# **PUBLISHED BY THE GLOBAL BUSINESS AND TECHNOLOGY ASSOCIATION**

**ISBN: 1-932917-07-1**

The materials published in this Readings Book may be reproduced for instructional and noncommercial use. Any use for commercial purposes must have the prior approval of the president of the Global Business and Technology Association.

All full papers submitted to the Global Business and Technology Association Conferences are subject to a peer reviewing process, using subject specialists selected because of their expert knowledge in the areas.

Global Business and Technology Association (GBATA) is publishing partner with EBSCO Publishing. This allows researchers from throughout the world to access articles from the Readings Book.

Printed in the United States of America, 2011.

## **Centre for Rapid and Sustainable Product Development**

*GBATA 2011 Readings Book is sponsored by the Management Research  
Centre for Rapid and Sustainable Product Development (CDRSP) at  
Polytechnic Institute of Leiria, Portugal.*

# FORWARD

The purpose of the conference is to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations of new challenges in global business and technology: strategies, policies and issues.

*All full papers submitted to the Global Business and Technology Association Conferences are subject to a peer reviewing process, using subject specialists selected because of their expert knowledge in the areas.*

Academicians, practitioners, and public policy makers at all levels throughout the world submitted original papers for conference presentation and for publication in this Readings Book. All competitive papers were refereed (subject to a peer review). The result of these efforts produced 368 empirical, conceptual and methodological papers involving all functional areas of business education with a special focus on international aspects. Of the 261 papers accepted for presentation at the conference, 139 papers are published in this Readings Book.

# ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the Thirteenth Annual International Conference of the Global Business and Technology Association (GBATA). The GBATA extends its many thanks to the financial sponsors of this conference: Management Research Centre for Rapid and Sustainable Product Development (CDRSP); Faculty of Creative Industries and Business UNITEC Institute of Technology, New Zealand; Istanbul Bilgi University, Turkey; Polytechnic Institute of Leiria, Portugal; Curtin University of Technology, Australia; Brno University of Technology, Czech Republic; and State University of New York - Old Westbury, USA.

A successful conference could not be possible without the special cooperation and care of the program committee members. Furthermore, many thanks go to the reviewers for reviewing the many papers that were submitted to this conference.

The last but not the least important acknowledgement goes to all these who submitted their work to be considered for presentation at the conference. Also, special thanks to the session chairs and discussants for taking the extra time to make this conference a success.

Nejdet Delener, Ph.D.  
President, Global Business and Technology Association

# **FINANCING OF INNOVATIONS IN OIL AND GAS BUSINESS**

**Valentin Afanasiev, State University of Management, Russia**  
**M.M. Kuznetsov, Renewable Energy Systems, UK**

## **ABSTRACT**

*In this paper we investigate the conditions and characteristics of financial innovations in the production and refining of oil and gas. Analysis of current conditions shows significant differences in the approaches to these innovations, especially in justifying the strategic investment. One of the assumptions that have found confirmation in the findings of the comparison is the conclusion that the effectiveness of investment in innovation in the oil and gas sector, most evident in comparing the contrasting indicators of research and development (R & D), quoted on the Euronext market securities. The differences found in terms of investment in oil and gas sector indicate that the innovation projects in enterprises of this sector should be analyzed and evaluated differently. Positive experience in financing innovation based on the indicators R & D, also allows you to understand the strategy of individual enterprises, energy companies, operating environment, the importance of evaluating the institutional and political differences, approaches to financing and its availability in different countries.*

## **INTRODUCTION**

Research of tendencies, conditions and characteristics of innovation's financing for flow and reprocessing of oil and gas are usually under great interest in both specialized and in economic sphere where relations of financiers towards these products are sustainable positioned as indicators, defining perspectives of development. Interest in the analysis of current trends, factors and features depends on the need of identification of common and differences in orientation, approach and implementation of funding for such innovation, which, in particular, will be on demand in the process of developing and making strategic investment decisions. Special attention in this case should be given to research and assess of the validity and effectiveness of investment in innovation in the oil and gas sector. It is important to identify and compare specific indicators of the effectiveness of funding for research and development (R&D), including those based on change trends in quotation of securities on the regional stock market Euronext.

## **FINANCING OF INNOVATIONS IN OIL AND GAS BUSINESS**

Investing in high-tech innovation has traditionally been a major factor of economic growth, assessing the conditions of funding of projects in research and development, reflecting their priority in the development of any economy. Ratio analysis of financial indicators for R&D shows that the development of research activity has a positive effect on the investment image of the company, which ultimately provides the most important conditions for making decisions on strategic foreign participation. The main result of the development and implementation of R&D investment projects is to obtain knowledge about new products and services which are becoming sooner or later the property market. The analysis shows that they are implemented with the extraction of very substantial benefits from research, not only in attracting additional investors, but in creation of new formats of collaboration with other industrial and commercial companies.

It should be noted that such interaction as shows analysis of the evolving practice of relations, can serve as a specific impediment to growth in private funding for research and innovation, as investment in the energy

sector requires significant levels of state subsidies. Obviously under these circumstances, developing and implementing R&D projects in the oil and gas sectors, investors meet some uncertainty in strategic decision-making. The results of research confirm the fact that innovation and modernization of energy technologies in the oil and gas sectors are becoming increasingly important in the foreseeable future, to ensure the unconditional growing demand for energy. Such estimates are formed in a professional environment and are increasingly formulated amid concerns for the stability and security of energy supply, in conditions of growing relevance of setting and achieving targets for environmental protection.

An essential feature of the processes is that the real knowledge of project design and implementation of financing innovation in the sector of the energy industry remains quite limited and not always reliable in a highly competitive struggle for participation in its implementation. Appearing in these publication results of research studies and development arising from these findings is an attempt to compensate for a deficiency actual awareness of the interested audience on this issue. The results of these studies and presented here findings provide, in our view, adequate analyze and choose of the most productive approaches to evaluate the effectiveness of funding of general corporate investment and innovation in the European energy sector.

Without overloading of this publication with direct materials of implemented research it is possible to claim that a higher degree of intensity of R&D financing is characterized by increasing of its productivity. However, we have to be aware that, since R & D investments create intangible assets, they require special methods of analysis and conclusions, because they could not be used as a tangible asset, or traditional forms of evaluation. It is important to note that as shown by the research, the level of investment is one of the key indicators of R&D, which rightly confirms the strategic importance of prospectively-oriented innovation in sustainable development. It is advisable to take into account that some authors rightly characterize R&D investment with a high degree of specificity, which is manifested in particular that they are less specific as to whether and on efficiency, than other, more obvious attachment. In the analysis and evaluation is important to be clear about the inverse relationship, manifested in particular, that vague, deferred guaranteed and low-end incentives may not be sufficient priority to investors who are competing in the field of venture innovation. Obviously, the ultimate effectiveness of such decisions is provided by long, continuous investment in R&D funds required, for example, to launch new products, which casts further doubts on the potential investors.

According to made research an essential or even the major part of financial investment in R&D are concentrated in the gas and oil business nowadays. The analysis made it possible to define essential differences on how these two groups of investment differ in R&D financing. Differences among major, most important projects of reach companies are also noticed in this context, in comparison with less profitable participation of firms with scarce resources, which are usually devoid of such opportunities. This defined the amount of impact of the investor's firm, profitability and its business' funds available on appropriateness and efficiency of innovations' financing.

The independent task of the study was devoted to analysis of the relationship of trends and effectiveness of financing R & D with the legal status of the implementing companies. This made it possible to estimate a significant effect of stability of the investor on terms and conditions for the development and implementation of specific investment programs. In this regard the role of mobilization and availability of various provisions of the stock market for the implementation strategic projects for financing innovation in the oil and gas sectors was defined and explored. This analysis allowed us to make fairly reasonable conclusion that the stock market may in fact sufficiently accurate information about the investment performance of permanent participants of the stock market in innovation through the prices of assets available to finance R&D.

The main source of displayed in this publication studies and their results, respectively, was a system OSIRIS, which represents a database that consists of a detailed balance sheets, profits, losses and cash flows data for virtually all energy companies in the industry from 24 European countries. In addition, research base complementary materials OSIRIS firm-level data and economic parameters by country, available in the materials of the World Bank and industry publications of professional analysts. As one of the most effective resource has been selected and is widely used in studies renowned R&D proxy index, defined as the ratio of intangible assets to total assets, and often called in a professional environment R&D intangible assets. This choice allowed constructively analyze sufficiently different firms in different countries at the level of factors that might somehow influence the trends, conditions and programs to implement the financing R&D activities of companies.

OSIRIS data were analyzed at 270 firms for a number of European countries over the period 1984 - 2008. During the analysis some changes in the composition of actors and a competitive environment were taken into account, such as: the emergence of new states of the European Union, as well as good and substantial regulatory changes in the European sector of the oil and gas industry, the capital structure of R&D relationship was especially analyzed for it. With regard to these circumstances was the subject of a special analysis for the period 1995-2007, which had been received, evaluated and taken into account the maximum available number of observations. Studies of the total sample consisting of 274 firms and includes 3'562 observations appear to be sufficiently representative.

In order to study the impact on corporate financing of innovation in energy area, there were analyzed classification of companies in relevant sectors of European countries. They showed that the applied, rather various classifications of industries, such as: NAIC 2007; GICS code; Industry Classification Benchmark; Financial Times industry class; 2007 NAICS Code and the NACE 2, derived from SIC codes can reasonably assess the characteristics of the investor's R&D. For the analysis of the study perspective were used industrial Classification Benchmark (ICB), allowing on the basis of ICB, isolate and evaluate the 11 subsectors in the energy market, including oil and gas. The analysis, conducted on this basis, showed the heterogeneity of conditions for financing innovation in these sectors and, hence, the need for differentiated approaches to assessing the feasibility and effectiveness of specific projects of innovation. Study of a comprehensive database on firms level did not allow to provide detailed analysis, based only on the immediate data of the company, because the jurisdiction of the residents of different countries under current law distorts the data specificities of the tax regime, accounting standards, etc.

Research has generally allowed the authors of the publication to come to the following agreed conclusions on their results:

Revitalization of investment in R&D is crucial for energy companies in the sector of oil and gas industry, but restricted information about the structure of innovative activity and the conditions of its financing remains quite significant obstacle for their effective development;

There are significant differences highlighted in the financing of innovations, emerging from changes in the institutional (including financial institutions) environment, political climate and other conditions of innovative investment in various countries;

Results of target analysis, conducted at the aggregate level, show that the state support in increasing of funding for innovative programs of energy companies operating in the sectors of oil and gas may create a preferred or substantial economic conditions of the competitive advantages of national business, including the stock market;

Active, relatively new in the oil and gas sector investors in innovation are usually a higher level of R & D activities in comparison, even with traditionally strong, but more traditional companies;

Along with this the continuing influence of the largest, financial surplus of potential investors is maintained, consistently controlling the most profitable segment of innovative projects of oil and gas industry, based on the image, a solid legal status and stability of the distribution of the stock market;

The main task of ensuring the effectiveness of innovative development of the company becomes a permanent analysis, evaluation and accounting of trends, conditions and characteristics of financial innovations in R & D, as in the segment and in the national sections, taking into account the specific impact on the corporate level;

In justifying and making decisions in investing R&D activities of small innovative programs it must be taken into account the value of the company size of the investor, the profitability of innovation financing, sales and distribution of cash, their impact on financial opportunities;

The level of profitability of enterprises usually refers to the possibilities of innovative development, so that the positive relationship between profitability and R&D could mean relief of external borrowing for the development of intangible assets;

Flexible and responsive to market conditions, private corporations, tend to have higher growth rates of innovative programs of investment in R&D, especially compared with the long-running public companies;

It is necessary to increase constantly further study of this issue from the perspective of a more detailed analysis of individual countries, energy companies, operating environment, the value and impact of institutional political differences, changes in approaches to R&D funding and its availability. This will facilitate obtaining a qualitatively significant, meaningful substantive conclusions and explanations of trends, conditions and factors of innovation financing in the oil and gas sectors.

As provided by these results in the research were also analyzed trends, conditions and characteristics of financial innovations in the production and refining of oil and gas. The analysis of the actual conditions of their implementation has shown significant differences in the approaches to the organization and implementation of such innovative projects, especially in the justification and implementation of finance strategic investments. One of the assumptions that have found confirmation in the findings of the comparison is the conclusion that the effectiveness of investment in innovation in the oil and gas sector, most evident in comparing the contrasting indicators of research and development, quoted on the Euronext market securities.

The differences found in terms of investment in oil and gas sector indicate that the development and implementation of innovation projects in enterprises of this sector should be analyzed and evaluated differently, taking into account not only the product specifics, but the functioning and development of specific enterprises, which goes beyond the framework for analysis. The positive experience of finance for innovation based on indicators of R&D, given in research, also allows to understand the strategy of individual enterprises, energy companies, operating environment, the importance of evaluating the institutional and political differences, approaches to financing and its availability in various European countries.

## **ABSTRACT**

*Outward foreign direct investment (O-FDI) undertaken by Latin American multinationals (LAMNEs) has increased in recent years. This paper investigates value creation in the LAMNEs and suggests that operational efficiency and strategic decisions have propelled these firms to higher levels of performance. This study suggests that internal use of corporate resources, combined with external industrial opportunities appear to enhance value creation among the largest LAMNEs.*

## **INTRODUCTION**

The number of Latin American firms that operate in cross-border production has increased steadily over the past decade. Analysis of foreign direct investment (FDI, hereafter) data shows that out-bound investments by these firms exist in a variety of industries at all levels of scale production (UNCTAD, 2006; Forbes, 2007). Prominent Latin American multinational enterprises (“LAMNEs”, hereafter) include CEMEX of Mexico, EMBRAER of Brazil and Banco de Chile, which operate in the cement, aircraft manufacturing and financial services industries respectively. These companies have joined the ranks of Forbes Global 2000 firms as the largest multinationals in the world (Forbes, 2008). This trend is in marked contrast to previous years when Latin American firms lagged behind their counterparts from other regions, including the emerging markets of Asia (UNCTAD, 1995).

Once established as global firms, how do these firms perform, in terms of creating market value for their stakeholders? What are the sources of this value creation? The basic thesis of this paper is that a set of managerial skills and corporate strategies that leverage internal resources and capabilities coupled with strategic decisions to enter specific industries appear to be driving the creation of market values among LAMNEs.

The goal of this paper is to present a conceptual framework and empirical evidence on internal management capabilities in deploying resources that help explain variations in market values generated by the largest Latin American firms. Understanding the internal sources of acquiring market strength has both implications for corporate strategic decisions and competitive behavior as firms expand their cross-border business activities in their home region and around the world.

## **Research Questions**

To achieve this goal, the paper addresses three research questions as follows:

- What are the likely internal operational capabilities embedded in firm resources that enhance value creation in LAMNEs?
- What are the sources of these internal efficiencies in Latin America's largest firms?
- What are the strategic implications of these value creation activities among large LAMNEs engaged in cross-border investments?

Answers to these questions may throw light on whether or not LAMNEs are more or less like their older, traditional counterparts from North America, Western Europe and Japan upon whom most international business research has been based. Thus, can the FDI activities of LAMNEs be explained by the internationalization processes and motives of outbound FDI, as current theories such as the O-L-I model of the Eclectic Paradigm proposed by Dunning (1995, 1988), or the transaction cost models (e. g. Hill & Kim, 1988) would suggest?

## **RELATED LITERATURE AND CONCEPTUAL FRAMEWORK**

There are compelling reasons for investigating the forces that drive performance of Latin American multinational enterprises (LAMNEs). First, as newcomers in the global marketplace of foreign direct investment (FDI), there is a natural intellectual curiosity about these firms that marks them as targets for research investigation. Second, knowledge about these new firms from Latin America has the potential to advance our understanding of how firms of varying geographic and unique cultural backgrounds manage and perform in juxtaposition to more entrenched, traditional multinational firms from Western Europe, the United States, Canada and Japan. Do these newcomers from Latin America confirm or reject the range of prevailing and competing conceptual frameworks and theoretical formulations that seek to explain internationalization and performance of firms and industry? The question is intriguing because existing theories of FDI and allied explanations of global business expansion are based on the motives and behavior of traditional MNEs.

Finally, because global economic, political, technological and other dimensions of the environments in which all MNEs operate is perennially in a state of flux, firms are constantly evolving and adapting to changes in these environments. Hence, the need to examine systematically performance of newcomers in the global FDI landscape cannot be overemphasized. Understanding these new entrants in the global marketplace can only contribute to new insights into how firms adapt, survive and thrive in a hyper-dynamic environment.

### **Studies on Market-Value Creation among Global Firms**

This study focuses on factors that affect market values of LAMNEs, because these firms have been catapulted into the ranks of the largest global firms as a result of their rapid increases in market values that compare favorably with those of older and traditional MNEs (Forbes, 2008).

Several studies have investigated the value created by MNEs and other firms operating in the global marketplace during the past decade. Yet, the topic of value creation still remains an under-researched one, especially with regard to global newcomers such as Latin American firms engaged in outbound foreign direct investment. Three strands of research on value creation can be found in the literature of global business expansion: First, creation of market value driven by corporate market data and information, as processed by financial markets. Second, the literature reports studies on market value creation as a result of diversification strategies of firms in both the financial and real goods sectors. Third, some studies have examined market value in the context of global trade liberalization and macroeconomic reforms in host economies.

### **Financial Markets and Firm Valuation**

Many of the studies on value creation as a performance metric focus on the financial market and its influence on creating firm or stockholders' value, with some studies addressing bond holders' value as well. (Pierre-Xavier, 2005). Evidence is mixed on whether or not global diversification, which by definition accompanies most global investments in both the financial sector and the real goods sector. Denis et al (2002) reported in their study that diversification results in the loss of shareholder value. On the other hand, Bodnar et.

al. (1999) found, to the contrary, that global diversification actually leads to increases in shareholder value, even though both studies used the same valuation methodology. When Doukas and Kan (2006) make a distinction between bondholder and share holder values, bondholders win out in value gains as a result of diversification while shareholders see their share of value declines.

One of the most recent studies on value creation comes from a study by Gande, Schenzler and Senbet (2009) in which the authors show that global diversification enhances firm value. This mixed and contradictory evidence indicates that the jury is still out, in terms of the extent of value creation by firms as they expand across global markets, even when studies use the same methods of evaluation. Hence, a compelling case can be made for further study to investigate the determinants of market value in international business research.

## **Industrial Diversification Strategies and Value Creation**

At the industrial levels within real goods markets (in contrast to the financial sector), Barry and Kearney (2006), using portfolio theory, concluded that a more diversified manufacturing sector in Ireland, for example, leads to overall growth, thereby affirming the traditional view that large firms operating in diverse markets often contribute to growth in those markets. It can be argued, at least tangentially, that the presence of LAMNEs in a wide range of industries reported in the Forbes 2000 largest firms of which the current study is based, may be an indication of the potential contribution of these firms to growth in specific countries and economies in which Latin firms expand abroad.

## **Trade and Macroeconomic Factors:**

The literature also reports on studies that focus on the effects of external macroeconomic factors on value creation among firms expanding into global markets. For instance, Wooster (2006) found that value creation is most significantly associated with expansion by firms into emerging markets that are undergoing economic reforms through market liberalization. The study focuses on entry modes into host emerging markets that are at an advanced stage of reform and market openness. Incidentally, the profile of economies targeted in that study fits many emerging Latin American countries such as Brazil, Argentina and Mexico which also attract as well as export capital in the form of FDI. Wooster's study (2006) demonstrates the effect of external, extra-corporate influences, in the form of host- market liberalization and economic reforms, on value creation.

An equally significant external influence on firm performance, albeit with an indirect effect on value creation, has been investigated by Baggs and Brander (2006). Using Canadian-US cross-border data, the authors demonstrate that tariff reduction in foreign markets correlate with increasing profits for export-oriented firms, while domestic tariff reductions are associated with declining profits in import-competing firms. This finding would suggest that purveyors of outbound FDI may have benefited or lost from declining tariff barriers since the early 1990s—depending on the nature of a firm's global activities, with the creation of the World Trade Organization and the acceleration of globalization in general.

Examining the literature, one can conclude, even in the face of some of the contradictory results (see Denis et al, 2002), that the weight of evidence favors enhanced value creation as determined in financial markets and some diversification strategies of firms (Barry and Kearney, 2006, Gande, Schenzler and Senbet, 2009). Hence, by becoming global, the evidence suggests that LAMNEs may be contributing to overall global growth, at least to the extent that individual Latin firms form part of a portfolio of investments in specific markets (Wooster, 2006).

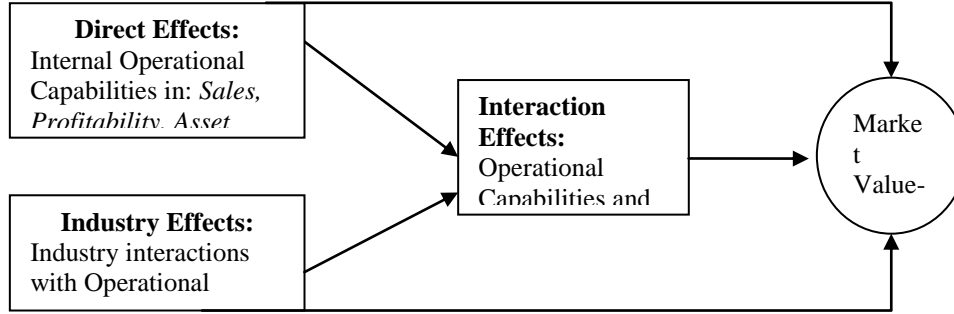

## **Gap in the Literature on Value Creation**

What appears to be missing in the literature on Latin American firms as new players on the global FDI landscape centers on identifying and evaluating the role played by internal operations of firms, indicators of firm efficiency as well as industry of choice in creating market values for firms engaged in global cross-border production and investment activities.

This paper attempts to bridge the gap between market value driven by external influences such as a) market data and financial information and b) trade liberalization, versus value creation from internal capabilities such as sales generation, asset acquisition and strategic choice to enter specific industries.

Our basic thesis is that internal managerial operational capabilities and strategic decision to enter specific industries decisions can have significant influences on market values of firms. We focus on sales generation, levels of profitability, acquired physical assets that are deployed in production as well as presence in an industry are key drivers of success in the marketplace that would translate into increases in a firm's value. We present this argument in a conceptual framework as depicted in Figure 1.

Figure 1: Operational and Industry Effects on Market-Value Creation in Latin American Multinational Enterprises

## METHODOLOGY AND HYPOTHESES

### Data and Sources

Data for this study was collected from Forbes Global 2000 annual ranking (2007) of the top 2000 publicly-held companies in the world. Sixty-three companies originating from Latin American countries were selected for the study based on worldwide sales, profits, assets and market values. Nearly 50% of the companies originated from Brazil; followed by Mexico with a large number of MNEs; then Chile, and finally Peru, Venezuela, Argentina and Colombia with one to two firms each.

#### Model Formulation

The methodology utilized seeks to examine the effects of sales, profits, asset utilization and industry presence on the market value of the firms in this study. The following equation is used to estimate the direct and interaction effects of operations and industry presence on value creation:

$$MKTVL = \alpha + \beta_1 SALES + \beta_2 PROFITS + \beta_3 ASSETS + \beta_4 PMARG + \beta_5 ASSETUTL + \sum \delta_i IND_{ik} + \sum \lambda_i (IND * X)_{ik} + \epsilon_i$$

where, MKTVL = market values estimated by the product of the mean stock price and number of outstanding shares. The *independent variables* are represented as follows: SALES = firm world-wide sales; PROFITS = firm world-wide profits; ASSETS = firm world-wide assets; PMRGN = firm gross profit margin; ASSETUTL1 = firm asset utilization in generating sales; ASSETUTL2 = firm asset utilization in generating profits; IND = industry dummy variable: IND1 = Energy, IND2 = Financial Services, IND3 = Materials; IND 4: Other industries, including assorted retail and telecommunication services

(IND\*X) represents the interaction variables of industry and the above regressors. The interaction variables are specified in the form (IND\*X)<sub>ik</sub>, i=1...k, number of industries, i=n, number of firms.

$\alpha$  = intercept reflecting other non-specified effects on market value

$\beta_i$  = direct effects of the independent variables on market value

$\delta_i$  = industry effects on market value.

$\lambda_i$  = interaction effects of industry and the above regressors of firm capabilities in operations and generating efficiencies on market value

$\varepsilon_i$  = error term

Ordinary Least Squares (OLS) stepwise regression was used to estimate subsets of the above full-model equation and their direct and indirect effects of the independent variables on market value. To explore a wide range of effects that explain variations on market values, we estimate and examine several models of equation (1) as presented in Tables 1-3.

## Hypotheses

**H1:** As LAMNEs increase their outward FDI, their overall financial performance, as measured by market value of the firms will increase. This will be so, in part, because of a natural increase in volume of activity such as sales that accompany regional and/or global market expansion.

**H2:** Increased efficiency in generating sales and profits through deployment of organizational assets will have a positive and direct effect on market values of LAMNEs that are actively engaged in outbound FDI in regional and global markets. This hypothesis is based, in part, on the general trend of increased acquisition of advanced managerial skills and enhanced technologies among emerging market firms in recent years. The sample of firms in this study all originate from emerging markets of Latin America.

**H3:** We expect that increases in operational efficiency in generating sales and profits and deployment of assets will be linked directly to specific advantages uniquely embedded in industries in which LAMNEs specialize. These industry advantages will explain, in part, variations in values of LAMNEs that engage in cross-border direct investments.

## EMPIRICAL RESULTS AND DISCUSSIONS

### Direct Effects of Operations and Industry Presence

Table 1 shows that firm operations in terms of sales generation (SALES), profitability (PROFITS) and asset acquisition (ASSETS) explain variations in market value (MKTVL) creation within LAMNEs. The results show positive and statistically significant effects of these operations on market value ( $p < 0.001$ ), in the estimated four models (Model 1 through Model 4), with Model 4 accounting for the highest explanatory power (adjusted  $R^2 = 0.957$ ). As a result, H1 is supported.

Likewise, the direct effects of industry presence show a strong, positive and statistically significant association between market values and the energy industry (Model 2,  $p < 0.08$ ) and an even stronger and positive association in Model 4 ( $p < 0.05$ ) and a somewhat positive relationship in the materials industry (Model 1,  $p < 0.10$ ). These results suggest that LAMNEs have acquired enough capability and experience in these industries to generate market value. Such a finding may also signal the acquisition of industry competitive advantages accumulated over time by firms surveyed in the respective industries.

## Direct Effects of Efficiency Proxies and Industry Presence

While the influence of sales, profits, assets and industrial presence are important, exploring insight into how efficiently LAMNEs utilize their assets to generate value may also shed more light on value creation strategies. Table 2 shows the potential effects of efficiency proxies on market values. As indicated above, three efficiency measures are employed in this study to investigate the role they play in creating market value in LAMNEs. These efficiency measures are presented here anew as follows: Profit/Sales (Profit margin = PMRGN); Sales/Assets (One measure of asset utilization = ASSETUTL1); Profit/Assets (Alternative measure of asset utilization = ASSETUTL2).

Table 2 indicates that none of these efficiency measures explains variations in market value. This lack of association between profit margins and asset utilization may be due to chance or failure of these measures to fully capture true efficiency levels in LAMNEs. This may be so, since true efficiency may be derived and properly captured at local, plant-level operations. In the latter case, discreet local or national operations are unable to influence investors' evaluation of overall, worldwide market values. By contrast, stockholders and other investors usually have access to information on worldwide sales, profits and assets, information that help to influence market evaluation of firms. Based on the statistical results, efficiency indicators, as measured in this study do not explain variations in market values. H2 is rejected.

## Interaction Effects between Industry and Operations and between Industry and Efficiency Proxies

The empirical results presented in Table 3 show statistically significant and positive interaction effects between industry and operations--SALES, PROFITS and ASSETS—and their impact on market values ( $p < 0.000$  for all estimates of Model 1 through Model 3). Specifically, the results strongly suggest that industry presence appears to have a moderating effect on operations, amplifying the influence of these operations on market values.

However, interaction effects between industry and the efficiency proxies—PMRGN, ASSETUTL1 and ASSETUTL2—were positive but not statistically significant. Reasons for this lack of association between the efficiency measures and industry presence may be similar to ones suggested above: from a statistical artifact of chance, to inappropriate measures of efficiency, to the local nature of efficiency gains that have little or no impact on market valuation of firms. The results are mixed regarding H3: Industry has positive and moderating effects that amplify variations in market values as a result of presence in the energy and materials industries. However, no statistically significant association appears to exist between the efficiency proxies and industry presence, not surprisingly because of the general lack of any association between efficiency and market values as indicated above.

## IMPLICATIONS AND CONCLUSIONS OF THIS STUDY

The primary goal of this study has been to investigate empirically factors that help explain variations in market value among Latin America's largest firms operating worldwide. Statistical analyses and their results suggest strongly that the source of LAMNE's value creation is embedded in the ability to generate sales, profits and acquire stocks of physical assets as well as the strategic choice to invest in specific industries such as energy and materials. In particular, the results suggest that industry presence appears to have a positive and moderating effect on operations in sales generation, profits and acquisition of assets in creating market values. However, there appears to be no evidence to link efficiency, as measured in terms of profit margins and asset utilization, to market valuation.

Positive effects of operations and industry presence on market values suggest enhanced managerial and technical skills and increased competitiveness of LAMNEs that have made it possible for these firms to be ranked among the largest in the world.

As LAMNEs continue to expand, they will increasingly counter competition from traditional MNEs and other newcomers, particularly from emerging markets of Asia. How the competing groups of MNEs—both traditional versus emerging—adapt to each other's competitive maneuvers as well as respond to new global FDI opportunities and challenges in a dynamic environment should provide endless research opportunities as well.

For now, based on this study's narrow investigation and results, opportunities for further research exist on a number of issues. For instance, future studies may focus on collecting and using more firm-level data to investigate and measure specific capabilities among LAMNEs such as workforce efficiency, choice of technologies and managerial techniques deployed in coordinating worldwide operations, among others. New data on the foregoing could shed light on specific internal corporate capabilities that confer competitive advantages on firms through a) growth in market values and b) the accumulation of embedded operational and strategic knowledge.

# THE LEGAL NATURE OF DOCUMENTARY LETTERS OF CREDIT IN INTERNATIONAL TRADE: A SOUTH AFRICAN LAW PERSPECTIVE

Dane Ally  
Tshwane University of Technology, South Africa

## ABSTRACT

*The doctrine of “strict compliance” and the fraud exception, which are applicable to documentary letters of credit, are explored. This doctrine entails that banks are obliged to pay a beneficiary if, by exercising due diligence, the bank is satisfied that such documents comply with the terms of the letter of credit. However, some might anxiously ask: Are banks compelled to pay a beneficiary even if he has committed fraud in order to receive payment? This paper answers this issue by considering the provisions of the Uniform Customs and Practice for Documentary Credits, including South African and foreign case law. I conclude that the application of the South African common law principles provide an equitable solution concerning the competing interests of the buyer and the beneficiary, if the buyer can clear the difficult hurdle of having to provide evidence that fraud had indeed been committed.*

## INTRODUCTION

South Africa’s participation in international trade gained significant momentum after it became a constitutional democracy on 27 April 1994.<sup>1</sup> Economic isolation was substituted with access to new markets. This increased exposure to international trade meant that South Africans who were, prior to 27 April 1994, not exposed to international trade, had to acquaint themselves with the legal nature of documentary letters of credit, since it has become a conventional means of payment in international commercial transactions. A letter of credit transaction is an undertaking<sup>2</sup> between the buyer of goods and his bank that the buyer’s bank will pay the seller upon presentation of certain documents specified in the letter of credit.<sup>3</sup>

The *Uniform Customs and Practice for Documentary Credits* (UCP 500)<sup>4</sup> provides that it is applicable to all letters of credit where the terms of the UCP are incorporated into it. In such instances, the terms of the UCP are binding on the parties, unless such terms are expressly excluded in the letter of credit. Although South Africa has not domesticated the terms of the UCP into its national law, it has become a custom or trade usage to incorporate the terms of the UCP expressly in documentary letters of credit.<sup>5</sup> It is important to note that there is one key area where the UCP does not apply – that is, when the issue of fraud as a defence to payment, is at issue. In such instances the dispute must be resolved based on domestic law.<sup>6</sup> It is against this background that this paper explores the doctrine of “strict compliance” which is applicable to documentary letters of credit in international trade, while having regard to the fraud exception as it is applied in South African law.

It is trite law that two fundamental principles are applicable to documentary letters of credit: They are the principle that the letter of credit is autonomous, and the doctrine of “strict compliance”. The former doctrine is not explored in this paper,<sup>7</sup> because our focus is centred on the latter doctrine.

Before I delve into the issues sought to be addressed in this paper, it is appropriate to identify the different parties who are, in general, involved in a letter of credit transaction:

- (a) *The buyer or applicant.* The buyer of the goods is the person that arranges that the issuing bank issues the letter of credit in favour of the seller or exporter.
- (b) *The seller or beneficiary.* The seller or exporter of the goods is the beneficiary of the credit.

- (c) *The issuing bank.* The buyer's bank is the issuing bank. This bank gives an undertaking to another person (usually the seller) that, upon the production of specific documents, it will make payment in terms of the letter of credit.
- (d) *The advising bank.* This bank is usually located in the country where the seller/ beneficiary is domiciled. The issuing bank normally instructs the advising bank to notify the seller of the establishment of the credit. The advising bank has the duty to ensure the authenticity of the credit, "but has no obligation to make payment under the credit".<sup>8</sup>
- (e) *The confirming bank.* This bank is ordinarily also located in the area where the seller/ beneficiary carries on business, and may be a bank where the seller has an account. Unlike the position with the advising bank, the confirming bank gives a separate undertaking to the seller that it will make payment under the letter of credit upon production of specified documents. It follows that the seller would, under these circumstances, have the benefit of undertakings from both the issuing bank and the confirming bank that payment will be made under the terms of the letter of credit.<sup>9</sup>

This contribution is presented in four parts. Part one consists of this introduction, while part two considers the doctrine of "strict compliance" relating to documentary letters of credit; part three explores the fraud exception under the South African common law, followed by the conclusion in part four.

## THE DOCTRINE OF "STRICT COMPLIANCE"

The doctrine of "strict compliance" is contained in article 13(a) of the UCP.<sup>10</sup> Although the principles included in the UCP do not constitute binding law within its conventional meaning, the UCP represents internationally accepted commercial best practices, and parties who incorporate its terms into letters of credit are in this manner bound to those principles.<sup>11</sup>

This doctrine is applied in several jurisdictions, particularly in the United States of America<sup>12</sup> and England.<sup>13</sup> The doctrine of "strict compliance" entails that, in order to receive payment from the relevant bank, the documents presented by the seller or exporter must *on the face of it*<sup>14</sup> "strictly comply" with the terms contained in the letter of credit and accompanying documents.<sup>15</sup> For example, in the case of *Beyene v Irving Trust Co*,<sup>16</sup> the name of the beneficiary was typed inaccurately. The court held that the bank was lawfully entitled to refuse to make payment. In other words, the bank did not – under those circumstances – commit a breach of its obligation to perform in terms of the letter of credit. In similar vein, it was held in *Equitable Trust Co of New York v Dawson Partners Ltd*,<sup>17</sup> that it is "both common ground and common sense" that a confirming bank may "only claim indemnity if the conditions on which it is authorized to accept are in the matter of the accompanying documents strictly observed."

This judgment upholds the important point of view that the issuing bank or confirming bank must effect payment in terms of the letter of credit when the documents presented by the seller or exporter to the issuing or confirming bank conforms to the terms of the letter of credit. It also means that bankers only have to examine letters of credit (and accompanying documents)<sup>18</sup> with reasonable care<sup>19</sup> in order to be indemnified in a dispute where it is alleged that they have breached their undertaking to perform in terms of the letter of credit. The Appellate Division of South Africa (now the Supreme Court of Appeal) embraced this doctrine in the matter of *Delfs v Kuehne & Nagel (Pty) Ltd*.<sup>20</sup> It was common cause that the bank was entitled to refuse payment based on the discrepancy between the letter of credit on the one hand, and the contents of the commercial invoice and the air waybill, on the other hand.<sup>21</sup> It is important to note that insignificant differences – as opposed to discrepancies that go to the essence of the documents – may not be relied upon in order to refuse payment.<sup>22</sup>

However, the doctrine of "strict compliance" may be susceptible to abuse by unscrupulous sellers. An example of such conduct was highlighted as early as 1925 by the dissenting judgment delivered by Cardozo J in *O' Meara v National Park Bank*.<sup>23</sup> The doctrine of "strict compliance" was accordingly relaxed in order to protect honest buyers from such beneficiaries.<sup>24</sup> As indicated earlier, the issue of fraud is not covered by the provisions of the UCP. In the United States, for instance, this issue is governed by the provisions of the *Universal Commercial Code*.<sup>25</sup> The fraud exception – from a South African law perspective – is discussed below.

## THE FRAUD EXCEPTION IN SOUTH AFRICAN LAW

Fraud or forgery, relating to the letters of credit, is committed when a beneficiary falsifies the documents he or she has to submit in order to receive payment, thus knowingly and unlawfully misrepresenting to the bank that he or she has complied with the dictates of the letter of credit – when, in actual fact, he or she did not.<sup>26</sup> At this juncture, two situations must be distinguished, that is, whether fraud had been discovered after payment had been made, and whether fraud had been discovered before payment had been made.

When fraud had been discovered after the bank made payment while exercising reasonable diligence, the bank will be indemnified. It follows that the applicant will have to recover any damages he or she had suffered by initiating criminal or civil proceedings or both, against the beneficiary.<sup>27</sup> It has been said that the applicant must be extremely careful when deciding who it chooses to deal with. This is the case, because in such circumstances, the risk is borne by the applicant or buyer.<sup>28</sup>

Conversely, when fraud is discovered *before* payment had been made; the applicant may prevent the bank from making payment by launching an interdict (also known as an injunction in some jurisdictions) against the bank.<sup>29</sup> This implies that, if the interdict is granted, the seller cannot succeed with a claim of non-performance against the bank on the ground that it failed to make payment. This would be the case, because the court order lawfully prevents the bank from making payment. On the other hand, if the applicant does not succeed with the interdict, and the bank pays despite the allegations of fraud, the applicant faces the onerous task of initiating civil proceedings against the bank and the beneficiary for the recovery of damages.<sup>30</sup> The Appellate Division of the High Court applied the doctrine of “strict compliance” in *Loomcraft Fabrics CC v Nedbank Ltd*<sup>31</sup> when it reasoned that the liability of the bank is based on its undertaking towards the beneficiary to effect payment if the prescribed documents are presented. The court further reasoned that, if the relevant documents are presented, the bank is duty-bound to make payment – unless the applicant produces proof that the beneficiary committed fraud in order to receive payment.

It was alleged in the *Loomcraft* case that fraud had been committed in respect of the date stamped on the transport documents; including the place where the goods were to be shipped (the original details appearing on the document had noticeably been altered). The court authoritatively held that in order to succeed with an interdict, the applicant bears the burdensome duty of having to show, on a balance of probabilities, that the beneficiary committed fraud. However, the court emphasised that this does *not* mean that fraud by the beneficiary – as is the case whenever fraud is alleged in any other case in South African law – may easily be accepted as having been proven. In this regard, Van Niekerk and Schulze note that it has been argued that the court’s point of view that fraud will not easily be inferred, is indicative of the fact that in practise “something substantially more” than proof on a balance of probabilities is required.<sup>32</sup> This point of view is not supported, since section 9 of the South African Constitution guarantees the right to “equal protection and benefit of the law” to everyone.<sup>33</sup> When this section is read contextually<sup>34</sup> with sections 39(2)<sup>35</sup> and 8<sup>36</sup> of the Constitution, it is clear that this common law burden of proof must be applied while having due regard to the provisions of section 9 of the Constitution. In other words, the supreme law of South Africa dictates that every litigant is entitled to equal benefit of the law. Differently put, in order to survive constitutional muster, a compelling reason must exist as to why an honest applicant should be treated differently from any other litigant merely because he seeks assistance from the courts to prevent an unscrupulous beneficiary from unjustifiably gaining from his alleged fraudulent conduct.<sup>37</sup> Furthermore, eminent South African scholars, writing on the subject of the foundations of South African law pertinently describe the unjustifiable inequity occasioned by such unequal treatment of like cases as follows:<sup>38</sup>

*“It is unjust to select arbitrarily different systems of value in considering one case and another. It is unjust to discriminate arbitrarily among equal cases.”*

Viewed in this light, I forcefully submit that it is questionable whether such an unusually burdensome evidentiary rule would survive the rigours of constitutional scrutiny. The firm guidance of the Constitutional Court is awaited on this important issue.

It must be underlined that the *Loomcraft* court was called upon to consider the fraud exception in the narrow sense, given that the applicant relied on fraud based on the face of the document.<sup>39</sup> What if the buyer is,

prior to the application for the letter of credit, fraudulently induced by the beneficiary to open the letter of credit? Would the court consider evidence outside of the letter of credit in order to determine whether fraud had been committed? In striking contrast with the decision of the Supreme Court of Ohio in *Mid-America Tire, Inc v PTZ Trading Ltd*,<sup>40</sup> the South African court in *Union Carriage and Wagon Co Ltd v Nedcor Bank*<sup>41</sup> rendered an *obiter dictum* (an opinion delivered by the court without considering the merits or demerits of the legal issues)<sup>42</sup> to the effect that it would have been prepared to consider evidence outside of the letter of credit so as to determine whether the beneficiary had committed fraud. This generous approach, as opposed to the narrow approach adopted by the Ohio Supreme Court, should be embraced by the courts of South Africa.

## CONCLUSION

The doctrine of “strict compliance” primarily serves to enhance three important purposes in international trade: First, it serves as a vehicle that promotes the commercial effectiveness of the letter of credit; secondly, it makes the task of banks less problematical when acting as facilitators for both the buyer and seller of goods, normally situated in different parts of the world; and, thirdly, it serves the purpose of making letters of credit a trustworthy mode of payment for beneficiaries.

There is no South African authority that clearly supports a fraud exception when the misrepresentation by the seller persuaded the buyer to open a letter of credit. In such circumstances, evidence outside of the documents would be essential in order to prove fraud. Although the *obiter dictum* in the *Union Carriage* case does not constitute binding law, it nevertheless has considerable persuasive value. More importantly, it serves to prevent a dishonest beneficiary from benefiting from his fraudulent conduct. This judgment should be embraced by the courts of South Africa, despite the fact that it implies that the principle that letters of credit deal exclusively with what appears *on the face* of the document – having regard to the principle of reasonableness, and in order to discourage unfair commercial transactions – should be relaxed.

This principle of reasonableness is firmly rooted in the South African common law. This principle entails that the interests of the relevant parties are balanced and weighed against each other, with the aim of reaching a decision that is reasonable, having regard to all the circumstances of the case.<sup>43</sup> For example, this concept is applied in criminal law and in the law of delict to determine whether a person exceeded the bounds of self-defence, or whether a police officer went beyond the limits of justifiable homicide when he or she attempted to affect an arrest. More to the point, the courts of South Africa apply this principle in disputes relating to unfair competition.<sup>44</sup> Against this background, there appears to be no compelling reason why the principle of reasonableness may not effectively be applied to grant an urgent interdict in favour of a buyer when it is evident that the beneficiary will, to the detriment of an honest buyer, unduly benefit from his or her fraudulent conduct.<sup>45</sup>

To be sure, such an application of the principle of reasonableness will make a significant contribution towards the advancement of fair international business transactions, if the buyer can satisfy the weighty burden of having to show that fraud had in fact been committed. Unfortunately, satisfying this threshold burden depends on evidence, the existence of which is, more often than not, within the particular knowledge of the alleged fraudster – not the buyer. Applicants should, for this reason, be extremely prudent when deciding on a seller or beneficiary while relying on the letter of credit as a means of payment. This problem is, however, not unique to the South African legal system. I submit that this drawback of the letter of credit is an unavoidable outcome of the two important principles which govern the legal nature of the letter of credit, that is, the principle that the letter of credit is autonomous, and the doctrine of “strict compliance”. In my view, any attempt to relax the function of these principles even further would unquestionably weaken the economic effectiveness of the letter of credit.

Lastly, I am of the view that the abnormally demanding evidentiary rule, suggested as being applicable to instances when an applicant relies on the fraud exception, should not be adopted by the Constitutional Court of South Africa.

10. Article 13(a) of the UCP, in pertinent form, reads as follows: "Banks must examine all documents stipulated in the Credit with reasonable care, to ascertain whether or not they appear, on their face, to be in compliance with the terms and conditions of the Credit. Compliance of the stipulated documents on their face with the terms and conditions of the Credit shall be determined by international standard banking practice as reflected in these Articles. Documents which appear on their face to be inconsistent with one another will be considered as not appearing on their face to be in compliance with the terms of and conditions of the Credit."
11. Chow & Schoenbaum note 3 above 277.
12. For a general discussion of the position in the USA, see Chow & Schoenbaum note 3 above 270-321.
13. See, for example, the matter of *Equitable Trust Co of New York v Dawson Partners Ltd*, (1927) 2 App Rep 49.
14. In *Rayner and Company Ltd v Hambro's Bank Ltd* [1943] 1 King's Bench 37, the letter of credit described the goods as "coromandel groundnuts" whereas the bill of lading described it as "machine-shelled groundnut kernels". Evidence was led in the court below that both descriptions – in this particular trade – refer to one and the same product. The bank refused to make payment, because it was not conversant with this particular trade usage. The court held that the bank was justified in refusing payment, because, *on the face of it*, there was a discrepancy on the documents. This judgment suggests that buyers and beneficiaries have a duty towards banks to ensure that their intentions are unambiguous when drafting the relevant documentation.
15. Chow & Schoenbaum note 5 above 270.
16. 762 F 2d 4 (2d Circ 1985); see also *Mutual Export Corp v Westpac Banking Corp*. 983 F 2d (420 (2d Circ 1993); and *Hanil Bank v PT Bank Negara Indonesia* US District Court, Southern District of New York, 2000 No 96 Civ 3201, 41 UCC Rep Serv 2d 618, cited in Chow & Schoenbaum note 5 above 275.
17. (1927) 2 App Rep 49 52. However, compare *Voest-Alpine Trading USA Corp v Bank of China* 167 F Supp 2d 940 (SD Tex 2000), where the district court decided that documents describing the beneficiary as "Voest-Alpine USA Trading Corp" instead of "Voest-Alpine Trading USA Corp" did not validate the decision of the bank to refuse payment in terms of the letter of credit. This more flexible approach is preferred above the rigid approach suggested in the *Hanlil Bank* decision.
18. Documents that may accompany the letters of credit are, *inter alia*, marine bills of lading, non-negotiable sea waybills, charterparty bills of lading, multimodal transport documents, air transport documents, courier and post receipts, insurance documents, commercial invoices, etc. See articles 23-38 of the UCP 500.
19. Article 13 of the UCP; see also Van Niekerk 7 Schulze note 5 above 247.
20. (1990) 1 SA 822 (A).
21. The letter of credit indicated that the exporter would supply 50 gazelle, 100 impala and two cheetah to a buyer in Saudi Arabia. However, the invoice and the air waybill reflected that only 47 gazelle, 104 impala and two cheetah had been transported to Saudi Arabia.
22. Van Niekerk & Schulze note 5 above 248.
23. 239 NY 386, 146 NE 636. In this case the majority judgment held that the bank should not be concerned about the underlying contract between the seller and the buyer. It must fulfil its obligation to pay the seller when the required documents have been presented. Cardozo J was of the opinion that, when a bank pays upon the presentation of a bill of lading which misrepresents the nature of the goods, it should have a remedy.
24. Van Niekerk & Schulze note 5 above 240-241.
25. Chow & Schoenbaum note 3 above 286.
26. Snyman (2008) 531 an eminent South African criminal law scholar, defines fraud in these terms; see also Neethling, Potgieter & Visser (2010) 297.
27. Van Niekerk & Schulze note 5 above 251.

28. *Phillips v Standard Bank of SA Ltd* 1985 3 SA 301 W.
29. The *Phillips* case note 28 above.
30. Chow & Schoenbaum note 3 above 288-289 makes a similar point with regard to the legal position in the USA. See also Van Niekerk & Schulze note 5 above 252.
31. 1996 1 SA 812 (A).
32. Note 5 above 253.
33. See section 9(1) of the Constitution of the Republic of South Africa, 1996, (the “Constitution” or “Bill of Rights”) provides as follows: “Everyone is equal before the law and has the right equal protection and benefit of the law.” Because the fraud exception forms part of our the common law, the common law burden of proof must be developed and adapted in order to give effect to the spirit, purport and goals sought to be advanced by the Bill of Rights – see sections 39(2) and 8 of the Constitution, as well as notes 35 and 36 below.
34. For a discussion of this form of interpretation, see Currie & De Waal ((2005) 156, who explain this concept as follows: “When it comes to the interpretation of particular provisions of the Bill of Rights, the courts use other provisions of the Constitution and the Bill of Rights to provide a further context for the interpretation of individual provisions of the Bill of Rights.”
35. This section provides as follows: “When interpreting any legislation, and when developing the *common law* or customary law, every court, tribunal or forum must promote the spirit, purport and objects of the Bill of Rights.” (Emphasis added).
36. Subsection 3(a) of this section reads as follows: “When applying a provision of the Bill of Rights ... a court in order to give effect to a right in the Bill, must apply, or if necessary *develop*, the *common law* to the extent that legislation does not give effect to that right.” (Emphasis added).
37. See, in this regard, the difficult test adopted by the Constitutional Court in the seminal case of *S v Makwanyane* 1995 3 SA 391 (CC) that must be satisfied by a beneficiary in order to justify such an unusual burden of proof. For a discussion of the justifiability standard adopted in the *Makwanyane* case, see Currie & De Waal note 34 above 178-186.
38. Hahlo & Kahn (1968) 35.
39. Fraud in the narrow sense is limited to fraud in respect of the documents, while fraud in the broad sense is concerned with fraud perpetrated by conduct outside of the documents.
40. 2002, 95 Ohio St 3d 362, 768 N E 2d 619.
41. 1996 CLR 724 (W).
42. Du Plessis (1999) 241 gives an explanation of this concept in the following terms: “Not everything the court decides with respect to the question of law is binding, however; only the *ratio decidendi* (the actual reason for the conclusion of law) is binding. *Obiter dicta*, that is [sic] remarks on legal issues made in passing and which are strictly speaking not necessary to arrive at the particular legal finding which the court eventually makes, are not binding.” However, I must add that, despite the fact that *obiter dicta* are not binding, it is common knowledge that they do have considerable persuasive value, particularly in the absence of contradictory authority.
43. Neethling (2010) 4 TSAR 825.
44. Neethling note 43 above 825.
45. Van Niekerk & Schulze note 5 above 253 express a similar point of view.

# INDUSTRIES OF THE FUTURE AND EMERGING TECHNOLOGIES: A VISION FOR A SUSTAINABLE FUTURE

**Maria Fatima Ludovico de Almeida**

**Pontifical Catholic University of Rio de Janeiro, Brazil**

**Carlos Augusto Caldas de Moraes, Candido Mendes University, Brazil**

## ABSTRACT

*Prospective assessments of how the future industries will face technological advances may seem a paradox, given the high degree of uncertainty and complexity inherent to the diffusion of innovations. Conversely, this paper - which is based on a prospective study carried out by the authors in 2010 – emphasizes the importance of understanding and anticipating the global driving forces and the key factors that will directly influence the diffusion of emergent technologies into industrial processes concerning eight sectors, namely: health; agro industries; forest systems; energy; buildings; mobility; telecommunications; and materials. The purpose of this paper is to present the main findings of this prospective study, reinforcing that there are certain sectors and specific patterns of innovation that need to be taken into account in public policies, corporate strategies and academic R&D orientation towards a 2030 vision for a sustainable future.*

## INTRODUCTION

Emerging technologies based on biotechnology, nanotechnology, information and communication technologies (ICT), and green chemistry will shape the future of some industries and will transform many others. In many cases, these technologies will determine the development and restructuring of industries as never before. These changes, in turn, will promote debates and revisions of current regulatory frameworks and corporate business models.

Will the new technologies findings be focused on radical innovative solutions that will generate new businesses? Or will technological advances be more incremental, concerning the improvement of existing technologies and businesses? Which new industrial configurations will emerge as a result of the diffusion of innovations related to biotechnology, nanotechnology, green chemistry, and ICT? And at what pace? To what extent the so-called emergent technologies will create or resolve ethical dilemmas?

These are questions for which planning based on prospective studies, particularly prospective scenarios, offers a robust conceptual framework. In fact, prospective scenarios are addressed for complex and highly volatile environments, organizing and revealing uncertainties and trends concerning the analysis of potential impacts of emerging technologies on current and future industrial configurations in long-term horizons (Georgantzis and Acar, 1995; Schoemaker and Van der Heijden, 1992; Van der Heijden, 2005; Schwartz, 1996; 2004).

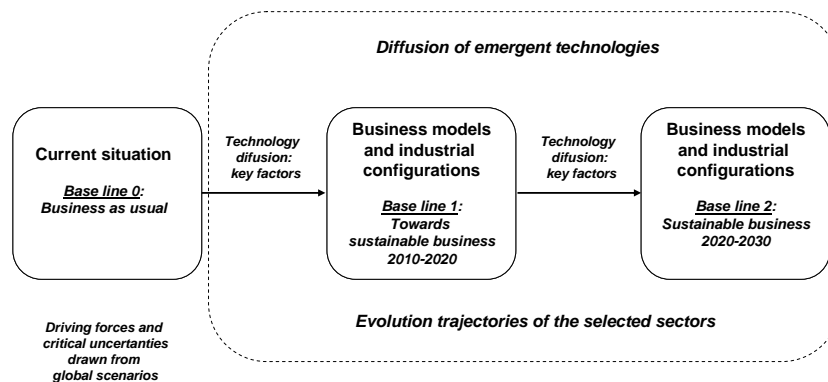

This paper - which is based on a prospective study carried out by the authors in 2010 – emphasizes the importance of understanding and anticipating the global driving forces and the key factors that directly influence the diffusion of emergent technologies into industrial processes concerning eight sectors, namely: health; agro-industries; forest systems; energy; buildings; mobility; telecommunications; and materials. The purpose of this paper is to present the main findings of this prospective study, reinforcing that there are certain sector- and technology-specific patterns of innovation that need to be taken into account in public

policies aligned to a vision for a sustainable future. It was assumed that the evolution of these sectors based on emergent technologies' diffusion and respective public policies would have a great impact on the achievement of a vision for a sustainable future in 2030.

## CONCEPTUAL MODEL

Figure 1 represents the conceptual model developed and adopted in the prospective study. It integrates four basic elements: (i) the current situation as a baseline (*business as usual* scenario); (ii) diffusion of innovations based on emerging technologies in the selected sectors, focusing on the mentioned new technologies; (iii) business models and industrial configurations along the period from 2010 to 2020, and (iv) business models and industrial configurations aligned to a vision for a sustainable future in 2030 (period from 2020 to 2030).

**Figure 1: Basic structure of the conceptual model**

From the current situation analysis, sectorial outlooks were described as a basis for constructing the “business as usual” scenario (*Base line 0*, in Figure 1). The analysis of long-term global scenarios led to the identification of the main driving forces, trends, and critical uncertainties that would influence the business models and industrial configurations concerning each sector along the period of 2010 – 2020.

In the sequence, with the adoption of prospective scenario’s methodologies reviewed in the first phase of the research (Godet, 2001; Schoemaker, 1992; Van der Heijden, 2005; Schot, 1998; Georgantzis and Acar, 1995), it was possible to describe the evolution trajectories concerning the eight sectors for the first ten years. The 2020 future scenes for these sectors were translated into new baseline (*Base line 1*, in Figure 1). From these new baseline and considering the diffusion of the so-called emergent technologies in a time horizon of 10 years, the evolution trajectories of the above-mentioned sectors were designed within the perspective of a sustainable future in 2030 (*Base line 2*).

As already mentioned, the prospective study’s scope encompasses eight sectors, and four groups of emergent technologies. The selected sectors include health; agro industries; forest systems; energy; building; mobility; telecommunications; and materials. For developing a cross-impact analysis focusing on the diffusion of emerging technologies on industrial configurations associated to the selected sectors, the following emerging technologies were considered: biotechnology; nanotechnology; green chemistry; and information and communication technologies (ICT).

## METHODOLOGY

Aligned with the qualitative model represented in Figure 1, a schematic overview of the prospective study development is showed in Figure 2. It comprised three main phases: (i) conceptual; (ii) participative; and (iii) conclusive.

The conceptual phase encompassed: (i) bibliographic and documentary reviews covering the research central themes and prospective studies; (ii) selection and analysis of systemic prospective studies at global level; and (iii) identification and analysis of prospective studies focusing the technologies and the sectors selected.

Concerning the bibliographic review, the following theoretical frameworks were considered: (i) dynamic approaches to innovation systems (Geels, 2004; 2005; 2008; Breschi and Malerba, 1998; Malerba, 2004; Johnson, 1998; Bergek, 2002; Bergek and Jacobsson, 2003; Carlsson and Jacobsson, 2004; Edquist, 2004); (ii) technology assessment approaches, in particular its constructive perspective (Smits et al. 1995; Sanmartín and Hronszky, 1994; Todt, 2002; Schot, 1992; Sanmartín and Ortí, 1992; Schot and Rip, 1998; Shrader-Frechette, 1985); and (iii) scenarios building (Van der Heijden, 2005; Schoemaker and Van der Heijden, 1992; Schwartz, 1996; 2004), with special attention to cross-impact analysis as proposed by Godet (2001).

**Figure 2: Development of the prospective study: a schematic overview**

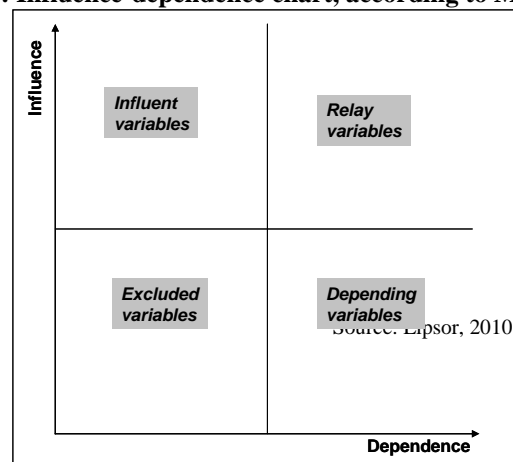

In relation to the analysis of systemic prospective studies at global and sectorial levels, several documents were selected and reviewed with an attempt to: (i) mapping the driving forces that will influence the diffusion of emergent technologies and the evolution of sectorial trajectories; (ii) identifying the main trends and critical uncertainties drawn from multiple scenarios; and (iii) identifying key issues concerning emergent technologies advances, new business models and future industrial configurations.

By way of illustration, three prospective studies at global level were consulted and reviewed: (i) “Mapping the Global Future 2020”, a study prepared by the U.S. National Intelligence Council, in 2002, (ii) “Global Scenarios 2025”, which were prepared by Shell in 2005; and (iii) “Global Scenarios 2065”, proposed by the Global Scenario Group as part of the normative study “Great Transition”, published in 2002. At sectorial level, the main reference adopted was a prospective study titled “Vision 2050: the new agenda for business”, which was published in 2010 by the World Business Council for Sustainable Development.

The cross-impact analysis aimed at: (i) identifying the key system variables (internal and external); (ii) mapping the inter-relationships and relevance of these variables for explaining the evolution of the system; and (iii) building the causal chain of the system, comprising the set of eight selected sectors, in this case.

Basically, the cross-impact analysis method comprised: (i) identification and description of key variables; (ii) expert judgment about the relationships between variables within a structural matrix; (iii) classification of variables adopting MICMAC method proposed by Godet (Lipsor, 2010); and (iv) design of the influence-dependence chart (Figure 3) and its corresponding influence graphs, which provided all the information needed to build the causal chain of the system.

**Figure 3: Influence-dependence chart, according to MICMAC method**

In the *participative phase*, a workshop was held in Brasilia in September 2010 and was attended by more than 60 experts from Brazilian government, academy, and industry. The objectives of this workshop were: (i) to

validate the partial results from the conceptual phase; (ii) to build a vision for a global sustainable future, concerning the eight selected sectors (time horizon: 2030), (iii) to design the evolution trajectories of the selected sectors in a horizon of 20 years, considering key factors that will influence the diffusion of emergent technologies in two periods of time (2010-2020: and 2020-2030); and (iv) to analyze the implications for Brazilian public policies, corporate strategies and academic R&D orientation towards the 2030 vision for a sustainable future.

Finally, in the conclusive phase, the results of previous phases were consolidated in a final report entitled “*Prospective study on industries of the future and emerging technologies: a vision for a sustainable future*” (CGEE, 2010). The present paper summarizes the main findings presented in that document.

## RESULTS OF THE PROSPECTIVE STUDY

This section presents the results of the prospective study, focusing on its conceptual and participative phases (See Figure 2). Considering the qualitative nature of the model and the methods of analysis that were employed, the research focus was on qualitative results and insights. To accomplish this, the application of the MICMAC method proposed by Michel Godet (Lipsor, 2010) during the conceptual phase was crucial, given its capacity for reconstructing the causes of any result of the participative phase by backtracking the impact flows within a given configuration.

### Main Results of the Conceptual Phase

During the conceptual phase, it was possible to identify a preliminary list of variables based on the analysis of previous global prospective studies conducted by competent institutions in this field. The application of MICMAC method helped to validate this preliminary list, confirming the adequacy of the original selection.

The main results from the conceptual phase can be summarized as follows: (i) a list of key variables or external forces that drive the evolution of the system towards the desired direction – a sustainable future; (ii) a list of relay variables, according to Figure 2; (iii) a list of depending variables; (iv) an influence-dependence chart, showed in Figure 3; and (v) a corresponding influence graph, showing the relationships between variables.

The key variables are the following: values’ change; global governance; economic growth; and population growth. The five relay variables are: human development; regulation; technology diffusion; climate change and environment. Finally, the eight depending variables are directly associated to the selected sectors. Figure 4 represents the influence-dependence chart, which together with its corresponding influence graph, formed the basis for scenarios’ building during the participative phase (See Figure 2).

**Figure 4: Industries of the future and emerging technologies: influence-dependence chart**

## Main Results of the Participative Phase

All the objectives of the participative phase were achieved. The results and discussions of the Brasilia Workshop allowed the validation of the partial results from the conceptual phase; building a vision for a global sustainable future, focusing on eight selected sectors; and the design of future sectorial trajectories in two periods of time (2010-2020, and 2020-2030).

The scenario-building exercises developed during the participative phase have produced important insights concerning challenges of current situation and have showed which new technologies are relevant for governments, companies, and other stakeholders to face them. The scenarios designed for two periods (2010-2020, and 2020-2030) highlighted how the new technologies, considering social, economic, and political forces can support a sustainable future.

Due to space constraints, only the results for the energy sector are shown in this paper (See Table I). The findings concerning the remaining sectors can be found in the final report of the prospective study (CGEE, 2010).

**Table 1: Scenarios and diffusion of emergent technologies: focus on energy sector (Part I)**

Item	Description
Current situation: main challenges	<ul style="list-style-type: none"> <li>• International consensus on the need for an effective global greenhouse gas management system.</li> <li>• Multilateral and international discussions to set a price of carbon at a global level.</li> <li>• Effective policies to reduce the production costs of energy and to increase the efficiency of other forms of energy generation.</li> <li>• Intensive use of incentive mechanisms and guidelines concerning eco-efficiency (globally and locally).</li> <li>• Education on energy consumption habits regarding cost savings and environmental benefits related to eco-efficiency.</li> <li>• Feasibility demonstration and risk assessment for regulatory and public acceptance of promising technologies such as carbon capture and sequestration (CCS), nuclear and biomass.</li> <li>• Regionalization of energy solutions based on emergent technologies.</li> </ul>
Diffusion of key emergent technologies	<ul style="list-style-type: none"> <li>• <u>Biotechnology</u>: biofuels; biorefineries (biomass fractionation and conversion); microorganisms' biotechnology; synthetic biology, enzyme and fermentation technologies.</li> <li>• <u>Nanotechnology</u>: nanomaterials for renewable energy devices, including photovoltaic cells, fuel cells, wind power, among others; nanostructured catalysts for the petroleum industry and ethanol production; nanomaterials for ethanol and bioethanol production and reuse of biomass; new and more efficient lighting systems (both organic and inorganic LEDs); nanotechnology for power generation and storage (nanobatteries and capacitors); hydrogen technologies.</li> <li>• <u>Green chemistry</u>: remediation processes applied to fossil raw materials.</li> <li>• <u>Information and communication technologies</u>: systems for detecting leaks of chemicals (bio-nano-ICT convergence); new algorithms for digital Programmable Logic Controllers (PLC); new algorithms for power line communications; smart grids; new algorithms and artificial intelligence for seismic activities; systems for detecting potentially dangerous gases; and basic sensory mesh networks using Zigbee.</li> </ul>
Scenario 2010-2020	<ul style="list-style-type: none"> <li>• <u>Fossil fuels</u>: (i) the oil and natural gas industry will continue to be dominated by cartels at a global level; rising costs of exploration and production (remote reserves); and search for technological solutions concerning alternative sources of energy; (ii) increasing use of coal as energy source and search for new technological solutions towards cleaner processes regarding this energetic source; (iii) increasing consumption of natural gas, and search for technological alternatives for enhancing its use, especially regarding their chemical transformations; and (iv) potential exploration of shale and bituminous sources as well as oil reserves of very low API</li> </ul>

	level, depending on the viability of alternative technological solutions.

**Table 1: Scenarios and diffusion of emergent technologies: focus on energy sector (Part II)**

Item	Description
Scenario 2010-2020 (Cont.)	<ul style="list-style-type: none"> <li>• <u>Energy renewable sources' fuels</u>: (i) moderate growth of hydroelectric generation by 2020, (ii) continued growth of small-scale hydroelectricity plants by using existing, proven technologies; (iii) potential growth of solar thermal energy, by using existing, proven technologies; (iv) large potential growth of solar energy, due to several safe and economic technological innovations; (v) increasing use of some types of microbial biomass as feedstock for biofuels, like micro algae; (vi) rapid growth of ethanol production as fuel, which could be even greater due to new technologies diffusion (especially, lignocellulosic ethanol); (vii) huge growth of bio-jet fuels due to existing proven technologies (biodiesel) and those in development (BTL); (viii) utilization of waste based on densification technologies (pyrolysis) and gasification (BTL), as well as on alternative biotechnology applications, and (ix) strong prospects for profitability and growth of wind power, particularly in specific geographic conditions. Growth is fuelled by rapid technological development enabling large-scale energy production at a competitive cost per produced kWh.</li> <li>• <u>Other energy sources</u>: (i) potential growth of nuclear energy, by using safe and proven technologies; (ii) high growth (immediate and continuous) regarding the use of eco-efficiency technologies; (iii) moderate growth of hydrogen as energy source, mainly observed in specific market niches.</li> </ul>
Scenario 2020-2030	<ul style="list-style-type: none"> <li>• Significant decline of greenhouse gas emissions.</li> <li>• Competitiveness of solar energy.</li> <li>• Increasing use of clean energies in developing countries.</li> <li>• Nuclear power generation will remain crucial for mitigating climate changes in this period.</li> <li>• There will be stagnation concerning the generation of hydroelectric power by 2030.</li> <li>• Particularly, in relation to fossil fuels, it can be mentioned: (i) potential change in the rate of growth of oil supply due to the emergence of new remote reserves, e.g. pre-salt in Brazil; (ii) potential change in the rate of growth of coal use, due to the diffusion of alternative technologies for the application of coal-type coal to liquids (CTL), dimethyl ether (DME) and in situ gasification; (iii) increasing consumption of natural gas, with potential changes in its growth rates, due the emergence of alternative technologies for implementing such dimethyl ether (DME) and GTL offshore, and (iv) exploration of the potential use of shale and bituminous sources, due to the diffusion of disruptive alternative technological solutions.</li> </ul>

## CONCLUSIONS

The aim of this paper was to emphasize the importance of understanding and anticipating the global driving forces and the key factors that directly influence the diffusion of emergent technologies into industrial configurations and processes. The prospective study focused on eight sectors – health; agro industries; forest systems; energy; buildings; mobility; telecommunications; and materials – and demonstrated the usefulness of a variant of cross-impact methodology for building scenarios in uncertain environments. The cross-impact analysis revealed four driving forces, namely *values' change*; *global governance*; *economic growth*; and *population growth*; five relay variables (*human development*; *regulation*; *technology diffusion*; *climate change and environment*), and eight depending variables, which are directly associated to the selected sectors.

The analysis of the diffusion of emergent technologies in these eight sectors showed that this method generated a number of interesting results, which could be validated during a workshop (expert panel) involving more than 60 representatives of Brazilian government, universities, and industrial sectors. The main findings of the prospective study reinforced that there are certain sector- and technology-specific patterns of innovation that need to be taken into account in public policies and corporate strategies aligned to

a vision for a sustainable future. It was assumed that the evolution of these sectors based on the diffusion of emergent technologies would have a great impact on the achievement of the vision for a sustainable future in 2030.

The scenario-building exercises developed during the expert panel have produced several important insights that are useful for developing public policy programs intended to stimulate and support innovations concerning biotechnology, nanotechnology, green chemistry, and ICT prospects. They could help companies to establish their corporate strategies, and also academic institutions to define their R&D orientation. The scenarios highlighted how a sustainable future can be supported by emergent technologies, considering social, economic, and political forces, and providing decision-makers with relevant information to their future strategic choices.

## **ABSTRACT**

*We present a preliminary analytical framework for non-structural factors affecting boards of directors' effectiveness in managing strategy implementation. Going beyond the recent research on boards, focused on structure and performance, we investigate the role of work processes, dynamics and firm/environment level context. Departing from influential general board performance models, we ground our work on behavioral and contingency theoretical perspectives, attempting to identify the factors which may contribute to boards' effective involvement in strategy implementation. By analyzing the behaviors and work practices required to improve the quality of boards' intervention in that process, we contribute to an emerging research stream that aims to understand the 'black box' of board functioning.*

## **INTRODUCTION**

Why do boards fail in behaving accountably (Huse, 2009)? It is important to understand how boards can ensure that key strategy implementation decisions are consistent with planned strategies with a view to adding value. To cope with their natural distance from the strategy implementation (SI) playfield, effective boards must develop work processes and dynamics to ensure that strategic objectives are met. However, as various episodes of governance failure illustrate, some boards' work practices seem not to anticipate, assess and mitigate SI risks.

The objective of this paper is to present a preliminary analytical framework of non-structural factors which may affect the effectiveness of boards in the management of SI. Until recently, the literature pertinent to board research has focused on board structure and firm performance. We aim to expand this analysis by investigating the potential role of a board in the task of ensuring successful SI. We draw on behavioral and contingency perspectives, intending to specify the nature of the factors which may contribute to a board's effective involvement in that process.

Notwithstanding the growing emphasis on the importance of corporate governance to ensure the attainment of strategic objectives, the proposition of models to help understand how boards can effectively perform this role has received sparse attention (Schmidt & Brauer, 2006). The areas of board effectiveness and SI have been mostly examined independently by scholars on strategy and corporate governance. Although some scholars provided indications of how boards can work towards a sound strategic execution, no studies have analyzed the phenomenon systematically to identify influencing factors. There are few integrated models upon which to develop propositions and base empirical work on the subject. To our knowledge, no studies have proposed similar approaches to this subject.

## **ROLE OF BOARDS IN SI**

There is an increasing notion that value can be created by improving board effectiveness (Huse, 2009), defined as the ability of the board to perform its tasks (Forbes & Milliken, 1999). These tasks, conceptualized by

complementary - and sometimes contrasting - theoretical perspectives (Daily, Dalton, & Cannella, 2003) are, traditionally, categorized in four groups: monitoring, service, strategy and resource provision. Monitoring, consistent with the view that the separation of ownership from control propitiates managerial opportunism, is supported by the agency theory framework (Fama & Jensen, 1983). Grounded on stewardship theory (Donaldson & Davis, 1991), service encompasses advice and support to management (Lorsch & MacIver, 1989). Strategy comprises activities ranging from strategic direction (Phan, 1998) to management of SI (Stiles & Taylor, 2001). Resource provision, founded on resource dependence theory, relates to the ability to provide access to resources such as capital, stakeholders' relationships, experience and legitimacy (Dalton, Daily, Ellstrand, & Johnson, 1998).

In the literature, most attempts to explain boards' effectiveness rely on structural dimensions and characteristics such as board size, separation of CEO and board chair positions and presence of outside directors. In essence, these features stand for maximizing the chance of boards' independent behavior. However, empirical evidence has shown that the relationships among a board's structural characteristics and performance are uncertain (Bhagat & Black, 1999), for non-structural intervening factors restrict direct associations between them (Finkelstein & Hambrick, 1996). By this alternative logic, a board's work processes and dynamics may mediate the relationship between its structure and effectiveness. These factors have been studied in a line of research on corporate governance and boards grounded on strategic management and organizational behavior perspectives (Johnson, Daily, & Ellstrand, 1996). Non-structural factors of a board's effectiveness may relate to cognitive (Forbes & Milliken, 1999), behavioral (Huse, 2005), work process (Huse, Minichilli, & Schønning, 2005), environmental (Daily et al., 2003), information (Siciliano, 2002), knowledge (McGrath, MacMillan, & Venkataraman, 1995) and power (Pettigrew & McNulty, 1995) dimensions.

Literature and management practice display a growing consensus about the importance of boards' role in strategic management (Demb & Neubauer, 1990; Judge & Zeithaml, 1992; Pugliese et al., 2009), built on the perception that they are ultimately responsible for effective organizational functioning (Blair & Stout, 2001; Johnson et al., 1996). However, the multiple ways in which boards may address strategic issues are yet poorly understood. (Hendry, Kiel, & Nicholson, 2009). In the case of SI, the role of boards is not consensual in literature, and scholars' attention to boards' involvement in this mission has been sparse (Amaral-Baptista, Macedo-Soares, & Melo, 2010). Thus, a clear definition of the board's role in ensuring that strategic objectives are met is required.

We follow Brauer and Schmidt's (2008) argument that boards may have a meaningful role in SI. Grounded on an agency perspective and on insights from the strategy process literature, they suggest that this role should be to ensure that intended strategy converts into realized strategy. Boards are not supposed to be directly involved in SI activities lest authority conflicts with management might emerge (Mace, 1971). However, they are expected to intervene if the realized strategy deviates significantly from the intended strategy and management does not take proper corrective action (Jensen & Meckling, 1976). In doing so, boards should expand their monitoring task to address the causes of inconsistencies (Schmidt & Brauer, 2006) and foster strategy realignment. Such role definition illustrates that, in practice, a board's monitoring, service and strategy tasks are not separate or mutually exclusive.

## **PRELIMINARY ANALYTICAL FRAMEWORK**

The few existing studies on board effectiveness in SI focus on offering measures and tools to assess a board's performance on this task (Brauer & Schmidt, 2008; Drew & Kaye, 2007). Without excluding assessment tools, we take a different approach, in an attempt to identify which factors may affect boards' effectiveness in that task and how these factors may impact that effectiveness.

We draw upon behavioral and contingency perspectives (Gabrielsson & Huse, 2004) to develop an analytical framework of relationships among non-structural factors which may affect the effectiveness of boards in managing SI (Exhibit 1). The behavioral perspective supports the concept that a set of factors related to a board's work processes and internal dynamics may represent its ability to fulfill that role (Box 1). These factors may influence a board's effectiveness in the SI task (connector 'a'), which may in turn exert influence on a firm's SI performance (connector 'b'). The contingency perspective provides support to the notion that boards of

directors may selectively allocate attention to monitoring tasks (Tuggle, Sirmon, Reutzel, & Bierman, 2010). Beyond that, we posit that a board's attention to SI will be influenced by contextual factors (Box 2) and role expectations (Box 3) towards SI. The level of attention to SI is then expected to moderate the impact of the board's work processes and internal dynamics factors on its effectiveness in the SI task (connector 'c').

We propose this framework as a basis for explaining the contribution of board dynamics, work process and contextual factors to board performance, with respect to the task of managing SI and, ultimately, also to corporate performance on SI. In what follows, we focus the discussion on defining and characterizing the framework's constructs.

**Exhibit 1 – Preliminary analytical framework**

As argued in the previous section, the effectiveness of boards in fulfilling their SI management role may be influenced by the way boards actually work. Instead of concentrating attention on structural characteristics, we start by analyzing board-level factors of its dynamics and work processes that may support the task of ensuring SI, depicted in Box 1.

**Access to information.** Boards need to gain timely and comprehensive access to relevant information (Siciliano, 2002). Boards have specific information needs to understand SI key issues, as the scope and methods to gain access information may influence their involvement in such issues. In terms of scope, boards should proactively define their information needs in line with strategic objectives (Drew & Kaye, 2007). Failure to do so may lead to a situation in which boards are entangled with reports and presentations prepared by management. This kind of information may focus on minutiae or non-strategic dimensions, depicting a biased picture which may narrow or divert the board's span of intervention and analysis. In defining their needs, boards should address several information dimensions in addition to financials (Drew & Kaye, 2007). Although financial statements may give insights as to why a given strategic decision has failed, they may not suffice to reveal what is driving SI deviations. In her case study, Siciliano (2002) identified relevant additional dimensions such as service level (customer satisfaction, customer retention, volume of transactions, processing times), physical activity of products and services, human resources training and development, status of progress of key projects and strategic initiatives. As for methods, boards' SI reviews should be supported by task-specific assessment tools and metrics (Drew & Kaye, 2007; Siciliano, 2002). The format of the information available to them should be conducive to the discussion of key SI issues. In order to gain a "real-life" perspective of barriers to the success of SI, directors should establish access paths to middle managers and key employees (Drew & Kaye, 2007). Boards may also use management consulting support on SI progress reviews, in order to increase the span and depth of analysis and the quality of decision making.

**Business-specific knowledge.** Drawing on Forbes & Milliken (1999), the construct is defined as the extent to which the business-specific knowledge and skills, both external and internal, that are required for a board to effectively perform its SI management tasks are collectively present in a board. Knowing the external environment is critically important (McGrath et al., 1995). To perform its strategy tasks effectively, boards must have a sound knowledge of the industry, of the competitive scenario and of environmental forces that may interfere on the focal firm's strategy. In order to derive the most relevant implications for the success of SI, boards must possess (and use) sufficient knowledge of external aspects such as changing customer needs, competitive dynamics and sources of business risk (McGrath et al., 1995). The knowledge of firm-specific operations and internal management issues is also fundamental (Forbes & Milliken, 1999) and directors should possess explicit and tacit knowledge of internal operations in order to make consistent strategic decisions (Drew & Kaye, 2007).

**Cognitive conflict.** We draw on Jehn (1995) and Forbes & Milliken (1999) to define cognitive conflict as board-level disagreements about the nature and content of SI tasks, including differences of ideas, perspectives and opinions. Cognitive conflict may be evidenced by different characterizations of problems and by contrasting points of view about possible responses to problems (Dutton & Jackson, 1987). In order to intervene timely and decisively on the key issues of SI, directors should not display a conflict avoidance posture, welcoming the ability of each director to say what he or she thinks with openness to diversity of thought. The presence of cognitive conflict in boards may have a positive or negative impact in the management of SI. Disagreements in boards may propitiate richer and deeper discussions of strategic issues (Forbes & Milliken, 1999). They may lead to an increase of a board's critical investigation abilities, which may induce management to justify, reflect upon and possibly modify its position regarding strategic matters. By discussing several alternative courses of action, boards may benefit from a variety of points of view, potentially improving decision making. However, excessive levels of cognitive conflict may lead to interpersonal animosity and tension among directors, jeopardizing the quality of directors' interactions and commitment to the board (Mace, 1971).

**Cohesiveness.** In order to produce meaningful syntheses and make high-impact decisions in the SI dimension, boards should cooperate for consensus. Because board SI tasks are complex and require high degrees of interaction, communication and deliberation, directors must have sufficient interpersonal cohesiveness to execute them well (Forbes & Milliken, 1999; Huse et al., 2005). O'Reilly, Caldwell and Barnett (1989) suggested that a board's effectiveness in strategy tasks is positively related to social integration of directors and consensus. Excessive degrees of cohesiveness may be detrimental to a board's effectiveness in some circumstances (Forbes & Milliken, 1999). A highly cohesive board may be distracted by a proliferation of interpersonal exchanges and by groupthink (Mullen, Anthony, Salas, & Driskell, 1994). Thus, according to Janis (1982) and Forbes and Milliken (1999), the optimal functioning of a board in decision making tasks may happen at intermediate levels of cohesiveness. In a different line of reasoning, Byrne (1997) argues that groupthink is more prone to arise in highly cohesive groups in which members display low cognitive conflict. Thus, effective boards may be characterized by high cohesiveness and high cognitive conflict.

**Work processes.** In order for boards to act decisively on the issues that may cause SI deviations, robust work processes should be in place to ensure that they are analyzed and acted upon in a timely and thorough manner. Directors should prioritize substantial and enough time for gathering relevant information and preparing in advance for the task (Lorsch & MacIver, 1989). They should also be well prepared for the board meetings in order to contribute substantially. Given the high complexity of SI issues, boards should avoid deciding on the basis of superficial analyses. Instead, they should engage on thorough discussions to have a sufficient understanding of the implications of alternative courses of action (Sellevoll, Huse, & Hansen, 2007). This fact notwithstanding, board decision-making should be prompt enough to prevent that the company becomes stuck on board decision bottlenecks (Sellevoll et al., 2007).

**Independence.** Two dimensions of board independence are relevant to this study: independence from top management (agents) and from shareholders (principals). Agency theory suggests that board members should be independent of top management in order to perform their monitoring tasks. A vast body of research on boards has studied this proposition based on the assumption that independence from management can be validly measured by what Gabrielsson and Huse (2004) called 'usual suspect' proxies such as separation of CEO and board chair positions and presence of outside directors. As previously outlined in the previous section, a concentration of studies on direct relationships between these structural characteristics of boards and firm

performance produced ambiguous results (Daily et al., 2003) because of a lack of behavioral and contingency considerations. Instead of investigating mediating effects between board structure, behavior and task performance, we suggest to directly assess if boards display an independent behavior. Thus, we conceptualize independence from management as a collective board behavior that can be conducive to its effectiveness in the task of managing SI. On the dimension of independence from shareholders, we draw on theoretical insights from the literature on principal-principal conflicts. Principal-principal conflicts between controlling and minority shareholders are more prevalent in emerging economies and result from concentrated ownership, family control and weak legal protection to minority shareholders (Dharwadkar, George, & Brandes, 2000). They influence the corporate governance process and the work of boards (Young, Peng, Ahlstrom, Bruton, & Jiang, 2008). For example, in such a context controlling shareholders can decide on board director nominations. This may affect the board's ability to prevent strategic decisions that ultimately expropriate value from minority shareholders (Young et al., 2008). By influencing sub-optimal strategic choices by political reasons at the expense of performance (Filatotchev, Wright, Uhlenbruck, Tihanyi, & Hoskisson, 2003), boards operating in this context will not be effectively managing SI. Instead, they may be less likely to play a strong strategy monitoring role as they may lack independence from controlling shareholders and institutional support (Young et al., 2008).

As outlined in the previous section, a board's involvement in the task of managing SI may not be uniform. Instead, internal and external contingencies and role expectations may affect the level of attention that boards allocate to this task. In spite of significant time and information limitations, boards must allocate attention to a variety of tasks. Ocasio's (1997) attention-based view of the firm (ABV) grounds the notion that boards should selectively attend to certain issues while foregoing others, with basis on contextual factors and the structure of decision makers' interactions. As Tuggle et al. (2010) observed, "the ABV suggests that board members' attention to monitoring represents an important antecedent to actual monitoring, yet the allocation of attention to monitoring is expected to vary based on contextual and structural factors" (p. 947). In an extension of Tuggle et al.'s argument, we posit that **board attention to SI** (i) may positively moderate the level of influence of board-specific behavioral features on the board's effectiveness in managing SI; and (ii) may vary with basis on contextual and role expectation factors. We will elaborate this argument next, in an attempt to characterize these factors.

The contextual factors affecting board attention to SI identified in the research are shown in Box 2. We construe **past firm performance** as a predictor of a board's attention to SI based on the logic that poor levels of performance will motivate the board to increase scrutiny over potential deviations from the strategic plan in an attempt to accelerate corrective actions. Drawing on insights from prospect theory (Kahneman & Tversky, 1979), Tuggle et al. (2010) showed that a negative deviation from prior performance increased the board's allocation of attention to monitoring tasks. This was grounded on the notion that negative performance deviations relative to a point of reference function as a trigger that affects the board's behavior, as prospect theory suggests. Since boards have a fiduciary responsibility to shareholders to monitor and assess the performance of management, deviations from prior performance may be an especially relevant contingency for boards. Potential reputational effects of poor performance on board directors are also expected to motivate them to allocate more attention to strategy monitoring tasks.

**CEO trust.** CEO trust refers to the board's trust in the CEO's ability to make sound and independent decisions (Tacheva & Huse, 2006). Past research has established that the board's trust in the CEO is essential for board task performance (Huse, 1993). Notwithstanding, we expect this relationship to follow an indirect path. Trustful CEOs will tend to be perceived by boards as diligent agents on behalf of the principals' interests. Because a dysfunctional involvement of boards in SI tasks may give rise to authority conflicts with the CEO, board directors may be motivated to allocate less attention to this monitoring task if the CEO is trusted. Conversely, if the relationship between the board and the CEO is based on distrust, boards should be more diligent in scrutinizing the firm's strategic course.

**Environment's causal texture.** We draw on Emery & Trist's (1965) work on how organizations and their corresponding external environment co-evolve by means of mutual connections to define this construct as the level of environmental turbulence and uncertainty affecting a firm's strategic development. In a context of higher turbulence, it is expected that a firm's strategic response have high repercussions within its social field, potentially co-producing an outcome of more turbulence (Selsky, Goes, & Baburoglu, 2007). In order to cope with such higher levels of environmental uncertainty, we expect a board's attention to SI decisions to increase. Since strategic responses to turbulence may have dysfunctional consequences both at firm and social field levels, boards are expected to scrutinize strategic decisions and milestones with higher emphasis and detail. In line with Emery & Trist's arguments, boards are also expected to assume an active role in identifying and negotiating a

common ground for collective action at environment levels, in an attempt to stabilize the rules of competition and reduce environmental uncertainty.

Boards may display different expectations of their role on managing SI. We identify two dimensions of these expectations: **effort norms** and **accountability norms**. We depart from Wageman (1995) and Forbes & Milliken (1999) and define effort norms as the shared beliefs held about the degree of effort that a board should dedicate to the task of managing SI, including expectations on availability and use of time, and on the quality of a board's contribution to strategy tasks (Huse et al., 2005). Accountability norms encompass expectations about values, ethical norms, independence, extent of authority and accountability to evaluate and make SI decisions. As discussed in the previous section, board role expectations towards strategy implementation are not consensual in literature – and possibly not in management practice either. Forbes & Milliken (1999) and Huse et al. (2005) proposed that these norms may exert direct influence on the effectiveness of a board, by the argument that they lead to higher participation and contribution. We draw on Tuggle et al.'s (2010) attention-based view logic to posit that this influence may not be direct, but mediated by the board's attention to SI. By this argument, higher effort norms and accountability norms towards the task of ensuring SI will drive boards to allocate more attention to the task, which will then influence board effectiveness. In Box 3, role expectations affecting board attention to SI are depicted.

Building on previous board effectiveness research (Huse, 2005; Sellevoll et al., 2007), we construe that **board effectiveness in managing SI** may mediate the effects of board-specific dynamics and work process factors and corporate SI. Drawing on Forbes & Milliken's (1999) definition of task performance, we operationally define this construct as the extent to which boards can perform their SI management tasks effectively. Literature suggests that the level of accountability of a workgroup for a given task can be measured in a variety of ways. In studying the effectiveness of Norwegian boards, Sellevoll et al. (2007) developed performance measures on boards' strategy, monitoring and service tasks. Some of them are applicable to the specific context of the SI management task. For instance, boards that display high involvement and authority in guiding SI are expected to perform better on the task. In order to manage SI, an effective board should systematically control and follow-up on the status of key strategic initiatives and resource allocation decisions. Board involvement in SI should be continuous rather than sporadic (Zahra, 1990). They are also expected to be actively involved on questioning the current strategy and on understanding the reasons why the intended strategy is not being implemented in practice. They should also act as gatekeepers for strategic proposals from management (Stiles, 2001). On these grounds, boards should make sound proposals and decisions to reestablish the strategic course of the company. Finally, boards should ensure that key strategic decisions are properly put in action. Nevertheless, as highlighted by Brauer & Schmidt (2008), board involvement in SI should not be unrestricted but disciplined. Boards should not participate directly in SI in order to avoid role conflicts with management. Such direct involvement might also impair the boards' own critical capacity to continually question the strategy, jeopardizing its effectiveness in managing SI.

Few definitions of **strategy implementation** found in literature simultaneously emphasize the roles of top management and boards (Schaap, 2006), process perspectives (Hrebiniak, 2006), behavioral perspectives and environmental influence (Lehner, 2004). We build on Li et al. (2008) to define SI as a dynamic, interactive and complex process, comprised of several decisions and activities carried out by boards, top management and employees, affected by interrelated internal and external factors, aimed to convert strategic plans into concrete actions so that intended strategy can convert into realized strategy. Drawing on the field of strategy process research, Brauer and Schmidt (2008) suggested that SI may be measured by its consistency, defined by the extent to which resource allocation decisions are consistent with the firm's intended strategy. They also derived potentially useful indicators. For instance, the volatility in implementation consistency and the time lags between inconsistencies and corrective actions may indicate the firm's SI quality.

## CONCLUDING REMARKS

Our intent was to present a preliminary analytical framework of relationships among non-structural factors which may affect the effectiveness of boards of directors in the management of SI. Understanding how boards can have a meaningful role in influencing an organization's strategic success is important because SI mistakes destroy value (Allio, 2005). This study extends research on boards of directors and strategy by incorporating behavioral and contingency perspectives in an attempt to explain how boards can fulfill their role in SI. It also intends to contribute to an emerging research stream that aims to understand the 'black box' of board functioning (Gabrielsson & Huse, 2004).

We expect the proposed framework to be used as a basis for future empirical work on boards and SI. We believe that with the help of this framework, scholars and practitioners can gain additional insights on the behaviors and work practices that need most attention in order to improve the quality of a board's intervention in the SI process. The framework could also help improve board and director performance assessment tools, making a potentially valuable contribution to financial analysts and investors.

# **DRIVERS OF CUSTOMER LOYALTY IN BUSINESS TO BUSINESS (B2B) CONTEXT**

**Mohammad Hossein Askariazad and Nazila Babakhani**  
**Sharif University of Technology, Iran**

## **ABSTRACT**

*This paper tries to investigate factors affecting customer loyalty in the Business to Business (B2B) context. Related literature in the field of customer loyalty and satisfaction has been critically reviewed to find out the most influential factors in modeling customer loyalty in B2B sectors. Through the extensive review of previous researches the gap in theoretical studies in this regard is highlighted. A holistic approach towards modeling overall customer loyalty leads to developing a conceptual framework for evaluating customer loyalty based on the important factors used in the studied literature.*

## **INTRODUCTION**

The concept of customer loyalty has attracted much attention in recent years and many authors have studied the importance of loyalty in the marketing literature. Loyal customers are expected to exert powerful effects on firms' performance and prosperity. In general, customer loyalty leads to increasing revenue, reducing customer acquisition costs as well as lower costs of serving repeat purchasers, which causes greater profitability for the firms (Lim *et al.*, 2004). Hence, it has been demonstrated experimentally by different researchers that there is a link between customer satisfaction, loyalty and the economic performance, measured in several ways, such as return on investment, stock market value and market value added (Martensen *et al.*, 2000). Customer loyalty in a Business to Business (B2B) context is of great importance due to the fact that business customers spend large amounts of money in their purchase of products and services compared to individual consumers (Rauyruen and Miller, 2007). With the advent of relationship marketing, achieving high sales volume is not the ultimate goal in B2B exchanges anymore. It is more important to build and sustain long term relationships with business customers and to manage and maintain loyal business customers. Suppliers, manufacturers and service providers all need to understand the nature and circumstances of their business customers thoroughly to develop enduring relationship with them and to build up strong customer loyalty (Gounaris, 2005; Rauyruen and Miller, 2007).

Customer loyalty in business-to-consumer (B2C) contexts has been studied by many researchers; however, limited researches concentrate on modeling customer loyalty and investigating its antecedents, particularly in B2B context (Lim *et al.*, 2004). Effective modeling is essential to enable interested parties to evaluate the customer loyalty and its consequences to exploit new business opportunities in improving the customer loyalty. Lack of these studies in B2B sector motivates the authors to conduct an extensive review of the related literature in an effort to identifying the drivers of loyalty and their influential impacts on the overall customer loyalty. The purpose of this study thus, is to critically review the literature on modeling customer loyalty in the B2B context to propose a conceptual framework for evaluating factors affecting customer loyalty. The particular emphasis in this work is to identify the gaps exists in previous theoretical researches in modeling customer loyalty in B2B sectors. The authors have analyzed the existing body of literature in the area of modeling customer loyalty in the B2B context and identified the most influential factors affecting this construct.

This paper is organized in the four following sections. Section 2, defines the concept of customer loyalty and reviews previous modeling techniques used in this context. Section 3, presents the research methodology. Section 4, presents the conceptual framework proposed by authors to be used in evaluating

customer loyalty in the B2B context based on the particular characteristics of this sector. Finally, this paper concludes by highlighting the key findings of this study and recommendations for further research in Section 5.

## **CUSTOMER LOYALTY DEFINITION**

The importance of loyalty has been considerably identified in marketing literature research. Aaker (1991) claims that loyalty plays fundamental role in the brand equity process – specifically noting that brand loyalty reduce marketing costs. It is consistent with Fornell and Wernerfelt (1987) who argue that the costs of customer retention are substantially less than those of customer acquisition. Besides, providing positive word-of-mouth recommendation and greater resistance among loyal consumers to competitive strategies from rival suppliers, is other element of brand loyalty (Caceres and Paparoidamis, 2005). Despite, many important managerial implication of customer loyalty, there exist some empirical gaps in researching this area. Although there are numerous ways of defining and measuring loyalty in a consumer market, in a B2B context loyalty has not been clearly defined. Oliver (1999, p. 34) defines brand loyalty as follows:

“Deeply held commitment to re-buy or repatronize a preferred product/service consistently in the future, thereby causing repetitive same brand or same brand-set purchasing, despite situational influences and marketing efforts having the potential to cause switching behavior.”

This definition highlights two distinctive aspects of brand loyalty, behavioral and attitudinal loyalty. Chaudhuri and Holbrook's (2001) define behavioral loyalty as “the willingness of average business customers to repurchase the service and the product of the service provider and to maintain a relationship with the service provider/supplier,” they also define attitudinal loyalty as “the level of customer’s psychological attachments and attitudinal advocacy towards the service provider/supplier” (Rauyruen and Miller, 2007). Many authors support the use of composite approach of loyalty which consists of both behavioral and attitudinal aspects. These authors state the disadvantage of solely focusing on behavioral loyalty, as making difficulty to tell which customers are loyal and problem to identify different degrees of customer loyalty (Rauyruen and Miller, 2007). Bloemer and Kasper (1995) study the differences between “true” loyalty and “spurious” and find that true loyalty implies true commitment to the brand in addition to repetitive purchasing. In the other word, they state that considering customer’s commitment to a brand should be accompanied by repeat purchasing behavior for explaining customer loyalty. In consistent with their research, Oliver (1997, 1999) also evoke this concept of commitment in his research on satisfaction and brand-loyalty relationship (Chumpitaz and Paparoidamis, 2004; Caceres and Paparoidamis, 2005).

There are different studies regarding to the antecedents of customer loyalty in the B2B context. Caceres and Paparoidamis (2005) find the significant effect of relationship quality components including relationship satisfaction, trust and commitment on business loyalty. Ricard and Perrien (1999) support a direct impact of relationship practice on customer loyalty as well. In consistent with these investigations, some authors connect several constructs such as relationship quality, trust, involvement, satisfaction, purchase development, organizational change, and switching costs to B2B customer loyalty and retention, while Jarvis and Wilcox, (1977) add some drivers of business-to-business loyalty such as perceived risks and absence of choice (Rauyruen and Miller, 2007). Other authors also study the impact of different variables on customer loyalty. For instance Ball *et al.*, (2003) classify these antecedents into four groups, namely characteristics of the environment, characteristics of the dyadic relationship, characteristics of the consumer, and consumer perceptions of the relationship with the marketing firm. They focus mainly on last group consisting of overall product or service satisfaction, performance trust and benevolence trust, depth or value of communication, firm or brand image, relationship quality and relationship satisfaction. Another example is Lam *et al.*, (2004) who study on potential antecedents of customer loyalty as customer satisfaction, customer value and switching cost.

## **RESEARCH METHODOLOGY**

In this research a literature survey approach has been employed as the research methodology for identifying different factors affecting customer loyalty in B2B contexts. The literature on customer satisfaction and loyalty has been collected primarily from high ranking journals in the field of management science. The central question that the authors pose here is: “what are the influential factors affecting customer loyalty in a B2B context?” The literature search is conducted using a combination of keywords such as: customer loyalty,

satisfaction, modeling, and B2B. There are numerous studies in the field of loyalty in the literature; however, the emphasis in this study is to review the previous works on modeling overall customer loyalty. The researchers try to provide a holistic review of loyalty and its drivers in the B2B context. The majority of the literature in the area of customer loyalty considers loyalty as a consequence of customer satisfaction. The authors, however, are interested in modeling overall loyalty in this study. Thus, satisfaction along with the other factors is considered as the antecedents of customer loyalty. The authors mainly investigate the following journals to collect the literature: *Journal of Total Quality Management*, *Journal of Marketing*, *International Journal of Service Industry Management*, *Journal of Retailing*, *European Journal of Marketing*, *Industrial Marketing Management* and *Journal of Business Research*. 35 papers are found by the researchers considering modeling loyalty in the B2B context. Each of these papers uses a combination of different factors in constructing the model of customer loyalty that in many cases differs greatly from other studies. Table I categorizes previous studies modeling loyalty based on different factors used in the applied models. The number of papers that used each factor in their modeling is highlighted in this table. For example there are 33 papers considering customer satisfaction in modeling loyalty while just 1 paper has been identified that use bonding as a separate construct in this regard. As it is mentioned in the Table I, satisfaction and perceived quality are cited frequently by many researchers, while some factors such as: disconfirmation, switching cost and bonding are mentioned rarely in the studied literature.

