku-Cha' and 'Iyemon'.

Figure 3: Concept development including concept visualization process of Coca-Cola Japan's 'Hajime' and 'Karada-Meguri-Cha', and Suntory's 'Juku-Cha' and 'Iyemon'

DISCUSSION

Past NPD studies dealing with design have argued that more effective use of design in NPD can lead to higher chances of success by referring to NPD management by firms that can be regarded as design-oriented. Their findings include that design can contribute to product idea & concept development. However, it was not yet clarified how design contributes to concept development, *how* design-oriented firms are making use of design for their concept development, and how their concept development approach differs from a general concept development approach. Based on the findings, we shall now discuss concept development conducted by design-oriented firms, and general concept development by firms not regarded as design-oriented.

Suntory was regarded as design-oriented, and the process they wanted to follow involved the creative visualization of a concept. On the other hand, Coca-Cola Japan was not regarded as design-oriented, and their standard process bore the characteristics of the general concept development approach introduced by Crawford (1991) in terms of concept visualization. In this standard process, the concept was visualized linearly.

Linear vs. Creative method of concept visualization

The comparison between Coca-cola Japan's 'Hajime' (where their standard process was used) and Suntory's 'Iyemon' (using their aspired process), indicates that design-oriented firms attempt to visualize a concept in a creative way in order to realize consumer-perceived creativity in a prototype. On the other hand, firms that take a general concept development approach usually visualize a concept in a linear way in order to develop a prototype that delivers a protocol defined by a concept. Design is defined as the creative visualization of a concept (Walsh et al, 1992). Using this definition of design, it can be said that design-oriented firms make use of design for their concept development in order to realize consumer-perceived creativity in a prototype (and ultimately in the final product), going beyond delivering a protocol defined by the concept, and that they apply sufficient resource investment towards it. Realizing consumer-perceived creativity in a prototype using creative concept visualization is the role of design for design-oriented firms.

As is shown by the differences between the 'Hajime' and 'Iyemon' project performance, when a firm aims to achieve consumer-perceived creativity in a product, a creative process is needed not only for concept idea development but also for concept visualization. This creative visualization of a concept can be adopted by firms that are not design-oriented as well, as shown by the case of Coca-Cola Japan's 'Karada-Meguri-Cha'. Here, it was not their standard process, but instead their unique 'Left & Right Brain Combination Approach' for NPD, that was adopted. This case suggests that, *if resources are committed to design*, creative visualization of a concept for realizing consumer-perceived creativity in a prototype is possible for firms those not particularly design-oriented firms as well. In the same vein, even design-oriented firms, when not investing sufficiently in design, and therefore not being able to apply creative visualization of a concept, cannot realize consumer-perceived creativity in a prototype (hence the final product), as shown by the case of Suntory's 'Juku-Cha'.

Concept visualization that leads to concept improvement

In addition, the case of Suntory's 'Iyemon', in comparison to Coca-Cola Japan's 'Karada-Meguri-Cha', shows that design-oriented firms not only visualize a concept in a creative way, but also apply what they have learned from the concept visualization to concept improvement, further ensuring creativity in a prototype. They also invest sufficiently in required resources to achieve this. In other words, the creative visualization of a concept can lead to its improvement, further ensuring creativity in a prototype. Bhattacharya, Krishnan & Mahajan (1998) argue that, as opposed to the early definition of concept in the NPD process, a concept that is refined in real-time using consumer feedback on prototypes can improve product attractiveness. This supports the effectiveness of design process management by design-oriented firms, who apply the findings from concept visualization to achieve concept improvement, depending on the conditions of the firms and/or their circumstances.

CONCLUSION, IMPLICATIONS AND FUTURE RESEARCH

Design is the creative visualization of a concept, a process involving iteration between visualization-idea generation (or improvement), including associations of seemingly irrelevant ideas, and market testing. Creative visualization aims at realizing consumer-perceived creativity (novelty and meaningfulness) in a prototype. These are the key characteristics of concept development conducted by design-oriented firms and distinguish it from the general concept development approach.

In a general concept development approach, concept visualization is linear. It is a process for the development of a prototype that delivers a protocol defined by the concept with no iteration involved. This approach may encounter limitations when a firm aims to realize consumer-perceived creativity in a product's appearance, and may hamper NPD success in a market where such perceptions are crucial.

There are two main areas for future research. First, this research has identified that, in addition to the creative visualization of a concept, design-oriented firms apply the findings gained from concept visualization to concept improvement, thus ensuring creativity in a prototype (hence the final product). To what extent this is effective for NPD success should be further investigated. Secondly, these research findings should be explored and applied to contexts other than the Japanese unsweetened beverage market.