Table I. Summary of papers addressing loyalty for each factor

Factors	Reference	Total
Satisfaction	Taylor and Baker, 1994, Fornell <i>et al.</i> , 1996, Andreassen and Lindestad,1997, Patterson andSpreng,1997, Andreassen and Lindestad, 1998 , Bloemer <i>et al.</i> , 1998, Kristensen <i>et al.</i> , 1999, Bayol <i>et al.</i> ,2000 , Cronin <i>et al.</i> , 2000, Martensen <i>et al.</i> , 2000, Bou-Llusar <i>et al.</i> , 2001, Devaraj <i>et al.</i> , 2001, Zins, 2001, , Johnson <i>et al.</i> , 2001,O'Loughlin and Coenders, 2002, Ball <i>et al.</i> ,2003, Chumpitaz and Paparoidamis, 2004, Lam <i>et al.</i> , 2004, Ulaga and Eggert, 2004, Caceres and Paparoidamis, 2005, Rauyrueen and Miller, 2007, Aydin and Özer,2005, Jayawardhena <i>et al.</i> , 2007, Tu'rkylmaz and Özkan, 2007,Chitty <i>et al.</i> , 2007, Molinari, <i>et al.</i> ,2008, Park <i>et al.</i> , 2008, Spreng <i>et al.</i> ,2009, Gil-Saura <i>et al.</i> , 2009, Jayawardhena, 2010, Santouridis <i>et al.</i> ,2010, Forgas <i>et al.</i> , 2010, Deng <i>et al.</i> , 2010	33
Perceive quality	Taylor and Baker, 1994, , Fornell <i>et al.</i> , 1996, Andreassen and Lindestad,1997, Patterson andSpreng,1997, Bloemer <i>et al.</i> , 1998, Andreassen and Lindestad, 1998, Kristensen <i>et al.</i> , 1999, Bayol <i>et al.</i> ,2000, Cronin <i>et al.</i> , 2000, Martensen <i>et al.</i> , 2000, Bou-Llusar <i>et al.</i> , 2001, Johnson <i>et al.</i> , 2001, Devaraj <i>et al.</i> , 2001, Zins, 2001, O'Loughlin and Coenders, 2002, Ball <i>et al.</i> ,2003, Gounaris, 2005, Chumpitaz and Paparoidamis, 2004, Aydin and Özer,2005, Caceres and Paparoidamis, 2005, Rauyrueen and Miller, 2007, Chitty <i>et al.</i> , 2007, Tu'rkylmaz and Özkan, 2007, Jayawardhena <i>et al.</i> , 2007, Cretu and Brodie, 2007, Molinari, <i>et al.</i> ,2008, Park <i>et al.</i> , 2008, Spreng <i>et al.</i> ,2009, Jayawardhena <i>et al.</i> , 2010, Santouridis <i>et al.</i> ,2010, Deng <i>et al.</i> , 2010	31

Communication	Ball <i>et al.</i> , 2003,	1
Bonding	Gounaris, 2005	1

## THE CONCEPTUAL MODEL

The conceptual framework proposed by authors in this study (Figure 1), is quite similar to that of American Customer Satisfaction Index (ACSI) model. In the way it incorporates customer expectations, perceived quality, perceived value, customer satisfaction, customer loyalty and customer complaint. In the existing proposed model, the researchers also add two other constructs, i.e., corporate image and trust, to the model aiming a better explanation of customer loyalty in the B2B context. These two constructs have received particular attention within the domain of B2B relationships (Gil-Saura *et al.*, 2009; Gounaris, 2005; Caceres and Paparoidamis, (2005); Rauyruen and Miller, 2007 Cretu and Brodie, 2007; Brown *et al.*, 2010). Trust is an essential element of relational exchange and is a critical variable for enhancing customer loyalty. On the other hand, corporate image can also have a positive effect on customer satisfaction and maintain a loyal relationship with customers in a B2B exchange. Hence, enhanced corporate image leads to building trust in a long term relationship with business customers. As it is shown in Figure 1, in proposed model some factors affect customer loyalty through customer satisfaction, and others (i.e. trust) affect customer loyalty directly. Although in reality there may exist some more relations between factors, the most important ones are considered.

Figure1. The conceptual model

## CONCLUSION AND FUTURE RESEARCH

Maintaining loyalty, especially in a B2B setting, is an important issue in recent years and the benefits of achieving it is proven in different literature, thus developing the drivers of customer loyalty in a business environment can be impressive. This study contributes to propose a framework, modeling the most important

drivers of customer loyalty in B2B context. After examining the existing body of literature in the area of modeling customer loyalty in B2B contexts it is found that the majority of previous works focus on satisfaction, perceived quality, perceived value, corporate image and trust (Table I). It is also identified that in choosing the drivers of customer loyalty great differences exist between previous researches. As summarized in Table II there is only one paper which considers all the drivers that are embedded in the proposed model of this study. This highlights the need for a more holistic view toward modeling customer loyalty, covering all the important drivers, in a B2B context.

This study put together the main drivers of loyalty in B2B sectors from related literature. However, some situational factors which can affect buyer's purchase choice are not examined in proposed framework. Thus, embedding some environmental impacts on loyalty such as legal force and method of payment can be investigated in future. Also the proposed model needed to be tested with empirical data for real-life B2B exchanges to reveal the relative importance of different drivers of loyalty and their interrelationship. The weight of the drivers can be calculated using mathematical modeling techniques such as Principal Component Analysis (PCA) and Structured Equation Modeling (SEM). As a result, the present model provides a guideline for further researches to understand the main drivers of loyalty and can be used as a platform to investigate the impact of different factors on customer loyalty in various B2B sectors.

# **ANALYSIS OF THE FACTORS AFFECTING THE CONSUMERS' PREFERENCES AS FOR E-TRAVEL SERVICE QUALITY: THE CASE OF TURKISH AIRLINES**

**Özlem Atalık, Anadolu University, Turkey**

## **ABSTRACT**

*By the advent of World Wide Web, a noteworthy amount of internet application has been used by many firms including airline service providers in supporting their marketing activities. To effectively examine the e-travel service quality, it is crucial to know whether a particular airline's website is giving an added advantage that could trigger online purchase intention. In this study, eight website quality factors; information quality, security, ease of use, availability, customization, community, responsiveness, delivery fulfillment are studied. A guided questionnaire was used and 118 responses were collected at International Istanbul Ataturk Airport. According to the data, a number of results were found statistically meaningful in the survey and the factors affecting customer preferences for e-travel service quality are found as information quality, security, customer relationship and website functionality.*

## **INTRODUCTION**

With the increasing popularity of online shopping, business around the world now try to enhance their competitive advantages by focusing their resources on the virtual business environment. In airline industry, e-ticketing has changed the airline industry and behavior of consumers with reducing cost and providing new channel for communication and support. Airline service providers try to offer services through electronic infrastructures, especially through the web, to decrease their cost, expand revenue, creating reliable database of consumer for future customer relationship management plans (Dehbashi & Nahavandi, 2007). In the academic literature, website quality has generally been recognized as a critical factor to drive business online. As such, numerous studies have been devoted to website quality and evaluations (Bai et al., 2008, Mohd Tahir )

Therefore, this study aims at examining direct relationship between website quality dimensions as antecedents of consumer preferences airline website service. Factor was used to analyze the data. The findings showed that information quality, customer relationship, security and website functionality are direct influential factors in consumer preferences.

## **E-SERVICE QUALITY**

Computer-aided services have grown in number and significance in proportion to the rapid growth of Internet adoption. E-service growth, also known as web-based self-service, has further magnified the importance of service sector roles in modern economies (Calisir & Gumussoy, 2008). As commonly reported in the news media, service sectors in world economies continue to expand while manufacturing sectors are experiencing shrinkage, especially in the U.S. as electronic business environments post a new set of challenges to companies. One such new challenge is the quality of the electronic service (e-service) provided by company web sites and other electronic media (Liao, Palvia & Lin, 2006). The quality of enterprise web sites has become a key indicator of how well a company is likely to satisfy its consumer (King & Liou, 2004). Another new challenge is the rapid increase in the expectations and level of sophistication of the e consumer. In recent years, researches efforts have been directed at understanding how-consumer perceive the quality of e-service as well as how these perceptions

translate into customer satisfaction and behavioral intentions. Adding to the challenges of managing e-consumer, it has become crucial to understand how individual customer differences, in terms of their information technology (IT) skills, influence their online experience, behavior and attitudes. Some studies (Agarwal & Venkatesh, 2002; Chen & Macredie, 2005) have indicated that individual differences can influence IT acceptance and satisfaction with IT use. (Udo, Bagchi Kirs, 2010)

E-service quality, as defined by Santos (2003), is the overall customer perceptions, judgments and evaluations of the quality of service obtained from a virtual marketplace. Both practitioners and researchers use e-service quality and web service quality interchangeably. For instance, Zeithaml (2002) defines e-service quality as the extent to which a web site facilitates efficient and effective shopping, purchasing and delivery of goods and services. Zhang and Prybutok (2005) refer to the same concept as web site service quality. Several authors (Santos, 2003; Zeithaml, 2002) have developed diverse instruments to measure e-service quality. Since these instruments have little in common, exploratory studies are needed to derive a common instrument that can effectively evaluate e-service quality. Rowley (2006) has further asserted that since research endeavors in e-service are still in their infancy more efforts are needed to obtain the correct definition and measure of e-service quality. (Udo, Bagchi, and Kirs, P.J. 2010)

Several studies on service quality in physical encounters have concluded that some factors are responsible for consumer' perceptions of quality which are likely to lead to customer satisfaction and which, in turn, may lead to behavioral intentions to purchase. Some authors (Zeithaml, Berry, & Parasuraman, 1996; Zhang & Prybutok, 2005) have pointed out that behavioral intentions may predict behavior, implying that customer service quality constructs are relevant to behavioral intentions. Given that satisfied consumer are more likely to stay with a company for long periods, behavioral intentions directly impact company profitability. (Udo, Bagchi, and Kirs, 2010)

Moreover, previous studies have indicated that some of the most used key dimensions of online service quality research were navigability, playfulness, information quality, trust, personalization and responsiveness (Nusair & Kandampully, 2008), outcome quality, consumer service, process controllability, ease of use, information quality, website design (Su et al., 2008), technical adequacy, content quality, specific content and appearance (Chang & Chen, 2008), perceived ease of use, perceived usefulness, perceived social presence, trust, enjoyment (Hassanein & Head, 2007) site design, convenience, financial security, product information, product offering website design, reliability, responsiveness, trust, personalization (Lee & Lin, 2005), reliability/prompt responses, access, ease of use, attentiveness, security, credibility (Jun et al., 2004) , usefulness, ease of use, enjoyment, ease of use, information quality, website design, customer service, process controllability and outcome quality (Su et al, 2008), ease of use, security, responsiveness, empathy, customization (Madu & Madu, 2002) and content website and design website (Mohd Sam, M. Nor Hayati Tahir)

Therefore, this study adapted the Ho and Lee (2007) model that focusing on information quality, security, ease of use, availability, customization, community, responsiveness, delivery fulfillment.

## E-TRAVEL SERVICE QUALITY COMPONENTS

Ho and Lee (2007) have proposed the following 8 dimensions of web-based travel service quality based on their literature review: (Ho and Lee, 2007)

**1. Information quality:** The information made available by the websites has been widely accepted as a key component of the perceived service quality ([Kim and Lee, 2004](#)). The travel and tourism industry is an information-oriented business, and the internet can provide companies with an arena to construct a rich and dynamic platform for information supply and exchange. The issue of whether the quality of travel information carried on the websites meets the needs and expectations of users is thus crucial. Based on past research, the common criteria for assessing information content include accuracy, timeliness, its concise nature, relevance, reliability and completeness ([Madu & Madu, 2002](#); [Perdue, 2001](#)).

**2. Security:** This dimension deals with how a website proves to be trustworthy for its consumer. [Madu and Madu \(2002\)](#) suggest that online services are delivered and operated in a highly reliable and dependable manner

in order to build trust and convey confidence to consumer. Due to the lack of a physical entity and interpersonal contact while purchasing online, consumer are especially concerned with the transaction's safety. Security also refers to the attributes of privacy that are imperative for making transactions online ([Zeithaml, 2002](#)). Consumer may worry that their personal and transactional information can be accessed or used over the internet by third parties. Security has been perceived as being a critical dimension in terms of service quality or satisfaction, and is unique to the Internet environment ([Yoo and Donthu, 2001](#)). Lack of the assurance of security has been regarded as the main barrier preventing consumer from shopping online. It is natural to conclude that security is a crucial component of quality when considering online travel services.

**3. Ease of use:** This dimension contains three aspects. Navigation deals with how easily users search for information within the website. It is regarded as the essence of the multidimensional construct of e-travel service quality ([Kaynama and Black, 2000](#)). Without interaction with personnel, online consumer needs to locate information and merchandise by themselves. If they frequently get lost or confused during the search process, they are likely to quit. The design and presentation of a website involving a navigation mechanism affects the relevance and efficiency of the outcome of searching ([Perdue, 2001](#)). It suggests that navigation plays a dominant role in delivering satisfactory e-travel services. The second aspect, website access, refers to the ability of users to access resources (including travel-related information and service features) on the travel website and it is related to the ease of connection and speed of download ([Cox & Dale, 2001](#)). It is likely that online users will quit and click on to other sites because it took too long for them to access a website or download information from it. Thus there is a degree of support for website access as one of the important components related to service performance. The third part of this dimension describes the transactional functionalities which enable consumer to feel that the website is intuitive, simple, and user-friendly for completing transactions ([Kim and Lee, 2004](#)). Several components, including easy ordering, easy payment, and easy cancellation, indicate the degree to which consumer believe that of the use of the website would involve little or no effort.

**4. Availability:** Availability refers to the extent to which the services provided by the website can be obtained and used. This dimension deals with the extent to which online information resources are equipped for providing consumer with the wanted services that are easy to locate. These services also take the difficulty out of linking web pages, and facilitate the making of purchasing decisions ([Madu and Madu, 2002](#)). The variety of information and the comprehensiveness of its coverage are considered to be primary indicators ([Wan, 2002](#)).

**5. Customization:** Customization may be regarded as the extent to which a website can tailor-make services to fit individual customer's needs, for example, the extent to which the customized content of the website can provide a user with the relevant and up-to-date information that will meet his specific needs. This dimension involves individual designs for clients in accordance with their patterns of consumption and preferences resulting in an optimum online service. Customization saves the consumer' time and even increases their perception of service quality ([Madu and Madu, 2002](#)).

**6. Community:** A virtual community which is developed in a website may be regarded as an online social organization to provide users and consumer with the opportunities to share opinions and exchange information among them. Indeed, such an opinion-exchanging platform that comprises both chat rooms and a Bulletin Board System (BBS) is effective in terms of word-of-mouth communication. These service features provided by websites give users the opportunity to interact with website personnel or other users. This two-way communication makes it easier for users to search for information, make purchasing decisions, and give feedback to the website. Close relationships developed through the interaction within online communities prompt users to participate, learn and act more online.

**7. Responsiveness:** Although carrying the same name as the one in SERVQUAL, this dimension has been measured by the promptness with which a website responds to consumer in an online environment ([Kaynama and Black 2000](#); [Madu and Madu 2002](#); [Zeithaml, 2002](#)). For example, how can queries or questions from consumer are answered quickly and efficiently? How can consumer' needs and complaints be responded to via e-mail in a courteous way? How do the employees of a website deal with consumer' concerns in regard to transaction completeness? These issues are conceptualized as components of the responsiveness dimension.

**8. Delivery fulfillment:** This dimension refers to a website's success in delivering product/service and its willingness to correct mistakes that occur during transactions. It overlaps to some extent with the reliability

dimension of [Zeithaml, \(2002\)](#), which has been identified as an important factor in e-service quality. [Wolfinbarger and Gilly \(2003\)](#) especially lay emphasis on the error-free ordering process and on-time delivery of an order for online consumer. A website that makes effort to minimize the dissatisfaction with the services provided will receive a higher level of quality evaluation from its consumer.

## RESEARCH

**Objective of the Research:** The aim of this study is to determine the consumers' order of e-travel service quality preferences concerning the capabilities, facilities and services of THY web site.

**Methodology:** The research is administered by the questionnaire applied between August 14-18, 2009 by 118 passengers. 100 usable questionnaires were gained in the research. Data were collected from Turkish passengers departing from Istanbul Ataturk Airport. The international terminal of Istanbul Ataturk Airport was chosen as the main data-collection point as it is the largest international airport in Turkey. The passengers were selected randomly among Turkish citizens who bought e-tickets.

**Reliability Analysis of the Research:** For the reliability analysis a number of correlation tests are used and it is possible to say that the research is reliable as a whole, according to the coefficient of reliability  $\alpha = 0.7982$ .

**Collection of the Research Data:** A pilot work has been done with 22 passengers to learn how good the questions in the questionnaire form serve for the objective of the research. According to answers to those questions, some modifications have been done in the questions. Based on the review of the related literature, an initial pool of 21 scale items capturing e-travel service quality was generated. The respondents were requested to select the response that best indicated their expectations on each statement, using a Likert-type five point scale. All of the activities listed by the interviewers fitted well into the previous eight categories of e-travel service quality and confirmed the multidimensional structure of service quality. In addition, the interviewees were asked to describe their experiences and opinions while completing the 21 scale items.

### Research model

The research model has been constructed on the basis of identifying the quality factors which are essential for the consumers in the process of e-travel service taking.

#### 1. Demographics

**Table 1. Demographics**

<i>Nationality</i>		<i>Gender</i>		<i>Education</i>			
Turkish	Other	Man	Women	High School	Associate Degree	BA Degree	MA or PhD
100%	0%	72%	28%	38%	9%	51%	2%

<i>Age</i>				<i>Monthly income (TL)</i>			
20-30	31-40	41-50	51- and more	1000 – 3000	3001 – 4000	4001 – 5000	5001 and more
19%	60%	19%	2%	22%	55%	15%	8%

Table 1 presents the profiles of the sample in terms of the principal socio-demographic characteristics. As it can be seen at Table 1, 72% of total respondents are male and 28% of total respondents are female passengers. When the distribution of the participants related to their educational background is examined, it can be seen that 51 %

of the participants are university graduates, 2% of the participants have master or Phd degrees and 38% of them are high school graduates. When the proportion of the members is analyzed in terms of the general sum a high proportion has been seen as university graduates 51%. When the monthly incomes of the participants are examined, it has been seen that 22 % of them have monthly income as 1000-3000, 55 % of them have monthly income as 3001-4000, and 15.0 % of them have monthly income as 4001-5000 and %8 of them have monthly income as 5001 and more. When the distribution of the subjects according to their age range is analyzed it can be seen that 19% of them are aged between 20-30, 60 % of them are aged between 31-40, 19 % of them are aged between 41-50, and 2 % of them are aged between 51 and more.

## 2. Results of factor analysis

In the factor analysis done for the preferences of THY passengers who use e-travel applications, the value of Kaiser – Meyer – Olkin (KMO) has been found as 0.796. Since the calculated KMO value is higher than 0.60, the amount of samples used for the factor analysis has been found to be satisfactory. What is more, the Bartlett Test's result 0,000 has also approved that significant factors have been taken from the samples. As the results of the factor analysis to identify the e-service quality preferences of the passengers, 4 distinctive factors have been highlighted. The results of the factor analysis are shown in Table 2.

**Table: 2 Factor Loadings**

	Factor loadings			
	1	2	3	4
Information accurate	<b>,791</b>	,189	,076	,039
Provides in-depth information for consumer making purchasing decisions	<b>,670</b>	,074	-,199	,189
Information update	<b>,538</b>	,026	,366	,080
Easy to find wanted information	<b>,417</b>	-,353	,136	-,208
Responds to users' inquiries promptly	,044	<b>,772</b>	,014	,150
Easy for users to turn to chat rooms for more information	,038	<b>,688</b>	,026	,192
Company behind the site reputable	,038	<b>,574</b>	,217	,020
Understand specific needs and gives personal attention	,317	<b>,490</b>	,133	-,276
Has adequate secured feature to protect consumer' information	<b>,458</b>	,006	-,150	-,183
Provides FAQ information	,223	<b>,352</b>	,098	,245
Makes full confirmation in on-line payment	,066	,017	<b>,767</b>	-,141
Consumer are informed as transaction is completed	-,072	,093	<b>,751</b>	-,163
Security payment system	,037	,194	<b>,602</b>	,039
Has comprehensive information	,001	<b>,421</b>	-,004	,228
Functionality as the site should be linked quickly	-,094	,024	,046	<b>,659</b>
Search functionality helpful	,286	-,002	,245	<b>,625</b>
Language	,201	,016	,036	<b>,579</b>
Easy access to the site	-,268	,393	,142	<b>,550</b>
Be linked quickly	,337	-,166	,015	<b>,548</b>
Quick and easy to complete a transaction	,054	,096	,076	<b>,523</b>
Easy to maneuver	,416	,119	-,094	<b>,518</b>

As a result, four dimensions of e-travel service quality were identified and 21 scale items were retained. With these four factors, 79.6 % of the variance might have been explained. The four quality dimensions extracted were defined as follows:

Factor 1, Information quality refers to the amount, accuracy and the form of information about the products and services offered on a web site (Nusair et al., 2008) Information quality refers to the measurement items that are mainly related to the service attributes of the provided information provided by websites. This factor refers to information accurate, provides in-depth information for consumer making purchasing decisions, information update, easy to find wanted information.

Factor 2, customer relationships, is related to personalized services a website provides for its consumer and their interactions with other website users through the online community. This factor refers to responds to users' inquiries promptly, easy for users to turn to chat rooms for more information, company behind the site reputable, company behind the site reputable, understand specific needs and gives personal attention, has comprehensive information, provides FAQ information.

Factor 3, Security, consists of such service attributes as the protection of consumer information and confirmation of payment. The dimension of security may be regarded as the degree of the customer's trust and confidence in the website This factor refers to makes full confirmations in on-line payment, consumer are informed as transaction is completed, security payment system, has adequate secured feature to protect consumer' information.

Factor 4, website functionality, refers to service characteristics regarding the functionality and availability of the site. This factor refers to functionality as the site should be linked quickly, search functionality helpful, language, easy access to the site, be linked quickly, quick and easy to complete a transaction, easy to maneuver.

It appears that online consumer e-travel service quality on the basis of website functionality, including the elements such as workable functionality that are quickly linked and can be easily turned off when the site is difficult to access, or cannot be navigated easily, for much time may be unnecessarily used up. The performance pertaining to these key features of a website affects searching for, conveying and browsing travel-related information.

## **CONCLUDING REMARKS**

The Internet has become one of the most important platforms for travel-related service entrepreneurs to provide services and communicate information with their target consumer. The number of travel-related websites has grown rapidly during the past decade, and the competition has become more intensive than ever. To survive, or even succeed, entrepreneurs need to be customer-orientated. An e-service company should see things through consumer' eyes, realize their needs, and design an online service system that can meet consumer' preferences. Therefore, understanding how consumer defines e-service quality is crucially important for a company doing business in the world of the Web. (Ho, Lee, 2006)

Distribution through own websites is generally regarded as the most cost effective for airlines. They are thus attempting to migrate consumers from traditional channels to their own online channels as fast as possible. For airlines to increase migration of travellers to their websites it is necessary to understand traveller preferences towards the Internet as a distribution channel.

According to the research results, online consumer placed emphasis on information quality, customer relationships, security, website functionality were the four most critical factors in evaluating e-travel service quality. Finally, they must know that e-travel service quality factors are crucial because these factors can also affect consumer' decisions to purchase on the websites. E-travel service providers can evaluate the performance of their online services and initiate proper practices, which are aimed at improving their service quality. In other words, the scale of e-travel service quality factors can help management to map the performance of specific service domains more precisely and to propose corresponding improvement programs more effectively.

# THE ROLE AND IMPLICATIONS OF KNOWLEDGE SHARING IN COMPLEX RESOURCE ORGANIZATIONS

**Sriram Balasubramanian and Guy Callender**  
**Curtin University, Australia**

## ABSTRACT

*Over the next ten years many petroleum corporations will face a knowledge loss closely related to the retirement of half of their workforce in addition to the relentless pursuit of higher production efficiency from existing resources and seeking new sources of oil in remote and more dangerous locations. In this environment significant value may be generated for an organization by the collective knowledge of its existing employees to eliminate mistakes, re-work and avoid the need for new learning caused by a failure to engage in formalised, knowledge sharing. A review of the literature does not explain how complex resource organizations are managing change to overcome the prospect of knowledge loss. This conceptual paper explores the dimensions of knowledge sharing and its relationship to knowledge management, knowledge transfer and the management of change and its ability to provide "forward momentum in turbulent times."*

## INTRODUCTION

Growth in world energy demand from petroleum sources is estimated to increase, even though alternative energy sources are being developed (Scarso, Bolisani & Salvador, 2009). Factors such as globalization, deregulation, technological innovation, depleting reserves and higher development costs have driven petroleum companies to reduce costs (Burnett, Brookes-Rooney & Keogh, 2002; Ednie, 2005, Scarso et al., 2009) and seek higher efficiency through automation and organizational re-structuring (Burnett et al., 2002; Sánchez & Palacios, 2008). Such strategies may have resulted in leaner organizational structures created by many petroleum companies reducing staff, through acquisitions, strategic alliances, joint ventures and other consortia agreements (Sánchez & Palacios, 2008; Kamph, 2009). There are claims that such practices are leading to a decrease in informal employee knowledge sharing and communications (Sánchez & Palacios 2008; Kamph, 2009) and a reduction in traditional 'learning on the job'.

There are also catastrophic operational losses in the petroleum industry which capture international media attention on a regular basis. Unfortunately, some of these incidents involve loss of life, serious injuries and environmental damage. Media reports demonstrate the losses which occur across a wide range of petroleum assets. For instance, Whittell (2010) and *Hydrocarbon Processing* (2005; 2006) have reported a number of abnormal situations, which include undetected instrument failures leading to erroneous control of critical processes, or undetected degradation in equipment performance resulting in constrained capacity. Many of these losses may have been prevented by knowledge sharing in such organizations (Davidson, 2006; Himmelsbach, 2007; Benson & Durler, 2009; Ahuja 2010), although the evidence supporting such claims is not really clear.

Examining the anticipated retirement of more than half of the petroleum industry workforce within the next 10 years Ahuja (2010) has calculated that major petroleum corporations may lose about 231,000 years of cumulative experience, learning and knowledge. Nevertheless, a significant amount of knowledge exists in the memory of people which could be transferred to other people. Knowledge capture from a dwindling workforce should be important to organizations, assuming the knowledge is of value, scarce, and threatened by loss (Burnett et al., 2002; Scarso et al., 2009; Jackson, 2010).

Many large organizations are seeking to better manage the collective knowledge of their employees (Chaharbaghi & Nugent, 1994; Drew & Smith, 1995; Dervitsiotis, 2007; Reinstein, 2007). Edwards (2008) points out that there are many examples of good practice in Knowledge Sharing in the energy sector and finds that some organizations, especially in the oil industry, are leaders in Knowledge Sharing practices. Even though the current quality management systems in many organizations, referred to as the Performance Improvement Framework (PIF) in this study, apply knowledge management as one of its core components, Knowledge Management and the PIF are often viewed as unrelated activities (Akdere, 2009). Additionally, their interaction has not been widely explored (Akdere, 2009). Furthermore, though many researchers and organizations claim that there can be a significant value from Knowledge Sharing and a PIF, they provide little guidance on how complex resource organizations leverage knowledge transfer for such a process (Deming, 1992; Flynn, Schroeder & Sakakibara, 1994; Kanji, 2002; McAdam, 2004; Gupta, 2010).

Some petroleum companies have a very flat organization structure with business units spread across the globe (Refaiy & Labib, 2009; Scarso et al., 2009). These business units of necessity operate with a great deal of autonomy, functioning almost as a discrete company, highly focused on performance (Scarso et al., 2009). In particular, the knowledge barriers tend to grow among these distant, self-reliant parts of the organization, that become “knowledge islands” with specific backgrounds, values, languages and behaviours (Scarso et al., 2009). Several global corporations have promoted communication and social interactions to bridge such knowledge islands within an organization and alliance partners (Inkpen, 1998; Scarso et al., 2009).

Even though many researchers and organizations claim that there can be significant value from Knowledge Sharing, especially to create Performance Improvement, they provide little in the way of systematic evidence to justify the claim (Deming, 1992; Flynn et al., 1994; Kanji 2002; McAdam, 2004; Akdere, 2009). Further, it is unclear how complex resource organizations are managing change to prevent knowledge loss. It may therefore be useful to research how major resource companies could use Knowledge Sharing to prevent knowledge loss.

## DEFINITIONS

Knowledge may be divided into two distinct types: explicit and tacit knowledge (Kumar & Nti, 1998; Bresman, Birkinshaw & Nobel, 1999; Joia & Lemos, 2010). *Explicit knowledge* involves knowledge that is of a codifiable nature, such as knowledge described in manuals or reports (Bresman et al., 1999; Joia & Lemos, 2010). Explicit knowledge is expressed in formal language, words, symbols and numbers and can be stored in a database that allows the data to be conventionally transmitted and searched (Inkpen & Dinur, 1998; Joia & Lemos, 2010).

In contrast *tacit knowledge* is the knowledge carried within the memory of people, which is often intuitive, not written, and cannot be verbalized or articulated (Inkpen & Dinur, 1998; Bresman et al., 1999; Akdere, 2009; Joia & Lemos, 2010). Tacit knowledge is also difficult to express in formal language as it comes from experience, perceptions, individual values and depends on the context in which it is generated (Joia & Lemos, 2010). It is knowledge that seems to occur through a habitual process, which has a very personalized nature, making it harder to transfer and communicate to others (Inkpen & Dinur, 1998; Joia & Lemos, 2010). For example, articulating or describing an organizational process can be very difficult as the “knowledge supporting the process is highly tacit” (Inkpen, 1998, p. 74). Tacit knowledge therefore cannot be easily exchanged in intra-firm and inter-firm relationships, as it involves deeply embedded expertise and skills (Ratten & Suseno, 2006; Davenport, Prusak & Strong, 2008).

The dichotomy between explicit and tacit knowledge demonstrates the likelihood that *Knowledge transfer* will be a complex phenomenon and, in practice, success is often not easy to achieve (Ding, Akoorie & Pavlovich, 2009). Ratten and Suseno (2006) estimate that more than half the knowledge that exists in firms is largely of a tacit nature. Tacit knowledge can be classified into two categories: the first is technological knowledge such as material processing, machine maintenance, product design and new product test knowledge. The second is managerial knowledge such as staff management, supplier management, and customer management (Refaiy & Labib, 2009). There are also a number of factors that may affect the outcome of transfer, even for the relatively simple case of transferring knowledge within the same firm (Ding et al., 2009). These

include the challenge for many organizations is to systematically capture the tacit knowledge, transfer it to a form of explicit knowledge and share it to create value (Ratten & Suseno, 2006; Refaiy & Labib, 2009). Typically, this process is referred to as *Knowledge Management*.

Knowledge Management can be described as the ability of an organization to leverage its collective wisdom, to increase its responsiveness and innovation through the systematic capture, transfer and application of knowledge (Davidson, 2006; Thomas, 2007). Davenport et al. (2008, p.R-11) define Knowledge Management as “a concerted effort to improve how knowledge is created, delivered and used”. Once again, there are claims, such as that of Anderson and Boulanger (2004) that Knowledge Management is one of the factors propelling the global knowledge economy, organizational change, competitive advantage and wealth creation for many organizations.

*Knowledge Sharing* describes the process of sharing mutual knowledge, beliefs and assumptions. Haythornthwaite (2006) believes that Knowledge Sharing can facilitate productive work and interaction, where group members have a shared understanding of content, process and each other. Firms are embedded in a social environment where human resources are instrumental to innovation and are supposed to use all information available to them (Spithoven, Frantzen, & Clarysee, 2010). While there are numerous sources of useful information, ranging from specialized knowledge embodied in individuals within enterprises, to publicly available general knowledge (Spithoven et al., 2010) the literature is not very clear how complex resource organizations use knowledge sharing to maintain performance.

*Knowledge Sharing* is defined as “provides a link between individual knowledge workers, where such knowledge resides, and the level of organization, where it attains its (economic, competitive) value” (Hendriks, 1999, p.91). For the knowledge to be shared at least two parties are required. The first party communicates the knowledge in some form, and the other party perceives these expressions of knowledge and makes sense of them (Hendriks, 1999; Haythornthwaite, 2006; Spithoven et al., 2010). As knowledge does not have a physical form, it cannot be physically shared (Hendriks, 1999). Yet, many companies believe they gain significant competitive advantage through their ability to establish Knowledge Sharing amongst their workforce (Kumar & Nti 1998; Burnett, Illingworth & Webster 2004; Davenport et al., 2008; Akdere, 2009).

Knowledge Sharing acts as a resource that could enable organizations and its employees to achieve faster learning and create better decision-making processes (Al-Busaidi, 2005). There has been a significant amount of research dedicated to examining learning within an organization, as well as learning between organizations (Cohen & Levinthal, 1990; Huber, 1996; Inkpen, 1998; Kumar & Nti, 1998; Zahra & George, 2002; Todorova & Durisin, 2007). The nature of organizations as social communities further encourages organizations to learn by sharing knowledge between their partners, customers, suppliers, and competitors (Kogut & Zander, 1996; Dyer & Singh, 1998). Since tacit knowledge (explained in subsequent sections) is acquired through inner individual processes such as experience, reflection, internalization and individual talent, some understanding of the personal component is the factor for sharing tacit knowledge (Joia & Lemos, 2010). As people work and integrate within organizations, a structured *Performance Improvement Framework* may be necessary to facilitate the spread of tacit knowledge (Joia & Lemos, 2010). In such an environment of learning could Knowledge Sharing provide a critical link between a Performance Improvement Framework and Management of Change?

Nonaka and Takeuchi (1995) have proposed a spiralling process of sharing and reflection, comprising of internalization (conversion of explicit to tacit knowledge), then socialization (conversion of tacit to tacit knowledge) and combination (explicit to explicit). The process of such conversion of knowledge leads to the creation and proliferation of knowledge through sharing, where people are able to reflect on what they have learnt, put it into practice and then improve on it (D'Eredita & Barreto, 2006). There are a number of authors Cohen and Levinthal (1990), Zahra and George (2002); and Todorova and Durisin (2007), who have claimed that the ability of a firm to recognize the value of new external information, to assimilate it, can apply the knowledge to commercial ends. However, once again, it is not very clear how complex resource organizations can use Knowledge Sharing to continually improve their existing procedures, technology and performance.

The implication of Knowledge Sharing seems to be achieved through tacit to tacit communication although there are those who suggest Knowledge Sharing can also be achieved through a tacit to explicit to tacit

conversion loop, outlined below (Refaïy & Labib, 2009). According to this view, Knowledge Sharing is facilitated by the creation of virtual team. In virtual teams, members must develop mechanisms for knowledge sharing, which includes distribution of existing knowledge among team members its evaluation and synthesis leading to the construction of new knowledge (Hendrix, 2007). This process involves critical thinking, reflection, participate in group discussions, exchange of ideas, arguing from different perspectives and coming to a decision based on some level of consensus (Hendrix, 2007).

Davenport and Prusak (1998) described the process of Knowledge Transfer as the sum of transmission and absorption. The amount of knowledge transferred might be distorted or reduced through some knowledge barriers, which may exist in the form of barriers such as space and time, or more fundamental barriers such as social distance, cultural difference (including language) and differences in mental and conceptual frames (Hendriks, 1999). Davenport et al. (2008) claim that knowledge and organizational learning are two sides of the same coin, as organizations cannot learn without effective knowledge and knowledge is not possible without effective learning. Their research demonstrates that there is no single recipe for creation, transfer and dissemination of knowledge. for example, Davenport et al. (2008, p.R-11) note that “while firms in highly competitive industries may choose to focus the majority of their efforts on knowledge creation because their survival depends on having the most advanced products, others, say those with far-flung operations, may be better off focusing on how best to disseminate existing know-how to diverse work forces”.

Avoiding major catastrophic incidents remains a key outcome of this research. Its aim is to research the links between knowledge sharing and safe performance and reduction of losses caused by frequently occurring, minor events. It is reported that a review of the Belke and Delguid incident databases indicate that improved process measurements and real-time analysis/detection might have prevented, or at least substantially reduced, the damage from approximately 25% to 40% of these incidents (*Hydrocarbon Processing* 2005; 2006). Detecting the initial failure early enough to take corrective action and manage the necessary changes through a systematic framework, may have high potential value (*Hydrocarbon Processing*, 2005; 2006; Whittell, 2010). This is an industry claim which seems to be unsubstantiated through academic research.

Knowledge Sharing systems have been implemented in various global companies during the last few years. However, many of them have failed because they were limited to technical solutions and did not consider the organizational and cross-cultural factors that are necessary to make a knowledge-sharing platform successful (Voelpel, Dous & Davenport, 2005). The literature prompts the question: Is there a reliable process to simplify, validate and distil the knowledge being shared? Could a common, reliable technology provide the infrastructure required to facilitate the networking?

## MANAGEMENT OF CHANGE

The *Management of Change* not only affects a business but also influences personal behaviour in an organization. Reinstein (2007) notes that managers are often engaged in process changes or implementing technology. The impact of this focus is emphasised by Reinstein (2007) who reports that an analysis completed by Deloitte Consulting on sixty two companies implementing ERP programs found that 62% were people issues, 16% were process, 9% were technology and 3% were knowledge assets. This view is reinforced by Law (2009 p.384) who observes that transformational technological changes present a challenge where “the business and people aspects of the change need to be balanced”. This research suggests the people side is overlooked, with the focus being on the change leaders implementing structural changes too quickly to yield the results that owners and shareholders seek (Law, 2009).

Often the impact of such changes at the level of the individual in the organization is not adequately considered. In many of the Management of Change models which recognize individuals they are seen as recipients of change (Becker, 2010) rather than deliverers. The individual needs are lost in the overall structured, objective and clinical perspective on dealing with change (Becker, 2010). Law (2009) claims that technological and organizational changes can only be successful in an organizational culture of trust, loyalty, ongoing learning, enthusiasm and productivity and adds that even if the participants involved in the change, know what to do to implement the change, there is a sense of uncertainty about the value of the changes. For successful implementation of changes, organizations may need to convince individuals to learn and adopt the new

knowledge, requiring individuals to relinquish or at least refine their existing knowledge and practices (Becker, 2010).

Martin, Weisenfeld and Bekmeier-Feuerhahn (2009) also observe that conservative forces in big organizations are slow to change. Vested interests, once labelled as “dynamic conservatives”, may oppose even promising innovations. Martin et al. (2009) favour management of change in a conducive environment, where the mindset of people supports change and individual goals are broadly aligned to organizational objectives. Further, they add that the employees should be included in the process of successful management of change, as employee structures contain both conservative and progressive forces, aimed at overcoming outdated solutions.

Brown and Eisenhardt (1997) observe that many organizations successfully manage changes by blending limited management structure around responsibilities, prioritizing extensive communication and design freedom to create improvisation. This combination is neither so structured that change cannot occur nor so unstructured that chaos ensues. Additionally, such organizations rely on a wide variety of low-cost probes into the future, including experimental products, futurists, and strategic alliances. Such organizations ‘link the present and the future together through rhythmic, time-spaced transition processes’ (Brown & Eisenhardt, 1997, p.1).

Sikora, Beaty and Forward (2004) proposed a model to study the varying levels of employee physiological stress levels with different changes in an organization. They note that the current organizational change and work stress models inadequately address the subjective experience of employees. They add that the complexity of contemporary work settings with multiple and simultaneous changes, is contributing to the high psychological stress levels in employees. Dool (2010) also points out that the environment of continuous, serial change has increased employee stress and leads to a condition known as enervative change. The net effect of employee response to cycles of major and minor organizational changes is believed to be a primary contributor to employee resistance to change (Sikora et al., 2004; Dool, 2010). The cumulative impact of multiple and sometimes conflicting change initiatives may eventually overwhelm an individual’s cognitive appraisal and coping mechanisms (Sikora et al., 2004; Dool, 2010). Dool (2010) claims that a new framework for management of change is required, so that organizations can adapt to changes and avoid the negative effects of changes. Such a framework of change might shift the notion of change from being an unusual organizational adaptive response to a positive and natural part of the organization.

An example of this type of approach to change is exemplified by a *Performance Improvement Framework* used by many complex resource organizations to facilitate the management of their operations (Collison & Parcell, 2004). Many major petroleum companies are driven by a focus on all activities around Performance Improvement, building a high performance culture, sustainability, safety and profitable growth (Ednie, 2005). There is evidence that this approach to facilitating the sharing and diffusion of knowledge has had some positive effects. For example, Steinberg and Davis (2002) claim that a Knowledge Sharing culture saved Shell around \$200 million in the year 2000. Kruzner and Trollinger (1996), Davidson (2006); Barr and Cook (2009); Scarso et al., 2009) also observe that a Performance Improvement Frameworks help large organizations to capitalize on the available knowledge. Scarso et al. (2009) highlight global oil corporations such as Shell, BP, and ChevronTexaco have large communities of practice to facilitate Knowledge Sharing

One method of deconstructing this challenge is to use the model below to summarize the research. It was seen from the various frameworks that a systematic link to *Knowledge Sharing*, a *Performance Improvement Framework* and *Management of Change* is not readily visible. A model is proposed below to explore the link between *Knowledge Sharing* (KS), *Performance Improvement Framework* (PIF) and *Management of Change* (MOC). Based on the basic framework described below in Figure 1, it will be explained how any changes required to existing knowledge base can be managed and absorbed into the organizational learning process and exploited, through a systematic process of performance improvement. In this context, some of the existing literature will be examined in areas like *Knowledge Management*, *Knowledge Sharing*, *Organizational learning*, *Absorptive Capacity* and a few existing *Performance Improvement Frameworks* like *Total Quality Management* (TQM) and *Operations Excellence*, for improving the quality of this research. It is not the intention to prescribe or evaluate any particular *Performance Improvement Framework* in this study as it would be specific to each organization. Further, there have been numerous studies already carried out on topics such as *Knowledge Management*, *Knowledge Sharing* and *Management of Change*. Hence this study will be an exploratory research to establish the link between *Knowledge Sharing*, a *Performance Improvement Framework* and *Management of*

*Change*. Any further identified gaps in literature for establishing causal links between *Knowledge Management*, *Performance Improvement Frameworks* and *Management of Change* will be suggested for future research.

**Figure 1: Conceptual Model of the Management of Change focused upon Knowledge Sharing**

(Source: Original Table)

Until recently, the petroleum companies were protective of their knowledge, due to the level of competition within the industry (Thomas, 2007). However, the petroleum industry is coping with losses due to an aging workforce coupled with an acute labour shortage (Himmelsbach, 2007; Benson & Durler, 2009; Ahuja, 2010). For many years it has been claimed that petroleum companies can have significant competitive advantage if it can use information to act faster, respond to external changes faster, make more informed decisions, by allowing every individual in the company to better communicate, collaborate and share information on a routine basis by establishing forums through a form of knowledge exchange (Reed, Palmeri, Coy & Brady, 2006; Ahuja, 2010). This research will test this premise.

## CONCLUSION

Many companies believe they gain significant competitive advantage through their ability to establish Knowledge Sharing amongst their workforce (Burnett et al., 2004). Preliminary information gathered to study the importance of the Knowledge Management process in creating sustainable competitive advantage through sharing tacit knowledge in many industries suggest that the relationship between Knowledge Sharing, Management of Change and a Performance Improvement Framework (PIF) in petroleum companies was examined and preliminary results show that until recently, insights into the dynamics of the relationship between a Performance Improvement Framework (PIF), Knowledge Sharing and Management of Change in the petroleum industry have been fragmented. Some organizations, especially in the oil industry, claim to be seen as leaders in Knowledge Sharing practices and have earned a good reputation for Knowledge Management (Edwards, 2008) and Management of Change (TTC, pers.comm). However other parts of the resource sectors are yet to embark on explicit Knowledge Management (Edwards, 2008) and Management of Change initiatives, seemingly unaware of the fields.

Since the 1990s, with the economic perception changing from an emphasis on tangible resources to intellectual assets, it has become clear that a company with an unstructured approach to corporate *Knowledge Management* is incapable of competing in this new environment (Burnett et al., 2002; Culpan, 2008; Benson & Durler, 2009; Kamph, 2009; Joia & Lemos, 2010). Dynamic markets for both end products and technologies, coupled with the increasing costs of doing business, inter-firm partnerships like strategic alliances, joint ventures, joint industry projects and acquisitions are no longer a strategic option, but a necessity in many markets and industries. Partnerships help companies pool their resources and knowledge, and spreading the costs and

risks to a number of organizations (Burnett et al., 2002; Kamph, 2009). Acquisitions can provide instant access to new knowledge in the form of expertise, process and technology from another organization (Burnett et al., 2002). Overall, the challenge is not losing current knowledge.

# **PRIVATIZATION OF AIRPORTS: SUCCESS FACTORS AT THE PRIVATIZATION OF AIRPORTS IN TURKEY**

**Unal Battal, Anadolu University, Turkey**

## **ABSTRACT**

*The privatization of airports was carried out by the General Directorate of State Airports Authority of Turkey (SAA), which, starting in 1994, used the Build-Operate-Transfer (BOT) methodology to transfer the operating rights of airport terminals to the private companies, while keeping the airside operations under state control. In this paper is mainly looking at the evolution of airport governance in Turkey. This paper is organized as follows: In the section 1 focuses on airport privatization in Turkey and analyzes success factors in the privatization methodology undertaken by the SAA. In the section 2 focus on the framework conditions as a success factor. In section 3 focus on analyze success factors in the privatization methodology. Finally, conclude by raising some questions for further research.*

## **INTRODUCTION**

Over the last 25 years, the governance structure of airports has changed in many parts of the world. Today airports are no longer a homogenous group of public utilities, but a heterogeneous group with ownership structures ranging from state-owned to partial and even full privatization, with regulatory systems ranging from cost regulation to price cap and even to complete deregulation and with different degrees of competition, ranging from pure monopolistic to oligopolistic markets.

Airports, even publicly owned airports, have become more commercialized and more profit oriented. Thus, the upstream markets within the vertical air transport supply chain followed the trend set by the downstream markets, as the airline industry underwent these changes earlier and many (“downstream”) air transport markets are now characterized by fierce competition between airlines.

World international and domestic airports are expected to handle a record five billion passengers in 2011, half a billion more than last year. This figure will rise to nine billion in 2025, Airports Council International (ACI) chairman James Cherry said. This growth in passenger numbers means more capital investment will be needed in airports to build new terminals and expand old facilities. Last year, the world's airports spent some US\$38 billion on airport improvements to cater to increasing passenger numbers. This investment is likely to increase over the next few years.

Accordingly, governments, airport operators, civil aviation regulators, airlines and service providers must work together with to meet and respond to passengers' needs. They provide incentives for airport operators to continue to build non-aeronautical revenue streams, and the operators of commercial services in airports are stakeholders with whom they must work closely with to ensure successful ventures. Improving airport security also brings airport operators, vendors and regulators into a much needed partnership.

## **AIRPORT PRIVATIZATION IN TURKEY**

The European economy experienced a remarkable change in the 1980's with the emergence of privatization procedures, which first started in the UK under Thatcher government, both for firms in production economy, but also for infrastructure providers and public utilities. The main aim of UK privatization was reducing government involvement in industry. Followed by the UK, continental Europe started to privatize

government companies in various sectors. As an emerging economy, Turkey was also influenced from this wave and set up the Republic of Turkey Prime Ministry Privatization Administration (PA) in 1984. Since then, a number of public enterprises have been privatized in different sectors, such as energy, transportation and telecommunication.

The PA has used different privatization methods, like straight sales, leases, granting of operational rights, establishment of property rights other than ownership, profit sharing model and other legal forms, depending on the nature of the business. The receipts attained from privatization reached a peak in the middle of 2000's, as large public utilities were included in the process. Figure 1 shows the value of privatization implementations in Turkey undertaken so far.

Fig. 1: Privatization Implementations in Turkey by Years

In Turkey, air transport has gained more and more importance in the last decades. From 1988 to 1993, number of passengers served by Turkish airports doubled. As a result, the existing capacity not only became inadequate, but also started to suffer from the bad quality. Especially terminals in main airports were insufficient, which required enlargements or replacement with high levels of investment. This, together with the privatization wave in the Turkish economy led to the first airport privatization in 1993, which was the tender of BOT for Antalya Airport Terminal 1, prepared and implemented by the General Directorate of State Airports Authority (SAA) independent of the Republic of Turkey Prime Ministry Privatization Administration (PPP). Similar contracts followed over the next decade, as can be seen from Table 2, which summarizes the BOT implementations for Turkish airports. It is interesting to see that the operating period granted for BOT contracts varied significantly, depending on the income that could be received from the operation and the cost of the terminal construction according to predetermined plans by the SAA.

We see that BOT was one of the interesting options pursued, since the investments are financed by the private sector, but in the long term the government remains the owner. Especially in developing countries as in Turkey, it is controversial to transfer the ownership of strategic infrastructure to the private sector; therefore it may be one of the motivations behind BOT implementations.

The airport privatization in Turkey that has been undertaken by the SAA, can be summarized as a two stage process. In the first phase BOT implementations have taken place, in which the winning operating company is required to build a terminal according to the contract and gets the operating rights for that period. At the end of this period, the operating company is obliged to give all the rights back to the SAA. This policy has been implemented already at Antalya (Terminal 1 and 2 separately), Istanbul Atatürk, Dalaman, Ankara, Izmir and Milas-Bodrum airports.

However, since significant efficiency gains are not only observed in the construction process, but also in the operation of the terminals, it was natural to continue operating them in private hands at the end of the contract period. It is for this reason that we observe a second phase in the privatization process. In this second phase, the SAA agreed to transfer the operating rights of the newly acquired terminals via long-term leasing back to the private sector. The interested companies were asked to submit their bids in price auctions. The one with

the highest bid obtained the operating rights for a predetermined period. In Antalya and Istanbul Atatürk airports, the BOT period has already come to an end, followed by a long-term lease agreement.

Table 2: BOT Implementations for Turkish Airports

Airport	Year of Tender	Winner	Operation Period	Operation Until	Investment Period	Investment Amount	Number of Firms in the Tender	Notes
Istanbul Atatürk	1997	TAV	3 y 8 m		30 m	306 mill USD	12	1) Prolonged in 2001 with additional 13,5 months due to the earthquake.
Antalya Terminal 1	1994	Fraport (+Bayindir)	9 y	01.09.2007	2 y	65,5 million USD	2	Fraport took over 50% in 2001, and 100% in 2005 of the operating company Bayindir
Antalya Terminal 2	2004	Celebi-ICTAS	3 y, 5 m, 26 d	24.09.2009	N/A	71,1 million USD	N/A	
Ankara Esenboga	2004	TAV	15 y, 8 m	Mid 2023	36 m	188 million USD	2	1) TAV offered 15y8m, ICTAS offered 17y6m for operating rights.
Izmir Adnan Menderes	2004	Havas-Bayindir	6 y, 7 m, 29 d	January 2015	2 y	125 million USD	6	1) Participants: Havas-Bayindir, Gama-Casa-Riva, Teknotes-Manas, Celebi-Fraport (7y8m), Tepe-Akfen and İçtaş-Constain. 2) TAV took over Havas in 2005
Dalaman	2003	ATM(Aksa-Turkuaz-Manas)	6 y, 5 m, 20 d		2 y	72,4 million USD	4	Participants: ATM (6y5m), Bilkent Holding-Regional Airport(9y5m), Cakir Yapi, Makyol(8y6m)
Milas-Bodrum	2006	Teknotes-Aerodrom Beograd	3 y, 9 m		N/A	N/A	8	Participants: Teknotes-Aerodrom Beograd (winner), Global/ERS/Borsy Pil(4y10m), Makyol(5y8m), Celebi, Ictas, Alsim, Aksa/YDA, TAV

## The Characteristics of the BOT Implementation

SAA defines the framework of the contract in advance, where they determine;

- (1) For the building phase; the content what is to be built, the amount of investment;
- (2) For the operating phase; the revenue sources for the operating company and the proportion of the revenues for both parties;
- (3) A guaranteed number of annual passengers over the contract period (in most of the cases).

In the BOT applications in Turkey, the sealed bid auctions have been used, where the bidder with the shortest operation period wins the auction. However, in order to take part in the auction, the participants should fulfill some criteria in terms of technical proficiency, experience in this area and financial situation in a pre qualification process. The revenue sources for the private operating company vary from airport to airport, however they mainly cover the following activities; passenger fee; loading bridge fee; space assignment, rent and advertising revenues; revenue share and endorsement revenues; counter fee; CIP and meeting room revenues; ticket office, restaurant, bank, office, luggage revenues; car parking rents; electricity-water revenues etc.

## Long Term Leases

The operation period for the BOT contract at Istanbul Atatürk airport terminal expired in June 2005. Instead of taking the operating rights back from the operator TAV, which had won the BOT tender, the SAA started to pursue a policy of long-term leasing. It quickly completed the legal applications in order to lease the operating rights to the private sector via tenders. For Istanbul Atatürk airport, the lease period was set at 15.5 years. Four consortia originally considered taking place in the tender. However, ADP-SNC Lavalin dropped out before the auction started. Alsim-Alarko & Corporation America was not allowed to take part in the auction, as they did not fulfill the requirements set by the SAA. Only Malaysia Airports and TAV participated in the sealed

bid auction and bid 1.59 billion USD and 2.1 billion USD respectively. Following this, separate price negotiations between the parties and the SAA determined the winner TAV with a lease amount of 3 billion USD. The situation for Antalya airport was slightly different, as the two international terminals were operated by two different private firms following the original BOT implementation. In 2007 the SAA prepared a tender for the two international and one domestic terminal. The tender followed the same two-stage process as in Istanbul Atatürk with sealed bid auction and subsequent price negotiations. Celebi Holding was not allowed to participate in the auction, as they did not fulfill the requirements set by the SAA. Newly established consortia Fraport-IC Ictas Holding10 (shortly ICF Airports) overbid TAV with 3.2 billion USD and it was given the operating rights of those three terminals until 2024. (SAA, 2008)

## **THE FRAMEWORK CONDITIONS AS A SUCCESS FACTOR**

By analyzing privatizations which have already taken place, one can identify the factors governing the success or failure of a privatization. World privatization examples show that success seems to depend above all on the relations in the triangle between government, airlines and airport. These relations must be adapted ex ante to the future challenges the aviation industry has to face through increasing bottlenecks in the infrastructure and the conditions of the post-privatization era. Changing conditions include:

- (1) The abolition of the existing closeness and quasi identity between the airport owners on the one side and the regulator on the other.
- (2) The transformation of a state-owned infrastructure provider into a commercial entity.

These changing conditions also determine the relevant positions of co-operation and conflict in privatization projects. The airlines and the consumers are interested in adequate infrastructure at competitive prices. They hope that privatization will make use of the latent efficiency potential and thus lead to lower prices. Potential investors involved in a privatization are interested in the lowest possible purchase price, the highest appreciation, high returns on investment, entrepreneurial freedom and especially when the level of investment for purchasing the airport and for improving the infrastructure are taken into consideration in long-term planning security. For the public sector privatization leads to a conflict of interest: on the one hand, it has to pursue politico economic, traffic political and structure-political targets, on the other hand, it is interested in the highest possible privatization earnings.

Investigating the examples of successful and failed privatization endeavors one can see that they differ in the way they handled the conflict of interest between these different parties. The less successful privatizations solved the conflict by forming a two party coalition but this solution regularly inhibited the success of the privatizations and thereby had a negative feedback effect on the winners. In the end, the winners were losing too. Successful privatizations did not build two-party coalitions but three party-partnerships. In these system-partnerships each party had to forgo the pursuit of individual goals in favor of a successful privatization. In the end all the parties involved benefited, and thereby transformed a seemingly irresolvable conflict into a “win-win situation”.

However, the conditions for the formation of such “win-win situations” can only be created by the government. This means that the state must adhere to its political responsibility and restrict itself by for example, waiving a short-sighted maximization of privatization yields. It also means that a regulatory framework must be established which enables an intelligent self-restriction of all the parties involved.

## **Success Factors for the Privatization of Airports an Airline Perspective**

Airport privatization must be understood and undertaken as a politically active process. The task of the government is to set up a regulatory framework which

- (1) balances out the various interests of the “stakeholders”, especially airlines and airports,
- (2) protects the user (i.e. passengers and airlines) from monopoly abuse of the airport and
- (3) creates a basis for system partnership to enable growth

Independent monopoly price regulations must be set up not only because of the lack of infrastructure but also due to the continuing monopoly of the airport and the danger of the monopoly becoming even stronger after privatization. The objective of such regulations is a macro economically useful and fair reconciliation of

interests between the airport and the airlines, which will lead to satisfactory results for both parties. This requires both a fair division of risks within the branch airlines face considerable investments in aircraft and marketing measures when serving new routes and a fair division of profit resulting from growth and efficiency. Regulation must also assure that prices and fees stay in line with market conditions. In order to prevent prices being based on strength within the market instead of on effective performance, regulations must prevent the misuse of power when setting airport charges. At the same time, a fall in quality standards must be avoided. Additionally, the regulation must set up incentives to maintain and build up an efficient airport infrastructure. Due to the long-term character of infrastructure investments, the regulations must make it possible for airports to achieve investment security, reasonable profits and adequate return on interest taking account the risk they also face.

The price regulation principles should take into account the following facts:

- (1) Rise in the cost of living,
- (2) Changes in air traffic volume,
- (3) Changes in productivity of the airport and

Furthermore the regulations should provide incentives for further productivity and a healthy development in air traffic. Most price regulations have intended only to cover the costs of the airport (“cost plus” method). The disadvantage of this method is that it provides inefficient outcomes because there are inadequate incentives for innovation, productive performance or investments.

In order to achieve an economically useful and fair mediation between the conflicting interests of airports and airlines, the regulation requires the transparency of the airport’s income, costs and investment. The following are needed in time in order to achieve this transparency:

- (1) forecast data, e.g. regarding traffic,
- (2) proof of cost relatedness for all airport charges,
- (3) budgeted/actual comparisons for the development of productivity, the amount of traffic, investment, fees and revenue.

These items should be made available to the regulator as well as to the airlines in a comprehensible form. For the airlines, they are the basis for a system partnership based on trust. For the regulator, they are the basis on which it can create an incentive system within the regulations to increase productivity and efficiency in the airport.

The regulatory period must give airport companies and airlines mid-term planning security, but it also has to leave room for flexible reaction to environmental changes. A regulatory period of 3–5 years therefore seems adequate. For the initial phase a regulatory period of 3 years seems appropriate in order to ensure that the effects of the agreed regulations can be reviewed in time.

In order to avoid danger of quality decrease after privatisation, binding quality standards must be agreed on and laid down. These can be included either in the regulation contract or in an additional agreement. A system of penalties should be created for non-compliance with the agreed upon standards.

## SUCCESS FACTORS FOR THE PRIVATIZATION OF AIRPORTS IN TURKEY

Airport privatization should be development under a P3 (Public/Private Partnership) model from the perspective of central government. Government should be setting priorities for understanding the process:

- (1) What are the **Reasons/Objectives**? Why does government turn to the P3 model for delivery of infrastructure?
  - a. Lack of sufficient funds for development, or inability of the state to borrow
  - b. Scheduling and budget control – delivery time and cost of construction
  - c. Ideology – belief that private sector is inherently more efficient and cost conscious
  - d. Infusion of funds into government coffers – ongoing rent payments or one time asset sales
  - e. Any combination of the above
- (2) Who are the **Decision Makers**? Many entities have control and a direct stake in the process and the outcome.
  - a. Central government
  - b. Regional/municipal government
  - c. Military/Air Force
  - d. Ministry of Transportation
  - e. Ministry of Finance
  - f. Political Opposition

- g. Some may have directly opposing interests
- (3) What is the **Regulatory Framework** required? What are the minimum regulatory requirements to conduct and oversee P3s?
  - a. Law allowing concession of public assets
  - b. Land ownership issues
  - c. Foreign ownership issues
  - d. Economic regulations that will apply
  - e. Set-up of a regulatory or oversight agency
- (4) What **Concession Type** is appropriate? What is the appropriate vehicle for delivery of the stated objectives?
  - a. Management contract
  - b. Design, Build, Finance, Maintain (DBFM)
  - c. Build, Operate, Transfer (BOT)
  - d. Long term leases
  - e. Sale of assets
  - f. Sequence and number of airports to be included:
    - i. One airport at a time – initially faster; ability to develop a template; lowers cost of delivery and markets respond well; overall roll-out slower
    - ii. Multiple airports (bundling) – ability to co-ordinate services; allows cross-subsidization; limits competition; overall roll-out faster; possible financing problems
- (5) What is the **Business Case**
  - a. Understanding the opportunity from the bidders' perspective
  - b. The value is in the concession – not the real estate
  - c. Anticipated growth and revenue streams; positive bias
  - d. Sovereign guarantees, subsidies, cross-subsidization
  - e. Risk-transfer
  - f. Timing with respect to domestic and international financial markets
- (6) What are the **Delivery Horizons**? What is the average time between decision to proceed and project realization?
  - a. Preparation of bid documents (legal, financial & technical) 12 months
  - b. Pre-qualification submissions and evaluation 6 months
  - c. RFP submission and evaluation 9 months
  - d. Contract negotiation and financial closing 3+ months
  - e. Total time to start of concession 30+ months
  - f. Time to deliver new/upgraded terminal 24+ months
  - g. TOTAL 54+ months

## CONCLUSION

The world's airlines, through IATA, have made it known that they are strongly supportive of privatization of airports where it ensures needed capacity is constructed and when it promotes greater efficiency. But significantly IATA has said that greater use should be made of low-interest, low-risk, long-term bonds written against the security of the cash flow from user charges. This seems to reflect a concern that airports should not be sold off to the private sector without their first being an effective set of controls on market power. While there are many examples of airport privatization around the world, it is fair to say that the greatest successes have been in situations where the institutional framework is well developed and where the political risk factor is somewhat reduced. Even then, policy makers continue to search for effective mechanisms.

This change in policy with a move to lease agreements, as illustrated by these two examples, raises a number of interesting questions that are worth being investigated in greater detail;

- Why did the SAA prefer leasing the terminals instead of full privatization or partial privatization?
- How did the SAA decide the length of long term leasing period of the terminals?
- What kind of requirements did the SAA have for participating in the auctions? Did the auctions take place in a competitive environment?
- Which criteria helped the SAA on the choice of the two stage auction methodology?

- What kind of agreement design was used to distribute the risk between the bidder and the bidder?

# THE IMPACT OF INFORMATION DISCLOSURE ON THE VALUE OF BRICS COMPANIES: INTELLECTUAL CAPITAL EMPIRICAL RESEARCH

**Elvina R. Bayburina and Elena G. Kusaya**  
**National Research University Higher School of Economics, Russia**

## ABSTRACT

*In the world of knowledge economy, knowledge significance and key importance of innovations for creating competitive advantage the new drivers of companies' sustainable development are of great importance. The Intellectual capital and its components is the solid basis to create new drivers of value sustainability. The assessment of which concerns both academic and business researchers. There is a necessity to reveal the most significant value drivers and to report them adequately in order to satisfy internal and external stakeholders and their information disclosure requirements. Disclosed information is especially vital in countries with emerging capital markets, since they are comparatively less stable than developed ones and until recently any information about companies has been relatively unavailable. The traditional financial statements fail to solve this problem, firstly, due the fact, that it is impossible to represent Intellectual capital promptly with the help of conventional financial measures. Obviously, more detailed report helps external users to assess position and competitiveness of a company properly. Simultaneously, it enables managers to determine core intellectual assets and estimate quality of managing them. What's more, disclosed additional information signals about the company's readiness and ability for innovative development. Thus, the authors of this article firstly analyze the features of value creation by companies from BRICS countries and then introduce the research of their reporting practices in terms of Intellectual capital. The subject of this study is Intellectual capital information and its disclosure in different sources. The principle aim of this analysis is to assess the impact of Intellectual capital disclosure on companies' value. In order to achieve this objective the authors proposed the appropriate definition of Intellectual capital and marked out its components and subcomponents; determined some disclosure measures of corresponding components and subcomponents of Intellectual capital; collected data about listed BRICS companies in line with the determined measures; estimated Intellectual capital on the basis of existing measures; developed a methodology for the appreciation of Intellectual capital disclosure and created a final index; examined the correlation of developed index with existing measures. The results of the project "Researches of corporate financial decisions of the companies of Russia and other countries with emerging capital markets under conditions of global transformation of the capital markets and formation of economy of innovative type", carried out within the framework of the Programme of Fundamental Studies of the Higher School of Economics in 2011, are presented in this paper.*

## INTRODUCTION

Modern companies have to cope with new difficult tasks in all aspects of their activities due to development of information technologies, increase in knowledge significance and key importance of innovations for creating competitive advantage. One of trigger value drivers is an ability to inform stakeholders adequately. The traditional financial statements fail to solve this problem, firstly, owing to the fact, that *Intellectual capital* and its components are the most essential drivers of companies' value growth and it is impossible to represent them promptly with the help of conventional financial measures (Firer, Williams, 2003). Moreover, there are many pieces of research (e.g. Ortiz, 2009), representing magnitude of non-financial measures for explaining difference between market and book value of companies. That is why problems of *Intellectual capital disclosure* come to the force both for companies, publishers of financial reports, and analysts, users of financial reports. Obviously, more detailed report helps external users to assess position and competitiveness of the company properly. Simultaneously, it enables managers to determine core intellectual assets and estimate quality of managing them.

Such information is especially vital in countries with emerging capital markets, since they are comparatively less stable than developed ones and until recently any information about companies has been relatively unavailable. What is more, additional information signals about company's readiness and ability for innovative development. Recently many various definitions of *Intellectual capital* were constructed and proposed. Itami, the pioneer in this field, defined *Intellectual capital* and its components as the intangible assets which include particular technology, brand name, customer information, reputation and corporate culture that are invaluable and priceless to a firm's competitive power (Itami, 1987). Stewart esteemed *Intellectual capital* as knowledge, information, intellectual property and experience that can be used to create wealth (Stewart, 1997). Edvinsson (in Bontis, 2003) viewed *Intellectual capital* as applied experience, organizational technology, customer relationship and professional skills that provide the company with a competitive advantage in the market. For Bontis, *Intellectual capital* means individual workers' and organizational knowledge that contributed to sustainable competitive advantage (Bontis, 2003), while Pulic includes all employees (Pulic, 2000), their organization and their abilities to create value added that is evaluated on market into *Intellectual capital* (Puntillo, 2009). International accounting standards also include the definition of *Intellectual capital* (e.g. IAS 38), however, it consists only of measures available from accounting reports. More general approach is used in this study, considering that assets, which are difficult for taking into straight account, frequently are very influential in terms of company's value. (Berezinetz, Udovichenko, Sisolyatina, 2010; Garanina, 2009) The fundamental definition of this study is worked out by Bayburina and Golovko (Bayburina, 2007; Bayburina, Golovko, 2008, 2009, 2010). Thus, the *Intellectual capital* is a "complexity of key qualitative characteristics of the company. The complexity of such characteristics represents the competitive advantage originated inside and within the company" (Bayburina, 2007; Bayburina, Golovko, 2008, 2009, 2010). This notion gives the broadest idea of *Intellectual capital* concept, considering, that this definition is wider than the notion of intangible assets and is not limited to concrete measures as it was in definitions mentioned previously and above. Thus, *Intellectual capital* is a complexity of knowledge, accrued experience of employees and intellectual property. It is important to mention that not all objects of engineering design, marketing mix tools, customer relationship principles are the objects of the intellectual property (Bayburina, 2007; Bayburina, Golovko, 2008).

## **THE IMPORTANCE OF INTELLECTUAL CAPITAL REPORTING AND MEASURING**

Many researchers have approved the crucial role of *Intellectual capital* to evaluate the company and to define prerequisites for future earnings forecasts, to explain the difference in market and book value of company by the means of *Intellectual capital* components (Petty and Cuganesan, 2005). At the same time companies under the competition threats and world economy transformation conditions are now more concerned with *Intellectual capital reporting*. Some companies, especially in Europe have developed special types of *Intellectual capital reports*; however such practice is not common and is not applied elsewhere in emerging economies and emerging capital markets by example of BRICS, such as Brazil, Russia, India, China, and South Africa. (On 24th of December 2010 South Africa received an official invitation to enter BRIC. The entrance has previously been approved by members of BRIC, however, according to many experts; South Africa is not on the level of other BRIC-countries by some economic measures.) Meanwhile, various studies of information disclosed for investors and analysts indicate a substantial difference between the type of the information found in the annual reports of companies and the type of information demanded by the market (e.g. Eccles et al., 2001; Eccles and Mavrinac, 1995). In general, companies, investors and analysts require more reliable information, for example, on managerial competencies, expertise, and experience. Stakeholders require more reliable information concerning the client analytical lens, e.g. features of customer relations management integrity. Personnel competencies are to be observed also. All those mentioned above factors are related to *Intellectual capital* (Bukh, 2003). Thus, there is necessity to analyse reporting practices of BRICS companies. Such analysis will help to mark out the available reporting practice, its strength and features. On the other hand it may become a basis for new reporting standards development. At last, more complex analyses and investigation, including both *Intellectual capital* in terms of value creation and reporting are useful, since it will probably enable companies to identify and to assess their intangible resources and to report information about them adequately internally and externally (Petty, Cuganesan, 2005). According to Puntillo, there are 34 methods of measurement of Intellectual capital (Puntillo, 2009; Sveiby, 2001). They are divided by levels (organization level only with the identified components) and by types of valuation (monetary, non-monetary). This scheme involves the range of complexity of *Intellectual capital* analytical tools. Each method has for sure its advantages and disadvantages. There is no doubt that the

*Intellectual capital* and the information disclosed research should be executed by the means of at least 2 different approaches. Taking into account the above mentioned reasons within the bounds of the research two types of *Intellectual capital* evaluation approaches are going to be tested and the results received are to be discussed. The first one is based on financial evaluation of *Intellectual capital* by the means of empirical panel data research and the second one corresponds to the investigation of *Intellectual capital disclosure* by the means of the certain index analysed through the content-analysis.

## INTELLECTUAL VALUE RESEARCH DESIGN

The main goal of this research is to evaluate the influence of particular components of the *Intellectual capital* on the *Intellectual value* of BRICS companies and to reveal the influence of the *Intellectual capital disclosure* on the *BRICS companies' value*. The first part of this research is based on the model developed firstly by E.R. Bayburina and T. Golovko (Bayburina, Golovko, 2008). This research is going further, since one more country is now added into emerging capital markets sample (BRICS, incl. South Africa). The main task of this part of the research is to reveal the influence of financial measures, chosen like proxy for *Intellectual capital components* (subcomponents) and *some fundamentals* as the dependent variables. Following Bayburina and Golovko, the authors determine the dependent variable *Intellectual Enterprise Value, IEV*, as the difference between *Market value of company's Equity and the Book value of its Equity* (Bayburina, Golovko, 2008). The calculated delta reflects the excess of the Market capitalization over the Book value, which on the panel data of over 5 years help to eliminate short-term speculative reactions; this delta also reflects how "the market" (stakeholders and mainly investors) measures the level of the company's internal efficiency (Bayburina, Golovko, 2008). By this pattern the value is generated by its intellectual part. So, Bayburina and Golovko conclude, that the *Intellectual value* of the company is a part of the total value, created through the process of the intellectual components' accumulation (Bayburina, Golovko, 2008). And moreover this value can be traced by the external stakeholders of the company. In addition, the authors can underline that the delta (the difference) between the Market value of the equity and its Book value can also be traced (Bayburina, Golovko, 2008). According to (Bayburina, 2007; Bayburina & Ivashkovskaya, 2007) it is necessary to determine the reason for taking into account only the characteristics of the Equity. Managers of BRIC (BRICS also) companies when targeting the capital structure of the company do not always consider future growth and sustainable development as the long- and medium term goal especially with emerging markets sample of companies. That is why the choice of the capital structure by BRIC (BRICS also) companies depends on a range of factors, which cannot be considered in this article and are left for the future distinguished research from the conceptual point of view.

From the point of view of Bayburina, Golovko (Bayburina, Golovko) 2008 the *Intellectual capital* is a complexity of key qualitative characteristics of the company, which are not always objects of intellectual property, such as, for instance, competencies. Thus, *Intellectual capital* is a complexity of knowledge, accrued experience of employees and intellectual property. It is important to mention that not all objects of engineering design are the objects of the intellectual property; however its importance for the process of the value creation is difficult to underestimate, for example, in the companies of the high tech industry. Simultaneously it is complicated to provide the full, complete, exact definition of the notion '*Intellectual capital* of the company'. For this purpose it is reasonable to concentrate on its structure and the content. According to the paper and main approach mentioned above the following components of *Intellectual capital* are chosen: human capital, process capital, innovation capital and network capital. Moreover, the key notions of *Intellectual capital* components are used:

1. *Human capital* consists of employees' knowledge and skills, their key competencies; loyalty (which hang upon labour conditions and social programs, training programs undertaken by companies).
2. The company's infrastructure refers to *process capital* (e.g. information technologies and systems, working processes, business-routines, operational processes, acceleration and integration of key, primary and secondary business processes, controlling, etc.)
3. *Innovation capital* includes commissioning and development of advanced technologies, capital investment, and increase in effectiveness of cost management as a consequence of modernisation, reinvestment policy and balance of the dividend policy. The increase of dividends usually leads to a decrease of reinvestment in business, from the other hand dividends are considered to be a signal for the market, however in general the dividends paid tend to decrease the financial opportunities for new innovations to be implemented.
4. *Network capital* is a complex system of relations with external stakeholders, such as banks, investors, creditors, government and suppliers. Correspondingly, fair marketing practices and competition, promotion of

social responsibility, forehanded and full executing of contracts, etc. sustain the accumulation and synergetic value of network capital. Taking into consideration the network capital it is worth to mention that the specific of the world economy stage influence the degree of stakeholders' activity. Specific and intensity of the business network collaboration depend on each particular investigated year. According to this logic the influence of each particular year on the *Intellectual value creation* is quite high. It is obvious, for example, that in 2007 year the world observed the so-called "stock market rally" on emerging markets caused by the activeness of investors and oil prices turbulent positive dynamics, in 2008– 2009 the obvious drop affected the network collaboration activity. Consequently, the authors have decided to prove a significance of the "time-factor" to be investigated along with the network capital. It is necessary to trace the industry dynamics - that is the market situation for the particular company, - whether the impact of the industry is positive or negative, and by means of this relation revealed it is possible to predict the company's perspectives towards its future market position and network position and possibilities for network collaboration.

The research model includes the following dependent variable *Intellectual Enterprise Value, IEV*, is determined as the difference between *Market value of company's Equity and the Book value of its Equity*. The research model includes the following fundamental factors: *Book value of assets (BVA)*, *Return on assets (ROA)*, *Return on equity (ROE)*, *Net income (NI)*, *Earnings before interest, taxation, depreciation and amortization (EBITDA)*, *Earnings before interest and taxation (EBIT)*. *Intellectual capital* proxy variables are structured as follows. Human capital is presented by *Personnel Expenses (PE)*, *Number of Employees (NE)*, and *Total Assets per Employee (TA/E)*. *Operating expenses (OE)* reflect Process capital. *Capital expenditures (CE)*, *Dividends Paid (DP)* and *Research and Development Expenditures (R&D)* stand for Innovation capital. Network capital is presented by the influence of particular time period (*Dummy of Year*). At last, a set of dummy-variables, reflecting industry influence were selected (*Dummy of Industry*). Taking into account the necessity to assess companies from different countries the final research sample was formed along with the following criteria:

- a) The sample is formed from BRICS companies listed from the year 2005 till 2010.
- b) The selection of such time period is caused by the length of *Intellectual capital* accumulation and, therefore, the necessity to analyze panel data for not less than 5 years (Bayburina, Golovko, 2009).
- c) Such research is of special interest, owing to the fact, that, from one hand, BRICS countries are leaders of emerging economies, though, at the same time, they differ dramatically from each other. It should be mentioned, that the information used in the study should be available in the open sources (e.g. annual reports or other information on websites), thus making it useful and acceptable to trace for a wide range of users. In order to ensure comparability, companies should have financial reports along with the National GAAP accounting standards. As the results of previous studies show (Bayburina, Golovko, 2009), the number of companies, especially from India and Brazil, which have IFRS financial reports in the period earlier than 2005, is not quite high and is not sufficient enough for the research purposes, thus it is necessary to impose restrictions on usage of such type of reports in the research.
- d) For the purpose of comparability, the limitations on the companies' capitalization prescribe to choose companies with market capitalization in 2010 not less than \$200mln.

Statistical information for the research was collected from the Bloomberg data source and corporate web-sites. The final sample includes 316 companies from BRICS countries, representing 10 industries. According to all limitations and principles of the analysis the basic research model can be presented as following:

$$(1) IEV_{it} = \alpha + (\rho^1_{it} \dots \rho^n_{it}) X IC + (\beta^1_{it} \dots \beta^k_{it}) X FV + \varepsilon_{it},$$

where:

*IC* – a vector of *Intellectual capital* subcomponents;

*FV* – a vector of fundamental variables;

$\varepsilon$  – a vector of random errors ("white noise");

*I* – BRICS company index;

*T* – a year index;

*N* – a particular *Intellectual capital* component index;

*K* – a particular fundamental variable index.

To reach the main goal of the research the special research model has been introduced and a series of linear regression tests has been held. The empirical panel data research was fulfilled with the use of regression analysis software tools (program packages Stata 11.0, Eviews 7.0, Microsoft Excel 2010).

## RESULTS OF STUDY: INTELLECTUAL VALUE

In order to choose the most important factors in terms of influence on *Intellectual capital* a set of linear regression models were constructed. The final model includes factors which are significant. The authors have also carried out specification tests: the Wald Test, Breusch-Pagan Test, Hausman Test. Wald Test showed that the Fixed Effect Model provides a better explanation than the Pooled-up Model. Breusch-Pagan Test showed that the Random Effect Model provides a better explanation than the Pooled-up Model. Hausman Test showed that the Fixed Effect Model is rejected compared to the Random Effect Model. According to the results the Random effect model of the regression has been chosen. So the basic criterion was the highest value of the Wald statistics (443,31).

**Table 1.** Model specification

Test	Statistics
Wald Test	F test that all $u_i=0$ : $F(155,335) = 1.28$ Prob > F = 0.0312
Breusch-Pagan Test	$\chi^2(1) = 15.05$ Prob > $\chi^2 = 0.0001$
Hausman Test	$\chi^2(6) = 16.27$ Prob > $\chi^2 = 0.0124$

The multicollinearity was not found. The average VIF meaning is 2,26, which is admitted. The final model is as follows:

$$(2) IEV_{it} = 567,65 + 0,27*BVA_{it} - 0,55*OE_{it} + 1024*TA/E - 5,38*DP_{it} + 10*R\&D_{it} + 5209*Dummy\ of\ 2007$$

## INTELLECTUAL CAPITAL DISCLOSURE RESEARCH DESIGN

The main research task of this research is to analyze annual reports as media of *Intellectual capital disclosure (here and further ICD)* by BRICS listed companies and to evaluate size, industry and time effects on disclosure along with the effects of ICD on the growth of a company. This part of research is based on the work of Branco (Branco *et al.*, 2010), devoted to the *Intellectual capital disclosure* of companies of emerging capital markets by example of Portuguese companies. The Market Capitalization is used in this part of the research as the measure of size, the change in market capitalization is used in this part of the research as the measure of growth. To analyze the influence of the industry on ICD, the Dummy variable is used. A one/zero variable is used to designate companies, according to sectors (one stands for companies from a knowledge intensive sector, zero stands for companies from a traditional sector). The following sectors are considered as knowledge intensive industrial sectors: Retail, Media, Banks and Technology. The other sectors (Raw resources; Construction and materials; Industrial goods and services; Travel and Leisure) are considered as traditional sectors. Following Petty *et al.* and Branco *et al.* in order to test the hypothesis that the value growth (growth of Market capitalization) of companies in the sample was affected by their *Intellectual capital disclosure*, the research model includes the two main types of variables, dependent variable is “growth” and key independent variable is “level of disclosure”, other independent variables are “time”; “size”; “industry” (Petty *et al.*, 2005; Branco *et al.*, 2010). “Growth” is calculated as change in the market capitalization of each company from one period to the next over the observed years. “Level of *Intellectual capital disclosure*” is calculated as the change in the total ICD index from one period to the next over the observed years. The derived variables are taken to indicate the increase in overall reporting of *Intellectual capital* and form the main hypothesis of this part of the research as follows: “companies with higher levels of ICD will achieve higher levels of size and growth than other companies” (Branco *et al.*, 2010). The ICD index-proposed methodology is based on content analyses and non-parametric statistical methods are used to assess industry, size, and level of disclosure and time effects. It should be mentioned that in this part of the research, a computerized content analysis of the annual reports was conducted, using a list of terms related to *Intellectual capital*. In total 256 annual reports in PDF format were collected. They were then searched for terms/expressions related to *Intellectual capital* with the help of the software PDF-XChange viewer. In this study the *Intellectual capital* is divided into three categories: internal capital, external capital and human capital as it was proposed by Guthrie and Petty (Guthrie, Petty, 2000). Internal capital refers to “the knowledge embedded in organizational structures and processes” (Petty, Cuganesan, 2005) and includes patents, trademarks, systems and processes used in day-to-day activities. The

external capital category consists of the relationships a firm has with outside stakeholders, such as relationships with customers and suppliers, brand names, trademarks and reputation (Petty and Cuganesan, 2005). Finally, human capital refers to “the skills/competences, training and education, experience and value characteristics of an organizational workforce” (Petty, Cuganesan, 2005). This study focuses on a sample of 62 companies chosen from the listed BRICS companies. Annual reports were collected for the period from 2006 to 2009. Taking into account the necessity to assess companies from different countries the final research sample was formed along with the following criteria:

- The company is the member of top-100 companies of the particular country in terms of highest market capitalization in 2010.
- The period of listing has a constraint history of 5 years (since 2005 till 2009)
- The corporate web-site of the company and its annual reports are available in English.
- Annual reports are available from 2005 to 2009, annual reports are presented for the calendar year (not for only for the financial year).

Along with all the criteria the final sample was formed and it does not include companies from India, since companies selected previously are used to present annual reports for financial year not for the calendar year, that because of that their results are not comparable with others. At last, reports for the year 2005 were excluded from the sample, since too many companies did not disclose this report on their web-site. The sample consists of 45 companies from knowledge-intensive industries and 17 companies from traditional industries. Statistical information for the research was collected from the Bloomberg data base and corporate web-sites. To reach the main goal of the research the special research model has been introduced and a series of tests has been held. The data research was fulfilled with the use of software tools (program packages Stata 11.0, EvIEWS 7.0, Microsoft Excel 2007).

## RESULTS OF STUDY: INTELLECTUAL CAPITAL DISCLOSURE

The results of content-analyses show, that the most frequently disclosed information is information about human capital in comparison with external capital and internal capital. The most popular, mentioned search terms for the category of internal capital are “trademarks” and “management processes”. “Consumer”, “customer”, “brand” are the most often revealed terms for external capital. At last, terms «employee», «training», «experience», «team», «human resources» are often disclosed in the category of human capital. An upward trend in the total *Intellectual capital disclosure* is suggested; however the amount of external capital disclosure decreases a bit in the year 2008. Following Branco the authors used non-parametric statistical methods to test the connection of independent variables mentioned above and *Intellectual capital disclosure* (Branco, 2010). Thus, the Mann-Whitney U test was used to test industrial affiliation. Spearman’s Rho test was used in order to decide whether size, time and growth are significant. Also Friedman test and Wilcoxon signed rank test was held for comparing the difference in *Intellectual capital disclosure* in time. Friedman test confirmed the differences in *Intellectual capital* and its categories disclosure. Wilcoxon signed rank test confirmed only differences in the amount of disclosure between 2006 and 2007, 2008 and 2009, 2006 and 2009 years. The results are presented in Table 2.

**Table 2.** Wilcoxon and Friedman test results (time period significance for ICD)

<i>Wilcoxon test:</i>	2006-2007		2007-2008		2008-2009		2006-2009		2007-2009		<i>Friedman test</i>	
<i>Disclosure:</i>	Z	P	Z	P	Z	P	Z	P	Z	P	$\chi^2$	P
<i>Internal capital</i>	-2,55	0,01	-0,26	0,80	-0,51	0,61	-2,81	0,01	-0,26	0,80	29,93	0,00
<i>External capital</i>	-2,72	0,01	-0,12	0,91	-2,38	0,02	-2,63	0,01	-1,31	0,19	43,74	0,00
<i>Human capital</i>	-2,45	0,01	-2,26	0,02	-2,32	0,02	-2,92	0,00	-2,20	0,03	51,84	0,00
<i>Intellectual capital</i>	-4,44	0,00	-1,50	0,13	-3,11	0,00	-4,77	0,00	-2,37	0,02	142,58	0,00

The hypothesis of positive connection of size and the amount of total *Intellectual capital disclosure* or its categories was not confirmed. This situation can be explained, for instance, by poor reporting practices in BRCS

countries. As for industrial affiliation, Mann-Whitney U test showed that this factor is significant for total *Intellectual capital disclosure* for all years except the year 2007 and for external capital disclosure for all years. Thus companies from knowledge-intensive industries disclose more information, than companies from traditional ones. The differences in external capital disclosure are connected with the fact, that knowledge intensive companies, mentioned above (like banks and media) are closely working with clients and brand is more important for them, so they demonstrate higher level of external capital disclosure.

**Table 3.** Mann-Whitney test results (industry importance for ICD)

Mann-Whitney test	BRCS: 2006		BRCS: 2007		BRCS: 2008		BRCS: 2009	
<i>Disclosure:</i>	<i>Z</i>	<i>P</i>	<i>Z</i>	<i>P</i>	<i>Z</i>	<i>P</i>	<i>Z</i>	<i>P</i>
<i>Internal capital</i>	-0,92	0,36	0,35	0,72	0,49	0,62	0,21	0,84
<i>External capital</i>	-2,88	0,00	-2,73	0,01	-2,60	0,01	-2,71	0,01
<i>Human capital</i>	-1,84	0,07	-0,93	0,35	-0,91	0,36	-0,96	0,34
<i>Intellectual capital</i>	-2,46	0,01	-1,54	0,12	-2,04	0,04	-1,91	0,06

As for connection between *Intellectual capital disclosure* and growth, the relationship is significant at 5% level only for growth 2006-2009 and ICD index for the period 2007-2009. The correlation is negative. It may be connected with the fact that many companies did not restore their capitalization to the level of the year 2006 by the year 2009, while the amount of *Intellectual capital disclosure* increased during the period. The same findings are observed for growth 2006-2009 and ICD index 2006-2009.

## CONCLUSIONS AND IMPLICATIONS

In the world of knowledge economy, knowledge significance and key importance of innovations for creating competitive advantage the new drivers of companies' sustainable development are of great importance. The *Intellectual capital* and its components is the solid basis to create new drivers of value sustainability. One of such key competitive issue of *Intellectual capital disclosing and reporting* is to inform stakeholders adequately. Meanwhile, various studies of information disclosed for investors and analysts indicate a substantial difference between the type of the information found in the annual reports of the companies and the type of information demanded by the market (e.g. Eccles *et al.*, 2001; Eccles and Mavrinac, 1995). In general, companies, investors and analysts require more reliable information, for example, on managerial competencies, expertise, and experience. Stakeholders require more reliable information concerning the client analytical lens, e.g. features of customer relations management integrity. Personnel competencies are to be observed also. All those mentioned above factors are related to *Intellectual capital* (Bukh, 2003). Thus, there is necessity to analyze reporting practices of BRICS companies. Such analysis will help to mark out the available reporting practice, its strength and features. On the other hand it may become a basis for new reporting standards development. In this research two types of *Intellectual capital* and its disclosure investigation were conducted: both are based on financial and non-financial measures. Both types showed the importance of human capital in terms of creation of company's value and reporting. The measures of Innovation or Internal capital, such as dividends paid or R&D expenses are significant according to the first part of our research, but the category of internal capital is the least disclosed. Such result is somewhat expected, since the tough and rival global competition among companies may decrease their wish to disclose additional information about internal capital. Comparing results of two studies of BRICS companies enables also to conclude that company's size influences positively on the amount of *Intellectual capital* accumulated. However, this fact doesn't not affect the *Intellectual capital disclosure* significantly. The influence of particular time period is important in both parts of the research. As for *Intellectual capital* creation, the year 2007 was important as a period of economy overheating before the crisis of the year 2008. At the same time, the amount of the *Intellectual capital disclosure* increased over time. At last, the industry type is significant only for *Intellectual capital disclosure*, but not for the *Intellectual capital* accumulation.

Thus, this study provides new empirical evidence on *Intellectual capital disclosure* and *Intellectual capital* empirical investigation. The main limitation of this study is the unavailability of annual reports for the similar sample in the second part of the report as it was in the first part of the research. Thus, the development of this research can be executed through the further analysis of companies' web-site contents and press releases, in particular, in order to increase the sample. Also it is possible to apply more complicated content-analyses, in order to create more thorough understanding of the essence of *Intellectual capital*. Promptitude and quality of

corporate disclosed information are of great importance within the framework of knowledge economy. Notably disclosures of the higher quality positively affect expectations of internal and external stakeholders. The information about *Intellectual capital* is probably the most valuable as long as complicated in terms of reporting quality as well as from the point of view of valuation and empirical research, due to the characteristics of this type of intangible capital. There is no convenient, common or best practice of *Intellectual capital disclosure*. Academic community creates different methods of appraising *Intellectual capital disclosure quality* among companies; however, there is still no well-defined approach and, concerning overall results received to the moment, the more it is investigated, the more questions arise. These findings along with the proceeding growth of the information significance explain the need for further development of this subject.

# LONG-TERM M&A EFFICIENCY AND INTELLECTUAL CAPITAL IMPACT: EMPIRICAL EVIDENCE OF EMERGING MARKETS

Elvina R. Bayburina and Tatyana V. Petrunina  
National Research University, Russia

## ABSTRACT

*The results of the project “Researches of corporate financial decisions of the companies of Russia and other countries with emerging capital markets under conditions of global transformation of the capital markets and formation of economy of innovative type”, carried out within the framework of the Programme of Fundamental Studies of the Higher School of Economics in 2011, are presented in this paper. Since the world doesn’t fail to come to the era of globalization, technologies and innovations are developing at a huge pace. Companies should always stay upbeat in order to correspond to requirements of contemporary market and to stand the global competition. That is the main reason why merger’s activity has dramatically increased. A company should estimate M&A efficiency in order to formulate and to execute strategic decisions. Scholars investigate various factors that influence deals’ efficiency. This efficiency was revealed to be affected by such factors, as company’s size, its experience in M&A, alignment of merging companies, etc. The question whether all necessary M&A efficiency factors are investigated still arises, the new economy incubates the new success factors and value drivers, such as the Intellectual capital and its components as the specific advantage business-model features of each particular company. According to the research results, Intellectual capital impacts on the long-term M&A efficiency by the means of its components, such as human capital, process capital, innovation, network capital.*

## INTRODUCTION

Since the world doesn’t fail to come to the era of globalization, technologies and innovations are developing at a huge pace. Companies should always stay upbeat in order to correspond to requirements of contemporary market and to stand the global competition. That is the main reason why merger’s activity has dramatically increased. There are a lot of researches dedicated to evaluating efficiency of *Mergers and Acquisitions*, M&A. A company should estimate M&A efficiency in order to formulate and to execute strategic decisions. Why are some M&A more successful than the others? What are the particular key factors of this success? And what should a company do to grasp the maximum long-term sustainable benefits from this kind of deals? These are the main questions that a company encounters. Scholars investigate various factors that influence deals’ efficiency. This efficiency was revealed to be affected by such factors, as company’s size, its experience in M&A, alignment of merging companies, etc. The question whether all necessary M&A efficiency factors are investigated still arises, the new economy incubates the new success factors and value drivers, such as the *Intellectual capital* and its components as the specific advantage *business-model* features of each particular company. However, obviously the impact of *Intellectual capital* on the M&A efficiency is underestimated. In order to examine the extent of *Intellectual capital’s* importance in M&A effectiveness, several things should be determined. On the one hand, a researcher faces with a problem of measuring *Intellectual capital*. Despite the plethora of methods for its measuring, there is not a single one that is perfectly appropriate. The majority of models suffer from subjectivity in defining *Intellectual capital’s* indicators and indexes. In comparison with other models, *Value Added of Intellectual Capital*, VAIC method, created by Pulic in 2000 (Pulic, 2000), is based on the *factual information* and can be easily defined from company’s *financial statements*. These advantages have made VAIC method extremely widespread. Another problem, while evaluating *Intellectual capital’s* impact on M&A efficiency, lies in choosing how to measure parameter of efficiency. The *event study* methodology is extremely popular in academic research due to its simplicity. Nevertheless, it has one substantial drawback. This

method is not able to catch *long-term character* of mergers' processes. On an ideal market share prices correctly reflect future perspectives of companies. Still everybody knows that even developed markets are far from being ideal. One more model, which is also frequently used, is the method of *empirical testing of financial information to measure efficiency*. It implies comparison of company's financial ratios before and after the deal. It seems to be more objective, than *event study*, but it lacks relativity also to some extent. Imagine that market is going up. What is happening with financial ratios? They obviously increase, though not due to deal's efficiency, but due to positive market trend. In comparison to the *empirical testing* the *event study* methodology still has several significant advantages (along with the disadvantages). Firstly, it gives an opportunity to estimate the direct influence of these deals on the shareholder's wealth. Moreover, the abnormal return methodology has a forward-looking dynamics, which actually means that *stakeholders' expectations* form the capital market dynamics. Furthermore as it was already discussed, the method is friendly to use. Despite all of these obvious advantages, *event study* methodology provokes serious doubts in its validity. Some researchers are engaged in the process of fruitful modification and improvement of the initial *event study* methodology.

In particular, more and more models for predicting the shareholders return after the announcement are being put forward. Currently, statistical and economical methods are distinguished (MacKinlay, 1997). Those methods include *Capital Asset Pricing Model*, *CAPM* and *Arbitrage pricing theory*, *APT* models and they are the most wide-spread. Some researchers propose more complicated mathematical models for predicting shareholders' returns. For example, authors A. Sharkas & M. Hassan (Sharkas, Hassan, 2010) justified the usage of *Exponential Generalized Autoregressive Conditional Heteroskedasticity*, *EGARCH (1,1) model*. Along with *event study* approach, other methods of assessing deals' efficiency, such as accounting method and surveys of executives, are used (Bruner, 2001). At the same time, both methods are as well disputable. The methodology of conducting surveys seems to be too subjective. The results can be easily affected by manager's excessive optimism concerning a certain deal. *Empirical testing* method provokes a problem of choosing comparable companies (Martinova *et al.*, 2006). Thus, the present research tries to solve the problem of peer selection by proposing to compare *company's performance* along with the *Intellectual capital impact* before and after the deal. An approach, which is worth of interest, to measure M&A deal's efficiency, which has lately become very popular, is *Data Envelopment Analysis*, *DEA Analysis*. The method is based on comparison of a company in every period with the best practice companies in corresponding industry (see, e.g. Abd-Kadir *et al.*, 2010). *Data Envelopment Analysis*, *DEA* methodology is more appropriate, in author's point of view. Nevertheless, the methodology is far from being universal. Moreover, from authors' point of view, it grasps primarily the operational performance, instead of strategic. Besides, the described approach it doesn't take the life cycle of a market: if a certain market goes down, financial ratios rapidly change, but the relative standing of a company may not be influenced. Thus, the purpose of the present article lies in comparing the results of *event study* method with conclusions derived from the real financial information received later on several years after deal. As a proxy for measuring efficiency the ratio of *market capitalization to book value of total assets (Tobin's Q)* was chosen. In order to meet this objective a regression model on the basis of financial information before the deal was constructed. To construct a model the *Intellectual capital* and its components are to be defined. From the point of view of Bayburina & Golovko (Bayburina, Golovko, 2009) the *Intellectual capital* is a complexity of key qualitative characteristics of the company, which are not always objects of intellectual property, such as, for instance, competencies. Thus, *Intellectual capital* is a complexity of knowledge, accrued experience of employees and intellectual property. It is important to mention that not all objects of engineering design are the objects of the intellectual property; however its importance for the process of the value creation is difficult to underestimate, for example, in the companies of the high tech industry. Simultaneously it is complicated to provide the full, complete, exact definition of the notion '*Intellectual capital* of the company'. For this purpose it is reasonable to concentrate on its structure and the content.

According to the paper and main approach mentioned above the following components of *Intellectual capital* are chosen: *human capital*, *process capital*, *innovation capital*. Moreover, the key notions of *Intellectual capital* components are used. *Human capital* consists of *employees' knowledge and skills*, their key competencies. The company's infrastructure and *profit optimization margin* refer to *process capital* (e.g. information technologies and systems, working processes, business-routines, operational processes, acceleration and integration of key, primary and secondary business processes, controlling, etc.). *Innovation capital* includes commissioning and development of advanced technologies, *capital expenditures* and investment, increase in effectiveness of cost management as a consequence of modernization, *reinvestment policy* and balance of the *dividend policy*. The increase of *dividends* usually leads to a decrease of reinvestment in business, from the other

hand dividends are considered to be a signal for the market, however in general the dividends paid tend to decrease the financial opportunities for new innovations to be implemented. *Network capital* is a complex system of relations with external stakeholders, such as banks, investors, creditors, government and suppliers. Specific and intensity of the business network collaboration, M&A type and frequency depend on each particular investigated year. It is obvious, for example, that in 2007 year the world observed the so-called “stock market rally” on emerging markets caused by the activeness of investors and oil prices turbulent positive dynamics, in 2008 – 2009 the obvious drop affected the network collaboration and M&A activity.

The model of the empirical part of the research included influence of *Intellectual capital* variables described by *profit optimization margin (process capital)*, *employees’ leverage (human capital)*, *capital expenditures (innovation capital)* and some others. Afterwards, it was used for predicting company’s performance after the deal. If there were no controversial events and opposite dynamics of the market (since financial crisis occurred in 2008, it is necessary to explore whether it could have affected our results), that could affect market capitalization, happened in the investigated period, the difference between real and forecasted performance can be fully attributed and referred to the features and characteristics of the deal. According to the specific of the investigated companies of the sample we would try to evaluate the crisis input to the possible biases. To sum up, our main research goal is as follows. First of all, we measure the M&A deals’ efficiency *over the largest emerging capital markets of Brazil, India and China (BIC)* using *modified empirical testing* method, taking into consideration *Intellectual capital and its components*. The main research hypotheses are as follows:

*H<sub>1</sub> Intellectual capital and its components impact on the long-term M&A efficiency of the companies of the largest emerging capital markets*

*H<sub>2</sub> Each Intellectual capital component impacts on the long-term M&A efficiency of the companies of the largest emerging capital markets in its particular way.*

Secondly, we compare the results of this approach with the results of the *event study* methodology. Thus, the research is structured as follows: in the first part sample companies are selected. Afterwards, the authors choose and substantiate methodology of investigating long-term efficiency of M&A deals. Then, necessary indicators are chosen. As a result, the chosen methodology was applied to the given sample. In conclusion, the results are compared and discussed. In the final section a one can find implications for future research.

## SAMPLE SELECTION CRITERIA

The research was conducted on the sample of companies of BIC countries (Brazil, India, China), largest emerging capital markets. Taking into account the necessity to assess companies from different countries the final research sample was formed along with the following criteria. The sample is formed from BIC listed companies from the year 2005 till 2010. The sample is formed from BIC companies involved in M&A activity as an acquirer in the period from the year 2000 till 2010. The present research investigates acquisitions, as well as joint ventures. The selection of long-term period is caused by the length of *Intellectual capital* accumulation, its long-term impact (according to the main hypotheses) in terms of efficiency and value, not less than 5 years (Bayburina, Golovko, 2009) and, therefore, the necessity to analyze panel data for not less than 3 years before the deal and 2 or 3 years after the deal. The sample is formed from BIC companies, which belong to one of the following industries: manufacturing; telecommunications; consumer; basic materials. Statistical information for the research was collected from the Bloomberg data source and corporate web-sites. Bloomberg was chosen as a major source of information. The application of all the criteria brings us with a sample of 24 companies. The sample consists mostly of Chinese enterprises (88,5%). At the same time, according to the above mentioned data criteria there are no Russian companies in a sample (and it is not possible to analyze BRIC instead of only BIC companies), Indian company account for 7,7%. All the rest not so high percentage of the sample goes to Brazil (3,85%).

## METHODOLOGY AND MODEL SPECIFICATION

As mentioned above, traditional *empirical testing* method involves comparing performance of companies engaged in M&A activity with the performance of their peer companies. Thus, a researcher encounters the problem of choosing comparable enterprises and ventures. Invalid choice of such type of companies may lead to bias of estimates and to wrong conclusions. This was the reason why we have chosen another methodology, based on the direct comparison of companies’ performance before and after the deal. The method involves

several stages. *Step 1: Empirical model construction* based on financial information of companies 3 years before a deal. *Step 2: Empirical testing* and application of derived coefficients to forecasted efficiency 2 or 3 years after the deal. *Step 3: Event study investigation. Analysis of empirical findings* and the results of event-study. Taking into account the necessity to assess companies from different countries and that the sample in this particular research is heterogeneous, there is the strict necessity of using relative instead of absolute figures. According to all limitations and principles of the analysis the main dependent long-term dependent investigated variable as the Efficiency proxy variable is the ratio of *Market Capitalization to book value of total assets (Tobin's Q)*. According to previous studies (Bayburina, Golovko, 2009) it is necessary to determine the reason for taking into account the characteristics of the Equity and correspondingly *Market capitalization (MC)*. Managers of BRIC or BRICS companies when targeting the capital structure of the company do not always consider future growth and sustainable development as the long- and medium term goal especially with emerging markets sample of companies. (BRICS: Brazil, Russia, India, China, South Africa. On 24th of December 2010 South Africa received an official invitation to enter BRIC. The entrance has previously been approved by members of BRIC, however, according to many experts; South Africa is not on the level of other BRIC-countries by some economic measures.) That is why the choice of the capital structure by BRIC (BRICS and BIC also) companies depends on a range of factors, which cannot be considered in this article and are left for the future distinguished research from the conceptual point of view. According to all limitations and principles of the analysis the empirical research model can be presented as following:

$$(3) \quad Q_{it} = \alpha + (\rho^1_{it} \dots \rho^n_{it}) X IC + (\beta^1_{it} \dots \beta^k_{it}) X FV + \varepsilon_{it}$$

where:  $Q$  – a vector of ratios of *market capitalization to book value of total assets (Tobin's Q)*;  $IC$  – a vector of *Intellectual capital* subcomponents;  $FV$  – a vector of fundamental variables;  $\varepsilon$  – a vector of random errors (“white noise”);  $I$  – BIC company index;  $T$  – a year index;  $N$  – a particular *Intellectual capital* component index;  $K$  – a particular fundamental variable index.

The research model includes the following fundamental factors: *Book value of assets (BVA)*, *Return on assets (ROA)*, *Return on equity (ROE)*, *Net income (NI)*, *Earnings before interest, taxation, depreciation and amortization (EBITDA)*, *Growth of Earnings before interest, taxation, depreciation and amortization ( $G_{EBITDA}$ )*, *Growth of Earnings before interest and taxation ( $G_{EBIT}$ )*, *Sales turnover (Sales)*. *Intellectual capital* proxy variables are structured as follows. Human capital is represented by *Number of Employees (NE)*, *Net Income per Employee (Employees leverage, NI/E)*. *Profit optimization margin (POM)*, *Operating expenses (OE)* reflect *process capital*. *Capital expenditures (CAPEX)*, *Amortization & Depreciation (A&D)*, *Dividends Paid (DP)* stand for *innovation capital*. *Network capital* is represented by the influence of particular time period and is investigated separately.

*Profit optimization margin (Net income/Sales turnover)* shows how many dollars of net income are derived from one dollar of sales; it reveals enterprise's efficiency related to cost optimization, since cost structures of the companies from the same industries are similar. *Amortization ratio (Amortization & Depreciation/ Total assets)* characterizes speed of impairment and retirement of assets. *Dividend payout ratio (Dividend payout/Net income)* represents the share of net income paid out to shareholders as dividends. *EBIT growth ratio (EBIT growth/ current EBIT)* and *EBITDA growth ratio (EBITDA growth/ current EBITDA)*, both coefficients demonstrate current growth rates of a company. *Capex ratio (Capital expenditures/Total assets)*, the indicator gives a vision of company's future growth perspectives. *Operational expenses ratio (Operational expenses/Sales turnover)*, the ratio reveals how optimal is the operational cost structure of a company. *Employees leverage ratio (Net income/Number of employees)*, the indicator characterizes the level of company's human capital.

We assume that coefficient before variable calculated as profit optimization margin should have a positive sign: the more net income per dollar of sales a company earns, the higher is its operational efficiency and operational optimization. The sign of amortization ratio coefficient is ambiguous. On the one hand, significant amortization implies considerable cash flows for a company. On the other hand, fast impairment implies that a company modernizes its assets more frequently. In this case a company has to divert more cash flow to capital expenditures with the detriment for another investment activity. Also we expect the coefficient sign of dividend payout ratio to be positive, as far as dividends favorably influence the investors' attitude or negative, as far as the dividends negatively influence the financial possibilities to renovate the equipment and necessary operational routines. It is presumed that the signs of EBIT and EBITDA growth ratios coefficients also exceed zero, because capital expenditures lead to company's growth in long-term period, over more than 5 years of research period. Operational expenses ratio is expected to influence *Market capitalization* and *Tobin's Q* correspondingly and negatively. Employees leverage characterizes to some extent the features of human capital of the company. All

companies of the sample are similar in operational activity; therefore, high productivity of workers signifies the ability of the whole company to use efficiently its resources. It is assumed that higher level of employees leverage and human capital, correspondingly, favorably affects *Market capitalization* and *Tobin's Q* (following Bayburina, Golovko, 2009).

*Network capital overview: "time-factor"*. Network capital is a complex system of relations with external stakeholders, such as banks, investors, creditors, government and suppliers. Correspondingly, fair marketing practices and competition, promotion of social responsibility, forehanded and full executing of contracts, etc. sustain the accumulation and synergetic value of network capital. The networks capital is generated outside and partially within the company by the wide range of the corporate interactions and cooperation with external stakeholders of business networks (following Bayburina, Zhukovets, 2010). Obviously, the networks management can increase the corporate value significantly, but unbalanced inner-isolated managerial decisions cannot. As of day, it is not an easy matter to assign the key analytical substance of the business networks structure and the networks capital features as the value drivers of the company. The range of applied and empirical papers of the networks intuitive phenomenon and the possibility of the development of those new unique value drivers especially networks based, preliminary force out researchers to find the common concept of the analysis. The networks value drivers are to be unique and thus to be sustainable under up-to-date rival competition and even under the conditions of the distressed world economy. According to this widespread academic heritage, it is possible to distinguish networks capital as the part of the *Intellectual capital* of the company. The main distinctive feature is that the networks capital is accumulated mostly by the interactions of the company with the external business environment. The main issue in this case is that the company is quite limited in leveraging the business environment and is stint in resources to manage the external counterparts' interactions in contrast to internal corporate processes (following Bayburina, Zhukovets, 2010). Taking into consideration the network capital it is worth to mention that the specific of the world economy stage influence the degree of stakeholders' activity. Specific and intensity of the business network collaboration, M&A type and frequency depend on each particular investigated year. It is obvious, for example, that in 2007 year the world observed the so-called "stock market rally" on emerging markets caused by the activeness of investors and oil prices turbulent positive dynamics, in 2008 – 2009 the obvious drop affected the network collaboration and M&A activity. Consequently, the authors have decided to prove a significance of the "time-factor" to be investigated along with the network capital. Since financial crisis occurred in 2008, it is necessary to explore whether it could have affected the expected research results. The majority of companies in the sample are quoted on Chinese stock exchange. Shenzhen Stock Exchange Index is presented (taking into consideration the infrastructural features of Chinese capital market, it is worth to mention that there is a strong linkage between the Shanghai Stock Exchange and the Shenzhen Stock Exchange in terms of returns, return volatility, and volume volatility). Therefore, its dynamics is the most relevant.

**Graph 1:** Dynamics of Chinese stock exchange index

The above graph reveals that the value of index has doubled from 2000 till 2010 according to the sample time formation criteria. Year 2008 showed 21% drop of index, though its value still exceeded the before-crisis value (before 2006). Since the significant number of companies in the investigated sample were involved in M&A activity before 2007 (50%), the observations included years before 2006, when index value was relatively low. We can make a conclusion, that factual value of Tobin's Q should have been even more than predicted, but this is not the case. Despite the soundness of this argument, in the second section of the article we'll investigate whether our results are affected by the inclusion of crisis. As a result, predicted values of Tobin's Q should change proportionally according to the market dynamics. To reach the main goal of the research the above mentioned special research model has been introduced and a series of linear regression tests has been held. The empirical panel data research was fulfilled with the use of regression analysis software tools (program packages Stata 11.0, Eviews 7.0, Microsoft Excel 2010).

## EVENT-STUDY METHODOLOGY

The next stage of the research is to compare the results of the described above empirical approach with the results of *event study* methodology. In the academic literature the issue of choosing event window still has no single solution. Following Husainov (Husainov, 2008), we have chosen a period of 15 days. These include 7 days before the deal and 7 days after. Analysis of 7 days before the official announcement of a deal is essential to take insider information into account. This factor is extremely relevant due to emerging markets features. Calculation of abnormal returns was implemented according to the scheme, presented on the graph 2 below.

**Graph 2:** Structure of event study methodology

CAPM model was taken as a basis for calculating abnormal returns:

(4)  $R_{it} = \alpha_i + \beta_i R_{mt} + \varepsilon_{it}$ , where:  $R_{it}$  – return of company  $i$  in period  $t$ ;  $R_{mt}$  – market portfolio return in period  $t$ ;  $\varepsilon_{it}$  – random error or “white noise”,  $i$  – BIC company index;  $t$  – a year index;  $m$  – a market index.

Calculation included several steps. *Step 1*: CAPM model was estimated on the basis of company’s daily returns in the pre-announcement period. *Step 2*: Derived coefficients were used to predict stock returns in the event window. *Step 3*: Abnormal returns were calculated as differences between actual and predicted values of stock returns. Abnormal returns in each of 15 days were summed up for every company. Calculated average CAR of all companies in sample was tested for significance.

(5)  $AR_{it} = R_{it} - \hat{\alpha}_i - \hat{\beta}_i R_{mt}$ , where:  $AR_{it}$  – abnormal return of company  $i$  in period  $t$

(6)  $CAR_i = \sum_{t=-7}^7 AR_{it}$ , where:  $CAR_i$  – cumulative abnormal return of company  $i$

## RESULTS AND MAIN FINDINGS

*Empirical research results (3 years before a deal)*. The model described above was tested in software package *Stata*. First of all, a *pooled regression* on the basis of 72 observations (data of 24 companies over 3 years before a deal) was constructed. Thereafter, we tested *Fixed effects* model, which assumes the existence of unobservable *Fixed effect* for every company. Thus, this model takes potential heterogeneity of the sample into account. Based on F-statistics, the null hypothesis about the *pooled regression*’s superiority is rejected, which means, that *Fixed effects* model correctly explains the investigated dependence. *Breusch-Pagan* Test revealed that *Random effects* model also surpasses pooled regression. *Hausman* test allowed us to make a conclusion that *Random effects* model leaves behind the *Fixed effects* model. The multicollinearity was not found. After elimination of insignificant coefficient model presents the follows.

**Table 1: Model specification**

Test	Statistics
Wald Test	F test that all $u_i=0$ : $F(23,38)= 109,7$ Prob > F= 0.0000
Breusch-Pagan Test	$\chi^2(1)= 63,84$ Prob > $\chi^2= 0.0000$
Hausman Test	$\chi^2(6)=1,23$ Prob > $\chi^2= 0.9753$

(7)  $Q_{it}=3,719 + 60,518 \times \text{Profit optimization margin}_{it} + 161,276 \times \text{Employees leverage}_{it} + 359,663 \times \text{Amortization ratio}_{it} - 34,287 \times \text{Operating ratio}_{it}$

All the coefficients have expected signs: the more is *Profit optimization margin* and the higher is *Employees’ leverage* and *Amortization ratio*, the higher is *Tobin’s Q*. On the other hand, the higher is the share of *operational costs* in sales, the less efficient is the company and, in turn, the less valuable is the company for investors. Accordingly, the coefficient negatively influences the corresponding variable.

*Empirical research results (3 years after a deal)*. The next step is to predict *Tobin’s Q* in three years after the deal period. On average, the deviation of *Tobin’s Q* factual value from *predicted one* is -8,229. *This difference appeared to be insignificant at 10% level*. This result can be explained by the additional investigation of the model specification. In particular, the model can be improved by adding extra factors. Besides, macroeconomic factors could also affect the results. During the considered period the financial crisis took place so that it could affect market capitalization dynamics of the observed companies. The majority of the companies of considered sample are quoted at the Chinese stock exchange. Accordingly, Chinese stock exchange dynamics is the most

relevant. As we can see on graph 1, from 2006 till 2007 value of an index has redoubled. 2008 has shown 21 % falling of an index, however its value and together with mentioned percentage of falling considerably surpassed the meaning of index before crisis (till 2006). As the majority of the Chinese M&A has occurred in 2007, observations included 2004-2006, accurate that period of time when values of an index were rather low. It means that actual value should be even more than we have predicted and that we don't observe. Despite validity of the statement, we investigate, how will change our conclusions with taking into account financial crisis. For this purpose as a resultant indicator Tobin's Q was adjusted by the Chinese stock exchange index. As a result of calculation of look-ahead values, Tobin's Q should change proportionally the movement of an index. Correspondingly, this part of the research is dedicated to investigation of how crisis affects our results. The new response variable is Tobin's Q adjusted to crisis. On the basis of F-statistics, *Breusch-Pagan* statistics and *Hausman* test *Fixed effects model* was chosen. The multicollinearity was not found. Elimination of all insignificant variables (at prudent level of significance) gave us the following regression, the final model is as follows:

**Table 2: Model specification**

Test	Statistics
Wald Test	F test that all $u_i=0$ : $F(23,38)= 18,06$ Prob > F= 0.0000
Breusch-Pagan Test	$\chi^2(1)= 30,93$ Prob > $\chi^2= 0.0000$
Hausman Test	$\chi^2(6)=36,64$ Prob > $\chi^2= 0.0000$

(8)  $Q_{it}=0,0102 - 0,0182 \times \text{Profit optimization margin}_{it} - 0,000262 \text{ Dividend payout ratio}_{it}$

The above model appears to be worse than initial, as far as coefficients are less significant. Moreover, constant is highly significant, which testifies that fixed effects (factors that were not included in the model) have a greater influence on the response variable, than other factors. The average deviation of factual values from predicted amounted to -7,2365. The difference this time has become *significant at a prudent level*.

*CAR research results.* On the basis of selected for research companies CAR was calculated. For eight sample companies (33,3%) CAR appeared to be negative, while the rest of selected companies (66,6%) have positive value of CAR. For the whole sample CAR is positive and significant (at 5% level of significance), with the value of +0,0452 (see table 3).

**Table 3: CAR calculation**

Indicator	Value
CAR average	0,04521
CAR variance	0,000833
t-statistics	54,25039

The initial hypothesis was that the results of *event study* approach will significantly differ from the results of empirical investigation of financial information. As we have just determined, the results of two approaches differ significantly. Our research goal is twofold. First of all, we aimed to assess the long-term efficiency of M&A deals on the markets of BIC countries, since the number of corresponding studies is limited and we tried to measure the impact of *Intellectual capital* on the determined *efficiency*. For this reason, the sample of industrial enterprises involved in M&A activity in 2000-2010 was used. Another purpose of the research was to apply different methodologies to estimation of M&A efficiency and to test whether the results are consistent and corresponding to the Intellectual capital concept and investigation. To sum up, our main research goal was as follows. First of all, we measured the M&A deals' efficiency on developing emerging markets e.g. BIC using *modified empirical testing* method, taking into consideration *Intellectual capital and its components*. The main research hypotheses were confirmed. *Intellectual capital* impacts on the long-term M&A efficiency by the means of its components, such as *human capital*, *process capital*, *innovation*, *network capital*. Human capital is significantly represented by *Net Income per Employee* (*Employees leverage*, *NI/E*). *Profit optimization margin* (*POM*), *Operating expenses* (*OE*) reflect *process capital* significantly. *Amortization & Depreciation* (*A&D*), *Dividends Paid* (*DP*) stand for *innovation capital*. *Network capital* is represented by the influence of particular time period and makes the vital input into the model and results.

Our modified empirical approach indicates that three years after the deal the additional input to the corporate performance the advantages of M&A is not so high (the constant in the model is quite exiguous), the variables that are significant are with the negative signs of coefficients and they are *Dividend payout ratio* (which is the outflow of the company and negatively influence efficiency), and, what is worse, *Profit optimization*

*margin* (which reveals enterprise's efficiency related to cost optimization). To some extent it is possible to conclude that deterioration of these companies' performance took place 3 years after M&A. M&A is the additional obligation to the company, that is why its stakeholders after M&A tend to demand higher level of *Dividends paid* after a deal, *M&A synergy* is quite an arguable question, especially because *Profit optimization margin* after started to contribute negatively into long-term *M&A efficiency* and *long-term corporate performance*, that with no doubt means, that 3 years after M&A the *operational efficiency* and possible M&A *synergy* were deteriorated. Secondly, we compared the results of this approach with the results of the *event study* methodology. Event study methodology by the means of days (not years) window testifies that M&A deals in the period of 2000-2010 with no doubt have improved the performance of participating companies after 7 days after M&A. Since the empirical method based on the actual panel data of financial information is more objective, we can drive the conclusion that calculation of abnormal return by the means of CAR scheme won't necessarily lead to valid results.

## CONCLUSIONS AND IMPLICATIONS

Since the world doesn't fail to come to the era of globalization, technologies and innovations are developing at a huge pace. Companies should always stay upbeat in order to correspond to requirements of contemporary market and to stand the global competition. That is the main reason why merger's activity has dramatically increased. There are a lot of researches dedicated to evaluating efficiency of M&A. A company should estimate M&A efficiency in order to formulate and to execute strategic decisions. Why are some M&A more successful than the others? What are the particular key factors of this success? And what should a company do to grasp the maximum long-term sustainable benefits from this kind of deals? These are the main questions that a company encounters. Scholars investigate various factors that influence deals' efficiency. This efficiency was revealed to be affected by such factors, as company's size, its experience in M&A, alignment of merging companies, etc. The question whether all necessary M&A efficiency factors are investigated still arises, the new economy incubates the new success factors and value drivers, such as the *Intellectual capital* and its components as the specific advantage business-model features of each particular company. However, obviously the impact of *Intellectual capital* on the M&A efficiency is underestimated. One of the most significant problems, while assessing M&A efficiency, lies in choosing how to measure this efficiency. Present article pursued an objective to compare the results of *event study* methodology with the results of empirical investigating financial information. Despite the method used by present researchers is disputable, results of the investigation eloquently testify, that calculation of abnormal returns is unable to reveal the actual long – term efficiency of M&A deals and depict factors that matter and that are worth of investigation, e.g. *Intellectual capital components*. It seems quite logic, that *event study* method is not always able to grasp the long-term efficiency of these deals: this instrument is based upon investors' reaction, which is frequently driven by speculative incentive, especially on developing markets.

Our initial hypothesis was that the results of *event study* approach will significantly differ from the results of empirical investigation of financial information. As it was determined, the results of two approaches differ significantly. Our research goal is twofold. First of all, we aimed to assess the long-term efficiency of M&A deals on the markets of BIC countries, since the number of corresponding studies is limited and we tried to measure the impact of *Intellectual capital* on the determined efficiency. For this reason, the sample of industrial enterprises involved in M&A activity in 2000-2010 was used. Another purpose of the research was to apply different methodologies to estimation of M&A efficiency and to test whether the results are consistent and corresponding to the *Intellectual capital* concept and investigation. To sum up, our main research goal was as follows. First of all, we measured the M&A deals' efficiency on developing emerging markets e.g. BIC using *modified empirical testing* method, taking into consideration *Intellectual capital and its components*. Intellectual capital impacts on the long-term M&A efficiency by the means of its components, such as *human capital*, *process capital*, *innovation*, *network capital*. *Human capital* is significantly represented by *Net Income per Employee*. *Profit optimization margin*, *Operating expenses* reflect *process capital* significantly. *Amortization & Depreciation*, *Dividends* stand for *Innovation capital*. *Network capital* is represented by the influence of particular time period and makes the vital input into the model and results. The main research hypotheses were confirmed. Our modified empirical approach indicates that three years after the deal the additional input to the corporate performance and M&A efficiency the advantages of a deal is not so high (the constant in the model is quite exiguous), the significant variables are represented in the model by coefficients with the negative signs. Those significant variables are *Dividend payout ratio* (which is the outflow of the company and negatively influence

efficiency), and, what is worse, *Profit optimization margin* (which reveals enterprise's efficiency related to cost optimization). To some extent it is possible to conclude that deterioration of these companies' performance took place 3 years after M&A. M&A is the additional obligation to the company, that is why its stakeholders after M&A tend to demand higher level of *Dividends paid* after a deal, *M&A synergy* is quite an arguable question, especially because *Profit optimization margin* after a deal started to contribute negatively into long-term *M&A efficiency* and *long-term corporate performance*, that with no doubt means, that 3 years after M&A the *operational efficiency* (which was revealed before the deal) and possible *M&A synergy* were deteriorated. Secondly, we compared the results of this approach with the results of the *event study* methodology. Event study methodology by the means of days (not years) window testifies that M&A deals in the period of 2000-2010 with no doubt have improved the performance of participating companies after 7 days after M&A. Since the empirical method based on the actual panel data of financial information is more objective, we can drive the conclusion that calculation of abnormal return by the means of CAR scheme won't necessarily lead to valid results. Further researches can extend the investigated sample and period. Moreover, it would be interesting to explore the influence of one and the same factors on company's efficiency before and after the deal. It is logical to assume that the influence of factors will differ in these two time periods. Besides, model specification improvement (which is, inclusion of more factors) will provide deeper insights into the field of investigation. Furthermore, it would be useful to compare obtained results with the results of other methods of investigation. Applying various methodologies to assessing M&A deals efficiency would give researchers a complete vision of the M&A market in order to investigate *corporate performance* along with *corporate control*.

# AN INTEGRATIVE MODEL FOR MULTIPLE STRATEGIES FORMULATION: THE CONTRIBUTION OF STRATEGIC FORESIGHT

**Andréa Belfort-Santos and Maria Angela Campelo de Melo**  
**Pontifical Catholic University of Rio de Janeiro – PUC-Rio, Brazil**

## ABSTRACT

*This article proposes an Integrative Model to enhance the interaction between strategy formulation and prospective approach. The model's formulation was based on solid theoretical foundations in the strategy and prospective areas, and was developed according to action research methodology, based on one of the author's conduction of the implementation of a strategic planning process. Tested during the corporate planning process of a business group in Brazil's electricity sector, the model seeks to consolidate a multiple strategy formulation process, enriched by support from scenarios, and constitutes an instrument for the management of uncertainty in decision-making.*

## INTRODUCTION

In order to deal with the high degree of dynamism, complexity and uncertainty of the corporate environment, organizations develop planning processes based on *prospective* approach, incorporating into the strategic discussion a plural reflection on the future, which seeks to incorporate the dimensions of economic, social and environmental sustainability.

However, in corporate practice it is not usual to make extensive use of complex studies of scenarios when formulating the firm's strategies and defining its commitments, due to the decision-making difficulties encountered by managers when confronted with the diverse possibilities of these processes. In this way, when establishing their long term commitments, most executives select, as basis for their strategies, just one of the scenarios, neglecting the others. Beyond this, it is possible to observe that exists a distance between the processes of scenario construction and strategy formulation, as the authors discovered when analyzing various planning processes underpinned by scenarios performed in Brazil over the past fifteen years. For their inherent complexity, these processes are conducted as separate activities, with the first, which is devoted to the construction of alternative scenarios, having very little influence on the development of the second - the formulation of strategies -, especially when they are performed by different teams.

Thus, the interface between the prospective approach and the strategy area constitutes, for this reason, a field open to investigation, both for the development of theoretical models exploring the richness of using scenarios for the formulation of strategies, as well as in the practical application of the models, in order to evaluate the possibilities of enhancing the integration of these areas in organizational practice. This article intends to contribute to this field.

## STRATEGIC FORESIGHT

The term '*Prospective Stratégique*' has become widely used since the 1980's - especially in France - to explain the inter-relation between *prospective* approach and strategy. Godet and Durance (2007) argue that in successful firms, strategies are formulated aiming at anticipating and configuring products, services or even

entire sectors of activity. Thus, the winners are those that are concerned with foresight and innovation and not those firms that concentrate on positioning themselves in today's markets. According to these authors, *Prospective Stratégique* is the art of anticipating possible futures to illuminate present action, preparing the organization not only to face expected changes in its environment (pre-activity) but also to provoke desired change on it (pro-activity). Focusing on decision-making and action itself, the *prospective* is close to strategy, preparing organizations to recognize and face changes, when necessary, or provoke them, when possible. Moving from anticipation to action, based on the knowledge generated during *prospective* reflection, the *Prospective Stratégique* or Strategic Foresight reaffirms its purpose of illuminating - in the present - the choices that determine the future of the organization.

The main instrument to exercise a prospective analysis is the construction of scenarios, perceived by Godet (1983) as descriptions of possible futures, feasible or desirable for a system and its context, and of the path – or trajectory – which links them to the initial situation of that system. For Schwartz (1995), the technique of scenarios building constitutes a tool to explore the future in a world of great uncertainty, serving more precisely to organize the perception of alternative futures environments and to support the decision making process. For this, various scenario construction methodologies have been developed to perform *prospective* approach. They can be divided broadly into two schools: the French and the Anglo-Saxon. The first is characterized by a high level of sophistication and structuring, methodological rigor and the use of various analytical methods during the scenario preparation process, while intuitive and creative methods predominate in the second. Despite their methodological differences, both fulfill their role, developing scenarios that are plausible, consistent, realistic, qualitatively contrasting, challenging as a whole and useful for the strategic process (BELFORT-SANTOS, 2011). Scenarios have a wide use, ranging from improving the shared perception of the possible future evolution of the environment, based on the creation of a common organizational language and view of the future, to the making a highly effective contribution to the quality of decisions, formulation of strategies and organizational learning (VAN DER HEIJDEN, 1996; FAHEY; RANDAL, 1998; POSTMA; LIEBL, 2005).

By improving their collective understanding of possible future developments of reality, executives question existing decisions, generate strategy options and formulate decisions, while learning in the course of this process. For this reason, various authors consider that the use of scenarios in strategic planning should focus on organizational learning and choose strategic conversation as the main instrument of this learning process, as it facilitates the creation of a shared mental model that underpins institutional action and takes into account environmental uncertainty to counteract the prevailing organizational view (DE GEUS, 1988; VAN DER HEIJDEN, 1996; FAHEY; HANDAL, 1998). Thus, strategic foresight reflection encourages the organization to embark on a double-loop learning process (ASHBY, 1952; ARGYRIS; SCHÖN, 1974), incentivizing the reassessment of values and its view of the future, thus leading to new corporate strategies.

In academic literature, the strategy concept is understood from diverse perspectives, ranging from the purely rational view of the Design School (ANSOFF, 1965; 1991) and its followers of strategic planning and positioning, which advocate a unique strategy, exclusive and valuable for the company (Porter, 1991), to perceptions of strategy as resulting from adaptation and learning based upon the decision making daily practice, emerging, therefore, as a company's pattern of behavior over time (Mintzberg *et al.* 2000); or yet to views that consider it as multiple, representing options which the company should use as its interests or the environment changes. In the latter sense, Beinhocker (2006, p. 334) conceptualizes strategy as "a portfolio of experiments, a population of competing Business Plans that evolves over time".

As seen, Beinhocker believes in multiplicity of experiences to reach a higher objective. However, analysis of planning processes under scenarios of large Brazilian companies in the last 15 years brings a reflection on the feasibility of several conflicting strategies simultaneously existing in the organization. It seems necessary, especially considering the maturity level of the strategic process of large corporations in Brazil, the identification of a grand strategy, one that indicates the direction to be followed and direct major business decisions. On the other hand, it makes sense to consider the arguments of Beinhocker by arguing that when a company is able to internalize and manage a variety of ways by which it can achieve a goal, this company is more likely to succeed in comparison with others that put their stakes *a priori* in a single direction. Thus, this paper proposes a new understanding of the strategy:

Strategy comprises a set of grand choices (main strategy) and a portfolio of experiments (complementary or alternative to the main one) with a great potential reach, that guide the management of the present and the construction of the future over a long-term horizon, under conditions of uncertainty.

Considering this understanding, it is necessary to develop a way of conceiving strategies, being them the main or alternative or complementary ones, and combining them so that they can help the company achieve its overriding objective, which is to survive and grow. The Integrative Model was proposed as an instrument to this process.

## INTEGRATIVE MODEL

The Integrative Model aims to address a paradox of planning under scenarios: the creation and recognition of uncertainties versus their internalization and management in the sphere of strategy (LINDGREN E BANDHOLD, 2003). According to Brown and Eisenhardt (1998, p. 147):

*“The dilemma of the strategy in an uncertain, changing future involves balancing between the need to commit to a future while retaining the strategic flexibility to adjust to the future”.*

In order to deal with this paradox, a new understanding of the content of Strategy is proposed, considering that it should consist of multiple strands, rather than merely a single one, and cover the most relevant future possibilities, although a main direction should be maintained as the one to be pursued in principle. With this aim, the Integrating Model adopts the scenario technique as an inspiration for the preparation of the set of strategies. Each scenario is then analyzed in depth, using various strategic assessment techniques, in order to guide the choice of the main and additional strategies.

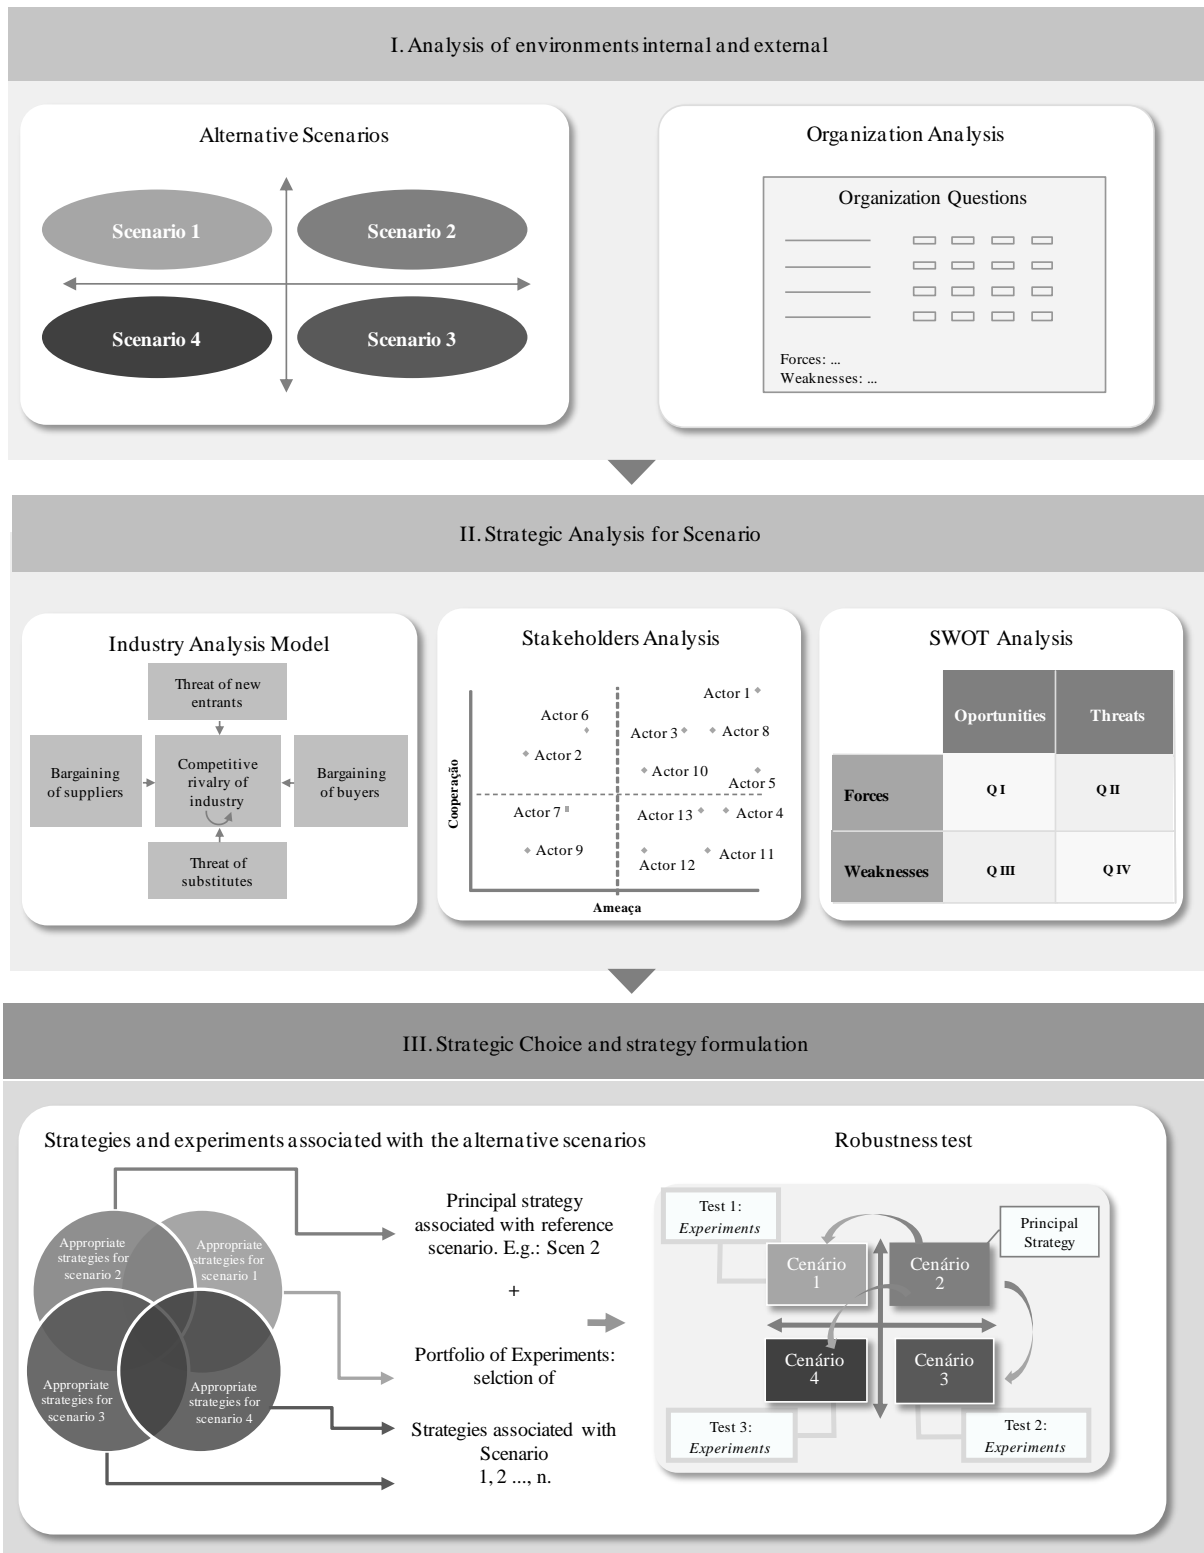

As a matter of fact, based on one of the author's experience in the preparation of macroeconomic and sectoral scenarios in Brazil, and on the strategic foresight literature, it is possible to affirm that a set of well-constructed scenarios reflects the important alternatives in a sector or segment, translating the most plausible future possibilities over the time horizon analyzed. Thus, strategies designed for each alternative scenario should encompass a broad portfolio, which enables the company to act on various fronts to achieve its objective, internalizing the widest possible scope of market options. In this way, irreversible commitments are postponed until uncertainty is reduced, turning strategic decision-making under uncertainty into a continuous process (FRIEND; JESSOP, 1969).

Certainly, no organization would be able to conduct all alternative strategies simultaneously with an equal commitment of resources, as it is impossible to conduct so many business plans at the same time when resources are finite. In other words, a company's planning process minimally requires a definition of the main path to be followed. Thus, the Integrative Model, which is presented in Figure 1, proposes:

- *using the alternative scenario-building technique to explore the most plausible future possibilities over the time horizon considered, exploring the variety of markets;*
- *analyzing these scenarios in depth, by means of strategic analysis tools commonly found in strategic planning processes. Among these tools, were chosen, for this model, SWOT analysis (strengths and weaknesses of the internal environment x opportunities and threats in each scenario), the structural analysis of industry and stakeholder analysis developed for each scenario;*
- *outlining a set of strategies that are appropriate for each scenario;*
- *selecting a scenario as a reference to define the main Strategy (or set of strategies);*
- *adding experiments (alternative or complementary strategies) based on the analyses and strategies outlined for other scenarios and submit the full set to robustness tests; and*
- *instituting a process to monitor uncertainties and actions to manage the experiment portfolio.*

Thus, a differentiation process is built into the company, based on which a qualitatively distinct portfolio of experiments is generated and managed in order to guide the organization in the face of environmental uncertainties.

# THE CASE OF ELETROBRAS

The application of the Integrative Model in a real case was designed to assess the practical feasibility of the theoretical model previously defined, as well as to deepen it and enrich it with the results of the experience, thus contributing to the theoretical development of the subjects studied. Additionally, to the business system to which it was applied, the challenge was to improve its strategic planning process, integrating and modernizing it in order to introduce new concepts that could prepare the organization to deal with uncertainty.

The Integrative Model served as a methodological basis for the Corporate Strategic Planning project of the Sistema Eletrobras, conducted by 'Macroplan - Foresight, Strategy and Management', a consulting firm where one of the authors, who coordinated the project, works. Eletrobras, holding of the Sistema Eletrobras, is a publicly traded company controlled by the Brazilian government, which leads a pool of companies for generation, transmission and distribution of electricity in Brazil. This system is formed by a holding company and 12 subsidiaries, six for generation and transmission of electricity and six for distribution, plus a research center. In addition, Eletrobras holds half the capital of Itaipu, the biggest hydroelectric dam in the world in power generation, with installed capacity of 14,000 MW, owned by the governments of Brazil and Paraguay. Altogether, the Sistema Eletrobras has a generating capacity of 39,500 MW of electricity - including half of the Itaipu power belonging to Brazil - which accounts for 37% of the national total. This amount is generated by 46 hydroelectric plants, thermoelectric and thermonuclear. The transmission lines are over 59,000 km in length, representing about 56% of the total lines of Brazil (ELETROBRAS, 2010a).

The theoretical model was applied to the process of strategic planning of the Sistema Eletrobras by means of the action research methodology, turning this case study a field of analysis that allowed improving the theoretical model through analytical generalizations. Accordingly, with this research strategy, it was sought to explore in the best way the interaction between the researcher and the group members, in order to solve practical problems while developing the theory from the experience. Thus, repeated cycles of observation, analysis, proposal of new actions, negotiation with the group members and evaluation, as recommended by action research, characterized the whole process.

Given its complexity, the proposed strategic planning process was implemented in four modules, namely: (1) scenarios construction, (2) analysis of the internal environment and application of tools of strategic analysis, (3) selection and formulation of strategy, including the setting of multiple strategies, and (4) consolidation and analysis of consistency and robustness of the Plan. As a result, in the Strategic Plan were defined: (a) the mission of the Sistema Eletrobras of "acting in the energy markets in an integrated, sustainable and profitable way; (b) its future vision for 2020, namely," to be the largest global enterprise system for clean energy, with a return comparable to that of the best companies in the electricity sector"; (c) its organizational values, translated into "focus on results, entrepreneurship and innovation, value and commitment of people, and ethics and transparency," and its proposed benefits to their main stakeholders - shareholders, customers, government and society.

Taking the main strategy of the system, associated with one of the designed scenarios, five strategic objects, associated with its business and markets, were defined: (a) to expand the generation, transmission, distribution and sale of electricity in a competitive and profitable way; (b) to maximize the participation of clean energy in the energy matrix of the system; (c) to selectively expand its international operations, focusing on the American continent; (d) to participate in the management of electric power programs of interest to the government, establishing targets for implementation and for economic-financial balance; (e) to ensure that the projects of the Sistema Eletrobras are vectors of sustainable development to their surrounding areas. These strategic objectives comprise 19 specific strategies. Another set of seven strategic objectives, related to management, were broken down into 23 specific strategies.

Considering the other scenarios, four main themes have been defined to integrate the portfolio of experiments. They are: (a) electric transportation, including challenges relating to the supply network, storage capacity, reducing the cost of batteries and associated research and development; (b) revenue generation through the sale of carbon credits; (c) more water to the Northeast through the desalination process coupled with nuclear

generation and other energy sources; and (d) investment in smart networks - Smart Grid and PLC (broadband); and distribution.

Clearly, in the whole set of experiments of this case study, a bias related to innovation could be observed. Other experiments related to hedging strategies were listed in the process but were not incorporated into the Strategic Positioning of the Sistema Eletrobras.

## IMPLICATIONS FOR THE ORGANIZATION

The model considers the need to implement a portfolio of experiments' management process. However, as this article focuses on the portfolio's **formulation**, considerations regarding the implications of the formulation of multiple strategies in the organizational environment are presented below, drawn both from literature and practical experience.

Even if the organization privileges a main path, the portfolio of experiments increases its options. However, it is not feasible to keep many options open for a long time because many of them have a specific time horizon. Thus, at some point, it is necessary to decide whether the main strategy should continue to occupy this position, or whether another one has become more important and should therefore receive more investments. In addition, it is necessary to manage the portfolio of experiments to accelerate or cancel initiatives, or implement new options, at the appropriate moment. To achieve this, it is necessary to institute a strategy portfolio management process that considers not only organizational conditions and the evolution of initiatives, but also the evolution of the environment and competitors' movements.

Although the portfolio of experiments, in principle, reflects existing market diversity, the pressure to select these experiments (their continuity, acceleration or disposal) over time should internalize market parameters in the company. Thus, an important stage in the portfolio of experiments' management consists of monitoring the environment and especially the key variables on which the scenario's configuration was based. As regards the portfolio of experiments' management, monitoring the environment means being able to detect signals emerging from the contextual and transactional environments that may convey information about each experiment – or about initiatives that have not been included in this set – in order to facilitate decision-making regarding the organization's options.

When implementing the Integrative Model, the monitoring of the environment based on scenarios constitutes a critical factor of success, given that the latter support the set of strategies' formulation. Based on the scenarios' main elements – trends and uncertainties – an assessment of the development of the real trajectory compared to the alternatives futures outlined should be undertaken, analyzing their impacts on the defined portfolio of experiments. It is also necessary to be prepared to capture signals that were not anticipated in the scenarios and that may have an impact on the strategy portfolio. Thus, the tracking of the external and internal environments emits potentially important signals that should be thoroughly analyzed in terms of the scenarios and set of multiple strategies.

Additionally, in order to assess the evolution of the experiments, it is required to create an environment for the selection of the investments in the portfolio and for the rapid reallocation of resources aimed at fully developing the most promising experiment (Beinhocker, 2006). Thus, if it necessary to reorient the strategy, this should be done as promptly as possible. In this case, the investments that have already been undertaken accelerate this repositioning, giving the company an advantage over others that concentrate investments in one specific area.

## CONCLUSIONS

The reflection on scenarios opens up various strategic formulation possibilities, running the scope from the choice of a desired or more probable scenario to the adoption of robust strategies – appropriate to the range of plausible scenarios or multiple strategies - that jointly explore all scenarios, or even including the decision to maintain a flexible stance without assuming long-term commitments. However, whatever the strategy chosen, the contribution of strategic foresight is optimized when the whole set of scenarios is considered, whether during

the complete strategy formulation process or during its management. The Integrative Model here proposed uses the set of scenarios to formulate multiple strategies, and seeks to put environmental uncertainty at the heart of strategy.

The adoption of multiple strategies permits the integration of two currents of the literature: the traditional one, that proposes the definition of a single strategy, exclusive for the organization in its segment and the heterodox current, based on learning and experimentation, that envisions various possible strategies in contexts characterized by complexity and uncertainty, although it is impossible to define, *a priori*, which is the best. In order to integrate these currents, the set of strategies proposed should contain a main choice to guide the organization, and a portfolio of additional, complementary or alternative strategies that add flexibility and warranties if the main direction ceases to be the most appropriate one.

The application of the Integrative Model to the Strategic Planning of the Sistema Eletrobras demonstrated its feasibility in a real case, allowing the analytical generalizations applicable to a case study in order to extend the theoretical knowledge in the field studied. Moreover, with this experiment it was possible to express the real possibility of amplifying the contribution of prospective analysis for the formulation of multiple strategies and for the management of uncertainty in decision making, adopting methods that use scenarios throughout the strategic planning process.

For the Sistema Eletrobras, various evaluations brought evidence that the entire proposed planning process, with emphasis on the Integrative Model, constituted an invaluable contribution to the improvement of its corporate planning. Furthermore, they made clear that the use of alternative scenarios and the analysis of various methods of strategic evaluation by means of scenarios have brought a deeper awareness, for the participants, of the various future possibilities and of the challenges and opportunities in each of these alternatives. This appraisal has also showed that the process generated alternative views of how to overcome these challenges and capture opportunities, and that the design of the portfolio of experiments brought innovations to the planning of the system and might substantiate the adoption of proactive posture desired by the group.

The use of multiple strategies protects the firm against a single and risky bet in intensely uncertain environments, while the explicit preference for a main strategy provides the organization with a predominant unity of direction. The Integrative Model essentially internalizes the management of uncertainty in decision-making, for although a main choice is prescribed, it is clear - given uncertainty - that this choice is not definitive and requires the analysis of alternative paths and strategic reorientation mechanisms if necessary. Thus, strategic decision-making under uncertainty becomes a continuous process and irreversible commitments are postponed for as long as possible until either uncertainty is reduced or environmental circumstances require the company to define its position.

Working in the midst of such diversity is no easy task and requires the development of an open organizational culture, in which most members of the team will concentrate on the main Strategy, while others will try to develop alternative paths. To achieve this, the firm needs to recognize this plurality, create an environment favorable to it and develop creative and bold teams that will dedicate themselves to the experiments.

In order to manage a multiple strategy portfolio, an organization must be ready to perceive change at an embryonic stage, internalize it and unhesitatingly change or adjust the main direction chosen. It requires boldness, together with an awareness of the risks assumed and associated with mechanisms of protection in the face of uncertainty. It thus truly requires the management of uncertainty.

# **REAL ESTATE MARKET IN RIO DE JANEIRO, BRAZIL: AN INVESTIGATION ON THE MAIN FACTORS THAT INFLUENCE CONSUMER'S BUYING BEHAVIOR**

**João Renato de Souza Coelho Benazzi**  
**Pontifical Catholic University, Brazil**

## **ABSTRACT**

*The purpose of this research was to investigate the set of most relevant factors that influence clients that are in the process of buying their first residence in the Real Estate Market of Rio de Janeiro, Brazil. The research process was conducted through two distinct phases: one qualitative and a subsequent quantitative phase. On the qualitative phase interviews with market specialists and a focus group with sellers were both conducted, in order to identify a list of relevant product attributes. During the quantitative phase, a group of real estate brokers was asked to put the previously identified relevant attributes in order of preference. A list of ordered attributes considered more important to the first-time real estate buyers decision was produced and suggestions for the management of companies of this sector were made.*

## **INTRODUCTION**

The real estate market nowadays has considerable importance for the Brazilian economy. The potentialities of this industry were amplified by a favorable economic scenario (since 2006 and up to mid 2008) which generated changes in the real estate companies' financial planning. Previously, the companies played the role of bankers of the operations, whereby returns on capital frequently extended themselves beyond production cycles, which is not always compatible with its funding requirements for new investments (Stahl and Pecahan, 2005).

Specifically, some of the greatest real estate firms Initial Public Offerings (IPO) in Brazil's stock market, during the period from 2005 to 2008, brought an intense dynamism to the market, in such a way that those extremely capitalized companies began searching regional and local partners in order to implement new projects in the real estate industry, with important consequences in market growth and competitive intensity within the sector in Brazil (FIESP, 2001 apud Stahl and Pecahan, 2005).

Mapping publications of the real estate market, factors influencing customers' decisions, and defining purchasers' most important attributes (CORDEIRO, 1992), based on the perception of the sector's professionals, can be a useful contribution to more efficient management of the sector, given the extreme competition among the real estate market. (ALBUQUERQUE and BARROS, 2003)

The objective of this paper consists on identifying, on the basis of perceptions of executives and professionals of the real estate sector, a set of crucial attributes for the purchase of the first home for middle class citizens in Rio de Janeiro, Brazil. Additionally it intends to conduct a preliminary inquiry on the feasibility of a method to measure the importance of attributes that can be used in future research on the subject. (CHURCHILL and NIELSEN, 1999) This work is limited to an initial exploration of the subject in order to seek indicators which may be useful to guide future developments.

This research intended to produce a list of ordered attributes that are relevant in the decision process of first-time real estate buyers in the market of Rio de Janeiro, Brazil from the professionals involved in the selling process point of view. Having a comprehensive view of the opinion of those professionals is important as they not only have extended experience in knowing the clients buying priorities but also have a remarkable influence on the clients during their relationship and intense communication process with those potential consumers. That situation may have important repercussions both on the clients satisfaction and the business survival and its profitability.

Initially, specialized literature was researched concerning the main attributes considered in the first-time home purchases (DANTAS, 2000; MEYER and HADDAD, 2001, 2001b, 2002, 2004). Departing from the set of attributes identified through literature review, interviews with specialists (real estate executives) were carried out in order to choose a reduced set of relevant attributes. This second set of attributes was submitted to a second phase of confirmation through in-depth focus group analysis. The last phase of the research process consisted of the application of questionnaires with real estate brokers, specifically with the professionals with direct customer contact at the moment of sale in order to produce set of attributes relevant in the buying decision process ranked in order of importance. This article presents a summary of the results obtained through the research process and analyses the managerial opportunities and threats of the findings.

## THEORETICAL REFERENCES

Similarly to other industrial sectors, the real estate market has suffered sharp and rapid changes due to ambient uncertainty and growing competition that characterize the contemporary social and economic contemporary environment in emerging economies. According to Mello and Cunha (1997) various problems hamper strategic adaptation of real estate companies in Brazil, such as paternalistic organizational culture of those family-owned enterprises, high degree of variability and long maturation period of the distinct phases of both producing and selling processes in the industry, complexity of the product itself and high number of players involved in the market, among other strategic factors (MALIZIA and HOWARTH, 1995).

Meyer and Haddad (2004) argue that literature on real estate marketing, despite its importance, is still very restricted in Brazil. Market research, especially regarding consumer profiles and buying preferences is still incipient in the country and its instruments of research are still in construction when regarding the peculiarities of the local real estate market, especially when compared to countries that already have some tradition in this area in particular (WIND and SPITZ, 1976). Meyer and Haddad (2001b) point out that the frequent adaptations that are consistently carried out by first-time owners in residential constructions in Brazil may be an indicative of poor product adaptation to clients demands and, consequently, underline the inefficiencies of research processes on consumer preferences and behavior among the companies in the industry.

Despite this, Guagliardi et al (2004) point out that the adoption of marketing tools has been decisive when regarding improved orientation in the offering of products to the target market and management of the businesses. This reorientation took place during the early 2000 due to deregulations processes which enabled the consumer to access new features in modern constructive systems.

Therefore, according to Stahl and Pecahan (2005), the research phase prior to launching is especially important and must be carried out in such a manner as to identify what the customer values most. The social man seeks much more than housing when choosing a property. He will also consider issues such as status, comfort, practicality and overall welfare. (BALARINE, 1996; BALARINE, 2004)

Fernandez and Hochheim (2004) show clearly the importance of market analysis, affirming that the success of a real estate enterprise is related to the correct perception of the desires and necessities of the existing demand relative to supply. For this reason, the market analysis becomes part key in the conception of the enterprise (MYERS and MITCHELL, 1993). This analysis brings suggestions of improvement or differentiation of the product and strategies of commercialization that optimize its absorption for the target market. It can still conclude for a radical change in the conception of the product in case that it detects more attractive niches by making the analysis of the set of ambient variable (localization), of the demand and of it offers (competition).

According to Carrol and Green (1995), it is important to measure the relevance of the most important attributes in the purchase decision process, but, despite the method, it is clearly necessary to previously carry out a qualitative research. Interviews with consumers and research with the market specialists are extremely important to identify the most significant attributes.

Regarding the attributes choice, Wind and Spitz (1976) point out that any product or service can be seen as a structural collection, functional, psychological, social and economic of attributes. Therefore, in order to configure a desirable mix of products attributes, information on the consumers preferences and its relation to the these attributes levels can be crucial.

These authors also argues that understanding the consumers most important attributes depends on precise information availability on the importance of the attributes and on the exchanges and compensations that the purchasers make between attributes, when they choose products or services. (BOONE and KURTZ, 1989)

Brandstetter and Heineck (2005) show the consumer behaviour has two main research paths. One says respect to the relations that investigate the interaction between the man and the construction, known as the relations environment-behaviour, generally tied the aspects already wide spread out by the architecture and ambient psychology.

The other one relates the consumer behaviour in economical and demographic geographic labels. In this last literature, the consumer behaviour is related to the habitation with diverse emphases that involve the mobility processes generally, choose and satisfaction (BRANDSTETTER and HEINECK, 2005; MÜCKENBERGER, 2001).

It is important to stand out the specificities of buying in the real estate market (HOCHHEIM, DANTAS and SON, 1999). When developing evaluation criteria, the purchasers tend to a different decision process and a detailed and rigorous research (FREITAS and HEINECK, 2006). With no doubt, the home purchase is one of the situations of higher consumer involvement, has one of the highest high risks (performance, psychological, financial and - auto image, satisfaction. Besides, there are many available alternatives and brands, the purchaser can feel unsafe for having little or no experience of purchase and over all involves much money and the cancellation and adjournment of the satisfaction of many other necessities (MEYER and HADDAD, 2004).

Stahl and Pecahan (2005) underline this fact when affirming that, in the purchase decision process, the purchaser needs a great effort on the comparing process, and the technical attributes tend to the most relevant attributes.

## **RESEARCH METHOD**

The research process was conducted through two distinct phases: one qualitative and a subsequent quantitative phase.

The qualitative phase consisted on the use of two distinct data collection methods. First, an exploratory study was conducted where a set of five interviews with market specialists on the Real Estate market in Brazil were realized. The objective of those interviews was to obtain an extensive list of motives and attributes relevant to buyers when facing the decision of choosing their first residence. A second qualitative phase consisted of a focus group with eight real estate sellers, where the main objective was to establish an hierarchical list of the ten most important attributes among those identified in the interviews.

The information obtained was submitted to content analysis. The central aim, clearly of qualitative and interpretive perspective, intended to capture perceptions, opinions and evaluations of respondents regarding the possible reasons for the positive or negative preferences towards consumption decision processes, products and other factors of influence. One of the main aspects focused was the reason offered by the respondents for their behaviors and attitudes. The research concerned about classification is, fundamentally, based on interviews and employ, as analysis tool, the verbal expressions contained in the participant narratives. The illustrative expressions of each interview were selected as quotes and are preliminarily classified, based in their similarity. The groups of quotes are organized and re-organized, each group's attributes are explicated and the meaning of

each group is consolidated in a definitive category. The result is a list or map of qualitatively different ways in which people undertake, define, distinguish and understand the aspects of reality that are the object of the research. It is a process of analysis that involves a sequence of actions, comprising the decontextualization, the classification (or codification) and the contextualization of data (TESCH, 1990).

During the phases of interview and analysis of document originated by the data transcription, it is necessary to have in mind that we are dealing with what the interviewers revealed about their self-images, the people they are related to and aspects of their daily consumption. In many contexts one can expect that such images do not correspond to the respondents real opinion (ALVESSON, 2003). Such opinions may be selected or even deformed due to a variety of influences, from the expectations regarding the interviewer's reaction, a positive public image to be built or even the defense of public faces, images and roles played by the interviewed. It proved vital to interpret the interviews from a critical perspective in order to identify those possible counterfeits and point them out among the data collected.

During the quantitative phase of the study, a group of fifty real estate brokers was asked, through questionnaires, to assign notes to the set of ten attributes selected in the focus group and to put the previously identified relevant attributes in order of preference. Results are described and discussed in the following section.

## RESULTS AND ANALYSIS

The first step of this work was based on the research of the most important attributes that influence the first time home buyers choice process. Based on further research specifically on some selected articles, the most important attributes were selected (ALMEIDA and BOTELHO, 2005; BALARINE, 2004; BRANDSTETTER, 2004). Although this work's main target is middle class consumers, opinions regarding consumers of all classes were included in this very first step of the research ( i.e. on the interviews) as the objective of this phase was only to produce a first extensive list of relevant motives, from buyers point of view.

During the next step of the research process ( the focus group phase), the initial list of product attributes was submitted to the market specialists, in order for them to debate. This step led to the election of a set of ten most important factors in the specialists conception, which were: Image of the promotional agents, payment conditions, localization of the enterprise, security of the place, concept of the product or thematic conception of the enterprise, maintenance costs, quality of room disposal, quality of supporting sales material, business security and number of parking slots per apartment.

As the attributes were pointed out in the interviews with specialists, it seemed important to test that information with the real estate brokers, as those were the professionals who have direct contact with the customers during the sales process. A focus group was carried out with six real estate brokers.

The results that were produced in the focus group with the real estate brokers were coincident with those already found in the interviews with specialists. The list of product attributes was the same, and the results were reinforced. For instance, valuation potential was not pointed as decisive in the purchase process, because other factors were supposed to have more significant relevance, such as localization of the enterprise and quality of neighbour constructions.

The members of the focus group were also asked to order the identified factors in the order of preference of the buyers. Although it has been easy to arrive at a consensus on the most important factors in the purchase decision process, the consensus on its importance order showed difficult to achieve.

After the qualitative phase, the quantitative stages of the research took place. A questionnaire with ten items (the ten product attributes listed by the market specialists) was submitted to a sample of fifty real estate brokers. Each item consisted of an assertive of agreement, affirming that the attribute in question "is very important for the decision of middle class potential customers when they intended to buy their first residence". Each assertive was followed by a scale of agreement of five categories equally spaced. In that scale 5 meant most important and 1 least important.

**Table 1: Attribute relative importance**

Attribute	Average	Order on the basis of the Averages
Payment conditions	4,90	1

Business Security	4,65	2
Security of the place	4,33	3
Localization	4,20	4
Image of promotional agents	4,20	5
Maintenance costs	4,18	6
Sales material	4,06	7
Parking facilities	3,78	8
Room disposal	3,71	9
Thematic conception of enterprise	3,53	10

Table 1 shows the results of this phase of the research. The list of product attributes is followed by the average rank of the evaluations made by the fifty respondents and by the order of importance of each attribute.

According to those results the most important attribute of an apartment should be its payment conditions, followed by the security of the business itself and the security conditions of the apartment's neighborhoods. On the fourth place is the localization of the building followed by the positive image of sales representatives and Maintenance costs of the building. The sales material that supported the sales process, parking facilities, room disposal of the apartment and the thematic conception of the enterprise were the less valued attributes of the product.

After the application of the questionnaires, the respondents were asked to put the attributes in order of importance, according to their perception on the purchase behaviour of the buyers. Table 2 shows the positions of order produced by the results of the questionnaires and the positions produced in the forced ordinance phase. The results – specifically the order of importance of the product attributes, were quite similar. There were only two inversions of position: localization of the enterprized was ranked third place, and security of the place forth. Also the Thematic conception of enterprise was ranked ninth place and the room disposal was ranked tenth.

**Table 2: Compared order of attributes**

Attribute	Order on the basis of the Averages (questionnaire)	Order on the basis of forced ordinance
Payment conditions	1	1
Business Security	2	2
Security of the place	3	4
Localization	4	3
Image of promotional agents	5	5
Maintenance costs	6	6
Material	7	7
Parking facilities	8	8
Room disposal	9	10
Thematic conception of enterprise	10	9

The similarity of the two set of data was evaluated by way of a correlation for ranks of Spearmann. The results are shown in table 3. The coefficient of 97,6% correlation suggests that the two forms of evaluation had been consistent, one with the other. This means that the methods of measuring the importance of attributes by means of questionnaire and forced ordinance had shown that it is a consistent and a trustworthy measure (NELSON and RABIANSKI, 1988). It also shows that the answers of the questionnaires had been coherent, considering that very significant differences in the two sets of orders could mean error, lack of care, disinterest, lack of agreement or any another problem occurred during the fulfilling of the questionnaire or in the task of the forced ordinance (ZIKMUND, 2004).

**Table 3: Nonparametric Correlations**

SPSS			OrdQue	OrdFor
Spearman's rho	OrdQue	Correlation coefficient	1,000	,976(**)
		Sig. (2-tailed)	.	,000
		N	10	10
	OrdFor	Correlation coefficient	,976(**)	1,000
		Sig. (2-tailed)	,000	.
		N	10	10

\*\* Correlation is significant at the 0,01 level (2-tailed).

**OrdQue:** decurrent order of the averages of the answers to the questionnaire

**OrdFor:** Decurrent order of the forced ordinance

## CONCLUSIONS

This research intended to produce a list of ordered attributes that are relevant in the decision process of first-time real estate buyers in the market of Rio de Janeiro, Brazil from the professionals involved in the selling process point of view. Having a comprehensive view of the opinion of those professionals is important as they not only have extended experience in knowing the clients buying priorities but also have a remarkable influence on the clients during their relationship and intense communication process with clients. That situation may have important repercussions on the clients and the business.

The results suggest that consistent information on the relative importance of the attributes was produced. Payment conditions and Business security were ranked as the most important decision factors when Brazilian middle class young couple intend to buy their very first apartment, in Rio de Janeiro. Conversely attributes such as the sales material that supported the sales process, parking facilities, room disposal of the apartment and the thematic conception of the enterprise were considered of less relative importance in the buying decision process.

Finally, it is strongly suggested that those attributes should be object of more extensive research efforts in Brazil, especially in identifying if buyers priorities are similar to the set here identified though the sellers opinion on buyers priorities. Brazilian Real estate companies may take great market advantage in prioritizing specific product aspects directed to market segments. Such measures of importance will also be used as a base for balance the results of the factors of satisfaction in future research and for the analysis of exchanges and compensations (trade-offs) that the customers make in their purchase decision processes (CURRY, 1997). More specifically it may be of extreme managerial importance to try to measure the level of an attribute that can compensate the non-achievement of a desirable level in another attribute.(CARN, 1998)

# INFORMATION AND COMMUNICATION TECHNOLOGY ADOPTION PATTERNS OF INDIVIDUALS LIVING IN A LOW INCOME NEIGHBORHOOD

**Etienne Barnard, Wynand Grobler and Andrea Garnett**  
**North-West University, South Africa**

## ABSTRACT

*Technological progress and development of information access has arguably infiltrated all facets of human existence. However, different sectors of society have adopted information and communication technology (ICT) at different rates; in particular, ICT adoption patterns by individuals earning lower incomes are certainly lower than in other social groups. The study empirically investigated the ICT access and usage of low income individuals on a variety of ICT mechanisms. A quantitative research method was deployed and a stratified random sample of 350 questionnaires was administered to residents in Bophelong (a low income neighborhood in South Africa). By using descriptive analysis, the most relevant factors regarding respondents' information technology adoption patterns were extracted. This paper aims to contribute to a better understanding of ICT adoption patterns (broadly defined) among low income individuals for the purpose of public policy making, thereby assisting with the development of a coordinated approach to the provision of information resources in environments of this nature.*

## INTRODUCTION

The emergence of Information and Communication Technology (ICT) has been recognised as an important contributing factor to Human Development and has generated enthusiasm about the possibilities for alleviating poverty in poor economies. Many authors (Maitland 1984; Rezaian, 2006; Freire, 2000; Sen, 2009) have referred to the possibilities derived from ICT to bring about human development, to stimulate economic growth and to enhance quality of life. It is also widely recognised that ICT brings about empowerment and broadens the base of participation of the poor (Brown, *et al*, 2001; Kleine, 2009). Norris (2001) refers also to the potential that ICT has in enhancing the capabilities of a society to work as an organized network, internally but also to the outside world.

The benefits of ICT in education have also been strongly emphasized by previous research (Selinger, 2009; Angrist and Lavy, 2002). Limited access to Information and Communication Technology may consequently be seen as an obstacle to the alleviation of poverty in poor economies.

The economic benefits of ICT on the Macroeconomic level in high-income countries (Van Ark *et al*, 2003; Drace *et al*, 2006, Rezaian, 2006) and low income countries (Mann, 2003; Warchauer, 2004) suggest that remarkable economic benefits can be expected from ICT diffusion. Specific types of ICT like mobile phones can empower people and *turn the ownership of a mobile phone into a business model....* (Hamel, 2010:45).

Adoption patterns globally are testament to an incredible spread of mobile technology, especially in developing countries (ITU, 2009). According to Hamel (2010:8) “there are now more than 4 billion mobile phone subscriptions around the world with 75 percent of them in developing countries. The ITU (2009) also revealed that Internet growth was tremendous, with 1.5 billion Internet users around the world; however, only 60 percent of these users are in developing countries. In particular, access to internet and ICT in general are

substantially lower in Africa, Latin America and the Middle East than elsewhere (Hamel, 2010:10). Against this background the following questions arise: to what extent is ICT adopted by poor communities in South Africa, and to what extent is ICT used in such neighborhoods? The first section of this paper gives an overview of the Low Income Neighborhood in which we have chosen to investigate these issues, namely Bophelong in South Africa. The second part elaborates on the relevant literature on ICT adoption, followed by a look at the methodology used. Our findings are then discussed and we end with a conclusion which contextualizes the work and describes some avenues for further exploration.

## **BACKGROUND OF THE LOW INCOME NEIGHBORHOOD**

Bophelong is a former black township on the outskirts of the industrial town of Vanderbijlpark. It was established in 1955. The area belongs to the Emfuleni Municipality, on the southern tip of the Gauteng Province in South Africa. In the late nineties, the area was extended with 10,000 new low cost (RDP) houses. Most of the people who settled in the new houses were poor – those who could not previously afford a house. The population in Bophelong is estimated at 37,779, and the number of households is estimated at 12,352. The average household size in Bophelong, calculated from Statistics SA data (2007) is three persons per household. The average household size for Emfuleni as a whole is 3.52. Several studies have found increased levels of poverty in Bophelong. Sekhampu (2004), in his study found 62 percent of the population to be living below the poverty line. A follow up study by Slabbert and Sekhampu (2009) revealed that 66.3 percent of the residents of Bophelong are poor and that the unemployment rate is 62.2 percent. Fifty four percent of the poor were found to be female. Dubihlela (2011) found a poverty gap index of 0.53 among female-headed households in Bophelong, meaning that on average, households have a shortfall of 53 percent of their income to be placed on their respective poverty line.

## **LITERATURE REVIEW**

In the literature review the definition and types of ICT, the impact of ICT on communities, and determinants of ICT adoption will be discussed.

### **Definition and Types of ICT**

According to Quibria and Tschang (2001:2), new ICTs can be divided into three broad categories, namely, computing, communication and internet-enabled communication and computing.

These ICTs include then:

- ☐ Computing: The use of personal computers and different software.
- ☐ Communication: Two forms of communication can be distinguished, namely, one way and two way communication. In terms of one way communication, radio, television and any broadcasting media are included. Two way communication includes devices such as telephones (fixed line), mobile phones etc.
- ☐ Internet-enabled communication and computing: The internet, including the World Wide Web, multimedia and the use of mobile phones to access the internet are incorporated in this category.

### **Impact of ICT on Communities**

Research on the impact of ICTs to reduce poverty is sparse; some of the more important contributions in this regard include Mansell and When (1998); Talero and Gaudette (1995) and the World Bank (1998). A comprehensive report by Quibria and Tschang (2001:4) indicates that ICTs can potentially enhance the welfare of the poor. In this regard the following important impacts are mentioned that are relevant in this study:

- (1) Information about markets, opportunities
- (2) Employment, where ICTs are used to provide information on new employment opportunities

Maitland (1984:65) refers to *stimulating economic growth and enhancing the quality of life* of communities by adoption of ICTs. The United Nations (2000) and Rezaian (2006) refer to the role that ICTs can play in reaching Millennium Development Goals and as enablers of development. The adoption of ICTs in a poor neighborhood thus may lead to poverty alleviation.

Norris (2001) believes that ICTs can *enhance the empowerment of civil society by augmenting their capacity to work as organised networks both within and beyond borders*. Other researchers (Brown *et al*, 2001; Kleine, 2009) indicate that access to ICTs may have positive impacts on peoples' sense of empowerment and ability to participate meaningfully in their societies.

The impact of ICTs on education according to Hamel (2010:33) lies on the level of access: “benefits of online information are a source of great optimism and offer immense potentials for ICTs to fill a large gap in the developing world”. Selinger (2009) advocates that the biggest role of ICTs may be the use as a means to enhance learning. This may be relevant in a poor community where limited access to ICTs and specifically the internet may limit the ability of poorer people to further their careers via enhanced learning.

The economic impact of ICTs has also been discussed by various authors. The economic benefits of ICT on the Macroeconomic level in high-income countries (Van Ark *et al*, 2003; Drace *et al*, 2006, Rezaian, 2006) and low income countries (Mann, 2003; Warchauer, 2004) suggest that remarkable economic benefits can be expected from ICTs diffusion.

Norris (2001) indicates that gender, ethnicity, age, income are significant dimensions that give rise to inequality of access to ICTs. Guida and Crow (2009) indicate that the adoption pattern of young educated adults may be higher than older people because of the access to disposable income.

## **Information and Communication Technology Adoption**

When looking at the adoption patterns of ICTs in poorer countries, the study of Quibria and Tschang (2001) discusses the determinants of ICT adoption. In this regard they refer to population size, income level, educational background and complementarity between technologies. This study was conducted in Asia where poverty is high. The study indicates the following important findings relevant to our study and with which we will draw comparisons:

- ☐ Using simple regression, computer usage is strongly correlated with GDP per capita or income.
- ☐ Internet usage is strongly positively correlated with Income level
- ☐ Mobile phone usage is strongly positively correlated with income
- ☐ The relationship between computer usage and education is statistically significant at the 10 percent level with tertiary education
- ☐ Internet usage is significant at the 1 percent level with secondary education.
- ☐ Telephone use is strongly correlated with personal computer use and internet use.

## **RESEARCH METHODOLOGY**

This study aimed at analysing the adoption patterns of Information and Communication Technology (ICT) in a typical low-income South African neighborhood. The research is based on a quantitative survey methodology, using questionnaire interviews. Maps were obtained for the different areas of Bophelong and a stratified sample was compiled by taking into account the geographical distribution and concentration of people in different areas of the township. The areas were divided into different extensions and the questionnaires were distributed evenly among the inhabited sites. A total of 350 households were interviewed by four fieldworkers in March 2011. All households approached were willing to participate in the study. To obtain a sample size that would supply statistically reliable results and be representative of the population of the area, the researchers relied on the experience and convention regarding similar surveys (Sekhampu, 2004; Slabbert and Sekhampu, 2009; Dubihlela, 2011) conducted in similar locations in South African townships.

## RESULTS

Our main results are summarized in Figs. 1 to 4, where we show the frequencies of use as well as the most common applications of various information and communication technologies (ICTs) by our target population. Fig. 1 shows that the radio, cellular telephone and television are the most commonly used ICTs in this community; about 28 percent of the respondents are frequent (daily or every other day) users of computers, but only about 6 percent of the respondents use the Internet frequently. In Fig. 2 it can be seen that person-to-person calls and short messages (SMSs) are the most common applications of cellular telephones. Very few of the respondents call Interactive Voice Response systems (IVRs), and only about 30 percent use their mobile phones for internet access (which is about the same percentage as those regularly sending multimedia messages (MMSs)).

**Fig. 1: Usage frequencies of various ICTs by all respondents**

**Fig. 2: Applications for which mobile telephones are used by respondents.**

In Fig. 2 we also see that some of the typical gender stereotypes are confirmed and others contradicted: whereas female respondents do indeed use their mobile telephones more frequently for various forms of communication (person-to-person calls, SMSs and MMSs), they are also substantially more likely to play games on their telephones than male respondents.

Fig. 3 demonstrates that the vast majority of our respondents use prepaid cellular telephones, and are able to use automated services to perform recharges of those telephones. (We did not distinguish between different ways in which the voucher codes can be entered – typically, USSD and IVR technologies are used for this purpose in South Africa).

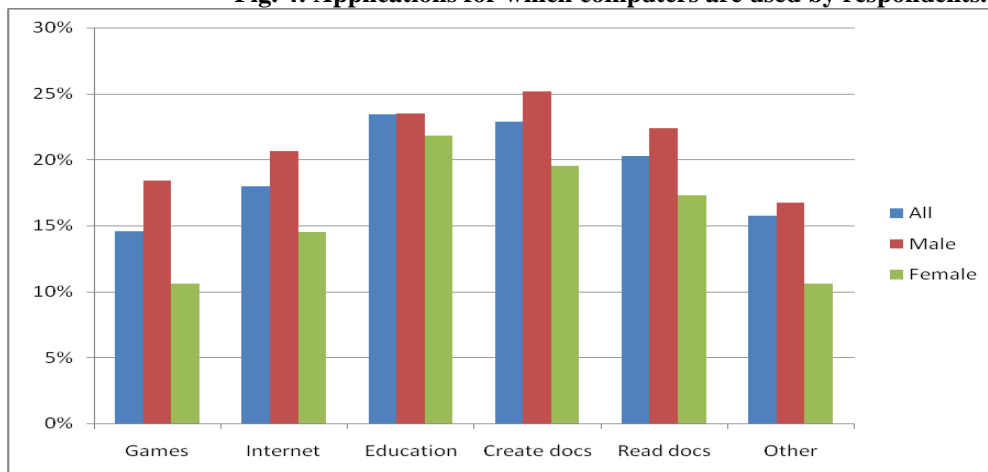

**Fig. 3: Frequencies of prepaid recharges for cellular telephones through various mechanisms.**

ATM denotes recharges at automated teller machines

Fig. 4 summarizes the most frequent applications of computers – we see that access to educational software is the most common application, followed by the creation of documents and internet access. Males are more frequent users in every category, with educational software being closest to usage parity between the genders.

**Fig. 4: Applications for which computers are used by respondents.**

We have also investigated how respondents' *age* and *household income* correlate with their use of ICTs. For the purposes of this analysis, we define “regular use” as weekly or more frequent use. We find that all these correlations are rather weak in our population: the strongest observed value is a negative correlation between age and mobile internet usage (with a Pearson correlation coefficient of -0.35), and is a positive correlation between household income and mobile internet usage (Pearson correlation coefficient equals 0.28).

## DISCUSSION

Although our study was intended to be exploratory rather than prescriptive, a number of interesting conclusions are suggested by our findings. Perhaps the most significant result is the relatively high percentage of respondents who use their mobile telephones for internet access. In fact, the number of mobile internet users is almost twice as many as those using computers for internet access. This has important managerial implications, in various quarters, since it implies that the mobile internet is a viable mechanism for reaching out to these populations. Given the relatively recent advent of the mobile internet in South Africa, this phenomenon is certain to grow in importance and provides a platform for marketing, health, governmental and almost boundless other interventions.

Our findings on gender differences in the use of technology also have implications that should be considered carefully. For one thing, the relative dominance of males as computer users calls for specific efforts to promote computer usage by the female population; on the other hand, the unexpectedly high fraction of female game-players on mobile telephones may point to market opportunities that are currently not widely understood.

The lack of correlation between most forms of ICT usage and demographic variables such as age and income is notable. This suggests that ICTs such as computers and telephones are *not* a significant economic factor in this community – a suggestion that is strengthened by the frequency of entertainment-related applications of these technologies reported by the respondents.

## CONCLUSIONS AND MANAGERIAL IMPLICATIONS

We believe our study is the first to look at ICT usage patterns in low-income communities in South Africa; although limited in scope to a single community in Southern Gauteng, we believe that its results are at least somewhat relevant to a substantial cross-section of South African society. It would be interesting to extend this work in a number of directions – for example, to confirm our suspicion that similar usage patterns will be observed in other communities with comparable demographics, but also to contrast these findings with those that occur, for example, in rural communities and also in other socio-economic strata. Given the dynamic nature of ICTs in general, it is also important to monitor changes in these usage patterns over time.

As stated in the introductory section of this paper, ICTs are an important mechanism for economic and personal empowerment. We believe that detailed studies on the usage of these technologies are an important management tool for government and industry, and hope that a more complete picture of their usage will eventually lead to policies and procedures that spread their benefits even more widely.

# WHAT BULGARIAN UNDERGRADUATE STUDENTS BELIEVE ABOUT ACADEMIC DISHONESTY

Donald L. Brady, Mark Trocinski, and Lucia Miree  
American University in Bulgaria, Bulgaria

## ABSTRACT

*The results of this study indicate that a majority of respondents believe that six of the 10 academically dishonest constructs investigated are inappropriate. In spite of this favorable finding, the percentage of respondents that believe these constructs are appropriate is large enough to be troubling. Respondents believe the three constructs that can be classified as unauthorized collaboration are appropriate behaviors. Beliefs tend to be influenced by grade point average, class standing, and gender in particular. The reason beliefs were found to be so favorable can be attributed to a strongly enforced honor code.*

## INTRODUCTION

Academic dishonesty, in all of its forms, is a significant problem in academia (McCabe and Bowers 1994, Spiller and Crown 1995, and McCabe and Trevino 1996). Therefore, academic dishonesty, sometimes referred to as academic misconduct or cheating, has been the subject of considerable research since as early as 1928 (Brownell 1928). Studies have shown that students who are academically dishonest were found to be more likely to engage in and be accepting of unethical behaviors in the workplace (Sims 1993, Nonis and Swift 2001, Harding et al. 2004, and Lawson 2004). Therefore, one conclusion has to be considered unanimous – academic dishonesty is a growing problem and source of concern for university faculty, administrators, and businesspeople.

## Previous Research

Academic dishonesty is not well-defined in the literature because different perspectives are considered. Definitions have been based on a person's behavioral intentions, the particular behaviors violated, and violations of an institution's honesty policy (Lambert et al. 2003, p. 2). Because of the lack of standardization surrounding the topic, research on academic dishonesty has occasionally produced contradictory conclusions. A predominant area of conflicting results is in the incidences of dishonesty reported. Research implies that the rates of the occurrences of academic dishonesty have been increasing over the years. For example, in three cross-sectional studies, the rates of academic dishonesty increased from 11 percent (Bowers 1964), to 54 percent (Haines and Diekhoff 1986), and to 100 percent (Brown and McInerney 2008). A longitudinal study at nine schools over a 30-year time period found increasing rates of academic dishonesty (McCabe and Bowers 1994). Rates higher than 70 percent have been reported in additional studies (Meade 1992, Sims 1993, Genereux and McLeod 1995, Brown and Abramson 1999, Brown and McInerney 2001, Chapman and Lupton 2004, and Brown and McInerney 2008). However, other studies have found that the incidents of academic dishonesty have not increased over time, and that the reported differences were the result of discrepancies in the way the research was conducted (Cole and McCabe 1996 and Brown and Emmett 2001). Additionally, students that self report are more likely to be altruistic and concerned about cheating, causing the severity of the problem to be understated (Miller et al. 2008). Regardless of whether or not rates are increasing, the numbers reported are high enough to be of concern to academics.

Unfortunately, academic dishonesty can be viewed narrowly or broadly. Therefore, what is taken into consideration as being academically dishonest can vary from study to study. In other words, the basis for being academically dishonest is not consistent, and therefore, a standardized perspective of the topic is lacking.

Studies narrowly focused on test cheating or plagiarism (e.g., McCabe and Trevino 1993 and McCabe and Bowers 1994) reported different results than those with a broader scope or no precise definition of academic dishonesty (e.g., Blankenship and Whitley 2000 and Lambert et al. 2003). In a comprehensive analysis of 31 studies that were published over a 33-year time period where the number of students that engaged in academic dishonesty was assessed, four variables common to all the studies were examined. Only the number of academically dishonest behaviors included in the study was significantly related to the percentage of students found to be dishonest (Brown and Emmett 2001). Therefore, the percentages of academically dishonest students reported in each study were undoubtedly influenced to some extent by what behaviors the researchers considered to be dishonest. Additionally, results vary when the intent of the studies differ even though the specific research approach employed, for example the questionnaire, is the same (McCabe and Trevino 1997 and Miller et al. 2008). Thus, what is considered to be academically dishonest behavior can impact results.

## **Academic Dishonesty across Cultures**

Most of the research about academic dishonesty was conducted with students in American universities. Fewer studies have been conducted outside of the United States, even though the number of these studies has increased since 2000. International studies can be classified as either country-specific or comparing two or more countries cross-culturally. Examples of country specific studies have been done in Russia (Poltorak 1995), India (Gitanjali 2004), Taiwan (Chun-Hua and Ling-Yu 2007), Canada (Birchard 2006), Brazil (Monzani Da Rocha et al. 2007), and Sweden (Trost 2009). Rates of academic dishonesty ranging between 50 and 88 percent were reported in these studies.

The results of cross-cultural studies on academic dishonesty, in which two countries were compared, vary depending on the countries involved. In most studies, American students were found to be less academically dishonest, but the results were not always absolute or consistent. One of the earliest cross-cultural studies involving Japanese and American university students examined cheating on examinations (Diekhoff et al. 1999). The results found that Japanese students were more likely to cheat, consider cheating justifiable, and overlook cheating by others than American students. Polish business students were found to be more academically dishonest, to feel that cheating was acceptable, and to provide information about exams to students in other sections of the course than American students (Lupton et al. 2000). In other studies, American students were found to be more academically dishonest. American accounting students were found to be more likely to cheat than United Kingdom accounting students (Salter et al. 2001). American business students were found to be more likely to cheat and to believe that their peers cheat than Hong Kong business students (Chapman and Lupton 2004). In one study, the results were mixed. Russian students were found to be more likely to cheat, believe that giving answers to exam questions to a student in another section of the course was appropriate, and believe that cheating on one exam is not wrong than American students. However, American students were found to be more likely to use exams from a prior term to study for current exams and use information gathered by another student from the library to avoid having to do the work themselves than Russian students (Lupton and Chapman 2002).

At least five studies examined academic dishonesty in Central Asian and Eastern European countries. One study compared American students with Lebanese students from universities utilizing the American education model (McCabe et al. 2008). The findings of the study indicated that Lebanese students committed almost 48 percent more incidents of academic dishonesty than American students. Lebanese students were about six times more likely to help others cheat on exams. The findings suggest that Lebanese students were highly influenced by the norms of the collectivist society where they were raised and to transfer those norms to the academic setting. Another study compared American students with students from eight transitional countries, six of which were part of the former Union of Soviet Socialist Republics (USSR) and two of which were closely allied dependent states (Grimes 2004). The results of the study indicated that student cheating is socially acceptable and not considered ethically wrong. Students in the eight transitional countries were found to have relatively lower standards of academic honesty than American Students. A study of academic dishonesty among Romanian college students found that only four percent of the students would report another student who cheated on an exam (Teodorescu and Andrei 2008). It was concluded that Romanian students are influenced by their peers, do not want to get involved, and tend to accept and protect the status quo, in this case academic dishonesty. A comprehensive cross-country study of students in 42 universities in 21 countries found that

students in Western European, and Eastern European countries in particular, had a high propensity to be academically dishonest (Teixeira and Rocha 2010). The same study also found that students in Southern European countries were more likely to be academically dishonest than students from the United States, the United Kingdom, and Scandinavian countries. Another study explored corruption, which includes academic dishonesty as a component, among university students in six Central Asian and Eastern European Countries, one of which was Bulgaria (Heyneman et al. 2008). The results indicated that corruption is prevalent in the countries studied, that students would tend not to report cheating they observed, would cheat if they could get away with it, and would not feel guilty about cheating. Although academic dishonesty appears to be high in universities around the world, collectively, these studies show that academic dishonesty is more pervasive and considered less troublesome among university students in Central Asia and the former communist nations of Eastern Europe.

## **Purpose**

Since the emergence of pro-democracy movements and the subsequent fall of Communism in the early 1990s, an American-style liberal arts orientation in higher education has appeared in some Eastern European universities. However, the older traditional approach to higher education where students specialize in courses in only one academic area is still prominent in most Eastern European schools. Further, education in Eastern European countries emerges from a collectivity philosophy of education and has a history of academic dishonesty. Academic integrity tends to be stressed in those institutions where the American style of education is employed, and codes of academic conduct are enforced. As the studies cited previously have shown, in the cultures of Eastern Europe and Central Asia, students tend to have less concern about academically dishonest behavior than students in the American culture.

As the citizens of these post-communist and developing countries become greater participants in the global economy and take their roles in multi-national organizations, they will be faced with increasing demands for ethical and honest behavior. Therefore, understanding how students from Eastern European and Central Asian countries are affected when confronted by a different approach to academic dishonesty will be extremely important to know. With this in mind, the purpose of this study is to determine what beliefs students at a Bulgarian university with an American-style liberal arts orientation have about participating in academically dishonest behaviors.

## **METHODOLOGY**

Because only one American-style university exists in Bulgaria, this study was confined to that institution. However, because students are enrolled from 40 different countries, mostly Eastern European and Central Asian, the results are expected to represent the beliefs of students from those areas as well as Bulgaria.

## **The Sample and Data Collection**

Data were obtained from a convenience sample of 260 students at a university in Bulgaria where an American-style educational program is employed. The sample size was calculated mathematically to provide 95 percent confidence and insure precision of  $\pm 3$  percent error. A convenience sample was employed to speed data collection, minimize costs, and facilitate the interviewing process. Since a convenience sample is a non-probability sampling method, care was taken to assure the sample would be as representative of the population as possible. Interviews were conducted in all campus facilities and locations to increase the likelihood that members from all segments of the student body were represented fairly in the sample. The characteristics of the respondents included in the sample are similar to those of the students attending the study institution. Also, the sample is large and represents approximately 24 percent of the student body. Therefore, the sample is expected to be as representative of all students as a probability sample would be.

## **Questionnaire Design**

The questionnaire consisted of value-scaled questions to measure basic information about academic dishonesty and dichotomous and multiple-category questions for classifying respondents. The four areas of academic dishonesty that were examined in the study were identified after searching the definition of academic dishonesty at 10 randomly selected colleges and universities. What constitutes academic dishonesty differed from school to school. However, a common aspect was that being academically dishonest can include anything associated with a student's attempt to gain an advantage on any academic activity through unethical and inappropriate means. Also stressed was the idea that dishonesty requires the inappropriate behavior to be done deliberately, intentionally, and knowingly. Therefore, to be academically dishonest, students must know that a behavior is inappropriate but decide to engage in it anyway.

Since an honor code is in place and rigorously enforced, academic integrity is stressed at the study university. By means of first-year student orientation and distribution of policies and standards related to academic behavior, all students have been informed and know what constitutes inappropriate academic behavior. Thus, students should know that the following four areas identified from the 10 randomly examined schools are associated with academically dishonest behavior:

- Cheating – misrepresenting one's true knowledge by accessing unauthorized sources of information or using inappropriate technical means to enhance what one knows.
- Deceit – fraudulent use of materials by incorrect or inappropriate representation.
- Plagiarism – taking credit for the work of another person in whole or in part as though the material is the student's own effort.
- Unauthorized collaboration – giving or obtaining inappropriate assistance from others.

Examining constructs associated with these four areas of concern is an appropriate way to determine students' beliefs about academic dishonesty. Thus, considering these four areas in light of the university's academic environment, the following 10 constructs of academic dishonesty were identified for inclusion in the study:

- Looking for answers on another student's paper during an exam. (Cheating)
- Submitting a homework paper containing material copied from another student's paper. (Plagiarism)
- Submitting the same term paper in two or more classes without permission. (Deceit)
- Providing another student with information from your homework paper for inclusion in that student's homework paper. (Unauthorized collaboration)
- Submitting an assignment containing content copied word-for-word from another published source without a citation. (Plagiarism)
- Using previously prepared concealed notes to improve answers on an exam. (Cheating)
- Asking another student who has already completed the exam in another section of the course about what questions were on the exam. (Unauthorized collaboration)
- Working with classmates as a group on a project assigned to be done individually. (Unauthorized collaboration)
- Submitting an assignment containing material from another published source that is rewritten in your own words without a citation. (Plagiarism)
- Submitting a term paper that was purchased from a term-paper writing firm. (Deceit)

Each of the 10 constructs was reworded into a statement that would permit a person's beliefs about the appropriateness of that construct to be measured. These statements were written so respondents could indicate how appropriate or inappropriate they believe each construct is.

Seven-interval semantic differential scales were employed to quantify responses to the 10 statements. For statistical purposes, the intervals were numbered from 1 = extremely inappropriate to 7 = extremely appropriate for each statement.

## Analytical Procedures

Values for each respondent's assessment of the 10 statements regarding academic dishonesty along with classification data were entered into an SPSS spreadsheet. When respondents did not answer a question on the questionnaire, the question was ignored for statistical purposes for those individuals. As a result, the sample size

for those questions is less than 260 by the number of non-responses. The data were subjected to various statistical analyses for analytical purposes. Descriptive statistics were used to understand the nature of the collective responses for each measured construct of academic dishonesty and for comparisons among constructs. Chi Square tests for goodness of fit were conducted to determine if the frequencies observed were different than what would be expected to occur by chance. The t-test for two independent samples was employed to determine if statistically significant differences existed within the academic dishonesty constructs when grouped in various ways.

## FINDINGS

Exhibit 1 shows descriptive statistics for the respondents' responses about how appropriate or inappropriate they believe the 10 constructs of academic dishonestly measured are.

**Exhibit 1: Beliefs about the appropriateness of the constructs of academic dishonesty**

Construct	n	Mean	Mode
Copy word-for-word	259	1.98	1
Use previously prepared notes on an exam	259	2.15	1
Look on another student's paper	260	2.41	1
Purchase a term paper	259	2.70	1
Copy another student's homework	260	2.71	1
Submit same term paper twice	260	3.60	3
Reword a published source	259	4.11	4
Provide your work to another student	260	4.12	4
Work as a group on an individual assignment	260	4.63	4
Ask about exam questions	258	4.69	7

n = sample size (the number of respondents answering the question)

Values used to quantify beliefs: 1 = Extremely inappropriate, 2 = Very inappropriate, 3 = Inappropriate,

4 = Neither appropriate nor inappropriate, 5 = Appropriate, 6 = Very appropriate, 7 = Extremely appropriate

The higher the number the more appropriate the construct behavior is considered to be by the respondents and the lower the number the less appropriate. The data in Exhibit 1 indicate, on average, respondents believe the following five activities or behaviors are inappropriate to very inappropriate (between intervals 2 and 3):

- copying material word-for-word from another published source,
- using previously prepared concealed notes to improve exam answers,
- looking on another student's paper to improve their own exam answers,
- submitting a term paper that was purchased from a term paper-writing firm, and
- copying another student's homework and submitting it as their own.

The mode for all five of the constructs was interval 1 (extremely inappropriate).

Respondents are unsure about how appropriate or inappropriate is the construct, submitting the same term paper to more than one class. The mean value was in the inappropriate to neither appropriate nor inappropriate range (between intervals 3 and 4).

On average, respondents indicate uncertainty about how appropriate or inappropriate the remaining four constructs are. Mean values were in the neither appropriate nor inappropriate range (in the vicinity of interval 4).

- rewording material from a published source in their own words,
- providing their work for a graded assignment to another student requesting it,
- working as a group on a project assigned to be done individually, and
- asking about answers on an exam from students in a different section of the class.

Modal values are about the same as means except for asking about answers on an exam from students in a different section of the class. In this case, the interval selected most frequently was 7 (extremely appropriate).

If the degree of appropriateness and inappropriateness is disregarded, the sample can be conveniently divided into three groups. The percentage of respondents believing each construct as inappropriate can be found by adding the percentages selecting intervals 1, 2, and 3. Similarly, the percentage of respondents viewing each construct as appropriate can be found by adding intervals 5, 6, and 7. Those respondents selecting interval 4 believe the construct is neither appropriate nor inappropriate. These numbers are shown in Exhibit 2.

**Exhibit 2: Percentage of respondents believing that each construct of academic dishonesty is appropriate or inappropriate**

Construct	Inappropriate Percent	Neither/Nor Percent	Appropriate Percent
Copy word-for-word*	89.2	2.7	8.1
Use previously prepared notes on an exam*	84.5	6.6	8.9
Look on another student's paper*	80.7	9.2	10.1
Copy another student's homework*	73.0	13.1	13.9
Purchase a term paper*	70.3	12.0	17.7
Submit same term paper twice*	52.3	17.3	30.4
Reword a published source	38.6	20.8	40.6
Provide your work to another student	35.4	27.3	37.3
Ask about exam questions*	25.2	19.0	55.8
Work as a group on an individual assignment*	12.2	23.5	52.3

Inappropriate = the sum of the percent of respondents selecting intervals 1, 2, and 3.

Neither/Nor = the percent of respondents selecting interval 4.

Appropriate = the sum of the percent of respondents selecting intervals 5, 6, and 7.

\* =  $\chi^2$  test of differences between the frequency of respondents with inappropriate and appropriate beliefs is significant at  $p < 0.000$ .

The results indicate respondents believe the following six activities or behaviors are inappropriate:

- copying material word-for-word from another published source,
- using previously prepared concealed notes to improve exam answers,
- looking on another student's paper to improve their own exam answers,
- copying another student's homework and submitting it as their own,
- submitting a term paper that was purchased from a term-paper writing firm, and
- submitting the same term paper to more than one class.

Over 50 percent of the respondents reported that these constructs are inappropriate. For all six of these constructs, anywhere from one to three respondents in 10 believe these behaviors are appropriate.

For the following two constructs, the percentage of respondents that believe the behaviors are appropriate is not statistically different than those that believe the behaviors are inappropriate.

- rewording material from a published source in their own words, and
- providing their work for a graded assignment to another student requesting it.

The number of respondents that believe these two behaviors are appropriate is approximately four in 10. The percentage of respondents that believe these constructs are neither appropriate nor inappropriate (selecting interval 4) was also substantial. As many as 20 to 30 percent of the respondents are not sure whether these behaviors are appropriate.

The percentage of respondents that believe the following two constructs are appropriate is larger than the percentages that believe they are inappropriate:

- asking about answers on an exam from students in a different section of the class, and
- working as a group on a project assigned to be done individually.

Just over half of the respondents believe these two behaviors are appropriate. Only about two respondents in 10 indicated that they believe these two behaviors are inappropriate. Approximately two respondents in 10 are unsure about the appropriateness of the behaviors and selected interval 4.

## T-tests

T-tests for independent samples were conducted to determine if gender, class standing, grade point average (GPA), and country of citizenship had any impact on beliefs about engaging in academically dishonest behavior. Differences were found to exist in the areas of gender, class standing, and grade point average. Country of citizenship (Bulgarian or non-Bulgarian) had no influence on beliefs about any of the 10 constructs.

## Gender

The results of the t-tests for gender are shown in Exhibit 3.

**Exhibit 3: Beliefs Compared by Gender**

Construct	Gender	n	Mean	df	t	p
Look on another student's paper	Female	113	2.36	257	-.530	.597
	Male	146	2.46			
Copy another student's homework	Female	113	2.42	257	-2.669	.008*
	Male	146	2.94			
Submit same term paper twice	Female	113	3.03	257	-4.012	.000*
	Male	146	4.00			
Provide your work to another student	Female	113	3.96	257	-1.381	.168
	Male	146	4.25			
Copy word-for-word	Female	112	1.66	256	-2.933	.004*
	Male	146	2.23			
Use previously prepared notes on an exam	Female	113	1.98	256	-1.674	.095
	Male	145	2.29			
Ask about exam questions	Female	112	4.58	255	-.858	.392
	Male	145	4.78			
Work as a group on an individual assignment	Female	113	4.45	257	-1.492	.137
	Male	146	4.77			
Reword a published source	Female	112	4.23	256	.903	.367
	Male	146	4.03			
Purchase a term paper	Female	112	2.25	256	-3.476	.001*
	Male	146	3.03			

\* =  $p < .05$

Statistically significant differences between the means of male and female respondents occurred for four of the 10 constructs of academic dishonesty. The following constructs showed t-values that are significant beyond the  $\alpha = .05$  level for a 2-tailed test assuming equal variances.

- copying another student's homework and submitting it as their own,
- submitting the same term paper to more than one class,
- copying material word-for-word from another published source, and
- submitting a term paper that was purchased from a term-paper writing firm.

The differences observed between women and men for these constructs are unlikely to occur by chance only. This claim can be made with 95 percent confidence. In all four instances, the mean score for the women was lower than the mean score for men. This means that, on average, men tend to believe that these four academically dishonest behaviors are more appropriate than women.

## Class Standing

Respondents were also grouped according to the number of credit hours completed and classified as underclassmen (Freshmen and Sophomores) or upperclassmen (Juniors and Seniors). See Exhibit 4 for the results of the t-tests for class standing.

**Exhibit 4: Beliefs Compared by Class Standing**

Construct	Class Standing	n	Mean	df	t	p
Look on another student's paper	Underclassmen	111	2.55	257	1.280	.202
	Upperclassmen	148	2.32			
Copy another student's homework	Underclassmen	111	2.70	257	.000	1.000
	Upperclassmen	148	2.70			
Submit same term paper twice	Underclassmen	111	3.53	257	-.471	.638
	Upperclassmen	148	3.64			
Provide your work to another student	Underclassmen	111	3.97	257	-1.184	.237
	Upperclassmen	148	4.22			
Copy word-for-word	Underclassmen	111	1.99	256	.197	.844
	Upperclassmen	147	1.95			
Use previously prepared notes on an exam	Underclassmen	111	2.33	256	1.737	.084
	Upperclassmen	147	2.01			
Ask about exam questions	Underclassmen	110	4.29	255	-3.074	.002*
	Upperclassmen	147	4.99			
Work as a group on an individual assignment	Underclassmen	111	4.66	257	.104	.917
	Upperclassmen	148	4.64			
Reword a published source	Underclassmen	110	3.75	256	-2.942	.004*
	Upperclassmen	148	4.39			
Purchase a term paper	Underclassmen	111	2.77	256	.585	.559
	Upperclassmen	147	2.64			

\* =  $p < .05$

Statistically significant differences in means were found between upperclassmen and underclassmen in only two of the 10 constructs of academic dishonesty. The following constructs show mean differences that are statistically different beyond the  $\alpha = .05$  level for a 2-tailed test assuming equal variances:

- asking about answers on an exam from students in a different section of the class, and
- rewording material from a published source in their own words.

In both instances, the mean score for the underclassmen was lower than the mean score for upperclassmen. This means that, on average, upperclassmen tend to believe these two behaviors are more appropriate than underclassmen.

## Grade Point Average

Respondents were arbitrarily divided into two groups based on GPA for analytical purposes. One group included respondents with the highest GPAs (3.5 or above on a 4.0 scale). The other group contained respondents with lower GPAs (below 3.5). Five respondents had completed no coursework and, therefore, had no GPA. Thus  $n = 255$  of which 83 (32.5 percent) had GPAs of 3.5 or above and 172 (67.5 percent) had GPAs below 3.5. The results of the t-tests for GPA are shown in Exhibit 5.

Statistically significant differences between the means of the highest and lower GPA respondents occurred for two of the 10 constructs of academic dishonesty. The following constructs exhibited statistically significant differences in means beyond the  $\alpha = .05$  level for a 2-tailed test assuming equal variances:

- submitting the same term paper to more than one class, and
- submitting a term paper that was purchased from a term-paper writing firm.

In both instances, the mean score for respondents with lower GPAs was higher than the mean score for respondents with the highest GPAs. This means that, on average, respondents with lower GPAs tend to believe these two behaviors are more appropriate than respondents with the highest GPAs.

**Exhibit 5: Beliefs Compared by Grade Point Average**

Construct	GPA	n	Mean	df	t	p
Look on another student's paper	Lower GPA	172	2.34	253	-.641	.522
	Highest GPA	83	2.46			
Copy another student's homework	Lower GPA	172	2.76	253	1.102	.272
	Highest GPA	83	2.53			
Submit same term paper twice	Lower GPA	172	3.82	253	2.722	.007*
	Highest GPA	83	3.14			
Provide your work to another student	Lower GPA	172	4.20	253	1.280	.202
	Highest GPA	83	3.92			
Copy word-for-word	Lower GPA	171	1.99	252	.174	.862
	Highest GPA	83	1.95			
Use previously prepared notes on an exam	Lower GPA	171	2.22	252	1.718	.087
	Highest GPA	83	1.89			
Ask about exam questions	Lower GPA	171	4.69	251	.077	.938
	Highest GPA	82	4.67			
Work as a group on an individual assignment	Lower GPA	172	4.66	253	.442	.659
	Highest GPA	83	4.55			
Reword a published source	Lower GPA	171	4.12	252	.342	.732
	Highest GPA	83	4.04			
Purchase a term paper	Lower GPA	171	2.89	252	2.478	.014*
	Highest GPA	83	2.29			

\* =  $p < .05$

## CONCLUSIONS AND RECOMMENDATIONS

Of the 10 constructs of academic dishonesty examined, those that the respondents believe are most inappropriate are:

- copying material word-for-word from another published source,
- using previously prepared concealed notes to improve exam answers,
- looking on another student's paper to improve their own exam answers,
- copying another student's homework and submitting it as their own,
- submitting a term paper that was purchased from a term-paper writing firm, and
- submitting the same term paper to more than one class.

At least 50 percent and as much as 90 percent of the respondents reported that these six behaviors are believed to be inappropriate.

The academically dishonest behaviors that respondents believe are most appropriate include:

- rewording material from a published source in their own words,
- providing their work for a graded assignment to another student requesting it,
- asking about answers on an exam from students in a different section of the class, and
- working as a group on a project assigned to be done individually.

Between 40 and 50 percent of the respondents indicated that they believe these four behaviors are appropriate. Three of these four constructs of academic dishonesty just happen to be in the same area of academic dishonesty - unauthorized collaboration. Respondents were less likely to believe that academically dishonest behaviors in the other three areas of concern (cheating, plagiarism, and deceit) are appropriate. Therefore, issues associated with unauthorized collaboration seem to present significant belief challenges.

Why do respondents believe this category of academically dishonest behavior is more appropriate? Perhaps this aspect of the students' training in academic integrity is deficient in some way. Perhaps instruction about what constitutes unauthorized collaboration may be inadequate or emphasis on not engaging in unauthorized collaboration may be insufficient. Possibly, students may simply decide to ignore this aspect of academic integrity for some purpose. A more likely explanation, however is that Bulgaria is a collectivist

society. The norms and societal forces of collectivist societies have been shown to cause students to be prone to engage in academically dishonest behaviors (McCabe et al. 2008 p. 464). Thus, students' beliefs are likely to be guided by the norms that shaped their childhood, and therefore, think that unauthorized collaboration is appropriate.

Respondents were most likely to believe submitting an assignment containing material copied word-for-word from another published source is inappropriate. Students may be less inclined to participate in this academically dishonest behavior because of the existence of academic tracking tools such as Turnitin.com. Such tools increase the chances that the dishonest behaviors will be discovered, and the students will be punished for engaging in plagiarism. This logic presents another possible reason why students may tend to believe that engaging in unauthorized forms of collaboration is appropriate. Students may perceive that such behaviors are less likely to be tracked or are harder to verify, and therefore, they are relatively safe from being detected.

In spite of the fact that a larger percentage of the respondents believe more of the constructs are appropriate than inappropriate (i.e. they are more likely to be academically honest than dishonest), other less gratifying conditions are also implied. The percentage of respondents that believe that participating in the other seven constructs associated with cheating, plagiarism, and deceit is appropriate is substantial enough to be troubling.

- copying material word-for-word from another published source,
- submitting a term paper that was purchased from a term-paper writing firm,
- using previously prepared concealed notes to improve exam answers,
- submitting the same term paper to more than one class,
- copying another student's homework and submitting it as their own,
- looking on another student's paper to improve their own exam answers, and
- rewording material from a published source in their own words.

Anywhere from 8 to 30 percent of the respondents believe that these academically dishonest behaviors are appropriate. Why so many respondents believe these behaviors are appropriate is a concern.

Respondents' beliefs about providing their work for a graded assignment to another student requesting it and copying another student's homework and submitting it as their own appears to be a paradox. The respondents believe submitting material copied from another student as their own is inappropriate, but believe permitting classmates to copy their work when asked is appropriate. Thus, providing assistance is considered to be acceptable, but receiving assistance is not. Assistance cannot be given without being received and therein lays the paradox. However, the paradox can be explained. A few students may be receiving the inappropriate assistance from a number of different people supplying it. Perhaps, the old adage that it is better to give than to receive is the motivation. Perhaps, the student giving the aid does not believe doing so is dishonest because whatever grade that student receives is earned. Only the student that receives the aid is viewed as behaving dishonestly. The proclivity to provide unauthorized collaboration when asked may be strengthened further by the obligations inherent in a collectivist culture. These factors may work together to permit students to believe that providing unauthorized assistance is justified.

The results tend to support gender as being an influence of beliefs about the appropriateness of academically dishonest behaviors. This finding is consistent with those of previous international studies (Teixeira and Rocha 2010, Crittenden et al. 2009). For four of the 10 academically dishonest behaviors examined, men had statistically significantly higher appropriateness belief scores than women. This may simply be the result of the physiological and psychological differences in men and women. For example, research has shown that men and women differ in the way problems are viewed and approached, and differ in their sensitivity and thinking processes (Conner 1999). Also, gender differences have been reported to be caused by biological factors (sex chromosomes and hormones), socialization processes (cultural concerns and differences in how boys and girls are raised), and information usage (selectivity and processing procedures) (Putrevu 2001).

Although not as substantial as for gender, class standing and GPA were also found to influence beliefs about the constructs of academic dishonesty. For both variables, significant differences were found for two constructs. Regarding class standing, the results of this study are consistent with those of previous studies that found upperclassmen more likely to be dishonest than underclassmen (Jordan 2001 and Teixeira and Rocha

2010). However, other studies have shown just the opposite to be true (Dawkins 2004 and Chun-Hua and Ling-Yu 2007). Perhaps, the fact that only two constructs showed differences is indicative of the inconsistency in results found in previous studies. The findings for GPA are consistent with those of most previous studies (McCabe and Trevino 1997 p. 392, Crittenden et al. 2009 p. 345, and Teodorescu and Andrei 2009 p. 278). Respondents with the highest GPAs (3.5 and above) tend to believe both of the behaviors are less appropriate than respondents with lower GPAs (below 3.5). One implication is that academically stronger students are less likely to believe that these unethical behaviors are appropriate. Another explanation may be that academically strong students are less likely to need to engage in academically dishonest behaviors to obtain good grades.

Country of citizenship did not influence beliefs about the appropriateness of the academically dishonest behaviors. The reason that no significant differences were found between Bulgarian students and students from other countries may be that students from Eastern Europe and Central Asia are similar in how they view academic dishonesty. Countries in these areas tend to possess collectivist societies (McCabe et al. 2008 p. 464). Therefore, students from these countries are likely to hold comparable beliefs.

The overall results of this study are consistent with the findings from previous studies examining academic dishonesty in Central and Eastern Europe (Heyneman et al. 2008, McCabe et al. 2008, Teodorescu and Andrei 2008, Crittenden et al. 2009, and Teixeira and Rocha 2010). This study tends to substantiate or reinforce the findings of the previous studies. Although the beliefs that respondents reported about the appropriateness of academically dishonest behaviors produced somewhat lower scores than were found in previous studies, the levels are still high and disconcerting. The reason the beliefs about the academically dishonest behaviors are lower might be attributed in part to the study university's academic integrity or honor code. The existence and enforcement of an honor code has been found to be significantly related to the reduced incidence of cheating (McCabe and Trevino 1993, May and Loyd 1993, and McCabe et al. 1999). The attention placed on academic integrity and enforcement penalties may have an influence on shaping students' beliefs about the topic. Another reason that may also be contributing is that students sometimes behave differently than they believe. For example, students that are relativists or existentialists may not always do what they believe. Even though a behavior may be believed to be academically dishonest, the relativist may behave dishonestly if the situation is perceived to be conducive to not getting caught. The existentialist may engage in a dishonest behavior even if the behavior is believed to be academically dishonest because existentialists are only concerned about making free and independent decisions. The possible consequences of the decision to the existentialist or anyone else are discounted or ignored. Thus, behaviors could deviate from beliefs resulting in increased incidents of academic dishonesty actually being committed.

Strengthening efforts to instill the virtues of behaving with academic integrity in students remains important to the objective of developing well-rounded liberally-educated students. The findings of this study indicate that attention to this aspect of a student's education may help improve students' beliefs about what is academically dishonest behavior. Hopefully, improvements in beliefs about behaving with academic integrity resulting from a student's education will be applied beyond the academic experience also.

## **CONCLUDING REMARKS**

Since only one university offering an American style education exists in Bulgaria and the student body is small, some may want to consider this study exploratory in nature or as a case study. Although empirical in nature, the results cannot be used to explain why the relationships observed exist. The study should serve as the basis and beginning for further discussion and formal research. In this way, a clearer understanding of the relationships found can be assessed. In particular, this study shows the need for additional research such as the following:

- Determine how the constructs examined interact and impact each other.
- Determine what training procedures will help improve students' beliefs about academic integrity.
- Determine how the content used to educate students about academic dishonesty affects students' beliefs about academic integrity.
- Determine how students' beliefs about providing another student with assistance relate to beliefs about receiving assistance from another student.

- Determine whether including information and specific prohibitions about unauthorized peer collaboration in academic dishonesty/honor codes and training improves students' beliefs about the inappropriateness of engaging in this method of academic dishonesty.
- Determine how academic dishonesty/honor codes influence and change students' beliefs about academic integrity.
- Determine why and how various personal and situational (contextual) variables impact beliefs about academic integrity.
- Determine how beliefs about academic integrity correlate with behavior.

Only beliefs about academic dishonesty were described in this study. No attempt was made to predict behavior. Describing students' beliefs may or may not accurately explain how students will react to a given situation. Other factors including, but not limited to, strength of moral character, ethical sensitivity, religious values, social norms, peer pressure, increased competition for post-graduate educational programs and jobs, and perception of alternatives can also influence behavior. As a result, nothing can be said with absolute certainty about how students will behave when actually confronted with a situation requiring a decision involving academic integrity.

# ROLE OF NETWORKING FOR MULTINATIONAL CORPORATIONS

**Ekaterina Buzulukova, Higher School of Economics, Russia**

## ABSTRACT

*The present paper analyzes the advantages of networking for multinational corporations' (MNC) activity in modern life. Globalization has lead to increase of world competition, and financial crisis intensifies the marketing wars and sharpen problems of future development opportunities. In this complicated situation, multinational corporations should look for new tracks in order to survive in the global market. One opportunity is to develop network relationships with suppliers and customers which could supply MNC with new possibilities, resources and improve performance. More precisely, network advantages and circumstances that influence on MNCs' network success will be discussed.*

## INTRODUCTION

The number of MNC has grown rapidly. According to estimations of UNCTAD (World investment report, 2010) the quantity of MNC comes to 82000 and number of foreign subsidiary is close to 810000. But in spite of this fact only 12% of corporations have remained their position in the ranking of Financial Times 'Fortune 500' since year 1955. This means that big companies despite the holding outstanding resources also suffered heavily from environmental changes and have to transform their organizational forms to overcome difficulties and strengthen their market position. In modern life such transformations are closely connected with network organizations. Many MNC are looking for reliable partners to develop long term relationships. This signifies that in some circumstances networking forms are more effective than even vertical or horizontal integration.

In addition to that transformation modern marketing concepts also focused on development of relationship-based approach, such as relationship marketing or customer relationship management (CRM), and, of course, "network" organizations. The discovery that value can be created by cooperation has led marketing managers to search for "win-win" positions as a way to enhance profitability through collaborative network integration. The industrial network approach (for details, see e.g. Johanson *et al.*, 1994) suggests that specific actors, e.g. firms, organizations, possess specific resources and perform specific activities which create exchange relationships among them. In that sense, the activities of one actor are always, more or less, dependent on the outcome of those of certain others. Hence, e.g. the competitiveness of a company lies in its long-term exchange relationships with others in a network, and the changes in different companies' role and position in a network. (Johanson and Mattsson, 1987).

The role of networking has become of significant importance in last decades. At the end of the 1980s, network organizations were already the part of business environment. Besides some of the networks may span several continents and combine corporations from different business fields. In short, they were seen as a powerful tool for strengthening company's positions in the global economy (Drucker, 1989; Halal, 1986; Johnston&Lawrence, 1988). Many authors concern of advantages of such interactions for Small and Medium sized enterprises (SME) but network form of cooperation could also improve competitive advantages for multinational corporations. Conducted researches shown that instead of being diversified and integrated, in some circumstances it is better for MNC to become more flexible, to develop network and specialize on core competences (Kanter, 1989). The success of companies like Dell, Nike, or Cisco, and other such companies with similar business models based on the integration of value "networks" (Anderson & Narus, 1998 and Peppers, D.

and Rogers, M., 2001). Also commonly known partnerships of General Electric and Toyota in car industry, America On-line and Time Warner in mass communication media, Canon and Kodak in copier industry, Thompson and JVC in videotape recording, Delta and Air France in air lines.

Since 90<sup>s</sup> the amount of interorganizational interactions has increased significantly. The interactions are carried out in two forms: financial including mergers and acquisitions and non-financial forms like strategic alliances, creating network organizations, supply chains and others. If in 1990s amount of transnational mergers and acquisitions was about 99 billion dollars, in 2008 this quantity was close to 707 billion dollars. With the beginning of world financial crises the number of M&A dropped to 250 billion dollars (UNCTAD, World Investment Report 2010). However number of strategic alliances is increasing very fast. According to George W. Keeley estimations more than 20,000 new alliances were formed in U.S. between 1987 and 1992, compared with 5100 between 1980 and 1987 and 750 during the 1970s. Nearly 6 percent of the revenue generated from the top 1000 U.S. firms now comes from alliances, a fourfold increase since 1987. Japanese firms are far more experienced and comfortable, with alliances than U.S. firms. A recent survey revealed that 74 percent of Japanese CEOs think alliances are effective, while only 4 percent think they are dangerous; in the U.S. the respective numbers are 17 percent and 31 percent.

Consequently the growth of network relationship is observed now and many Multinational corporations are involved in such interactions. The long term development even for them is closely connected with transformation of their organizational structure and depends on how rapidly corporation could become flexible, effective and customer oriented. Nonetheless networking has its downside relating to partner's opportunism, risk of knowhow lost and incremental partner's dependence. In such situation the research of significance of networking for Multinational Corporation has become of vital importance.

## LITERATURE REVIEW AND PRELIMINARY ANALYSES

A development of interorganizational relationships is connected with several issues. First of all it is come out from changes in business environment (Kraats, 1998). The following factors could be distinguished: globalization, sharpen competition, increase of world trade, eliminating of trade limitations, development of information and communication technologies, and reduction of product life cycle, rise of R&D importance and also government interest in collaboration of local and multinational companies. Customization as well encourages big companies to collaborate with SME. However, the rapid growth of interorganizational cooperation is also concerned with advantages of network relationships in two options, firstly because of benefits in increasing companies' value and secondly owing to the fact of cutting costs (Sheresheva, 2009). The first group of factors could be specified as rapid entrance to the new market, stimulation of innovation, acquiring of good reputation, knowhow access, stimulating effective usage of assets, quality improvement and flexibility. Next point of network benefits is reduction of costs. These advantages deal with decreasing in transaction and production costs, risks diversification, allocating of investment, R&D and marketing expenses due to partners' participation. More precisely these data could be seen in the table below.

**Table 1: The courses of network relationship development**

Criteria	Factors
Environmental changes	Globalization Growing competition Development of world trade Information technologies High R&D costs Customization Internet trade Government support Growth of innovation necessity
Network attractiveness factors:	

<ul style="list-style-type: none"> <li>• Cost reduction</li> </ul>	Decreasing in transaction costs Reduction of production costs owing to outsourcing and networking contracts Risks diversification Allocating of investment, R&D and marketing expenses due to partners' participation
<ul style="list-style-type: none"> <li>• Benefits of increasing companies' value</li> </ul>	Knowhow enrichment Access to additional resources Growth of effective usage of assets Quality improvement Flexibility Rapid entrance to the new market Innovation stimulation Reputation increase

Evidently various relationships objectives could be solved by means of diverse forms of networking. There are different forms of interorganizational deals: mergers and acquisitions, strategic alliances, internal, stable and dynamic network organizations, supply/ demand chain networks, hub networks and some others. Different approaches in network classification could be found (Achrol, 1997; Castells, 1996; de Man 2004; Moller, 2007; Miles, Snow, Coleman, 1992). The most common point of view is issued by Miles, Snow and Coleman who distinguished internal networks, stable networks and dynamic networks. An internal network is way to develop entrepreneurship in corporation without engagement in much outsourcing. This type signifies building internal market within multinationals and setting market prices of subdivision products but not internal transferring prices, which could help analyze efficiency of different affiliates work and stimulates internal competition. e.g. General Motors' components business provides a good example of an internal network where subdivisions could sell their products not only General Electric partners but also to Mitsubishi Motors, Daewoo, Opel corporation. The stable network uses stable partner relationships to increase their flexibility. Often such network organizations are formed near focal company, delivering some materials for it. For instance, in BMW any part of a car is a candidate for outsourcing, and somewhere between 55 and 75 percent of total production costs at BMW come from outsourced parts. The similar situation is in Chrysler and Toyota; there more than 70% of components are made from outsourced details. Dynamic networks often have a focal company that typically rely on core skills such as manufacturing (e.g. Motorola), R&D or design (e.g. Reebok), design & assembly (e.g. Dell Computer).

Moreover the last years' tendency is analyzing MNCs' development according to organizing internal and external networks (Ghoshal, Bartlett, Beamish, 2008; Miles, Snow, Coleman, 1992). What this means is Multinational corporation are trying not only develop external networks but also reorganize their organizational structure and building internal networks in the business areas there they could be appropriate. This can dramatically increase the effectiveness of different division collaboration.

Some authors broaden the meaning of network collaboration and include such forms as strategic alliances into it (Stuart, 1998). Strategic Alliance is an arrangement between two companies who have decided to share resources in a specific project. It is defined as a partnership between firms whereby resources, capabilities, and core competences are combined to pursue mutual interests (Hitt and others, 2001). In the new economy, strategic alliances enable businesses to gain competitive advantage through access to a partner's resources base, including markets, technologies, capital and people. In MNC strategic alliances are widely used. For example, Toshiba's approach is to develop strategic alliances with different partners for different technologies because they believe that a single company cannot dominate in any technology or business by itself. Strategic alliances also help to overcome competition and transform it into cooptition (Tsai, 2002). There are different kinds of strategic alliances: extending range of goods and services (e.g. Nokia & Yahoo alliance), risk diversification (e.g. Alcatel & Zucotto Wireless), innovation and R&D (e.g. GlaxoSmithKline), joint production and marketing (Hyundai&Kia in Russia).

Another widespread MNC's network form is focal supply chains. Focal companies concentrate all significant competences about product, brand, marketing strategy and core competences. They standardize production and quality requirements for all their partners and built relationships according to partner capabilities to comply these rules, e.g. Volkswagen and Siemens. Focal networks usually include several levels of suppliers

in compliance with two characteristics: suppliers' volume and originality of purchased materials. With core suppliers from the first level, which deliver great volume of components or some specific materials MNC builds long term relationships and helps them to launch innovation technologies, optimize business processes and finance quality control measures. While with second level suppliers transactional relationships are realized. Between them strong competition is existing and MNC forces them to lower end prices. For example Siemens have 120,000 suppliers worldwide with nearly 2500 purchasing staff and 1500 frontline buyers in 256 purchasing departments. Twenty thousand of these suppliers are designated first choice and their data is stored in Siemens' internal electronic information system. There are four level of suppliers could be distinguished according to value proposition and volume: High-value/volume products with high technical demand, such as power supplies, coolers for central processing units (CPUs), customized gate arrays, high-value/volume standard products, such as printed circuit boards, memory integrated circuits (ICs), precious metals, zinc-plated tin sheets, low-value/volume products with high technical demand, such as parts for which tooling is necessary, relays, transformers, low-value/volume standard products, such as metals, chemicals, plastics, resistors, capacitors. And only for the first group cooperation and partner relationships' are built.

In fact, not all forms of networking could be applicable to MNCs. For example virtual corporations hardly could become MNC because they connected medium and small sized companies on a temporary basis. Furthermore dynamic focal networks also will be unfavourable to MNCs, because they lead to increase in transaction costs. The analyses of MNC's relationships illustrates that they rarely involved in value creation networks because such forms refer to presence of several equivalent partners but MNC tries to play a leading role in all type of collaboration and achieves its own interests. Furthermore MNCs attempt to form value creation chain internally in order to avoid core competence lost.

In addition it should be added that relationships between MNC and small business enterprises are widely spread. Small businesses have such advantageous as flexibility, easiness of innovation implementing, fast decision making processes, closeness to customer, entrepreneurial organizational structure and broad customization opportunities. Therefore MNC surrounded with many small business enterprises that helps them to raise flexibility and mobility. Theirs relationships are built on the basis of customization standardized MNC's products, innovation technology application and individual services implementing.

Another important partner of MNC's relationships is local and domestic government. This type of relationships could help MNC to enter new markets, reduce risks, organize joint enterprises, cut down taxes and create investment attractive business environment. For the government benefits are: increase in employment rate, bringing new technologies, development of local supporting productions, and of cause growth of taxes earnings. For example Russian government support BP and Rosneft project of oilfield development.

Nevertheless network operations are not appropriate in any situation. For example, KPMG research shows that large number of strategic alliances failure. The share of unsuccessful strategic alliances according to specialists' estimation was about 60-70% (KPMG, 2001). Paris and Casher analysis shows that near 30% of MNCs' relationships are provided with positive effect, 25% with negative effect and 45% neutral one (Parise, Casher, 2003). The subject of network relationships efficiency also was discussed by Thompson (2003), Chan and Kensinger (1997) and Miles&Snow (1992). According to the made review the main reasons of networks failure are: demands the complete utilization of the supplier's or distributor's assets for the benefit of one core firm, high expectations of one of the partners, overspecialization and unhealthy dependence on core firm, corporate executives use "commands" instead of influence to intervene in local operations, extending asset ownership expertise may become too narrow and role in value chain is assumed by another firm, excessive mechanisms to prevent partners' opportunism or exclusive relationships, misguided modification of internal structure, corporate intervention in resource flows or in the determination of transaction prices, antagonisms among whole network goals and individual goals, slowing down the speed of management decisions due to excessive network widening, the decrease of flexibility owing to necessity of coordination between partners, increase in management dependence, difficulties in blurring of network bounds, rise in relation maintenance costs, risks in knowhow losses. Several groups of factors could be highlighted such as: imbalance in group members' interests, complication in management procedures, and invasion into partners' internal affairs, partners' opportunism and risks in core competence losses.

In conclusion some specific aspects of MNC's networking could be summarized in Table 2. Moreover it was showed that in various situations different types of network collaboration will be successful. Above mentioned internal and stable networks are more successful in mature and capital intensive industries, however internal networks are better in industries there number of suppliers is limited and there business units

should be interested in end results. Stable networks help to improve flexibility in material and high-tech intensive industries. Dynamic networks are more appropriate in developing high-tech industries and in short product life cycle branches.

**Table 2: MNC's networking peculiarities**

Relationships types of MNC involvement	<ul style="list-style-type: none"> <li>• Internal networks</li> <li>• Stable networks</li> <li>• Dynamic networks</li> <li>• Strategic alliances</li> <li>• Focal supply chains</li> <li>• Partner's relationships with small business enterprises</li> <li>• Supporting relationships with local and domestic government</li> </ul>
Advantageous of networking for MNCs	<ul style="list-style-type: none"> <li>• Cost reduction: decreasing in transaction costs, reduction of production costs owing to outsourcing and networking contracts, risks diversification, allocating of investment, R&amp;D and marketing expenses due to partners' participation</li> <li>• Benefits for company value: knowhow enrichment, access to additional resources, growth of effective usage of assets, quality improvement, flexibility, rapid entrance to the new market, innovation stimulation, reputation increase</li> </ul>
Networking limitation	<ul style="list-style-type: none"> <li>• Partners' opportunism</li> <li>• Risks in core competence and knowhow losses</li> <li>• Complication in management procedures</li> <li>• Overspecialization and unhealthy dependence on partner</li> <li>• Antagonisms among whole network goals and individual goals</li> <li>• Slowing down the speed of management decisions due to excessive network widening</li> <li>• Difficulties in blurring of network bounds</li> <li>• Rise in relation maintenance costs</li> </ul>

## SUMMARY

To summarize multinational corporations are playing the leading role in modern life, they own most of world assets but in spite of this, corporations are faced with rapid environmental changes and have to be flexible and proactive. Partner's relationships and networking could help MNC solve different range of problems like access to additional resources, effective usage of assets, quality improvement, flexibility, rapid entrance to the new markets, innovation stimulation, knowhow enrichment and costs reduction. The selection of appropriate network model depends on several factors concerning type of industry, MNC's tasks, organizational structure and interaction characteristics between Mother Corporation and its subdivisions. There are many examples of successful long-term relationships between multinationals and small business enterprises, where partners promote each other. Although network collaboration could solve some problems and makes positive impact on company's performance in some situation it brings to unexpected negative results. In short networking and MNC is a complex issue with no simple answers.

# ACHIEVING PATIENT SATISFACTION IN A HIGH STRESS HEALTH ENVIRONMENT

**Guy Callender, Catherine Meunier and Itziar Rebollar-Lazaro**  
**Curtin University and Hollywood Fertility Centre, Australia.**

## ABSTRACT

*The development of in vitro fertilisation (IVF) has created a new branch of medical science that has the potential to bring great happiness to those who achieve successful pregnancies and long periods of misery to those who are unsuccessful. As a part of some wider research into the support needs of clients, this paper addresses some of the challenges of managing patient satisfaction in an area of health sciences that is associated with high levels of patient uncertainty and also high aspiration for positive outcomes. The authors have used the literature of the business sector, especially retailing and marketing, to explore the key parameters of patient satisfaction and the outcomes have relevance for both medical practice and customer service.*

## INTRODUCTION

Assisted Reproduction Therapy (ART) embraces a number of therapies, the best known being in vitro fertilisation (IVF), a treatment which offers a potential solution for women and men who are unable to achieve reproduction without some form of intervention by medical science. IVF was first successfully demonstrated by Steptoe and Edwards in 1978. The treatment, for which research had started many years earlier, was highly controversial (Inge, Brinsden and Elder, 2005) and did not achieve formal recognition until 2010 when Edwards was awarded the Nobel Prize for Medicine (Nobel Foundation, 2011).

The incidence of reproductive difficulties may have been exacerbated by success in another area of medical science: the creation of an effective oral contraceptive. This advance in science created choice about the timing of reproduction. While the medical and social consequences of the oral contraceptive are beyond the scope of this paper, it may not be a coincidence that deferral of pregnancy, permitted by reliable contraception, led to deferral of pregnancies by women, perhaps for too long. As women reach the age of 40, their fertility has reduced significantly (from an 86 per cent likelihood of pregnancy to 36 per cent) and the possibility of infertility has risen from 3 per cent to 32 per cent (Carcio, 1999). The same source suggests that in the ten years between 30 and 40 years, the likelihood of infertility increases approximately four-fold. The reproductive issues for men are not so age-critical. Nevertheless, for males over the age of 45 years, the quality and productive adequacy of semen also declines, so that older age couples (35 years and 45 years for women and men respectively) are more likely to be seeking ART.

The economic imperatives that encourage the deferral of pregnancy beyond the age of 30 years, are quite well established. Paradoxically, it is the post-30 years sector of the population who will be most likely to be seeking treatment. At this stage, the natural decline in fertility is well established, but medical science offers a tempting, but not a guaranteed, 100 per cent successful solution. Indeed the causes of infertility may exist long before age-related conditions exacerbate the possibility of low fertility.

By engaging in ART, a couple seeking IVF treatment are likely to expect success in their endeavours. ART clinics offer a range of services to ensure the possibility of success is maximised. Many of these clinics have arisen in the private sector, because of patient dissatisfaction with delays and uncertainties in the public sector (Rod and Ashill, 2010), but as a consequence, the cost of ART now represents a significant investment by potential participants. A standard treatment may take between 3 months and many years (Meunier and Callender,

2010) and during this time the patients ostensibly remain hopeful as the medical and scientific support services do their best to achieve a successful pregnancy. But this success is sometimes elusive and the body clock continues to tick. There are physical, emotional, psychological barriers that may not be surmountable and yet the parties are locked together by hope and advanced scientific technology that is designed to enhance the possibilities of success.

In this difficult environment, the exchange relationship between the parties looks like a standard services contract. The patients (male and female) are assessed, an estimate of potential success is made and the procedures begin. The service provided by the IVF clinic will not change: the ethical, clinical, medical, administrative procedures will be consistent, but as time goes on the unsuccessful clients can be expected to seek a point of blame. For the service provider, this is a complex relationship: on the one hand the client is not satisfied, but on the other success could never be guaranteed.

In this paper the authors have sought to apply some business-related literature to a worst-case customer service situation. A literature review of the relevant service management literature will lead into parts two and three which are case studies outlining the role and service requirements of clinical scientists and clinicians in an ART facility. The discussion of the issues arising from the cases will be linked to the outcomes of the literature review and the implications for the client requirement exposed by the case studies, leading to the final discussion and some views on the direction of future research in this area.

## LITERATURE REVIEW

The traditional organisation-centric view was discussed by Levitt (1960) in a study which argued that focusing on the firm and ignoring the needs of customers led to sub-optimal outcomes for both the organisation and its customers. This theme was taken up by Drucker (1974), as noted by Heinonen et al. (2010) and later by Parasuraman, Zeithaml and Berry (1985), who expressed the view that organisational performance could be predicated on its ability to conceptualise and operate a particular business according to the needs of its customers.

In terms of medical research, Henderson, Caplan and Daniel (2003, p. 73) observed that while "patient satisfaction research" has been conducted for decades, several issues exist ... an absence of theoretical discussion about the phenomenon of 'patient satisfaction', no standardised approach, few comparative studies, and a lack of consensus among medical staff that satisfaction is an assessment of the quality of care". Of course, there has been some research into these areas in subsequent research, but studies addressing this entire scope are not found in the literature. Indeed, in this paper, the authors have restricted themselves to addressing the "phenomenon of 'patient satisfaction'", the provision of two cases and contributing some arguments that support the view that patient satisfaction is closely linked to the patients assessment of the quality of care.

The search for performance measures that attempt to better describe the nature of service quality in the 1980s led to the identification of five dimensions of SERVQUAL identified by Parasuraman, Zeithaml, and Berry (1985), who initially labelled them as: Tangibles, Reliability, Responsiveness, Assurance and Empathy. These attributes of service quality provide some guidance for the description and measurement of service contract terms and conditions can be developed.

The description of tangibles, reliability and responsiveness are comparatively straightforward. "Tangibles" describe physical goods, for example, documents and web-based information available to patients. "Reliability" relates to delivery where the clinic "promises to do something by a certain time, it does so ... performs the service right first time ... provides services at the time it promises to do so ... insists on error free records" (Parasuraman et al, 1991, pp. 446-447). "Responsiveness" refers to the willingness of clinic staff to help patients promptly. For instance, the staff will "tell you exactly when services will be performed ... prompt service ... [are] always willing to help ... never be too busy to respond to customer requests" (Parasuraman et al, 1991, p. 447).

The less tangible element, "assurance", could be defined as "instils confidence ... [you] feel safe in their transactions ... consistently courteous ... [and] have the knowledge to answer customer questions" (Parasuraman

et al, 1991, p. 447). The final attribute, "empathy", could be defined in terms of the supplier providing the buyer with "individual attention ... have operating hours convenient to all their customers ... employees who give customers personal attention ... have customers' best interests at heart ... [and] understand the specific needs of their customers" (Parasuraman et al, 1991, p. 447). These five elements provide a starting point for the understanding, analysis and propagation of service quality awareness and development of techniques to better address the service issues identified by Levitt (1960) and Drucker (1974).

However, these are not the only approaches. Carman (2000) reported on the 1995 research by Gronroos (in Carman, 2000, p. 337) that split service quality attributes into functional (provider attentiveness and ambiance) and technical ("the quality of what is delivered"). This view sits quite well with the growing trend to describe many tangible activities in terms of their outcomes rather than attributes, but such an approach makes the role of an ART clinic more difficult to analyse because of the complex links between the clinic and the principal physicians involved in the practice. This element is examined more closely in the later discussion, where it is suggested that the existence of both an independent physician, who also works within an ART clinic, adds a social and operating complexity to service performance and its perception by the patient.

The customer service focus has grown in popularity since then, but not so much in the medical discipline and has not been accompanied by a large amount of detailed research into customer service needs or managerial responses to these needs (Rod & Ashill, 2010). Fortunately for IVF clinics, there have been calls for a better understanding of customer satisfaction in the wake of service failure (Hart, Heskett & Sasser, 1990; Schneider & Bowen, 1999; Liao, 2007), which is one of the key ways in which we might be able to understand the dilemmas facing service delivery in a IVF clinic. The pervasive growth of services also reflects major changes in the structure and sophistication of societies, both in terms of the types of services being offered and the demand for these services by more informed consumers. As a consequence, consumers have come to have much higher levels of service-level agreements, both explicitly (in the case of common consumer services such as hairstyling, plastic surgery, dental treatment) and implicitly (in the case of the provision of government services such as health care and infrastructure).

The reward for organisations which seek to better understand the needs of customers and the range of their responses to the failure of service delivery (an inherent feature of ART that will be discussed later in this paper) can be found in the "service delivery paradox" (Hart, Heskett and Sasser, 1990) which demonstrates that "customer satisfaction and patronage intentions increase above prefailure (sic) levels when customers are very satisfied with the recovery efforts" (Liao, 2007, p. 475). Recognising the existence of service recovery performance (SRP) (Liao, 2007) may be critical to articulating the needs of patients undergoing ART. It is likely that patients undertaking ART carry an inherent sense of injustice that they are unable to reproduce the same way "as other people". This abiding sense of injustice also affects patients interactions with the frontline staff (physicians, administration, laboratory staff and nurses) in a service environment filled with hidden dissatisfaction which makes service delivery more difficult to achieve.

In framing the research, Liao (2007, pp. 476-477) took that view that "several types of justice are relevant for customers ... and ...customer evaluations of justice are likely to be highly correlated with each other ... conceptualizing customer perceived justice as a latent, higher order factor driving the four first-order dimensions of procedural, distributive, informational and interpersonal justice". Using this framework, the results of the research showed that justice was a core element of customer perceptions and that a number of service delivery issues were highly relevant to recovery from service delivery failure: "prompt handling of customer complaint, effective problem solving, making an apology, and being courteous play a pivotal role in shaping customers' justice perceptions (Liao, 2007, p. 487).

In addition to the issue of justice, is the element of "past experience". As Senti and LeMire (2011, p. 179) "satisfaction is affected by the degree of agreement between the patient's preconceived expectation ... and perceptions of actual care". While this research was undertaken in the context of hospital admission, the clinic subject of this research is embedded in a large hospital precinct suggesting that patients may not distinguish between admission and attendance.

The strength of the emotional response has also been discussed by Amyx, Mowen and Hamm (2000, p. 560) who, in a literature review noted that Attribution Theory provides some explanation of the high level of dissatisfaction expressed by consumers in the service environment because "where negative outcomes occur ...

individuals tend to be more motivated to seek causality ... [compared to situations where] failure is attributable to chance or the actions of the consumer". Indeed, it may be more appropriate to view the ART relationship as actually beginning in service recovery mode; requiring much higher levels of service delivery and actions to instinctively respond to patients' latent dissatisfaction.

The clinic used as the case study in this paper, applies an ART model that harnesses collaboration between four distinct disciplines: physicians, administration, laboratory services and nursing services. The literature demonstrates there are a range of patient care issues likely to manifest themselves during ART. These problems and challenges will vary in intensity over the life of the treatment, but may be more prevalent amongst those whose chances of success are compromised by age, state of health and the overall duration of treatment (which can range from months to years). The multiple roles of the Laboratory and the Nursing teams, both owned and operated by the Clinic and integral to its operations appears below followed by a discussion of the service management issues affecting patients at the clinic and the four inter-disciplinary units.

## **CASE STUDY ON ART LABORATORY SERVICES**

The ART Laboratory team is composed of two different departments; Andrology and Embryology. Both are under the general supervision of a Laboratory Manager who has an s-level Master degree in Science. All laboratory staff have a minimum qualification of a Bachelors degree in Science. All Embryologists are members of the relevant Fertility Society of Australia group, SIRT (Scientists in Reproductive Technology).

### **Communication with the male patient**

The Andrology Laboratory gives both diagnostic and clinical services to ART patients. Following their initial consultation, the Andrologists are the second and main point of contact for the male partner with the clinic, as every couple will need to have the male's fertility assessed through a Semen Analysis. The results of each Semen Analysis are reviewed by a physician and are accounted for by the specialist at the moment of deciding on a treatment regime for the couple. The Andrologists and Senior Scientists are available for the patients to clarify questions and concerns regarding the results and the laboratory procedures used. A qualified Andrologist should be able to liaise compassionately yet honestly and specifically with the patient, especially when an adverse result is reported.

### **Communication with the female patient**

The staff of the Embryology Laboratory have a short yet constant contact with the patient – usually the female partner, mainly from the moment when the oocytes (a human egg before maturation) are ready to be retrieved by trans-vaginal oocyte aspiration (TVOA) until the last day of embryo culture: a total of 7 days.

#### **a. Pre TVOA Consultation**

Patients are called the day before egg retrieval to make sure they and the laboratory is prepared for their forthcoming IVF treatment. During this phone call the embryologist will confirm all important aspects with the patient and can answer questions or concerns that the patient may have at this stage. All consents have to be reviewed and confirmed verbally with the patient to ensure the IVF Clinic complies with patient wishes and needs. With this activity, the laboratory staff assist all other departments by acting as a final confirmation and filtering point to ensure that the patient has received all relevant information and that their treatment corresponds with what the doctor and the nurses have requested. This opportunity is also used to confirm the patient's current address to ensure that we have the most current contact details for all patients.

#### **b. TVOA**

Even if the role of the embryologist during TVOA is mainly technical, the patient often has concerns or questions to be answered before being sedated. It is important for the scientist to be able to liaise empathically with the patient during this very emotional moment and communicate effectively with her. Scarcely a patient

will request to see an embryologist after the procedure. However, in some instances when there is a large discrepancy between the expected and real outcome of the procedure (that is, the number of oocytes retrieved) the scientist will explain the situation to the couple.

In some occasions the sperm on the day of insemination will be unexpectedly of worse quality than during the initial assessment. In these circumstances it is important to communicate this to the couple and inform them that the treatment might need to be changed; that is adapted to respond to the new situation. This can often cause distress in the couple, add to pressure on the male partner who might have to come back to the clinic for further semen collection, surgical intervention or just for clarification. Having a suboptimal semen sample on the day of TVOA is one of the most stressful situations that the male patient can face during treatment in an IVF clinic.

#### **c. From “FERT CHECK” to Embryo Development Phone Calls**

The day after TVOA, often called “day 1”, the oocytes are assessed to confirm if they were successfully fertilized. The patients are then informed by a phone call about this first outcome. Patients will be contacted every time the embryos are assessed to ensure that the couple is well aware of the progress and development of their embryos. This will allow the couple to be well prepared for the embryo transfer, which is the moment when the embryos are put back into the uterus of the patient.

The “fert check” call is mostly a moment of delivering good news, given that the expectation is to obtain at least 70 per cent fertilized eggs. However, 5 per cent of the cases fail to fertilise. It is also possible to have a lower fertilization rate than expected and the patients have to be informed of these adverse outcomes or bad news. Similarly, embryos may fail to satisfactorily divide or reach specific morphological milestones, in which case the chances of pregnancy are minimal, or even nil. In this latter situation the embryos would not be transferred to the patient and the couple would have their cycle cancelled.

At this time it is important to communicate effectively with all other departments in the clinic including nursing, counselling and administration, as the patient will be distressed, disappointed and may require psychological support, adaptation of the treatment to the circumstances and extra clinical care. In many cases it will be time for the doctor to review or modify the treatment of the patient. The whole impression of the quality of the service from the clinic will greatly depend on the way all departments liaise together with the couple. It is important to ensure thorough and accurate communication of the possible causes of this outcome and the possibilities for future treatment.

The role of the scientist, besides being informative, includes being compassionate, not being patronizing and offering future alternatives to patients. The technical jargon has to be translated for the patient to clearly understand the situation and know the steps that will follow. One of the most common occurrences of poor patient satisfaction regarding the laboratory performance is not only related to technically bad outcomes, but also the communication, clarity and compassion showed during delivering both good and poor results, as will be discussed.

#### **d. Embryo Transfer**

Around 95 per cent of patients having a TVOA will successfully have an embryo suitable for embryo transfer. The couple or the female partner alone will attend to the clinic for this procedure. The embryologist will see the patient prior to the embryo transfer to discuss in more detail the embryo development, freezing of any embryos and what the following embryo transfer procedure involves. This interview summarizes all the information given to the patient during the previous days, so it is necessary for all scientists to be able to deliver consistent information to the couple. Patients can also ask any other question they have at this time.

#### **e. “Day 6” call – final phone-call**

This is the last point of contact between the couple and the scientists. The patients are informed of the number of embryos that were suitable to be frozen as this is the last day of embryo culture. All embryos not suitable for freezing are to be discarded. It is important for the scientist to be aware of previous communications

with the patient; in order to deliver consistent information and any relevant explanations, if for any reason the outcome is worse than expected.

## CASE STUDY ON NURSING

The nursing team is led by a Nurse Manager whose staff comprise a Deputy Nurse Manager, a number of Senior Clinical Nurse Coordinators and Nurse Coordinators and some Nurses' Assistants. Overall there are at least seven nursing staff, mostly occupying full-time positions. The nursing staff must possess formal nursing and midwifery qualifications and experience to be employed in the Clinic. Typical qualifications include a Bachelors degree in Health Sciences (Nursing) or its equivalent and postgraduate qualifications in Midwifery or Assisted Reproduction. Some staff hold qualifications at Masters level. Mandatory annual professional development ensures that all nurse clinicians maintain the currency of their qualifications (a condition of continuing employment).

The nursing team provides multifunctional support across this ART practice. The main areas include the provision of support for the physicians involved in the practice. The nursing team, along with the physician are the main interface between patients and the clinic. At the commencement of ART, patients will be interviewed by a nurse who will translate the physician's agreement with the patients into an active treatment cycle. This interview also links to the administrative side of the relationship, including issues such as patient consent which also followed up by the laboratory scientists. The nurse interview ensures patients are clear about all aspects of their treatment cycle and understand their rights.

During a treatment cycle, a patient may present at the clinic with a particular problem. The nurse on duty will triage the patient and direct them to the appropriate care regimen. This process may also include a level of patient counselling, which while not formal, provides patients with emotional support at the clinic level (which is both by an appointment or by necessity system, including a 24/7 direct contact with the assigned physician or nurse manager).

In providing support to physicians the nursing role extends to overall facilitation of patient care, in particular the management of patients' treatment cycles, arranging operational procedures and ensuring patients have necessary access to support services such as a dietician, counsellor, psychiatrist, endocrinologist and acupuncturist. There are detailed procedures that take place during a treatment cycle that may not involve all patients. For example, nurses will take blood samples and, once analysed by the laboratory, will communicate the results to the patients. Nurses will be involved in technical tasks such as phlebotomy, pap smears, suture removal, IUIs, ETs and will also assist physicians during invitro insertion, *abdo paracentesis* (removal of fluid from the abdominal cavity) and similar treatments.

In addition, it is the nurses who will talk new patients through their entire treatment, a process that takes between 30 and 60 minutes. This type of interaction will continue regularly throughout the cycle, resulting in the nurses offering an informal counselling and support service on behalf of the Clinic. The medical details need to be maintained in a highly organised and completely reliable basis. The nurses will also complete all the paper work for the commencement of the treatment cycle, including the completion of a comprehensive set of consent forms and responding to detailed questions about drug dosages, blood tests and cycle dates. The nurses therefore handle the day-to-day management of patient care. This starts with blood tests, consent form completion, patient-nurse interviews, completion of procedures (in conjunction with physicians and the laboratory), interviews of patients that have recently completed a trans vaginal oocyte aspiration (TVOA), handling on-going patient questions, organising theatre cases and giving patients comprehensive advice on the next stages of their treatment.

In summary, in this fertility clinic, the nurses provide a direct link between the clinic and the patient. While the patient may see their physician from time to time, they are likely to visit the clinic more regularly to monitor progress, especially when approaching TVOA and post-TVOA. It is worth mentioning that this close relationship between nurses and patients creates a working relationship which, while supportive of the role of the physician, also creates an additional patient-clinic relationship which is subject to the vicissitudes of treatment.

## DISCUSSION OF THE SERVICE QUALITY ISSUES

If ART progresses smoothly and a successful outcome occurs within a few months, then the potential for a positive relationship is enhanced. The laboratory and nursing roles do not operate in isolation. As is apparent from the separate discussion of the two cases, the existence of different specialisations where practitioners interact with patients in a mutually supportive but different role extends to a range of internal customers, some of whom are integral to the clinic and others who are commercial providers.

The primary internal clients include the clinic's physicians (who also operate private practices in gynaecology and obstetrics), the laboratory team, the nursing team, the ultrasound technicians, employed counsellors and the administrative team. Beyond these internal customers are a range of related providers such as blood analysis laboratories, operating theatres, drug companies, anaesthetists, theatre nurses, accreditation agents, professional bodies, ethicists and researchers. In addition, enrolled nurses and trainee doctors spend time with the clinic as part of their education program. How are the needs of these diverse service relationships managed?

The academic literature of the past two decades demonstrates the significant awareness of the complex demands placed on the health sector. In Australia, patients with private health insurance have a vast range of complex choices to make in relation to their chosen physician. The choice of physician will also determine choice of clinic, so that the patient choice has business ramifications for the clinic, making the issue of service quality of prime importance. However, the lack of choice of clinic may create inherent dissatisfaction with patients if they are unable to duplicate the type of relationship they have with their physician with the staff of the clinic too (Amyx, Mowen & Hamm, 2000). An outstanding physician will attract patients to the ART clinic, and the performance of the physician and her or his relationship with the patient will also be influenced by the patient's experiences with the remainder of the clinic. Furthermore, there are status issues to be considered.

The physician occupies a high status role, supported by education, continuing professional development and high levels of skill. The social status of the clinic is an adjunct to the physician, but it has a separate corporate identity that differentiates itself increasingly from the physician. This may be a mistake: from a service perspective it may be better to maintain a very close, almost invisible relationship between the lead physicians and the clinic. Once the clinic becomes separate from the physician, its social status in the mind of the patient becomes different and the attribution of success or absence of success may slip from physician to clinic and a new outlet for patient dissatisfaction (warranted or unwarranted) becomes created. The patients' unhappiness about their progress, especially those who have been engaged in the process for more than six months, an arbitrary estimate, creates a source to which unsuccessful patients can attribute perceived services failure.

In summary, the opportunity to participate in ART is voluntary, it involves significant personal expense, the patient has a choice of physician but that choice also pre-selects the ART clinic (a decision over which the patient has no influence). Once treatment begins, the interactions between the physician and patient occur within the physician's surgery and within the clinic. There is not one party interacting with the patient, but multiple individuals and groups. These groups have different roles and responsibilities, but for the patient there remains a single, immutable goal: a successful pregnancy. This situation creates some unique issues for all service providers.

First, while success rates have improved dramatically since the first successful use of ART in 1978, the outcomes of ART still remain uncertain – especially for older patients. It is evident that a multitude of factors will influence the outcomes of treatment that are beyond the control and skills of all the clinical parties to the treatment. In some cases, while particular IVF candidates may be advised that successful treatment is unlikely, that is not a barrier to attempting ART. Second, the laws in different jurisdictions (even within the same country) permit various options for potential patients in relation to surrogacy, donor sperm, donor eggs and other more complex arrangements. This has the effect of widening the options for those who can afford to travel in pursuit of more radical options, and limits choices for those who live in more conservative locations and are unable to seek alternative possibilities. The variation in legal rules in relation to assisted reproduction mean that the legal system determines the possibilities available under existing laws, and these may increase or reduce the range of possible treatments available to IVF candidates. In some cases, better outcomes may be achieved by

going to another country. These variations have existed ever since IVF became a practical possibility. Such are the ethical dimensions of IVF. So, while freedom of choice of physician may be a significant issue (Amyx; Mowen & Hamm, 2000), the medical options, as prescribed by law, remain a significant restriction on the scope of treatment available. These limitations, which are beyond the control of any of the parties to the ART, may have a negative effect upon patient's perceptions of their treatment and its potential for success.

Third, the service provision in the ART environment can be described as both medical and psychosocial (Schmidt, Holstein, Boivin, Tjornhoj-Thomsen, Blaabjerg, Hald, Rasmussend and Andersen, 2003). This is a significant feature, as will be discussed in the next paragraph. It is evident from the two cases studies that, in addition to the physician, the clinical and laboratory staff of the clinic (and to a certain extent the administrative staff) all provide ion-going psychosocial support for patients – ongoing activities, especially listening to patients. Fourth, the social juxtaposition of physician and clinic staff means that a patient may not be willing to complain to their physician about their perceptions of the service delivery they have received from either the doctor or the clinic. However, they may feel they have a master-servant (sic) relationship with clinical staff in either the laboratory, the nursing group or administration, which permits complaints to be aired. So even if the problem lies with the human condition and the impact of age, health disposition, innate fertility, the patient may feel they can attribute the failure of their IVF treatment to one or more of the service delivery groups.

Fifth, as the clinic is housed within a hospital, it is likely that patient's perceptions may be influenced by their past experience of hospital admission, creating the possibility of both positive and negative impressions of their treatment. One of the challenges here is to shape patients' expectations (Schneider and Bowen, 1999) in ways that aim to overcome the power of past experience. In this regard, a focus on exceeding the basic SERVQUAL requirements may be a worthwhile approach to bringing patients' perceptions to align more closely with the objectives of both the laboratory and nursing staff. Finally, in an ART clinic, as compared to the relationship with a single medical practitioner, there are many "targets" available for the expression of satisfaction or dissatisfaction. The laboratory provides services that aim to deliver to the patient a perfect, fertilized embryo to commence gestation within its mother. This embryo is, like every naturally formed embryo, microscopic in size. Its successful gestation depends upon many factors – not the least being the genetic quality of the sperm and egg. These have been brought together in the laboratory, in accord with existing scientific best-practice and international standards of laboratory and clinical performance, in circumstances that satisfy all the legal and ethical standards of the jurisdiction in which the ART is taking place. But there remains the element of chance, and research evidence shows that patient vulnerability rises with the number of unsuccessful treatments (Schmidt et al, 2003) and with this, patient stress.

## CONCLUSIONS

The basic challenges inherent in ART, in particular, the likelihood of success and the potential for long periods of treatment provide a fundamentally negative outlook for some patients. This discussion paper is a precursor to a research activity aimed at understanding more about the nature of patient perceptions and their impact on their views of service delivery. Despite the fact that successful ART leads to the emergence of a healthy baby, the path to such success is littered with problematic situations. For laboratory and nursing staff – the focus of this paper – the potential for patient dissatisfaction is high. Older patients or those with known reproductive problems will commence treatment with both high expectations and uncertainty. Others may share the same expectations but this is not known at this stage. Patients will arrive at the clinic because of the choice their physician has made, rather than an independent choice they have made. This may create an unspecified negative at the start of the relationship. As the treatment progresses, the psychosocial interaction between patients and the laboratory and nursing staff will unfold. As the cases make apparent, some of these interactions are face-to-face but many are by telephone. Because there are multiple staff members, patients may be dealing with a different laboratory scientist or nurse every time they visit the clinic. The relationship between the clinic staff and the patient is not of the social nature of doctor-to-patient, rather it is almost a commercial transaction with psychosocial overtones which may not be well understood by the parties – especially the patient.

While the literature provides some guidance on the focus points of the service interaction in these circumstances – especially the fact that patients may well arrive at ART with an underlying sense of injustice which will be heightened by any breakdown in the service relationship. As the literature shows, the fact that ART

is largely an intangible service with, in successful cases – a tangible outcome, during treatment, the issue is all about service and the patients' perception of that service. As Liao (2007) has emphasised, for the laboratory and nursing staff, who carry a highly technical as well as a psychosocial role, the service requirements appear to be certain: a need to handle patient complaints promptly, to focus on problem solving, of apologising and maintaining courtesy are key elements for handling complaints. It should also be recognised that in the case of ART, all staff are likely to be dealing with many patients who arrive at the service point, the clinic, with an abiding sense of injustice (why can't we have a child easily? Like "everybody else?"). This situation really means that laboratory, nursing and administrative staff are in service recovery mode from the start of their relationship with many patients.

# COUNTERFEITING AS A MEANS OF TECHNOLOGICAL CAPABILITY DEVELOPMENT

Hanni Candelin-Palmqvist and Mari Ketolainen  
University of Turku, Finland

## ABSTRACT

*The aim of this conceptual paper is to discuss counterfeiting as a means of technological capability development. The themes of counterfeiting and capability development are discussed widely in previous literature but so far the number of studies combining these two themes is limited. In the counterfeiting companies, the technological capability development seems to be a result of reverse engineering or, in the case the counterfeiter is also an original equipment manufacturer (OEM), through the acquisition of technology and/or design blueprints. Thus, unlike in many other companies, in counterfeiting firms the capability development starts from the product, and occurs more as a side product of reverse engineering or illegal production. The improved technological capabilities of a counterfeiting company may lead both, directly or indirectly, to an increased number of innovations and new products, improved products and processes, an increase in R&D, and an increased number of patents.*

## INTRODUCTION

“Copying to catch up is the only way to catch up.” – Thurow 1997

Throughout human history, various nations have imitated products of others in the hopes of offering even better products. The histories of many nowadays developed countries, such as Japan, Korea and the US, include stories on imitations and reverse engineering (cf. Kim 1980, Thurow 1997; Kim 1997; Hobday et al. 2004; Church 1999; Thurow 1997; Yamamura, Sonobe & Otsuka 2005). A more recent example is China, whose strategy of acquiring foreign technologies is underpinned by reverse engineering activities including imitating, copying and improving foreign products (Trott & Hoecht 2007).

However, the issue of imitation is not only a national level phenomenon pertaining to the development of a nation's capabilities. Companies imitate the products of other manufacturers and infringe upon intellectual property rights only to end up intentionally or unintentionally developing their own capabilities. In some companies counterfeiting may be seen as a strategy to home-grown innovation (McDonald & Roberts 1994) and sometimes, even the only way to develop one's capabilities. This question of intentionality is also one of the central ones in understanding capability development (cf. Bakhru 2007). It seems that counterfeiting may be done with the intention of developing one's capabilities but capability development may also occur as an unintentional outcome of counterfeiting. However, this paper does not differentiate between unintentional and intentional capability development.

The aim of this paper is to discuss counterfeiting as a means of developing a company's technological capabilities<sup>i</sup>. Technological capabilities are important for the performance of the company and for the survival in the industrial competition. In addition to this, technological capabilities of the local firms are also central features of the national systems of innovation (cf. Bell & Pavitt 1995; Coombs & Bierly 2006). The themes of counterfeiting and capability development<sup>ii</sup> are discussed widely in the previous literature (cf. Bakhru 2007; Chaudhry, Zimmerman, Peters & Cordell 2009; Chaudhry & Walsh 1996; Coff 2010; Jacobs, Samli & Jedlik 2001; Kaikati & LaGarce 1980; Laamanen & Wallin 2009; Nielsen 2010; Winter 2000) but so far the number of researches combining these two themes is limited, and for example the impact of counterfeiting on the

development of counterfeit producers and organizational learning has not been studied (Staake, Thiessen & Fleisch 2009). Most of the existing firm-level studies of learning and capability development focus on the most innovative firms at the technological frontier aiming at sustaining, deepening and renewing their existing innovative capabilities. However, latecomer firms, such as counterfeiters, move into a business on the basis of the technology they have acquired from other firms in other countries. During their start-up time they lack even the basic technological capability (Figueiredo 2003). For this reason some emerging countries such as China require that all multinational corporations operating in the country transfer technology into the country (Thurrow 1997).

This paper is structured as follows: first, the phenomenon of counterfeiting is discussed. This is followed by the discussion of organizational capabilities and capability development. In the final chapter discussion and concluding remarks are provided. It should be stressed that the authors do not in any way condone counterfeit activities. Instead the authors feel that the immensity of the counterfeiting activities calls for an increased understanding of the multiplicity of the phenomenon.

## COUNTERFEITING AS A BUSINESS PHENOMENON

Intellectual property infringements<sup>iii</sup> are not a new phenomenon, but the large-scale manufacturing of counterfeit goods has occurred post-industrially (OECD 1998). The number of counterfeit products has increased steadily in the world, however the past few decades have witnessed an explosion in the levels of counterfeiting, the widening of the counterfeit product range as well as the integration of pirate markets into one global market (cf. OECD 2008).

The negative effects counterfeits have on companies range from financial losses to forced withdrawals from markets; from brand devaluations to destructions of whole product categories; from decreases in technological investments to even greater investments in technology (cf. Globerman 1988; Harvey & Ronkainen 1985; McDonalds & Roberts 1994; Shultz II & Saporito 1996; Wilke & Zaichkowsky 1999; Grossman & Shapiro 1988). Counterfeiting may also have an impact on society as a whole (cf. Globerman 1988; Nill & Shultz II 1996; OECD 1998). A country may suffer a loss in output and jobs to the extent that imported counterfeits displace local sales of genuine goods or foreign exports decrease. Counterfeiting activity may also lead to a reduction in the inflow of new foreign direct investment in cases where producers of original products perceive off-shore production to be more susceptible to piracy and cannot rely on the enforcement of their intellectual property rights (Globerman 1988).

On the other hand, it has also been argued by some that piracy encourages the creation of local industry by supplying local producers with the financial capital, the experience and the trained labor force required to become legitimate producers in the future. Some authors have suggested that counterfeiting or piracy may be seen as a strategy on the road to homegrown innovation (e.g. McDonald & Roberts 1994) especially in developing economies, as emerging, lower income countries are often a source of counterfeits (cf. Bosworth & Yang 2002, Nill & Shultz II 1996, Shultz II & Saporito 1996). Imitation and piracy may provide a prospect of an alternative to craft industry and an economy tied to primary resources to newly industrializing countries and transition economies (McDonald & Roberts 1994).

Counterfeiting and piracy have had their share in the development of countries such as Singapore, Japan, Korea and Taiwan (McDonald & Roberts 1994). Numerous studies (cf. Kim 1997; Hobday et al. 2004; Church 1999; Thurrow 1997; Yamamura, Sonobe & Otsuka 2005) report on the important role of imitation, reverse engineering and copy-and-develop technological learning strategies in the development of once emerging nations such as Japan, Korea and the United States. And it is these same activities of imitation, copying and improving of foreign products that are the reasons for China's strategy of acquiring foreign technologies (Minagawa et al. 2007).

Minagawa et al. (2007) report of three Chinese packaging machinery manufacturers whose counterfeiting and precise product imitation practices, along with the companies' original equipment manufacturing (OEM) business, was used as a strategy to develop their business as whole and become a legitimate firm in this industry as well. The imitation activities of the companies resulted in technological

capability developments in the manufacturing process – one of the companies was able to provide the same products as the original but for a cheaper price. Direct imitations in the case of another of the companies lead to the development of new products. In the case improvements were made to counterfeit products, the new products were instantaneously protected by the appropriate intellectual property rights and anti-counterfeiting strategies (Minagawa et al. 2007), despite the seemingly lacking respect toward the IPRs of the original manufacturer. The profits generated from the counterfeiting activities were in all three cases used to develop the technological capabilities of the counterfeiter, e.g. research and development activities (Minagawa et al. 2007). These activities resemble those highlighted by Hobday et al. (2004) – some companies are able to develop their technological capabilities in such a way that they become successful legitimate players in specialist and niche markets from a “copy-and develop” phase. According to Trott & Hoecht (2007) especially those counterfeiting companies which are legitimate manufacturers of the genuine products as well may be interested in new product development through counterfeiting. Another way in which a counterfeiting company may become a legitimate player in the field is through acquisitions – when a legitimate OEM acquires the counterfeiters in the hopes of getting rid of the illicit activities (cf. Yang et al. 2004; Shultz & Saporito 1996; Jacobs et al. 2001; Bosworth & Yang 2004). The following section takes a closer look at capability development.

## DEVELOPMENT OF TECHNOLOGICAL CAPABILITIES

No matter whether a company is producing products legally or not, the responsiveness to the rapid changes in the turbulent business environment has become a major source of obtaining and sustaining competitive advantage. (cf. Kyläheiko, Jantunen & Sandström 2008.) Hsu and Chen (2009) and Bell and Pavitt (1995) state that capability development is an essential element in the evolutionary development of these sustainable advantages, and in creating new bundles of resources. This is why, today, the continuous development of organizational capabilities is more important than ever before (Hsu & Chen 2009).

As Penrose (1959) and Amit and Schoemaker (1993, 35) state, capability is a firm’s ability to deploy its resources. Resources include for example human capital (including managers), technological capital, knowledge-based capital, and tangible-asset-based capital (Easterby-Smith, Lyles & Peteraf 2009). Organizational capabilities, then again, are considered as the firm’s ability to perform repeatedly a productive task which relates either directly or indirectly to a firm’s capacity for creating value through effecting the transformation of inputs into outputs (Grant 1996; Winter 2000).

One of the relevant organizational capabilities for companies is technological capability. According to Bell and Pavitt (1995) technological capability can be defined as the resources needed to generate and manage technological change, including skills, knowledge, experience and organizational systems. Each firm has certain firm-specific technological resources (e.g. patents and knowledgeable engineers) that it uses to offer products with desirable characteristics. Technological capability can be also considered as an ability to combine these resources (Afuah 2002). Figueiredo (2003) has extended the aforementioned definitions, and states that in the context of the latecomer firms, such as many counterfeiter are, technological capability refers to the firm’s abilities to carry out in-house improvements in process and production organization, products, equipment, and project engineering.

To become competitive and catch up with the technological frontier, the latecomers, such as the counterfeiting firms, have to engage in technological learning process in order to build their own capabilities (cf. Figueiredo 2003). However, this learning process is not the only way to develop or build organizational capabilities. Every firm acquires many capabilities that enable it to carry out activities necessary to move its products and services through the value chain (Day 1994). However, before implementing a particular means of obtaining new capabilities, a firm must select the suitable mode, and choose between internal development, e.g. training, and external sourcing, e.g. hiring new personnel (Capron & Mitchell 2009; Lacetera, Cockburn & Henderson 2004). Even though recruiting new personnel may be a somewhat faster way of advancing an organization’s capabilities, it certainly is not a shortcut to success. It takes some time and money before the skills of the individual yield benefits to the organization.

Also developing capabilities internally is very costly for the firm, and this has been recognized e.g. by Sapienza, Autio, George and Zahra (2006). Capron and Mitchell (2009) argue that firms that take into account

constraints based on their capabilities and internal social contexts when choosing between internal development and external sourcing, will be more effective at developing new capabilities, and in turn, will survive longer than firms that assess those constraints poorly. In the case of counterfeiting firms, the traditional means of obtaining new capabilities are not necessarily the most topical ones, as for these companies the product is the key in developing capabilities, instead of human resources.

Capabilities, especially technological ones, can also be developed or obtained through cooperation, networking with partners or even through mergers and acquisitions. (cf. Capron & Mitchell 2009; Rosenkopf & Nerkar 2001) This allows companies to either develop or obtain completely new capabilities or to develop further the existing ones. Some of the counterfeiters may even utilize the OEM networks for capability development, but counterfeiters engaged merely in illegal activities may not have the networks with which to develop their capabilities. If a counterfeiter is able to develop its capabilities it may end up as part of the legitimate manufacturer's network as these manufacturers seek collaboration with the counterfeiters (Minagawa et al. 2007). In addition to these ways of developing capabilities, counterfeiters develop their capabilities through reverse engineering and by obtaining design blueprints, which are generally acquired through e.g. joint-ventures (cf. Hobday et al. 2004; Minagawa et al. 2007) or forced transfers of technology.

According to Zhou and Wu (2010) a firm's technological capabilities are developed over time and usually accumulated through its past experiences. Also Grant (1996) and Teece, Pisano and Shuen (1997) have highlighted, that the development of capabilities is usually shaped by company's current market position and past history of developing capabilities. However, if the company is a latecomer in the market like many counterfeiters are, they do not have too many past business experiences to reflect on. Firms also have to make investments in capability development on the basis of the expected changes in their operating environments. The capability development may take a long time, so the capability development process has to be initiated long before new capabilities are actually needed in business. (Kyläheiko et al. 2008) Thus, this requires firms to constantly anticipate the needs for future capabilities (Day 1994). Anticipating future needs requires intentional activities to be taken for the capability development, and as Bakhru (2007) has stated, central to understanding how firms are able to create capabilities is to ascertain the degree to which the development process is an intentional and managed one. For some counterfeiting firms making plans for the future, and anticipating what is going to happen, may be challenging. The long-term planning these companies do is most probably related to the products, not the capabilities the company possesses or would like to develop.

## CONCLUSIONS

The aim of this paper was to discuss counterfeiting as a means of technological capability development. The discussion took the counterfeiter's viewpoint, and pondered whether this activity can bring some improvements to the company's capabilities and activities. Based on the literature, it can be claimed that counterfeiting can act as a means of technological capability development, and this development can be either intentional or unintentional. The discussion as to whether capability development is an unintentional or intentional process is partly attributable to the fact that there has tended to be focus on the development and improvement of existing capabilities rather than on the creation of new capabilities (Bakhru 2007). As Bakhru (2007) has brought up, the issue of intentionality also relates to the managerial input, as intentional capability development requires effort and input from the management. This could be a focus of future research.

Technological capabilities are usually developed through internal operations, such as training, as well as through external sourcing, such as cooperation with a trusted partner. Counterfeiters with OEM activities may benefit from existing partners and networks. However, it is questionable whether these are relevant options in the case of those counterfeiters, whose business does not include legitimate OEM activities and the cooperation networks attained through it. It is more likely that these options apply for counterfeiters with OEM activities, as many of the technology-oriented companies develop their capabilities e.g. in cooperation with their partners.

In the counterfeiting companies, the technological capability development results from e.g. reverse engineering or, in the case the counterfeiter is also a legitimate manufacturer, through the acquisition of technology and/or design blueprints. Counterfeiters use the information acquired to produce infringing copies and it is in this process that technological capabilities may develop. Thus, unlike in many other firms, capability

development in counterfeiting firms starts from the product itself, and occurs more as a by-product of reverse engineering or illegal production.

The improved technological capabilities of a counterfeiting company may lead both, directly or indirectly, to an increased number of innovations and new products, improved products and processes, an increase in R&D, and an increased number of patents. For example Minagawa et al. (2007) report that in the case improvements are made to counterfeit products, the new products are instantaneously protected by the appropriate intellectual property rights and anti-counterfeiting strategies. The development of technological capabilities through counterfeiting may also result in an overall development of a nation in case the counterfeiter is able to become part of the formal economy, as stated by e.g. Minagawa et al. (2007). Becoming a part of the formal economy by transforming into a legitimate actor in the field may be a result of the development of technological capabilities during counterfeiting activities. The question thus arises: what do these counterfeiting companies do after their technological capabilities have been developed? The companies seem to have two options: namely to continue copying and producing counterfeits; or to start developing products of their own and become a part of the formal economy. In case they go for the development and production of own products, can these companies become first-movers instead of latecomers? This is a question that future research could tackle.

This paper has shown that counterfeiting can act as a means of capability development. This adds to the current research on counterfeiting activities, as the impact of counterfeiting on the development of counterfeit producers and organizational learning has not been studied (Staake, Thiessen & Fleisch 2009). Both managers and researchers need to realize the multiplicity of the phenomenon and its implications on legitimate business. Capability development can and should be seen as an additional and important motive for counterfeiting as well as an outcome. As a result of capability development the counterfeiters of today may be the competitors of tomorrow. Managers of legitimate manufacturing companies need to take into consideration the fact that in the future the threat of counterfeiters is even greater as a result of developed capabilities and improved R&D processes.

Like any research paper, also this one has certain limitations. This study is purely conceptual, and thus, it lacks empirical data to support the existing literature. In the future this paper could be expanded with a more extensive literature review and by collecting empirical data to support the developed ideas. This paper also focused only on technological capabilities and in the future the focus could be extended to other relevant capabilities.

<sup>i</sup> Technological capabilities can be also researched on national level, see for example Kogut and Chang (1991) and Anand and Kogut (1997).

<sup>ii</sup> In the literature capability development has been also referred for example as capability building (Keil, Autio & George 2008; Zhou & Wu 2010), capability accumulation (cf. Figueiredo 2008) and capability learning (cf. Winter 2000). However, this study utilizes the concept of capability development.

<sup>iii</sup> Intellectual property infringements comprise of infringements on the intellectual property rights (IPR) such as trademarks, patents, copyrights, geographical indications, and industrial designs. Intellectual property infringements tend to come in two main forms: counterfeiting and piracy (Europe's Product Piracy Challenge 2002, 1). The two terms are used loosely, especially in business literature, maybe due to their sometimes inseparable nature: pirate software, for example, may carry counterfeit packaging and authentication labels (Europe's Product Piracy Challenge 2002, 1). For the purpose of this paper the terms counterfeiting, piracy and intellectual property infringement, are used synonymously. The terms are used interchangeably to explain any type of infringement of intellectual property as well as to describe any kind of unauthorized use of intellectual property, may it be trademarks, patents, copyrights or something else, either with or without the intent to deceive consumers or steal sales from the original producer.

# **ADDRESSING DIALECTICAL TENSIONS FOR STAKEHOLDER DIALOGUE IN CSR DECISION MAKING: A CASE OF SUGAR PROCESSIONG CONGLOMERATE AND SUGAR CANE FARMERS IN THAILAND**

**Suwichit Chaidaroon**  
**Nanyang Technological University, Singapore**

**Prapai Jantrasakul**  
**King Mongkut's University of Technology, Thailand**

## **ABSTRACT**

*Thailand, one of the leading sugar producers, has tried to increase its level of sugar production by persuading farmers of competitive crops to grow sugar canes. Therefore, this research seeks to examine sugar cane farmer's decision to grow sugar canes vs. competitive crops (cassava, rubber, and eucalyptus) by examining four independent factors: cane price, competitive crop price, sugar mill support, and community support. Conjoint analysis with data from Thai farmers indicates that the first three factors significantly influence the farmer's choice of crops to grow (sugar canes vs. competitive crop).*

## **INTRODUCTION**

In recent years, it is almost undeniable that corporate social responsibilities (CSR) have gained interests among business sectors and their stakeholders. Yet, many organizations treat their CSR efforts as a systemic organizational activity in response to social and environmental impact, rather than a process through which moral values and concern are genuinely articulated and negotiated among stakeholders (Maclagan, 1999). This systemic approach may allow organizations to meet fundamental social reporting requirements but it does not lead to a long-term citizenship mentality among corporations (Hess, 2008).

To create a genuine dialogue with stakeholders, van de Kerkhof (2006) argues that all perceived constraints and opportunities must be articulated so that needs and concerns are addressed honestly (Kaptein & van Tulder, 2003). Any deliberation or assumed CSR needs singly from the organizational perspective does not suffice (van de Kerkhof, 2006) and the organizational motives behind CSR will be scrutinized (Burchell & Cook, 2008).

To reinforce the participatory nature of stakeholder dialogues in CSR decision making (O'Rordan & Fairbrass, 2008), this paper reports a case on perceived discrepancies between a sugar processing conglomerate and sugar cane farmers in Thailand as the company attempted to develop their CSR efforts. Based on the assumption that once the perception gaps are identified a genuine dialogue can be created, the paper uses this case as an illustration to develop a typology of dialectical tensions (Baxter, 1988), or opposing points, in CSR decision making. It is hoped that this framework of dialectical tensions can be taken into consideration by organizations as they conduct stakeholder dialogues to develop their CSR programs in the future.

## RESEARCH METHOD AND DATA COLLECTION

The present research employed a qualitative case study approach to investigate the interested phenomenon in a real-life setting (Yin, 2009). Among the various uses of case studies, this project studied the bounded phenomenon faced by the selected organization and their stakeholder as an instrumental case to illustrate the ways in which a corporation struggled to develop their CSR efforts by engaging the relevant stakeholder (Stake, 1995).

A major sugar processing conglomerate with its more-than-half-a-decade establishment in Thailand was chosen as a case in this study. The site for this project covered the northeastern part of Thailand, the country that was ranked as the sixth largest sugar producer and second largest sugar exporter in the world (Suksawat, Piewthongngam, & Tenglolai, 2008). This sugar company has set up various factories around the region to process sugar and to allow convenience for sugar cane farmers to distribute their canes to the company as transportation could be a major obstacle among them.

Given a fierce competition in the sugar industry in this region, sugar cane farmers had several options to sell their harvest to other companies via several outlets. Therefore, the selected sugar processing company in this study attempted to conduct their CSR programs directed towards sugar cane farmers in order to improve the quality of sugar farming and processing as well as to establish the sense of loyalty among sugar cane farmer to their company at the same time. Their dual goals in CSR activities created some challenges for them to be “good” to the sugar cane communities and to be a successful business enterprise in the region at the same time. Hence this research project studied the CSR efforts of this sugar processing conglomerate and sugar cane farmers as their primary stakeholder in this case to address the following questions:

**RQ1:** How did the sugar cane processing company and sugar cane farmers perceive each other’s roles in their business transactions?

**RQ2:** What communication challenges in CSR efforts were perceived by the sugar processing company and the sugar cane farmers?

Data were collected through two group discussion sessions with mid and high levels managers of the company to explore past CSR efforts with sugar cane farmers as well as the organizational needs and motivations in developing CSR programs with this group of stakeholder. In addition, eight in-depth interviews were conducted with sugar cane farmers in eight different villages in northeastern part of Thailand. Based on the assumption of naturalistic inquiry (Potter, 1996), these farmers were purposively selected as they appeared to be opinion leaders who were willing to share their needs and concerns about sugar farming and industry (Frey, Botan, & Kreps, 2000). Based on the grounded theory procedure, interviews and filed notes were transcribed and coded inductively to respond to the research questions until saturation was reached (Strauss & Corbin, 1990).

## FINDINGS

Consistent with previous research, both sugar cane farmers and the company indicated explicitly that their relationships would be strengthened if the corporate social responsibility initiatives were mutually beneficial to both parties (Bhattacharya, Korchun, & Sankar, 2009). However, when asked about the discrepancies or challenges in CSR efforts, all participants revealed these challenges subtly through their unmet needs. Specifically, these challenges can be categorized into two dialectical tensions (Baxter, 1988), or opposing points that both parties struggled to balance as they articulated their needs for CSR initiatives.

First, the both parties wrestled with the goal to be successful in their business while becoming a good citizen of the community. As both farmers and the company relied on each other in their business transactions, they hoped to maintain good relationships with each other. However, when asked how they communicated the way they balanced these two goals, company appeared to employ traditional business tactics such as asking farmers to sign written contract when offering certain agricultural assistance to them while the farmers. At the same time, the farmers tended to see the company mainly from their entrepreneurial side and yet still relied on

the company for most assistance. These perceptions responded to the first research question regarding their perceived roles. They both hoped to work with each other on an equal partnership basis but their communication appeared to perpetuate the imbalanced roles.

Second, when asked to discuss the previous CSR initiatives they hope to have received and provided, both parties struggled with the balance between material and intellectual assistance. Both parties saw the value in providing material assistance such as fertilizers, insecticides, or irrigation while how-to knowledge in sugar cane farming was also important. However, the way these assistances were presented led to some unintended consequences and misperceptions between the two parties. For example, while the company attempted to provide effective fertilizers and insecticides, farmers expressed their heartened fear for using chemical substances that will affect their health and environment.

In summary, this paper reported preliminary findings of a study to identify communication and role discrepancies between a sugar processing company and sugar cane farmers. Two dialectical themes were identified through qualitative data including (1) balancing business goals and becoming a good community citizen and (2) intellectual and material CSR initiatives. While these two themes are based on data from this sugar cane industry case, they seem useful for other organizations to consider as they engage in a dialogue with stakeholders to make a decision for their CSR initiatives.

# MANAGERIAL ISSUES FOR ADOPTING DIGITAL BOOKS--A PRELIMINARY STUDY

**Chiang-nan Chao, Leonora Fuxman, and Ibrahim Elifoglu**  
**St. John's University, USA**

## ABSTRACT

*The digital books are emerging, as more and more consumers are adopting or moving to adoption of digital books, given the availability of digital books and the instruments, i.e. PCs (including tablet PCs) and specially designed digital book readers, i.e. Amazon's Kindles. However, the data show that the total market share of digital books is still small in comparison to the printed books. This study, through an empirical survey to explore, from the consumers' standpoints, some managerial issues about adopting digital books. Those managerial issues are both strategic and technical aspects, both environmental and personal aspects. The study finds digital books have significant advantages over the printed books. Although digital book downloading is growing rapidly, in some ways, it still lacks some of the advantages printed books, e.g. it is time consuming to download some books, and the consumers do not need to concern of copyright for printed books. The findings suggest that publishers need to more aggressively promote digital books as it is a way to preserve our environment.*

## INTRODUCTION

In the past few years, a growing number of digital book readers have enabled readers to purchase digital books rather than printed books, e.g. Amazon's Kindles, Sony's eReaders, Barnes and Noble's Nook, the hot Apple's iPad, RIM's playbook, Samsung's Galaxy, and HP'Slates. Apple's iPad2 hit the market on March 11, 2011 with over 14 millions of its predecessor of iPad sold around the world, and predicted of 33 million unit sales in 2011 [Kim, 2011]. Digital book readers have enabled book readers an alternative way to read books that provides them with lower cost, and more convenience to read and to carry around. Book publishers and retailers have found an option to reach their customers and market in a hope to improve their bottom lines in this very competitive publishing world. The digital book market is far smaller than the traditional printed book market; however, the growth rate is phenomenal [Rich, 2010].

The emergence of digital books is challenging the traditional way of publishing, however, digital books make up just under 3 percent of textbook sales, although the share to grow to 10 percent to 15 percent by 2012 as more titles are made available as digital books, and the market share of digital books in comparison to the overall printed books, including newspapers and magazines is only slightly above 5% [Foderaro, 2010; Wilhelm, 2010]. The academic research is still quite limited due to this emerging nature of digital books. This study, in an empirical experiment setting, examines from the book readers' points of views and their preferences, in order to provide some managerial insights of this digital book market: what consumers prefer and how they make purchasing decisions. The focus is mainly on the digital books and digital publishing related issues.

## REVIEW OF LITERATURE

In the recent years, the traditional printed publishing industry is facing an emerging challenge from digital publishing, quite resembling the competition between filmed cameras and digital cameras, even though the digital publishing represents only a small fraction of the total publishing industry's sales. However, some of the printed publishing, i.e. newspapers, have experienced a sharp decline recently. Figure 1 documents the decline of some major newspapers in the U.S. [Peters, 2010].

Figure 1. Circulations decline of some major newspapers in the U.S.

Amazon's information provides a glimpse of the digital book market, the International Digital Publishing Forum (IDPF) provides more detailed information about digital publishing. Figure 2 presents the digital publishing sales from 2002 to 2009 [Sherr and Clark, 2010; Source: [http://www.opendigitalbook.org/doc\\_library/industrystats.htm](http://www.opendigitalbook.org/doc_library/industrystats.htm)].

Contrary to traditional printed publishing, the digital publishing market needs both digital gadgets and digital books. As far as the selection of digital gadgets, consumers have quite a number to choose from, from tiny gadgets, such as iTunes, Blackberry, iPod touch, and iPhones, to specially manufactured digital book readers, i.e. Amazon's Kindles, Sony's eReaders, Barnes and Noble's Nooks, Samsung's Galaxy, etc, to generic tablets like Apple's iPad and iPad2, netbooks and laptops, and desktop computers. While for the digital books, there is no universal standard, just like with printed books which have a variety of type settings. For many people, the problem with digital books is that they come loaded with just many limits. Digital books bought today from Amazon.com, for example, can be read only on Amazon's Kindle device or its iPhone software. Some restrictions on the use of digital books are likely to remain a fact of life. Because of this, some potential digital book customers shy away from jumping on the band wagons of digital book. On the other hand, there is no single technology standard for digital books, while the early comers like Amazon tend to dominate in the nascent market. Many publishers are concerned about what gadgets will eventually become dominant, since it will have profound impacts if they select wrong formats. Some developers believe that there is a limit to people's appetite for new digital media. The dominant operating systems are currently either Apple's or Android of Google, with Apple's system is a dominant position [Warner, 2011].

Figure 2. digital books sales, in mil. of US\$

Source: <http://idpf.org/about-us/industry-statistics>. idpf is the International Digital Publishing Forum.

To make the situation more complicated, often digital gadget makers, publishers, and book retailers disagree with one another so it is difficult to develop new business models for profit/cost sharing. Dominant players often pressure others to go along with their terms. Amazon has tussled with publishers recently over digital book prices, but a new pricing model that is emerging could improve Amazon's profit margin on digital books for any e-readers. Publishers will set prices for many digital books, with retailers such as Amazon and Apple taking 30% of the revenue. This guarantees a profit on every sale. Amazon's previous policy of discounting new digital book best sellers at \$9.99 typically resulted in losses, since it paid more than \$9.99 for those books. What's more, Amazon is years ahead of Apple in building relations with the publishing industry, being one of the biggest print-book retailers in the nation. Amazon now offers more than 450,000 digital books, and has access to more than 1.8 million free out-of-copyright titles. Apple has said it will start with 60,000 titles from five of the largest publishing houses. A new approach proposed by Apple intends to let every player in the distribution channel to collect a fee or commission. Apple's app stores enable the company to collect commission on every book or magazine sold, and the stores generated over \$1.1 billion in eighteen months to February 2011. Apple is now requiring publishers that conduct sales of content—which includes books as well subscriptions—to offer a way to do so within apps, which will be handled by the iTunes billing system. The policy, which the company says isn't new, was cited in Apple's rejection of a Sony Corp. app for reading digital books earlier this week [Kane, 2010; Trachtenberg, 2010; Fowler and Trachtenberg, 2010; Kane, et al, 3, 2011; Checkler, et al, 2011].

Barnes & Noble Inc. has stepped onto the nascent digital-book battleground with Amazon.com Inc. and Sony Corp., saying it would launch its own digital bookstore with bestsellers priced at \$9.99, in line with its rivals. It would offer more than 700,000 titles, including more than 500,000 public domain books from Google Inc., and that it expects to be able to offer more than one million titles by July 2010. Book formats supported by the new Barnes & Noble digital bookstore include those that can be viewed on Apple Inc.'s iPhone and iPod Touch, BlackBerry smartphones and most Windows and Mac computers. However, titles bought through Barnes & Noble's digital bookstore are not compatible with Sony's Reader or Amazon.com's Kindle digital book reader, the two dominant e-readers in the U.S. market [Rich, 2010; Rich and Stone, 2010; Trachtenberg, Fowler, 2010; Bilton, 2011].

Both book resellers and publishers want to provide their customers with an alternative of digital books. In addition to bring about new titles in a digital format, they republish old titles by big-name authors. These approaches further enable the demand growth of digital books [Trachtenberg, and Kane, 2010].

Printed books and magazines on the other hand are in the low technology, but the screens won't go blank, nor would they be transacted virus, and they have been around for thousands of years. However, they are heavy and expensive. For example, college students pay \$700 to \$900 a semester in addition to the already high expenses in tuition and other fees [Foderaro, 2010].

## METHODOLOGY

With the focal questions in mind, this research studied the views of consumers with regards to how they view digital books as compared to the traditional printed books, the books include all books, magazines, newspapers, and other related. A survey was developed to investigate the issues related to the subject of this study, in the consumer preferences on products and their quality, price and promotion, deliveries. The following variables were based on literature reviews.

### Variable Selection

The following variables affect how and where consumers make their purchase decisions.

1. *easy to obtain*
2. *low cost of possession of the reading materials*
3. *easy to read*
4. *attractive prices for possessing contents*
5. *easiness to carry around*
6. *weights*
7. *easy to share with others*
8. *need of special reading instruments, i.e. kindle, eReader, iPad, Galaxy, Nooks, etc.*
9. *free delivery or delivery incentives*
10. *compatibility in the formats*
11. *concern with copyright*

### Hypothesis, test of hypothesis, and sampling

The hypothesis for this research is to find if there is a significant difference from the consumers' standpoint between digital book and printed books. The hypothesis for this study states:

H: There is no significantly different preference from the consumers' standpoint between digital books and printed books.

Alternatively, there is significantly different preference from the consumers' standpoint between digital books and printed books.

Due to the nature of this empirical study, the questionnaires were distributed to college students in a large university campus in the Northeast of the United States for a convenient sampling since students tend to browse on the websites and download digital books. The respondents were asked to evaluate the selected variables in a five point Likert scale, with 5=strong agree, 4=agree, 3=neutral, 2-disagree, and 1=strongly disagree. Since the independent variables were of nominal nature and dependent variables were of ordinal nature, Mann-Whitney nonparametric statistic tests were used to test the hypotheses. Mann-Whitney nonparametric statistic tests were used to test the hypotheses. The Mann-Whitney U (M-W U) test, often referred to as the rank sum test, was applied to test the null hypotheses. If the null hypotheses that the two samples were drawn from the same population were true, the totals of the ranks (or equivalently, the mean ranks) of the two samples would be expected to be about the same [Hamburg, 1977; Conover, 1980; Davis and Cosenza, 1985; SPSS<sup>x</sup>, 2002]. Five percent of the Mann-Whitney two-tailed probability level was selected to signify the differences between preferences for digital books vs printed books.

## RESULTS

A total of 341 consumers was surveyed at a college campus in the eastern U.S., with 135 completed responses for analyses, representing 39.6 percent of the total surveyed. Table 1 presents the general information of the respondents. All the respondents had experience in downloading digital articles and/or books from websites. Table 2 presents online activities related to digital books, digital newspapers, and digital magazines.

Table 1: Backgrounds of the respondents

<i>Demographic issues</i>	Groups	Valid %
1. Age 1<18; 2=18-35; 3=36-55; 4>55	<18	1
	18-35	98
	>35	1
2. Your gender, male=1, female=2	Male	61
	Female	39
3. family annual income?	<\$30k	20
	\$30-50k	15
	\$50-75k	25
	>\$75k	40
4. Your highest education	high school	12
	College	80
	graduate	8
5. Your marital status	Married	11
	Not married	89

Table 2. Issues related to reading of digital books, newspapers and magazines.

	Response	Valid %
6a. have you ever read any book, newspapers, and magazines on computer or on any digital form?	Yes	90
	No	10
6b. do you have any e-readers, i.e. Amazon's Kindle, iPad, Nook, Sony's e-readers, or any other brand?	Yes	15
	No	85
7a. each week, how many hours on average do you spend on reading printed books, newspapers, magazines, including textbooks	<5	45
	5-10	37
	11-15	12
	16-20	2
	>20	4
7b. each week, how many hours on average do you spend on reading digital forms of books, newspapers, and magazines, including textbooks	<5	53
	5-10	23
	11-15	12
	16-20	7
	>20	5

Table 3 presents the Mann-Whitney test results. Significant differences are found in eight of the eleven variables: *easiness to carry around*, *low cost of possession of the reading materials*, *easy to share with others*, *easy to read*, *attractive prices for possessing contents*, *easy to obtain*, *free delivery or delivery incentives*, and *concern with copyright*. Therefore the null hypothesis is rejected. These eight variables, seven appear that the respondents prefer digital form vs. printed form, while the variable *easy to read* the respondents prefer printed forms.

Table 3: Mann-Whitney test results for all variables.

## MANAGERIAL IMPLICATIONS

The Mann-Whitney test results reject the null hypothesis and conclude that there are statistically significant differences from the consumers' standpoints between digital books vs printed books, as in the eight out of the total eleven variables, the significance levels are less than 5%. These variables are *easiness to carry around, low cost of possession of the reading materials, easy to share with others, easy to read, attractive prices for possessing contents, easy to obtain, free delivery or delivery incentives, and concern with copyright*.

These mean ranks of these variables indicate that seven out eight digital books receive high ranks than printed books. It is noticeable that one variable, *easy to read*, the respondents give higher rank for the printed book against digital book. It may suggest that publishers need to further refine the digital books in order to make them easier to read.

Three variables show there is no statistically significant difference between digital books and printed books: *weights, need of special reading instruments, i.e. kindle, eReader, iPad, Galaxy, Xoom, etc., and compatibility in the formats*. This may suggest, from the users' standpoint, publishers may not need to focus on this issue.

This empirical survey finds that consumers do not prefer special digital reading gadgets, as those usable gadgets have only been introduced in the recent few years. A generic functioned computer, i.e. iPad2 or netbook, or laptop, enable users to enjoy digital books, rather than purchasing specially design digital book readers, i.e. Amazon's Kindle.

Since this research, as it surveyed only college students, and the use of a small convenient sampling, cautions must be made in trying to generalize the outcomes of the research.

# WHY DO FIRMS MANAGE SECOND-TIER SUPPLIERS?

**Wen-Jan Chang and Dah-Hsian Seetoo**  
**National Chengchi University, Taiwan**

## ABSTRACT

*The triad relationship of '2<sup>nd</sup> tier supplier – 1<sup>st</sup> tier supplier – focal firm' is the basic unit to decompose more complex supply chain management practices. The reasons of 2<sup>nd</sup> tier supplier management of focal firms can further inform why focal firms practice different management methods to players of different tiers along a supply chain. From field observation, we wonder the motives behind do not much agree with traditional system view of supply chain management, but are more related to the theories of dyad inter-organizational relationship. Through case studies of eight companies, we find that the motives of 2<sup>nd</sup> tier supplier management include: curbing the opportunism of 1<sup>st</sup> tier suppliers, exploiting bargaining power of focal firms, and helping 1<sup>st</sup> tier suppliers with weaker position, inferior management skill, or unfulfilled integrator role. This paper also discusses contextual assumptions of these motives.*

## INTRODUCTION

For a focal firm, a 2<sup>nd</sup> tier supplier is the supplier of its direct supplier (1<sup>st</sup> tier supplier). To manage 2<sup>nd</sup> tier suppliers means a focal firm involves in the relationship between 1<sup>st</sup> tier suppliers and 2<sup>nd</sup> tier suppliers to allow some extent of direct flow of goods, money, information, knowledge from 2<sup>nd</sup> tier suppliers to the focal firm. 2<sup>nd</sup> tier supplier management practice includes actions like designating 2<sup>nd</sup> tier suppliers, auditing 2<sup>nd</sup> tier suppliers, transacting with 2<sup>nd</sup> tier suppliers, among others. However, despite of the popularity of this practice, few theories explain why firms manage relationships with upper stream suppliers instead of just interact with adjacent suppliers. Supply chain management related studies try to prove that multiple relationships across the supply chain can improve efficiency. Nevertheless, a micro foundation of this causal relationship is lacking. To fill this research gap, this paper investigates why a focal firm manages its 2<sup>nd</sup> tier suppliers. The triad of '2<sup>nd</sup> tier supplier-1<sup>st</sup> tier supplier-focal firm' is a basic unit to decompose multiple relationship management across the supply chain. Therefore, this paper aims to provide a micro foundation for supply chain management. Besides, the expected findings are also normative in that they suggest certain situations in need of 2<sup>nd</sup> tier supplier management to improve the performance of the focal firm. Especially, nowadays, competition is not between individual firms but between rivalry supply chains (Christopher, 1998).

## THEORY

Few if none research focuses on 2<sup>nd</sup> tier supplier management. In this section, we review two related research streams: supply chain management and triad relationship. Both of them could shed some light on the interrelationship between multiple actors in a supply chain.

### Supply Chain Management

There is no common definition of supply chain management (Burgess, Singh, & Koroglu, 2006). In this paper, we adopt the definition of Christopher (1998). He defines supply chain management as the management of relationships with suppliers and customers from upstream to downstream to provide greater customer value

with lower cost to entire supply chain. Many scholars regard supply chain management as a philosophy (Mentzer et al., 2001). The common features in this philosophy mentioned by scholars are system view, strategic approach, integration, synergy, synchronization, partnership and customer-orientation (Bechtel & Jayaram, 1997; Storey, Emberson, Godsell & Harrison, 2006). In a supply chain, actors with this philosophy must cooperate with each other to implement the supply chain management practices. The practices are various linked operation processes of actors across chain (Lambert and Cooper, 2000). All these processes aim to facilitate the flow of goods, information, resources across chain so that the effectiveness and efficiency of entire supply chain can be improved. To better coordinate these chain-wide processes, companies from up stream to down stream must work together as an integrated organization. Therefore, one important topic in SCM is the management of inter-organizational relationship. Most researches propose that to execute supply chain management, firms must treat each other as partners, build trust and commitment, share risk and reward, and value long-term goals (Mentzer et al., 2001; Storey et al., 2006). However, in practice few companies can implement supply chain management across an entire chain (Storey et al., 2006). It is reasonable to infer that not all actors are willing to cooperate with others. On the other hand, these kinds of actors still selectively establish links with other players of a chain. Except direct linkage, Lambert and Cooper (2000) points out that a focal firm can manage, monitor, or do nothing to any one linkage in a supply chain. The motives behind these management practices might be quite different from supply chain management philosophy, which emphasize integration of whole supply chains.

## Triad Relationship

In a power asymmetry dyad relationship, the less powerful party can involve a third party to lessen its dependence on the powerful one. Emerson (1962) suggests that a dependent party will find substitutes or form alliances with other weak players to fight against the powerful party. Gargiulo (1993) observes another strategy of the weak party to handle the asymmetry situation. A weak party can build link to a third party who holds power over the strong party. Through the influence of the third party, the weak party can lessen its dependency on the strong party. The above researches are all based on the point of view of a weak party. Does a powerful player in a dyad relationship exploit its bargaining power by establishing relationship with a third party? In a supply chain context, focal firms in weak or strong position may develop different strategies to involve third parties. Structural holes theory proposed by Burt (1992) is another way to analyze triad relationship. In the triad of “2<sup>nd</sup> tier supplier – 1<sup>st</sup> tier supplier – focal firm”, the 1<sup>st</sup> tier supplier bridges a structural hole between the 2<sup>nd</sup> tier supplier and the focal firm thus enjoys the benefit of information and control. To share or get the benefit hold by the 1<sup>st</sup> tier supplier, the focal firm may link with the 2<sup>nd</sup> tier supplier directly to close the structural hole. However, the focal firm does not eliminate the role of 1<sup>st</sup> tier supplier entirely. We need to know more about to what extent focal firms will skip 1<sup>st</sup> tier suppliers when linking 2<sup>nd</sup> tier suppliers.

## METHOD

We adopted case studies method developed by Eisenhardt and Graebner (2007) to analyze empirical data and build theory. This paper aims to answer a practical question ‘why firms manage 2<sup>nd</sup> tier suppliers’ which is not found in theories, thus induction is an appropriate method. Among various qualitative inductive methods, we chose case studies method developed by Eisenhardt and Graebner (2007), which is especially suitable for exploring new phenomena with rudiment theoretical schemes.

## Case Selection and Analysis

We selected 8 companies in Taiwan: 6 in electronic industry and 2 in textile industry. Electronic industry and textile industry are chosen because of their significance in Taiwan’s GNP. The composition of the informants is one president, five purchasing manager or staff, and one sales manager. They all experience 2<sup>nd</sup> tier supplier management practice and therefore are qualified to provide information. We conducted interviews with semi-open questionnaires. All interviews are tape-recorded and transcribed. Then we analyzed transcribed texts to extract constructs and propositions. The extracted constructs and propositions in previous cases are modified when we proceeding into later cases until they can accommodate all phenomena of cases. Table 1 summarizes these motives and corresponding management practices of focal firms.

**Table 1 The Motives of 2nd Tier Supplier Management**

<b>Motive</b>		<b>Management Practice</b>
Curb the opportunistic behavior of 1st tier supplier		1. Gaining information of 2nd tier supplier through 1st tier supplier 2. Exchanging information with 2nd tier supplier 3. Auditing 2nd tier supplier before mass production 4. Designating 2nd tier supplier 5. Transacting directly with 2nd tier supplier
Supplement 1st tier supplier's bargaining power		1. Transacting directly with 2nd tier supplier 2. Handling 2nd tier supplier's problem after mass production
Supplement 1st tier supplier's capability		3. Handling 2nd tier supplier's problem after mass production
Substitute 1st tier supplier's integration role	1st tier suppliers do not see the possibility to create greater value by joint development of focal firms and 2nd tier suppliers	Co-development with 2nd tier supplier
	1st tier suppliers cannot translate properly focal firms' request specification to procurement specification to 2nd tier suppliers	1. Designating 2nd tier supplier 2. Transacting directly with 2nd tier supplier 3. Handling 2nd tier supplier's problem after mass production
	When information transferred from 2nd tier suppliers via 1st tier suppliers to focal firms, the value addition of 1st tier supplier is less than the cost of delay and distortion it causes.	Exchanging information with 2nd tier supplier

## Case Analysis Results

The case analysis result shows that there are seven 2<sup>nd</sup> tier supplier management methods. They are not comprehensive representation of all 2<sup>nd</sup> tier supplier management available. One management method might correspond with more than one motive. The seven management methods are listed below.

1. Auditing 2<sup>nd</sup> tier supplier before mass production.
2. Handling a 2<sup>nd</sup> tier supplier's problem after mass production.
3. Transacting directly with 2<sup>nd</sup> tier supplier.
4. Gaining information of 2<sup>nd</sup> tier supplier through 1<sup>st</sup> tier supplier.
5. Designating 2<sup>nd</sup> tier supplier.
6. Exchanging information with 2<sup>nd</sup> tier supplier.
7. Co-development with 2<sup>nd</sup> tier supplier.

## FINDINGS

The analysis of cases indicates that focal firms manage 2<sup>nd</sup> tier suppliers out of two kinds of motives: curbing 1<sup>st</sup> tier supplier's opportunistic behavior and supplementing 1<sup>st</sup> tier supplier's ability in 2<sup>nd</sup> tier supplier management. The inability of 1<sup>st</sup> tier suppliers includes insufficient capabilities, weak bargaining power, and ill-functioned integrator role.

## Curbing the Opportunistic Behavior of 1st Tier Supplier

Barney (1990) argues, not everyone is opportunistic, but focal firms can not verify who is and who is not. In the cases studied, we found that the information asymmetry between 1<sup>st</sup> tier suppliers and focal firms bothers focal firms of possible cheating of 1<sup>st</sup> tier suppliers. Many inter-firm relationship studies have investigated solutions to suppliers' opportunism. Those solutions include replacing suppliers, configuring appropriate governance modes (Williamson, 1985), and intervening in partner's operation (Gulati & Singh, 1998). Nevertheless, these solutions are not feasible in thin markets and for weak focal firms (Heide & John, 1988). In this kind of situation, it is common that firms adopt 2<sup>nd</sup> tier supplier management to regulate 1<sup>st</sup> tier suppliers. By applying Burt (1992)'s structural hole framework, once focal firms link to 2<sup>nd</sup> tier suppliers directly, closing the structural hole, focal firms can capture benefits originally appropriated by 1<sup>st</sup> tier suppliers.

## **Supplementing 1st Tier Supplier's Ability in 2nd Tier Supplier Management**

If a focal firm finds out that a supplier is not qualified to manage its suppliers, the focal firm can simply search for a better supplier. However, in some occasions, focal firms find it necessary to manage 2<sup>nd</sup> tier suppliers. These situations include: (1) all 1<sup>st</sup> tier suppliers are incompetent to manage a certain 2<sup>nd</sup> tier supplier; (2) the relation-specific asset investment traps the focal firm in a thin market; (3) the focal firm intentionally splits purchasing orders to several 1<sup>st</sup> tier suppliers to augment its bargaining power towards each 1<sup>st</sup> tier supplier; (4) the 2<sup>nd</sup> tier supplier is a monopolist, all 1<sup>st</sup> tier suppliers are weak when facing it; (5) though ill performing in managing some 2<sup>nd</sup> tier suppliers, the 1<sup>st</sup> tier supplier as a whole is still better than other alternatives. These five situations lead focal firms to help 1<sup>st</sup> tier suppliers in the parts they perform poorly. The inability of 1<sup>st</sup> tier supplier comprises three types. (1) 1<sup>st</sup> tier supplier's bargaining power towards 2<sup>nd</sup> tier supplier is weak. Powerful focal firms will expand monopoly power to upstream markets (Spulber, 1992). For less powerful focal firms, they will join the negotiation between 1<sup>st</sup> tier supplier and 2<sup>nd</sup> tier supplier to enlarge 1<sup>st</sup> tier supplier's power (Emerson, 1962). (2) 1<sup>st</sup> tier supplier's capability of managing 2<sup>nd</sup> tier supplier is insufficient. Managing 2<sup>nd</sup> tier suppliers out of this motive is generally only temporary for focal firms. Whenever possible, 1<sup>st</sup> tier suppliers will replace the 2<sup>nd</sup> tier suppliers with more reliable ones, otherwise 1<sup>st</sup> tier suppliers will be replaced by focal firms. (3) 1<sup>st</sup> tier supplier does not act the integrator role to bridge a focal firm and 2<sup>nd</sup> tier supplier. The integration role displays in three aspects: channeling information, initiating co-development project, and transforming demand specifications. The first aspect, channeling information, is a supply chain wide phenomenon and is not specific to certain 1<sup>st</sup> tier suppliers. Therefore, the supply chain management studies emphasize the direct information exchange between firms in different tiers (Bechtel & Jayaram, 1997). As for the second and third aspects, sometimes they are caused purposely by focal firms. When focal firms want to keep the profit of integration or want to internalize the activity of 1<sup>st</sup> tier suppliers in the next step, they will strategically choose less capable 1<sup>st</sup> tier suppliers (Chiang, 2007).

## **DISCUSSION**

### **The Imperfection of Market Competition**

In the triad relationship of '2<sup>nd</sup> tier supplier-1<sup>st</sup> tier supplier-focal firm', if the market between 2<sup>nd</sup> tier suppliers and 1<sup>st</sup> tier suppliers and the market between 1<sup>st</sup> tier suppliers and focal firms are in perfect competition, neither focal firms nor 1<sup>st</sup> tier suppliers need to manage their suppliers. Furthermore, the focal firms need not to involve the 2<sup>nd</sup> tier supplier market. However, when one of the two markets is imperfect, the focal firms will need to manage 2<sup>nd</sup> tier suppliers. For instance, 1<sup>st</sup> tier suppliers are in a perfect competition market, but 2<sup>nd</sup> tier suppliers are in an imperfect competition market, which means 2<sup>nd</sup> tier suppliers may be opportunistic or monopolistic towards 1<sup>st</sup> tier suppliers. In the cases this paper analyzes, some 1<sup>st</sup> tier suppliers are weak relative to focal firms and 2<sup>nd</sup> tier suppliers. The surplus profit is possessed by 2<sup>nd</sup> tier suppliers and focal firms. If focal firms want to capture a bigger portion of the surplus, they can only bargain with 2<sup>nd</sup> tier suppliers. Secondly, when 2<sup>nd</sup> tier suppliers are in a perfect competition market, but 1<sup>st</sup> tier suppliers are in an imperfect competition market, the surplus profit of the supply chain is possessed by 1<sup>st</sup> tier suppliers. Facing the opportunism and monopoly power of 1<sup>st</sup> tier suppliers, focal firms may contact 2<sup>nd</sup> tier suppliers to confine 1<sup>st</sup> tier suppliers' opportunistic behavior. When both 1<sup>st</sup> tier and 2<sup>nd</sup> tier suppliers are in an imperfect competition market, the incentives of focal firms to manage 2<sup>nd</sup> tier suppliers are even stronger. Generalizing the discussion

to a whole supply chain, we can infer that if one of the markets of supply chains is imperfect, there is surplus that motivates a focal firm to seize it by actively managing the suppliers who hold it.

## The Strategic Intention of 2nd Tier Supplier Management

Focal firms may strategically choose less eligible 1<sup>st</sup> tier suppliers and accordingly involve the 2<sup>nd</sup> tier supplier management. For instance, focal firms split orders to several 1<sup>st</sup> tier suppliers to stimulate competition between them and pool risk. This strategy augments focal firms' power relative to 1<sup>st</sup> tier suppliers but lowers 1<sup>st</sup> tier suppliers' power relative to a common 2<sup>nd</sup> tier supplier. A complementary practice is summing purchase amount of each 1<sup>st</sup> tier suppliers towards a certain 2<sup>nd</sup> tier suppliers. Then the focal firm bargains with the 2<sup>nd</sup> tier supplier by the total amount to get a better deal. When a focal firm's margin is low, it may choose a 1<sup>st</sup> tier supplier not acting integrator role well and do the integration by itself to earn the return of integration.

## The Comparative Advantage of 1st Tier Suppliers

There is an assumption when we argue that focal firms manage 2<sup>nd</sup> tier suppliers to supplement 1<sup>st</sup> tier suppliers' inability. That is focal firms are more capable than 1<sup>st</sup> tier suppliers in managing 2<sup>nd</sup> tier suppliers. This assumption is not a normal situation in a supply chain because 1<sup>st</sup> tier suppliers should be more capable than its suppliers or customers to perform its "in-between" role. We want to elucidate the role and capability of 1<sup>st</sup> tier suppliers and clarify when focal firms will outperform 1<sup>st</sup> tier suppliers.

**Pooling.** A 1<sup>st</sup> tier supplier can pool several customers' orders to generate economy of scale. If a focal firm skips the 1<sup>st</sup> tier supplier to purchase from a 2<sup>nd</sup> tier supplier, the purchasing amount is smaller therefore no price advantage can be achieved. Only when focal firms are big companies and split orders to several 1<sup>st</sup> tier suppliers which do not have other customers would the direct procurement of the focal firms to a 2<sup>nd</sup> tier suppliers justify.

**Bridging.** Between focal firms and 2<sup>nd</sup> tier suppliers, a 1<sup>st</sup> tier supplier can channel information, fill the knowledge gap, and coordinate the linkage of processes. When focal firms are in distance with 2<sup>nd</sup> tier suppliers in geography, mind set, culture, or technology, 1<sup>st</sup> tier supplier is necessary to bridge these two parties. However, if the distance between 2<sup>nd</sup> tier suppliers and focal firms in every aspects is short, and meanwhile 1<sup>st</sup> tier suppliers add little value or cause extra cost in between, focal firms would displace the bridging role of 1<sup>st</sup> tier suppliers.

**Buffering.** 1<sup>st</sup> tier suppliers should buffer focal firms from fluctuations in upper stream markets. Whenever 2<sup>nd</sup> tier suppliers cause problems, 1<sup>st</sup> tier suppliers should try to mitigate or absorb them before pass them to focal firms. If 1<sup>st</sup> tier suppliers perform no buffering function, focal firms are forced to confront with 2<sup>nd</sup> tier suppliers' problems.

Each 1<sup>st</sup> tier supplier acts multiple roles, not all of which are well performed. A focal firm should review carefully how a 1<sup>st</sup> tier supplier functions in each role then adopt proper management methods.

## CONCLUSION

Supply chain management literatures focus on the partnership and the interlinked operation processes between firms across chain. In reality, this cooperation-oriented approach is not the only motive behind all kinds of inter-organizational management practices in a supply chain. This paper finds that a focal firm may manage its 2<sup>nd</sup> tier supplier, an initial step in supply chain management, out of different strategic concerns. From a transaction cost view, 2<sup>nd</sup> tier supplier management can be deemed a hybrid governance mode to curb the opportunism of 1<sup>st</sup> tier supplier. From a power perspective, a strong focal firm manages 2<sup>nd</sup> tier suppliers to further exploit its bargaining power and a weak focal firm manages 2<sup>nd</sup> tier suppliers to help 1<sup>st</sup> tier suppliers to balance the power of 2<sup>nd</sup> tier suppliers. Complying with supplier development research, a focal firm will help its 1<sup>st</sup> tier suppliers to improve operation activities of which 2<sup>nd</sup> tier supplier management is a part. From a vertical integration view, a focal firm may take over the integrator role of 1<sup>st</sup> tier supplier just to earn the return of this integration activity.

This paper contributes to theory in demonstrating that the theories of dyad inter-organizational relationship can be extended to triad relationship of a supply chain. This extension then can supplement the dominant system view of supply chain management research stream. For practitioners, this paper provides a

useful guide to the occasions and methods of 2<sup>nd</sup> tier supplier management to improve a focal firm's performance. However, readers should apply the findings cautiously because they are derived from certain context and thus may not be applicable in other industries or economies. Future research can test the findings in big sample survey to validate their robustness.

# INVESTIGATING THE BUYER BEHAVIOUR OF ORGANIC FOOD IN URBAN CHINA

**Jue Chen, Antonio Lobo and Bruno Mascitelli**  
**Swinburne University of Technology, Australia**

## ABSTRACT

*This paper aims to investigate the dimensions important to consumers in the People's Republic of China associated with their pre-purchase evaluation of organic foods. Data was collected in China in two stages i.e. two hundred valid on-line survey responses were collected for the purpose of the pilot study, and subsequently nine hundred and sixty paper-based responses were obtained from four major Chinese cities. The findings of this study revealed that Chinese consumers' purchase of organic food is influenced by the following dimensions: product-related, regulatory, and lifestyle (variety seeking and self-indulgence). Additionally the above mentioned dimensions had a direct or indirect impact on pre-purchase evaluation and behavioural intentions. Personal attitudes for the purchase of organic food influenced pre-purchase evaluation, and finally pre-purchase evaluation impacted on the behavioural intention.*

## BACKGROUND AND HYPOTHESES

In the last decade or so, there has been a significant increase in the interest of organic foods. Current literature, examining consumers' awareness of organic food has been well developed in North America and Western Europe (Bonti-Ankomah & Yiridoe 2006). Organic foods are perceived as being more nutritious, healthier, safer, and environmentally friendly. They contain less chemical residues and taste better than conventional food hence, consumers are willing to pay a premium price for organic food (Krystallis et al. 2006). Even in newly emerging markets, consumers are still willing to pay a higher price for higher quality, taste, and 'safety' certified foods (Grannis et al. 2001). China has experienced dramatic economic growth in the last twenty years, and is developing an affluent urban middle class for the domestic organic food market. Over the recent period the Chinese organic sector has grown faster than the worldwide average. China has gone well beyond being an adopter of the world organic concepts, and is now an active organic innovator (Paull 2008). Only a handful of studies in relation to organic food consumption have been conducted in Asian countries such as Japan, Taiwan, India and Thailand. As best as can be ascertained, very few studies of this nature have been undertaken in China, a fast growing economy where organic foods are increasingly being marketed. As such little is known or understood about Chinese consumers' attitudes towards organic products or their purchase behaviour.

This research aims to investigate the dimensions influencing consumers' purchase intentions of organic food in urban China. The conceptual model for the purchase intentions of organic food in China was developed based on the theories of reasoned action and planned behaviour (Ajzen 2005; Ajzen & Fishbein 1969) and also the consumer decision making process (Blackwell et al. 2006). These theories have been widely utilised within the food and organic food studies (Drichoutis et al. 2007). The conceptual model relating to consumers' purchase intention of organic food in urban China comprises the following dimensions:

Product-related: A study by Steptoe, Pollard, and Wardle (1995) reveals that concern for health, moods, convenience of food preparation and sensory appeal are components in the choice of food. Organic food purchase is motivated by consumers' sensory appeal and concern for health (Arvanitoyannis et al. 2003). However, studies also revealed that some of the reasons for the non-purchase of organic food include consumers' perceptions of it being expensive, lack of perceived value and unsatisfactory in appearance (Sanjuán et al. 2003).

Regulatory: There is a relatively poor understanding of the legal use of the term 'organic' on food products including inspection and certification systems (Padel & Foster 2005). Misleading labelling and

certification, low profile distribution channels, limited in availability and choices (Gallagher & McEachern 2003).

**Lifestyle:** For regular organic food buyers, consumption of organic food is part of their lifestyle and they have related interests in nature, society and the environment. A recent trend emanates from the US which is called LOHAS (acronym for Lifestyle of Health and Sustainability). It refers to a new kind of lifestyle and a trend which some consumers practise. This trend is gaining popularity in the affluent cities of China like Shanghai and Beijing (United States Department of Agriculture 2008). Consumers who attempt to pursue a healthy diet and balanced lifestyle have higher intention to purchase organic food products (Magistris & Gracia 2008).

**Ethnocentrism:** Studies demonstrate that country of origin is an important issue for organic food consumers, Norwegian consumers perceive locally produced organic goods as being safer than imported cheaper organic foods (Storstad & Bjørkhaug 2003). From ancient times, Chinese people have valued patriotism. However, Chinese consumers' attitudes toward western luxury goods are generally positive (Lu 2008).

Consumers' purchase of organic food is based on subjective experiences and perception of organic food products (Hughner et al. 2007). It is perceived that organic food is healthier, natural, nutritious and environmentally friendly. Consumers' attitude toward the purchase of organic food is generally assumed to be positive (Chen 2007). It is perceived that organic food has better quality, and consumers with positive attitudes toward organic food are more likely to form positive intentions to purchase organic food (Honkanen et al. 2006). Based on extant literature, the following hypotheses have been elicited:

**Hypothesis one**

*H<sub>1a</sub>: Product related dimension has a positive influence on the individual attitudes of urban Chinese consumer*

*H<sub>1b</sub>: Product related dimension is positively correlated to the pre-purchase evaluation*

*H<sub>1c</sub>: Product related dimension is positively correlated to the Chinese consumers' behavioural / purchase intentions*

**Hypothesis two**

*H<sub>2a</sub>: Regulatory dimension has a positive influence on individual attitudes of urban Chinese consumers*

*H<sub>2b</sub>: Regulatory dimension is positively correlated to the pre-purchase evaluation*

*H<sub>2c</sub>: Regulatory dimension is positively correlated to Chinese consumers' behavioural / purchase intentions*

**Hypothesis three**

*H<sub>3a</sub>: Lifestyle has a positive influence on the individual attitudes of urban Chinese consumers*

*H<sub>3b</sub>: Lifestyle is positively correlated to the pre-purchase evaluation*

*H<sub>3c</sub>: Lifestyle is positively correlated to Chinese consumers' behavioural / purchase intentions*

**Hypothesis four**

*H<sub>4a</sub>: Ethnocentrism has a negative influence on the individual attitudes of urban Chinese consumers*

*H<sub>4b</sub>: Ethnocentrism is negatively correlated to the pre-purchase evaluation*

*H<sub>4c</sub>: Ethnocentrism is negatively correlated to Chinese consumers' behavioural / purchase intentions*

**Hypothesis five**

*H<sub>5</sub>: Chinese consumers' attitudes towards organic food is directly and positively correlated to Pre-purchase evaluation*

**Hypothesis six**

*H<sub>6</sub>: Pre-purchase evaluation is directly and positively related to behavioural / purchase intentions*

## METHODOLOGY

This study is predominantly quantitative in nature. To ensure validity and reliability and of the survey instrument, pre-testing using focus groups was undertaken. Data was collected in China in two stages i.e. 200 valid on-line survey responses were collected for the purpose of the pilot study, and subsequently 960 usable paper-based survey responses were obtained from four major Chinese cities. This data was collected in 2009 and 2010. The English version of the instrument was translated into Chinese by the bilingual researcher. For purposes of verification, all items of the survey were translated back into English to verify the reliability of the translation. The translated versions were also cross-checked by three other bilingual researchers to ensure content and face validity.

The on-line survey was made available via the university's Opinio platform. This Opinio software enables production and reporting of a survey and ensures anonymity, confidentiality and privacy to participant. The web link to the on-line survey was sent to selected Chinese food outlets for onward submission to their customers. The sampling frame was drawn up using the retail food outlets' customer database. Participants were randomly selected from the sampling frame. Care was taken to include a proportionate number of prospective customers. Four hundred and five participants logged onto the web link, and finally a total of two hundred valid on-line responses were collected during one month period.

After the on-line data was analysed, the survey instrument was slightly modified for usage in paper-based survey, which comprised the main study. Organic foods are still relatively new products, primarily available in large supermarkets in major Chinese cities (Li et al. 2005). Previous study indicates that data collected in food outlets of retail chains is an efficient method (Drichoutis et al. 2007). The paper-based survey questionnaires were administered at major supermarkets in four selected Chinese first and second tier cities, namely Beijing, Shanghai, Shenzhen and Chengdu. These cities are geographically dispersed, i.e. they are located in the east, west, north and south of China, and are economically and politically prominent and the main engines of China's phenomenal economic development. Hence consumers are more affluent, and are more likely to be aware of organic foods. All the participating supermarkets had dedicated organic food sections.

Shoppers were approached randomly by trained personnel to participate in self-administered questionnaires at the main entrance of the supermarkets. They were instructed to seek out demographic variation where possible and the questionnaires were presented to consumers entering these supermarkets throughout the day during the trading hours of the stores. Consumers were approached randomly and asked 'Have you ever heard of the term organic food?'. If the respondent answered 'yes', then they were asked 'Would you like to participate in the survey?'. If the consumer answered 'No', the next customer entering the store would be approached and so on. Then, every tenth individual consumer who walked in the supermarket was asked the same questions. A small gift of organic food (eg: nuts, vegetables, milk) was offered in appreciation of their time to answer the questions. Five hundred questionnaires were distributed in each city, hence a total of two thousand questionnaires were administered. Finally, nine hundred and sixty valid surveys were obtained. The paper based data was collected over a period of one month. Both on-line and paper-based survey response rates were as high as 50 percent. This is consistent with extant literature which suggests that the response rates of consumers of specialised goods like organic food products can be as high as 40%-50% (Honkanen et al. 2006).

## RESULTS

SPSS version 18 was used to examine the data for accuracy, missing values, fit between their distributions and the assumption of multivariate analysis. A series of exploratory factor analyses (EFA) was performed on the pilot study data of the 200 on-line surveys to identify the factors and associated latent variables. Data analysis of the pilot study revealed ten factors which were named 'sensory appeal', 'price perception', 'regulatory', 'self-indulgence', 'variety-seeking', 'opinion-leadership', 'ethnocentrism', 'attitudes', 'pre-purchase evaluation', and 'behavioural / purchase intention'. Out of the original 52 statements, seven were deleted in the process of the EFA. Hence 45 statements were retained, and used in the next stage of data collection, i.e. paper-based survey (the main study).

A series of confirmatory factor analyses (CFA) was then conducted on the data from the paper-based surveys to validate the findings from the EFA of the pilot study. Confirmatory factor analysis is like creating a structure and testing an objective against the structure to see how well it fits. To evaluate the measurement models for each dimension, covariance structure analysis was carried out using software called AMOS (Analysis of Moment Structures) version 18. Ten statements were removed due to model fit requirements. Hence 35 statements forming seven measurement models were retained for the final model. All the re-specified measurement models were formed to satisfy most indices (Kline 2010). The reliability of scores of the measurement model ranged from .827 to .570. It is assumed that the internal consistency was acceptable and adequate to be part of the structural equation model.

McEachern & Willock's (2004) study suggests that it would be an advantage to adopt structural equation modelling in future research regarding organic consumers' attitudes and motivations, as it would create the capacity to scrutinise a series of dependent relationships concurrently. 'It allows analysing simultaneously the relationships between dependent and independent variables in the organic food intention to purchase model' (Magistris & Gracia 2008 p.935). A structural model aims to specify which latent variables directly or indirectly influence the other latent variables in a model (Bollen 1989). In this study, all latent variables in the

measurement models were validated, and re-specified models fitted well. The structural model was tested and presented as the final stage. Post hoc model modifications were performed in an attempt to develop a better fitting and possibly more parsimonious model.

The 35 statements of the measurement models were reduced to 28 statements in the final best fit model which is shown in Figure 1. This model explained that 41.3 % of the variance was in ‘individual attitudes’, and that 39.5% of the variance was in ‘pre-purchase evaluation’ while 66.4% of the variance was in the ‘behavioural/purchase intention’.

Figure 1: Purchase intention of organic food in urban China

Note: Chi-square =931.176, df=331,  $p^a$  (Bollen-Stine bootstrap  $p$  value) = .001, CMIN/DF=2.813, GFI=.931, AGFI=.915, TLI=.905, CFI=.916, RMSEA=.044, 90% CI= (.041,.048), SRMR=.0497

Reliability tests were conducted on all the dimensions. The Cronbach's alpha scores ranged between .715 to .827, except for one dimension, i.e. regulatory. This reading had a Cronbach's alpha of .609. Ideally the Cronbach's alpha should be above .700. However the Cronbach alpha values are quite sensitive to the number of items in the scale. With scales fewer than ten items, it is common to find quite low Cronbach values (Pallant 2007). Therefore, the internal consistency of dimensions in the final model was acceptable and adequate. In order to confirm how well the results obtained from the use of measures fitted relevant theories, discriminant validity testing was conducted based on the final model.

Table 1 summarises the results of hypotheses testing. A version of 't' test was employed which uses critical ratios from the SEM. Standard errors in the S.E. column, C.R. column stands for Critical Ratio (magnitude > 2 indicates statistical significance at the .05 level).  $P$  value indicates statistical significance at levels of 0.001, 0.01 and 0.05 respectively. The direction and importance of the relationships is determined by the magnitude of Beta weight.

Hypothesis one was partially supported. Product related dimension had a significant relationship with personal attitudes and pre-purchase evaluation, but no significant relationship with behaviour/purchase intentions. However, the results also revealed that the product related dimension had an indirect effect (.371) on behavioural intentions, which means the product related dimension was associated with behavioural/ purchase intentions through the mediatory affect of personal attitudes and pre - purchase evaluation.

Hypothesis two was partially supported. Regulatory dimension had a significant relationship with personal attitudes and pre-purchase evaluation, and no significant relationship with behavioural/purchase intention. However, the results also revealed that the regulatory dimension had an indirect effect (.332) on behavioural intentions, which means that the regulatory dimension was associated with behavioural / purchase intentions through the mediatory affect of personal attitudes and pre - purchase evaluation.

Hypothesis three was partially supported. The lifestyle dimension comprised 'variety seeking' and 'self-indulgence' factors, both of which had significant influences on personal attitudes and purchase intentions. The results also revealed that the lifestyle dimension had indirect effects (.161) on behavioural/purchase intentions, which means that it was associated with pre-purchase evaluation through the mediatory affect of personal attitudes.

Hypothesis four was rejected. The results indicate that the ethnocentrism dimension did not influence personal attitudes, pre-purchase evaluation or purchase intention.

Hypothesis five and hypothesis six were supported. Personal attitudes dimension had a significant influence on pre-purchase evaluation ( $p$  value was significant), and the pre-purchase evaluation dimension had a significant influence on behavioural / purchase intention ( $p$  value was significant).

Table 1: Summary of hypotheses test (H<sub>1a</sub> - H<sub>6</sub>)

Hypothesis No				Estimate	S.E.	C.R.	P	Accepted /Rejected	Beta

## CONCLUSION AND LIMITATIONS

Firstly the findings of this study have revealed that consumers' attitudes are positively and directly influenced by the dimension of the product, regulatory and lifestyle (especially variety seeking and self-indulgence) issues. The results also revealed that both product-related and regulatory dimensions had significant influences on pre-purchase evaluation, and both dimensions were associated with behavioural / purchase intentions through the mediatory affect of personal attitudes and pre-purchase evaluation. This affirms that the characteristics of organic food have both direct and indirect effects on consumers' intention to buy organic products (Chen 2007). Interestingly noted, items relating to price were deleted due to model fit requirements. This may provide evidence that price is not as important as is the food safety in a comparative measure. Food safety is the one of most important issues influencing consumers' buyer behaviour of organic food in China. Consumers probably give up purchasing food products unless there are signs of the products quality (Ennis 2007). Labelling seems one of the important issues among organic food purchasers. Confusion still exists among consumers as to what defines 'organic'. An organic logo is the consumer's guarantee that product has been produced organically (McDonald 2001). There is a lot of confusion amongst Chinese consumers and previous food and milk scandals have damaged consumers' confidence. There is a lack of trust in overall organic food quality as consumers are unsure about the enforcement of quality by Chinese authorities. Government agencies and industry need to be aware of the necessity to regulate and provide credible certification to organic food. They also need to enhance the inspection and certification of organic food labelling as well as ensure that the labelling and logos of organic food are a sign of quality. This has severe managerial implications for producers and marketers of organic food products in China. They need to work tirelessly to gain the confidence of the consumers by publicising the overall quality process and associated food safety issues. Additionally they need to enhance the awareness and promote the benefits of organic food, as several potential consumers are ignorant about these facts. They need to make it convenient for consumers to purchase organic food products by streamlining the distribution network and making these products readily available even in the smaller cities.

Changes in lifestyle can have adverse effects on the consumption of organic food. Organic food consumers are being portrayed as 'greenies', 'health nuts' or 'yuppies', who are more interested in fashion than anything else. Hence consumption of organic food reflects a 'green' lifestyle (Lockie et al. 2002). The results of studies on ethnocentrism reveal that consumers in developing countries, buying foreign products is generally considered a social symbol, and also very trendy, particularly those products originating from prestigious countries (Batra et al. 2000). Our analysis reveals that the ethnocentrism dimension of Chinese consumers did not negatively influence their personal attitudes, pre-purchase evaluation or even their final purchase intention. This finding is in line with Wang & Chen (2004) who suggest that the impact of ethnocentrism on consumers willing to buy domestic products tends to be weaker, particularly, when consumers hold higher conspicuous

consumption values, and where they tend to perceive domestic products as lower quality products. This aspect of our findings should motivate and encourage exporters of organic food products to China. Exporters especially from developed countries should leverage on this finding and endeavour to market their organic food products both effectively and efficiently.

This research study is one of the very few associated with consumer buyer behaviour of organic food in urban China. The unique conceptual model used in this study is a combination of three theoretical models, namely, the theory of reasoned action, the theory of planned behaviour and the theory of consumer decision making process. The findings of this research study have important implications for marketers of organic food in China. They should attempt to leverage on these findings by educating their target audience, (both existing and potential customers) and by promoting trials of organic food products. Beneficiaries of this research study include various stakeholders in China and globally such as consumers, vendors both local and international and government agencies.

A number of hypotheses were tested in this study using extensive data obtained from a large sample size. Further analysis using invariance testing will be performed to investigate whether there are significant differences in the data obtained from the four major cities of China. Finally, it would be beneficial to investigate changes in consumers' attitudes and their behavioural intentions over time by conducting a longitudinal study.

# THE MULTIDISCIPLINARY PARADIGM IN THE FIELD OF INNOVATIVE MARKETING – PREREQUISITES FOR BECOMING

**Marina Chernova National Research University, Russia**  
**Oleg Klepikov, FOLIO Research Group, Russia**

## ABSTRACT

*Inefficiency of classical research methods is attendant by a gradual inversion of transition from quantitative analysis to qualitative or adjacent methods, in particular, for example, semantic differential, etc. and it potentiates also with a syndrome of consumer accustoming and training that is original display of marketing companies activity feedback. Way of marketing research development as a separate direction, was undergoing difficult oscillating motions many times which on a global scale periodically inclined researchers mainly at one moment to a qualitative, at another – a quantitative pole. Meanwhile, many professional researchers, based even on their own competence, not to mention supervision and environment actual, note influence of periodically arising tendency on this or that research type. Each similar tendency has been always mediated by occurrence of a new methodology, or a new view on already existing techniques.*

## INTRODUCTION

Fundamental principle of any research complex is communication mediated through the cognitive processes – i.e. relation for information interchange between a researcher and a consumer which assumes the answer of the respondent to any question, or participation in any conscious action. Researches do not supervise directly over consumer unconscious reactions too often.

Certainly, the considered phenomenon is in the level of researcher professional competence, and each competent expert aspires to lower its influence by applying projective techniques and more or less successfully disguising true purposes of his/her researches. These and some other attempts to tilt the balance from time to time in favor of one or another side that leads to efficiency increase in separately taken situations, but do not result in essential efficiency growth of the research process on a global scale.

In this background, as it has already been mentioned earlier, while taking part in researches, the consumer can often realize its purposes, general structure, and formulated hypotheses at level of logic thoughts. In addition, while participating in the consumption process, the respondent can learn new models of analytical support of communications and their implementation process. By gaining the similar experience, people under test show two classic tendencies:

1. Tendency of accustoming to used methodologies;
2. Tendency of manipulation training that results in a form of unconsciously shown behavioral patterns.

As a matter of fact, these tendencies are a negative feedback of a connection between marketing and consumer which, moving to the modern level, unfortunately does not provide any possibility for its complete compensation any more. It turns out that the quality of consumer behavior management decreases with the time and it demands new research paradigms and analytics of researches results to be born, however there has been given no adequate answer to these questions by research environment.

An exception can be a quite limited list of perspective directions which resists described negative phenomena within an existing subject matter:

- So occurrence of new mathematical models for studying the semantic differential as a combination of a qualitative and a quantitative estimation with maximum attention distraction of the respondent from purposes declared for them, already makes a serious contribution to an estimation of perception semiotics of the existing and potential consumer;

- Development of electronics and network technologies led to creation of new forms of behavioral reactions and ethnographic systems of a new type – to large electronic databases with analysis of which dynamics of consumer behavior may be investigated, with simultaneously occurring possibility of an answer implementation for his/her queries and modulation of this answer according to individual patterns of perception;

- A qualitative breakthrough in the area of cognitive sciences with their parallel invasion in various fields of activity that already causes and will cause in the future changes on a larger scale in the research and administrative processes what will be discussed later.

## **MARKET PROSPECTS OF MARKETING RESEARCHES DEVELOPMENT**

Our disappointment would be not fully described without speaking of one more trouble of many allocated processes and systems, and unfortunately the research market in this case is no exception.

The trouble means a large quantity of the diverse techniques of an embodiment of researches for one separate subject. And though a similar diversity reflects a quite high useful competition for any market, nevertheless, taking into account that the economical answer almost directly depends on research and analytical processes, it will be wrong to assert that the developing state of things has a positive impact on the whole economy.

It is possible to investigate any of research areas as an example, including:

1. Researches in the area of brand capital;
2. In the field of consumer satisfaction;
3. Basic researches,

that completely show all correctness of expressed statements (Berger, Heath, 2007).

In the given context a statement of the question would be logical – what the competition on almost operating economy markets will lead to? There is a simple answer – by exceeding a threshold this competition leads to destabilization of economy and to attendant decrease in its efficiency. Incomparability of data as consequence of application of different analysis methodologies is an indisputable result of this competition and is an acute problem not only for the research environment.

How to fight against the built paradigm in the world of marketing researches? In our opinion, everything is both simple and complicated at the same time.

Logical development of a modern paradigm:

1. Development of researcher expertise for example, when researches of the brand capital will not be torn away from researches of commodity appeal that now is deprived of possibility to make a qualitative evaluation of the level of capital use;
2. Working out new methodology, in particular due to growth of Internet and mobile devices invasion.
- 3.

Thereupon, it is extremely necessary to increase researcher expertise that will allow them to receive fuller comprehension not only of tools, but also of the process and global problems it has. Nowadays many existing researches of the brand capital have a perfect answer to the question: "What includes the attributive instrument of "the brand capital" concept? However they do not respond to the question: "How the use of the brand capital and adherence correlate with each other?", while the correlation of these parameters allows to make a real efficiency estimation of capital resources use and expected prospects of a brand. In most cases in modern level we receive "analytics of second level" – and though it is not a descriptive analytics, but also not yet an analytics that directly favors making decisions. Whether conscious or unconscious, research companies and separate professionals are afraid of responsibility during researches since they cannot be completely sure about

their results that is frequently connected not only with insufficient expertise of direct line executives, but also with lack of knowledge of researchers participating in developing of tools and methodology.

Expertise growth will be more helpful in distribution of new technologies connected with network solutions, in particular with the Internet and mobile devices. The penetration level of cellular communication and the Internet, and also technological development of devices of access to these services, already now allow to receive the increasing accessibility of audience, and the providing of research services – a big standardization and synergy of received data.

Transition to a database: Development of a synergetic modeling based on made researches that will allow to see the information more completely. Forming of an information richness paradigm (high penetration level and fullness of databases).

Occurrence of multiservice systems, such as Google, Yahoo, MSN, and others, and also improving feedback mechanisms with consumers (e.g. Amazon company site, where it is possible to find an easy example of this feedback in the form of the books recommended to you) that visually shows possibilities of research development in the field of database processing. In many respects, further evolution of similar systems will define rotation of many modern research procedures of similar database use since the use of it will allow by mathematical modeling of the retrospective data will allow to have an investigation of information that is more detailed and abstractive from uncontrolled cognitive processes in a consumer head and investigation of appropriateness in consumer preferences and their behavior that will lead to:

1. More completeness of received data;
2. Development of multidimensional methods of analysis;
3. More precise segmentation;
4. And to other, not less significant results.
- 5.

It is important that all these processes will have a much bigger efficiency factor, not only because of the extraordinary accuracy, but also because of essential reduction of operational expenses for a research project.

As reinforcement to this rotation can act a creation of the information richness paradigm that means an achievement by memory systems of state, when a stream, volume, and frequency of digitization of the arriving information will reach a certain threshold of efficiency and will allow to obtain as much as possible detailed data as in the field of the objects, subjects, and groups of people under test description, and in prognostication of their behavior based on empirical data.

Birth of a new paradigm: Search for more universal principles of consumer behavior description and structure of consumer motivations.

In addition to databases that by definition are most applicable in work with as much as possible segmented data of commodity and brand consumption, but not less significant prospect of a research process development, there are achievements of cognitive sciences and development of a new doctrine – neuroeconomics.

Nowadays, we can actually ascertain a competence of received experimental proofs of inaccuracy or insufficient validity of the "rational man" concept. By following the way of these proofs, the behavioral economics in the process of its development has come to terms of forming a new discipline – neuroeconomics to study fundamental processes that operate economical behavior of a person in biological system level. Of course, this birth will influence marketing researches with their often straightforward approaches to an estimation of respondents and their basis based on subjective judgment of an analyst which hopelessly become obsolete with the time (Krugman, 1971). Besides, it is possible to predict with confidence that the process of regeneration of an existing research paradigm to a new one will move along the exponent.

At the same time, comprehension of a person behavior not like a calculation system, but like a heuristic process based on universal biological laws and not less universal biochemical processes that occur in his/her brain, will stimulate development of marketing and branding from another point that realizes an essentially big transparency of study and a big predictability by modeling.

In practice, it may be compared with an example, like when we constantly have a dry mouth, we will make an assumption based on only this symptom that we have a diabetes (level of modern marketing researches), or we will go through a biochemical research and after having received results of research, we would learn that there is a really high blood sugar level, and the diagnosis "diabetes" is quite competent (level of neuro-paradigm). If the first conclusion is no more than an assumption, the second is the exact diagnosis based on a fundamental indicator. But you will wonder how it is possible, what about the diagnosis accuracy in the first case? Are we really sure that if we have stopped only having a symptom, instead of having a real indicator, would we have made the right diagnosis? Therefore, a dry mouth can be a symptom of following diseases (not complete, but a significant list): mentioned diabetes, anemia, cystic fibrosis, rheumatic arthritis, hypertension, HIV infection, Sjogren syndrome, infectious parotitis, and many more. Thus, only the objective indicator allows to differentiate a precise diagnosis.

Similar circumstances refer the side of marketing researches, except for the fact that we (researchers) now make the diagnosis mainly by symptoms as doctors in the Middle Ages, and the device of tool and object diagnostics is not completely developed and is used, though the main part of it is already created and somewhat described. As you probably already guess, this instrument is the neuromarketing and the neuroeconomics that refers to the research tools and its analytical procedures: "Neuromarketing in the field of researches is a complex of tool procedures that fixes object neurophysics indicators with the subsequent synthesis of object knowledge of motivation structure and behavior models of consumers based on received indicators using received knowledge by practical implementation of economical relations" (Dolan, 2002).

## **DYNAMICS OF PUBLIC PROCESSES AND MARKETING RESEARCHES**

As we can see, in existing model of a society two tendencies are combined – the increasing segmentation of commodity markets and capital globalization.

Thereby, we receive two models of business that need an essentially different approach not only to management, but also to providing data.

Thus, the part of the market which we conditionally call "commodity" (commodity and brand assortment from the point of branding) will follow the way of the increasing satisfaction of private requirements, while winning consumer heart with possibilities to satisfy more and more individually attributive consumption models.

The second – "the conceptual" part of the market that mainly consists of brands-giants, big parent companies that accumulate capital and administrative mechanisms as it now will aspire to support affiliated brands but since the components of conceptual brands mainly will not have a close connection directly with concrete commodity concepts, their management will be arranged in agreement with requirements of this convergent model.

With reference to marketing researches it will mean following: Commodity brands will need methods, allowing to carry out flexible fine accommodation and forecasting of small groups of individuals, which can be so small that for example, it would contain only one family in its structure, and there absolutely other research concepts for concept brands will be needed, since their problem will be maximization of appeal of the concept in the opinion of the widest audience. And although it stands for reason that mutual penetration of these concepts in opposite concepts is expected, nevertheless the process of polarization will be strongly marked. How can professional researchers respond to this challenge?

Increasing availability of data connected with the increasing virtualization and penetration of network services in our life, leads to consolidation of the market providers of these services, perfection of technology for gathering information, growth of systems productivity and application of allocated calculations.

Therefore, we understand that growth of productivity of calculation systems will increase. Even if all of us in future will reach an efficiency limit of one computing unit, we can easily extend possibilities by using

allocated calculations as they are already applied not only in certain scientific network projects, but also in your modern desktop four core computer. In addition to parallel development of program environments for storage and data processing, it will lead to a possibility that after achieving a high level of synergy and transparency of at first sight diverse information about a single person, we can make a detailed investigation of his/her habits, allocate preferences we need, and study connections between any of accessible data (Zadeh,1983).

It is not a secret for anyone that all these processes are observed already now. Development of CRM and ERP systems is the forerunner of similar developments, and some prototypes of already discussed systems work in service structure of companies like Google, Yahoo, etc.

The corporations built mainly in some other way and hence they do not have those widely allocated information sources, will turn to same providers of services like this, while more and more concentrating the market around them.

Development of universal algorithms that allow to make segmentation processes automatic by creating a more stable platform for a finer CRM systems setup and application distribution score models, data mining systems, calculations based on fuzzy logic and trainable neural networks with subsequent reduction of a classical marketing expert analyst role and his/her primary replacement by mathematicians.

Let's discuss what the development of these systems based on databases will demand from a marketing expert analyst. At first sight it might seem that basically changes are not that essential, but it is not true.

The first obvious consequence will show that not sociological, but exactly mathematical skills are more required. Score models will be more required (already now most software manufacturers for mathematical and statistical data processing offer such options or independent software packages), data mine technologies, and neural network calculations, as optimal systems for estimation and modeling of heuristic thinking of an individual.

As a result, a serious revision of education programs is needed since if not experts that have education irrelevant to requirements of the market will remain out the door that can cause deficiency of professional structure in our sphere and otherwise lead to unreasonable costs from employer side.

Looking further away, it is possible to ascertain that hyper segmentation and other described processes will lead to high economical reasonability of automated computing and analytical processes application which in case of a feedback practically will exclude participation of an analyst during the information processing.

A part of research companies will move to provider systems of consolidated data and analytics supply, based mainly on automatic systems. Scale and popularity of similar processes will not allow the research companies to remain aside of these tendencies. As a result, the considerable share of their business will be based on further service providing of data processing and optimization of computing models.

There will be also a change of the research market paradigm that will invert it. So the largest companies along with development of systems exactly optimized for their business will begin to make an essentially smaller profit, but among small and average business provider support will be required because of high capacity of individual systems.

## **NEUROSCIENCE – CHANGE OF SOCIAL AND ECONOMIC PARADIGMS WITH SIMULTANEOUS UPDATE OF MARKETING TOOLS**

However let's move to other spheres where many things will radically differ from routine of databases. Let's talk about neuro study and its practical perspective.

In last twenty years, cognitive sciences have been strongly stimulated by development and universal distribution of innovative study technologies of the processes occurring in nervous system. This might include occurrence of specific programs on functional visualization of the data received using a magnetic resonance tomograph, positron-emission tomography and infrared spectroscopy, and magnetic encephalography.

All listed and some other methods allowed scientists to approach experiments on brain from some other perspective that makes possible to almost fully exclude invasive procedures.

In this context development of a virtual reality systems is also important that allows you practically to model surrounding space, thereby making the experiment easier and increasing its authenticity (Plassmann, Ambler, Sven, Kenning P, 2002).

This explosive development caused many fundamental discoveries in the studying area of central nervous system functioning principles. Here, it is necessary to mention the study of neuroscientific principles and models of making decision by a person, study of emotional reactions, search of their universal neurobiological correlates, no less than condition correlates such as: trust, pulsive, compulsive and usual demand, etc. In addition to listed concepts, it is necessary to enhance possibilities for a detailed study of complex attributive concepts, for example, quality or price concepts. Researches in the area of studying optimal (fair from the point of view of a potential consumer) price with search and description of factor influence that transforms it are to be especially mentioned (Knutson, Rick, Wimmer, Prelec, Loewenstein, 2007) .

## **BRANDING POLARIZATION TO A CONCEPTUAL AND COMMODITY BRANDING AND TENDENCIES THAT ARE CONNECTED WITH IT IN NEURO RESEARCHES**

As we can see, neuro sciences have a surprise in store for us, have not they? And the problem of each real expert in the area of making researches is to be prepared that neuroprinciples (if we may call them so) will invade in real sphere of economy (Ariely, Gregory, Berns. 2010).

What is the point to begin with? – Perhaps, first we need to have an optimum definition for something that as a matter of fact can be three basic models of neuro searches use:

1. Result study of already made researches referring fundamental subjects and use of received knowledge in the further business practice;
2. Work on commodity markets and optimization of trading space;
3. Work in the area of conceptual branding.

Let's consider each aspect in detail.

*First aspect: Result study of already made fundamental researches.*

Everything here is quite clear. Our key problem is to concentrate on results and to receive knowledge which would have a practical use, without touching the neuroresearch tools. An excellent example, though it is not absolutely refer to the research environment, can be a principle of neural networks functioning, due to which is possible to attract additional attention by optimization of a shown material. (For example, a single multi angle presentation of the same object which due to its large potentiation of separate neuronal mechanisms can theoretically lead to essentially higher speed of perception, i.e. comprehension of shown stimulus that is the for example extremely important for panel board and poster advertising) (Berger, Draganska, Simonson, 2007).

*Second aspect: Work on commodity markets and optimization of trading space.*

Narrow assortment brands – high risk level and not less high potential of return from improvements will allow to count on capacious budgets, so here it is necessary to expect that neuromarketing technologies will be most widely used. Among the purposes of researches can be following enumerated: precise pricing, testing of goods concepts, revealing of the most significant factors of making decisions by purchasing goods, operating these factors, optimization of demand models based on neuroscientific data and many more.

Diversified brands – as in this case the use of expensive neuroscanning technologies usually will be economically unjustified (except for the study of combined reactions of individual categories and product categories), it suppose to be expected to spread most brilliant studies of visual attention and reaction of the vegetative nervous system, which is directly connected with emotional response of a human to one or another stimulus. As an example can be noticed the optimization of arrangement of POS-materials in shop space or the optimization of goods outlay on shelf space in a shop (Ahlerl, Kenning, Plassmann, 2006).

*Third aspect: Work in the area of conceptual branding.*

In this point researchers have an opportunity to make researches with a larger budget as well to expand range of researches due to this possibility. Actually the researcher in this area will be practically limited only by a set of accessible concepts and development of research methods (Lee.N., Broderick.A., Chamberlain L.. 2006).

The most demanded purpose of these researches could be testing of the brand concepts (sensing, semiotics, semantics, figurative perceptions, value model, dominant factors of choice etc).

The neuro-paradigm will lead to new requirements in training of analysts and company management. It will give impetus to a renewal of the enterprise staff.

The following important question is, how the popularization of neuroscientific research in management area of economical relations, goods and branding, can impact on staff of research companies, companies themselves and researchers on customer side?

This question is extremely important for all of us. After all, only few people have sufficient knowledge in these complex and highly multidisciplinary areas. The future of a modern classical researcher is extremely vague. Though the full replacement of modern researchers and researches is not to be expected, there likely can be an essential redistribution of forces towards experts with education and knowledge in area of neurosciences or more profile directions: only neuroeconomics or neuromarketing directions are not expected (Fugate, 2007).

The general trend will be a redistribution of budgets in favor of the most objective and efficient methods, which are these last mentioned disciplines. And this will entail change of the research market including birth of new giants and emergence of specialized companies.

Certainly, in this background, the education also can not stay aside. And the immediate task of universities and institutes is to start preparing qualified experts which could understand not only separate disciplines (for example, he is an excellent expert in psychophysiology but has no real knowledge in economy), but also to promote the cross-disciplinary approach in training to these neo-doctrines that will allow to accelerate their development and seriously affect all related areas.

## **MODELING OF A VIRTUAL REALITY AND ITS APPLICATION DURING NEURO RESEARCHERS**

The last innovation in the list, but not the least important in research business is modeling of a virtual reality. In our opinion, if implemented in its full sensory experience framework, it should give a significant breakthrough in experimental researches, which as we all know are heavily affected by a number of inherent negative factors. Moreover, it is possible to expect that exactly the virtual reality will allow to bypass bottlenecks of both field and laboratory experiments.

The symbiosis of the neuroscientific paradigm and the virtual reality will allow to embody the dream of any expert in research area, to receive full and almost completely reliable information about potential or actual consumers, their consumption patterns, preferences and desires of not only awareness level but also of subthreshold level (Bojadziev, Bojadziev, 2007).

## **CONCLUSION AND FUTURE DIRECTIONS**

By summarizing the discussion, it is necessary to list the most significant and interesting moments in the form of theses:

- Modern research paradigm becomes very quickly hopeless obsolete in sociology area as well as in marketing area, and has a very wide range of problems.
- Gradually receding technologies are replaced by innovative and evolutionary global trends: neuro-paradigm of researches and consumer relations management, and marketing based on databases.
- Development of neuroscientific paradigm within marketing researches will allow to improve the reliability for a wide range of tasks, including: description of models of making decisions by a person, studying of emotional reactions, studying of principles and dynamics of trust formation, predicting of pulse, compulsive and habitual demand, detailed studying of multi-attributive concepts, as, for example, quality or price, finding of optimal (from the point of view of the potential consumer) price with definition and description of influence of the factors, that transform it.

- It is most probable, that the spheres of implementation of these directions will be a little polarized by moving the focus of database based on commodity markets with their usual high segmentation, and neuroparadigms – to the conceptual branding and single-commodity brands.
- Invasion of new technologies would entail changes of the structure of marketing research market, largely by changing its form, as well changes of structure of demand for personnel. The high demanded will be people who are educated in mathematics and statistics, as well as in the neuroscientific area, that in turn will lead to a shift of emphasis in the educational processes.
- Neuro-paradigm will not only change the research processes, but also will not claim principles of management, communications, etc.
- Development of modeling technologies of virtual reality, that has the possibility to simulate a full sensory experience, will extend the practice of ethnographic research, will allow to avoid many mistakes during experiments, and when used within the neuro-paradigm it will allow to give a fully completed description of most consumer behavior aspects.

# **A STUDY OF MANAGERS' PERCEIVED ENVIRONMENTAL UNCERTAINTY IN ASIA**

**Jeong-Gil Choi, Kyung-Hee University, Korea**

## **ABSTRACT**

*This study tested for differences in the perceived environmental uncertainty (PEU) of hotel general managers in two Asian countries, Korea and Japan. This study also examined whether the level of PEU escalates over time. The data were collected through questionnaires and telephone interviews. PEU was measured using questionnaire items that corresponded to seven major sectors of the industrial environment of the organization. The results are quite different from what was expected, indicating that managerial perceptions did not substantially vary across hotels in different countries or over different time periods. This study provided a picture of hotelier' PEU in different time and international settings.*

## **INTRODUCTION**

It has been argued that firms that follow different strategies will tend to perceive their environments differently (Zahra, 1987). As a result, the same objective environmental attributes may be perceived differently by different organizations (Snow, 1976). The environment one organization perceives as unpredictable, complex, and evanescent, another organization might see as static, and easily understood (Starbuck, 1983). The performance consequences of such differing perceptions were confirmed by Bourgeois (1985), who reported that higher performance was associated with firms that experienced a greater degree of congruence between objectively measured volatility and PEU. In other words, firms that survey their environments with greater perceptual precision tend to achieve higher than average levels of economic performance.

Perceptions of environmental uncertainty have been found to differ significantly across nations (Miller, 1993), and the national culture has been found to influence perceptions of environmental factors, such as crises and threats (Bluedorn, Johnson, Cartwright, & Barringer, 1994; Jogaratnam & Law, 2006). The primary purpose of the present study is to identify the differences in PEU by focusing on hotel managers in Asia. This study tested for differences in the perceived environmental uncertainty (PEU) of hotel general managers in two Asian countries, Korea and Japan. This study also examined whether the level of PEU escalates over time.

## **THEORETICAL BACKGROUND**

### **Business Environment**

The environment is defined as the totality of physical and social factors that are taken into consideration during the decision-making behavior of individuals in the organization (Duncan, 1972). Therefore, organizations need to be knowledgeable the boundaries of the organization. Such knowledge is possible when the firm executives continually scan the environment. The organizational environment consists of two major components: the task (or specific) environment and the remote (or general) environment (Olsen & Roper, 1998). The task environment has a more direct relationship with the day-to-day success of an organization and consists of events involving the customer, supplier, regulator, and competitor segments. Meanwhile, the remote environment is related to such factors as the economic, technological, sociocultural, ecological, and political events. Because these events are so broadly based, it is often difficult to determine how they will influence the organization. This remote environment is especially important to multinational operators because many events can critically impact corporate decisions to enter and operate in international markets (Olsen & Roper, 1998).

Typically, firms cannot control their general environment. Furthermore, many developments in the general environment are difficult to predict with any degree of accuracy. However, some trends in the general environment, such as population distribution by age, ethnicity, and income levels, can be forecast with a high degree of accuracy. With access to clearly defined key environmental risk variables, managers are able to focus on the key variables that have the greatest impact on performance.

## **Perceived Environmental Uncertainty (PEU)**

Perceived environmental uncertainty (PEU) is the difference between the amount of information required to make a decision and the information already at hand (Galbraith, 1977). In effect, PEU exists when managers feel unable to comprehend major events or trends in the environment or when they have little confidence in their ability to reliably assign probabilities to the likelihood that a particular event may transpire (Milliken, 1987; Elenkov, 1997; Freel, 2005). It is not uncommon for managers to be exposed to more information than they are able to perceive (Mintzberg, 1973; Hambrick, 1982; Jogaratnam & Law, 2006). Therefore, managers faced with limited time and capacity for information processing and bounded rationality (the inability to comprehensively understand the environment) must be selective in their approach to scanning (Daft et al., 1988; Hambrick, 1982).

Unfortunately, such an approach may result in the failure of managers to notice changes that turn out to be important and may even cause managers to misinterpret changes (Pfefer & Salancik, 1974). These failures may in turn lead to an inability on the part of the managers to make the necessary changes to organizational strategy, structure and processes in response to environmental conditions, resulting in below average performance (Lawrence & Lorsch, 1967; Lindsay & Rue, 1980; Weick, 1987). Perceived environmental uncertainty is more relevant than the external (objective) environment and is a key input in the strategic management process (Bourgeois, 1980). The growing importance of strategic planning recognizes the need for organizations to establish formal links between the external elements of the organization and the internal decision-making or resource-allocation functions.

## **PROPOSITIONS**

### **Propositions**

This study proposes that a general manager's perceptions of uncertainty in his or her organizational environment are different across countries and time periods. The pertinent propositions are as follows.

**Proposition One:** Managerial perceived environmental uncertainty (PEU) is significantly different across countries.

**Proposition Two:** Managerial perceived environmental uncertainty (PEU) is significantly different across time periods.

## **METHODS**

### **Measurement**

In this study, PEU was measured using questionnaire items that corresponded to seven major sectors of the industrial environment of the organization: (1) relations with suppliers, (2) competitor actions, (3) customer demand, (4) relations with financial/capital markets, (5) relations with governmental regulatory agencies, (6) relations with the labor market, and (7) technological developments. These environmental dimensions were suggested by previous theory and research by Dill (1958), Katz and Kahn (1966), Lawrence and Lorsch (1967) and Thompson (1967). The statistical package software SPSS was used to test the hypotheses. To test the differences between/among observations, a statistical t-test and paired sample difference tests were used.

### **Sample and Data Collection**

This study observed two countries, Korea and Japan. Five-star (the highest level of government rating) and four-star (the second-highest level of government rating) hotels from each country were included. Most of the data were collected through questionnaires and telephone interviews. The questionnaires were mailed to the general managers in each country. Because of the language differences, it was necessary to translate the survey questionnaires into three different languages: Korean, Japanese, and English. To improve the responses to the survey, the researcher provided translated supplemental information for the questionnaires. The researcher contacted the general managers in these countries by faxing and calling to facilitate a fast and appropriate response.

Approximately 100 hotels were initially contacted in the two countries, 63 of which agreed to participate in the study. Data were obtained from 36 hotels in Korea and 24 hotels in Japan. The size of the hotels in Japan ranged from 70 to 750 rooms per hotel, and the size of the hotels in Korea varied from 100 to 700 rooms. In terms of the property type, 75% of the Korean hotels were independently owned and 62.5% of the Japanese hotels were independently owned (Table 1).

**Table 1. Demographic profile**

Ownership Type	Korea		Japan	
	Frequency	Valid Percent	Frequency	Valid Percent
Chain owned	9	25.0	9	37.5
Independently owned	27	75.0	15	62.5
Total	36	100.0	24	100.0
No of rooms	Korea		Japan	
	Frequency	Valid Percent	Frequency	Valid Percent
50-149	4	11.1	2	8.3
150-249	6	16.7	2	8.3
250-349	8	22.2	2	8.3
350-449	10	27.8	8	33.3
450-549	4	11.1	5	20.8
550-649	1	2.8	3	12.5
650-749	1	2.8	1	4.2
750 and over	2	5.6	1	4.2
Total	36	100.0	24	100.0

## FINDINGS

### Variations in PEU

The results of the environmental uncertainty questionnaire, presented in Table 2, generally support the view that managerial perceptions vary from organization to organization within an industry. In 2010, the top executives of the Korean hotel industry perceived that government regulatory agency actions (overall mean: 4.01) were the most uncertain aspect of their organizational environments, followed by the actions of labor unions (3.79), financial/capital markets (3.68), raw materials and component suppliers (3.47), customer actions (3.23), competitor actions (3.10), and technological developments (3.02). In the Japanese hotel industry, a similar pattern of managerial perceptions emerged. As in Korea, the top executives perceived government regulatory agency actions (4.14) to be the most uncertain environmental factor, followed by the actions of labor unions (3.33), raw materials and component suppliers (3.28), financial/capital markets (3.61), technological developments (3.29), customer actions (3.10), and competitor actions (2.73).

Therefore, these results corroborated the expectation that the managerial perceptions of the environment would vary across organizations within an industry. However, it was surprising to find that managerial perceptions did not vary more substantially across countries in the expected manner.

Table 2. Variations in PEU

Questionnaire item	Year 2006				Year 2010			
	Korea		Japan		Korea		Japan	
	Mean	N	Mean	N	Mean	N	Mean	N
<b>1. Raw materials and components suppliers:</b>								
a. Price changes	3.16	25	2.66	18	3.33	36	2.75	24
b. Quality changes	3.36	25	3.27	18	3.55	36	3.20	24
c. Design changes	3.28	25	3.61	18	3.41	36	3.45	24
d. Introduction of new materials	3.4	25	3.44	18	3.58	36	3.70	24
Overall mean	3.3	25	3.25	18	3.47	36	3.28	24
<b>2. Competitor actions:</b>								
a. Price changes	2.72	25	2.38	18	2.83	36	2.66	24
b. Product quality changes	3.16	25	2.83	18	3.30	36	2.70	24
c. Product design changes	3.08	25	3.0	18	3.16	36	2.83	24
Overall mean	2.99	25	2.74	18	3.10	36	2.73	24
<b>3. Customers:</b>								
a. Demand for existing products	2.92	25	2.94	18	3.05	36	2.91	24
b. Demand for new products	3.44	25	3.16	18	3.41	36	3.29	24
Overall mean	3.18	25	3.05	18	3.23	36	3.10	24
<b>4. Financial/capital market:</b>								
a. Interest rate changes								
1. Short-term debt	3.64	25	3.16	18	3.44	36	3.41	24
2. Long-term debt	3.8	25	3.55	18	3.75	36	3.75	24
b. Changes in financial instruments available								
1. Short-term debt	3.96	25	2.74	18	3.83	36	3.37	24
2. Long-term debt	4.0	25	3.27	18	3.86	36	3.62	24
c. Availability of credit								
1. Short-term debt	3.64	25	3.22	18	3.55	36	3.58	24
2. Long-term debt	3.80	25	3.55	18	3.66	36	3.91	24
Overall mean	3.81	25	3.25	18	3.68	36	3.61	24
<b>5. Government regulatory agencies:</b>								
a. Changes in laws or policies on pricing	4.04	25	4.38	18	4.22	36	4.12	24

d. Changes in training and development systems	3.16	25	3.05	18	3.16	36	3.08	24	
Overall mean	3.2	25	3.19	18	3.02	36	3.29	24	
<b>Aggregate mean for all items</b>	<b>3.42</b>	<b>25</b>	<b>3.31</b>	<b>18</b>	<b>3.56</b>	<b>36</b>	<b>3.49</b>	<b>24</b>	

If we examine the aggregate means for all the items in the environmental uncertainty questionnaire (Table 2), it is clear that there was almost no difference between the perceptions of Korean and Japanese managers (3.42 versus 3.31 in 2006 and 3.56 versus 3.49 in 2010). Inspection of the overall means for each of the seven major environmental factors also revealed no substantial differences. Thus, it seems clear that these perceptual data do not support the widely held belief that substantial differences exist between the environmental conditions in Korea and Japan. Proposition one was rejected. Table 3 presents more detailed information regarding the differences in the PEU associated with different countries (Pair 1) and different time periods (Pairs 2 and 3).

**Table 3. Paired sample difference tests**

	Paired difference				t	df	Significance. (2-tailed)
	Mean	Std. Deviation	Std. Error	95% Confidence Interval of the Mean			

			of the Mean	Lower	Upper			
Pair 1	KPEU 2010- JPEU 2010	.03305	.92323	.18845	-.35680	.42289	.175	23 .862
Pair 2	KPEU 2010- KPEU200 6	.01049	.7583	.15167	-.30254	.32353	.069	24 .945
Pair 3	JPEU 2010- JPEU 2006	.03257	.7671	.18083	-.34895	.41408	.180	17 .859

This study also explored if there is any significant difference of PEU according to different time periods. It was assumed that the current business environment has become more complex (and thus more uncertain) compared with the previous period. In other words, the study assumed that the business environment becomes more uncertain as time passes. But, this proposition was revealed to be false (Table 3). There was no significant difference of PEU according to the different time periods. Proposition two was rejected. Managers perceived similar levels of uncertainty in 2006 and 2010.

## DISCUSSION AND CONCLUSIONS

This study proposed that the managerial perceptions of uncertainty in the organizational environment would vary across countries and across time periods. However, the results revealed that there is no significant difference in the managerial perception in different countries. Furthermore, there is no significant difference in the managerial PEU across different time periods.

This result does not support a previous study (Miller, 1993) that concluded that perceptions of environmental uncertainty differed significantly across nations. The underlying reasoning for the first proposition, that organizations operating in ostensibly similar environments may in fact perceive the environment differently, was not accepted. This conclusion can be explained by other studies (May, Stewart, & Sweo et al., 2000; Bluedorn, Johnson, Cartwright, & Barringer, 1994; Jogaratnam & Law, 2006), in which the national culture was found to influence the perception of environmental factors, such as crises and threats. The observed countries have similar national cultures and thus similar business environments. PEU exists when managers feel incapable of comprehending major events or trends in the environment, or when they have little confidence in their ability to reliably assign probabilities to the likelihood that a particular event may transpire (Milliken, 1987; Elenkov, 1997; Freel, 2005). In this sense, it can be said that managers in both countries exercise similar levels of confidence in their business environment changes, and thus perceive the same levels of uncertainty. The PEU across the two countries was quite similar in this study.

Surprisingly, there was no significant difference in PEU across different time periods. Managers in both countries perceived similar levels of uncertainty in both 2006 and 2010. This study rejected the second proposition. This finding can be explained by the following three cases. First, when managers are accustomed to a significant increase in complexity and uncertainty in the business environment, they do not acknowledge it when it occurs. Second, when managers have developed the knowledge and managerial techniques to overcome uncertainty, they do not acknowledge a significant increase of complexity and uncertainty in the business environment. Third, in reality, the business environment is neither complex nor uncertain. Therefore, they do not acknowledge it.

The results of this study imply that hotel managers in both countries share a common business environment in terms of the uncertainty level. Their PEU levels even remain constant across different time periods. Under these conditions, it is obvious that managers in both countries will exercise similar strategies for their businesses.

To be competitive in these markets, it is necessary to improve the predictability and lower the level of uncertainty.

This study attempted to test for a difference in the perceived uncertainty of hotel managers in two countries in Asia. The inclusion of more countries might lead to different conclusions for the propositions raised by this study. Furthermore, a continuous longitudinal study would more thoroughly verify any differences in the perceived environment uncertainty across different time periods. A more concrete explanation of why there is no PEU level escalation as time passes would be articulated in future research.

# DOES MONEY REALLY MOTIVATE SALES REPRESENTATIVES?

**RL Coetzee and M Wiese**  
**University of Pretoria, South Africa**

## ABSTRACT

*Many organizations invest a great deal of time and money in designing incentive schemes that are failing to achieve their objective of motivating employees. Self-administered questionnaires were completed by a sample of 100 pharmaceutical sales representatives from three South African companies. The questionnaire made use of a four-point Likert scale to rate the importance of various external motivational factors. The study showed that internal competitions and teambuilding were seen as less important among respondents. The respondents also indicated that being well-informed and having strong products and brands were indeed more important than financial incentives. The results of this study could enable management to recognize those factors that might lead to increased performance levels and ultimately to increased sales and a lower turnover of the sales force.*

## INTRODUCTION

Most people get up in the morning, go to work, and behave in ways that are predictably their own. They usually give little thought as to why they work hard, enjoy certain projects, or find some recreational activities so much fun. Yet, all these behaviours are motivated by something. Employee motivation affects productivity, and part of a manager's job is to channel subordinates' motivation toward the accomplishment of the organization's vision or goals (Daft, 2005:294). For their sales managers it is not an easy task to ensure that their sales teams are motivated and performing at their peak, even more so in times when sales are not that good and customers are difficult to call on. Companies need to ensure that their sales forces are highly productive and motivated. As a result, companies consequently try to improve the productivity of their sales force through better selection, training, motivation and compensation. Of these, compensation and incentive schemes play an important role in motivating sales people to perform better (Abratt and Klein, 1999). Incentive schemes as a form of motivation has long been part of compensation plans in the pharmaceutical industry and practised by the majority of pharmaceutical companies operating in South Africa. Behaviour that positively affects performance must be contingently reinforced rather than indiscriminately rewarded. Pay is by far the most recognized reward in human resource management, and pay for performance is closely equated with a reward system (Smith & Rupp, 2003). A survey, performed by Watson Wyatt in the United Kingdom in 2005, indicated that only 38% of employees are motivated by the incentives and performance management systems offered by their organizations (Empey, 2005). Conventional wisdom, supported by considerable research, suggests that, regardless of how well a sales force compensation plan is received, other motivational factors are also important to sales people. Motivators like promotion opportunities, recognition, incentive awards, and fringe benefits are important motivational devices used in sales organizations. Unfortunately, little is known about the relative importance attached to these motivators by sales people (Chonko, Tanner & Weeks, 1992). Although some studies have been done on determining reward preferences of sales people (Lopez, Hopkins & Raymond, 2006; Chonko *et al.*, 1992; and Ingram & Bellenger, 1983) as well as on compensation and incentive schemes in the South African pharmaceutical industry (Abratt & Klein, 1999), there is very little information on how a sales representative interprets the importance of these extrinsic/external motivational factors.

A poorly motivated sales force will be costly to the organisation in terms of lower performance, excessive staff turnover, increased expenses, higher use of the sales manager's time and a negative effect on the morale of colleagues (Jobber & Lee, 1994). Not everyone is motivated by the same thing and sales managers must work towards tailoring the motivational environment to the individual (Chonko *et al.*, 1992).

## Sales management

Sales management is the attainment of sales force goals in an effective and efficient manner through planning, staffing, training, leading, and controlling organizational resources. Miao, Evans and Shaoming (2007) suggest that the use of sales controls have significant consequences in supporting sales people intrinsic and extrinsic motivation. One of the responsibilities of sales management is to understand the needs of employees and to tailor the motivational programme so that satisfaction of those needs can be accomplished by performing desired organizational tasks. Thus, to manage successfully presupposes that sales managers understand the needs of the sales force (Jobber & Lee, 1994). Target setting, the compensation of sales people, and the impact of the leadership style of the sales manager form a very important part of sales management and more specifically the motivation of sales representatives.

The behaviour and performance of sales people are mainly influenced by the compensation and reward structures applied in an organisation. Rajagopd (2010) argues that compensation as well as sales territory design influences the effectiveness of the sales forces. These compensation systems may also affect the satisfaction and retention of sales people. A key challenge for sales managers would therefore be to identify rewards that will motivate their sales people but will also develop a quality sales force (Lopez *et al.*, 2006). Sales managers must be knowledgeable about the elements of compensation, balancing compensation and using unexpected rewards. Despite the variety of creative names used to describe parts of the compensation plan, it consists of salary and commissions. Bonuses based on sales goals, prizes given as rewards for sales contests, and commission increases based on tonnage are all examples of commissions (Smith & Rupp, 2003). Guaranteed minimums and Christmas bonuses are part of salaries. The distribution of money between salary and commission is the key to its positive or negative influence on motivation (Smith & Rupp, 2003). Abratt and Klein (1999) are of the opinion that the incentive proportion of the sales compensation plan has increased over the last 30 years. They state that the majority of sales representatives prefer a combination plan consisting of base salary plus a form of incentive (Abratt & Klein, 1999). According to Smith and Rupp (2003), money can either motivate or de-motivate, depending on its eventual distribution. Compensation plans must have a balance of salary and commission to motivate, while maintaining some level of control and ethics. Ideally, a salesperson should have a long-term view including survival and prosperity of the company (motivated by salary), coupled with a short-term view of higher earnings (motivated by commission), without conflicts between the two. Lopez *et al.* (2006) are of the opinion that there is no doubt that employing commissions as a reward, motivates sales people in some situations. However, heavy reliance on commissions to reward sales people may cause concern about high-pressure sales techniques, coercive selling, ethical selling issues, and salesperson behaviours. Organizations (and specifically sales managers) are therefore often faced with the issue of designing commission reward structures and also mitigating the risk of any negative aspects around commissions. According to Smith and Rupp (2003), prizes have become so common; they are a form of commission that sales people expect. Expected rewards decrease the intrinsic motivation for the rewarded activity. Unexpected rewards, in the context of the same activity, increase motivation. Self-determination of rewards (picking your own prizes) could be expected to increase motivation (Smith & Rupp, 2003).

There is little research to guide sales managers in understanding which forms of compensation and rewards are most preferred by sales people. Lopez *et al.* (2006) contributed to this knowledge by performing a study to identify the extent to which sales people prefer particular rewards. Although Lopez *et al.* (2006) argue that financial incentives (or commissions) are preferred over pay raises and other types of rewards, they also report findings that age, as well as other internal factors could influence reward preferences and they also suggest a need for further research on how different career stages might influence preferences for different rewards.

## Motivation

Motivation refers to the forces, either internal or external, to a person that arouses enthusiasm and persistence to pursue a certain course of action (Daft, 2005). According to Daft (2005), intrinsic rewards are the internal satisfactions a person receives in the process of performing a particular action, while extrinsic rewards (the focus of this study) are given by another person, typically a supervisor, and include promotions and pay increases. The specific nature of the sales job together with the personality of the sales person, the diversity of

the company goals, and the changing character of market conditions greatly influence the motivation level and therefore the performance of sales representatives (Abratt & Klein, 1999).

To increase motivation, marketers and sales managers reinforce intrinsic and extrinsic rewards of all types. Previous research has shown that the reward with the highest value was pay, followed by promotion, personal growth, and sense of accomplishment (Chowdury, 1993; Chu, Gerstner and Hess, 1995; Krafft, 1999). Malik and Nadeem (2009) found in study under pharmaceutical representatives in Pakistan that the three top motivators were pay and fringe benefits followed by job security and promotional opportunities. Liao (2009) also states that an increase in financial incentives reinforces the motivation of sales representatives. The least-valued rewards were liking and respect, security, and recognition. In other words, sales people are highly motivated by pay and the chance to get ahead and satisfy their intrinsic needs, and less motivated by compliments and security. However, researchers also found that the importance of motivators varied with demographic characteristics; financial rewards were mostly valued by older, longer tenured people and those who had large families whereas higher-order rewards (recognition, liking and respect, sense of accomplishment) were more valued by young sales people who were unmarried or had small families and usually more formal education (Kotler & Keller, 2006).

## **Incentive schemes**

Organizations utilize incentive schemes to motivate their employees. In the pharmaceutical industry this is no different and often a lot of emphasis is placed on the design and structure of incentive schemes. Incentive schemes can include various components, such as commissions, incentive trips, and special awards (e.g. “rep of the year”, medals). Successful incentive payment or reward scheme will encourage staff to go the extra mile. But to be a truly effective “carrot”, an incentive scheme requires careful planning, good design, and excellent communication (Gray, 2002). In a study performed by Abratt and Klein (1999), the most important measure used for incentive payments was *sales above target*. In there study, Abratt and Klein also identified other measures such as *company performance* and *different rates by product category*. Very few companies used *market information* as a basis for incentive payments.

## **RESEARCH OBJECTIVE**

The objectives of this study are to determine the importance of various external factors in motivating pharmaceutical sales representatives; to establish the five most important external motivational factors; to establish the five least important external motivational factors and to determine whether demographical differences exist in the importance of selected motivational factors.

## **RESEARCH METHOD**

Non-probability, convenience sampling was used, since the characteristics of this method was considered suitable in view of financial and time restraints. The target population for this study consisted of 100 pharmaceutical sales representatives in three selected pharmaceutical companies in South Africa. Data was collected by means of a quantitative, self-completion measurement instrument. The motivational factors selected for usage in the questionnaire were identified from previous research done by Jobber & Lee (1994). Questionnaires were distributed *via* regional managers to hand to their representatives for completion and a specific date was provided on which these forms needed to be returned. In this study, a four-point Likert scale, ranging from “not important” to “very important”, was used to avoid a mid-point and thus respondents were compelled to make a decision towards one or the other end of the scale. The questionnaire was also designed to obtain demographical information such as gender, age, academic background, marital status and family background.

## **RESEARCH RESULTS**

## Demographic profile of sample

Pharmaceutical sales representative positions are more often filled by females than males (75% vs. 25%) and the majority of representatives are married (66%). There were also a large number of respondents with children (62%), with 12% having three or more children. It is also evident that the pharmaceutical representative's position is not limited to people in their twenties or thirties, with 27% of respondents being older than 40 years of age and the oldest respondent being 62 years old. This is also reflected in the number of years experience within this group of respondents: 58% of respondents have more than 6 years experience as pharmaceutical representatives with 34 years being the longest total years of experience. The level of education amongst respondents were also quite high; with 52% of respondents having Bachelor, Honours or Master degrees, while 48% of respondents have also attempted further studies while employed as pharmaceutical sales representatives.

## External motivational factors

Factors that were listed as external motivators included *incentive schemes* such as *financial incentives*, *incentive trips*, and *prize/awards*. In the literature review section, it was noted that these were the factors most commonly used by pharmaceutical companies as incentive schemes to motivate representatives. Other factors such as *appraisal*, *target setting*, *strong products*, *being well-informed* and *exclusive territories*, were also evaluated. The last mentioned factors are often forgotten by sales managers when looking at ways of motivating sales representatives. In Table 1 the results of the data collected are displayed in accordance to how these factors were rated as *not at all or less important*, *quite important* or *very important* (The *not at all important* and *less important* options were combined for statistical reasons).

**Table 1: The importance of external motivational factors (N=100)**

	Not at all or less important (%)	Quite important (%)	Very important (%)	Mean value	Ranking
<i>Appraisal and performance feedback from my managers</i>	6	41	53	3.47	7
<i>Involvement in target setting</i>	13	62	25	3.12	12
<i>Teambuilding</i>	22	45	33	3.06	13
<i>Internal "competitions"</i>	48	38	14	2.59	14
<i>Prizes / awards</i>	18	42	40	3.19	11
<i>Strong products and brands</i>	9	11	89	3.89	2
<i>Being well-informed</i>	0	7	93	3.93	1
<i>Prospects of promotion</i>	17	32	51	3.32	9
<i>Training opportunities</i>	2	46	52	3.50	6
<i>Pension and medical aid</i>	3	21	76	3.71	5
<i>Company car / car allowance</i>	4	20	76	3.72	4
<i>Financial incentives</i>	2	11	87	3.85	3
<i>Exclusive (individual) territories</i>	8	41	51	3.43	8
<i>Incentive "trips"</i>	22	22	56	3.31	10

Among the external motivators, it appears to be the *internal competitions*, *teambuilding* and *incentive trips* that were seen as less important among respondents. This is very interesting as these factors are often viewed as important in motivating pharmaceutical representatives and are included in the incentive scheme "packages" of many pharmaceutical companies. *Prospects of promotions* only ranked 9<sup>th</sup> and is in contrast with previous findings that suggested the promotion was second most important after pay.

When looking at the five most important external motivational factors the respondents indicated that being well-informed (mean value = 3.93) and having strong products and brands (mean value = 3.89) were indeed more important than financial incentive (mean value = 3.85). One could probably also argue that without being well-informed and having strong products and brands, targets will not be met and financial incentives will not realize. Although having a company car /car allowance (mean value = 3.72), as well as pension and medical aid (mean value = 3.71) are sometimes viewed as just "part of the package"; they are actually perceived as being better motivators than things such as incentive trips or prizes and awards.

As evident from the table, competitions (mean value = 2.59) amongst each other are not really motivating the pharmaceutical sales representatives as this factor was ranked least important followed by teambuilding (mean value 3.06) and involvement in target setting (mean value of 3.12). Prizes/awards (mean value = 3.19) and incentive trips (mean value = 3.31) are very often used as part of incentive schemes in the pharmaceutical industry; therefore it is quite interesting to see that representatives do not perceive them to be highly motivational, as they are two of the five least important factors.

## Linking demographics with motivational factors

To determine whether the demographics of a sales representative will determine which motivational factors will be more important to him/her, some chi-square tests were done between certain demographical variables and motivational factors. The selection of these factors was done on the basis of initial indications that there were some differences in the preferences for these motivational factors amongst various demographical populations. Another reason for choosing these factors is that there have been speculations that representatives of different demographics will perceive these specific factors differently in terms of importance (Lopez *et al.*, 2006). The **Chi-Square method** was used to determine the statistical significance. The first decision was made to focus on the five most important external motivational factors and to compare how males and females rated these factors in terms of importance. Table 2 illustrates the differences between the male and female preferences for these factors.

Table 2: Rating of the five most important external motivators mean values and gender

	Being well-informed	Strong products & brands	Financial incentives	Company car/allowance	Pension & Medical aid
Male	3.88	3.88	3.96	3.56	3.64
Female	3.94	3.89	3.81	3.77	3.73

Although the ranking between males and females for external motivators are very similar for the two most important factors (being well-informed and strong products and brands), males seemed, once again, to have given a higher ranking to financial incentives than females, and females rated company car /car allowance and *pension and medical aid* more important than males. When male and female ratings of these selected motivational factors were compared, no significant differences were detected ( $p$  values were constantly higher than the expected value for statistical significance, which was 0.05).

Gender, age, marital status and educational backgrounds were also compared with factors such as incentive trips, prizes/ rewards, internal competitions, teambuilding as these factors did appear to have some differences when the first statistical analysis was done. The  $p$ - value results of the chi-square tests are presented in Table 3.

Table 3: P-values of selected motivational factors and age, gender, marital status and education

	Age	Gender	Marital status	Education
Incentive trips	P = 0.8372	P = 0.4274	P = 0.0806	P = 0.498
Prizes/awards	P = 0.5879	P = 0.5124	P = 0.4893	P = 0.2832
Internal competitions	P = 0.3487	P = 0.9034	P = 0.7390	P = 0.092
Team building	P = 0.7736	P = 0.4371	P = 0.4209	P = 0.7332

Different age groups were evaluated in terms of their preferences for the selected motivational factors. The decision was made to split the age groups as follows: 23 – 30; 31 – 40; 41 and older, to have similar sample size groupings for statistical testing. There were no major differences between the different age groups and their rating of incentive trips and prize/awards as external motivational factors ( $p$  = 0.8372 and  $p$  = 0.5879 respectively). For incentive trips a slightly higher percentage (27%) of age group 31 – 40 rated these trips as not important, 21% of the 23-30 group and 15% of the 41+ group. For the older representatives prize/ awards were not that important as for the younger group of representatives, as a lower percentage of them indicated that this was very important (27% of age group 41+ vs. 42% of age group 23-30 and 46% for the 31-40 groups). More than 60% of representatives older than 40 rated internal competitions as not important compared to 36% of the 23-30 group and 49% of the 31-40 group of representatives. The younger representatives seemed to rate internal competitions more important than their older colleagues. Interestingly, for the older representatives

teambuilding was indicated as very important by 42% of this age group compared to less than 30% for their younger colleagues. Unfortunately, as evident from Table 6, none of these differences were significant.

When male and female ratings of these selected motivational factors were compared, no significant differences were detected, although females gave a slighter higher rating to team building.

For ease of comparison, the marital status grouping was done as follows: Single (includes all single as well as divorced and widowed respondents) and Married (includes all married as well as co-habit respondents). It seems as if single people tend to be more in favour of incentive trips as a form of an incentive scheme than married people, although not statistically significant ( $p = 0.0806$ ). The rating in terms of prizes/awards was similar amongst single and married people ( $p=0.4983$ ). When asked about internal competitions and teambuilding, there was also not a significant difference ( $p = 0.7390$  and  $p = 0.4209$  respectively) between single and married people.

For statistical purposes the educational demographics were divided into two groups: Matric/Diploma (Including High School, Matric or equivalent, Post-school Certificate/Diploma and National diploma/Higher diploma) and Bachelor/Honours/Master degree (Including Bachelor degree or equivalent, Honours degree or equivalent, Master degree or equivalent and Doctoral degree or equivalent). No significant differences were noted when representatives with different educational qualifications rated the importance of the selected motivational factors. Although representatives with tertiary degrees appeared to be more in favour of internal competitions (21% vs. 6% ranked this as very important), it is not overall statistically significant ( $p = 0.092$ ). For representatives with different educational backgrounds there were no distinctive differences in their preference of motivational factors.

## **LIMITATIONS**

The study was limited to external motivational factors, therefore excluding internal motivational factors. The sample consisted of sales representatives from three pharmaceutical companies in South Africa, thereby excluding representatives from the rest of the pharmaceutical industry in South Africa. Due to the nature of non-probability sampling, the respondents used in the study are not representative of the broader South African pharmaceutical sales representative population. Therefore the results cannot be generalized.

## **IMPLICATIONS AND RECOMMENDATIONS**

Respondents in this study rated being well-informed as the most important external motivational factor in the performance in their daily duties. This underlines the importance of having effective knowledge sharing systems within the organisation. Any new information on promoted products should be shared with the sales representatives in a well structured manner. Representatives should not only be well informed on their products but also on their own as well as the company's sales performance, market share, etc. Strong products and brands were rated as the second most important external motivational factor. Representatives are highly motivated to sell products and brands that are well accepted by customers. Unfortunately, with the continuous changing environment of the pharmaceutical industry, the same product which is perceived as "strong" today could become "second class" tomorrow with new products entering the market. This motivational factor is not really controllable by sales managers as they cannot choose which products to promote.

From the results of this survey, it was clear that a financial incentive was not perceived as the most important motivational factor. A ranking of external motivational factors indicated that financial incentives were rated as less important than being well-informed and strong products and brands. In a study on reward preferences of sales people, Lopez *et al.* (2006) found that sales people in the early (exploration) stage of their careers tend to prefer fixed salaries and feel that commissions are too risky, but as sales people try to establish themselves and succeed, the preference for incentive pay was more relevant. Lopez *et al.* (2006) advise managers to be wary of incentive schemes such as commissions, bonuses, and rewards as they can motivate sales people to work harder but not smarter. In other words, sales people are more focused on the outcomes of their work rather than the content of the work. If rewards are perceived as control mechanisms, they tend to dampen an individual's desire for exploration and learning. Although it was established in this survey that financial

incentives were not the most important external motivational factors, the fact remains “money motivates” and these incentive schemes should be structured very carefully. Most importantly, these schemes should be simple and uncomplicated to ensure that sales people do not have difficulties in understanding them, see the relationship between efforts and rewards, and are able to calculate what their incomes will be.

It was interesting to note that fringe benefits such as a company car/car allowance and pension and medical aid received higher motivational importance ratings than factors such as incentive trips and prizes and rewards. In pharmaceutical sales management more time is usually spent on designing incentive programs than looking into the actual fringe benefits of sales people. Jobber and Lee (1994) compared the perceptions of sales management and sales people. In their study they found that sales managers valued factors such as competitions/prizes and incentives based on target setting more highly than sales people and sales people valued things such as fringe benefits more highly than their sales managers. They concluded that their survey clearly demonstrated a need for sales managers to check their assumptions about what motivates their sales people.

Prizes and rewards did not get a very high importance rating from the respondents (only 40% rated them as very important). Prizes have become so common, they are a form of commission that sales people expect. Smith and Rupp (2003) cited research that reinforces the finding that expected rewards decrease the intrinsic motivation for the rewarded activity. Internal competitions are not perceived as an important motivational factor with 48% of the respondents rating this factor as not at all important or less important. It is clear that arranging internal competitions amongst sales representatives to stimulate sales efforts will not necessarily be effective, as not everyone will be motivated by this. This is also true for teambuilding, which is another popular method of motivating sales people. Although it is still important to build a strong team in which the representatives can feel comfortable and can motivate and encourage each other, one might have to look at other options than teambuilding and internal competitions to establish effective teams. Incentive trips have always been perceived as an effective method of not only “thanking” sales representatives for their past achievements, but also to motivate them for forthcoming sales achievements. Although, 56% of respondents ranked this factor as very important, it was still one of the five least important external motivational factors. In companies where incentive trips are reserved only for teams or individuals that achieved expected targets or who have outperformed the rest of the sales teams, this might still be an effective motivator. The last factor ranked as one of the five least important external motivational factors, was involvement in target setting. In most pharmaceutical companies, targets are set by senior management and representatives are merely informed what they need to achieve. Many companies have debated whether target setting should maybe include at least one or two representatives from each sales team, and this might still be further investigated.

Some previous studies on personal characteristics of sales people have been done with contrasting results. Ingram and Bellenger (1983) concluded that the personal characteristics included in their study were not strong predictors of what a salesperson’s reward valences will be, while Chonko *et al.* (1992) came to the conclusion that personal (demographic) variables are related to reward preferences, but also not strongly. From the results of this study, it would unfortunately also be difficult to conclude that different demographics will determine different preferences for motivational factors.

# **SUSTAINABLE FOOD PRODUCTION IN SOUTH AFRICA, ACCESS TO LAND, THE MEANS OF PRODUCTION, COMMITMENT AND CUTTING-EDGE TECHNOLOGY**

**JD Coetzer, Tshwane University of Technology, South Africa**

## **ABSTRACT**

*In this paper two opposing philosophies are contrasted. The centralist ideology, largely socialist in essence, is identified as an attempt to placate the hungry masses. Because that is what this is all about – feeding the hungry. But all the Marxists in the world cannot make it rain on demand. We have some way to go before we will be able to control the forces of nature. The opposing viewpoint is that of capitalism. Here we will attempt to sell our produce to the hungry masses. The equation of supply and demand will also ride on the impact of nature upon harvests and live-stock. The complicating factor here is man. Alan Greenspan said ‘it is not that humans have become more greedy than in generations past. It is that the avenues to express greed have grown enormously’ (Mallor, p75).*

*The thin veneer of civilization is under scrutiny when competition for and access to food is at stake. This is very much the case in South Africa where sustainable resources have been drawn into a quagmire where for all but the right reasons, sustainable food resources, agricultural land; means of production and access to infrastructure (government support) are dealt with in a non-productive way.*

*There is currently no discussion on ethical business in South Africa. It is a given (Mallor, p77) that if you want to be understood by and to influence someone who has a different ethical underpinning than you do, you must first determine his ethical viewpoint and then speak in an ethical language that will be understood and accepted by him. Several aspects that expose and explain the context of South Africa are thus presented for consideration. That some of the issues will be highly contentious cannot be avoided. In modern societies, where diversity is valued as an independent virtue, considering the impacts of your decision on the full range of society's stakeholders has taken on great significance in prudent and ethical decision making (Mallor, p89).*

*The world food crisis of 2007-8 alerted the world and policy makers not only to the fact that global agricultural productivity growth has been slowing down but that current national agricultural policies may not be adequate to prevent such crisis in the future ... (Sarris, p11). We need to agree on the means necessary to produce the maximum numbers in food. We will need to make and negotiate contracts along the road. Keeping in mind an almost fanatical opposition to each other, the parties confronting each other shall be compelled to adapt.*

## **FOOD, GLORIOUS FOOD**

The World Health Organisation (WHO) has recently indicated that a looming food scarcity will generate the probability of widespread unrest and protests. This is clearly stated by Sarris (p34) when they indicate that a lack of food creates considerable insecurities across the world and may lead to perverse policies and outcomes. They further explain in simple terms the results of improper interference. It is further their considered opinion (on p42) that ‘... no country has been able to sustain a rapid transition out of poverty without raising productivity in its agricultural sector. The process involves a successful structural transformation where agriculture, through higher productivity, provides food, labor, and even savings to the process of urbanization and industrialization. A dynamic agriculture raises labor productivity in the rural economy, pulls up wages, and gradually eliminates the worst dimensions of absolute poverty’.

Mallor (p528) confirms the importance of land and its recognition in the law. In the agrarian society of previous eras, land served as the basic measure and source of wealth. In today's society, land functions not only as a source of food, clothing, and shelter but also as an instrument of commercial and industrial development. Sarris *et al* (p43) point out the obvious when they say that 'most of the world's poor live in rural areas, or migrated from them in search of better opportunities. It seems almost obvious that growth in agricultural productivity is the surest way to end poverty'. Somewhat cynical, but true is the further allegation that (Sarris, p28) the tendency of growing food imports with an inability to pay is mostly an African problem. The basic prerequisite is that Africa should recognize that agriculture can be broadly divided into food production, which in many of the poorest countries is still predominantly subsistence production; traditional commodity exports, and newer, often high value, products that can be destined for internal or export markets (Sarris, p161). After the recognition comes action: make it easy for farmers to feed the people: Sarris (p163) points out that farmers face a number of inherent disadvantages in the market that interfere with the 'normal' exchange between buyer and seller. Farmers are numerous, cash poor and in business for themselves (not employees of a common employer). Poverty itself has different aspects: Inadequate and often unstable income, inadequate, unstable or risky asset base, poor quality and often insecure, hazardous and overcrowded housing, inadequate provision of public infrastructure, inadequate provision of basic services, limited or no safety net (Bas, p11). This is a world-wide problem and the inputs of all sectors of society, countries and agencies should be attracted.

Talking, agreeing, on the essence of sustainable food has been done in the past. Unfortunately not always with the success expected. A lot of development agencies focused on policies they thought would make countries more attractive to foreign investors. UNCTAD organized sessions at which trade ministers of different developing countries would promise never to nationalize foreign investments, and offering extraordinary tax breaks on profits made (Sarris, p160)

## THE SOUTH AFRICAN CONTEXT

External of Government itself, the two most credible institutions on the issue of food production in the Republic of South Africa, are AgriSA (an agricultural organization) and TLU (also involved with agricultural issues). Another organization with a reputation for providing incontestable information is 'Solidarity', a trade union with a national profile in South Africa. Through their good offices it was possible to access substantial information provided by the Information Development Group. According to the information they provided, the position as regards surface ownership during 2001, painted a picture quite contrary to that which the government propagated. In terms of a given surface area of 1 225 884 square kilometers (the average population per square kilometer was 36 persons) wherein 20,20% was owned by Blacks; 44,08% was owned by Whites; 1,03% was owned by Asians; 9,37% was owned by Coloureds and 25,33% was owned by the Government. Since the Government was a black dominated entity, they with one fell swoop moved into the position of power in that about 56% of the surface area belonged to 'Blacks'. As such these figures are meaningless. Some perspective is given by Bas (p182) when it is postulated that under the previous regime 80% of the population were compelled to live in the homelands. Further perspective is provided by assessing population statistics. The population for blacks at 1904 was estimated to be about 1 200 000 (for all ethnic groups together) and since then a population explosion has been documented. The current figures indicate a population of about 45 500 000 for non-whites. White citizens would currently number about 3 500 000. The estimated population statistic for whites in 1904 was about 1 050 000.

Two issues need to be further examined: Firstly, the stated moral justification for the (then) statutory approach to land; and secondly the cultural and tribal attitudes towards land as communal property juxtaposed to the contemporary claims of land as being privately owned. Dr HF Verwoerd, then Minister of Native Affairs, stated as follows on 17 September 1956: '*...The fundamental principle is the traditional policy of separate development. The European enjoys rights and privileges in one part of the Country, the European area, and the Native has similar rights and privileges in the Native areas, i.e. the Reserves, whether tribal territory or areas purchased by for him by the Government. In the Native areas the European has no claim to property*'. (Quoted in the 'Foreword' to 'Urban Native Law' by Gordon Davis, Q.C.) Davis further (on p vi) explains that 'the housing and settling of the urban Native on an ethnic basis is conducive to greater satisfaction amongst the Bantu people themselves. It has certainly been found to be the successful basis of school building and planning and is not a source of conflict and strife, but has just the opposite effect'.

As far as property rights are concerned a Chief was under no obligation to obtain the consent of, or even to consult with his people regarding the purchase and sale of land (Davis, p19). It was also stated that no

‘individual member or members of a tribe [could] institute proceedings against the Chief or the tribe in regard to the ownership, occupation or acquisition of land...’ (Davis, p26). The Euro-centric concept of private property is anathema to black culture and the following will elucidate the vexing question on why blacks in Africa so readily embraced the Marxist-Communist philosophy: ‘In Bantu law all property whatever acquired by the *kraalhead* or by or through an unemancipated member of his family, is administered by the *kraalhead*; no member of the family has an individual right to own anything. This is the general rule’ (Seymour, p68). Private law, as far as Bantu law is concerned, was/is limited to matters of marriage, lobola, succession, the status of the *kraalhead* and the customary union. Seymour (p 306) pointed out that immovable property, for purposes of succession, may be divided into two kinds:

- a) Property falling within s 23(2) of Act 38 of 1927. This type of land is not devisable by Will, but must invariably devolve upon one male person who is determined according to a prescribed table of succession.
- b) All other immovable property. Despite the fact that Bantu law does not contemplate ownership of immovable property, when a Bantu person, whose estate devolves according to Bantu law, dies intestate leaving immovable property, it devolves upon the heir of his Great House. But where a *kraalhead* had acquired a piece of land with moneys contributed by his several Houses, it was held that the heir of each House was entitled to a share of the land proportionate to the amount contributed by his House.

Cultural values, primitive traditions and a rigid patriarch system thus had as much to do with the ‘discrimination suffered’ by the blacks of Africa as the colonization of the continent.

Landowners in Europe or the USA will show some amazement when confronted with the Draft Land Tenure Security Bill. In terms of Chapter 4, the ‘Rights of persons Residing (i.e. not the owners of the land) on Farms are set out in s15(1) as follows:

- a) The right to own livestock and not be unreasonably restricted
- b) right to grazing land for the livestock
- c) right to crop
- d) right to reasonable access to pathways
- e) right to build houses and homesteads
- f) right to visits and be visited
- g) right to bury members of the family on the farm
- h) right of access to burial grounds and ancestral land
- i) right to reasonably practice culture
- j) right of access to clean water/electricity/development
- k) right to do commercial farming

The issue to be determined here is whether under these conditions, sustainable food production is promoted or restricted. In considering the question, there can be no half-measures: You are hungry, or you are not.

It should be noted that conflict (concerning specifically land and/or rights thereto) is not necessarily racial in nature. In Usangu (Tanzania) ‘conflicts were arising over access to resources, especially water and grazing – both between and among irrigators and pastoralists. There was also increasing concern expressed over environmental issues. Population expansion and unmanaged exploitation now leave many without water for parts of the year, and have led to deterioration of water quality, reduced pasture area and quality...’ (Bas, p203) An invasion of pastoralists since the 1950s, seeking livelihood opportunities, was seen as causing wetland degradation and increasing direct water use through seemingly increasing livestock numbers. Evidence cited included highly visible tree and bush clearing around stock *kraals* (especially by the Sukuma pastoralists, who are commonly said to have deforested and destroyed their own homeland), and bush encroachment onto the grassland (Bas, p205).

In South Africa the share of agriculture in the GDP for the period 1969/71 was 30,6%. This declined to 26,6% for the period 2002/4. The share of the economically active population in agriculture in the total economic active population fell from 0,68% in 1969/71 to 0,41% in 2002/4. Almost one third of the white farmers gave up, retired or had their farms expropriated. The share of agricultural imports in total merchandise imports increased from 17,4% in 1969/71 to 18,1% in 2002/4. The change indicates the fact that we were becoming a food import economy.

Regrettably, as can now be gleaned from the above, no debate can be conducted on the aspect of security of property (as well as security of tenure) without reference to the historical background. It is even more regrettable that the historical background will itself be eschewed by the political fallout of the opposing political ideologies, i.e. the separation of the ethnical groups into homelands, as was implemented by the previous regimes (colloquially known as ‘apartheid’) and the current ideology of the present regime wherein a

culture of entitlement is perpetuated – *ad infinitum* – in order to ‘redress the imbalances of the past’. In this vein it should be stated that the Republic of South Africa is a Constitutional State. The Constitution (Act no 108 of 1996) and specifically the Bill of Rights contained therein (s 14c) guarantees the concept of ownership and private property. In the GREEN PAPER issued by the Government during September 2010, ‘Rural Development and Land Reform’ is the subject under discussion. This document has recently been withdrawn because of the overt tendencies and philosophies expressed in it that brings farming and farm properties perilously close to the Zimbabwean situation. The Freedom Charter (1955) is elevated above the Constitution when the Minister in charge of this portfolio (the Hon G E Nkwinti) states that ‘the land will be shared by those who work it’. It must be pointed out that the total implosion of the agricultural sector in Zimbabwe is not seen as a calamity at all: USAID and other international food distribution agencies have seen to adequate food provision in the absence of regular crops.

The biggest challenge in presenting a paper on this subject is then to avoid the stale political arguments and to maintain a strict and scientific basis of knowledge. This cannot be sustained on all arguments as some of the arguments (and the factual information on which it is based) have been hijacked into subservient roles and to serve pre-set political agendas. Cheick Sidi Diarra, UN Under-Secretary-General (Special Advisor on Africa) laments in ‘Africa Renewal’ (August 2010 / Vol 24 Nos 2-3) that ‘the price of commodities are not fixed by Africans themselves. They are fixed elsewhere’. He then adds that ‘*[T]he rest of the world has to change its perception of Africa. It has to see Africa not only as a continent which is forever leaning on international aid and support. It has to see Africa as a continent of huge potential*’.

In view of the above we have to establish an equal playing ground in order to facilitate a scientifically accountable basis for negotiating a road to progress: the way forward, towards sustainable food production. It is common cause that South Africa has a colonial past (Gie, p76). The Dutch established a halfway station at the Cape of Good Hope as a commercial facility and to replenish fresh produce for the ships and crew of the ‘Here XVII’ a commercial entity (and perhaps the first real global trade organization) on route to India and the Far East. The primary purpose thus was to obtain fresh fruit, fresh vegetables, wine and meat produce for the health and maintenance of crews manning the many ships conducting trade with the East (Gie, p66). The Cape of Good Hope, as far as Europe was concerned, was an exporter of food.

The wars and politics of Europe influenced and guided several developments in South Africa. When Jan van Riebeeck, a Dutch citizen but senior official of the ‘VOIC’, landed in the Cape on 6 April 1652, his purpose was a-political. Subsequent developments as well as the evolution of several European alliances over the centuries culminated with the ‘taking over’ of the Cape by the English in 1806. This was ostensibly to secure the Cape against Napoleonic forces and to protect its inhabitants against the wars ravaging the European Continent. After the defeat of Napoleon the English remained. They re-configured the administrative system, amended the legal system, introduced a new socio-economic system and, in general terms, expanded the British Empire by declaring Natal a British Colony and followed this up with several military expeditions until the Orange Free State and the Zuid Afrikaanse Republiek (ZAR) were brutally subjugated and brought under control in the collective entity known as the Union of South Africa, established in 1904. The British Government of the time prohibited people of colour to participate in the political spheres of government.

Another complicating factor is the socio-economic nature (and the corresponding culture) of the indigenous peoples of South Africa. History indicates a largely socialist trend, with Headman and Chiefs being the ‘owner’ of fixed property and consequently also the individual/s clad with the authority to regulate access thereto, they were responsible for the well-being of the tribe, in specific terms, and were only held responsible to account by Paramount Chiefs and ‘kings’. Most of the tribes followed a nomadic culture and when strife or dispute arose regarding land or grazing of animals, it was resolved through the simple and decisive mechanism of war. King Shaka of the Zulus perfected this aspect and literally obliterated the population of the internal districts of South Africa in what became known as the ‘Mfecane’ – a focused campaign to subjugate all internal tribes to the Zulu with imminent and effective massacre the destiny of any dissidence. The hinterland was effectively depopulated in this fashion. To whom then does vacant land belong?

## COMPETITION FOR LAND

It was unavoidable that with the internal drive for more land and grazing for their animals, the white ‘Voortrekkers’ would come into contact, and also into conflict with the remnants of some of the indigenous tribes. Some were friendly, such as the Setswana, and would contract for land with the counter contractual obligation being protection against the Zulus. Other were not so friendly, such as the Matabele, and attacked the

‘Voortrekkers’ and although at various times the surprise element had the tribal cohorts on the winning side, the fact that the ‘Voortrekkers’ could use advanced fire-power (albeit single-shot front-end loading muskets) ensured that the outcome favoured the white settlers. The might of the Zulus were finally broken in the battle at Bloodriver on 16 December 1838, today remembered as the Day of the Covenant, a day of special reverence to the ‘Voortrekkers’ keeping in mind that about 350 fighting men (add a further 120 men to take care of the animals inside the defensive wagon circle) had to face and defeat a military machine comprising in excess of 15 000 Zulus .

Farming activities hereafter expanded exponentially and large tracks of land were occupied by farmers who established vast food-production entities. As South Africa is a land of great extremes as far as climate is concerned, farmers built up an extensive ‘bank’ of knowledge and experience. These farms could not be properly tended to by the farmers alone and over many generations a culture evolved in terms of which farm labourers became members of the ‘family’ of the farmer. In this vein labourers had access to free medicine, to an allocation of land for private use and farming activities and close co-operation in the activities on the farm between the farmer and his labourers were more common than not. It is, regrettably, and inevitably, part of human nature that in some instances a fall-out occurred and labourers were evicted from the farm. In other countries this process is referred to as ‘urbanisation’ of the individuals concerned.

The fundamental and revolutionary changes that came about in South Africa during 1994 with the election of a black majority government and the consequent drive for the reversal of property rights would inevitably impact on the farming community. This had to be regulated as the Constitution of the Republic of South Africa guaranteed property rights. It is, after all, a universally acceptable principle of the Rule of Law. Middle-ground was reached when it was decided that only land that was expropriated after 1913 for ‘white’ usage would be eligible for return to previous owners. The process itself is not without peril as any ‘previously disadvantaged’ person could now lodge a claim on land, any land, and it became the burden of the legitimate owner to disprove the claim, either on merit or on time prescription. With substantial political interference this process quickly became notorious and some farmers could not afford the expensive litigation whilst running a farm under risk as well. All capital expenses incurred after the date of lodging of the claim against your land would be for your own expense. No compensation would be allowed therefore. Moreover, the current Minister of Rural Development and Land Reform claims a discretionary right to ‘attach’ your property – ostensibly for the advancement of a non-racial society. Exactly how that will be achieved through expropriation of farmland belonging to whites, is not explained. When white farmers had been farming on land for four or even five generations, had invested not only capital but their blood, sweat and tears, even their very lives, in the development thereof, the issue of emotion should not be underestimated. The legacy of bitterness caused by this policy has yet to be measured. The Minister is unmoved (GREEN PAPER, p2, 3). Because of three centuries of being ‘disadvantaged’ he feels that blacks are entitled to claim land boldly and any resistance is to be reviled as racism.

Perhaps we should also revisit the historically based attitude that founded the colonization process. It is stated here (the original text is in Afrikaans but it is freely translated) for consideration: (Gie, p76) ‘A nation is obliged to make its land serviceable to mankind to the utmost degree. They should take care that it produces the maximum means of subsistence and that healthy social relationships be maintained thereon, failing which another nation of higher standing and who has a more developed concept of progressive benefit will obtain the moral right thereto and will consequently be able to extract more from the soil. This is a harsh law but just and absolutely essential for the advancement of the world. On this moral principle rests ultimately the colonization not only of South Africa, but also America, Australia and Nieu-Zeland’.

## STATUTORY LIMITATION

The legal system has been very ambivalent in the manner in which security of land and security of tenure has been dealt with. If administrative law deals with state authority, what is the distinction, if indeed there is one, between constitutional law and administrative law? Both form part of public law but administrative law deals with only one branch of government: the state administration (Burns, p46). The supremacy of the Constitution has replaced the sovereignty of parliament. This means that all administrative action and legislation promulgated by parliament is weighed against the constitution and may be declared invalid in the event of conflict (Burns, p47). It should thus be noted that the GREEN PAPER (referred to above) has been withdrawn by government. The real threat of constitutional litigation has prevailed, for now. The withdrawal was recalcitrant and with much grumbling and shaking of fists.

The concept of 'just administrative action' encompasses the common law principle of administrative legality. As a result, all administrative action must conform to procedural requirements as well as the substantive requirements of fairness, rationality and reasonableness (Burns, p61). In assessing whether the principle of administrative legality has been met, the courts must balance the right of the individual to the unencumbered enjoyment of his/her constitutional, statutory and common law rights against the duty of the administration to promote and protect the general public interest or well-being (Burns, p72). Wiechers (p12) quotes AV Dicey in stating that '*no man is punishable or can be lawfully made to suffer in body or goods except for a distinct breach of the law established in the ordinary legal manner before the ordinary courts of the land. In this sense the rule of law is contrasted with every system of government based on the exercise by persons in authority of wide, arbitrary, or discretionary powers of constraint ...*'.

It should also be kept in mind that the Bill of Rights (Chapter 2 of the Constitution) states categorically that everyone is equal before the law and this includes the full and equal enjoyment of all rights and freedoms. The Constitution (s 25) states emphatically that '[N]o one may be deprived of property except in terms of law of general application, and no law may permit arbitrary deprivation of property'. For purposes of legal-technical debate, two aspects need to be sounded out: In s 25(2) it is stated that 'property may be expropriated in terms of law and general application ... for a public purpose or in the public interest'. The second and ominous aspect lies in s 25(4) where it is stated that the public interest includes 'the nations' commitment to land reform, and to reforms to bring about equitable access to all South Africa's natural resources'. This is given substance in the Expropriations Bill, published in the Government Gazette, no 30963 of 11 April 2008. In terms of Chapter 4, s10(1)(b) an expropriation authority must consider 'the need for land, water and related reform in order to redress the results of past racial discrimination'.

## REALITY CHECK

In modern society the state needs specialized knowledge to meet the needs of a sophisticated urbanized society, on the one hand, and a less sophisticated rural society on the other (Burns, p54). Afri-Forum, an organization created to serve the farming community has researched several aspects. A critical and very contentious element is the clamour for South African farmers to establish commercial farming entities in other African countries. The demand for knowledgeable and expert input is so acute that the South African government has had to do several back-flips. In the past these farmers were politically vilified as thieves and scoundrels who had stolen whatever they might have gathered. The fact that they had provided food, cheap food, to the inhabitants of the country was of lesser concern. With the advent of the recent uprising/s in Northern Africa and with the simmering discontent from local supporters on the non-delivery of basic services, a food shortage suddenly appears to be a grim reality. This is to be avoided. Keep the farmers on their lands. Economies-of-scale is an unknown concept in Africa. Subsistence farming is a romanticized idea that should be allowed to slowly fade into oblivion. Most of the highly controversial (draft) Bills have now been withdrawn. The question, however, remains: for how long? Farming is a long term activity and investors, farmers and industry will want to know how safe any investment will be in the long run.

Sarris (p13) identifies a major issue of Lesser Developed Countries (LDCs) and especially for African economies' fragility and vulnerability as being this increased exposure to food imports, the implications about food security, and the impact of external food market shocks. Agriculture often provides a safety net: a refuge for people when the informal economy fails. This is true in Africa, where high levels of HIV/AIDS infection and limited public health facilities have sent people with the illness back to rural areas to seek help from family members. If the sector attracts the most destitute, then it is not surprising that poverty is also concentrated in rural areas (Sarris, p165). For those developing countries that rely on exports, losing market access will translate into a loss of vital earnings, which jeopardizes economic and social development. Further, exclusion from international markets may shut them out from sources of expertise, inputs and technology (Sarris, p226). It is thus vital that farmland should be seen as almost sacrosanct and if not to that degree, then at least free from political interference and manipulation.

The importance of food production being elevated above petty politics has been recognized in the past. Many food insecure developing countries have gone through a long period of pursuing policies that actually penalized agriculture. Studies indicate that agricultural disincentives were stronger the lower a country's per capita income (Sarris, p242). This was then obviated through some creativity: Successful take-off to sustained agricultural growth was achieved through a judicious mix of subsidies, pricing policies and border measures, as well as other institutional and infra-structural support measures (Sarris, p245).

Not everything in Africa is destined for failure. Bas (p180) relates the story of South Africa's Working for Water (WfW) programme as being a story about a fortuitous, synchronous alignment of the goals and objectives of the new political order, environmental sustainability and the alleviation of poverty. At its peak WfW had more than 42 000 workers in the field, drawn from the so-called 'poorest of the poor' primarily in rural areas. Fifty four percent of the beneficiaries were women, 26 percent youth, and 1 percent were people with disabilities (Bas, p189).

Starting out cold, the programme had no experience to draw on and insufficient attention was given to developing a strategy and to medium- and long-term planning. Stands were occasionally cleared with no or insufficient follow-up, making the situation worse, not better. In some cases stands of indigenous trees were accidentally cleared due to insufficient training. This situation was further exacerbated by the desire for political expediency, and the need to satisfy political goals often superseded ecological objectives (Bas, p190).

The impact of climatic change on agriculture has not even been addressed in South Africa. The vital inputs required from cutting-edge technology in order to mitigate the effects on crops and grazing land – and ultimately, sustainable food provision – can only be attended to through scientific and clinical methods. Political ideology has no role to play. 'Onderstepoort' (a research institution linked to Pretoria University) is still the only credible veterinary facility in Africa and the intimate linkage with farmers, established over decades, and it can only be seen as detrimental to society as a whole if subsistence farming is to be enforced by way of centralized planning. The fact that ideology cannot make it rain is yet to hit home in Africa. The United Nations had already concluded that 'ever since the United Nations Conference on the Application of Science and Technology to Development was held in Geneva in 1963, there has been a growing conviction, expressed by the General Assembly and shared by all the organs of the United Nations system, that science and technology can make an outstanding *contribution to economic and to social progress and to reducing the gap in living standards* (my italics) between the developed and developing countries (Everyman's United Nations, p83). After 48 years we have very little to show. Contrast this with the 1966 World Land Reform Conference, held in Rome, that was organized jointly by the UN and FAO, in association with the ILO. The Conference 'confirmed the view that defects in the agrarian structure acted as a strong deterrent to economic and social progress and that *comprehensive land reform* (my italics) was essential for adequate development' Everyman's United Nations, p88). After 45 years they have equally little to show.

## CONCLUSION

Food is a daily necessity. Lack of food will initiate action and lead the hungry to do whatever is necessary to still that basic and instinctive need. The very recent incidence of unrest (and sedition) that led to the downfall of the government in Tunisia is a case in point. Sarris (p12) points out that many developing countries and especially those in Africa have long been exports concentrated in primary commodities, and it is well known that these commodities are characterized by volatile world prices. The combined effects of negative trending and unstable terms of trade for African economies is one of the reasons for their alleged negative performance (Sarris, p12).

A more recent but less analyzed development has been the increasing food import dependence of developing countries and especially the LDCs despite ample natural resources for food production. This trend in itself does not necessarily imply any problems, as increased food imports dependence may be a natural tendency during the transition of an agrarian economy to one based more on manufacturing and services, and can be managed 'if' the export income generated by the non-agricultural sectors can pay for the increased food imports (Sarris, p12). It is most unfortunate then should the 'if' not deliver. In a country such as Zaire, water resources are plentiful (South African farmers would wish for access to those resources) the land is strong and rich in content. The climate is tropical. Yet Zaire has to import food. The tendency to become involved with the tragic border wars of Rwanda and Burundi is distracting and instead of promoting farming (of all sorts) rural residents are herded into villages for 'protection' against cross-border attacks. The land is lying dormant. Food is grown in Europe and the US and imported.

Food is colour-blind. There can be no justification, no ratification, to seek injury to the providers of food, farmers, agricultural experts and consultants because they are of a skin colour different to that of a government official. It is of some interest to note that one of the pillars of 'apartheid' was the Population Registration Act. In terms of this Act people were classified into their respective race groups. After the advent of the black majority government, this Act was destined to be eradicated from the statutes – *post haste*. Ever since then it has been a somewhat embarrassing issue to seek redress of property rights as everyone now had the same 'colour'.

The cry is to seek the advantage of the 'poor' and in cajoling the 'poor' into a support base, political advantage and the scourge of Africa – corruption - is gained. Exactly how hungry are you?

Spare a final thought for the population of Zimbabwe. After Robert Mugabe suffered a stunning defeat in the referendum in 2000, he initiated a carefully coordinated campaign, starting ten days after the referendum result was announced; gangs armed with axes and machetes invaded white-owned farms across the country. Government and army trucks were used to transport them to the farms and to keep them supplied with rations (Meredith, p637). They assaulted farmers and their families, threatened to kill them and forced many to flee their homes, ransacking their possessions (Meredith, p 637). As well as white farmers, farm employees and their families living on white-owned farms became the target of the terror campaign. Some 400 000 workers were employed by white farmers (Meredith, p637). Of course the matter was heard in Court. Mugabe reacted as follows: *'The Courts can do whatever they want, but no judicial decision will stand in our way... My own position is that we should not even be defending our position in the Courts. This country is our country and this land is our land ... They think that because they are white they have a divine right to our resources. Not here. The white man is not indigenous to Africa. Africa is for Africans. Zimbabwe is for Zimbabweans'* (Meredith, p 641). Today more than 4 million Zimbabweans have fled to South Africa. This necessitates additional and sustainable food production and more scientifically advanced methods to render the relief sought.

# STRATEGY IMPLEMENTATION: THE ROLE OF COGNITION, COMMUNICATION AND TRUST

**Gerard L. Danford**  
**Haaga-Helia University of Applied Sciences, Finland**

## ABSTRACT

*Much of the existing strategy implementation literature is focused on the managerial level and neglects to take into account the views of frontline employees who are in many cases critical during the successful execution of strategies. The author argues and supports the hypothesis that strategy implementation failure is partially due to; limited cognition, inappropriate communication and neglect of trust in strategy. Therefore, this paper examines frontline employee opinions (in a professional service organization) with respect to strategy cognition, strategy communication and trust in the strategy. The empirical analysis is based on a rather homogenous sample operating in a domestic setting. However, the complexities and challenges of strategy implementation within an international context are also discussed. The paper concludes by suggesting ways to improve the success during strategy implementation.*

## INTRODUCTION

Strategy is a never ending challenge for management (Smith 2009). This challenge is multi-dimensional when considering the complexity of strategy formulation and strategy implementation. Excluding the need for a good strategy to begin with, the poorly understood nature of strategy implementation is worthy of separate analysis. It is often quoted that nine out of ten strategies fail to be successfully implemented. Reasons for implementation failure are numerous ranging from resistance to change, organization, culture, motivation, communication, monitoring, leadership, along with many other challenges (Speculand 2009). A rather robust definition of strategy will be applied: 'the communication, interpretation, adoption, and enactment of explicit resource-allocation and activity decisions, at whatever point in the strategy process they may occur (Noble 1999). The focus in this definition is on implementation of intended strategies. Prior to beginning strategy implementation organizations first need to consider if there exists a common, along with individual understanding of strategy within the organization (cognition). Motivation to support a strategy and commitment cannot be taken for granted. Specific goals should be congruent with the strategy. Goal-setting congruence and implementation may be moderated by many factors; commitment, task complexity, feedback, and trust (Smith 2009). Communication should be designed in a way to enhance common and individual understandings of strategy. Furthermore, without trust the strategy buy-in of every employee in the organization may be absent.

## LITERATURE REVIEW

Crafting and implementing strategies is a complex process. Strategy implementation has been studied from many perspectives (Heide, Gronhaug and Johannessen 2002). Information systems, for one, have been considered vital to the successful communication of strategies throughout the organization. The medium and form in which information is disseminated is recognized as important during implementation (Conrad 1990). Before delving into the subject of strategic communication and the information channels in an organization, however, one needs to consider the subject of employee cognition. Organizations frequently fail to take account of employee contributions to strategy implementation. 'Many organizations have not provided a context for employee behavior'; therefore individuals are not prepared to perform to their maximum potential (Dobni, Dobni and Luffman 2001).

## Cognition

The people within any organization can have a profound impact on strategy implementation. Institutional theory has been employed to explain the diffusion of new structures and practices. However, there exists a need for increasing our understanding of the cognitive underpinnings of institutional theory (Iederen, Curseu, Vermeulen and Geurts 2011). Moreover, there is a need for a common understanding of strategy by all, especially when a large gap exists between the crafters of a strategy and the frontline staff. Cognition is the glue which binds strategy to the execution process (Moore 2001). Individuals vary in their relatively developed systems for conceptualizing. Cognition, communication and emotions are interwoven and one cannot address communication without considering these affects (Sypher, Davenport-Sypher & Haas 1988). If an organization articulates its goals in ways that have meaning for others, individuals will respond to achieve that goal (Comfort 2007). Furthermore, effective communication, based on the principles of cognition, can represent a creative spark which generates resonance between the organization and its environment. However, even shared understanding of strategic goals can lead to 'counter effort'. Motivational theories (Smith 2009) can explain some of these 'counter efforts'. More specific goals, for example, have been shown to evoke higher effort and goal commitment can be viewed as a function of the perceived importance of a task. Furthermore, timely and appropriate feedback increases the link between performance and goal.

Thus, taking account of the relationship between cognition and action transforms strategy implementation from a static, rule-bound set of procedures, into a dynamic process that is based on human capacity to learn and adapt to change. Cognition lessens the contrast between planning and practice. Cognition can also bridge the gap between information, meaning and action. One can adopt an individual conception of meaning; meaning is to be found by a particular information seeker and is connected to that person's purpose for searching (Budd 2011). Through cognition, one can avoid asymmetry in the information process. Cognition provides the initial content and activating link to the subsequent processes of communication.

## Communication

Communication can be viewed as a process within which individuals share meaning. Participants must understand (cognition) the meanings of the communication. Bad communication may result in effectiveness barriers – how effectively a received messages meaning affects conduct in a desirable way (Holm 2006). One can assume that communication is intended to bring about a response moreover, meaning is exchanged via symbols. However, all parties should have a common view on the meaning of these symbols. The sender's and receiver's understanding must overlap at some point. Strategy, as the direction of the corporation, can be very collective (McCarthy 2000). Managers play a key role in strategic communication and middle-management in particular represents a vital conduit within communication channels. Senior executives, the architects of strategies, mostly concern themselves with the big issues and important changes in strategic direction. Frequently, the communication of senior executives is formal, public and does not increase trust, especially emotional trust associated with behavioral change (Larkin and Larkin 2006). Supportive-interpersonal relationships create psychological safety and result in more flexible communication. If employees do not feel safe and comfortable, they may not be able to express themselves openly. The role of middle management during the strategy implementation process should be to create an environment within which employees can become both emotionally engaged and cognitively engaged (Daniels, Spiker, Papa 1997).

Corporate strategy communication has been neglected in the literature (Steyn 2003). However, academic interest has is growing. Three organizational communication methodologies have been adopted by researchers; interpretivism, critical theory and functionalism. Within functionalism, organizations are viewed as entities where communications are variables that shape and determine operations and performance (Peng and Litteljohn 2001). Functionalism is often administrative or management oriented. 'This approach focuses on goals and intended-unintended outcomes of communication systems and behaviors in an organization'. Even though management has communicated its intent (strategy) through specifically designed and crafted communications, many organizational participants remain vaguely aware of these efforts. Communications principles which can be more effective include (Klein 1996);

- message redundancy is related to message retention
- several media is more effective than use of just one
- face-to-face communication is preferred
- the line of hierarchy is the most effective communication channel
- personally relevant information is better than retained abstract, unfamiliar or general information

Communications systems should be in place which support the sharing of company information and engaging commitment (affective) which results in ‘employees understanding, identification with and involvement in the goals and values of the organization’ (Jacobs 2006). Vertical communication has been shown to be a strong predictor of commitment, however, horizontal communication (task related) is most effective in strengthening work-group commitment (Bartels, Peters, de Jong, Pruyn and van der Molen 2010). Two critical steps required to achieve effective communication during strategy implementation include; facilitating legitimization processes and addressing multiple communication processes simultaneously. Legitimization can be achieved through peer- and collaborative process (discussions in teams). Employing multiple communication processes could involve parallel use of face-to-face, teams, written documents, digital documents, feedback sessions and other forms (Huebner, Varey and Wood 2008).

## Trust

Research has shown that trust is crucial in driving economic agents towards mutually satisfactory and fair behavior. One could go further and state that trust is required for the viability of business (Castaldo, Premezzi and Zerbinì 2010). Furthermore, when taking the front-line employee perspective one could view trust as a trait, in other words ones propensity to trust. In the context of strategy implementation one could also view trust from a leadership perspective. Does trust in the management equate with trust in the strategy? If one takes a psychological contract view of the matter (transactional and relational contracts) ‘a fair days work + emotional involvement = a fair days pay’, then the psychological contract perspective on strategy implementation incorporates trust in management (Atkinson 2007).

For the purposes of this article the author is viewing trust between employees and management (including strategy) primarily as an emerging state. In such a state cognitive, motivational and affective states are influenced by contextual factors as well as inputs, processes and outcomes (Burke, Sims, Lazzara and Salas 2007). This perspective emphasizes interactions and situations. Underlying the emerging state perspective are; benevolence, integrity and competence (other authors have also incorporated predictability). Benevolence reflects benign motives, kindness and concern. Integrity involves an adherence to honesty and fairness. Competence refers to a parties ability to carry out her/his job (Dietz and Hartog 2006). Trust in the leadership of an organization has been found to be closely associated with organizational trust (Joseph and Winston 2005). The level of trust can be influenced by the leader’s communicative and supportive behavior. For example, the amount, frequency, timeliness and forthrightness of communication explain the level of trust in top management and immediate supervisors.

Strategy communication has also to be clear and transparent so as to guide employees in making choices and decisions during their daily tasks. It is important to bring out the energy in people by creating systems that encourage and stimulate them (McCarthy 2000). Manager should, therefore, share information with employees and listen to their objections to plans. Involving people in routine decisions satisfies the basic needs to belong and to feel important. From this basis, cooperation comes willingly. Employees want their opinions to count (Kahn, 1990). To experience ones job as meaningful, employees must be able to feel worthwhile, useful, and valuable. In addition to a certain amount of autonomy (task without tight link to others or control by others) ones position should also include some level of ownership over work. Tasks perceived as meaningful have clear goals which allow employees to have a better chance for success.

The speed of execution is increased when people feel ownership of the outcome and thus work more effectively (Smythe, 2008). Therefore, subordinates should be allowed to exercise some self-direction and self-control on routine matters. There should not be a mismatch between the organization image and the employees’ roles or a mismatch in one’s individual activities compared to the company strategy. Clear and explicit decisions

and choices must be made. Therefore, choices become the parameters within which people are allowed to operate with autonomy (McCarthy 2000)

However, job role clarity is not enough. The level of decision rights must be defined as well. Great execution starts by clarifying decision rights and making sure information flows freely to the right persons who are able to fulfill their responsibilities. Sharing information should go further than line employees just having bits and pieces of information in order to understand the bottom-line impact of their day-to-day choices. When everyone in the company understands the business realities from their own but also from their co-worker's point of view, cooperation will be more effective and everyone will be acting the organizations best interests. (Nielson, Martin and Powers, 2008)

Communication skills are vital in the strategy communication process (Willemyns, Gallois & Callan 2003). Effective communication builds trust in the workplace. Improved communication skills increases the trust between the manager-employee. However, managers have to work harder than employees to build and maintain trust. Therefore, organizations must truly value effective interpersonal communication and a supportive culture, otherwise employees won't expend the extra time and effort that is necessary to communicate properly (Gordon, 2006). Employees are very willing to fulfill their obligations to the organization by becoming more engaged when they feel their organization is genuinely concerned about them and their well-being. Thus, trusting and high-quality relationships between the employee and employer result in more engaged individuals, who in turn will most likely report more positive attitudes and intentions toward the organization (Saks, 2006).

## **International dimension**

The international corporation is in many cases a multilingual organization (Blenkinsopp and Pajouh 2010). Thus for companies involved with international business the importance of cognition, communication and trust during strategy roll-out may be even more critical. However, in many cases organizations and management often assume that that everyone else sees the world from the same perspective (Lillis and Tian 2009). Cultural differences create challenges regarding values, beliefs, nonverbal behavior, language and relationships (Chitakornkijasil 2010). Especially when the international corporation is operating in different cultural domains (collectivist and individualistic) it is necessary to take into account local culture, even though with time, these local cultural dimensions may become less significant (Zhang 2009) as a unified corporate culture emerges..

## **EMPIRICAL ANALYSIS**

During 2009 an exploratory investigation into the subject of cognition, communication and trust during strategy implementation was completed. This exploratory study was made in a professional service organization. The case organization was involved with educational services and in the process of implementing a new strategy. Some 350 professional trainers are employed fulltime in the organization. The majority of trainers have obtained a Masters level education and some 10 percent of trainers have a Doctoral degree. The majority of trainers have completed studies in economics and related business topics (law, management etc.). It should be emphasized that this was an exploratory investigation of the subject. The location of the survey was Scandinavia and a total of 113 respondents participated in the survey. Regarding the survey respondent demographics; 65% were female, 50% were over the age of fifty and 44% between 31 and 50 years of age. Furthermore, 66% were trainers, 10% were middle-lower management and the remainder represented other administration and support staff. Over 50% of the respondents had worked with the organization more than 10 years and 21% from 6-10 years. The survey was implemented during a full day in-house training session during 2009. The majority of participants in that training session completed the survey. There was a significant response (measured by number of responses) to open ended questions.

The respondents were first asked to rate their understanding of the concept 'strategy'. This question was employed in order to understand if they might already have a good understanding of the strategy, furthermore, it was necessary to see if respondents might feel they need some education on the subject of strategy.

**Question 1: How well do you understand the concept of strategy? (number of respondents 113)**

Some 84% of the respondents indicated that they understood strategy very well/well. One can only assume that the respondents have a good understanding of strategy to begin with. The respondents were next asked if they know where they can access information regarding the current strategy of their organization.

**Question 2: Do you know where you can access information of the strategy of your organization? (number of respondents 92)**

It appears that the respondents are well aware of where they can find this information (in this case the Intranet has a copy of the strategy). The respondents were next asked if they felt that the strategy should influence their daily work.

**Question 3: Do you feel the strategy should influence your daily work? (number of respondents 111)**

It is clear from the response to this question that respondents feel strategy should have a direct impact on their daily work. Next the respondents were asked if the strategy had an impact on their daily work.

**Question 4: Does your organization strategy have an impact on your daily work? (number of respondents 97)**

Some 54% of respondents felt the strategy had no/moderate impact on their daily work. Only 8% of respondents felt the strategy had a strong impact on their daily work. Next the respondents were asked if the organization strategy helps them when making daily decision on the job.

**Question 5: Does your organization strategy help you when making daily decision on the job? (number of respondents 97)**

72% of all respondents indicated that the organization strategy does not help/helps very little when making daily decisions on the job. The questions in the survey then moved to the subject of strategy communication.

**Question 6: Does strategy communication influence your understanding of your organization strategy? (number of respondents 104)**

42% of respondents indicated that communication has no/little impact on understanding. However, almost 32% felt that communication has a lot of impact on understanding. The next question was related to the frequency of strategy communication.

**Question 7: Does the frequency of strategy communication influence your understanding of your organization strategy? (number of respondents 107).**

64% of respondents felt that frequency of strategy communication influences a lot/quite a lot their understanding of the strategy. The next question was related to cognition and understanding.

**Question 8: Does clarity (clear terms, common language) help you to connect your work to your organizations strategy? (number of respondents 107)**

39% of respondents felt quite a lot and 58% felt that clarity helps a lot to connect their job with the organizations strategy. Cognition is apparently vital. The next question was related to form of communication.

**Question 9: Would two-way communication (where employees are able to e.g. ask questions) help you to connect your own work to the strategy? (number of respondents 109).**

Apparently two-way communication is vital in helping employees connect to the strategy of the organization. The next questions were open ended, thus the response rate was lower. A summary of the main

issues are presented. The first open ended question was related to the impact/relevance of strategy to ones individual job.

**Question 10: How should the strategy influence/connect with your work? (number of respondents 57)**

- provide direction/focus
- give meaning/objectives
- guide decision making/choices
- clarify priorities/my contribution
- give rules
- stimulate discussion
- unite people
- inspire

It is clear from the answers that employees desire more from the strategy of the organization, both at a general level (discussion and inspiration) and within their individual job functions (clarity and direction). The next question was connected to form of communication.

**Question 11: What form of strategic communication would help you connect your job to the strategy? (number of respondents 64)**

- personal (during development discussions)
- interactive & face-to-face
- team level communication
- departmental level
- brainstorming
- workshops
- online-digital

Many of the respondents wanted to combine personal development meetings with strategy discussions. Team and departmental level dialogue was emphasized within a spirit of open and interactive debate. It seems that people first of all wish to connect with the strategy at an individual task level and then at a broader team-department level. The final question was connected to cognition and ones understanding of strategy.

**Question 12: What kind of strategic information could help you in your daily work) (number of respondents 49)**

- concrete, practical, clear and understandable
- realistic, believable, justified and transparent
- detailed, not generic, connected with my job
- emphasis on; core issues, targets, goals, direction and focus
- clear priorities, comparison data, examples based on practice

Although the number of respondents to the above question was only 49, more than 87 different comments were made to this question (far more than in other open ended questions). It appears that what is lacking is strategic direction which is understandable, relevant to one's job and justified.

Finally the respondents were asked to indicate the importance of trust and belief (both words have the same meaning in Latin-FIDES) in the strategy.

**Question 13: How important is it that you trust/believe in the organizations strategy? (number of respondents 92)**

47% of the respondents indicated that personal trust in the strategy is very important. A further 49% indicated that they believe that personal trust in the strategy is important. In order to trust one must understand and in order to understand there must be effective communication. The importance of cognition and communication should not be neglected when building trust. The dividends of trust should be manifested in successful strategy implementation.

## CONCLUSIONS

The findings suggest that successful strategy implementation may be hampered by issues relating to cognition, communication and trust. Shared understanding and shared meaning are vital for parties to interpret properly goals and objectives, furthermore, the absence of these can mean that all parties are not united in one common goal. The result may be that decisions made each day are not congruent with corporate objectives. It appears from the empirical analysis that employees desire understandable, concrete (in relation to their individual tasks) and simple strategic directions which can assist them during daily decision making. Furthermore, communication should be personal (face-to-face or in small groups) and interactive. Trust is based both on the strategy itself and trust in management. Involving staff in the strategic process (even before roll-out) could enhance trust. In order to make the strategy 'live' every day corporations need to consider firstly cognition, followed by communication. These steps should strengthen trust in the strategy. Without trust, all other efforts will be futile.

## Managerial implications

It is clear from this investigation that management need to take into account individuals understanding of strategy, the means for communicating strategy and overall level of trust in management and the strategy. When implementing strategy, it is important that the strategic language (terms, clarity) used is practical and relevant to the individual employees context. Without trusting relationships, cognition and effective communication will fail. Within an international context there are a number of important implications for managers. First of all management need to anticipate the cognition and communication challenges which might be encountered in different markets. Furthermore, knowledge transfers must take into account local cultures and skills. Presenting the strategy in a way that recipients can understand (cognition) and which has a direct connection to individual's daily jobs is crucial. Second, more interpersonal exchanges can be initiated which enhance knowledge transfers. Third, encouraging peer-to-peer interactive help groups at the local country level can enhance shared experiences. Finally, there may be foreign market staff who are more inclined to buy-in to the new strategy. These individuals can be engaged as knowledge providers within their individual community.

# PURCHASING AND SUPPLY CHAIN MANAGEMENT PRACTICES IN CHINESE MANUFACTURING

**Zhang Dawei, Abu Bakar Abdul Hamid, Huam Hon Tat and Thoo Ai Chin**  
**Universiti Teknologi Malaysia, Malaysia**

## ABSTRACT

*This study focuses on the factors that impact the performance of purchasing and supply chain management in Chinese manufacturing. It aims to examine the relationships between these factors and performance and to analysis the strength of these relationships. According to the findings, there is sufficient evidence to suggest that there are positive, significant relationships between these five factors and purchasing performance. "Customer-supplier relationships" is the most important factor influencing purchasing performance followed by "Quality management practices in purchasing", "Purchasing-related information systems and technologies", "Purchasing policies" and finally "Purchasing personnel".*

## INTRODUCTION

Since 1990s, manufacturing enterprises have faced a rapidly changing and unpredictable buyers' market, rapid technological change and economic globalization. The new requirement is that emphasis is placed on offering customers appropriate products, in sufficient quantities, at the most opportune time, combined with the lowest possible cost and high service levels. The supply chain management (SCM) approach has gained wide acceptance in the marketplace, and is highly regarded by many enterprises as a strategy to attain their business goals (Altekar, 2005). Over the past 30 years, SCM has undergone major changes. The focus of supply chain management has been elevated from a logistics-driven model to a customer-driven model. Supply chain management has been dramatically influenced by the emergence of global competition. Competition between enterprises is resulting in strife between supply chains. More importantly, during the next decade, the manufacturing sector is almost certain to derive more profits from the full implementation of the concepts of supply chain management than any other sector. Supply chain management has also had a significant impact upon purchasing. Purchasing practices play a crucial role when measuring manufacturing performance. The responsibilities of the purchasing department have shifted from that of service to that of playing an increasingly critical role at the tactical and operational level (Ellram and Pearson, 1994). The development and evolution of supply chain management can, in part, be attributed to this shift (Chen et al. 2004).

China is the world's fastest developing economy. The sector most responsible for China's unparalleled economic growth has been manufacturing. Supply chain management is a new concept in China and implementation is still in its infancy. There is a wide gap in SCM practices between China and other international economies (Zhou, 2004). In order to support organizational goals and objectives, purchasing departments of Chinese manufacturing enterprises are facing a multitude of problems. With increasing foreign trade and outsourcing, Chinese enterprises have paid more attention to customer-supplier relationships, but they have still lack service and communication. These relationships are mostly short-term, where true partnerships have as been yet been formed. The disconnection between production and purchasing departments has led to large inventories and the consumption of much liquidity (Yan and Yin, 2008). The purchasing function has been ignored on a strategic level. In the purchasing practices, the emphasis has been laid on the cost and contract management while IT and E-business have not been widely used. The development of purchasing and supply chain management has been hampered by the general lack of professionals. Some local Chinese enterprises suffer from poor management, purchasers pursue self interests, and personnel who lack a code of ethics and

professional responsibility have not critically evaluated suppliers or performed market surveys before purchasing. Although supply chain management has been introduced and accepted in China over the past 10 years, it still has not shown remarkable progress. Every manufacturing enterprise in China is undergoing some form of transformation in order to reduce costs and to maximize profits. However, in China, this is easier said than done.

The purpose of this study is to examine the status quo of purchasing and SCM in Chinese manufacturing and to determine and analyze the factors that impact their performance in order to render suggestions that will improve the performance of both. Hence, this study aims at achieving the following objectives:

- (1) To determine the factors that impact the performance of purchasing and SCM in Chinese manufacturing.*
- (2) To examine the relationships between these factors and performance, and to analysis the strength of these relationships.*

## **LITERATURE REVIEW**

### **Purchasing and Supply Chain Management (SCM)**

Since the first coined in the early 1980s by Oliver, the term “supply chain management” has become a central issue of theoretical study. Its research objects have covered all the enterprises, products, services, actions, functional departments and members related in the supply chains. From different perspectives, many researchers have focused on different areas of supply chain management. Some of them focused on the entire chain (Cooper and Ellram, 1993; Tan et al., 1998); some focused on a part of the chain (Sheperd, 1994; Lambert et al., 1998; Keah, 2001); some researched on functions of supply chain (Farmer, 1997; Stevens, 1989; Jole et al., 2009); and also some focused on actions in the chain (Davis, 1993; Scott and Westbrook, 1991). As a new managerial philosophy, supply chain management has been defined in a variety of different ways. Cooper and Ellram (1993) define supply chain management (SCM) as an integrative managerial philosophy of the entire channel from suppliers to final customers. Sheperd (1994) define SCM is the interaction across all channels to provide the highest level of products and services to final customers. It focuses on the cooperation among organizations in the supply chain in order to enhance the supply chain’s effectiveness. A number of definitions describe SCM as an entire managerial mode (Ellram, 1991; Lee and Billington, 1992; Bregman, 1995; Liu et al., 2004; Benton, 2007), it connects every pitch point in the chain and it is also the systemic and strategic coordination mechanism for all organizations and departments within organizations in the supply chain. It aims to improve the performance of the entire supply chain and the members in the chain (Tan et al., 1998).

According to the previous descriptions of supply chain management, it is summarized as an integrated thought and approach. It aims to maximize supply chain performance through cost minimization, service optimization, inventory minimization, cycle-time minimization and quality optimization. SCM performs the functions such as planning, controlling and coordinating of materials, information and cash flow from original suppliers to ultimate customers. As an entire managerial mode, it consists of purchasing, operation, distribution and integration (Jole et al., 2009). In another opinion, Tracey and Tan (2001) divided SCM into two branches which are logistics and purchasing function. No matter what categories, purchasing is the essential one. In this paper, the focus is on the purchasing function of supply chain management.

Purchasing management is one of the most important parts of supply chain management. Purchasing activity links supply and demand between the supply chain upstream and downstream pitch point enterprise. More recently, much literature has been devoted to raising the profile of purchasing from that of a traditional business function to a more important, strategic role within an organization. According to Arjan (2005), the traditional purchasing function is a simple buying process. It begins with determining requirements and ends with delivery. It is the department that is responsible for making sure that the contract or order is fulfilled in accordance to proper terms and conditions as specified in the contract. From the view of Lamming (1985), as a new strategic function, purchasing should be renamed “external resource management”. The term “purchasing” is a limited word that confines the buying function and has no relevance to managing relationships. “External

resource management” is the function of obtaining the essential complements of internal resources from external resources. Reck et al. (1992) defined purchasing management as not only a traditional supporting function but also a fundamental supply chain strategic working process. Subsequently, Bensaou (1999) reported that the focus of purchasing has changed from transaction to relationship and from internal sourcing to global sourcing. This change has led to a series of developments in other related fields such as information technology, total quality management and global competition (Liker and Choi, 2004). In a four-stage supply chain management model, Freeman and Cavinato (1990) analyzed the purchasing function within the entire strategic process of supply management. The results indicated that the purchasing function is essential in every stage and makes a significant contribution to an organization’s performance.

## Purchasing Policies

Policy refers to a set of purposes, principles and rules of action that guide an organization. Every purchasing department have policies, many scholars have defined purchasing policy from different angles. Some authors defined purchasing policy as a tool, such as one of the administrative tools of departmental management (Ireland, 1998), a definition of manager’s objectives, leadership and views (Quayle, 2002), an orientation tool for purchasing employees (Yan and Yin, 2008), and a reflection of top-management philosophy (Stuart et al. 1991). Some authors defined purchasing policy as an action guideline, such as guidance to employees at all levels (Liu et al. 2004), and an action-oriented guideline that provide guidance (Robert et al. 2009). Robert et al. (2009) suggested that organizations should establish a set of policies for enhancing the ethical behavior of their purchasing personnel. From reviewing the relevant literature, several advantages of establishing policies are summarized: an established policy eliminates the necessity for making a new decision every time a comparable situation arises (Stuart et al. 1991); purchasing policies provide a framework for consistent decision making and action, it assures that decisions and actions will be consistent and in accordance with the judgment of the responsible department head (Liu et al. 2004; Stuart et al. 1991; Robert et al. 2009); an approved policy gives authority to the indicated course of action (Quayle, 2002; Ireland, 1998), provides a standard for evaluating performance (Liu et al. 2004), and assists in preparation for audits (Ireland, 1998; Liu et al. 2004). As mentioned above, purchasing policy is not only a principle but also an effective tool to meet the requirements of law and government, and eliminate unethical purchasing operation. Policies are broad guidelines to management actions. An approved policy provides a standard for evaluating performance. A series of high-level policy will contribute to purchasing and SCM performance (Robert et al. 2009). Therefore, the above argument leads to: *H1: There is a significant relationship between purchasing policies and purchasing performance.*

## Purchasing Personnel

Today, purchasing personnel have expanded their work scope from buying something to managing relationships and gathering internal and external information for making decisions easier (Cooper and Ellram, 1993). They are responsible for selecting qualified suppliers with the achievement of system-wide objectives, not just lowest cost (Bregman, 1995). It is understood that the success of an organization largely depends on its human capital, which refers to the collective knowledge, experience, skills and abilities of all staff (Maister, 1986). The effectiveness of a purchasing department depends not only on organization but also on the personnel (Bregman, 1995). Employees are an important asset for driving supply chain performance. It is certainly true for purchasing that quality of purchasing employees is the key to the success of any company (Arjan, 2005). Zheng (2003) described that purchasing professionals impact their firm’s performance by their decisions and actions about what their firm buys, who they buy from, how much they buy, and how they buy it. They must ensure they are operating in an ethical manner. According to Haynes and Helms (1991), being ethical means following a code viewed as fair by those within the profession as well as the community. A study from Giunipero and Handfield (2004) on purchasing education and training requirements indicated ethics was the number one requirement now and forecasted to be five years into the future. More education and more high-level skills than in the past are the required managerial capabilities for purchasing personnel (Ciancarelli, 1998).

In view of the above, working personnel is another factor that impact purchasing and SCM performance. Personnel is defined in this study as those employees and managers of purchasing or others SCM relevant departments with special relevant skills, experiences, ethics are having common expectation, practices

and goals. They contribute to purchasing and SCM performance in many new areas which are different from traditional (Cooper and Ellram, 1993; Bregman, 1995; Zheng, 2003). Nowadays, purchasing personnel is required to master a series of skills and knowledge which are conducted by previous researches (Faes and Matthyssens, 2001; Zheng, 2003; Giunipero and Handfield, 2004). Organizations or departments should provide more education and training to their purchasing personnel in order to improve their skills and knowledge eventually improve their purchasing-related working capabilities. From the relevant literatures, personal qualities such as ethic, education and professional skills (Giunipero and Handfield, 2004; Ciancarelli, 1998) will lead to high-quality personal performance. Highly qualified purchasing personnel will directly lead to improve purchasing performance. Accordingly, it is proposed that: *H2: There is a significant relationship between purchasing personnel and purchasing performance.*

## **Customer-Supplier Relationships**

A good customer-supplier relationship is another important factor that impact purchasing and SCM performance. To meet the goal of keeping competitive advantage, long-term and trustworthy relationships with the partners in supply chain is important and indispensable (Watts et al, 1992). According to Spekman et al. (1998), from the closed alliance in supply chain, organizations could adequately realize the advantages of reducing cost and increasing profit. In today's competitive world, supply chain partners, especially those who dependent on each other for their business are extremely need tight and long-term working relationships to gain effectiveness advantages of purchasing and supply management. In addition to this, developed channel contributes to build interoperable relationships with partners for sharing information resources freely and planning for their future conjointly. When endeavour to solve problems in new products design, supply chain partners need closely consociation so that both of them can have significant improvement (Spekman et al., 1998). According to Cavinato (1987), internal customer satisfaction is a key factor that impact purchasing performance. A number of studies have adopted it as a metric for measuring purchasing performance (Chao, 1993; Grieco, 1989).

According to Ellram (1994), trust is one of indispensable elements for developing customer-supplier relationship. It is necessary to keep long-term relationships with suppliers and customers so that they could obtain additional benefits from the good relationships. Heide and John (1990) indicated that in the integrated relationships and successful strategic alliance, all the partners in win-win situations with common goals, cross-functional teams and collaboration, they obey the rules which are based on the trusty, loyal, and especially fair in the communication of each other. Both the suppliers and customers in supply chain make up successful strategic alliance by interoperable, long-term relationships, the readinesses for problem solving and information sharing among themselves (Van, 1994). After all, an organization's success is linked to the strength of its relationship with supply chain partners. Purchasing department should develop tighter relationships between suppliers and internal customers. Developing partnership with the qualified supplier, more involvement of supplier can improve supplier performance. Well supplier performance involve in developing buyer's product can contribute to enhance customers satisfaction even the overall organizational performance. Therefore, it was hypothesized that: *H3: There is a significant relationship between customer-supplier relationships and purchasing performance.*

## **Purchasing-related Information Systems (IS) and Technologies (IT)**

The impact that information system (IS) and technology (IT) have on industrial and business performance has aroused great interest in the last few years (Sriram and Stump, 2004). Early uses of information systems were in the accounting and financial areas. However, beginning in the 1970s more IT resources and software solutions were allocated to purchasing (Arjan, 2005). More recent studies have discussed the contribution of certain information systems on purchasing performance. Palvia and Lim (2001) indicated that EDI systems were used to promote the efficiency and reliability of supplier-buyer, reduce cost and order cycle time, and improve customer satisfaction. As per the descriptions of David et al. (2005), information systems related to purchasing, such as electronic data interchange (EDI) and internet, are employed to make orders and exchange transaction information with suppliers. This is of great benefit to supplier-buyer relations and internal integration. Enterprise resources planning (ERP) is another information system that integrate all functions for processing and reporting. Davenport and Brooks (2004) explained the use of enterprise resources planning

(ERP) in SCM and also support and integrate other functions such as finance, human resource, manufacturing and so on. ERP provides advantages by enhancing operational efficiency and by increasing firm-wide information sharing (Laudon et al. 2006).

Javier (2007) described that information technology is a major factor in the development of business to provide effective support of an organization's strategies for gaining competitive advantages. Sriram and Stump (2004) pointed out that the implementation of information technology (IT), such as electronic order processing, is used to improve purchasing performance. Timely and accurate information is an essential requirement of purchasing-decision and supplier performance (Holland et al. 1992). The advantages and benefits of the internet are for the entire value chain by speeding up communication between customers and their suppliers, improving service quality, increased efficiency of the order process, and reduced inventory costs (Lancioni et al., 2000). Similarly, Laudon et al. (2000) found that internet technology advances production scheduling and order processing. It has a great impact on purchasing functions. The above studies suggested that the implementation of information systems in purchasing is a crucial factor that impacts supply chain success. More and more information technologies were used in automatic routine purchasing tasks to drive transaction and operation. They also serve strategic requirement, contribute to effective competitive strategies and good organizational relations. Purchasing-related information systems and technologies are essential ingredient for purchasing survival and improve the performance of firms. Therefore, the above argument leads to: *H4: There is a significant relationship between purchasing-related information systems, technologies and purchasing performance.*

## **Quality Management Practices in Purchasing (QMPP)**

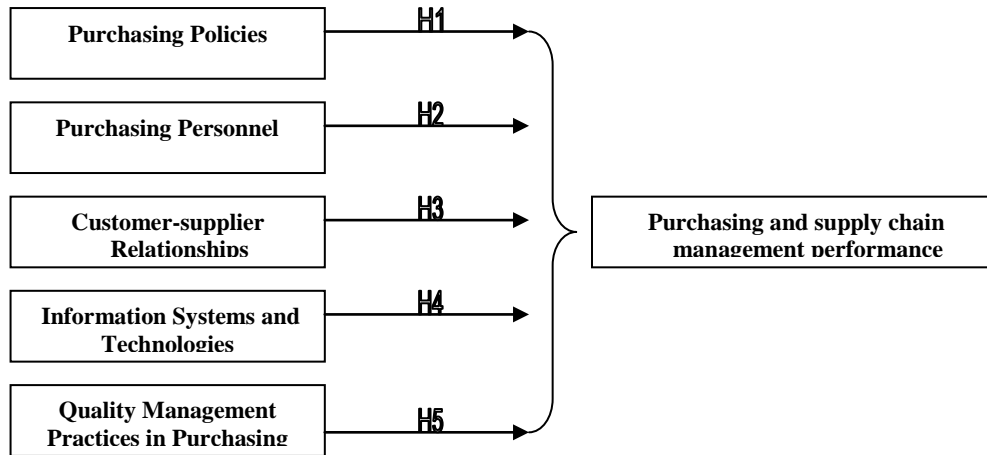

Aljian (1984) defined quality as the total composite of product and service characteristics of marketing, engineering, manufacturing, and maintenance through which the product or service in use will meet or exceed the expectations of the customer. In the vocabulary of purchasing, quality has a special meaning. It is not a generalization or an attribute to be characterized simply as "high" or "poor". It is specifically the sum or composite of the properties inherent in a material or product (Stuart et al. 1991). More and more managers support that quality management is closely linked to purchasing (Benton, 2007). Crosby (1980) studied in manufacturing and found that more than half quality problems as a result of failing purchasing materials. Consequently, quality of purchasing materials has a profound effect on final product and overall firm's performance. Much literature (Lorente et al. 2004; Lamming and Hampson, 1996) list several purchasing activities related to quality management including: managing suppliers quality, lowering materials cost, improving materials quality, reducing delivery time and disposing of mistakes in many ordered and received. Tan et al. (1998) also referred several tasks (supplier management, supplier selection, teamwork) to purchasing employees that can improve the quality of the end product.

Fred and John (2005) pointed out that one of the key responsibility of the purchasing department is to ensure that the organization's quality requirements are met consistently in order to maximize the value from their purchase. The ongoing measurement of quality performance becomes critical to the success of any serious effort to generate improvements (Minahan, 1998). Day and Farmer (2002) found that the most commonly used implementation of quality management in purchasing is likely the use of the supplier scorecard combined with the supplier business review. It is through this process that purchasing has the opportunity to address ongoing product quality or quality of service issues in a meaningful way. Tracey and Tan, (2001) suggested that managing quality at the supplier level is one of the key areas where purchasing departments can add value. This generally means working closely with your internal quality assurance team to ensure that your suppliers are fully measuring up to their contractual obligations. From above literature, many quality management practices related to purchasing function. While purchasing pursuing quality management, it will effectively improve supplier quality practice and set a standard for excellence. To achieve supplier quality excellence, purchasing should have employees who understand the principles and tools of quality management and work effectively with suppliers that ensure the quality of raw materials.

More recently, Lorente et al. (2004) researched on the relationship between quality management and purchasing performance. Results from the statistical analyses showed there are positive correlations between quality management and four measures of purchasing performance. Base on the findings from this research,

purchasing performance can be directly improved through quality management practices in purchasing, so the fifth hypothesis was developed: *H5: There is a significant relationship between quality management practices in purchasing and purchasing performance.*

**Figure I: Conceptual Framework**

## METHODOLOGY

### Instrument

Quantitative research was selected in this study and questionnaire was used to collect data from the respondents. The collected data was analyzed statistically using SPSS. The questionnaire frame consisted of 6 variables and 46 items which were derived from previous studies. To derive answer to the research questions in the questionnaire, each of the variables was measured with five-degree score based on the Likert Scale (1 = strongly disagree, 5 = strongly agree). In order to ensure the validity and reliability of the questionnaire, a pilot test of this research was conducted. The questionnaire was translated to Chinese and distributed to 20 purchasing staffs from Chinese manufacturing enterprises. Based on respondents' recommendations, amendments were made.

### Sample

The respondents were obtained by using convenience sampling method from Henan province, north and southeast of China. Northeastern China is the old industrial base of China. There are many state-owned and state holding large and medium-sized traditional manufacturing enterprises, such as China FAW (first auto works) Group Corporation, the biggest auto works of China. The southeastern coastal area is the most highly developed area in China. It has attracted large number of international high-tech manufacturing enterprises. Henan is a big agricultural province, most populous region in China and the health of the enterprises in this area is the main focus of the Chinese government. According to National Bureau of Statistics of China (2009), as of early 2009, there were 1.319 million manufacturing enterprises in the business sector registered, the sample size is determined as 384, and these sample enterprises were collected from Business Yellow Pages of China. A total of 124 useful questionnaires were returned, with a response rate of 32%.

## FINDINGS

### Reliability

Cronbach's Alpha is conducted before data analyzing. "0.7" is a standard of acceptable reliability (Uma, 2003). The reliability coefficient of the independent variables yielded the Cronbach-Alpha score 0.951 for "customer-supplier relationships", 0.910 for "purchasing-related information systems and technologies", 0.886 for "quality management practices in purchasing", 0.832 for "purchasing personnel" and 0.809 for "purchasing policies". For the dependent variable, the reliability coefficient is 0.941 for "purchasing and SCM performance". All of them are higher than 0.7, with the result that these questionnaires are reliable in this research.

## Hypothesis Testing

Pearson Correlation and Multiple Regression Analysis were used to test the hypotheses. The Pearson correlation analysis is used to investigate the relationship between the independent variables and the dependent variables. According to the results, the correlation value between purchasing performance and purchasing policies is 0.797\*\* with a P value (Sig.) 0.000 (<0.01). It indicated that purchasing performance is associated statistically with purchasing policies. Thus, *hypothesis 1 is substantiated*. The correlation value between purchasing performance and purchasing personnel is 0.763\*\* with a P value (Sig.) 0.000 (<0.01). It indicated that purchasing performance is associated statistically with purchasing personnel. Thus, *hypothesis 2 is substantiated*. The correlation value between purchasing performance and customer-supplier relationships is 0.844\*\* with a P value (Sig.) 0.000 (<0.01). It indicated that purchasing performance is highly correlated with customer-supplier relationships. Thus, *hypothesis 3 is substantiated*. The correlation value between purchasing performance and purchasing-related information systems, technologies is 0.758\*\* with a P value (Sig.) 0.000 (<0.01). It indicated that purchasing performance is associated statistically with purchasing-related information systems, technologies. Thus, *hypothesis 4 is substantiated*. The correlation value between purchasing performance and quality management practices in purchasing is 0.869\*\* with a P value (Sig.) 0.000 (<0.01). It indicated that purchasing performance is highly correlated with quality management practices in purchasing. Thus, *hypothesis 5 is substantiated*.

From the results of Multiple Regression Analysis, it is statistically significant in this analysis ( $P < 0.05$ ). The value of adjusted R square 0.850 is a high score and illustrates that 85% of the variation from the dependent variable is highly explained by these independent variables. This is considered a good fit. As shown in Table I, Tolerances of independent variables are from 0.197 to 0.504, and all of them more than 0.1, thus, there is no multicollinearity problem among these independent variables and multiple regression results are statistically significant. The values of "Beta" of all the five independent variables are from 0.137 to 0.260, it is also supports the research hypotheses. A comparison of the values of "Beta" clearly indicates that the factor "customer-supplier relationships" has the most influence on purchasing performance, followed by "quality management practices in purchasing", "purchasing-related information systems and technologies", "purchasing policies" and "purchasing personnel".

**Table I: Summary of Multiple Regressions**

Model	Unstandardized Coefficients		Standardized Coefficients	Sig. (P)	Collinearity Statistics	
	B	Std. Error	Beta		Tolerance	VIF
(Constant)	-4.524	3.403		.186

a. Dependent Variable: performance

## DISCUSSION AND CONCLUSION

Increasingly, some successful Chinese manufacturing enterprises are coming to realize the importance of supply chain management and scoring some achievements by applying this advanced concept. As a crucial role in supply chain performance, purchasing is becoming a hot research field in Chinese manufacturing. But in

contrast, there is still a wide gap in purchasing and supply chain management practices between Chinese manufacturing and the advanced international level. This research has investigated the factors that impact purchasing and SCM performance in Chinese manufacturing. According to the findings of this research, there are sufficient evidences to support that there are positive significant relationships between these five factors and purchasing performance. “Customer-supplier relationships” is the most important influencing factor for purchasing performance, it joins every pitch point in supply chain. “Quality management practices in purchasing” has the second greatest effect on purchasing performance, good quality management practices will substantially improve purchasing performance. “Purchasing-related information systems and technologies” has the third strongest relationship with purchasing performance among the five influencing factors, it is the necessary tool to serve purchasing and supply chain management. “Purchasing policies” has the second lowest impact on purchasing performance, successful policies provide guidance to purchasing towards correct path. “Purchasing personnel” has the lowest value and one that follows the other four factors, it is a critical asset for driving purchasing and supply chain performance.

# IS GLOBAL PROTECTION OF INTELLECTUAL PROPERTY RIGHTS REALLY NECESSARY?

**Ora Dippenaar**  
**Tshwane University of Technology, South Africa**

## ABSTRACT

*Counterfeiting and piracy developed into a significant economic and social problem. As technology improves, copying and imitating products become cheaper and the quality of the illegal product better. Innovation is encouraged through protection of intellectual property rights that reduces the risks of expropriation. Technology-importing countries usually prefer weak intellectual property rights systems as this provides the opportunity for inexpensive technology transfer and promotes the growth of domestic industries. Intellectual property rights should be seen as rules that regulate the terms of competition with social benefits attached, rather than mechanisms for creating legal monopolies. Countries must endeavour to find a balance between maintaining competition and promoting local innovation as well as encouraging commercial activity from abroad. The most important system of protecting intellectual property rights is the Agreement on Trade Related aspects of Intellectual Property Rights.*

## INTRODUCTION

One of the most dramatic changes concerning global economy is the development of international economic law. Weaknesses of the international system became clearer as globalisation expanded and technology improved. According to Yar (2005) one of the most important achievements concerning protection of intellectual property rights was the conclusion of the Agreement on Trade Related aspects of Intellectual Property (TRIPS), a foundation of the new World Trade Organisation (WTO). Intellectual property rights define the extent to which their owners may exclude others from activities that infringe or damage the property (Maskus, 1998).

In the 1990's the world moved towards an international system of intellectual property rights with unilateral adoption of stronger laws and enforcement procedures. These decisions were taken because of external pressure and realisation that strong intellectual property rights are important in attracting investment and technology. (Maskus, 1998).

Intellectual property rights have varying impacts on foreign direct investment in different sectors. Investment in lower-technology goods and services depends little on the strength of property rights and much on input costs and market opportunities. Investors with a product or technology that is hard to imitate may pay little attention to intellectual property rights. Firms with easily copied products such as software and pharmaceutical products would be interested in the strength of intellectual property rights as would firms considering investments in local research and development facilities. Research indicated that both volume and technological quality of investment are diminished in countries with limited intellectual property rights (Maskus, 1998).

## COMPETITION AND/OR MONOPOLY

A few problem areas regarding intellectual property rights in many developing countries are inadequate copyright and trademark protection allowing extensive copying of entertainment and software products and unauthorised use of well-known trademarks. Another problem is exclusion from patent protection of

pharmaceutical products. Also a problem is absence of patent protection for biotechnological inventions for plant varieties. Lastly is inadequate procedures for administrative and judicial enforcement of defined rights (Maskus, 1998). Weak intellectual property rights are a form of strategic trade policy as it allows uncompensated imitation and copying of foreign products and technology. Developing countries are concerned over potential monopoly pricing and limited distribution of new technology and products (Maskus, 2000).

Intellectual property rights should be seen as rules regulating the terms of competition rather than mechanisms for creating legal monopolies. While intellectual property rights do create market power, the impact on competition varies across products, technologies and countries (Maskus, 1998).

Because ideas are essentially like public goods where many can benefit from one idea, there is a risk of expropriation. Ideas, however, have wider benefits than just to the innovator. There is a social cost to restricting dissemination of ideas. Innovation is encouraged through protection of intellectual property rights which reduces the risks of expropriation, but might create an artificial monopoly for a time (Yueh, 2007).

Maskus (2000) is of the opinion that it is a mistake to think of intellectual property rights as mechanisms for creating monopolies. Intellectual property rights define the extent to which their owners may exclude others from activities that infringe or damage the property. Intellectual property rights sets out and protect the boundaries of competition and regulates the terms of competition. The strength of protection depends on the scope of the rights granted as well as the ability of competitors to develop non-infringing products and the ability of consumers to substitute among supply sources.

Article 40 of TRIPS provides wide latitude for competition policies. Each WTO member must develop a system for protecting trade secrets from unfair competition according to specified minimum standards (Maskus, 1998). The adoption of TRIPS reinforces the view that the justification for granting intellectual property rights is to present to the innovator some monopolistic return from an investment that will benefit society and which would otherwise not occur. A patent holder can prevent third parties from making, using, selling or importing a product. Patent owners also have the right to assign or transfer the patent and to conclude licensing contracts (Yueh, 2007).

## **Patents**

For an invention to be patentable it must meet three criteria: it must be new, it must contain a step that is not obvious to one skilled in the specific area and it must be useful. Attempts to extend protection beyond the patent grant are considered anti-competitive and subject to anti-monopoly remedies (Maskus, 2000).

The patent system provides incentive for firms to undertake risky, long-term research and development that leads to major technological breakthroughs. It takes an average of 12-15 years for a product to make it from basic pre-clinical research through clinical testing and regulatory marketing approval to product launch. Around the inventions grow new industries that use these technologies or improve on them. The social gains to large technological advances far exceed private return because their spill-over benefits have a substantial positive impact on growth (Maskus, 2000).

Two arguments that justify the granting of patents are firstly that patents provide an incentive to undertake the research effort and costs required to invent new technology and products and bring them to market. A patent that is not “worked” through production or sale, locks up an area of technology in return for little gain to consumers. Therefore some countries include working requirements within particular time limits for patent grants to be sustained. Secondly, patents expand technical knowledge. In return for creating market exclusivity through a patent, society requires some compensation. For this reason, patents bear a disclosure requirement in which the technical aspects are made known and others are free to use the information to develop new inventions that do not violate the patent claim (Maskus, 2000).

Patents provide the right to exclude for a fixed time all others from making, selling or using the product or process without authorisation. The patent claim must meet technical criteria for novelty, or non-obviousness. It must also survive any opposition procedures based on competing claims of prior invention or insufficient novelty. Therefore, patent applications are laid open for inspection by interested parties. Thus, the social benefit of patents is to create a protected market which may or may not involve considerable market power, in return for

disclosure of technical advances. Upon expiry of a patent, all firms are free to produce and market versions of the product (Maskus, 1998).

## Copyright

Copyright laws protect the expression of an idea (in other words its presentation in words, music, dance steps, colour, etc) rather than the idea itself. To receive copyright the item must be original, but there is no need for novelty in the underlying idea. Registration to receive copyright is not necessary, because the original expression is protectable. Exceptions to copyright protection come under the “fair use doctrine” which states that protected work may be used in the interests of educational, scientific and technical advance. Therefore uncompensated quotation of work is allowed, subject to appropriate citation, as is the making of limited copies for educational and research purposes (Maskus, 2000).

Rapid and dramatic improvements in copying technology caused growing demands for stronger global protection and extension of protection to areas such as software, internet transmissions and broadcasts (Maskus, 2000).

Countries must recognise in their laws protection of well-known trademarks. Registration may be cancelled for non-use, but only under limited circumstances (Maskus, 1998). A trademark cannot be protected in the same manner in the United States, European Union member states and countries like for example China, Japan and Arabic-speaking countries that do not use the Roman alphabet (Bretonnière, 2011).

## COUNTERFEITING AND PIRACY

Trademarks indicate the inherent quality of the product or service in order to enable the consumer to know beforehand what quality to expect. This provides firms an incentive to maintain quality in order not to erode the value of their trademarks. The need to protect high-end consumer trademarks is evident, since otherwise free riders would duplicate such marks and attach them to goods of lower quality (Maskus, 2000). Better technology provides the availability of affordable equipment to manufacture cheap, high-quality copies. When the pirate product is largely indistinguishable in quality and appearance from its authorized counterpart, the price-conscious consumer has an extra incentive to opt for the cheaper product (Yar, 2005).

Large manufacturers spend millions tracking consumer tastes, designing new products, distributing them and creating demand through impressive advertising campaigns. Counterfeits are only good as long as they are counterfeits of some brand. Thus, the reason why consumers buy a counterfeit is because it represents the brand it is supposed to be copying (Eisend, 2006). Counterfeiting may enhance consumer welfare by providing lower-cost alternatives, but it also reduces welfare by increasing confusion, raising search costs, diminishing the value of trademarks and lowering incentives to maintain product quality and develop new products. Two types of transactions are involved in counterfeiting, namely deceptive and non-deceptive counterfeiting. Deceptive counterfeiting is where consumers are not aware that they purchase a counterfeit product and believe they buy the genuine product. This form of counterfeiting is observed mainly in markets for automotive parts, electronic products and pharmaceuticals. Non-deceptive counterfeiting is where consumers are aware that the product purchased is a counterfeit product, but do not care (Nia, 2000).

By tolerating faking we tolerate something that damages business, is morally wrong and ethically unacceptable. It is distressing that consumers are tolerant of this immoral and illegal practice. If the public become unsure as to whether a manufacturer’s product is the real thing or a fake, the manufacturer is in the position where the strength of his brand is threatened (Nia, 2000). According to studies done by Eisend (2006), it is the perception of consumers that for example Calvin Klein and Lacoste shirts have lost their exclusivity in recent years due the appearance of so many faked products. People desire uniqueness.

A particular problem arises around the policing of borders and customs controls. Given the increasing economic dependence on international trade, there is pressure to alleviate border restrictions to encourage free flow of goods and to minimize transaction costs incurred by business. This is in direct contrast with the need to institute better border inspection and control to curtail movement of “illicit” goods (Yar, 2005).

## **The fight against piracy**

Where public agencies have been reluctant to invest time and resources in tackling intellectual property violations, industrial and commercial organizations are playing a leading role in policing and enforcing legislation. They also attempted to bring intellectual property crime into the criminal justice mainstream through the appointment of specialist liaison personnel to assist police, customs, etc. Governments responded to pressure from these groups by establishing specialist units within criminal justice agencies to address intellectual property violations for example the United Kingdom has the National High-tech Crime Unit and the National Technical Assistance Centre. The United States has the FBI's Internet Fraud Complaint Centre (IFCC). Interpol has established an Intellectual Property Crimes Unit in 2002. Countries with wide varying levels of economic development and abilities have considerable differences in strength of laws and enforcement (Yar, 2005). In the past, copyright violations have been largely dealt with through civil remedies available to copyright holders. Prosecutors were reluctant to be involved in this complex domain of law. In recent years we have seen the incorporation of additional provisions for criminal sanctions into both international treaties and national laws. On international level, Article 61 of TRIPS establishes a mandatory requirement for signatories to make criminal provisions against 'commercial' copyright violations. Criminalization has become necessary because it has become socially accepted that intellectual property violations are not genuinely wrong and harmful comparing to "real" crimes such as theft, homicide and rape (Yar, 2005).

High costs of enforcement may discourage some governments from administering their obligations effectively (Maskus, 1998). When disputes among nations cannot be resolved, the Dispute Settlement Understanding (DSU) is invoked. Parties to the DSU are countries and not individuals or firms (Yueh, 2007).

## **IS THERE ADVANTAGE IN INTELLECTUAL PROPERTY RIGHTS?**

It is doubtful that firmer global copyright protection would result in significant additional amounts of literary, music and entertainment production. Similarly, better protected trademarks in developing countries seem unlikely to expand incentives for product and brand development in developed countries. However, innovation in developing countries may increase as they raise their level of intellectual property rights (Maskus, 1998).

The emerging global system of protection for intellectual property as embodied primarily in the TRIPS agreement, rebalances global policies in favour of information developers. At the same time there are concerns that protected firms will choose to exercise their stronger rights in anti-competitive ways, raising prices and license fees and reducing international access to technology. The TRIPS agreement provides wide discretion for enacting pro-competitive implementation strategies and competition rules. Countries must bear two things in mind. First there need to be a balance between maintaining competition and promoting local innovation on the one hand and encouraging commercial activity from abroad. Secondly, over-enthusiastic pursuit of means to limit the benefits of TRIPS will invite future trade dispute (Maskus, 1998).

## **CONCLUSION**

The necessity for global protection of intellectual property rights is not a perception, it is an imminent reality. Developed countries will hardly invest in countries without an adequate intellectual property rights system. Intellectual property rights systems attempt to strike a balance between providing adequate incentives to develop new technology and products and ensuring effective distribution of inventions into the economy without free riders on board.

Even where the law makes provision for criminal prosecution of intellectual property violations, there are few such actions. Intellectual property crimes are seen as low priority by criminal justice agents. Enforcement of TRIPS is expensive, which might discourage some governments from administering their obligations.

Without protection of intellectual property rights, innovation will slow down. Quality of products will deteriorate and consumers will be uncertain about quality of all products. Life important products for example medicine, aeroplane- and motor vehicle parts quality may become questionable. Global protection of intellectual property rights is not important...it is imperative for a healthy economic and social environment.

# **ORGANISATIONAL CLIMATE AND CULTURE SUSTAINABILITY THROUGH EMPLOYEE ENGAGEMENT AND CUSTOMER EXPERIENCE CAUSALITY**

**Adri Drotskie, University of Johannesburg, South Africa  
Rica Viljoen, Da Vinci Institute, South Africa**

## **ABSTRACT**

*This paper is based on the assumption that an employee experience leads to a customer experience. The root cause leading to the effect of a change in customer experience is the employee experience which comprises employee engagement. This paper presents an integrated systemic approach of a framework that materialised through Grounded Theory. Customer experience is seen as strategic differentiator in organisations interacting with customers, leading to a sustainable competitive advantage. The understanding and application of this causal effect therefore has significant implementation for national and international business managers and leaders.*

## **INTRODUCTION**

Customer experience is seen as a strategic differentiator in organisations interacting with customers, leading to a sustainable competitive advantage and changes in profitability. The customer experience however is the effect of the employee engagement approach within the organisation (Drotskie, 2009). Therefore, the employee experience leads to the customer experience. As the customer experience is the effect of something it cannot be directly changed in itself. The root cause leading to the effect of a change in customer experience is the employee experience, which comprises employee engagement. Employee engagement is determined by the interplay of perceptions on individual, group and organisational level (Viljoen, 2009). Management has a critical role to play in creating a culture conducive for engagement and customer experience.

This paper presents an integrated systemic approach of a framework that materialised through Grounded Theory. It has significant implications for national and international business managers and leaders.

In Figure 1 below, Heskett, Sasser and Schlesinger (1997) depict the customer service profit chain which indicates that the changes inside the organisation (people, processes and systems) leads to a certain value proposition which leads to a change in the customer experience which leads to profitability.

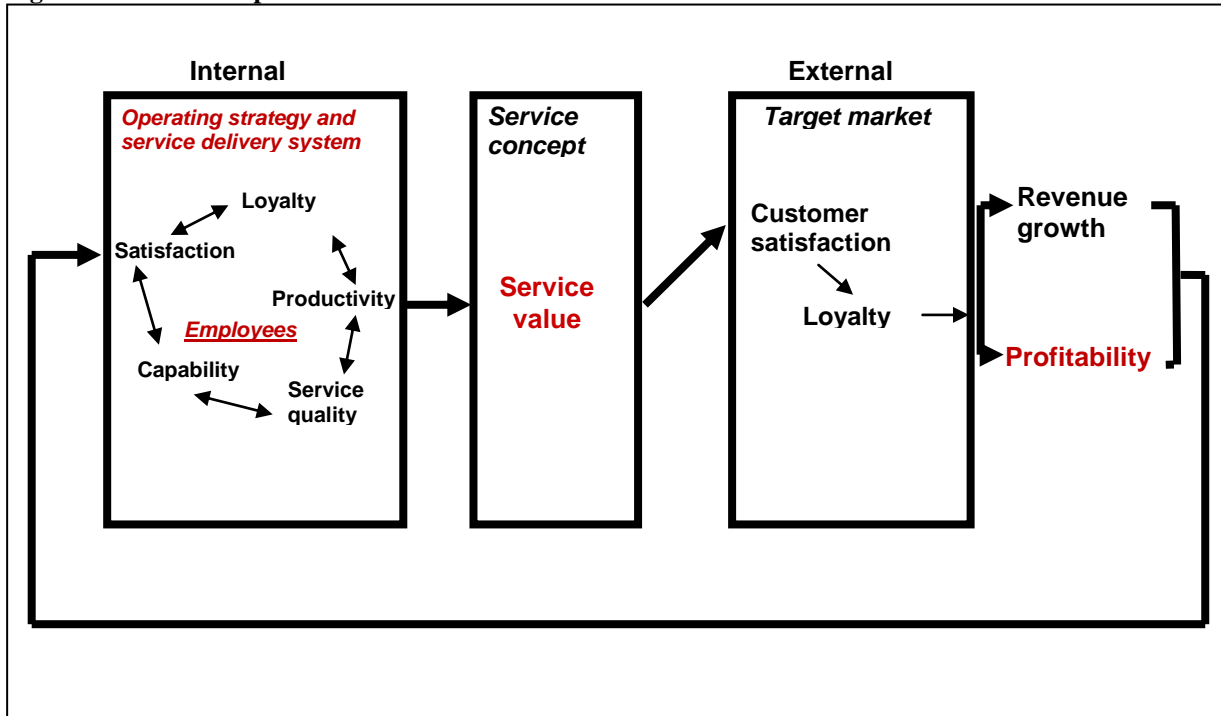

It is clear from Figure 1 above that employee satisfaction will impact on the service value that will directly impact on customer satisfaction. Since 1997, the field of employee satisfaction developed and employee engagement is currently view as significant contributor to organisational success. Similarly customer satisfaction developed into a much more refined construct, namely customer centricity.

## **PROBLEM INVESTIGATED**

An understanding of the external environment (in this case the world of the customer) may assist in creating insights, reawakening instincts and cultivating organisational change. Schutte (2004) explored the impact of happenings in the internal environment on the external environment. Jung (1953) years ago held

similar beliefs and based his insights on the age-old alchemy paradox - “as within so without”. If a person or an organisation would like to address something in the external environment, the real work must happen internally. Mutwa, Teish and Larsen (2003) described the same duality, namely, if people treat each other with trust within the internal environment then they will also treat customers in the same way. Customers appreciate an organisation that encourages the truth through customer feedback and then addressing all customer problems honestly (McKenna, 1991).

**Figure 1: The service profit chain**

Source: Adapted from Heskett, Sasser & Schlesinger, 1997: 19

As employee engagement within the context of organisational culture and climate causes the customer experience to change, this causality is of utmost importance for management understanding and organisational sustainability.

## RESEARCH OBJECTIVES

The research objectives are:

- Explore the pre-requisites for improved employee engagement
- Explore the pre-requisites for a changed customer experience
- Determine the causality between employee engagement and customer experience

## LITERATURE REVIEW

In this section of the paper, employee engagement within the context of organisational culture and climate and the customer experience are reviewed as two separate concepts.

### Organisational culture and climate

*“If the leadership dimension isn’t properly in place, a company simply cannot be successful. Organisations do not run by themselves. They need people – the right people in leadership positions to make them perform.”*

de Vries, 1984: unknown

Kets

It is assumed that organisations are social systems (French & Bell, 1999). Different employees often see the same thing but interpret it differently based on their own unique way of thinking (Salisbury, 1999). Therefore, in order to understand the way in which decisions are made and strategies implemented within an organisation, one would need to acknowledge and understand how employees within the organisation view the system and what constitutes their worldviews. It thus becomes critical for the leadership within an organisation to firstly value diversity and secondly ensure that all employees contribute significantly to the implementation of the organisational strategy thereby ensuring enhanced shared understanding and alignment (Viljoen, 2009). A culture, thus a system of shared meanings, may guide the way in which organisations act and the way in which individuals view and interpret the corporate world (Novinger, 2001). Schein (1985), Meek (1988) and others believed that a leader creates culture.

The way in which things are done in an organisation will contribute to how employees experience the workplace (Viljoen, 2009). A climate (a shared set of attitude in human affairs) conducive for engagement, involvement and participation should be engendered by leadership within the organisation (Botha and Schutte, 2003) to customer satisfaction. Organisational benefits will materialise from such a climate.

## The philosophy of engagement

Engagement can be described as “*the act of committing, pledging or engaging oneself*” or “*the state of being bound emotionally or intellectually to a course of action or to another person or persons*” (Macey & Schneider, 2008:3). Macey and Schneider (2008) offers a comprehensive description of engagement and describes it as discretionary willingness. An engaged employee is a person who is fully involved in, and enthusiastic about, his and her work. Viljoen (2009) defined engaged commitment as “*the trait of sincere and steadfast fixity of purpose, a man of energy and commitment*” and “*the act of binding oneself to a course of action*”.

In the model that will be presented in Figure 2, commitment is viewed as the emotional experience of the phenomenon engagement. Employee engagement, thus, is a concept that is generally viewed as managing discretionary effort, that is, when employees have choices, they will act in a way that furthers their organisation’s interests.

Statistics have shown that only 29% of employees are actively engaged in their jobs (Leadership Council, 2004). These engaged employees work with passion and feel a profound connection to their company. People that are actively engaged help move the organisation forward. A total of 84% highly engaged employees believe they can positively impact the quality of their organisation's products, compared with only 31% of the disengaged. 72% of highly engaged employees believe they can positively affect customer service, versus 27% of the disengaged. 68% of highly engaged employees believe they can positively impact costs in their job or unit, compared with just 19% of the disengaged. It is clear that in employee engagement has positive impacts on business results such as customer service.

Engaged employees feel a strong emotional bond to the organisation that employs them (Viljoen, 2009). This is associated with people demonstrating willingness to recommend the organisation to others and commit time and effort to help the organisation succeed. It suggests that people are motivated by intrinsic factors (e.g. personal growth), working to a common purpose, being part of a larger process) rather than simply focusing on extrinsic factors (e.g., pay/reward) (Leadership Council, 2004).

According to the Leadership Council report engaged employees are inspired to go above and beyond the normal call of duty in order to exceed organisational goals and that engagement can contribute to an increase in total share holder return of up to 47% through the reduction of absenteeism, enhanced customer feedback, less shrinkage of inventory and higher sales achievements (Leadership Council, 2004).

Except for limited efforts on the part of Jackson (2004), Katz and Miller (2003) and LeBaron (2005) no academic research could be found that either positions the concept of inclusivity as a radical transformational strategy as proposed by Viljoen (2009). This paper aims to contribute to the emergence of insights on

engagement and inclusivity and how it manifests in organisational success indicators such as customer centricity. In specific pre-requisites for engagement are identified.

## Customer experience

Over the past few years, there has been an increasing trend towards creating “experiences” for customers, particularly for those in the services sector. Because of this trend, authors such as Pine and Gilmore (1999:ix-x) are of the opinion that the service economy has been transformed into an attention economy, an entertainment economy, a dream society, an emotion economy or an experience economy. As the commoditisation of many service offerings continues, organisations have to devise new ways to achieve a competitive advantage, and in particular by focusing on the design and management of customers’ experiences. Experiences are inherently emotional and personal (Pullman & Gross, 2003:215).

To compete successfully in the customer experience territory, a growing number of organisations are systematically applying the principles and tools of total customer experience (TCE) to generate, strengthen and sustain enduring customer loyalty. Marketers today believe that engineering TCE and lasting customer loyalty are important in maintaining a customer focus and in creating customer preference (Mascarenhas, Kesavan & Bernacchi, 2006:397).

Organisations that apply total customer experience principles have the following features in common (Mascarenhas, et al., 2006:398-399):

- Anticipating and fulfilling customer needs and wants better than competitors do.
- Providing real customer experiences.
- Providing a real emotional experience.
- Providing experience as a distinct market offering.
- Utilising experiences as interaction.
- Changing experiences into engaging memories.

These principles listed above imply the customer experience is applied throughout the organisation. The customer experience is in the DNA of the organisation – its people, processes and architecture, thus the organisational culture.

It is clear from the many definitions of customer experience (Drotskie, 2009) formulated over time that the total customer experience is a concept that evolved over time to become a systemic and holistic concept focused on the customer. It is about a “human” interaction and therefore the emotions of customers are a vital part of an experience.

Drotskie (2009) accepts the definition by Seybold (2002:108) namely “a total customer experience is a consistent representation and flawless execution, across distribution channels and interaction points, of the emotional connection and relationship you want your customers to have with your brand” encompasses all the most important aspects of the total customer experience and is therefore adopted for this paper.

The customer experience is felt in all interactions with an organisation and therefore it is important to understand that customers interact with an organisation through various means and the experience must always be the same. This is true for any services organisation, for example financial services.

From the definition of total customer experience given above it is clear that a total customer experience consists of a variety of elements.

The following key elements of customer experience are entrenched across the organisation (Shaw, 2005: xix), namely strategy, culture, customer expectations, processes, channel approach, marketing and brand, systems, people and measurement.

According to Shaw (2005:xix), each of these elements represents an area in the organisation that has an extensive effect on customer experience.

## RESEARCH METHODOLOGY

The method of research applied in this paper is grounded theory.

The methodology of grounded theory was originally developed by Glaser (1978, 1992) and Strauss (1987) (Glaser & Strauss, 1967). Strauss (1987) who was influenced by Hughes (1956) and Blumer (1969), contributed to the methodology by highlighting the need for field research in order to develop a discipline as the basis for social action, and to acknowledge the complexity and variability of both phenomena and of human action. The importance of an awareness of the interrelationships between conditions, actions and consequences was highlighted. Glaser (1978, 1992) identifies the need for comparisons of data in order to identify, develop and relate concepts.

Strauss (1990) and Corbin (1991), describe an axis coding process for the development of **grounded theory**. This approach may be used during theory construction to "*think systematically about data and to relate them in very complex ways*" (Strauss & Corbin, 1990: 99). During axial coding the researcher attempts to identify which types of phenomena, contexts, and causal and intervening conditions and consequences are relevant for the domain under study. Axial coding may be viewed as evolving out of the work of Strauss and Glaser (Strauss and Corbin, 1998).

Two frameworks emerged from the grounded theory approach, applied by the researchers to determine a framework explore employee engagement and customer experience.

### Pre-requisite of employee engagement

The next step in content analysis involves combining and cataloguing related patterns into sub-themes. Patterns emerge when sub-themes are gathered in order to obtain a comprehensive picture of the information. These patterns may be tested with the interviewees. In this research stories emerged that had influenced the researcher's understanding of the phenomenon of inclusivity and, throughout the research process; the questions had been adapted slightly in order to test for new insights.

Viljoen (2009) adapted a technique of Strauss and Corbin (1998, xiii) to classify data. Categories are considered to be saturated when new data gathered no longer leads to new theoretical insights, neither does it reveal new properties in respect of the core theoretical categories (Charmaz, 2006). Ultimately, the insights gained are tested against, integrated into and presented in the Engagement Framework. A valid argument is then constructed for the choice of the themes. This is carried out by studying relevant literature.

The themes that emerged as pre-requisites of engagement are clustered on individual, group and organisational domain through grounded theory methodology. It was clustered as I-engage factors – factors needed on individual level to engage; We-engage factors – factors needed on group domain to engage; and Org-engage factors – factors on organisational level needed to engage (Viljoen, 2009). These pre-requisites are displayed in Figure 2.

It is not the intent of this paper to define the different factors as described in this Figure. What are important is how employees in the organisation experience and describe the factors and not how the researchers define it. Individuals and groups in organisations should engage around these factors and identify what is important for that specific system, and plan around it.

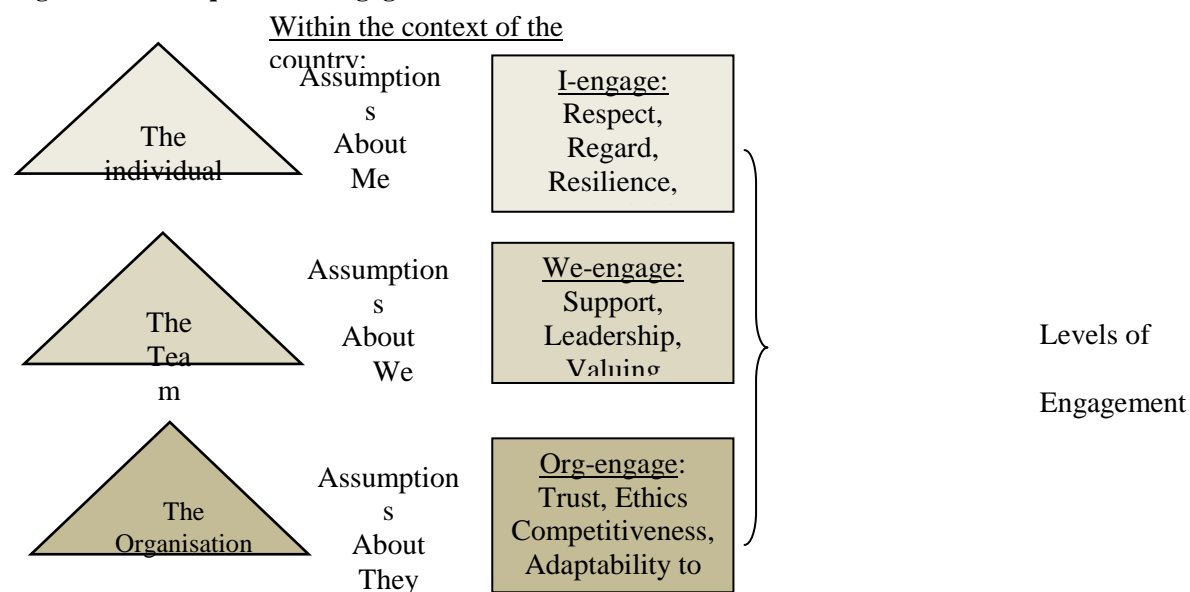

As depicted in Figure 2 above, the pre-requisites of employee engagement can be described as and synthesis between the following constructs:

- **Respect** refers to an assumption/showing of good faith and value towards another person.
- **Regard** refers to having a positive self-view and self-awareness. It further refers to both the perceived weak and strong points of an individual and how he or she deals with it.

- **Responsibly** refers to the extent to which an individual takes accountability for his or her behaviour.
- **Support** refers to the extent that individuals feel encouraged, cared for and assisted by others.
- **Supervisor leadership** refers to the leadership capability that is needed by managers to effectively manage and lead employees. It also specifically applies to the depth of leadership on supervisory level as effectiveness on this level has a direct impact on the achieving of organisational goals.
- **Diversity** refers to the degree to which diversity of thought; race, gender, age, language and nationalities are valued.
- **Accountability** refers to the degree to which an individual is held responsible for his or her contribution and behaviour by their team.
- **Trust** refers to the degree to which the intent of others is believed to be authentic and pure.
- **Alignment** refers to the degree to which teams have shared understanding of the values of the organisation and the strategy of the organisation.
- **Change resilience** refers to the ability of the organization and individuals to deal with change effectively
- **Inclusivity** refers to the degree to which an individual feel that they are been made part of the organisation. The practice of co-creating plans and strategies are utilised.
- **Ethics** refers to the sense of the individual that the right things are done in the organisation

The descriptions above crystallised from the Grounded Theory approach.

**Figure 2: Pre-requisites of Engagement**

Source: Viljoen, 2009

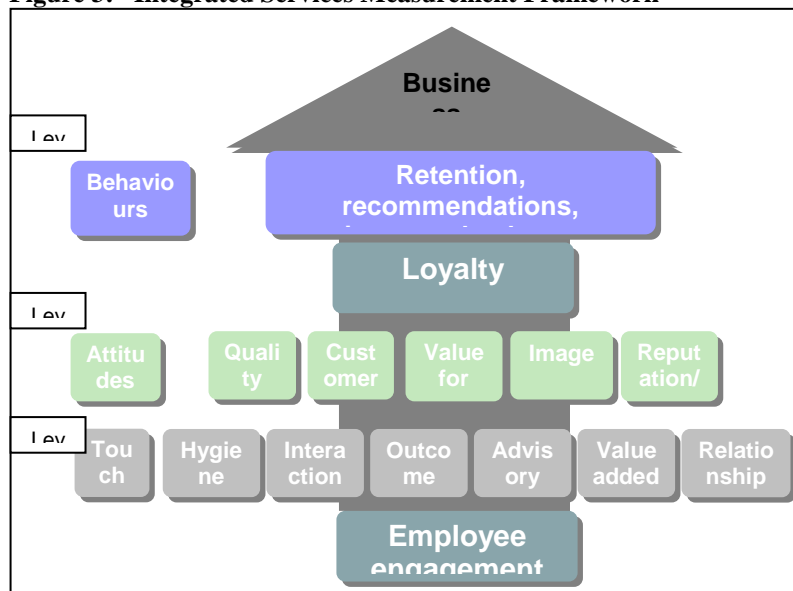

Leaders in organisations must create a space in which the wisdom, insights and gifts – the skills for which the individual was employed in the first place – are brought to the organisational table in order to create an environment in which diverse views, paradigms and perspectives may create a synergistic, sustainable outcome that manifests in organisational benefits such as optimal customer experience (Viljoen, 2009).

In this paper the researchers argue that through a process of inclusivity, employees can co-create strategies on customer experience and on values that will manifest in employee engagement and ultimately a positive customer experience.

## Pre-requisites of customer experience

The researchers developed a framework to determine the pre-requisites of a total customer experience, namely the Integrated Services Measurement (ISM) framework presented in Figure 3 below.

**Figure 3: Integrated Services Measurement Framework**

Source: Adapted from Markinor (2004). Copyright: Walker Information.

The ISM framework as depicted in Figure 3 indicates measurement of the customer experience on three levels, namely a touch point level, an attitudinal level and a behavioural level. To align customer experience being defined, as more than customer service, but including service, the basic service needs of customers were included in the framework. Customer experience is also defined as including the emotions and behaviour of customers and therefore the framework includes a measurement on an attitudinal and on a behavioural level as well as loyalty of customers towards an organisation.

**Level 1: Service needs.** This level describes the interaction between the customer and the organisation (i.e. the touch point). It represents the entire customer experience during interaction, fulfilling all service needs as described in the elements of the total customer experience. In customer-measurement terms, the touch point may be summarised in terms of attributes to provide the most comprehensive definition of the interaction (e.g. look and feel, timeliness, outcome [accuracy and speed], professionalism, communication [understanding, language, clarity during interaction]).

**Level 2: Attitudes** as emotional and intellectual dispositions caused by customer experience during interaction to meet service needs. These are the “feelings” customers have that will in turn affect their behaviour towards the service provider. Elements of the attitudinal level are quality of the organisation, customer focus, reputation and brand.

**Level 3: Behaviours.** These are intended actions that will make money for the service provider. Behaviours are initiated in response to and caused by customer attitudes.

## RESULTS / FINDINGS

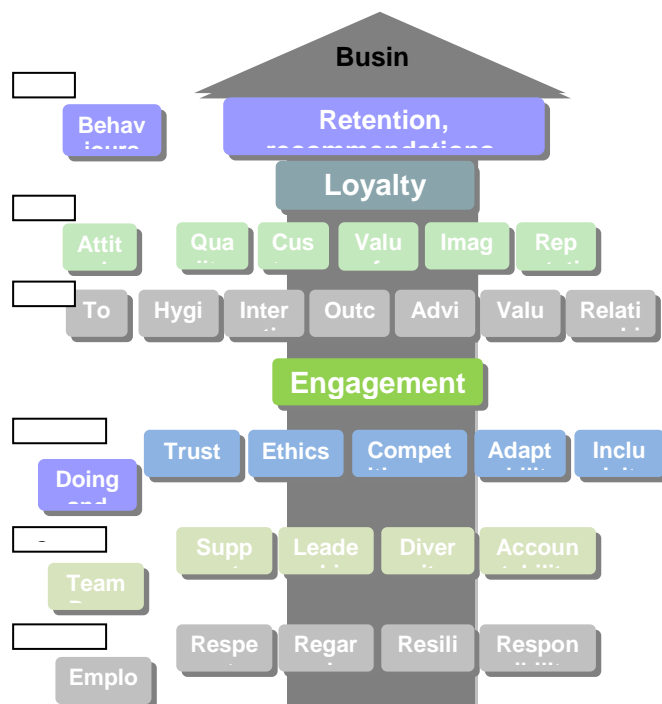

Through grounded theory methodology the pre-requisites of employee engagement crystallised (see Figure 2). The pre-requisites for a changed customer experienced are described in Figure 3. Viljoen (2009) argues that employee engagement will result in a positive customer experience. Drotskie (2009) argues that a positive customer experience is reliant on employee engagement.

The researchers of this paper argue that focusing on external factors in the world of the customer cannot change customer experience. To influence the customer experience, the employee engagement within the organisation should be optimized. Jung (1959) stated years ago that what happens inside, would manifest outside. The researchers agree with this philosophy and argue that an integrated approach towards optimising customer experiences should be followed.

The causality between employee engagement and customer experience are displayed in Figure 4, where a synthesis of the two frameworks discussed earlier is presented.

The Integrated Systemic Customer Experience Framework in Figure 4 above indicates that through rewiring the perceptions of the individual, the group and the team through a process of inclusivity, around the Doing and the Being – thus, the Strategy which includes customer experience factors and the values of the organisation – virtuous energy is released in the system that will impact on customer experience. Through optimising the customer experience at the touch points, the customer attitudes and behaviours can manifest in organisational benefits and ultimately in organisational success and sustainability.

**Figure 4: Integrated Systemic Framework of Customer Experience**

Source: Adapted from Viljoen (2009) and Markinor (2004)

## CONCLUSION

Culture, climate and customer experience should be studied simultaneously and systemically in order to gain a better understanding of causalities between these dynamics. An understanding of the external environment (in this case the world of the customer) may assist in creating insights, reawakening instincts and cultivating organisational change.

Optimising employee engagement can optimise customer experience. The enhanced customer experience will directly impact on business success and sustainability

The interrelated nature of Employee engagement and customer experience ask of leaders in the global context to elevate these topics into the strategic agenda. Employee engagement and customer experience can be the distinguishing factors in the New World of Work.

# **AN EXPLANATORY STUDY: PROBLEMS FACED WITH MAINTENANCE OF AIRPORT NAVIGATION AIDS IN TURKEY**

**Erdal Dursun, Directorate General of Civil Aviation, Turkey**  
**Vildan Durmaz, Anadolu University, Turkey**

## **ABSTRACT**

*The keypoint in the phase of preserving and improving of professional qualifications of technical personnel working on air navigation service procurements is the trainings given within a certain programme. Ensuring flight safety and eliminating possible risks paralleling with national and international regulations will be possible with setting up a trained and competent personnel structure. The adoption of working with a principle of zero mistake of Turkey, who has been taking a great test in the adaptation process to the European Union, will make her take a great path. Preventing possible mistakes and ensuring not to repeat what had been happened is directly related to technical personnel who will carry out the work in this area.*

## **INTRODUCTION**

The day-by-day growing acceleration of aviation sector has brought along the need of qualified personnel. At this point, reaching the desired competency level has exposed the need of a good quality theoretical training first of all and then an intensive on job training. In order to provide a safe air navigation service, training, periodical maintenance studies, and audits based on documentation have a great importance.

## **COMMUNICATION NAVIGATION SURVEILLANCE (CNS) AUDITS**

The authority of all kinds of arranging, auditing, and establishing rules authority concerning civil aviation activities in Turkey are legally belong to Turkish Directorate General of Civil Aviation. The required regulation studies in order to provide flight safety and its continuity are made by the Authority.

In this context, by Air Traffic Safety Electronics Personnel Certification and License Regulation (SHY-5), which was come into force in February 24, 2010; procedures and principles concerning determining health and training conditions, granting certificate, license, and degrees, maintaining them, renewing them, and cancelling them with a definite or an indefinite time which all civil technical personnel, who need to have and who carry out to plan technical infrastructure, to operate it and to provide its maintenance and operational duties concerning safety, at airports in Turkish air space of air traffic safety electronics services which are a base for the flow of air traffic in a safe, proper, and fast way, were established.

To assure the Air Traffic Safety Electronics Personnel Certification and License Regulation (DGCA, 2010) to have international norms, it has been applied some sanctions parallel to decisions in ESARR-5 (Safety Regulatory Requirement) Air Traffic Management Services' Personnel arrangement published by European Organization for the Safety of Air Navigation (EUROCONTROL) with Annex 10 to the Convention on International Civil Aviation (ICAO, 1995).

There are three Communication Navigation Surveillance (CNS)/Air Traffic Management (ATM) Technical Service Provider Organization authorized by the Ministry of Transportation of Turkey. The process to carry out maintenance activities of air navigation aids which take place in CNS services granting by the said organizations, are made in the context of Electronics Systems, Control, Maintenance, and Repair Directives prepared by themselves.

The qualifications of the personnel who will work in the context of this Directive were explained in SHY-5. According to the item "Safety Rules" of EUROCONTROL ESARR-5, the person who is responsible for providing air traffic services can't carry out this duty unless he is declared as qualified and unless he is authorized to carry out this duty (EUROCONTROL, 2002). On the other hand, according to the decisions explained in "CNS/ATM Technical Service Provider Organizations' Duties and Responsibilities" of Air Navigation Safety Electronics Personnel Certification and License Regulation, CNS/ATM technical service provider organization is responsible for the personnel who carry out the job towards air traffic safety electronics service, to have a valid license, degree or degrees available to the service provided.

## METHODOLOGY

In this study, the problems faced in the maintenance activities of airports' navigation aids, one of maintenance activities showing varieties in the aviation sector, and recommendations to these problems were presented. In order to obtain the required data, 40 (forty) CNS technical audit findings at various airports made by Turkish Directorate General of Civil Aviation have been utilized.

Before audits, the units were informed about the time and context of audits. When it was reached to related airport, it was negotiated with airport's senior chief, independent department managers, and technical personnel separately. All system and devices within the context of auditing, were examined at stations where they exist in terms of hardware and software specifications included in application procedures and also within the quality management system; maintenance forms, incident records, and technical fault reports belonging to the past periods were examined fastidiously.

Arranging and auditing actions taken by national authorities will light the way for the sector to better and will make the system interrogate itself. In this context, main problems faced in the maintenance activities of navigation aids devices in Turkish airports are:

- personnel not authorized by means of a license degree and a degree level,
- personnel working operationally without a sufficient training,
- personnel who have not been made a difference and who make a non-comprehensive maintenance,
- not having maintenance or having a mistaken maintenance,
- to fill out the related blanks by mistake at maintenance forms,
- to read mistaken values from the devices.

## RESULTS AND DISCUSSION

All findings obtained from all audits were gathered in a pool, then were analyzed and were determined that faults were generally come out parallel to the problems explained in six headings arrayed above and a fault triggered a different problem. Small faults in aviation can transform to bigger problems, when they are not sufficiently cared, by growing in the form of chain circles connected to each other. In spite of this, aviation needs to have a sensitive and fastidious operational approach. The reason is that the rules of aviation are written with blood.

When the problems arrayed are assessed, according to Organizations' Electronics Systems, Control, Maintenance, and Repair Instructions and flight safety requirements, it could be said that some weaknesses happen during periodical maintenances of navigation which are required to be done and also some maintenances were not made. On the other hand, it is obvious that it is necessary to set a personnel structure who will make control, maintenance, and repair procedures of navigation aids without interruption. As a result of periodical

control and maintenances interrupted, it could be said that navigation aids will be inactive by way of breaking down and some damages both hardware and software on the systems will cause.

It is useful to stress not having been established duty, authorization and responsibilities in electronics departments; not having been carried out job distribution and studies done within unit by an effective and a productive way; not having been assessed professional competencies according to EUROCONTROL ESARR-5 and not having been made any planning in order to develop knowledge and competency.

The solutions which could be suggested in the context of problems ordered are showed below:

- a good quality technical training,
- preserving and continuous control of professional competency,
- auditing maintenance activities orderly,
- remote control supported observation applications
- setting up an electronic registration in maintenance activities and following those.

For the only personnel who take place in the maintenance organizations of CNS/ATM technical service providers, it is significant to provide professional adequacy, preserve it by continuous control. In this context, parallel to international arrangements (EUROCONTROL, 2008), it will be useful to give trainings listed below.

## **1. Beginning Trainings**

1.1. Basic Training: It is the training process that it is necessary to be given basic knowledge and skills available to the discipline which will be followed in the area of aviation technical services.

1.2. Adequacy Training: It is the theoretical and on-the-job training which is needed to be given in order to gain required knowledge and skills in the areas which will be followed connected with the authorization.

## **2. Responsibility Trainings**

2.1. System/Device Training: It is the training which will be required to give to the personnel to reach adequacy level in order to gain necessary knowledge and skills relevant to system and devices. In this training's context, it must be theoretical system/device training and in-plant training.

2.2. In-Plant Training: Under inspection of assessment expert in the working environment, it is the process of integrating methods and skills relevant to the job gained before with the application. The point which must be given importance here is to transfer knowledge and skills in the operational environment rather than learning.

## **3. Continuation Training**

It is the training which needs to be designed in order to increase existing knowledge and skills of the personnel and/or to prepare a new technology.

3.1. Renewal Trainings: It is the training which needs to be designated to review, reinforce or increase existing knowledge and skills of the personnel.

3.2. Emergency and Extraordinary Situation Training: This training is the training which needs to be designated to gain necessary knowledge, skills, and behaviors in order to intervene an emergency, an extraordinary or a regressed situation.

3.3. Transformation Training: It is the training which needs to be designated to gain available knowledge and skills for the changes in the area (a new system/device responsibility), in the environment (new procedures, a new location) or in the system.

## **4. Progressive Training**

It is the training which needs to be designated to gain additional knowledge and skills for the situations like change of work profile, promotion, trainer, assessment expert, training manager etc.

Among duties and responsibilities of CNS/ATM Technical Service Provider Organizations are to maintain professional adequacies of the personnel continuously by theoretical and applied assessments. In this context, at units belonging to the degrees of the personnel who have, minimum working hours within a certain time period must be followed and the related personnel must be given refreshment trainings in order to be regain professional adequacies to the personnel who have stayed away from the active working with various reasons.

In the context of auditing maintenance activities continuously, periodical maintenance and repair forms belonging to navigation aids at airports in which CNS/ATM technical service providers give service are sent to Directorate-General of Civil Aviation with systematic time periods for examining by an unique center. At this point, parameters and numerical values on maintenance forms must be carefully examined and done the checks that momentary values read from devices are included in tolerances ascertained in relevant arranging regulation. On the other hand, relevant forms can be checked in the form of visiting stations where devices exist during the audits.

From the audits, it has been determined that many developed navigation aids examined have the support of remote control that they can be checked and followed from the regions out of stations where they exist. However, to establish data connection links of remote control system which will provide to work between related stations and technical block in which the personnel was located could lead to various additional costs. With this reason, these systems could not be kept active by some management units but by this way some weaknesses could happen in terms of keeping it under interrupted observation. In these occasions, necessary checks must be done by visiting stations in which the devices exist with frequent intervals by related technical personnel.

Today's modern navigation aids can record momentary data belonging to the system during the operation and warnings and dangers electronically. In the events of shutting down the system itself when it fails to work by various breakdowns of the devices; the investigations of these records backwards provide greater use. However, it was observed during the audits that navigation aids, whose lives of use were consumed, can't keep these records with various reasons and can be affected negative from energy interruption of memory units. In these events, first of all, it will be appropriate to switch the related units but if this doesn't bring a solution, in terms of safety, it will be appropriate to renew the whole system completely and to investigate the whole data backwards.

## CONCLUSION

As a conclusion, it has appeared that the existing periodical maintenance system belonging to navigation aids cause a risk and a weakness for aviation safety. The paper revealed the need of rebuilding and follow-up auditing is inevitable for the sustainability of the aviation. The findings strongly support this view. This paper provides contribution to the further studies about implementation and comparison of training models.

# JOB EVALUATION UNDER FUZZINESS

**Mehmet Ekmekçioğlu and Ahmet Can Kutlu**  
**Istanbul Technical University, Turkey**

## ABSTRACT

*Job evaluation, an important function of a human resources management of an organization, is a technique for systematically determining a relative internal value of a job within the organization. The most comprehensive method used in job evaluation process is the point-factor method where a set of compensable factors are identified for determining the worth of a job. In this study, a Fuzzy Analytic Hierarchy Process (F-AHP) approach is developed for job evaluation. In this approach, initially, factors are weighted by pair-wise comparisons and then jobs are evaluated with respect to job evaluation criteria by experts. At last the scores for each job are obtained as a base for an ideal compensation system.*

## INTRODUCTION

Job Evaluation is a technique for systematically determining a relative internal value of a job in an organization. It is used to establish a base for developing and maintaining a pay structure by comparing the relative similarities and differences in the content and the value of jobs (Milkovich and Boudreau, 1990). The main objective is ensuring equal pay for work of equal value. The private sector extensively implemented job evaluation practices in the early 20th century during World War II in response to the National War Labor Board permitting wage increases only for the purpose of correcting demonstrated inequities in wage structures (Treiman, 1979).

The most widely used method applied in job evaluation process is the point-factor method. In this method, for determining the worth of a job, a set of compensable factors are identified. Therefore job evaluation process can be considered as a complex multi-criteria decision-making problem with multiple factors and sub-factors in the evaluation process (Dagdeviren et al., 2002). In general preference of decision makers is to express their feelings with verbal expressions. As considering the uncertainty in information flow and the vagueness in the human feeling and recognition, the real life multi-criteria decision-making problems include vagueness and imprecision. Thus experts may prefer to use intermediate judgments rather than certain judgments. As a result the fuzzy set theory, first introduced by Zadeh (1965), makes the comparison process more flexible and capable to explain preferences of the experts (Kahraman et al., 2003). Thus, in job evaluation process, while dealing quantitatively with imprecision in the expression of the importance of each factor, the use of some fuzzy multi-criteria decision-making methods can be relevant.

In this study, the job evaluation problem is solved under fuzziness. A fuzzy AHP methodology for a point-factor job evaluation system is proposed. Initially factors are weighted by utilizing Chang's (1996) fuzzy AHP. Subsequently, fuzzy AHP scoring approach is considered for scoring the jobs with respect to the obtained weights and these scores establish a base for an ideal compensation system. The rest of the paper is organized as follows; in the following section, a literature review for job evaluation methods is given. In the next section, the proposed methodology is explained and in Section 4, an application case study is presented for the developed model. In the last section, the paper is concluded.

## JOB EVALUATION METHODS

There are four main job evaluation methods such as ranking, classification, factor comparison and point system (McCornick, 1979). The most popular method of them is the point-factor method (Kahya, 2006) where a set of compensable factors is identified to determine the worth of a job. This method is commonly used in industry for its reliability in generating accurate results (Das and Garcia-Diaz, 2001). In the point-factor job evaluation method, while determining the worth of a job, it enables to express the value of the job in monetary terms. The method is practically applicable to a wide range of jobs and also to newly generated jobs. In a typical point-factor method total points of job content evaluation plan are the sums of each of the factor ratings of the plan (Pittel, 1999) and the evaluation of the jobs is based on a multi-attribute value system (Spyridakos et al., 2001). The typical factors employed for the point-factor method are mainly categorized as skills, responsibilities, effort, and working conditions which were specified in the Equal Pay Act of 1963 (Davis and Sauser, 1993).

Most of the job evaluation studies emphasize on the weighting the factors. Kahya (2006), Charnes et al. (1955), Llewellyn (1964), Gupta and Ahmed (1988), and Ahmed (1989) used linear programming models in order to obtain the factor weights. These models consider the factor weights as the decision variables and the levels of each job for each factor as the parameters; and the wages in the market as the constraints. The most important disadvantage of these models is that they ignore the definitions of the levels while obtaining the level weights. Another disadvantage of these models is the difficulty to define constraints as many as the number of jobs and variables as many as the number of factors.

Kahya (2006) used surveys and interviews to determine the factor weights by consensus in a company in the metal industry. Weinberger (1995) developed a statistical model by using multivariate regression analysis to obtain the factor weights. The model includes the levels of the jobs for each factor as the independent variables and the wage in the market as the dependent variable. The relationship levels of the factors with each other were obtained by the correlation matrix. Das and Garcia-Diaz (2001) developed a computerized statistical method based on the central distribution and correlation measures in order to obtain the factor weights. The factors which have low effects or measure the same function can be determined and removed from the system by applying four statistical tests proposed in this study. Besides, the weights of the factors can be properly determined by using their partial correlation coefficients. Pittel (1999) presented the update of the factor weights by using the market weights of the jobs in his regression analysis model. Spyridakos et al. (2001) developed a model that determined the weights of the levels for each factor by using a value function and applied the model to evaluate the jobs in a big scale company. Davis and Sauser (1993) compared four weighting methods; an unweighted raw score composite, equal unit weights, committee judgmental weights and multiple regression weights. The results show that the weighting methods differed in their relative impact on the male and female dominated jobs. Dağdeviren et al. (2002) utilized Analytic Hierarchy Process (AHP) in the job evaluation process to obtain the factor weights by the pair-wise comparison of factors and sub-factors.

In real-life determination of the weights of the factors include vagueness and imprecision. The fuzzy set theory provides a proper framework for description of uncertainty related to vagueness of natural language expressions and judgments. In the job evaluation literature, Gupta and Chakraborty (1998) handled the job evaluation problem in a fuzzy environment by constructing a fuzzy mathematical model. They showed that the results of their analysis were close to the choices of the decision makers. Our paper proposes a fuzzy AHP approach for the job evaluation problem.

## PROPOSED METHODOLOGY

In the proposed methodology, initially, factors and sub-factors are defined upon the determination of job evaluation factors and sub-factors by the Union of Turkish Metal Industrial Producers (MESS, 1996). These factors are listed in Table 1. Subsequently appropriate linguistic scores of each factor and sub-factor are determined. In the next stage the weights of the factors and sub-factors are calculated by implementing Chang's fuzzy AHP method. Later, by using the linguistic scores of each job, planned to be evaluated, with respect to the weights of sub-factors, jobs are scored. At last these scores are used to establish a base for an ideal compensation system.

**Table 1: Factors and sub-factors used in the study**

Skills (S)	Education and basic knowledge
	Experience

	Ability
	Initiative and problem solving
Responsibilities (R)	Machine and equipment
	Materials and products
	Production
	Working safety of others
Effort (E)	Mental
	Physical
Working conditions (W)	Hazards
	Location

## Factors and sub-factors

The hierarchical structure for job evaluation factors and sub-factors is illustrated in Figure 1. The skills factor measures the level of skills required for the job. The sub-factors of this factor are determined as education and basic knowledge, experience, ability, and initiative and problem solving. Education indicates an employee's formal education level that makes him/her gain the required knowledge to be able to do the duties of the job in a satisfactory level. For example, the job that is evaluated can require an education background with a minimum level of university graduation with a bachelor degree.

The experience sub-factor measures the extent of experience gained for the person who has an adequate education level to fulfill the job in a satisfactory level. Experience covers the time to learn the methods, procedures and techniques about the application of the theoretical knowledge to the jobs. Ability is the sub-factor defined for measuring the abilities to fulfill the related job in a satisfactory level. The abilities of an employee may be; speaking level of a foreign language, number of the foreign languages he/she can speak, using knowledge of a specific software package program, etc. Initiative and problem solving sub-factor measures how difficult to solve the problems in the job are. The difficultness of the solutions depends on the job structure, the data type used for the identification of the problem and development of the solution and the method used for finding the solutions. A job structure can be classified as routine jobs, routine but sometimes-changeable jobs, different and complex jobs and new and dynamic jobs. Data can be classified by known amount or number and the method can be classified by its complexity.

**Figure 1: The hierarchical structure for job evaluation factors.**

The responsibility factor measures the results or effects of the wrong or inappropriate decisions or behaviors. The results can be in terms of materials, equipment or monetary. The results of the failures can be evaluated considering the appearance of the failure, prevention and the seriousness of the results. Working safety of others measures the loads of the jobs or number of the people who are supervised related to working safety.

The sub-factors; mental effort and physical effort measure the loads resulted from the mental or physical energy to fulfill the job. This factor is determined due to the type of the effort or the time consumed for the effort. Working conditions factor evaluates the effects of the conditions and the environment where employee works in. These conditions include heat, noise, light, etc. This factor takes care of the duration that an employee works under these conditions.

## Fuzzy AHP

AHP is one of the well-known multi-criteria decision making techniques that was first proposed by Saaty (1980). The classical AHP takes into consideration the definite judgments of decision makers (Wang and Chen, 2007). Although the classical AHP includes the opinions of experts and makes a multiple criteria evaluation, it is not capable of reflecting human's vague thoughts (Seçme et al., 2009).

As the uncertainty of information and the vagueness of human feeling and recognition, it is difficult to provide exact numerical values for the criteria and to make evaluations which exactly convey the feeling and recognition of objects for decision makers. Therefore, most of the selection parameters cannot be given precisely. Thus experts may prefer intermediate judgments rather than certain judgments. So the fuzzy set theory makes the comparison process more flexible and capable to explain experts' preferences (Kahraman et al., 2003).

Weight vector of factors can be obtained by either directly assigning or indirectly using pair-wise comparisons. Here, it is suggested that the decision makers use the linguistic variables in Table 2 to evaluate the weight vector risk factors.

**Table 2: Fuzzy evaluation scores for weight vector**

Linguistic terms	Fuzzy score
Absolutely Strong (AS)	(2, 5/2, 3)
Very Strong (VS)	(3/2, 2, 5/2)
Fairly Strong (FS)	(1, 3/2, 2)
Slightly Strong (SS)	(1, 1, 3/2)
Equal (E)	(1, 1, 1)
Slightly Weak (SW)	(2/3, 1, 1)
Fairly Weak (FW)	(1/2, 2/3, 1)
Very Weak (VW)	(2/5, 1/2, 2/3)
Absolutely Weak (AW)	(1/3, 2/5, 1/2)

After comparison is made, it is necessary to check the consistency ratio of the comparison. To do so, the graded mean integration approach is utilized for defuzzifying the matrix. According to the graded mean integration approach, a fuzzy number  $\tilde{M} = (m_1, m_2, m_3)$  can be transformed into a crisp number by employing the below equation:

$$P(\tilde{M}) = M = \frac{m_1 + 4m_2 + m_3}{6} \quad (1)$$

After the defuzzification of each value in the matrix, CR 'consistency ratio' of the matrix can easily be calculated and checked whether CR is smaller than .10 or not.

## Steps of the Methodology

The proposed fuzzy multi-criteria job evaluation can be implemented by succeeding the following steps:

*Step1:* Appropriate linguistic variables for factors and sub-factors are determined by experts.

*Step2:* Pair-wise comparison matrices are constructed, and experts' linguistic evaluations are aggregated to get a mean value for each pair-wise comparison.

*Step3:* Chang's extent analysis approach is used to obtain the weights of each factors and sub-factors.

*Step4:* The linguistic variables for evaluations are compared pair-wise and a mean value for each pair-wise comparison for each variable is aggregated.

*Step5:* Jobs, planned to be evaluated, are determined.

*Step6:* After determining of jobs, Fuzzy AHP scoring model is utilized by using experts' linguistic evaluations of each job with respect to sub-factors are aggregated to get a mean value as scores.

*Step7:* According to the scores, jobs are ranked to support a compensation system.

## CASE STUDY

The proposed methodology is applied to a medium scale firm operates in an electronic industry and manufactures sound systems and equipment. The job evaluation factors and sub-factors determined by the Union of Turkish Metal Industrial Producers (MESS, 1996) are considered for evaluating the blue collar jobs in the firm. The selected nine jobs determined by the experts.

## Evaluations of Factors, Sub-factors and Assessment Variables

After the determination of factors and sub-factors, the evaluations of the four experts in linguistic variables are used to determine the importance of factor and sub-factors by pair-wise comparison according to the linguistic variables defined in Table 2. The evaluations of the pair-wise comparisons and the weight vectors are shown in Table 3.

**Table 3: Pair-wise Comparisons for Factors and Sub-Factors**

	F <sub>S</sub>	F <sub>R</sub>	F <sub>E</sub>	F <sub>W</sub>	Weight Vector CR=0.030<0.1
F <sub>S</sub>	E,E,E,E	SS,E,SS,FS	VS,FS,FS,VS	VS,FS,FS,VS	0.421
F <sub>R</sub>		E,E,E,E	FS,FS,SS,SS	FS,VS,FS,SS	0.324
F <sub>E</sub>			E,E,E,E	SS,E,SW,E	0.134
F <sub>W</sub>				E,E,E,E	0.121
	F <sub>S1</sub>	F <sub>S2</sub>	F <sub>S3</sub>	F <sub>S4</sub>	Weight Vector CR=0.028<0.1
F <sub>S1</sub>	E,E,E,E	SS,SS,E,SW	E,SS,SS,SS	SW,E,FS,SS	0.268
F <sub>S2</sub>		E,E,E,E	E,SW,FS,FS	SW,E,VS,FS	0.326
F <sub>S3</sub>			E,E,E,E	E,E,SS,E	0.211
F <sub>S4</sub>				E,E,E,E	0.195
	F <sub>R1</sub>	F <sub>R2</sub>	F <sub>R3</sub>	F <sub>R4</sub>	Weight Vector CR=0.028<0.1
F <sub>R1</sub>	E,E,E,E	VS,FS,SS,E	VS,SS,SW,E	FS,FS,SS,SS	0.340
F <sub>R2</sub>		E,E,E,E	SS,E,FW,SW	SW,SW,SS,SS	0.193
F <sub>R3</sub>			E,E,E,E	FW,SW,FS,SS	0.244
F <sub>R4</sub>				E,E,E,E	0.223
	F <sub>E1</sub>	F <sub>E2</sub>			Weight Vector
F <sub>E1</sub>	E,E,E,E	SW,FW,SW,SW			0.411
F <sub>E2</sub>		E,E,E,E			0.589
	F <sub>W1</sub>	F <sub>W2</sub>			Weight Vector
F <sub>W1</sub>	E,E,E,E	E,SS,FS,SS			0.607
F <sub>W2</sub>		E,E,E,E			0.393

In the next stage, the overall weights of the sub-factors are calculated by the multiplication of the factors and their sub-factor according to the hierarchy as illustrated in Table 4. The most importance sub-factor is found experience for job evaluation with the value of 0.138 and the second one education and basic knowledge with the value of 0.113. The least important sub-factor is location in working conditions with value of 0.047.

**Table 4: Overall weights of sub-factors**

Sub-factors	Overall Weights
Education and basic knowledge	0.113
Experience	0.138
Ability	0.089
Initiative and problem solving	0.082
Machine and equipment	0.110
Materials and products	0.062
Production	0.079
Working safety of others	0.072
Mental	0.055
Physical	0.079
Hazards	0.073
Locations	0.047

Later, the pair-wise comparisons of the linguistic variables (Very Poor – VP, Poor – P, Medium – M, Good – G and Very Good – VG) for the assessment are conducted. Subsequently a mean value for each pair-wise comparison is aggregated. The results are expressed in Table 5.

**Table 5: Pair-wise Comparisons for Linguistic Variables for the Evaluation**

VP	P	M	G	VG	Weight Vector
----	---	---	---	----	---------------

VP	E,E,E,E	SW,SW,SW,SW	FW,FW,FW,FW	VW,FW,FW,VW	AW,VW,VW,AW	0.049
P		E,E,E,E	SW,SW,SW,SW	FW,SW,SW,FW	VW,FW,FW,VW	0.128
M			E,E,E,E	SW,SW,SW,SW	FW,FW,FW,FW	0.204
G				E,E,E,E	SW,SW,SW,SW	0.265
VG					E,E,E,E	0.355

## Jobs

The experts selected nine jobs determined by for the study briefly explained below:

*Job 1 - Workshop worker:* The duties are performing a variety of general manual labor tasks including, lifting and moving materials, loading and unloading vehicles, digging and refilling holes, and other activities in a helping or assisting mode, performing simple repairs on machinery or minor repairs to buildings, transporting materials, tools, and equipment to and within work sites as required and participates in special projects as required.

*Job 2 - Assembling worker:* The duties are assisting and supporting in structures assembling and installations, understanding layouts, blueprints and other design drawings relating to assembly functions and assembling structural components as per specifications provided, executing structural assembly functions like bulkheads, reworking and fittings, performing trimming, altering, reforming and assembling of structural parts. Assembling and fabricating gussets, shims, splices, metal pieces, plastic frames, wires and chords. .

*Job 3 - Electrical-electronics technician:* The duties are performing electrical lines, fixing equipment and machines when there is an error or a fault caused by electrical problems and assembling, maintaining and controlling other electrical and electronics devices.

*Job 4 - IT support worker:* The duties are answering technical questions, analyzing technology problems, providing assistance when computers crash and using technology protocols, such as live chat and diagnostic programs, to communicate and assist technology users and also investigating technical issues and determine solutions to fix the problem. They advise and train users on the proper use of hardware and software, and also help other technologists plan for new systems.

*Job 5 - Manager assistant:* The duties are controlling of required documentation, dealing with internet enquiries and general office administration and using computer for paper work such as writing documents, using calendar or agenda.

*Job 6 - Quality control worker:* The duties are working alongside teams of assembly operatives on the production process and he is responsible for testing, inspecting and checking the quality of the products ensuring that the finished product is of the highest standard.

*Job 7 - Sales assistant:* The duties are assisting customers in locating merchandise and answering a variety of questions concerning general merchandise, demonstrating use of merchandise upon request stocking shelves, keeping merchandise orderly and neat in appearance, counting and balanceing cash register and receipts, stamping or attaching price tags on merchandise and/or checks tagged prices to verify accuracy referring to price list, informing designated staff member of needs or places orders with outside sales representative within established limit, setting up promotional displays, making signs or arranging merchandise on counters or tables to promote sales, training new sales staff in basic operations and procedures and cleaning shelves, counters or tables.

*Job 8 - Technical designer:* He is responsible for standardizing quality across the range of products, categories and brands. The duties are participating in knowledge acquisition and knowledge management processes and interacting with design analysts and entities that have been engaged by them to deliver their products or services for their companies.

*Job 9 - Workshop foreman:* He is responsible for running the workshop, managing the workshop team, accounting management and development and dealing with factory, maintenance, groundwork, restoration and

fabrication. The duties include involving in pricing and following the product through to dispatch and reading drawings and dealing with fabrication.

After determining the jobs, they are evaluated with respect to the sub-factors and the results are shown in Table 6. The calculated scores are expressed in Table 7 with transformation of the scores to points out of 1000 to form a base for a pay system.

**Table 6: Experts' evaluation scores for jobs with respect to sub-factors**

	F <sub>S1</sub>	F <sub>S2</sub>	F <sub>S3</sub>	F <sub>S4</sub>	F <sub>R1</sub>	F <sub>R2</sub>	F <sub>R3</sub>	F <sub>R4</sub>	F <sub>E1</sub>	F <sub>E2</sub>	F <sub>W1</sub>	F <sub>W2</sub>
<b>Job1</b>	P,VP,P	P,F,P	P,VP,P	P,VP,VP	G,G,G	G,G,G	G,VG,G	G,G,G	P,P,P	VG,G,VG	G,G,VG	G,VG,G

## CONCLUSION

Job evaluation process can be thought as a complex multi-criteria decision-making problem considering multiple factors and sub-factors in the evaluation process. This study proposes a fuzzy AHP approach for the point-factor job evaluation method enabling decision makers to realize a hierarchical structure and an effective vague assessment of weights of factors and sub-factors having different characteristics under uncertainty. By utilizing the Chang's FAHP method, the weights of sub-factors are determined and subsequently the determined jobs are assessed with respect to weights of these sub-factors to score and rank the jobs considering the scoring approach.

The weight vector of criteria with certain values recommended by the Union of Turkish Metal Industrial Producers is [0.400 0.400 0.200 0.200] whereas it is found [0.421 0.324 0.134 0.121] by the FAHP method employed in the study. The proposed method provides more realistic and flexible results for a point-factor job evaluation system which considers human thinking style. The proposed methodology can be applied to any different job evaluation problem in any industry or service system.

In the future applications, the job evaluation under fuzziness can be integrated for other methods to gain a pay structure. Furthermore, the other fuzzy multi-criteria decision making approaches can also be used and the result of further studies can be compared with the result of this paper.

# THE FACTORS AFFECTING THE ATTITUDE OF CONSUMERS' PURCHASING PRIVATE LABELS

**Ebru Enginkaya**  
**Yildiz Technical University, Turkey**

## ABSTRACT

*Private labels in the consumer packaged goods have experienced a worldwide growth in availability and market share in recent years. Retailers offer private labels in many different product categories to attract new consumers and gain sustainable consumption. The growing penetration of private labels in a markets and acceptance by the consumer provides sales and profits for retailers. The changes in consumers' life styles, purchasing behaviours and expectations led changes in consumption patterns. This research aims to investigate the dimensions that are important to consumers during their purchase of private labels. The main purpose of this study is to investigate the relationships between private label attitude and consumers' shopping orientations and to examine the differences about private label attitude according to gender and income.*

## INTRODUCTION

Private labels have seen enormous growth in the last couple of decades in many countries and in many product categories. The market shares based on volume are generally higher than value shares, indicating that most private labels are sold at lower prices than their national brand counterparts. Private labels are an important phenomenon in retailing and increasing in importance. Some consumers will consider switching to the private label for a sufficiently large price differential (Gabrielsen and Sorgard, 2007). The roles and importance of private labels, brands that are exclusive to a particular store chain and compete in several product categories with major manufacturer's brands, have changed dramatically over the past decades. Private labels are evolving into full-fledged alternatives, capable of competing successfully with these manufacturer's brands on quality as well as on price and contributing substantially to profitability, store differentiation and store loyalty. Sales volumes and market shares of private labels, as well as their appeal to consumers have steadily increased. Many retailers appear to view themselves increasingly as active marketers of their own store brands, rather than as passive distributors of manufacturers' brands (Semeijin et al., 2004).

Private labels assist building loyalty by differentiating the retailer. These brands are available at one retailer exclusively whilst manufacturer brands are available at many competing outlets. Consumers who purchase private label brands regularly do not only become loyal to that particular brand but also to the retailer through which it is sold. Over the last decade, private labels have become omnipresent and have achieved enormous success, thus providing a base for the improvement in branding activities. Private labels have changed from inferior generics to brands in their own right with value beyond functional attributes (Beneke, 2010).

The growth in private labels has traditionally been attributed to two major causes. First, retailers use private labels to compete profitably in the price-sensitive segment. Second, these products enable retailers to get better deals from manufacturers in the form of lower prices on national brands. It is commonly believed that when the economy picks up, consumers go back to buying national brands. However, most recent trends show that private label sales are growing faster than national brands and have achieved much higher levels of penetration. Penetration of private label varies across countries and product categories. For instance Nielsen reports indicate that in developing markets, although the overall private label share is relatively low compared to the mature European and U.S. markets, there is a significant growth rate. This could be attributed to large multi-national retailers that expanded geographically, building new stores and introducing their private label brands into the marketplace (Boutsouki, Zotos and Masouti, 2008). Private labels are consumer products produced by

or on behalf of, distributors and sold under the distributor's own name or trademark through the distributor's own outlet (Burt, 2000).

Private labels have long been recognized as a low-cost alternative to national brands. Furthermore, the objective quality level of private labels has been steadily increasing, greatly narrowing the quality gap between private labels and national brands (DeVecchio, 2001). Private labels can help retailers attract customer traffic and create loyalty to the store by offering exclusive product lines and premium products (Baltas and Argouslidis, 2007, Corstjens and Lal, 2000, Binninger, 2008).

## **Consumer Perceptions and Private Labels**

Consumer are today willing to purchase private label products and are delighted to have private label brand ranges available in stores. Several factors drive consumer willingness to purchase private label products such as demographic factors, economic factors and psychographics. Demographic factors include household income, the number of children in the household, gender, etc. Economic factors are related to the economic cycle while psychographics involve value consciousness, risk awareness, price-quality inferences, self-smart shopper perceptions, etc. (Chandon and Diallo, 2011).

Consumers with favorable attitudes toward private label brands are extremely price conscious and tend to focus almost exclusively on paying low prices, essentially minimizing or disregarding other factors in brand evaluations (Burton et al., 1998). Especially after the economical recessions, as the buying abilities of the consumers are decreasing, the consumers change their traditional shopping habits. After the economical recessions, the consumers tend to go to shop less than before, or they tend to search the cheaper products.

Private labels have been for a long time affected by negative stereotypes such as low quality goods designed for low income consumers. For this reason, private labels have low market shares in some product category and can be found mainly in low added value product ranges. So, consumer attitude towards private labels was often negative at the beginning of private labels offer. However, this attitude towards private labels is now changing as retailers are launching higher value added product. Improved quality of private labels products has lead consumers to develop stronger preferences for private labels in most product categories (Chandon and Diallo, 2011).

Private labels provide consumers with a competitive alternative to national brands. Private labels offer lower prices owing to their lower manufacturing costs, inexpensive packaging, minimal advertising and lower overhead costs. For retailers, store brands offer an opportunity to increase store traffic and build store loyalty. Although private labels are generally priced lower than national brands, the higher margins earned on these products enable retailers to expand into lower volume categories for which success depends on greater per unit contribution margins. More importantly, the availability of proprietary brands not sold elsewhere may encourage store loyalty and increase store traffic (Dick et al., 1996). Consumers choose the brand with a better image to reduce the perceived risk. This affects the level of price consciousness and on the purchase intention. Therefore, perceived risk and price consciousness may be the mediator for the private label image and the purchase intention (Wu, Yeh, Hsiao, 2011).

Private label strategy that retailers applied was mostly focused on the cost advantage at the beginning. Although this tendency continues today, it has been to associate with the quality as well. Private labels have been strengthen and it has become the rival for producer brands as the competition in delivery channels oriented towards the retailers and their market portion increased.

Private Label creates a variety of images in the mind of consumer. In some parts of the world, the traditional perceptions of private label were once of low quality, unbranded alternatives, attracting the most cost-conscious consumers. Retailers have provided private labels as the low-priced high-volume alternatives for years. In today's private label market, however, although there may still be private label products of low cost and quality in existence, a different level of products has emerged – the premium “branded” private label product. The emphasis on the quality of store brands combined with the improved packaging and promotional programs was designed to increase customer awareness and sales of own brand products. These products offer consumers a

quality private label choice as well as providing to retailers a unique selling point for merchandising in their stores (Boutsouki, Zotos and Masouti, 2008).

## RESEARCH METHODOLOGY

### Objective of the Study

In Turkey, the retailing sector is growing rapidly with the increase in the market share of supermarkets since 1990s. Changes in expectations of consumers, growth and demand of private labels, competition, changes effect the retail sector. There are numerous factors influencing the attitude of consumers towards private label products. In this study it is aimed to examine consumer attitudes related to private labels. The variables which have effect on the attitudes that consumers develop towards the private label products were examined.

### Data Collection

In this study, the data is collected using a questionnaire and applied to clarify and sort out the demographics and attitudes of consumers' purchasing preferences about private labels.

Survey research which is known as the best suited approach for descriptive research is used to collect primary data in Istanbul. Face to face interviews were conducted with consumers who prefer to buy private label products from Carrefour, Migros, Bim, Metro and Diasa in Istanbul. Before the implementation, the questionnaire was pre-tested on 30 consumers in order to test the questionnaire. Data was collected over a period of three months. Total 40 variables were measured by face to face interviews. Questionnaire contains open and close ended questions. Close ended questions are constructed multiple choice and five-point likert scale ranged from "strongly agree" to "strongly disagree". Shopping orientations were measured with 4 variables. These variables are: Price consciousness, value consciousness, perceived quality and consumer innovativeness.

Convenience sampling method is used in face to face survey to select and collect data from 447 consumers who buy private labels. 500 respondents were interviewed, 53 questionnaires eliminated and 447 questionnaires were included in the research. The data analyzed by SPSS program.

Before testing the hypothesis reliability and validity of the scales were examined using Cronbach's alpha coefficient and factor analysis. Results are presented in Table 1, indicate that both the realibity and validity of the scales are above the acceptable limits.

**Table 1: Validity and Reliability Results**

Scales	Number of Variables	Alfa Coefficients	Total Variance
Price conciousness	8	0.77	61.27
Value conciousness	9	0.84	58.72
Perceived quality	5	0.74	67.42
Consumer innovativeness	11	0.71	54.67
Private Label Attitude	7	0.81	72.48

### Research Hypothesis

Consumers' propensity to purchase private labels depends on certain demographic factors, such as income, family size, age and education, certain individual difference variables, such as the degree of reliance by the consumer on extrinsic cues (those more reliant on such cues preferring national brands) and the consumers' tolerance of ambiguity (intolerants preferring safer national buys), and certain consumer perceptions of the particular category (degree of perceived quality variation, level of perceived risk, and perceived value for money), as well as the degree of consumer knowledge increasing private label choice. (Batra and Sinha, 2000)

In this study, we assess the impact of various shopping orientation on private label attitude. Although many factor effect private label attitude, in this study we examine price conciousness, value conciousness,

perceived quality and consumer innovativeness. Also differences between attitudes according to gender and income level were examined. In this study the hypotheses are:

- H1a: There is a significant difference between private label attitudes according to gender.  
H1b: There is a significant difference between shopping orientations according to gender.  
H2a: There is a significant difference between private label attitudes according to income level.  
H2b: There is a significant difference between shopping orientations according to income level.  
H3: There is a significant relationship between price consciousness and attitudes towards private labels  
H4: There is a significant relationship between value consciousness and attitudes towards private labels  
H5: There is a significant relationship between perceived quality and attitudes towards private labels  
H6: There is a significant relationship between consumer innovativeness and attitudes towards private labels.

## RESULTS

### Sample Characteristics

The sample characteristics were measured in terms of gender, age, and income level. Demographic profile of respondents including their gender, age and personal income levels is presented in table 2.

**Table 2: Sample characteristics**

	Frequency	Percentage
<b>GENDER</b>		
Female	294	65.7
Male	153	34.3
<b>AGE</b>		
Below 25	24	5.4
25-34	121	27.1
35-44	137	30.6
45-54	96	21.5
55-64	44	9.8
65 and above	25	5.6
<b>INCOME</b>		
500 million or less	14	3.2
501- 1000 tl	48	10.7
1001-2000tl	115	25.7
2001-3000tl	165	36.9
3001-4000tl	84	18.8
More than 4000tl	21	4.7

The sample included 294 female (65.7%) and 153 male (34.3%) respondents. 24 (5.4%) of the respondents were younger than 25. 121 (27.1%) respondents were between the ages of 25-34, 137 (30.6%) were between the ages of 35-44, 96 (21.5%) were between the ages of 45-54, 44 (9.8%) were between the ages of 55-64. The percentage of the respondents who are above the age of 65 is 5.6 ( 25). In terms of income level distribution, the majority of the respondents (36.9%) belonged 2001-3000 TL income levels.

### Private Label Purchase Attitudes

In order to test if there are any differences of attitudes towards private label attitude and shopping orientations between female and male respondents, independent sample t-tests were conducted. The results can be seen on Table 3. As seen on table 3, it is found that there is a significant difference between male and females concerning value consciousness. According to results, male respondents' value consciousness is higher than female respondents. Men give more importance to value than women. Although men and women respondents

have different opinions on value consciousness, no difference existed between males and females concerning private label attitude, price consciousness, perceived quality and consumer innovativeness. As a result, H1a and H1b rejected.

**Table 3: t-test Results**

	FEMALE		MALE		<i>t</i>	<i>p</i>
	Mean	Standard	Mean	Standard		
Price consciousness	19,0205	4,63355	20,2949	4,28058	-2.152	.323
Value consciousness	7,3203	2,38545	7,7699	2,02307	-1.578	.045
Perceived Quality	7,7729	1,79806	7,6962	1,86532	.320	.803
Consumer Innovativeness	43,7331	4,95803	44,1766	4,79471	-.686	.586
Private Label Attitude	15.4659	3.12279	15.9666	3.38477	-1.180	.198

To investigate the differences between income levels Anova tests were conducted. According to the results significant differences concerning price consciousness, perceived quality and private label attitudes were founded. There was no significant difference between income levels according to value consciousness and consumer innovativeness. As a result H2a was accepted and H2b was rejected.

Post-hoc analysis revealed that as income level decreases, the consumers generate more positive attitudes towards private labels.

The main purpose of this study is to explore the relationships between price consciousness, value consciousness, perceived quality, consumer innovativeness and private label attitudes. Before conducting regression analysis, pearson correlation coefficients were computed in order to understand if regression analysis can be performed.

According to the result of the correlation analysis there are positive relations between attitude towards private labels (dependent variable) and independent variables [price consciousness (0,206), value consciousness (0,192) and consumer innovativeness. (0,235)]. The analysis revealed that these three factors are related to private label attitudes significantly ( $p=0,000 < 0,05$ ). But there was no relation between perceived quality and private label attitude (0,005). Thus H5 was rejected. As no relationship determined between perceived quality and private label attitude, the perceived quality variable was not included in regression analysis.

**Table 4 : Regression Analysis Results**

	Standardized Coefficients			
	$\beta$	Std. Error	F	Sig.
Price consciousness	,407	,057	51,217	,000
Value consciousness	,204	,059	11,777	,000
Consumer innovativeness	,141	,059	5,659	,000

$R = 0,84$   $R^2 = 0,67$   $p = 0,000$

Dependent Variable= Private Label Attitude

The regression value ( $R = 0,84$ ) shows that there are positive relationships between dependent and independent variables. Price consciousness, value consciousness and consumer innovativeness account for % 67 of the variation in the attitude of private label purchases. Price consciousness, value consciousness and consumer innovativeness variables have an influence on consumers' attitude towards private labels. Price consciousness variable has the greatest effect on private label attitude ( $\beta = 0,407$ ). According to correlation and regression analysis H3, H4, H6 were accepted.

## CONCLUSION

The private labels have important improvements both in developed and developing countries. Turkish consumer and retail market has been growing rapidly within the last decades. The most important factor supporting these improvements is continuously increasing power of retailers in consumer markets. Looking for new ways to differentiate, retailers are creating a new brand on which their names are written. The value retailers give on products and services is increasing day by day with the created private labels. As the power of retailers increases in the market, the importance of private label also increases.

In today's competitive environment, there is a significant raise in the expectations of the consumers. Retailers feature private label products in order to provide awareness in market and meet consumer needs and expectations. Private label strategy that retailers applied were mostly focused on the cost advantage at the beginning. Although this tendency continues today, it has been to associate with the quality as well.

Demographic characteristics and shopping orientations and attitudes are the variable groups measured in this research. When perceived quality is evaluated, it is seen that perceived quality is not related with private label attitude. There is no relationship between perceived quality and attitudes towards private labels.

The findings also demonstrated that price and value consciousness are the major determinants of consumers' purchase decision of private labels. Price consciousness is the most important factor on the consumers' attitude towards private labels and purchase behavior. Consumers who are more sensitive to price and value, prefer private label products while shopping. According to their experiences these consumers believe that private labels are reliable and can be used instead of expensive alternatives. Price advantage of private labels is the major drive when buying private labels. The main advantage provided by private labels to consumers is the low price. Consumers prefer to use private label products produced. Especially in economic stagnation periods consumers switched their preferences to retailer brands because of economic conditions. Economic conditions and income level have a important effect on private label preference.

## Limitations

There are several limitations of this study. The major limitation of this study is this research conducted only five supermarket consumers. Second a convenience sampling technique was used to reach consumers and last limitation of this study is data consists of responses obtained from consumers located in Istanbul. Research to be conducted in the future about this study should use diverse retail market consumers.

# **EVALUATING THE SERVICE QUALITY PERCEPTIONS OF CUSTOMERS TOWARDS PRIVATE SHOPPING WEB SITES**

**İbrahim Kircova, Ebru Enginkaya and Hakan Yılmaz**  
**Yildiz Technical University, Turkey**

## **ABSTRACT**

*Considering the rapid growth of the private shopping web sites, evaluation of the web sites' service quality levels perceived by the customers gains importance. In order to provide insights about the relation between the customers' behavioural intentions and the service quality they attribute to their favourite web sites, a quantitative research was administrated. Analyzing the web site decisions, shopping frequencies, demographic characteristics and service quality perceptions of the customers may reveal important facts for both theoretic and practical aspects. Also findings may shed light on to the development process of e-marketing.*

## **INTRODUCTION**

Internet has quickly become one of the most valuable assets in modern technology and is developing as an integral part of modern commerce. More and more businesses are using the internet to carry out business and to market, buy and sell products and services to a wider audience. The concept of e-business strategy addresses the issue of how the internet can reshape companies and provide competitive advantage. Success is dependent upon management being openminded to understand and derive real value from internet. Internet provides a valuable new form of communication and is a growing source of information that help people make decisions (Bauer et al., 2010).

One of the most activities that have changed in the light of the internet is shopping. Online shopping is developing rapidly and increasingly worldwide today. E-tailers try to transform users to shoppers. The Internet is becoming a means for both firms and consumers to conduct business. E-shopping decreases the cost for manufacturer and the price for the customer. Manufacturer, by use of eprocurement, can find the best supplier and get a low price. Price transparency and information overload decrease the manufacturer's power to charge higher price. Because of the low switching cost, customer switches to another seller. On the other hand, today the competition in e-shopping is a price-based competition. Internet provides far more choices for the e-shoppers (Azizi and Javidani, 2010). E-shopping could lift the time and space constraints of the shopping process and enable more flexibility, ultimately, leading to a fragmentation of the shopping activity in time and space (Farak et al., 2007). E-retailing is promoted widely as a convenient avenue for shopping. Shopping online can economize on time and effort by making it easy to locate merchants, find items, and procure offerings. Consumers do not have to leave their home nor travel to find and obtain merchandise online. They can also browse for items by category or online store. These time and browsing benefits of online shopping are likely to be manifested in more positive perceptions of convenience and e-satisfaction (Szymanski and Hise, 2000). More and more people are going to prefer to make purchases online, thus getting a massive change in the online shopping trends. Online shopping allows people with a broad range of products in different categories. It also gives a chance to compare the same product with the others and also shows the best deal. Online shopping has become a significant part of our life as a result of the growing internet (Rastogi, 2011).

Market place sahibinden.com, auction house gittigidiyor.com and online multi-category retailer hepsiburada.com are the three leading e-commerce players in Turkey. Online multi-category retailer hepsiburada.com reached revenues of USD 164 million in 2008. Markafoni.com, an online private shopping site founded in 2008, reached 430 thousand unique visitors from Turkey in April 2010, biletix.com, an online shop selling event tickets, had more than 1 million registered customers in 2008 and sells approximately 3.5 million tickets per year. Online food delivery yemeksepeti.com currently works together with 3,500 member restaurants and gets more than 15 thousand daily orders from over 610 thousand registered customers (ystats.com, 2011). The numbers show that e-commerce and online shopping is growing faster each year.

## Private Shopping

A new “group buying” trend is emerging on the web, in which consumers effectively band together to get better deals or discounts when purchasing products and services. One of the flagship group buying web services, GroupOn, was recently valued at over \$1 billion providing a sense of just how big this sector could become. Groupon has effectively achieved “top-of-mind” status on this new category of group buying facilitators. Most group buying sites tend to offer localized deals and discounts in specific cities. Typical offers include percentage discounts at participating restaurants, coupons for savings off a minimum purchase at retail stores, two-for-one event ticket specials and other similar deals. Typically, each promotion only becomes valid if enough members sign up for it, encouraging viral sharing of individual deals. If the minimum sign-up is not met, the deal does not proceed and no one’s credit card is charged. Another way to look at the group buying trend is less as something entirely new and more as a novel twist on the long existing practice of rewarding your best customers with special deals and promotions. Companies have been placing paper coupons in circulars, sending snail mail flyers, and offering discounts online for years. Now, businesses are adding the “group” component to the equation, bringing with it a dimension of new customer attraction (mashable.com, 2010). Group purchasing companies such as Groupon allow consumers to come together to buy products in bulk and save money (Guo et al., 2011).

## Importance of Websites

The issue of e-store design has emerged as a major issue in online retailing. Currently, many e-tailers adopted advanced web technologies, such as customized solutions and computer-aided analytical tools, to improve online service in order to win the ultimate competition. web surfers are motivated to conduct online shopping activities because of the stimulation effect of interesting websites. The website is the primary interface for an e-tailer during consumers’ service encounter, consumers may not be interested in continuing their online navigation if they dislike the interface, although this e-tailer can actually offer benefits such as cheaper merchandise, analytical assistance, and faster delivery (Wang et al., 2011). The quantity and quality of individually customized information that the internet can provide, with minimal effort and cost, can facilitate better decisions and can make the decision-making process more efficient. This greater access to information in online environments has a significant impact on how consumers form consideration sets. However, while online stores offer consumers greater choice and convenience, finding products or brands that match needs may not be an easy task. If deciding which products or brands should be included in the consideration set becomes too difficult, consumers may abandon the online store, either to search in another online store or to abandon the decision process (Parra and Ruiz, 2009). Recent findings by industry analysts such that online consumers are impatient, easily dissatisfied and are likely to abandon their shopping carts and move to a different retailer if a website’s features fail to meet their expectations. The Forrester Consulting report also finds that attributes such as fast loading of pages, ease of navigation, efficient search and detailed product content are some of the features that online consumers expect from retail sites and decrease the likelihood that consumers will leave sites without making purchases. In addition convenience, customization, availability of information, ability to interact with the site and efficiency of the shopping process are important to online consumers (Papatla, 2011).

# RESEARCH METHODOLOGY

## Objective of the Study

As a relatively new e-business model, private shopping websites are achieving significant growth both globally and locally in Turkey. This study aims to evaluate the service quality levels and the relative effect on the customer loyalty of these web sites as well as to validate the E-S-QUAL and E-RecS-QUAL (Parasuraman, et. al, 2005) applicability in different market places. Therefore the research hypotheses developed as follows;

**H1:** Private shopping customers who perceive higher levels of service quality from their most preferred web sites are more likely to have higher loyalty toward the web site.

**H2:** Private shopping web sites which handle the non-routine encounters of their customers better can maintain higher customer loyalty.

## Data Collection and Sampling

In order to evaluate the perceived service quality of the private shopping websites and examine the relationship between the customers' service quality perception toward a website and their loyalty a survey was administrated. Convenience sampling method was used to collect the data where any random sampling was not possible because the web sites do not share their customer data bases with the legal and commercial concerns. Twenty-one post graduate students in the marketing class who have private shopping memberships were appointed to collect the surveys from the users of private shopping web sites whom they previously referred to subscribe to the various web sites and twenty surveys were distributed for each student. This method was chosen because the private shopping membership procedures are carried out with the reference system through the invitation e-mails sent by the existing members. 352 available surveys were collected with a response rate of 84 %.

## Measurements

Service quality perception of the web sites was measured with the E-S-QUAL scale of Parasuraman et. al.(2005). Aforementioned study comprises two scales; E-S-Qual and the E-RecS-Qual. As the former measures the service quality perception and consists of four dimensions; efficiency (8 items), system availability (4 items), fulfilment (7 items) and privacy (3 items), the latter is used to measure the web sites' handling quality of the customers' non-routine encounters and consists of three dimensions; responsiveness (5 items), compensation (3 items) and communication (3 items). Considering the differences of cultural profile and e-shopping behaviour in Turkey along with the cross-sectoral differences from the original study, exploratory factor analyses were administrated to assess the adaptation of both scales and reliability levels were tested with the coefficient alpha values. Consequently, in order to assess the relevance of the scales, both constructs'(E-S-QUAL, E-RecS-QUAL) effect on customer loyalty were tested through separate regression analyses. Loyalty construct was measured with the 5 item scale of Zeithaml et. al (1996) and the average of the scale items for each respondent was defined as the dependent variable in the regression models. Participants' demographic profiles were also measured in the survey to determine their gender, age, education, occupation and marital status.

## RESULTS

The demographic profile of the sample is presented in the Table 1. The majority of the respondents were female (65%) and single (68%). Mode class of the age distribution was 25-34 group with 186 respondents (58%) and most of the respondents were educated at university level (65%). Mode class of the occupation variable was white collared employees (45%).

## Reliability and Factor Analyses for E-S-QUAL

Cronbach's alpha score of the E-S-QUAL scale which consists of 22 items and 4 dimensions was 0.882 and no item had a major negative effect on the scale's reliability. Consequently an exploratory factor analysis with principal components extraction and varimax rotation procedures was administrated. Factor solution and the factor loadings were observed and the results did not present an adequate fit with the original scale and dimensions. Factor solution presented 6 dimensions and high cross loadings for some items on multiple

dimensions. After the examination of communality and factor loading values for each item, “(EFF6) This site is simple to use” question excluded from the scale and another factor analysis was administrated.

**Table 1: Sample characteristics**

Gender		Age		Education		Job		Marital Status	
Woman	229	18-24	102	Primary school	1	Entrepreneur	6	Single	239
Man	123	25-34	186	High School	22	Executive	37	Married	113
		35-44	51	University	229	Self employed	15		
		45-54	10	Grad School	92	Technical Specialist	16		
		55-64	2	PhD.	8	Public Employee	31		
		65 +	1			White Collar	159		
						Blue-Collar	4		
						Other	84		
<b>TOTAL</b>	<b>352</b>		<b>352</b>		<b>352</b>		<b>352</b>		<b>352</b>

The second factor solution represented a better fit with the original scale and the dimensions. The rotated factor solution presented 4 dimensions and the reliability scores were as presented in table 2. Although total variance explained decreased to 52% from 60 % , a more interpretable solution extracted.

3 items of the fulfilment dimension in the original scale converged with the efficiency factor in the present study. After the examination of the 4 remaining fulfilment items, its concluded to change the dimension's name as the “delivery” and combine the first dimension as the “fulfilment efficiency” factor. Another shifted item was “(EFF5) It loads its pages fast” and it correlated with the “system availability” dimension which is an expectable circumstance.

**Table 2. E-S-QUAL Factor Analysis**

Rotated Component Matrix				
	Component			
	Fulfilment Efficiency	System Availability	Delivery	Privacy
(EFF1) This site makes it easy to find what I need.	,631			
(EFF2) It makes it easy to get anywhere on the site.	,626

## Predicting Loyalty with E-S-QUAL

In order to evaluate the effect of perceived S.Q. attributed to the private shopping web sites by their customers on the loyalty toward the web site regression analysis was administrated. Exploratory factor analysis results and the revised dimensions of the E-S-QUAL were included as the independent variables into the analysis. Using the factor analysis with multiple regression helps researcher to combine a large number of variables into smaller number of dimensions (Hair, et. al. 2002). Another benefit of factor analysis is the orthogonal rotation option that avoids multicollinearity through multiple regression. Average of the 5 loyalty items for each respondent was identified as the dependent variable in the regression model. ANOVA results revealed a significant effect on loyalty according to the model ( $F=82.163$ ,  $p<.001$ ,  $R^2=.486$ ). T values and the beta coefficients for the dimensions of the scale are listed with the Table 3.

**Table 3. Multiple Regression Analysis**

	Unstandardized Coefficients		Std. Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	3,797	,023		164,688	,000
Fulfilment Efficiency	,326	,023	0,5433	14,121	,000
Delivery	,179	,023	0,2977	7,739	,000
Privacy	,162	,023	0,2705	7,031	,000
System Availability	,103	,023	0,1717	4,462	,000

Each factor had significant positive effect on consumer loyalty and the H2 supported with the regression model. “Fulfilment-Efficiency” dimension has the greatest relative effect on the loyalty in the model. The model accounted for the 48 percent of the total variance in the average loyalty values of the respondents.

## Reliability and Factor Analyses for E-RecS-QUAL

Second scale of the Parasuraman et. al.’s (2005) study was E-RecS-QUAL which measures the web sites quality of handling the problems of their customers about their orders. The scale consists of three dimensions; responsiveness (5 items), compensation (3 items) and communication (3 items). 109 respondents in our existing sample had non-routine encounters after their purchases from private shopping web sites. E-RecS-QUAL scale’s internal consistency was tested according to the data collected from these 109 respondents. The reliability tests for the 11 scale items resulted with an alpha score of 0.894 and no item had a negative effect on the overall reliability. In order to assess the applicability of the E-RecS-QUAL scale in the private shopping context, an exploratory factor analysis was administrated with the principal components extraction method and varimax rotation. Scatter plots and eigen values were evaluated and a 3 factor solution was obtained with a 69.959% variance extracted. However the explained variance was relatively high, single item observations revealed a multiple high correlation of the item “(COM3) It picks up items I want to return from my home or

business” with two factors. Consequently another factor analysis was administrated after the elimination of the mentioned variable from the scale. Extracted rotated factor solution is presented in Table 4.

Only two of the ten items; “(RES4) It tells me what to do if my transaction is not processed” and “(RES5) It takes care of problems promptly” were loaded under the compensation dimension instead of the expected responsiveness dimension. Nevertheless the total variance extracted with the factor solution was 73.266%.

## Predicting Loyalty with The E-RECS-QUAL Scale

Another aim of the study was to examine the possible effects of the web sites’ ability of resolving the customers’ problems which occur in their orders to the overall loyalty levels of these buyers. H2 hypothesis which was developed in this manner was tested by the multiple regression analysis. Three dimensions which were extracted by the previous factor analysis were identified as the independent variables in the regression model where the average loyalty value was appointed as the dependent variable. Model’s significance was tested with the ANOVA and it is revealed that there is a small but significant effect on the customer loyalty ( $F=9.069$ ,  $p<.001$ ,  $R^2=.206$ ). Subsequent to the t-tests, only the responsiveness factor was found to be significantly effective on the customer loyalty according to the model.

**Table 4. E-RECS-QUAL Factor Analysis**

	Rotated Component Matrix		
	Compensation	Responsiveness	Contact
(RES1) It provides me with convenient options for returning items.		0,868	
(RES2) This site handles product returns well		0,851	
(RES3) This site offers a meaningful guarantee.		0,582	
(RES4) It tells me what to do if my transaction is not processed.	0,762		
(RES5) It takes care of problems promptly.	0,684		
(COM1) This site compensates me for problems it creates.	0,79		
(COM2) It compensates me when what I ordered doesn’t arrive on time.	0,725		
(CON1) This site provides a telephone number to reach the company			0,741

(CON3) It offers the ability to speak to a live person if there is a problem.			0,731
Reliability test scores( $\alpha$ )	0,826	0,861	0,766

## CONCLUSION

Proliferation of the private shopping web sites created a new and promising domain in the e-business models. These sites also known as “deal of the day web sites” or “group shopping web sites” and they offer to their subscribers customized discount coupons on daily basis through their e-mails and mobile applications. Retailers who seek to increase their recognition, to create product / service trial or to maintain inventory turnover intend to cooperate with these web sites. In this sense private shopping web sites send the offer to their customers and present a now or never deal. These customized offers and relatively higher reliability that customers attribute to these sites direct them to make impulsive buying more often by creating an ease of choice sensation.

The aim of the study was to evaluate the e-service quality of the private shopping web sites and examine its influence on the customers’ loyalty. Initially internal consistency and applicability of E-SQ and E-RecSQ were tested in the private shopping domain considering its new and specific structure. Both scales presented satisfactory relevance with some modifications. Later on, effect of E-SQ and E-RecSQ on the loyalty levels of customers were analyzed. The findings revealed that the E-SQ and each of its four sub-dimensions

(Fulfilment-Efficiency, System Availability, Delivery and Privacy) are very important factors to maintain a loyal customer base. Previous research which studied the influence of E-SQ on loyalty in different e-shopping environments also supported our findings (Yang and Tsai, 2007; Carlson and O'Cass, 2010). Hereupon the private shopping web sites may harvest valuable outcomes investing in their service on these four dimensions. On the other hand E-RecSQ had a smaller influence on the loyalty construct according to the findings. The only significant factor was identified as the responsiveness whereas no significant effect was observed by the compensation and contact factors. The main reason of this situation may be the immature private shopping experience of customers and limited number of problems occurred along with their purchases.

Limitations of the research mainly based on the absence of non random sampling. Although the findings may shed light on the electronic service quality's influence on customers' loyalty, results can not be generalised over the whole population of e-shopping consumers. However this study reveals significant relationship between E-SQ and loyalty, there are other important factors such as price sensitivity (Choi et al., 2006), web site design, customer service (Wolfinger and Gilly, 2003) in the e-shopping context which are also critical determinants of web site preference. Future research may maintain a more comprehensive model to present the e-service quality along with the other determinants of behavioural intentions of customers in the private shopping domain which is a new and promising business model.

# **BARRIERS FOR PRODUCT INNOVATION IN SMALL AND MEDIUM TECHNOLOGY-BASED FIRMS IN BRAZIL**

**Miguel Artur Feldens, University of São Paulo, Brazil**

**University of Nove de Julho, Brazil**

## **ABSTRACT**

*Innovation and entrepreneurship can help developing one country's economy. Innovative products can bring remarkable advantages in competitive markets, especially in the international competitive arena. Some distinctive products can introduce innovations that generate the odds of growing the market size and market share or even creating a completely new market. Considering that the innovation is the main tool of the entrepreneur and that entrepreneurship can be learned and promoted at scale, this study aims to identify the main barriers to product innovation in small and medium technology based companies in Brazil. Although Brazil can be considered one entrepreneurial nation, accordingly to GEM reports, the rate of firms' surveillance is still low. In order to reach that goal, we analyzed the innovation process and its obstacles, using one qualitative research, by interviewing several agents involved in the innovation process, including entrepreneurs, venture capital investors, and managers of business incubators. For instance, the venture capital funds are so important for the generation of new businesses, since they support the entrepreneurs with the seed money. Although it can be considered still incipient in Brazil, this activity showed one growth rate of 50% from 2005 to 2008, reaching one amount of 11 Billion dollars in capital investments (GVcepe, 2008). The forecasts for the next years of this activity growth in Brazil are auspicious, aligned to the new economic scenario in the country and infrastructure investments.*

*However, although several public policies are being implemented and the private investments show one important growth, there are still some gaps to be surpassed, like the lack of convergence between the academic knowledge creation and its transformation to innovation. In 2008 the Brazilian scientific production reached more than 20.000 articles indexed to the Institute of Scientific Information (ISI), corresponding to the 13<sup>o</sup> score in the world ranking (MCT, 2009). Nevertheless in the same year, the patents register accounted only 101 patents in the United States Patent and Trademark Office, the 29<sup>o</sup> score in the world ranking (USPTO, 2009). As reference, Brazil has the fifth population and accounts by the 5<sup>o</sup> position in internet users and is nowadays the 8<sup>a</sup> economy in terms of GDP (CIA, 2010).*

*Based on the literature review regarding the barriers for innovation and entrepreneurship, the conceptual model was created to guide the data collection and analyses, and comparing two points of view, from the entrepreneurs and investors. As main findings, the study points out some interesting evidences. First, the entrepreneurs in general perceive huge difficulties concerning legal barriers, the capital costs and capital availability and, in some cases, to hire qualified professionals to engage in the emerging companies. These limitations impose to the entrepreneurs some deviations from the original purpose, blocking the orientation to high impact innovations and then driving them to search more conservative alternatives, which enable the generation of low term cash flow entries. In the other side, the investors claim for more ambitious projects with high growth potential. Here, there are additional problems: the lack of investors for the next steps of the business development and the lack of exit modes for the existing investors, raising the investment cycles compared to international averages and imposing one more selective posture to them in the portfolio election. One positive result shows that since the investment is decided, the investors participate close to the entrepreneurs in the business management.*

*Second, in both perspectives, it is consensual the difficulty to find technical and management qualified professionals to engage in new and uncertain businesses. Besides this, the cultural aversion to risks is another relevant barrier, inducing both the entrepreneurs as the investors to be more conservative in the decision making. Finally, regarding the capital availability, there is the sense of one positive view to the next future, tied to the capital availability economy growth. Remain several questions regarding activities that should be carried out by the government in order to emulate this kind of activity, by means of reducing the capital costs and performing more effective education investments in the entrepreneurship arena.*

*As contributions, this research allows to understand the scenario where innovative entrepreneurship happens, as well as the issues that slow down or cause failure in the process. Understanding these issues is the first step to address them systematically. Entrepreneurs that have this information can plan ahead and take measures to accelerate innovation in their businesses. Investors that are willing to support early stage businesses, and knowing the obstacles in this environment, will provide them with better chances to act and mitigate risks of failure in their investment portfolio. The study has limitations derived from its qualitative nature privileging more the understanding of the landscape than to identify specific relations. It is justified since its explorative characteristic. As suggestions for future studies, so on it could be extended to cover this kind of causal relations, by means of one quantitative study covering more extensively the target population and considering control variables like the sector influence.*

## INTRODUCTION

In the context of companies and entrepreneurship, innovation is a means to create competitive advantage, by increasing a company's share in an existing market or even by creating entirely new markets. Innovation is also good for customer, since it allows delivering better products. Besides being of interest of entrepreneurs, companies and countries, the subject has also allowed the growth of venture capital industry in Brazil, since venture capital firms can often back some businesses in early maturity states, in areas of greater potential growth. (GVcepe, 2008). In order to reach their innovation goals, companies and government define their strategies in R&D, create mechanism to enable innovative enterprises, and to induce innovation in specific areas. In the last few years, we can also observe in Brazil an important change in the attitude of government agencies and policy makers in this area, towards privately owned companies (MCT, 2009). One example is the release by FINEP, the most important agency to finance this area, in 2006, of the first non-refundable financing call for projects from private companies (Economic Subvention). This is being released yearly since then, and aims to accelerate innovation and competitiveness of Brazilian companies, applying non refundable public resources, directly in companies, sharing with entrepreneurs the risks and costs that are inherent to innovation (FINEP, 2010). Its third edition, launched in 2008, distributed R\$ 450 Million (roughly US\$ 300 Million) to 245 selected projects, from 223 companies.

On the companies' side, although Brazil is not well ranked in terms of number of patents and investments are still low when compared to world average, the share of private investments in innovation has been growing. According to the Ministry to Science and Technology of Brazil, in 2007 the companies were responsible for 47.05% of the investments in R&D, and the target is to grow it to 55% by 2011 (MCT, 2009). In this area, venture capital firms have an important role enabling businesses, specially in innovative areas. A research by GVcepe points out that this activity has grown by 50% between 2005 and 2008, reaching US\$ 11 Billion in investments (GVcepe, 2008).

On the other hand, despite the growth of public and private investments, there is still a huge gap between research and actual introduction of innovative products. In 2008, while the scientific production in Brazil surpassed 20,000 papers according to Institute of Scientific Information (ISI), taking Brazil to 13<sup>th</sup> position in the world (MCT, 2009), the country was 29<sup>th</sup> in number of patent deposits in United States Patent and Trademark Office, with 101 patents (USPTO, 2009).

This gap can be explained by the difficulties to create a company that is able to generate and sustain differentiation through innovation. In this paper, we analyze the challenges of innovative entrepreneurship, focusing in technology based companies, introducing product innovations in the market. These challenges include funding startups but go way beyond that (Owens, 2010). We believe that identifying the barriers to

product innovation is the first step to allow companies to take action, address these issues and become more efficient in the process of introducing new products in the market.

Innovation, either incremental or disruptive (Christensen, 1997), have risks, which raises the cost of capital to be invested – compared to financing the expansion of a mature business – and makes unfeasible traditional financing options. Especially in Brazil, given the high interest rates and the existence of mature business models with good potential gains, even established companies will prefer to invest in lower risk areas, like growing production of already introduced products. Therefore, there are few alternatives for entrepreneurs to get backed up to develop, prototype and produce a new product concept. Even the existing alternatives from the government or venture capital areas are not well known by most entrepreneurs. Besides that, barriers to innovation go beyond funding, and include a wide range of challenges that go from culture to legal and social restrictions to innovation in certain areas (Owens, 2009). We believe that understanding these issues in a broad way allows identifying practices that can be adopted to surpass these barriers and that can be replicated in other businesses. By identifying these issues, this paper will answer to the question: “What are the main barriers to innovative entrepreneurship in Brazil?”.

## **THEORETICAL BACKGROUND**

### **Types of innovation and impact in diffusion of innovations**

According to the “Oslo Manual” (OECD, 2005) the concept of innovation assumes some degree of novelty of a product that, at the minimum, must be “new or significantly improved to the organization”. But it can occur in different levels: new to the organization, to a certain market or to the world. The scope of this research includes innovations to a certain market or to the world, in other words, when a company was the first to introduce a product with certain characteristics in the Brazilian market or in its industry.

These degrees of innovations also have an impact in another concept that is relevant to this research, the diffusion of innovations. This is a theory about how, why and how fast new ideas and technologies are introduced in different cultures. The study of diffusion of innovations started in psychology and is useful in strategic decisions of the entrepreneur or innovator, when she wants to introduce a new product in a given market. Rogers (1962) proposes that this process is influenced by four main elements: (i) The innovation itself, its characteristics and impact to users; (ii) The communication channels to the market; (iii) Time necessary for the product to be adopted by users; and (iv) The social system where users live in.

Based on the elements above, we can notice that diffusion of a new product is a communication process, through certain channels, throughout time, targeting individuals that are members of a social system. The goal of this communication is to push these individuals through 5 steps: (i) Awareness of the innovation; (ii) Persuasion, when the individual actively seeks information; (iii) Decision to adopt an innovation, based on the analysis of pros and cons; (iv) Implementation of the innovation, when the individual starts using it, evaluates the real usefulness and may seek more information; and (v) Confirmation, when the individual decides to keep using it or use the full potential of the innovation.

Analyzing cases of diffusion of innovation, Rogers also identified different types individuals (or organizations), according to the way they react and speed of adoption of innovation: (i) Innovators are the first to adopt the novelty, they accept the risks associated with it and have financial resources to absorb failures; (ii) Early adopters are the second fastest, their opinions generally have higher influence to others, because they use more judgment than innovators to make a decision; (iii) Early majority have a great variance in the time to adopt an innovation, taking significantly more time than early adopters, and rarely have the status of influencers; (iv) Late majority will adopt an innovation after most individuals (or companies) started using it, they are normally skeptical and resistant to change; (v) Laggards are the last movers, with strong aversion to change agents. There are other ways to classify innovations, according to the degree of novelty, which may interest the innovator. In the following session, we will analyze innovation according to incremental, radical or disruptive impact.

### **Incremental, radical and disruptive innovations**

Now that we explored the concept and degrees of innovation, as well as the process of diffusion of innovations in a social system, it is also important to understand how organizations innovate. There are several models, according to its degree and impact, two of which are explored below. Most innovation theories are strongly influenced by the work of Joseph Schumpeter (Schumpeter, 1934), which demonstrates that there is an impact in economic development based in innovation, where new technologies replace old ones, in a dynamic process of “creative destruction”. According to his vision, there is “radical innovation”, which generates fundamental changes in the industry where it occurs. Incremental innovations, on the other hand, represent the continuous process of change and product improvement. Schumpeter’s vision is mostly focused on biggest changes that may change an industry.

According to Christensen (1997), innovation is important to the development of companies, and these have two options to grow their businesses. The first approach is to take market from a competitor, through “sustaining innovations”. Alternatively, companies can grow with disruptive innovations. The latter approach can be divided in two categories: (a) Disruptive innovations that create an entirely new market; and (b) Disruptive innovations that initially have lower performance than incumbent technologies, and appeal to lower end consumer at the beginning. Digital photography is in that category, since it was considered a lower quality alternative and eventually eroded most of the market of professional photography.

Christensen’s work explores the innovator’s dilemma, which occurs with established companies, since the introduction of disruptive innovations can cannibalize and destroy their main business. On the other hand, not launching disruptive innovations allows new entrants to grow and eventually take the established company from the market. Despite the differences in naming and the fact that the first author is more concerned in the economic impact and the second talks about companies’ point of view, these theories have a lot in common. For the purposes of this research, it is important to notice that are innovations that improve product performance, without destroying value and not compromising or changing an industry. This group includes examples like ethanol-fueled automobiles, and multi-core processors. There is also innovations like the car itself, which reduced the carriage industry, and cloud computing, which is still in infancy, but many experts say that will destroy the traditional software licensing business.

We are interested in both groups, but it is important to recognize the differences and the implications in speed and ease of diffusion and introduction into the market. Once we understood the concept of innovation and some ways to classify them, we can now analyze what makes some companies able to constantly introduce innovations.

## **Innovative company and management practices**

A company is considered innovative, by definition, when it implemented at least one innovation, no matter if it is a product innovation, a process or an innovation of any other nature (OECD, 2005). The focus of this section is more sharp, and we want to understand why come companies are able to recurrently introduce products that are completely new or significantly improved, not just sporadically innovating, but having it as an effective practice, easily recognized by the nature of the products it introduces in the market. Studying some cases of successful and innovative companies, we expect to identify management practices that are common to these organizations, which can explain the capacity to transpose the obstacles to innovation. This analysis doesn’t intend to be prescriptive, since different companies, teams, products and markets may require different ways to stimulate innovation. But these cases still allow entrepreneurs to evaluate and take advantage of practices that make sense in their own business.

The Business Week magazine and Boston Consulting Group annually publish a ranking with the 50 most innovative companies in the world (Business Week & Boston Consulting Group, 2010). It is interesting to notice the changes over the years. Historically, rankings like this invariably include companies like 3M, and most academic programs related to innovation would include cases like “Post It”, a product of the same company. In fact, many practices created by 3M still have a strong influence in organizations in different industries. Nowadays, companies like Apple and its iPad, as well as companies like Google, are the most frequent examples of companies that make innovation an essential business practice. At the top of the most recent ranking from Business Week are: Apple, Google, Microsoft, IBM and Toyota.

The example of 3M is still an important reference, since that company has been innovative for more than a century, and there must be something to be learned about maintaining a culture and business practices that favor innovation. Much of that culture come from McKnight, ex-President and Chairman from 1949 to 1966, who would tell managers to “delegate responsibilities and encourage collaborators to take initiative” (3M, 2002). Also according to McKnight, “...a manager that makes destructive criticism kills initiative. It is essential to have many people with initiative, to make a company grow”. But the only way a culture like this can generate results is through concrete actions and appropriate business practices. According to Larry Wendling, VP of Research at 3M, no company is innovative by chance and the secrets of 3M can be translated into what he called “The Seven Habits of Highly Innovative Companies” (Arndt, 2006):

1. Starting with the CEO, all levels of the organization must be committed to innovation, and that includes a generous budget for research and development;
2. Culture must be preserved, and that is why 3M preserved innovation even having, in average, a different CEO each 5 years, during the last 40 years. That requires hiring excellent professionals at all levels, let them do their work and have tolerance for mistakes;
3. Innovation requires a wide technology base, since the domain of different technologies allows the company to combine ideas from different projects into new products;
4. Talk, talk, talk! The company encourages researchers in different areas to create relationships between them, using formal and informal mechanisms, and that allows a researcher to quickly access the knowledge from another area;
5. Define individual goals to each collaborator and reward professionals with outstanding results;
6. Measure research efforts and identify the percentage of revenue that is related to research performed in recent years, identifying if investments are being made in the right areas;
7. Research has to be directly related to clients’ needs, and professionals have to devote time to understand their needs to be able to create valuable products.

A noticeable emphasis is felt on the tolerance culture and power delegation, reinforced by public recognition of successes and by the research area impact on the businesses accomplished. One sees that the edification of an innovative organization depends, therefore, on the alignment of research and development, with the practice of people, compensation and sales management. The innovative management should be supported by the highest level of the organization and articulated among the various functional areas, in order for this to become a sustainable practice.

Another case frequently studied is that of Google enterprise, since it is an enterprise recognized for pushing the frontier of technology innovation for the Internet, for introducing new products and ideas in an accelerated pace, given that these products come to change fundamentally the relationship that people establish with information. Marissa Mayer, VP of Google Search Products has shared some of the principles that keep the company innovative (Salter, 2008) (Mayer, 2006), summarized as follows:

- Innovation, not instantaneous perfection: some companies look to launch products only after they are perfect, facing the risk of investing for too long to find out that the market does not demand such product. At Google the idea is to launch early through the platform “Google Labs” – environment visited by most innovative users and “early adopters” – and only after mastering its perfection, taking into consideration what the market demands;
- Ideas come from all places: the company has mechanisms that allow anybody within the company to launch their ideas for discussion and to submit them to their peers’ “vote”;
- License to follow dreams: Google engineers can have 20% of their time dedicated to a project which they find interesting. Something similar had already been adopted by 3M and generated some of Google’s most interesting products;
- Transform projects instead of getting rid of them; even if a product is not successful, it has at its core good ideas that can be adopted in other projects. This belief is related to mistake tolerance and risk acceptance that is often a determining factor for an organization to remain innovative;
- Share all the information possible: the more information about products, projects and strategies are shared in the company, the greater the possibilities of cooperation between teams, diminishing the risk of duplicate efforts;

- Users, users, users: if the product is really relevant to the user, a sustainable business pattern should be possible. The thought should be focused on the interest and experience of the user in the first place, even if this means sacrificing revenue in short term or sustaining a non-profitable product for a long period;
- Apolitical data: decisions should be made based on concrete data all the time. Even user interface decisions are treated like a science: performing experiments, collecting data and proving the best approach. Google performs between 50 and 100 experiments with real transit (presenting a differentiated product to user samples and measuring the impact) all the time, to improve their products;
- Creativity loves restrictions: the current technology limitations or of any other nature are the fuel and motivation for engineers that seek out approaches which have never been tried before. Incorporating this perspective into the culture of Products and Engineering, the company encourages a behavior characterized by a search for creative solutions;
- If you are brilliant, we are hiring: recruiting the best talents is a recognizable key component to keeping the innovative culture and ability.

The elements above indicate also that in Google's case the tolerance for failure is a key factor in the maintenance of an innovative company. In this case, tolerance is made feasible by the fact that the company has a role in an industry that requires little capital mobilization to create a product (in comparison to the pharmaceutical industry, for example) and is accelerated by practices such as quick launching, without seeking perfection and transforming projects and profiting from good ideas, even when a product is not successful. The company also recognizes the importance of recruiting the best talents to make feasible the culture in which innovation may come from all places, and the freedom is given so that the collaborators may develop their own projects, evidently in the expectation that some of these projects may turn into big products.

Creating an organization with practices that encourage innovation and invest in innovative products demands financial resources compatible with the challenge. In order to withstand long development cycles without a generating a revenue, financing the cycle for innovation diffusion in the market and being tolerant with product failure, these financial resources can rarely be obtained through the traditional financing mechanisms. What follows is a panorama of the encouragements to innovation available in Brazil, which can be explored by entrepreneurs - innovators.

## **Previous research about innovation barriers**

The innovation theme is becoming ever more popular, in a way demonstrating that people and businesses still have many doubts and difficulties in relation to this subject. A search for the word "innovation" on Amazon.com currently lists more than forty-two thousand distinct titles. Despite the academic research and all the non-academic publications, the companies keep struggling to become more innovative, combating barriers of different natures, since they understand themselves to be "killing" ideas and causing the failure in the attempts to innovate (Owens, 2010).

In the academic area, this theme is studied under different disciplines. In a general way, the academic studies tend to be descriptive of a defined perspective on a problem. Below are examples of some research areas that deal with this theme:

- The area of people management, aspects such as organization culture and the profile of the recruited collaborators, impact the ability to innovate;
- The area of strategy is strongly linked to the innovation theme, because it makes feasible the implementation of the strategy as well as it is able to focus on development of new products and technologies;
- The area of technology, evidently, is interested in the innovation theme, dealing with the barriers that restrain innovation.

Non-academic authors also bring important contributions to the theme, presenting their cases, experiences and implemented solutions in specific businesses. These reports can eventually include solutions to problems difficult to be addressed and tend to be prescriptive in regards to very specific themes - that are not always re-applicable to other businesses.

Owens' analysis is based on two perspectives – academic and practical – and on an ample research with managers in different areas and levels, identifying six great themes in which barriers restraining innovation are frequently settled. Even if the focus of this research has been the innovation of existing companies, a great number of these concepts are applicable to innovative enterprises. Following are the types of barriers to innovation (OWENS, 2010):

- Individual: the resistance to change is a present characteristic, in lower or higher level, in practically all human beings. These psychological barriers also labor within an organization that seeks to develop innovation, as well as in the moment that the innovation is introduced into the market.
- Group: the resistance imposed by the group to an innovation may take the form of the organization's culture, fear, or aversion to risk. This resistance blocks the organization from generating, evaluating and implementing innovations.
- Organizational: the following level of restriction to innovation occurs when various groups unite in an organization. These barriers are generated by the strategies, organizational structures, management processes and practices, and have a direct impact on the ability to innovate.
- Industry: this type of restriction is a consequence of the way that the organizations compete in their sectors. For example, companies in a not very competitive industry or with products that have no differentiation will tend to be less innovative.
- Social: in a wider way, society has mechanisms to protect itself against possibly destructive changes; these are implemented as politics, norms, moral patterns, ethics, laws, rules and other forms of control. The mechanisms can limit severely the innovator's options and creativity.

Owens' focus in his research was on identifying the barriers which restrain existing companies from keeping themselves innovative. He tried to find out how the companies "killed innovation", evidencing that there are many barriers beyond the "innovator dilemma" (Christensen, 1997) previously introduced. This model is generic enough to be applied to the universe of innovative entrepreneurs, in starting-up companies whose focus is development of innovative products. In this way, this model, along with the knowledge of practices within innovative companies, the knowledge about the process of diffusion and of the innovation types, serve as base to structure the interviews and analysis that will be presented in the following chapters.

## METHODOLOGY

According to this study's objectives and to the bibliographical survey about innovation, this chapter demonstrates the methodological procedure used for the research, including the chosen method, the criteria for the choice of interviewees, as well as their profiles and those of their organizations.

### Research method

The research consisted of interviews of exploratory and inductive nature with different agents of innovation value in small technology-based businesses. The process was divided into two phases, the first being realized in a pilot interview, in which beyond data collection, the proposal was to validate the script used for the interviews and to identify other agents in the innovation process to be investigated.

Once these initial interviews were realized and the results analyzed, this research focused on a second group of qualitative interviews, with at least one representative of each one of the links of the chain which were identified.

All the interviews were realized with consent of the interviewee, taped and transcribed for a later analysis. The data available on the sites of the organizations offered the context, such as area and manner of performance, objectives, products and available services, etc.

### Criteria for the choice of interviewees

Six interviews were realized, one of which considered "pilot", which allowed perfecting the script of interviews and identify the other interviewees. All the interviewees in this stage worked in one or more of the following links in the chain of innovation:

- Entrepreneur in businesses with technology-based products which have innovative characteristics and are already generally commercialized;
- Manager of technical mechanism in innovation, as for example, incubator;
- Projects' evaluator for financial mechanisms for instigating innovation in businesses, as for example, FINEP edicts geared toward businesses;
- Manager of funds investment regarding Venture Capital or Private Equity;

## **Data collection criteria**

The main mechanism for data collection was the open interview, based on a previously defined script, seeking to identify the barriers for innovation in the perspective of each one of the interviewees. The scripts for the pilot interview and the subsequent interviews are, respectively, in Attachments A and B of this study. The interviews were complemented with secondary data, including the Internet sites of the organizations where each of the interviewees currently works.

## **Research limitations**

Opting to realize a series of qualitative interviews capable of covering several links in the chain of innovation, the chosen view demonstrated the scope of the problem. On the other hand, the view of the entrepreneurs in different stages of maturity in their businesses was not explored. A complementary study to this one could be a quantitative research, using the tools based on this study's findings, addressed to entrepreneurs in different situations:

- Incubators that already have a commercialized product;
- Those that have received investment of Venture Capital;
- Entrepreneurs with products in commercial stage;
- Entrepreneurs who have performed an exit strategy, as for example a strategic purchase, funding capital, among others.

Beyond quantitative researches, deepening the study could be done through case studies, not only with successful businesses according to the determined criteria, but also with businesses that did not reach their objectives.

# **RESULTS**

In this section the results of the pilot interview will be presented, in terms of approach refinement, the profile of the people interviewed and those of their organizations and analysis of the results per se.

## **Pilot interview**

The first person interviewed in this stage, other than being an entrepreneur at a business that has an innovative product, has experience in management of the incubator and has had a role in evaluating business projects, submitted to CNPq. The script of the pilot interview included questions about the organization and a great number of questions that sought to cover each of the dimensions presented by Owens (Owens, 2010). It was observable that an interviewee that is willing to take the challenge of innovation, and that works directly with this issue, is capable of covering spontaneously a great part of the themes, with a smaller number of open questions.

From this, the specific questions that sought to address each of the dimensions individually were eliminated. Also it led to the conclusion that the organizational data and previous projects of the businesses should be obtained as secondary sources (business site, for example), leaving more interview time to explore the main theme, which resulted in the scrip presented in Attachment B, adopted in the subsequent interviews.

The answers in the pilot interview were considered in analysis later, along with the answers of the other interviewees.

## Profile of the interviewees and organizations

In the following, the profiles of the interviewees as well as those of the organizations for which they worked are shown, indicating their connection with the theme of this research:

Berthier Ribeiro Netto – Google Diretor Founder of Akwan Information Technologies, acquired at a later time by Google, company in which he works as Engineering Director. Akwan was founded by Universidade Federal de Minas Gerais [Federal University of Minas Gerais] to offer research services to final users and companies in Brazil, and was responsible for the search engine [www.todobr.com.br](http://www.todobr.com.br), a search mechanism designed for searches on the Brazilian Internet. With this purchase, Akwan turned into the Center of Research and Development of Latin American Google.

Carlo Dapuzzo – Monashees Partner Monashees is a venture capital company that invests in “high risk” enterprises, focused on big markets (> R\$ 1 Billion) or that can create new markets with this potential. The typical investment made by Monashees varies between R\$ 250 Million e R\$ 5 Million, since its focus is on the seed stage or series A. The areas of operation are the Internet and Education, and the manner of operation consists of establishing a long term relationship, performing not only financial contribution but aggregating to the business management.

Guilherme Ary Plonski – Anprotec President / Professor at Universidade de São Paulo [University of São Paulo] Anprotec (Associação Nacional de Entidades Promotoras de Empreendimentos Inovadores – National Association of Entities Promoter of Innovative Enterprises) represents the interests of incubators, technological parks and enterprises, through an offer of activities that build capacities, articulation of public politics, generation and dissemination of knowledge. After 22 years, Anprotec aggregates 272 entities, that represent 400 incubators and 6300 enterprises, which come to a total of 33 thousand work placements.

Marcos Simões - Empreender Endeavor Institute The Empreender Endeavor Institute started up from a partnership with Endeavor Initiative Inc., an international non-profit organization that promotes entrepreneurship in developing countries. Endeavor’s objective is to make Brazil a global reference in entrepreneurship, through promoting high impact entrepreneurship. The model of the performance consists of selecting entrepreneurs, strengthening their businesses through a net support of mentors – volunteers and partners that advise and support these businesses, and multiplying the experience, so as to disseminate their stories and experiences in society.

Mara Abel – Endeepner Partnet / CEI-UFRGS Ex-Director Founded the company ENDEEPPER, that develops solutions for characterization of petroleum reservoirs and knowledge management in the area of “petrology”, and that began as a spin-off of Intelligent Database Group that is coordinated by UFRGS (Universidade Federal do Rio Grande do Sul – Federal University of Rio Grande do Sul). Professor at UFRGS, she was also director of the Institute Entrepreneurship Center of Computing Technology Institute at the Federal University of Rio Grande do Sul, a technology-based incubator that encourages projects with innovative character, in the area of Computing Technology.

Sílvia Meira – Chief Scientist CESAR / Member of the Council of Porto Digital / Professor at Federal University of Pernambuco CESAR (Centro de Estudos e Sistemas Avançados do Recife – Center of Studies and Advanced Systems) is a private center of innovation, which creates products, services and companies with Computing Technology and Communication. Created in 1996, CESAR has developed products and services that cover the whole process of innovation, from the idealization to the projects’ realization for companies and industries that perform in different sectors. Porto Digital is a cluster that shelters companies of Computing Technology and Communication in the city of Recife, created 10 years ago and that provided setup of dozens of companies, among which the production of management, financial, health, games and safety softwares deserves special mention.

## Analysis of the data from the interviews

The analysis of the data from the interviews will be shown bellow. This analysis is divided into three parts:

Firstly, the main barriers that each of the interviewees cited were identified and put together according to the pattern introduced by Owens (Owens, 2010), adapted to the context of innovative technology-based entrepreneurship;

Next, patterns in the answers were identified, which resulted in “groups” of interviewees, with complementary perspective about the theme studied;

Finally, a consolidation was made, presented in “4.3.3 Consolidated Analysis: Barriers & Groups”, which counters the perspective of the groups interviewed according to the each dimension of Owens’ patterns.

## **Analysis of Barriers Identified by Interviewees**

For this analysis, Owens’ pattern of 6 types of barriers for innovation, a generic standard applicable to the innovation context in established businesses as well as in innovative enterprises, was adjusted to the context, according to the description of each of the sections that follows.

### **INDIVIDUALS’ BARRIERS**

The analysis of individuals’ barriers has as a focus on the characteristics of the entrepreneur himself/herself and those of the remaining people involved in the entrepreneurship, such as collaborators and suppliers. The function of this section is to identify eventual obstacles related to capacitance, personal profile, educational background, abilities, cultures and beliefs. Barriers of this nature were mentioned spontaneously by all the interviewees, many times as the most relevant obstacle to the innovative entrepreneurship in Brazil. There are many individual aspects that intervene in the innovative entrepreneurship; the following are some of the ones most frequently mentioned:

Cultural barriers and of mentality, which limit the quantity of entrepreneurs and projects that have a “high impact” perspective, with potential to win over the high growth market or to create an entirely new market with a high growth potential. The majority of enterprises end up having a perspective of the business as a “lifestyle” (only sufficient to be economically sustainable) instead idealizing a great business; In the perspective of investors and other agents that foment the innovation, predominates among the entrepreneurs an idea of the “business owner”, and few are willing to allow the access to new partners, divide the decisions with the new partners and professionalize the management, conditions considered essential by the investors to mitigate the business’ risks;

The entrepreneurs-innovators in high technology areas tend to be technicians, focused on solving obstacles in the constitution of a product within their specialization area. These individuals are not always capable of translating a product to the client’s language, unable to leave the technical speech to pinpoint the benefits to the final client. This deficiency can be fatal to the process that disseminates the innovation.

### **GROUP BARRIERS**

The concept of “group” adopted related to the environment where a knowledge construction takes place which makes feasible innovative products; this includes university and research centers. Regarding this perspective, the interviewees highlighted the following points:

- Difficulty of the public university, where a great part of the basic research in Brazil takes place, to look kindly upon entrepreneurial activity, which complicates the usage of the scientific knowledge in enterprises. Frequently the result is that the knowledge reached based on public resources turns into publications, many times internationally and with high visibility, but rarely makes a business feasible, which would turn knowledge into generation of value, jobs and revenue;
- Lack of favorable culture to the innovation in broader terms, which could be fomented throughout the education process, and that means that a very small parcel of those leaving universities have ambition to start up a business and, of those, few seem to have a perspective of high impact business, besides an even smaller parcel effectively putting this ambition into practice.

### **ORGANIZATIONAL BARRIERS**

In this research, the concept of organization has been understood as the environment where the development of innovative products happens, such as incubators as well as the environment inside the micro and small technology-based businesses that invest in innovative products, besides the organization of client businesses, in which the implementation of new products takes place. The aspects mentioned most frequently by the interviewees were:

The great part of incubators and research centers have a bigger focal point and are densely taken over by people interested in surpassing the technical barriers for a product creation, rather than focusing on a business problem or deepening the knowledge of the users' needs. There are few that work on the other stages of the innovation process, such as articulation with investors, approximation to businesses, etc;

In the case of products concentrated on the corporate market, there is a natural resistance to changes, when the products reformulate the way people work and, especially in client businesses that are not exposed to the international competition, there is no search for products and other efficient processes, and there is little receptivity to innovative products, even if these generate significant productivity profit and competitive.

## **INDUSTRY BARRIERS**

Since we have dealt with innovative entrepreneurship, the concept of "industry" that was adopted corresponds to the environment that allows the development of these enterprises and their transformation into businesses, such as risk capital, fomentation mechanisms and partnership businesses in the development of new products. Some barriers frequently mentioned by the interviewees:

The chain value of risk capital has been little developed in Brazil, and the few investors willing to finance the development of innovative products have difficulty in finding alternative exists (start-up capital, investors in subsequent stages or strategic buyers for the invested businesses);

In the investors' perspective, since they need to be willing to perform for a long cycle until the egress or even be willing to stay with the business, these become more selective in the projects. At the same time, they do not find businesses with a high impact perspective to justify their entrance.

## **SOCIAL BARRIERS**

The social barriers in this study have to do with legal, regulatory and cultural issues in the country. The problems highlighted by the interviewees were:

Highly bureaucratic business environments, which generates costs, a misplacement of the entrepreneurial focus, and imposes the same complexities and obligations as on a big business;

Legal barriers which complicate the usage of governmental purchase power to ferment innovation, besides there are regulatory difficulties in other areas, such as the creation of investment funds, the usage of tax incentive in innovation activities by a greater part of the businesses.

Low tolerance to failure, in a cultural point of view as well as in the legal one, which ends up limiting the view of the entrepreneurs.

## **TECHNICAL BARRIERS**

Little by little the technical barriers were highlighted in a general way and, in some cases, explained as "irrelevant" in comparison to the others. This perspective seems consistent with the current unsteadiness between scientific production in the country and the production of innovative enterprises and patents. The barriers more frequently mentioned also relate to people and education:

Intensive enterprises in highly qualified manpower, especially those that attempt to develop competitive products internationally, still face difficulty in recruiting the necessary talent. Despite the dimension of the academic production in Brazil, the schools with international standards are still few; There is difficulty in finding qualified people to fill key positions to transform enterprises in big businesses.

## Interviewees' grouping

An important finding from the analysis of the interviews' transcripts, after relating the main obstacles identified by each of the interviewees, was the fact that these people were able to be placed into clearly-defined groups. In each group, there is a great conscience of prioritizing in terms of the innovation obstacles. A contradiction of perspectives was not notorious, however a clear difference in the order of priorities was perceivable.

## PERSPECTIVE OF THE ENTREPRENEURS

The interviewees directly involved in enterprises generally speak of these main barriers:

- Availability of qualified manpower and suppliers with whom to establish partnerships. Even though none of them identified the technical knowledge as a barrier in itself, the little availability of well-educated people to work in intensive companies is an obstacle to the business growth that depends on manpower;
- The university does not favor the emergence of innovative enterprises and, in some cases, there is an ideological view by part of the academic groups, who are opposed to transforming the research results into commercial products;
- Few options of "low costs" capital, feasible to an innovative company, which will many times be effective for years without generating revenue, ends up limiting enterprises to less innovative products, less risky, which can generate revenue in a short time;
- High complexity and high costs of managing a company in Brazil, in case of a micro or small business, demand an investment in the administrative area which is equal to or greater than the investment in the product itself.

## INVESTORS AND INNOVATION INDUCING AGENTS' PERSPECTIVE

Here not only fund of risk capital was considered, but also those who perform as investors in a natural person, as "angels" and agents that ferment or induce innovation. Some coherence in the perspective of these different agents was found, among which:

- Few entrepreneurs and few projects with a "high impact" view, in other words, with potential for quick growth, exploring a big marketing and growth potential, or that can create an entirely new market with high potential. The majority of the projects have a perspective that they call "lifestyle", capable of growing up to a point, generating revenue, but stopping at a limit, which makes them unattractive for this type of investor;
- Many entrepreneurs have a perspective of the "owner", more than one appropriate to the "entrepreneur", finding it difficult to accept, along with the capital disbursement, the aggregation of a partner with whom to divide decisions and difficulties in accepting the managing professionalization;
- Little post-innovation culture in the country as a whole, which along with a culture of little tolerance for failure, does not favor the outbreak of entrepreneurs with bold views;
- In the level of public politics, a lack of comprehension about the great diversity within the business universe in Brazil and its different needs. This cognitive dissonance complicates the process of addressing the obstacles of governmental competence in a systematic and efficient manner;
- Difficult in finding and engaging key people, capable of joining the entrepreneurs' group that are capable of transforming a small entrepreneurship into a great company. This is related to the lack of professionals as well as to the lack of availability to join a business in a beginning stage.

## Consolidate Analysis: Barriers and Groups

Table 1 shows the barriers cited by the interviewees which groups were previously described. The "Entrepreneurial Perspective" shows the barriers highlighted by the interviewees directly involved in innovative enterprises. The column "Investor and Inducing Agents' Perspective" contains the points highlighted by agents related to financing and to the induction of enterprises. Chart 1 summarizes this research's findings and confronts the different agents' perspectives, offering a more extensive view of the research theme. We noticed that there were no contradictions among the perspectives, but a difference of emphasis and a difference of rank in terms of the most relevant obstacles.

## CONCLUSIONS

Based on the theoretical reference regarding the innovation theme, the interviewees with different agents in the innovative-entrepreneurship context and the analysis of the obtained data, the present study presented a very ample qualitative view of the innovation environment in Brazil. The theoretical reference research established the foundation for the study, offering subsidies for the stage of data collection with interviewees and their analysis. The interviewees established a view applied to the Brazilian scenery and the innovation entrepreneurship technology-based context. Among the conclusions from the initial stage (that of a bibliographical survey) is the fact that the innovation is related to economic development (Schumpeter, 1934), through the creation of differentiated products and exporting possibilities. Another finding reported that the innovation is something concrete, susceptible to being measured and verified (OECD, 2005), which is a pre-condition for its management, be it in the business' environmental or governmental level. Another point, verified in the literature as well as in the practice of companies considered innovative, is that the innovation can be learned and encouraged (Drucker, 1993). Therefore, once the comprehension of this process (and its barriers) has been attained (Owens, 2010), it is possible to take concrete actions to accelerate the innovative entrepreneurship.

Table 1: Barriers for Innovation in two perspectives

Type of Barrier	Entrepreneurial Perspective	Investors and Inducing Agents's Perspective
<b>Individual</b> (Entrepreneur / innovator)	<p>Little availability and low manpower quality and available service rendering in Brazil make difficult the constitution of teams and well as the relationship with suppliers;</p> <p>The entrepreneurial mentality tends to be focused on internal market, not seeking the creation of innovative and competitive products on a global scale;</p> <p>The innovator – entrepreneur generally has a technical profile and has difficulties in turning the technical speech into one of benefits for the clients.</p>	<p>Few entrepreneurs have a view of entrepreneurship of “high impact” – with high potential for transformation of an industry and growth potential – predominating the “lifestyle” entrepreneurship;</p> <p>Cultural barriers of great part of investors, such as view of the “owner” and not of the partner, which complicates agreements with investors and limits business growth;</p> <p>Overestimation of the idea in itself, in relation to the business execution, limiting the search and the agreement with partners and reimbursement of “smart money”, necessary for a high impact entrepreneurship;</p> <p>Loss of focus by entrepreneurs, because of the view regarding technology and their possibilities, in detriment of the spotlight on business applications and/or on the final client.</p>
<b>Group</b> (environment where the erection of knowledge occurs for innovator – entrepreneurship, such as university, Research Center, etc.)	<p>The university as a public institution has difficulty taking kindly to commercial entrepreneurial activity, complicating the emergence of innovative enterprises from academic origin.</p>	<p>Little encouragement to a pro-innovation culture and entrepreneurship, which reflects on the fact that a minority of those leaving university undertake the practice and, among these, predominate a “lifestyle” perspective.</p>
<b>Organizational</b> (environments where the products and clients of innovative products are developed)	<p>In the case of products with a focus on corporate market, for industries less exposed to the international competition, there is little interest in and receptivity for innovative products and productivity revenues through technology;</p> <p>Few big companies in Brazil see the possibility of open innovation and licensing developed technologies for innovative entrepreneurs, which could be incorporated in their products;</p> <p>Introduction of innovative products in client companies, which alter the way in which people work, faces natural oppositions to change and companies are not prepared to manage these changes;</p> <p>Some industries in Brazil are dominated by international chains and have little autonomy to decide the purchase of innovative products in Brazil, which complicates the introduction of products with the focus on corporative clients);</p> <p>Few incubators are capable of being effective beyond establishing a basic infra-structure, making easier investments and connections (with investors, companies</p>	<p>Incubators and research centers generally are filled by those who seek research and solve problems of technical domain, but there are few people focused on the search of the most appropriate technology to solve big problems and create businesses, built on the perspective of the final client;</p> <p>The majority of innovative enterprises do not have all the management competencies to become great businesses, not all of them count on the support of incubators and not all incubators are equipped with these competencies;</p> <p>Enterprises focused on solving technical problems, and when seeking capital – be it public or private – seek imbursement of money and not “smart money” (Money, connections with the market, etc.).</p>

Type of Barrier	Entrepreneurial Perspective	Investors and Inducing Agents's Perspective
	that could license technology those incubated, with the market, etc).	
<b>Industry</b> (capital and instigation for enterprises)  <b>Industry</b> (capital and instigation for enterprises(continuation))	The chain of value is still underdeveloped, with few investors willing to disburse money in innovative businesses; Alternative exits for the investors are limited (there is a lack of investors in intermediary stages, low probability of opening capital and few strategic purchases), demands that the investor have willingness for a long term investment.	Lack of projects with perspective of high growth (aiming at a high growth market or that can create an entirely new market), that are attractive enough to mobilize investors; The products proposed bring few innovations or bring innovations only in a regional scale, which are not competitive internationally; Investors in initial stages need to be prepared for a cycle of maturation which tends to be long in Brazil in relation to other countries, due to the shortage of investors for all the stages (especially intermediary stages); Based on the facts above, funds of venture capital tend to be more selective, moreover they are still limited to great centers, such as São Paulo; Financial support with public Money to develop innovative products is limited to some areas of interest to MCT e FINEP, and many are limited to aspects of technical support and do not include the stages of introducing a product into the market;
<b>Social</b> (country, including legal, regulatory and cultural questions)	Highly bureaucratic environment raises the costs of making business and takes the way the focus of the entrepreneur in regards to the innovation, in order to dedicate great part of the energy to meet legal, fiscal and bureaucratic requisites; Lack of legal and fiscal regimes for innovative enterprises, expose micro and small businesses to the same costs and complexity of manage as those of a mature and established business.	Lack of a perspective that there is a great diversity in the universe of 5.5 million effective businesses in Brazil, generates a cognitive barrier for the problems to be tackled systematically in terms of defining public policies and incentives to innovation entrepreneurship; Legal and regulatory barriers still difficult to the constitution of new investment funds of investment capital, reducing the scope of investors; Current legal framework complicates the use of the State buying power to instigate innovation, since the innovative product is frequently disqualified in terms of the public edicts; The legislation that allows companies to obtain fiscal benefits to invest in innovation favors a limited number of companies; High transaction cost makes difficult for bigger businesses to invest on innovation in smaller businesses, with imbursement of capital to suppliers that develop innovative components for their products; In the cultural aspect as well as in the legal one, there is a low tolerance to failure, discriminating and punishing the entrepreneur that "breaks" a company; Regime of juridical insecurity in the country limits the access to new investors.
<b>Technical</b>	No technological availability barriers were highlighted (reflecting Brazil's position in terms of scientific production), but these technologies are dominated by very few people, and there is a difficulty in finding manpower for enterprises with high density of knowledge; A limited number of universities is capable of educating people with international standard to perform in companies that intend to compete internationally.	Difficulty in finding people for key positions for transforming an entrepreneurship into a big business.

With these premises in mind, the choice of the criteria for choosing the interviewees, data collection through qualitative interviews and their later analysis were made. The picture portrayed, which related the barriers identified by the agents inserted in the context of innovative enterprises' developments, sought not to attach itself to a pessimistic or optimistic view of reality, but merely to frame the problem in a way as complete

as possible based on the collected data. It is believed that a clear comprehension of the barriers for innovation is an essential step, so that these can be addressed in a systematic way, or so that the entrepreneurs or agents, attentive to the restrictions which are imposed upon them, can anticipate the risks and raise their chance for success.

On one hand, there is the difficulty that the entrepreneurs face regarding the legal barriers, the cost of making business, and the complication of investing capital to their businesses and, in some cases, the difficulty to engage enough qualified manpower. These factors many times leave the entrepreneurs few alternatives for generating short term revenue, taking the focus off the high impact view, leading the entrepreneurs to more conservative decisions. On the other hand, the investors and other agents that work to promote entrepreneurship, tend to highlight the lack of projects ambitious enough, with growth potential, to justify the investment. In Brazil, there are not enough investors for the following stages and there are few exit alternatives, demanding longer cycles of investment than the international average, the investors need to be highly selective in their choices. Once an investment has occurred, there is a worry in placing people in key positions in the invested businesses, to work along with entrepreneurs in order to transform an idea or a product into a great business.

In both of the perspectives, there is always a difficulty to find qualified manpower – technical as well as in management positions – and willing to embark in a new business. In the case when one finds these highly qualified professionals, the cultural barrier, the low tolerance to failure, is a limiting factor. Entrepreneurs as well as professionals who have a difficulty in making the option for a new business with high potential for growth (and the inherent potential for failure) are led toward the “safer” professional decisions, choosing a established or low risk businesses.

Insofar as capital availability, interviewees in both groups admit that the market is still incipient, but also report the fact that Brazil has a short history and a stable economic explains that the venture capital is incipient in the country. Therefore, an optimistic view predominates, that a virtuous cycle is about to begin, since the best enterprises can attract more investors and a greater offer of capital would make creating a high impact business a more attractable idea. It remains to be known whether the actions of the government could support the education of better professionals, reduce the costs of making business in Brazil, and in a concise manner, reduce the difficulties faced by innovative entrepreneurship.

This research has shown a perspective of the innovative environment, where the views of different roles allowed to pinpoint the obstacles that need to be overcome to become successful. The spotted barriers at times slow down or block the success of entrepreneurs, investors and the actions that seek to induce innovation. With this, one hopes to contribute that the problems that are under the regency of these agents may be addressed in a systematic way. Even though some obstacles are beyond the reach of these agents, the conscience of these challenges can contribute to taking the precautions that mitigate risks. The innovators may decide their path, accepting the fact that entrepreneurship like a lifestyle, though making possible the creation of short term revenue and possessing fewer risks, is not very interesting for risk investors. The decision based on this model is not less correct than one based on a high impact choice, but the expectations of the entrepreneurs must be clear in regards to this principal, so as to be able to focus on the realization and search for adequate mechanisms to finance their business, raising the chances of building an economically stable business. Those that opt for high impact entrepreneurship, must have the concept of the potentials that investors look for, the need for a sufficiently big and feasible view, so that the capital investment may be justifiable for a long term, when in Brazil the investor may resort to low cost and profitable alternatives. It is necessary to understand still, that to raise the chances for success, the investor will not only invest capital, but also management capacities and access to a network of relations. Therefore, the entrepreneur should be prepared, when with an investor, to divide the decisions about their business, adopting a truly entrepreneurship perspective and not that of the “owner”.

During the articulation of this research, there was a choice made for a wide-reaching view in terms of innovation environment, covering different agents, such as entrepreneurs, incubators and investors. Facing this diversity of perspective, a qualitative approach to data collection was adopted. Once this view was built, a natural step would be the quantitative research in one of more of the segments of interviewees. Another possibility to deepening, which would be valuable, was the realization of case studies and in-depth research.

The quantitative research among venture capital funds would allow the organization and prioritizing of obstacles in action plan to overcome these obstacles. In the entrepreneurship universe, the research among entrepreneurs in different stages (incubators, companies with products in the market, etc, would allow to identify the obstacles as well as the actions adopted by companies that reach the market, which can be replicated by future entrepreneurs.

# **AN ORCHESTRATED CONSPIRACY OF IGNORANCE? THE RISE AND FALL OF EDUCATION FOR SUSTAINABILITY IN NEW ZEALAND'S TERTIARY EDUCATION STRATEGIES**

**Leon de W Fourie and Peter Mellalieu**  
**Unitec Institute of Technology, New Zealand**

## **ABSTRACT**

*New Zealand enacted pioneering legislation embracing the notion of sustainable development through its Resource Management Act of 1991. Through its Tertiary Education Strategy (TES) 2007-2012 the Labour government signalled its desire that the country's higher education sector should support its ambitious environmental vision and goals. A strategic audit of the environmental performance of a publicly-funded New Zealand tertiary educational organisation examined the extent to which the institution achieved the environmental goals espoused in its government-approved charter. For several reasons, the institution had retreated substantially from its earlier pioneering commitments to environmental initiatives, initiated from the late 1990s. Specifically, the government's environmental policy aims were not translated into an explicit investment funding priority for the tertiary education sector nor into an appropriate system of monitoring and control. The most recent National government tertiary education strategy, TES 2010-2015, retreats further, condemning the nation's future professional leadership - and tertiary graduates in general - to a deep ignorance about the requirements, risks, and opportunities for sustainable development.*

## **INTRODUCTION**

New Zealand enacted pioneering legislation embracing the notion of sustainable development through its Resource Management Act of 1991 and was an early signatory to the United Nations Framework Convention on Climate Change (1992). The country's gross contribution of 77.9 million tonnes of CO<sub>2</sub>-equivalent (2006) greenhouse gas emissions (GHGs) is very small (0.44 per cent of the global total) and the effect on normal human life imperceptible. (UNFCCC National Greenhouse Gas Inventory Data, cited in Bertram & Terry, 2010, Table 2.3). There are several reasons. The population is small - around 4.5 million - on an island area slightly larger than the isles of Japan or the United Kingdom. The abundance of brisk Pacific winds and rainfall dilutes some wastes so that they are not readily perceived. A large proportion of the country's electricity is gained from renewable resources: hydro, geothermal, and wind. Furthermore, recreationally-attractive lakes, coastlines, mountainous landscapes, or indigenous subtropical forests lie within two hours' drive from most locations. Consequently, since 2000 New Zealand's businesses have promoted world-wide their tourist destinations and export products with variants of the marketing slogan '100% Pure' developed by Tourism New Zealand, a government-funded industry development agency.

New Zealand is however one of the most highly ranked countries for per capita emission of greenhouse gasses. Similarly, the country produces the second highest emission of greenhouse gasses per unit of GDP creation, and ranks highly in per capita material and energy consumption (Skilling & Boven, 2007). Furthermore, since mass European colonisation began from the 1840s, by the 1950s the country had completed extensive deforestation of much of the indigenous sub-tropical rain-forest replacing it with pastoral agriculture, plantation forests, and - to a lesser extent - population centres. Accordingly, New Zealand's unfavourable ranking attracts the spotlight of other countries to focus on the country's industries, exports, tourist destinations, waste production, GHG profile, and 'food miles'. The marketing slogan is not quite 100 per cent true! (Cumming, 2010).

The 2010 Environmental Performance Index (EPI) ranks 163 countries on 25 performance indicators tracked across ten policy categories covering both environmental public health and ecosystem vitality. New Zealand's EPI score (73.4) ranks the country comparable to Chile (73.3) and the United Kingdom (74.2), slightly superior to Mexico (67.3), The Philippines (65.7), Australia (65.7), and the United States (63.5), and inferior to the top-ranked countries of Iceland (93.5), Switzerland (89.1), Costa Rica (86.4), and Sweden (86.0) (Yale Center for Environmental Law & Policy, n.d.). The Environmental Vulnerability Index (EVI) on the other hand rates the relative resilience and vulnerability of a country's physical environment to future shocks, risks and hazards and thereby the proneness of the country's environment to damage and degradation. New Zealand's score of 292 (Vulnerable) rates similar to Chile (287, Vulnerable), Brazil (284, Vulnerable), United States (300, Vulnerable), and Mexico (302, Vulnerable). This compares to more vulnerable ratings assessed for the United Kingdom's EVI of 373 (Extremely vulnerable) and The Philippines (402, Extremely Vulnerable), and more favourable ratings of Australia (238, at risk) and Canada (251, At risk) (South Pacific Applied Geoscience Commission, n.d.).

## **EDUCATION FOR SUSTAINABILITY**

In the context of the aforementioned it could be expected that higher educational organisations in New Zealand to be at the forefront for educating students, conducting research, and advocating appropriate policy initiatives in support of sustainable development. It could also be expected for them to operate using sustainable practices. However, this expectation is not being achieved. For instance, in 2004 New Zealand's Parliamentary Commissioner for the Environment (PCE) recommended that ALL graduates leaving tertiary educational organisations - and schools - should possess "a core understanding of ... environmental sustainability as a result of institutes encouraging Education for Sustainability (EfS) throughout their organisations" (PCE, 2007, p. 8).

A more recent study of New Zealand's tertiary educational sector conducted by the PCE found that its 2004 recommendation had been accepted and implemented in "an ad hoc, isolated, and uncoordinated manner both within and across institutions" (p. 20). For instance, "While environment-specific courses are available, with some [institutions] offering good opportunities for skills and knowledge in sustainability, learning about sustainability is not a core (or even a fringe) component in most mainstream courses." Furthermore, "University students' understanding of sustainable development has not changed dramatically since 2002" (PCE, 2007, p. 20; Stone & Baldoni, 2006). These findings are reinforced by Williams' doctoral thesis that presented a comprehensive assessment of sustainable development activities in New Zealand tertiary institutions. Williams found that campus sustainable development activities relied too much on 'lone ranger' champions, and failed to get adequate support from senior institutional leadership (Williams, 2008).

The 1990 Talloires Declaration (TD) is a ten-point action plan initiated by university administrators for incorporating sustainability and environmental literacy in teaching, research, operations and outreach at colleges and universities. It is noteworthy that no New Zealand university has become a signatory to the Talloires Declaration (Association of university leaders for a sustainable future). In contrast, twenty Australian universities are signatories, eleven in the United Kingdom, and 166 in the United States. One institution in the New Zealand polytechnic sector, Otago Polytechnic, has orchestrated its commitment to sustainable development pioneered through its Chief Executive's membership of The Natural Step (Otago Polytechnic).

This paper analyses Unitec Institute of Technology's strategic response as a tertiary provider to the national educational policy. This paper reveals the dissonance between the policies for institutional academic autonomy, national environmental policy, and the subtle practicalities of negotiating financial investment within the educational sector. The paper concludes with implications for environmental politics and leadership at the institutional and national level, particularly regarding higher education.

## **RESEARCH METHODOLOGY AND APPROACH**

Two research questions emerged early in the outset of this research: Firstly, what is the state of sustainable development and Education for Sustainability at Unitec Institute of Technology and; secondly, to

what extent does the New Zealand government's tertiary education strategy support or hinder the tertiary sector's pursuit of an agenda for Education for Sustainability and sustainable development?

The initial focus was to identify strategic issues - especially as they pertain to sustainability - for the attention of Unitec's top management team. A strategic issue for this purpose is defined as a challenge, threat, weakness, or opportunity that demands top management attention. A strategic issue is framed in such a manner that the problem or challenge is expressed succinctly, that there are several strategic choices available for its resolution, but solutions are not explicitly recommended. Strategic choice, action, and control comes later in the strategic development process.

The information and insights presented in this article result from an overall approach to enquiry that Robson (1993, 2002) defines as Real World Enquiry (RWE). Real World Enquiry is conducted on and with people outside the safe confines of the laboratory. It is 'human' research "not only in the sense of covering studies about people, but also in trying to take account of the advantages accruing from the enquirers themselves being people" (p. xv). RWE is conducted when "one wants to say something sensible about complex, messy, poorly controlled organisational settings" (xvi). RWE contrasts with the traditional - or formal academic - research approach in that RWE focusses on solving problems rather than just gaining knowledge" (Robson, Box 1.1). Although RWE is regarded as of dubious merit by some academics, RWE is conducted in a systematic manner and underpinned by pragmatic 'critical realism': an approach that is a synthesis of features drawn from realism, post-positivism, constructionism, pragmatism, and the ideals of emancipatory research. "Critical realism criticises the social practices that it studies.... If false understandings - and actions based on them - can be identified, this provides an impetus for change" (Bhaskar, 1986, cited in Robson, p 41).

## UNITEC'S CHARTER AND ENVIRONMENTAL SUSTAINABILITY

In 2006, Unitec publicised its charter, a document then required as a basis for negotiating funding with the Tertiary Education Commission. It summarises Unitec's mission, distinctive characteristics, and commitments to several key areas identified by the TEC. The Charter states that Unitec's mission is "to inspire people to discover and apply their intellectual and creative potential and to contribute responsibly to their societies and cultures." Accordingly, Unitec is guided by several values including integrity, innovation, relevance, care, and fairness ... "reflected through the sustainable management of resources, now and in the future...." (Unitec New Zealand, 2006, p. 2).

Elaborating on its values, the Charter states that Unitec is committed to sustainable development. Unitec seeks to apply the principles of sustainability in its teaching and research, and in developing an eco-campus environment that will enhance the learning experience for staff and students alike. In doing so it addresses the issues of investing in sustainability (for example, by teaching and research in business and professional management); designing for sustainability (for example, by teaching and research in architecture, landscape architecture, construction, design, engineering, and the natural sciences) and; advancing sustainable practice (in all disciplines, including trades and technical education). In planning and operating its campuses, and delivering its programmes, Unitec adopted models of natural and physical resource use that are ecologically responsible and economically sustainable. (Unitec, 2006, p. 5)

A strategic audit conducted in 2008 revealed seven 'inextricably interrelated' issues that contributed towards a foundering of Unitec's earlier initiatives in support of environmental sustainability:

- a. Sustainability/'green' issues are rising in importance for Unitec's stake-holders - students, employers, suppliers, and clients.
- b. The government has pronounced an ambitious vision, aims and goals for the New Zealand's sustainable development.
- c. Unitec fails to seek systematic signals from its stake-holders about their needs for education, training, and research for sustainable development.

- d. Unitec is undertaking a period of financial and organisational restructuring to recover from recent financial losses, and projections of future increasing financial deficits.
- e. Unitec's sustainability initiatives - established from the late 1990s through to 2004 - are foundering.
- f. Unitec's implementation of practical steps that demonstrate a commitment to sustainability is ad hoc, isolated, and uncoordinated. There is no strategy, policy, nor organisational culture for sustainability.
- g. There is diffuse but motivated support amongst several dozen staff, students and senior Unitec leadership for a more systematic, orchestrated, and substantive policy for sustainability in terms of teaching, research, advocacy, and campus operational practice. (Mellalieu, 2008b).

In 2008 Unitec conducted a survey of the education and training needs of the Rosebank Business District which included one question about sustainability issues. The survey found that 22 per cent of respondents sought advice on 'Greening the Business' - a level comparable to businesses seeking advice on the categories of 'accounting/finance/law/economics', 'communication and media', and 'research and development', and just a little lower than those businesses requiring advice about marketing and management (Frederick & Chittock, 2008; Mellalieu 2008b). It is noteworthy that whilst Unitec employs about 35 staff teaching the foregoing subjects, none are designated to teach 'greening the business'. As examples of reduced institutional capability, academic programmes in environmental engineering had been terminated, and a programme in horticultural studies, informed by the principles of permaculture and organic practice, was under threat of closure [and later terminated]. Furthermore, the main body of Unitec's Strategic and Investment Plans included one single statement pertaining to environmental sustainability: "[Unitec] will focus on applied research serving educational, social, economic and environmental goals, regionally, nationally and internationally." (Unitec 2007a, b, cited in Mellalieu, 2008b).

At this point it would be apt to determine the role and impact of the Tertiary Education Commission (TEC) has on environmental sustainability in the tertiary sector, and pose the question as to what investment the TEC makes into this area.

## GOVERNMENT AND TERTIARY EDUCATION STRATEGY

The Tertiary Education Commission, established formally in 2003, is an agency of the Ministry of Education. TEC is responsible for investment decisions that support the government's strategic direction. New Zealand has an explicit, connected, future-focused Tertiary Education Strategy that directly contributes to broad national, economic and social goals. The Tertiary Education Strategy 2007 – 2012 is a five-year blueprint for a collaborative and co-operative tertiary system that contributes to New Zealand's national goals. (Office of the Minister for Tertiary Education, 2007).

The TES document also incorporated a Statement of Tertiary Education Priorities for 2008 – 2010 (TES/STEP). TES/STEP is the key document that guides TEOs in the development of their own institutional Investment Plans and Strategic Plans. The TES confirms that New Zealanders value its tradition of a broad and inclusive tertiary education system that makes a significant contribution to the economic, social, cultural, and the environmentally sustainable development of our nation" (TES/STEP, 2007, p. 2). From this statement, one anticipates goals for sustainability to be included in the government's agenda for education

Three of the government's thirteen national policy aims pertain to environmental sustainability, that is, almost one-quarter of the total number of aims. This notable proportion of aims is a positive signal that sustainability was recognised as important by the government. In pursuing such goals and aims, the TES document identified several long-term challenges and opportunities that tertiary institutions were anticipated to face, the consequences of which are New Zealand's need to build global awareness; lift productivity and innovation; respond to the changing demographic face of New Zealand; respond to Maori living as Maori in both Te Ao Maori and in wider society and; develop sustainable use of natural resources.

As part of the need to 'Build global awareness' the TES document states that the New Zealand tertiary education system needs to respond and provide education with an increased international dimension that supports New Zealand and New Zealanders to compete internationally and supports New Zealand's contribution to international economic and social development, and environmental sustainability, especially in the Pacific. (p.

9). In terms of the need to 'Develop sustainable use of natural resources', TES states that the New Zealand tertiary education system needs to provide knowledge to meet the challenges and opportunities of a changing world and to understand and work within environmental limits. This would imply helping New Zealanders understand and protect its environment because key industries rely on the quality of our natural resources.

The TES therefore elaborated on the government's national goals and aims, and indicated in broad terms the context for how it believes the tertiary education system should contribute. It could therefore be argued that there is an expectation that sustainable development would be an integral component in the TES areas of focus and priorities.

Although the government had high ambitions for the tertiary sector to lead the sustainability development agenda, it did not get any explicit priority from the TEC as investment into sustainable development was minimal.

As a result, Peter Mellalieu (co-author of this paper) sent a letter in 2008 to the then Prime Minister, Helen Clarke. In this letter her public statements of government's commitment to establishing New Zealand as "a truly sustainable nation" was challenged. Specific mention was made of lack of commitment by the government - through the Tertiary Education Commission (TEC) - to establish an investment priority for sustainable development and education for sustainability. An explanation of this weakness in the government's investment priority regarding education for sustainability was sought and government was urged to implement an appropriate correction to the Tertiary Education Strategy and Statement of Tertiary Education Priorities (MOE, 2007) to remedy what is regarded as a serious defect in policy activation. (Letter to Prime Minister Helen Clark from Mellalieu, 2008 March 7).

A reply was received from Hon. Pete Hodgson, MP for Dunedin North, Minister for Economic Development, Minister for Tertiary Education, and Minister of Research, Science and Technology. In summary, the Minister confirmed that the government was "committed to making considerable strides in addressing the sustainability challenges ahead of the nation." As an example he cited the establishment of a \$2 billion 'Fast Forward' fund focussed on making New Zealand's pastoral and food industries "environmentally and economically sustainable." He pointed out that there were examples of tertiary courses in environmental management and science throughout the country, and that some campuses had adopted sustainable practices across their campuses. He highlighted the example of Otago Polytechnic which embeds education for sustainability in all its courses.

Turning to the crucial issue of the Tertiary Education Priorities, he argued that they had been "identified and strongly supported by the majority of stake-holders responding to consultation in 2006", thereby giving the government "confidence that the priorities were where the most urgent attention for change should be focussed over the next three to five years [2007-2012]". Regarding the TES/STEP areas of focus for supporting social, cultural, and environmental outcomes, he emphasised the government's desire to achieve strong connections between TEOs and the communities they serve. He noted the TEC's 'Investment Guidance' document outlined the engagement process between TEOs and the TEC required for developing TEOs' Investment Plans. Specifically, the process "requires TEOs to actively engage with their communities in order to contribute to wider social and economic outcomes."

The Minister concluded by remarking that "the government is not in a position to set curriculum for the tertiary sector, as sections 160 and 161 of the Education Act provide legislative protection for the academic freedom and institutional autonomy of tertiary institutions". In essence, the Minister indicated the opportunity for TEOs to bring EfS into their curricula through gaining support from their communities and stake-holders. As the audit of sustainability at Unitec identified, there had been no explicit, systematic approach for identifying opportunities for EfS through consultation with its communities.

## **FINANCIAL AND MANAGERIAL RESTRUCTURING AT UNITEC**

In mid-2008 Unitec undertook a major organisational restructuring which included closing down several academic programmes and facilities. In addition, about one half of the senior and upper management left the organisation with approximately 50 people being made redundant. A key short term aim was to replace a convoluted matrix-like organisational structure with a leaner structure with more clearly defined 'command-and-control' managerial responsibilities. An equally important aim was to avert the forecast increase in financial losses that had begun to develop since 2005.

The newly appointed Unitec senior leadership developed a comprehensive corporate strategy in 2009 wherein it signalled that 'environmental sustainability' was one of twenty goals that Unitec intended to pursue. The importance of environmental sustainability at Unitec further surfaced at the annual internal teaching, learning, and research symposium where approximately two dozen staff presented poster displays of their research and teaching for sustainability. This was followed by a one-day 'grass roots' hui (workshop), involving some forty staff who developed a set of sustainability proposals for Unitec's new senior leadership (Mellalieu, 2009c; 2010b, c).

In early 2010, the senior leadership appointed the Executive Dean of Unitec's Faculty of Creative Industries and Business, Leon de W Fourie (co-author of this paper) to establish and head-up a project team to draw from the ideas of the hui a specific funding and investment plan for integrating sustainability into Unitec's teaching, research, advisory services, and campus operations. By December 2010, the strategy, project plan and budget had gained senior executive approval and provisional funding for 2011 (Unitec, 2010b; Clarke, Preston, Phillips & Fourie, 2010; Mellalieu, 2010b, c).

## **UNITEC'S ENVIRONMENTAL SUSTAINABILITY RESPONSE**

Towards the end of 2008 the National Party got voted in and the new Tertiary Education Strategy 2010 stated that high quality tertiary education is central to helping New Zealand achieve its economic, social, cultural, and environmental goals (TES 2010, p. 3). One of the elements of the 'vision' for the tertiary education system is that it should "produce high-quality research to build on New Zealand's knowledge base, respond to the need of the economy, and address environmental and social challenges" (p. 6). This element of the vision is later defined in TES 2010 as being one of the core roles of NZ universities, and Wānanga - but not the polytechnic sector in which Unitec is located (p. 18). The term 'environment' is used once more - almost as a footnote - in an appendix to the TES outlining the trends and context for the chosen strategy:

How did Unitec present to the Tertiary Education Commission its justification for its proposed expenditure on environmental strategy? Unitec's draft Investment Plan 2011-2013 made one reference to meeting the new government's policy aim "To improve the environment and community well-being" (Unitec, 2010a, p. 5). This is one of six outcomes targeted for learners and Unitec's community. Specifically, the TEC's new Sector Planning and Accountability Framework identified several national level outcomes and indicators. 'Environmental Management' is one outcome component. However, the actual indicators supplied by the Ministry of Education intended for use as accountability measurement are limited to economic and social indicators: earnings gained by new graduates; life satisfaction; standard of living; tolerance; social connection; mental and physical health; and social & community (Unitec, 2010a, p. 38).

Finally, Unitec's financial plan presents a table of Key Performance Indicators (KPIs) to be reported in an institutional Statement of Service Performance. The sole reference to environmental sustainability is presented under the component 'Impacts' as "Progressive improvement in resource consumption off 2010 base as per Unitec Environmental Strategy 2010 - 2015" (Unitec, 2010a, p. 39). 'Improving resource consumption' is a rather narrow interpretation of what an environmental strategy might seek to achieve. That thrust to improve resource consumption reflects what any enterprise - for profit or not-for-loss - would seek to pursue in the normal pursuit of its activities. In practice, the main budget line items were identified as energy management monitoring and control systems for several campus buildings, the employment of an environmental management officer, and a \$100,000 fund to seed pilot initiatives by staff, students, and suppliers (Unitec 2010b).

## **AN ORCHESTRATED CONSPIRACY OF IGNORANCE?**

It is clear that the tertiary education strategy under the previous Labour government (1999 - 2008) was - at best - ineffective in its support for TEOs to pursue an agenda for EfS and sustainable development. The government at that time had espoused vigorously an aim to balance economic progress with care for the natural environment. The government's Tertiary Education Strategy 2007-2012 affirmed that the New Zealand tertiary education system needed to assist the country's need to develop sustainable use of natural resources for several reasons. However, the vision, aims, and goals of the strategy were not translated into an explicit investment funding priority for the tertiary education sector. Furthermore, there were no criteria against which an institution's achievements against sustainability were to be monitored and evaluated.

In essence, the Labour government's Tertiary Education Strategy placed no priority for investment in sustainable development or Education for Sustainability within Tertiary Educational Organisations. Consequently, the senior leadership of a typical tertiary educational organisation, Unitec, saw no need for investing in a goal for sustainable development in its strategy. In Unitec's defence, the institution was faced with the need for financial and organisational restructuring - as did many other organisations when the global financial crisis later appeared.

The new National government's Minister for Tertiary Education was presented with an official Briefing from the Ministry for Education that made absolutely no reference to EfS and sustainable development as a priority or concern. This significant de-emphasis was reflected subsequently in the Tertiary Educational Strategy 2010-2015 that removed the aims for and rationale for EfS in the tertiary sector that had claimed a high - but effectively 'green-wash' - profile in the previous Labour administration's TES 2007-2012.

In contrast to the retreat in government's policy vision for EfS in the tertiary sector, Unitec's senior leadership over the same period responded positively to the increasingly orchestrated action by about 40 staff. Ultimately, a comprehensive strategy for environmental sustainability was crafted. A key outcome was the formulation of a strategic plan integrated into the institution's investment planning cycle with a significant budget committed for the 2011 financial year. Nevertheless, the principal justification for the strategy was narrowly stated in the institution's draft Investment Plan for negotiation with the Tertiary Education Commission as a strategy for 'improving resource consumption' [sic].

This case illustrates how the 1999 - 2008 New Zealand Labour government's vision, aims, and goals for sustainable development were not connected to practical investment, measurement, and control policies in the tertiary education sector. Whilst some tertiary educational organisations offered courses and research programs on topics related to sustainable development, the extent comes nowhere near the recommendation by New Zealand's Parliamentary Commissioner for the Environment that "all tertiary graduates leaving TEOs should possess a core understanding of ... environmental sustainability as a result of institutes encouraging Education for Sustainability throughout their organisations".

The failure to build 'connection' between strategic vision, aims, goals, investments, performance measurement, and controls is a fundamental flaw in any strategic management or policy making process.

The case of New Zealand reflects the results of a recent OECD review of Education for Sustainable Development. The review found several recurring barriers to greater adoption of EfS, including the inflexibility of education systems, and problems in promoting interdisciplinary approaches (OECD, 2008).

The 'rise and fall' of government policy for Education for Sustainability in New Zealand condemns graduates of Tertiary Educational Organisations to the consequences of what appears to be a 'conspiracy of ignorance' orchestrated by administrators in the Ministry of Education, the Tertiary Education Commission, and the senior leadership of some tertiary educational organisations.

## **MANAGEMENT IMPLICATIONS AND CONCLUSIONS**

Given the increasing scientific and economic evidence - and public acceptance - that the natural environment requires humanity to take an alternative approach to its care, whose responsibility is it to act? What actions should they take? Will the 'invisible hand' of the free market act in sufficient time to respond appropriately to the need to 'save the planet'? Will sovereign governments enact appropriate legislation and fund effective policies? What are the appropriate roles for the tertiary sector?

It can be argued that tertiaries - independent of government tertiary investment priorities - must consider seriously adopting a proactive role towards adopting a policy stance along the lines proposed by New Zealand's Parliamentary Commissioner for the Environment.

Boven (2000; 2003) examined why so little effective policy action has emerged in response to calls for sustainable development, limitations on emissions, and protection of the environment. He concluded that the key reason we have seen ineffective action is the dominance of ideas that have hitherto been both successful and therefore flourished and persisted. In particular, the set of dominant economic ideas (or paradigm) that lie at the foundation of our policy prescriptions were developed when there were huge opportunities for economic development, great benefits from competition, and few environmental constraints. Boven further notes that governments will not regulate adequately for sustainability because governments in democracies are "followers not leaders ... Governments will generally follow business leadership because businesses are motivated, resourced and organised. Therefore, when a proposed environmental protection policy is counter to the profit maximising interests of businesses that policy is not likely to be implemented" (Boven, 2000, p. 5). Boven's conclusion is well exemplified by the two cases presented in this paper.

Since we cannot rely on businesses or governments to consider adequately the environment, that leaves the task to individuals. However, the dominant paradigm suggests that individuals are motivated only by consumption, and that if they did care about the risk of crisis they could not achieve anything useful. Boven explores how changes in individuals' values could influence both their consumption patterns - and who they vote for. Those changes could lead - perhaps - to appropriate change. Finally, he concludes that professionals and opinion-leaders are the vital actors for altering peoples' values, since they help establish subgroups who can lend support to effective action by individuals. From where would appropriately informed professionals and opinion-leaders emerge? It can be concluded that they should be expected to emerge from a nation's universities and other tertiary educational organisations.

The New Zealand Education Act provides legislative protection for the academic freedom and institutional autonomy of tertiary institutions. Consequently, tertiaries have the freedom - if not the financial resources - to embark on programmes of sustainable development and EfS. However, students invest their time and financial resources in their higher education. Students' investment in higher education is made with their expectation of higher incomes and/or higher work-life satisfaction. To what extent can courses in sustainable development contribute to students' expectations? Should such courses be compulsory? To what extent is knowledge of sustainable development a prerequisite to a modern graduates' ability to be a 'critic and conscience of society'?

Despite ineffective - and subsequent withdrawal - of support for Education for Sustainability in New Zealand's Tertiary Education Strategies, this conclusion reaffirms that of New Zealand's Parliamentary Commissioner for the Environment that "ALL tertiary graduates leaving tertiaries should possess a core understanding of ... environmental sustainability as a result of institutes encouraging Education for Sustainability throughout their organisations" (PCE, 2007, p. 8).

The question is how should that aim be achieved? As a minimum it is currently in consideration that all Unitec students should study at least one course (approximately 150 hours of engagement) focussed specifically on sustainability issues, further reinforced by elaboration specific to a student's selected discipline. New Zealand examples are presented in Bould (2007) (for design students), and Dyer and Harnisch (2000) (for management students). Auckland University delivers a Masters of Architecture in Sustainable Design. Since 1992, Massey University offered a Bachelor of Technology in Environmental Technology and Sustainable Energy and a Bachelor of Resource and Environmental Planning.

However, these curriculum examples are insufficient to make an effective widespread impact beyond the few students who study these specialist courses. Education for Sustainability should be mainstreamed into tertiary education as a generic academic literacy comparable to how many students are introduced to evidence-based critical writing and statistical reasoning. It is also argued that engaging with EfS is a crucial trans-disciplinary literacy that provides the basis for creating the 21st century innovation architecture underpinning a nation's strategic core competencies (Mellalieu, 2009a). These strategic core competencies are founded on emerging green technologies such as biomimicry, industrial ecology, green chemistry, renewable energy, green nanotechnology, radical resource productivity, whole system design, and sustainability (The Natural Edge Project, 2004). As with the earlier establishment of strategic core competencies built on the steam and internal combustion engines, applied chemistry, aeronautics, electronics, and information technology green-based core competencies will take decades for a company, region, or nation to establish and exploit competitively.

# EMPLOYABILITY IN HIGHER EDUCATION IN A NON-WESTERN CONTEXT: THE IMPACT OF GENDER, AGE AND JOB STATUS

Gbolahan Gbadamosi, University of Worcester, United Kingdom  
Ayotunde Adebayo, University of Lagos, Nigeria

## ABSTRACT

*The study explored the impact of students' gender, age and job status on employability and employment in a non-Western context. Respondents were 183 students in a Nigerian university. Results revealed that majority of respondents considered key skills and competences; work experience; gender and age and as key factors in employability, while ethnic group and religion are much less important factors in getting a job. Less than half considered foreign language skills as important. For employability, significantly more males than females indicated problem solving skills as important, while more females considered written communication and foreign degree/qualification as more important than males. The multivariate analyses did not reach significant levels. Policy implications and suggestions for future study were discussed.*

## INTRODUCTION

Employability has remained a very topical issue particularly in the developed world with a lot of concerns being raised about the importance of ensuring that students in higher education (HE) are adequately prepared with skills that would make them employable on graduation. Worldwide, many students are keen on having the right skills that would make them employable and reduce the potential threat of unemployment. Equally many academics are keen on inculcating the appropriate skills in their tutees that would make them attractive to the world of work. Employers have also raised concerns about both the inappropriateness of skill preparations in HE as well as having potential employees with the right skills that will enable them hit the ground running on employment. On their part, governments are often interested in reducing the level of unemployment which has risen unabated across the world, particularly since the global financial crisis that started in the USA around 2007. Many governments not only want graduates to have appropriate skills that would make them employable, they also urge HE managers to critically evaluate courses on offer so that what they offer aligns appropriately with what industry demands. Finally, most managers of HE engage on all fronts with students, academics, tutors and employers to raise the employability profile of their graduates. In a nutshell, all the stakeholders in the HE sector – students, academic staff, HE managers, employers, government and other policy makers and perhaps even sponsors including parents – demonstrate a commitment to the ideals of high levels of employability.

Employability is often discussed as a matter of international relevance and the development of graduates' employability is seen as vitally important. Yorke and Knight (2007) interpreted 'employability' in terms of a graduate's (or other awardee's) suitability for appropriate employment. This being clearly distinguished from actually getting the job which may vary depending of several factors including but not limited to the state of the economy and patterns of discrimination in the labour market, ability and willingness of the graduate to relocate with job availability, shortages in skills and particularly specialisation of the graduate among others. Interestingly, academics have manifested a range of attitudes towards employability from stark indifference to extreme optimism (Yorker & Knight, 2007).

Employability is the responsibility of all and the stakeholders involved are many as reflected by the research output in this area over the last years: employers (Clarke, 1997; Purcell et al., 2002); students (Moreau

& Leathwood, 2006; Tomlinson, 2007); academic staff (Lindberg, 2007; Yorke & Knight, 2007); higher education institutions (HEIs) (Smith et al., 2007); the government (Morley, 2001) and perhaps parents. In the UK, for instance, HEIs are now charged with promoting graduate employability with their performances monitored (Knight & Yorke, 2003). Employability is high on the HE agenda and many universities not only embed it within their curriculum (Atlay & Harris, 2000; Harvey et al., 2002; Smith et al., 2007) but also indicate it on their websites and brochures as evidence of why their HEI should be applicant's choice. It equally stands high on the government agenda (Moreau & Leathwood, 2006). Nearly 15 years ago, Clarke (1997) in an executive summary of interviews with 40 CEOs on what employability means highlighted a host of qualities expected of an employable person. Harvey (2001) suggests that it remains difficult to measure and define. The emerging indications from the literature suggest that employability is a complex concept or one whose definition has been elusive. In this paper we argue that the concept is perhaps better understood from the perspective of the particular stakeholder under focus and what seems to be missing from our knowledge in this area is the convergence of thoughts across different stakeholder perspective rather than a mere lack of consensus within particular stakeholders. However, there is a consensus that irrespective of which stakeholder's perspective one takes, employability is about being able to place graduates or other awardees on a job with their current level of skills preparedness.

Another stream of discourse are academics who argue, justifiably so, that HE is being repositioned as an industry as opposed to its hitherto social institution status (e.g. Gumpert, 2001) and thus a sub-system of the economy creating a situation whereby HEIs both mediate and manage government policy (Morley, 2001). Washer (2007) argue that graduates need to be equipped with skills that they can use to 'sell themselves' to employers even though he concedes that some academics argue that the skills agenda threatens the concept of a liberal education and devalues traditional notions of a university degree. It is also evident that employers are not satisfied with the quality of young people and graduates coming into the labour market and consider this a failure of education and training (Clarke, 1997). Nevertheless, employers share part of this blame because of their failure to forecast and communicate their requirements regarding young people to the education and training system.

Gender differences in employability have attracted research attention as have the impact of the world economic downturn of the last few years. Some research has shown, for instance, that women graduates, graduates from 'new' universities, minority ethnic groups and/or working-class backgrounds are likely to benefit less from having a degree in terms of both employment opportunities and salary (Archer et al., 2003; Moreau & Leathwood, 2006). Unemployment was also associated with class of degree, gender, age and ethnicity (Moreau & Leathwood, 2006). The influence of gender remains even among those graduates who have a first class degree (Smetherham, 2004). Similarly, changes in the global economy, the level of competitiveness including among HEIs has made it imperative for all stakeholders in HE to adjust their view of the feasibility of keeping jobs for life as opposed to the more feasible idea of making oneself employable for life. Moreau and Leathwood (2006) observed that the policy discourse on employability constructs it as matter of individual attributes and responsibility, and hardly that of structured opportunities in the education and labour markets. On the other extreme are those who have argued that the labour market rather than the capabilities of individuals is the primary driver of employability (Brown et al., 2003). Similarly there is increasingly a tendency of individuals to consider their personal attributes including social class, gender or race as irrelevant in employability (Hesketh, 2003).

## **Employability in a non-Western context – Nigeria**

High level unemployment of HEI graduates has been a common phenomenon in Nigeria particularly over the last three decades but it seems increasingly more so recently. Some empirical studies in Nigerian have asked the question whether this is a problem of the quality of the graduates, for example, Adeyemo et al. (2010) noted that many employers of labour usually complain that graduates are poorly prepared for work. The importance of developing employability skills has been a subject of some considerable research in Nigeria (e.g. Dike, 2009; Oloruntoba, 2008), so has the question of what factors are most critical in gaining employment (e.g. Anyanwu, 2000; Adeyemo et al., 2010).

In a recent analysis using survey data Adeyemo et al. (2010) reported a mismatch between university outputs and labour market demands. These authors found (in the following order) field of study, subject

specialisation, reputation of university attended, class of degree, age of applicant, previous work experience, and theme of thesis/project work as the most important factors for employment. This list compares favourably with and confirms an earlier one by Anyanwu (2000). Other diversity related issues especially gender differences have also been highly topical in employability generally in Africa. In an empirical study of students and Deans of Faculties in HEIs in South Africa, Maharasoa and Hay (2001) reported that students, irrespective of their race and gender, agreed that employability is one of the greatest factors influencing their choices of courses of study and indeed some envisaged seeking employment nationally while others aspire to go abroad. Furthermore, both the students and Deans seem to agree on the importance of employability and its significance as a component of quality, it would appear that faculties merely pay a lip service to it as far as the implementation and follow up on ground (Maharasoa & Hay, 2001).

Again in Nigeria, attention has also been paid to gender issues and especially gaps in opportunities among the sexes in HEIs. There have been suggestions of significant disparity in this respect as evidenced in some reports. For example:

*“In traditional, colonial and post-colonial Africa, women education had suffered some great neglect as a result of the dampening cultural belief that no matter how educated they are, women ultimately would end up in the kitchen!” – (Oyebade, 2008: pp. 289).*

Oyebade (2008) citing several studies indicated that there is a very poor level of equity in accessibility to university education in Nigeria, whether on the part of women, or other educationally-disadvantaged groups such as nomads, migrant fishermen, street-children, or minority tribes.

## Research questions and objectives:

This paper seeks to explore and analyse students’ understanding and appreciation of what is required to be considered employable. To what extent do students recognise key employability skills and which particular skills do they value more? Does this differ by gender, age and job status? There were three dependent variables under investigation: employability perception, employability skills and employment, and confidence in educational skills. There were five independent variables: age, gender, job status, marital status and self-managed small business. The study seeks to test the following specific hypotheses:

1. There is no gender difference among the study variables (employability perception, employability skills and employment, and confidence in educational skills).
2. There is no relationship among study variables: employability perception, employability skills and employment, confidence in educational skills, age, gender, job status, marital status and self-managed small business.
3. There is no significant difference in the impact of age and gender on employability perception. Gender moderates the relationship between age and employability perception.
4. There is a collective impact of age, gender, and job status on the dependent variables (employability perception scale, employability skills and employment, and confidence in educational skills).

## METHODOLOGY

### The sample framework

This paper reports a case study of a big federal university located in South West Nigeria. The survey instrument was administered at the end of lectures to a sample of undergraduate students at different levels in a big faculty of the university over a four week period. Completed and usable questionnaires were returned by 183 respondents after 18 were excluded for various reasons of incompleteness out of the total 300 questionnaires administered representing a valid response rate of 61 percent. Of this number 90 were males and 91 female. Detailed profile is provided in table 1.

**Table 1: Demographic Profile of Respondents**

		Frequency	Percentage
Gender	Male	90	49.7
	Female	91	50.3

Age	Below 20	14	7.8
	21-25	106	59.2
	26-30	49	27.4
	31-40	9	5.0
	41-50	1	0.6
Marital Status	Married	17	9.4
	Not married	164	90.6
Job Status	Yes	36	20.1
	No	143	79.9
Self-managed SME	Yes	80	46.0
	No	94	54.0

*Note: Only valid percent are reported [N = 183]*

## Measuring instrument and reliability

*Employability Perception Scale (EPS):* the authors developed a total of 17 items from several sources surrounding the conceptual framework of employability in HE. These items were measured on a 4-point scale ‘strongly agree’ to ‘strongly disagree’. The items were pretested with small cohort of undergraduate students to check for item clarity and relevance after which very few minor adjustments were made. Cronbach alpha for these items in the present study is 0.75.

*Employability Skills & Employment Scale:* There were 13 items on this scale, a modified increase from the 10 items of Wilton (2008). Respondents were asked how they would classify the importance of the possession of these of these skills in gaining employment. These were measured on a 4-point scale from 1 = extremely important to 4 = extremely unimportant. Cronbach alpha for the scale in the present study is 0.83.

*Confidence in Educational Competences:* these were measured with the 18 competences items developed by Allen and De Weert (2007). Respondents were asked to indicate extent to which they would say their education has been able to instil each of the 18 competencies on graduation. The items were measured on a 5 point scale with 1 = to a great extent; 2 = to some extent; 3 = to a very little extent; 4 = not at all and 5 = don’t know. Cronbach alpha for the scale in the present study is 0.93.

*Demographic Profile:* other personal information sought from respondents include: age; gender; marital status; year of study; job status; job type and industry type.

## DATA ANALYSIS AND FINDINGS

In the section, we present the data analysis and our findings. In table 2 the descriptive statistics is presented followed by more rigorous analysis to answer our research questions and test the hypotheses.

**Table 2: Employability Perception Scale (EPS)**

	<b>Strongly Agree</b>	<b>Tend to Agree</b>	<b>Tend to Disagree</b>	<b>Strongly Disagree</b>
Educational institutions should develop key skills and competences to make their graduates employable	89.6%	8.7%	0%	1.6%
Individual are ultimately responsible for developing key skills and competences to make them employable	47%	45.9%	5.5%	1.6%
Work experience will enhance likelihood of getting a job	51.7%	33.9%	11.7%	2.8%
Obtaining a higher qualification (e.g. Masters’ degree) would enhance ability to get a job	42.3%	37.4%	13.2%	7.1%
You stand a better chance of getting a job with a foreign degree/qualification	47.2%	30.9%	14%	7.9%
A professional qualification provides a better chance of getting a job	59.3%	32.4%	5.5%	2.7%
Your contacts and connections is the single most important factor in getting a job	29.9%	40.1%	20.9%	9%

If you are very good, you will always get a job on your own merit	31.5%	43.8%	21.3%	3.4%
Class of degree (1 <sup>st</sup> , 2/1, 2/2, 3 <sup>rd</sup> ) have an impact on getting a job	51.1%	37.5%	9.7%	1.7%
The ethnic group (e.g. being Ibibio, Yoruba, Hausa, Igbo, Ijaw etc.) will have an impact on getting a job	15.6%	35%	30.6%	18.9%
Gender will have an impact on getting a job	23.3%	38.3%	22.8%	15.6%
Age will have an impact on getting a job	32.8%	48.9%	10.6%	7.8%
Religion will have an impact on getting a job	13.3%	32.8%	32.8%	21.1%
Sexual orientation (i.e. being gay/lesbian) will have an impact on getting a job	15.1%	25.1%	23.5%	36.3%
The course of study will have an impact on getting a job	25.7%	48%	17.3%	8.9%
Employment is best guaranteed only if you are in self-employment	35.9%	32%	17.7%	14.4%
Computer and other IT skills will have an impact on getting a job	55.2%	33.3%	9.3%	2.2%

Table 2 above is self explanatory presenting results for the Employability Perception Scale (EPS). However, some of the most interesting findings to flag on the table include: ethnic group, gender, age, religion, sexual orientation, course of study and self-employment. The importance or otherwise of ethnic group on employment was a near 50-50 split in a country where ethnic group is a major dividing issue. It is interesting to note that a large proportion of the younger generation (since about 95 percent of our sample is under 30 years of age) actually tend to disagree or strongly disagree that ethnic group is a key factor for job opportunity and access. About 61 percent strongly agree or agree that gender is an important factor in getting a job position while 81 percent strongly agree or agree that age is an important factor in getting a job. Up to 60 percent disagree that sexual orientation is a key factor in getting a job. Also about 27 percent tend to disagree or strongly disagree that course of study has an impact, while about 32 percent tend to disagree that self-employment is the best way of guaranteeing one's employment.

The result for the Employability Skills and Employment Scale (ESES) shows that 12 of the 13 items were adjudged as extremely important or important by at least 86 percent or more respondents. The most important items to flag for this scale is the "foreign language skill" which is judged by 48 percent of the respondents as unimportant to extremely unimportant.

*Results for Independent t-test:* to test the first hypothesis on gender differences in the study variables independent t-tests were conducted. Independent t-test conducted for each of the 17-items on the EPS revealed only one item: "*You stand a better chance of getting a job with a foreign degree/qualification*" was statistically significant with significantly more female believing this to be the case ( $t = -4.066$ ,  $df = 174$ ,  $p < .000$ ). Similarly Independent t-test was conducted to test significant gender differences for the 13 items on the Employability Skills & Employment Scale. Result revealed significant gender difference on two items: (1) "*problem solving skills*" with males indicating it is extremely more important than females ( $t = -2.242$ ,  $df = 163$ ,  $p < .026$ ) (2) "*written communication*" with females indicating it is extremely more important than males ( $t = 2.019$ ,  $df = 171$ ,  $p < .045$ ). The Independent t-test conducted to test significant gender differences for the 18 competences items revealed significant gender difference in only one competency "*communication skills*" ( $t = 2.338$ ,  $df = 167$ ,  $p < .021$ ) with significantly more females than males indicating the likelihood of more communication skills on graduation.

**Table 3: Means, Standard Dev., Cronbach's Alphas & Intercorrelations among Study Variables**

Study Variables	Mean	SD	1	2	3	4	5	6	7	8
1 Employability Perception Scale	1.96	.39	<b>(.75)</b>	.28**	.24*	-.02	.24**	-.11	.05	-.03
2 Employability Skills & Employment	1.57	.36		<b>(.83)</b>	.68**	.24**	-.05	-.03	-.08	-.04

3	Confidence in Educational Competences	1.67	.51	<b>(.93)</b>	.05	-.02	-.03	-.06	-.04
4	Age	2.31	.71		-	-.11	-.21**	-.17*	-.12
5	Gender	1.50	.50			-	-.21**	.26**	.03
6	Marital Status	1.91	.29				-	-.07	.04
7	Job Status	1.80	.40					-	.23**
8	Self-managed small business	1.54	.50						-

Notes: (2-tailed); \*  $p < 0.05$ ; \*\*  $p < 0.01$ ;  $n = 183$ ; Alpha reliability coefficients are reported in bold and parenthesis where applicable

Persons' correlations coefficients were conducted among the study variables to test the level of association and the second hypothesis. The result of the intercorrelation revealed significant correlation between the measure of employability perception on one hand and both the employability skills and employment measures, and confidence in educational competences measures. Employability perception is also significant correlated with gender. The employability skills and employment measure is also significantly correlated with age. The result also revealed some intercorrelation between some of the independent variables: job status and self-managed business; age and job status; age and gender; gender and marital status; and gender and job status.

**Table 4:Two-way ANOVA [Age and Gender on Employability Perception Scale (EPS)]**

Dependent Variable: Employability Perception Scale						
Source	Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
Corrected Model	1.665 <sup>a</sup>	8	.208	1.409	.198	.078
Intercept	98.947	1	98.947	669.729	.000	.834
Age	.092	4	.023	.156	.960	.005
Gender	.098	1	.098	.664	.417	.005
Age * Gender	.322	3	.107	.725	.539	.016
Error	19.650	133	.148			
Total	566.260	142				
Corrected Total	21.315	141				

a. R Squared = .078 (Adjusted R Squared = .023)

Note: no significant interaction effect and no significant main effect for the IVs

To test the third hypothesis, a two-way between-groups ANOVA was conducted to explore the impact of gender and age on employability perception as measured by the EPS. Respondents were divided into five age groups (see table 1). The result shows that interaction effect between gender and age group was not statistically significant,  $F(3, 133) = 0.725$ ,  $p = .54$ . The main effect for both age  $F(4, 133) = .156$ ,  $p = .96$  and gender  $F(1, 133) = .664$ ,  $p = .42$  did not reach statistical significance.

**Table 5: MANOVA for combined DV [employability perception scale, employability skills and employment, and confidence in educational skills]**

	F	Sig.	Wilks' Lambda	Partial eta squared
Gender	(3, 87) = 1.10	0.35	0.96	0.04
Age	(9, 212) = 0.66	0.75	0.94	0.02
Job status	(3, 87) = 1.24	0.30	0.96	0.04

To test the fourth hypothesis, a one-way between groups multivariate analysis of variance (MANOVA) was performed to investigate the collective impact of gender, age and job status differences in employability in higher education in the sample. Three dependent variables were used: employability perception, employability skills and employment, and confidence in educational skills. The independent variables were gender, age and job status (defined as whether respondents was in some employment or not). The necessary preliminary assumption testing was conducted to check for normality, linearity, univariate and multivariate outliers, homogeneity of variance-covariance matrices, and multicollinearity, with no serious violations noted. The result indicated no

statistically significant difference between males and females, among the age categories and job status on the combined dependent variables employability perception, employability skills and employment, and confidence in educational skills. Since we did not obtain any significant differences in our MAVOVA we could not investigate further into each of the dependent variable.

## CONCLUSION

The purpose of this exploratory investigation was to examine the impact of some demographic variables on employability in HE in a non-Western context using a sample of Nigerian undergraduate students. The descriptive statistic did generate a number of interesting findings like the significance of ethnic group, gender, age, religion, sexual orientation, course of study and self-employment in employability. Much of the survey data from our employability perception scale confirms the argument of Hesketh (2003, cited in Moreau & Leathwood, 2006); that the trend and discourse around employability encourages individuals to view their personal characteristics (e.g. social class or gender) as irrelevant. Overall, the findings from this study did not establish much gender and age differences on employability. Moreover, effort at multivariate deeper level analyses yielded rather disappointing results as no significant differences were found in the independent variables: gender, age and job status. Findings from extant studies (e.g. Coates & Koerner, 1996; Wilton, 2008) indicate that management education providers might well benefit from greater engagement with recent graduates about their experiences in the workplace and the relevant skills that should be developed on undergraduate programmes.

Policy implications and recommendations: the data presented in his paper suggest that the role of demographic profile in gaining employment may not be in the direction generally speculated by the general population in Nigeria. For example, findings from our sample suggest that key skills and competences; work experience; gender and age of the applicant among others are significant factors for gaining employment. The larger population tend to emphasise characteristics such as ethnic group and perhaps religion as important and these were not identified as important factors in getting a job by the sample. In terms of government policy direction and emphasis, the role of employers and educators the factors which are identified as more problematic and divisive in the country (ethnic differences and religious divide) seem generally less cited as such by this sample. Moreover, in the light of some of these findings, it might be beneficial to initiate processes for more engagement amongst the management of HEIs, employers, government policy makers and other stakeholders. This would help immensely in the determination and articulation of employability strategies and practices as the complaints and focus of key stakeholders seem completely divergent. None of the key stakeholders seems capable of addressing the various knotty issues raised by employability in HE in isolation of others. Universities may be limited in their capacity to enhance employability of their students, even though policy-makers consistently argue that they have a pivotal role (Tomlinson, 2007).

Limitations of the study: data for the present study was derived mainly from survey information with the attendant problems that it could be superficial and does not have the advantage of an interview which can give deep insight into the reason for some of the problems identified. Nigeria is a big and diverse country and even though data was collected from big university in a cosmopolitan city, this limits generalizability if such data is not spread across the country. Future studies would therefore benefit from the use of qualitative methods and a more diverse spread in data collection.

In sum, this paper contributes to the debate around employability in a less discussed non-Western context – Africa. It explores an employability perception scale that is adapted for the environment and clearly relevant in this context while also revealing the value of stakeholders' collaboration in HE in redirecting attention and ensuring success of improving employment levels and employability generally.

# THE ROLE OF VALUES ON THE PREFERENCE OF FOOD ATTRIBUTES

Ebru Genc, Eric Eisenstein and James Hunt  
Temple University, USA

## ABSTRACT

*We simultaneously evaluated environmental, functional and price attributes of a food product by means of a choice-based conjoint experiment. A sample of 146 consumers chose the product most preferred among many product profiles that were systematically varied across choice sets with respect to organic, fair trade and certified vegan, nutrition value, taste and price attributes. Choice data and data on value orientations were analyzed by a conditional logit model. This approach enabled us to model product choice as a function of three environmental, two functional and price attributes and of consumer characteristics. The latter permits market segmentation of preference data. The main results showed that consumers' preferences of product features are dependent on their value orientations. Results reveal that environmental attributes are placed relatively more importance by individuals that have higher altruistic value orientations. Whereas functional attributes is more preferred by individuals that have higher egoistic value orientations. We also found evidence for differences among environmental attributes in terms of their effect on choice.*

## INTRODUCTION

The market for environmentally friendly products, defined as products that address certain environmental issues is growing dramatically. In particular, food products have been appealing to consumers through their environmental attributes as well as their functional attributes such as taste and nutrition value. Several papers studied the comparison of functional and environmental food attributes of food products in terms of their effect on buying behavior. For instance, Bougherara and Combris (2009) studied how the addition of one environmental label to a conventional food product changes consumer willingness to pay (WTP), and to what extent the WTP for environmentally friendly products is due to functional attributes. Within that line of inquiry, this study goes further by comparing environmental, functional attributes and price attribute of a food product as a *trade-off* in terms of the relative importance given by consumers in their food product buying decisions.

Environmentally friendly products may also diverge based on the specific issue that is concerned. Particularly, food products can have different types of environmental attributes. Although it is possible to make different categorizations, for the purpose of this study, we categorize them into three main groups. The first group of attributes benefits natural environment through restricting the use of synthetic pesticides and chemical fertilizers. The second group benefits animal well-being through preventing animal cruelty. The last group benefits people through assuring farmers and workers are justly compensated and forced child labor is strictly prohibited. Since each of these groups reflects a different aspect of the environmental issues, we assume that each of them may have a different effect on product choice decision. Several studies find that consumers respond differently to different environmental labels (Howard and Allen 2006; Loureiro and Lotade 2005). Accordingly, we study the *relative* importance of three particular attributes (organic, fair trade, certified vegan) that belongs to each one of the three categories defined, in a realistic product choice situation. Unlike the previous studies, we consider *between-group effect* on choice decision in the way of *environmental* versus *functional*. We also consider *within-group effect* on choice decision; primarily within three environmental attributes and secondarily within two functional attributes. We anticipate that the category of the environmental attribute makes a

difference on the relative importance given to each of the environmental and functional attributes in a product choice decision.

Individuals are heterogeneous and consequently, they have different values, different life styles, different perceptions of the environmental problems and different prior informational levels (Johansson-Stenman 1998). Many studies examine this heterogeneity among consumers in terms of their effects on proenvironmental behavior (De Palsmacker, Driesen and Rapp 2005; Fraj and Martinez 2006; Honkanen, Verplanken and Olsen 2006). People choose products to achieve their value-oriented goals (Solomon, Bamossy, Askegaard 1999) and individuals who make consumption choices based on their values are increasing (Micheletti 2003). In this study, we examine the impact of individual differences due to a dichotomy of values, namely altruistic and egoistic value orientations. By definition, altruistic value orientations motivate individuals to increase the welfare of 'others' such as natural environment, animal welfare and people (Batson 1998). Egoistic value orientations lead individuals to look for boosting personal welfare (MacIntyre 1967). Particularly, we want to study how the altruistic/egoistic value orientations affect the importance placed on various attributes in a food product choice. In other words, we want to examine whether the importance placed on each of three environmental and two functional attributes varies according to whether individuals have higher levels of altruistic or egoistic values. Previous studies examine values in terms of their effect on whether to buy an environmentally friendly product or not (e.g. whether to buy a disposable diaper or cloth diaper) (e.g. Follows and Jobber 2000) or on willingness to pay for an environmentally friendly product. (e.g. Ojea and Loureiro 2007). Unlike previous studies, this research uses values to explain the relative importance placed on attributes and the levels of the attributes that are preferred by consumers when choosing an environmentally friendly food product rather than to explain the decision of whether to buy an environmentally friendly product or not or how much more they pay for these products.

Therefore, the objective of this study is threefold. Firstly, we compare two groups of attributes (environmental, functional) in terms of the relative importance placed on them by consumers on their food product choices. Secondly, we compare three environmental attributes (organic, fair trade, certified vegan) in terms of their relative effects on product choice. Finally, we assess whether the importance placed on two groups of attributes vary based on whether individuals have higher levels of altruistic or egoistic values. The hypotheses that explain the objectives of this study is as follows:

*H1: Individuals that have higher levels of altruistic values place more importance on environmental attributes compared to individuals that have higher levels of egoistic values.*

*H2: Individuals that have higher levels of egoistic values place more importance on functional attributes compared to individuals that have higher levels of altruistic values*

*H3: There are differences among environmental attributes in terms of the relative importance placed on them in consumer product choice*

## METHODOLOGY

### Pilot Study

A pilot study was conducted for two reasons. First, we wanted to validate the attributes that are actually important to consumers in their environmentally friendly food buying decision. Second, we wanted to confirm which of the value items relates to egoism or altruism in consumers' minds. A sample of thirty five respondents completed an online survey. In the first question, they were asked "Which of these product characteristics come to your mind when you think of buying an environmentally friendly food product?" We used 7 point Likert Scale: '1= Never –7= Always'. We determined the relevant attributes by choosing the items that have an average score of three or greater. In the second question, forty six value items were used for evaluation. The value items were adapted from the Rokeach Value Inventory and the study by Stern, Dietz and Guagnano (1995). Respondents were asked "In your judgment, please identify the following items on a scale basis whether it relates to altruism or egoism?" Here, we used 7-point Likert Scale: '1= certainly egoism, 2, 3 (unlabelled), 4= neither egoism nor altruism, 5, 6 (unlabelled) 7= certainly altruism'. 11 items were selected as measures of altruistic values and 8 items were selected as measures of egoistic values (see Table 1). Cronbach's coefficient alpha (1951) was computed to determine the internal consistencies for altruistic and egoistic value scales.

Cronbach's alpha coefficient produced by altruism scale is 0.89 and by egoism scale is 0.82. Therefore, all of the items were considered to be measuring the desired underlying concepts and so the scale is reliable.

**Table 1: List of Value Items**

<b>Altruism</b>	<b>Egoism</b>
Equality	A Comfortable Life
Forgiveness	Ambition
Helpful	An Exciting Life
Loyalty	Authority
Obedience	Choosing Own Goals
Politeness	Curiosity
Preventing Pollution	Independence
Protecting the Environment	Wealth
Respecting the Earth	
Responsibility	
True Friendship	

## Main Study

In the main study, a choice-based conjoint analysis was conducted to compare consumer preferences regarding to environmental, functional and price attributes of food products. Conjoint analysis is one of the most popular methods for analyzing consumer preferences (Green and Srinivasan 1990; Carroll and Green 1995). The underlying idea of conjoint analysis is simulating trade-offs that consumers face in a real life buying situation. By modeling consumer decisions, it reasonably predicts consumer behavior. The consumer's overall perception of utility is separated into a combination of part-worth utilities provided by various product attributes and their levels. In *choice-based* conjoint analysis, respondents express their preferences by choosing the best product profile among two or more alternatives that vary in various attribute compositions.

We chose six attributes for this study with two levels for each. Based on the purpose of this study, we selected from the two groups of attributes, environmental, functional, to compare the effect of each other on product evaluations. The environmental attributes included in the choice task are organic, fair trade and certified vegan. These are in fact specific labels that correspond to relevant attributes. The functional product attributes are nutrition and taste. In order to reduce possible misconception of the meanings of environmental attributes, we gave brief definitions for them in the questions. Organic was defined for the respondents as 'Products that have low or zero use of chemically synthesized inputs'. Fair trade was defined as 'Products that do not contain animal products and that have not been tested on animals. Certified vegan was defined as 'Products that do not contain animal products and that have not been tested on animals.' These three environmental attributes chosen for this study reflect a variety of issues that may be of concern to the environmentally concerned consumers. It is good to note that these three environmental labels are actual labels that are extensively used in the marketplace. By using actual labels, we think the choice tasks will be more realistic for the respondents. All environmental attributes included two levels indicating that whether the product addresses the particular environmental issue or not (organic/ not organic, fair trade/not fair trade, certified vegan/not certified vegan). Functional attributes which are taste and nutritional value also included two levels as low or high (low/high in taste, low/high nutritional value). We also included price as an attribute, and two levels were chosen for this study (\$1.50, \$2) to allow respondents to consider the choice task as a real life buying decision. We chose *16 oz can iced tea* as the product because it is widely available in the market and it can potentially carry all three environmental attributes.

Based on the chosen attributes and their levels, we created a sample design table which we used it for assigning *priors* to the levels of attributes by using the Choice Design platform of the JMP statistical software. By employing the prior information, JMP created the final design table for the survey while maintaining the coincidence of uncorrelated levels of different attributes appearing together. This design assures that an estimate of the importance of one attribute is unaffected by the estimate of other attributes.

The survey instrument was presented to participants in the form of a five-page online survey. In the very first page, respondents were given the instructions about their rights and responsibilities. The second page of the instrument included twelve questions related to conjoint analysis where each corresponds to a choice set. A total of twelve conjoint choice sets were presented for each respondent by using a random sampling of choice tasks. Each of the twelve choice sets included three product alternatives that have different attribute level compositions. For each choice task, respondents were asked to select the best product alternative for them to purchase. The third page of the instrument included the value items in order to define respondents' altruistic and egoistic value orientations. Respondents were asked to answer the question of "How important are the following words to you, as guiding principles in your life?" based on 7 point Likert Scale: '1= not at all important – 7= extremely important'. In the forth page of the instrument, respondents were asked to answer demographical questions. The final page of the survey included to measure three concepts which were considered as control variables for the study. These are environmental concern, perceived consumer effectiveness, perceived environmental effectiveness. Three statements were presented for each concept. Respondents were asked to answer the question of "To what extent do you agree with the following statements? Based on 7 point Likert scale: '1= strongly disagree – 7= strongly agree'.

## RESULTS

### Respondent Demographics

Data were collected from a convenience sample of consumers based on a self-completion questionnaire. Overall, 146 complete and usable questionnaires were obtained. The respondents who completed the survey are more likely to be female (63%), better educated (93% with some college and over) and younger (94% with age below 35) (see Table 3). The vast majority of the sample (85%) of respondents reported buying some type of environmentally friendly products in the past month (18% one, 25% two, 7% three and 35% four or more). Finally, 99% of respondents are non-vegans which is similar to the population statistics.

### Main Results

#### Model 1: The Relative Effects of Attributes on Choice

In the first model, we wanted to analyze the attribute effects on choice for the entire sample without making any differentiation regarding to subject characteristics. If we look at the results, we see that every attribute (organic, fair trade, certified vegan, taste, nutrition value and price) that we include in the model appeared as significant. The results confirmed our selection of attributes by showing that all of the selected attributes significantly affect choice (see Figure). The nutrition value attribute had the highest relative importance for the total sample contributing to 27% of the overall utility and taste came second with a slight difference with the relative importance of 26% on average. Fair trade and organic attributes became the third and forth respectively with an almost negligible difference in importance by contributing to 18% of overall utility. Certified vegan attribute followed them by being judged as the fifth important factor with a relative importance of 6%. Finally, price had a minor impact with a relatively less importance of 5%. However, one has to remain cautious concerning the impact of the price attribute. First, the product (ice tea) that we used in this study is a low- price item and second, as a result of this, the difference between the levels of the price (50 cent) is also small. We think that this can be an explanation of why price appeared as relatively less important in product choice.

**Figure: The Relative Attribute Importance**

On the other hand, the association between attribute levels appeared as expected. For example, being organic as opposed to non organic has a positive effect on the choice decision. This is exactly same for the other environmental attributes. Similarly, high nutrition value and better taste affect choice decision in a positive manner compared to lower levels. Finally, as expected, low price is preferred to high price. These results support the reliability of this study.

The resulting parameter estimates are referred to as part-worths. Each part-worth is the coefficient of utility associated with that attribute. These estimates are based upon the Firth bias-corrected maximum likelihood estimators. Therefore, they are considered to be more accurate than MLEs without bias correction. Based on these definitions, being organic compared to non-organic, on average increases the utility by .37 units. Being fair trade as opposed to non fair-trade increases the utility by .41 units, whereas being certified vegan compare to non certified vegan increases the utility by .25 units. On average high taste compared to low taste increases the utility by .55 units and high nutritional value compared to low nutritional value increases the utility by .21 units (see Table 2).

**Table 2: The Comparison of Model 1 and Model 2**

Altruism/Egoism*PRICE			-0.0000173	0.997

This first model allowed us to confirm that there are differences between environmental and functional attributes in which functional attributes are relatively given more importance by the entire sample. As we hypothesized, there are also differences within environmental attributes in terms of the relative importance. As results show, organic and fair trade attributes have quite higher impact on product choice compared to certified vegan. This suggests that all attributes within environmental category do not create the same impact on choice, which confirms our third hypothesis.

Overall, the relative importance of attributes shows how the respondents of the entire sample valued the different product attributes on average. In the following section, we will go beyond the average importance of each attribute and identify how the effects of these attributes on choice vary based on the values that altruism egoism scale takes.

### **Model 2: The Moderating Effect of Altruism Egoism Scale Variable**

In the second step of our analysis, we wanted to analyze how the inclusion of altruism egoism scale variable moderates the effects of attributes on choice. Therefore, we included the altruism egoism scale as an interaction term into the model. As results demonstrate the scale is another variable that significantly affects product choice. The effect appeared as more important than price and somewhat less important than other attributes. For the purpose of this study, we analyzed whether this variable moderates the relationship between product attributes and choice. Therefore, we are mostly interested in the interaction terms than the main effects.

When we look at the main effects, we see that some of the attributes (organic, nutrition value and price) becomes insignificant because they have a different meaning now (see Table 2). After an interaction term is added to the model, main effect coefficients now predict the attribute effect when altruism egoism scale equals to zero. Since no such people exist in this study (the scale takes values from 60 to 100), this isn't particularly

interesting. Therefore, the change in the significance of some of the attributes reflects nothing but the fact that these coefficients have different meanings in the two models. On the other hand, the main effects of certified vegan and taste remain significant since each has a *p-value* less than 0.01.

The results also show that the interaction between altruism egoism scale and certified vegan, taste and organic appears as significant (*p-value* less than 0.01 for the first two and 0.045 for the latter). One should carefully interpret the main effect coefficients after adding interaction term because they alone may not be meaningful. Therefore, the coefficients correspond to main and interaction effects should be interpreted together. When interpreting the interaction terms' coefficients, it is important to know the range of values that the altruism egoism scale takes. This scale is a continuous variable and took values from 60 to 100 with a mean of 83 based on consumers' responses. It is like a double-edged continuum in which altruism in one side and egoism in the other in the way of that the higher the value, the higher the altruistic value orientations of an individual.

In order to see the total effect of certified vegan attribute, we need to combine the main and the interaction effect. If we go through the continuum from the lower values to higher values, which means from egoistic value orientations to altruistic value orientations, having certified vegan compared to not having that attribute increases the utility more. In other words, it becomes a more important attribute compared to the other attributes for individuals that have higher altruistic value orientations. Similarly, organic attribute is given more importance by individuals that have higher altruistic value orientations than individuals that have higher egoistic value orientations because the combined coefficient becomes greater for higher values of altruism-egoism scale. For the taste attribute, if we go from the egoism side through the altruism side on the continuum, the relative effect of taste on choice decreases.

As numbers show all significant results confirmed our hypotheses which suggest individuals who have higher altruistic value orientations place relatively more importance on environmental attributes compared to functional attributes and individuals who have higher egoistic value orientations place relatively more importance on functional attributes compared to environmental attributes. If we ignore the significance of the coefficients, we can say that all (except fair trade) of the results are as we hypothesized. That is, for environmental category, the effects of the attributes are becoming greater for higher values of altruism egoism scale, whereas; for the functional attributes, the effects of the attributes are becoming smaller for higher values of the scale. Since the interaction effect is not significant regarding to fair trade, nutrition value and price, we can say that these results partially confirm our first two hypotheses. The insignificances of the interaction effects inform that altruism egoism scale does not make a difference with regard to these attributes. In other words, the importance placed on these attributes (fair trade, nutrition value, and price) does not vary based on whether someone has higher altruistic or egoistic value orientations.

Overall, altruism egoism scale is significantly moderating the relationships between half of the attributes and choice. Besides, if we compare AICs (corrected Akaike's Information Criterion) of the two models, we see that the second model explains choice in a better way as it has a lower AIC score (see Table 2) confirming that altruism egoism scale is an important predictor of choice.

## DISCUSSION

The data gathered for this study were used to determine which of six food product (ice tea) attributes (Organic, Fair Trade, Certified Vegan, Taste, Nutritional Value and Price) are most important. We analyzed how the effect of each environmental attribute on choice diverges from the effects of other environmental attributes and the functional attributes. Therefore, in this study, the type of the environmental concern (not just the presence or absence of one environmental attribute) was also incorporated as a product attribute. We believe that this will provide more insight into the investigation of the importance placed on attributes for different types of environmental issues in terms of what or whom they benefit (the environment, people or animal well-being).

As results show, all of the six attributes significantly affect choice decision. Nutrition value appears as the first criterion on which consumer choice of products are based. Taste comes second with a small difference. These are followed by organic and fair trade attributes with a negligible difference between each other. Certified vegan and price are superseded by other criteria, in which certified vegan becomes the fifth and price was given

less importance by consumers. There is much beneficial information that can be gained from these results. First of all, the results show the relative importance placed on these attributes by the average consumer. Second, they demonstrate that the effect of an environmental attribute is dependent on what or whom it concerns. This study specifically suggests that products that concern the natural environment and working conditions of farmers and child labor are on average more important for consumers than animal wellbeing. Therefore, analyzing proenvironmental behavior as a whole can give misleading conclusions. Each attribute should be examined separately by marketers, as their level of importance is different.

Although the result regarding the price attribute seems to be surprising, if considered carefully, it is not much. The product used in this study is a low price item so the difference between levels of price is very small (50 cent). We think that this would be the reason of why price becomes a less important criterion than it is expected to be. As the focus of this study is on the comparison of environmental and functional attributes, we will not go further in analyzing the details of price attribute.

One important implication of this study is providing information to marketers about the relative importance of the product attributes. Marketers can use this information to develop optimum products and satisfy consumers' preferences better. For example, they can obtain information on how changing the price, or other attributes, of a food product affects the desirability, or the utility, as perceived by potential buyers. Therefore, these results can be used for pricing products with different attributes.

We believe that all consumers are not the same in terms of the importance they place on environmental attributes of food products compared to functional attributes. Careful analysis of socio demographic and psychometric variables is needed for making an efficient segmentation and targeting. As socio demographic factors are not sufficient to explain environmental products buying behavior (De Palsmacker, Driesen and Rayp 2005), our study focuses on values (altruistic and egoistic) to segment consumers. As values are desired end states, buying behavior of food products can be considered as a means to achieving these values. It is an obvious advantage for marketers if personal values can be activated and related to the attributes consumers find important in a food product. Therefore, we assessed whether the importance placed on attributes by consumers vary based on their value orientations. As results of this study show, when buying food products, individuals that have higher altruistic values place more importance on environmental attributes, namely organic and certified vegan, whereas; those who have higher egoistic values place more importance on taste, which is a functional attribute. Therefore, a product that addresses the natural environment and animal wellbeing can be more advantaged, if consumers who have strong altruistic values are targeted. Similarly, a product that is prominent in taste feature can be highly advantaged, if consumers who have strong egoistic values are targeted. Advertisers can also benefit from these results by designing ads that appeal to these values and emphasize related attributes. For example, certified vegan products that assures the product is not tested on animals could be portrayed as beneficial to the welfare of "others", which is a desired end state for those holding higher altruistic values.

Another implication of this study can be on the promotion of new products since values can influence consumers' reactions' to new products. The more the attributes of a new product are consistent with dominant consumer values, the greater the likelihood of its success. Examining the target segment's value profile can help marketers to develop more appealing promotional campaigns. The more compatible a product is with consumers' values, the more likely consumers are to become involved in the message and find it relevant. Clearly, marketers should connect product attributes and benefits to consumer values. Because values represent the end state consumers desire to achieve and so, they are the driving force behind their consumption of products.

Overall, the present findings hold important implications for managers. Organizations can use these findings to maximize the effectiveness of their marketing actions. The results suggest that marketers should identify individuals based on value domains, namely the dichotomy of altruism and egoism for targeting purposes. Messages for each group of individuals should focus on the superiority of relevant features of the food product.

# **SUSTAINABLE DEVELOPMENT AND THE ROLE OF SMALL BUSINESS: COMPARISON OF ENTREPRENEURIAL ATTITUDES IN THE CZECH REPUBLIC, HUNGARY, POLAND, SLOVAKIA AND THE USA**

**Susan Glanz, St. John's University, USA**

## **ABSTRACT**

*Sustainable development means economic growth and social progress. The EU-wide sustainable development strategy was accepted in Gothenburg in June 2001, and several development indicators were developed to measure the achievements of the strategy. One evaluation tool is the socioeconomic development indicator, which measures the dynamism of the economy and its capacity to create new jobs. The popular perception in both the USA and in Europe is that Americans are more entrepreneurial than Europeans. In Europe, the lower economic growth rates, as compared to the US, is partially blamed on the lower entrepreneurial activity on the continent. This presentation will look at the entrepreneurial attitudes in the Czech Republic, Hungary, Poland and the Slovak Republic and contrast it with that of the USA, based on three surveys completed by the EU. Measurement of the legal and financial environment in the countries under examination is also evaluated by their changing rankings in the World Bank's Doing Business database, as economic development can be sustained only through job creation.*

## **INTRODUCTION**

The United Nations General Assembly held the World Summit on Sustainable Development (WSSD) in Johannesburg in 2002. The aim of the summit was to review progress in the implementation of sustainable development goals adopted in 1992 at the UN Conference on Environment and Development (UNCED) in Rio de Janeiro, and plan strategies for a renewed commitment to sustainable development. Paragraph 5 of the Johannesburg Declaration on Sustainable Development included a statement on employment, "28. We also agree to provide assistance to increase income-generating employment opportunities, taking into account the Declaration on Fundamental Principles and Rights at Work of the International Labour Organization."<sup>1</sup> Thus a goal of sustainable development was established: to find a balance between the human need to improve living standards and to preserve natural resources and ecosystems, for future generations. The European Union's sustainable development strategy was adopted by the European Council in Gothenburg in June 2001, and renewed in June 2006.

A tool to measure the success of the EU's sustainable development strategy is a socioeconomic indicator, the goal of which is to measure the development that 'promote(s) a prosperous, innovative, knowledge-rich, competitive and eco-efficient economy, which provides high living standards and full and high-quality employment throughout the European Union'<sup>2</sup>.

Politicians on both sides of the Atlantic talk of the job creating potential of small businesses. Starting a small business is a manifestation of entrepreneurship. Although different definitions of entrepreneurship have been used in history, today, the generally accepted definition of entrepreneurship is the one proposed by the OECD, which is: "Entrepreneurs are agents of change and growth in a market economy and they can act to accelerate the generation, dissemination and application of innovative ideas.... Entrepreneurs not only seek out and identify potentially profitable economic opportunities but are also willing to take risks to see if their hunches are right"<sup>3</sup>.

The popular perception in both the USA and in Europe is that Americans are more entrepreneurial than Europeans, and the lower European economic growth rates are partially blamed on the lower entrepreneurial activity on the continent. This presentation will look at the entrepreneurial attitudes in the Czech Republic, Hungary, Poland and the Slovak Republic and contrast it with that of the USA. The four Central European countries included in this study were chosen as they have geographic and strong historic and cultural ties.

To measure entrepreneurial activity within the EU, the Commission's Directorate-General 'Enterprise', is the department charged with studying the development of entrepreneurship. Since 2000, one of the tools used by the Commission to study changes in entrepreneurial attitudes is a regularly conducted public opinion survey. These surveys are completed in the USA as well, making the data comparable. The four central European countries were included in the EU surveys first in 2004. Since 2004 two other surveys were completed in 2007 and 2009.

The results of these surveys prove that the popular beliefs to be correct, American attitude is risk loving, but it did not translate into changing levels of entrepreneurial activity. The average number of self-employed business-owners in the US consistently hovers around 6%, and meanwhile in each of the other countries under examination, the ratio is twice that of the US' and is increasing.

## History - Why the Visegrad countries

When the communist governments collapsed in 1989/90, the economies of the four central European countries faced similar problems, e.g. number of unproductive state owned enterprises, the collapse of the Comecon trading system and the need for funds in convertible currencies. The economic reform models encouraged by the World Bank, the IMF, the European Bank for Reconstruction and Development (EBRD), the USA, and the European Community, the most important funders of the transformation, was rapid structural change. The structural corrections advocated by the funders were cutting government expenditures, liberalizing prices and selling-off state owned enterprises and encouraging the growth of the private sector. The respective leaders of Czechoslovakia, Hungary and Poland pledged their mutual cooperation in 1991, "to strive for European Integration"<sup>4</sup>, and at that time were known as the *Visegrad Triangle*<sup>5</sup>. With the breakup of Czechoslovakia into two separate countries on 1 January 1993, the Czech Republic and Slovakia became the third and fourth members of the group and, which then, became known as the *Visegrad Four* (V4). The rapid progress made by these countries in transforming their economies from socialist to market economies was already acknowledged in 1992, in the joint statement by the Foreign Ministers of the European Community and the *Visegrad* countries, which stated "The [European] Community recognized that the *Visegrad* countries have established democratic political systems which ensure respect for human rights, and made substantial progress in creating economic systems based on competitive markets and private entrepreneurship."<sup>6</sup> Meanwhile the USA has a mature economy and a long entrepreneurial tradition and is several sizes larger in all aspects, from population to per capita GDP, than any of the V4 countries individually or combined. In order to sustain an economic growth rate above the EU average, the V4 countries must encourage entrepreneurial attitudes to be similar with the US's; and underscored by EU publications analyzing various survey results as they emphasize "comparing European opinions with those of non-European countries, especially the United States".<sup>7</sup>

With three surveys completed in the Czech Republic, Hungary, Poland and Slovakia (the V4), within a relatively short time, comparisons can be made between entrepreneurial spirit between the V4 and the USA. Unfortunately not all questions were identical in the surveys, so all answers cannot be compared.

In the introduction to the results of the Flash Barometer 160, titled *Entrepreneurship*, the need to study entrepreneurship in Europe is summarized as:<sup>8</sup>

one of the main challenges facing the European Union Member States is the need to boost entrepreneurship. ... The European Commission opened the public debate by publishing, at the start of 2003, a Green Paper on 'Entrepreneurship in Europe'<sup>9</sup>, which focused on two questions in particular: why do so few Europeans set up their own business and why are so few European businesses growing?

## Entrepreneurial spirit

The first question asked in the Flash barometer surveys, to evaluate the entrepreneurial aspirations of individuals, focused on the preference of the respondents on their employment status, that is, do they prefer to be self-employed or to be an employee. The answers are reproduced in Table 1. Table 1 re-enforces the popular perception that there is greater entrepreneurial spirit in the USA than in central Europe, and this has not changed between 2004 and 2009.

**Table 1. Work Preferences (in %)**

	Being an employee			Being self-employed			Employment rate*		
	2004	2007	2009	2004	2007	2009	2004	2007	2009
<b>CZ</b>	54.8	54.1	62.1	30.5	29.6	32.1	64.2	66.1	65.4
<b>HU</b>	45.4	46.0	51.7	42.3	42.8	38.9	56.8	57.3	55.4

<b>SK</b>	56.5	56.8	64.8	29.4	35.9	25.6	57.0	60.7	60.2
<b>USA</b>	34.5	37.3	35.5	60.3	61.1	54.8	71.2	72.0	67.6

Q1. Suppose you could choose between different kinds of jobs, which one would you prefer: being an employee or being self-employed?

\*<http://epp.eurostat.ec.europa.eu/tgm/table.do?tab=table&language=en&pcode=tsiem010&tableSelection=1&footnotes=yes&labeling=labels&plugin=1>

Citizens of the V4 countries prefer being employees over being self-employed, with the exception of Poland. The surveys assume that being self-employed is a goal of an entrepreneur, and at the same time, this is the simplest form of entrepreneurship; and there is only one question in the survey that tries to find out the reason for being self-employed. The third question in the surveys was “Why would you prefer to be self-employed rather than an employee?” As expected in all countries personal independence is the number one reason given for wanting to be self-employed. In this study I will call those who would prefer to be self-employed as “potential entrepreneurs”.

Since there is no comparable statistical data for actual self-employment, I substituted for this data the figures provided by the OECD Labor Force Survey for “employers and persons working on own account, non-agricultural activities”<sup>10</sup> as a percentage of employed for the 2000- 2009 period, as those who are self-employed. This data is summarized in Table 2.

**Table 2. Percent of Employers and Persons Working on Own Account\*\***

\*\*Own calculations based on data provided by OECD. Stat., Annual Labor Force Statistics

I excluded agricultural employment and agricultural self-employment numbers when calculating the data for Table 2, as self-employment rates have typically been high in agriculture and it is declining in all five countries, and would skew the results.

While self-employment in Hungary decreased between 2000 to 2009; it remained virtually unchanged in Poland and the USA, and increased in the Czech Republic, and Slovakia. When comparing the desirability of self-employment to actual self-employment in these five countries we discover a different picture. The proportion of the respondents with a declared preference for self-employment is higher than that of those actually involved in entrepreneurial activities in all three surveys. In 2009 in the Czech Republic 16% were self-employed and twice as many people desired to be; in Hungary 11.2% were self-employed and 41% would have preferred to be; in Poland 11.8% were self-employed and 49% wished they were; and in Slovakia 15.4% were

self-employed, but 26% aspired to be. The smallest proportion of self-employed was in the USA (6.5%), which had the highest ratio (55%) of those who wished they were. So how can we explain this discrepancy?

## Legal and institutional barriers

The legal and institutional barriers for entering into business are measured across countries by the World Bank's *Doing Business* rankings. The World Bank's *Doing Business* is an annual publication introduced in 2002 which provides objective measures of business regulations and their enforcement in all nations. Data is collected in various categories and over the years new categories were added. To make the data comparable, only those categories which were used consistently will be included in this analysis. The ten categories for which data were collected are: Starting a Business, Dealing with Licenses, Employing Workers, Registering Property, Getting Credit, Protecting Investors, Paying Taxes, Trading across Borders, Enforcing Contracts, and Closing a Business. In two of the categories (Dealing with Licenses, and Registering Property) data was not collected every year; and three categories are not of primary importance to most potential entrepreneurs (Protecting Investors, Paying Taxes, Trading across Borders), thus I will exclude them from the analysis, leaving five categories. I divided these remaining five indicators into three subgroups. 1. *entry barrier* indicators, which measures the changes in the economic regulations that directly impacts an entrepreneur about to start a business; 2. *operating barriers* indicators, which influence entrepreneurs to stay in or to expand their businesses, 3. *the exit* indicators measure the cost of closing a business.

The *entry barrier* indicator used will be the *Doing Business*' Starting a Business index. This index consists of four components (number of procedures, time in days, cost and minimum capital). To create the entry barrier index I added up the components. The **lower** the indicator the easier it is to start a business.

The *operating barrier* index is the sum of the five components of the Employing Workers indicator (the difficulty of hiring index, the rigidity of hours index, the difficulty of firing index, rigidity of employment index, firing cost) and the three components of the Enforcing Contracts (procedures, time and cost) sub-index. Again, the **lower** the indicator, the easier - less restrictive – it is to operate the business.

The *closing index* is the sum of the Closing Business components of the *Doing Business* index, namely “weaknesses in existing bankruptcy law and the main procedural and administrative bottlenecks in the bankruptcy”, that is the time, and cost it takes to close a business and the recovery rate, which calculates how many cents on the dollar claimants (creditors, tax authorities, and employees) recover from an insolvent firm. In contrast to the other two indexes, here a **higher** the index is preferable, as this indicates that an entrepreneur recoups more of their costs when it closes the business.

The detailed data for all indexes is available from the author of this study.

### *The entry barrier index*

As table 3 shows the entry into the business world was made easier in all V4 countries, though entry is still more difficult than in the USA. The findings in economic literature are contradictory in this area, as in a study by Djankov and Murrell (2002), a World Bank economist, who found that lower entry barriers encourage entrepreneurship, while the conclusion that van Steel, Storey and Thurik (2007) arrived at was that easing entry regulations does not significantly impact entrepreneurial attitudes.

**Table 3. Entry barrier index**

	2004	2005	2006	2007	2008	2009	2010	Change	Potential entrepreneurs	
									2004	2009
<b>CZ</b>	107.4	105.3	98.5	79.7	72.5	64.4	62.7	- 44.7	30.5	32.1
<b>HU</b>	194.8	167.3	146	139.1	104.8	28.2	26.2	-168.6	42.3	38.9
<b>PL</b>	309.6	299.5	283.3	266.8	259	228.6	71.2	-238.4	51.1	49.2
<b>SK</b>	172.7	112.8	80.1	77.9	72.3	55.7	47.8	-124.9	29.4	25.6
<b>USA</b>	12.7	12.7	12.8	12.8	12.7	12.7	12.7	0	60.3	54.8

Reducing bureaucratic procedures and the cost did not seem to have a significant role in changing the mindset of the potential entrepreneurs in the V4. Of the four components of this index, the strongest influence on having a goal of being an employee to preferring to be an entrepreneur is the change in the percentage of the cost of starting a business. The cost of starting a business decreased in the V4, with the largest drop in Poland in 2009-2010; its impact – if any – will be felt in the future.

In spite of the ease of becoming an entrepreneur in the V4, the perceptions have not changed as Table 4 shows. In all countries the respondents believed that there is lack of information, difficulties with financing and bureaucratic red tape increased between 2007 and 2009, and in fact situation worsened since 2004. What might bode best for future V4 entrepreneurs is the increase of risk tolerance as shown by the table.

**Table 4. Perceptions**

	CZ			HU			PL			SK			USA		
	04	07	09	04	07	09	04	07	09	04	07	09	04	07	09

In agreement with the statement it is difficult to start a business because (Q12 in '04; Q16 in '07, Q18 in '09)

<sup>#</sup>One should not start a business if there is a risk it might fail.

This perception of worsening business conditions, both on the administrative level and the overall economy, is reflected in the decrease of the share of those who started in business because of an opportunity. The answers are summarized in Table 5.

**Table 5. Reasons for starting a business (in %). “You started a business because ...”**

	CZ			HU			PL			SK			USA		
	04	07	09	04	07	09	04	07	09	04	07	09	04	07	09
of an opportunity	46	57.9	50.4	57	43.8	43.2	49	60.4	55.5	33	60.5	39.7	71	72.5	62
it was a necessity	31	30.6	25.8	23	38.1	40.1	36	24.2	26.7	41	24.7	40.8	13	19.5	20.1
Both	19	9	13.3	19	14.3	16.1	12	12.8	12.8	24	7.2	18.9	10	5.4	12.5
NA	4	2.4	10.5	1	3.7	0.6	3	2.6	5.2	2	7.5	0.5	6	2.6	0.4

Q9 (2004), Q13 (2007), Q12 (2009), “All in all, would you say you started, or are starting, your business because you saw an opportunity or you started it out of necessity?”

In the V4, as in the USA the reason the share of respondents gave for launching, or for having launched their own business because they saw an opportunity declined between 2007 and 2009, except for the Czech Republic; the share of those who started their business out of necessity increased everywhere.

The 2009 survey tried to measure the public opinion about entrepreneurs. (The question in the 2004 and 2007 surveys was not asked, or rather a very different question was asked.) The highest favorable “rating” was in the US (73.4%), and second highest was in the Czech R (43.8%), with Slovakia (33.7%), and Poland (32.5%) following. In Hungary only 26% of the respondents had favorable view of entrepreneurs.

### Operating barrier index

Entrepreneurship is encouraged by liberal, transparent markets and this was a condition for EU membership. Market liberalization is reflected in the reduction of the *operating barrier index*, which is summarized in Table 6. A more liberal market should provide more opportunities to start a business, yet in Hungary the number of entrepreneurs who said that they started a business because they saw an opportunity declined. This can be partly explained by the fact that the operating index was reduced only after the 2009 survey was completed.

**Table 6. Operating barriers index**

	2004	2005	2006	2007	2008	2009	2010	Change	Potential entrepreneurs	
									2004	2009
<b>CZ</b>	1022.5	1022.5	1040	1040	1026	1013	737	- 285.5	30.5	32.1
<b>HU</b>	551	551	551	551	536	526	565	+14	42.3	38.9
<b>PL</b>	1209	1209	1189	1174	1039	1041	992	- 217	51.1	49.2
<b>SK</b>	867.7	777.7	777.7	777.7	776.7	776.7	740	- 127.7	29.4	25.6
<b>USA</b>	342.4	342.4	342.4	341.4	341.4	341.4	346.4	+4	60.3	54.8

In the Czech Republic, Poland and Slovakia the index improved, yet increasing the size of the potential entrepreneurial pool only in the Czech Republic. The index worsened in Hungary and the USA and the entrepreneurial pool decreased. The domestic and international economic conditions worsened, which impacted all countries. The worsening conditions and the perceived increase in financial and bureaucratic hurdles is reflected by the answer to the question in the survey, asking those who were **not** self-employed, if they could see themselves self-employed in the near future. The answers are summarized in Table 7.

**Table 7. Feasibility of self-employment in 5 years (in %)**

	2004		2007		2009	
	self-employment feasible in 5 years	Would prefer to be self-employed now (Table 1)	self-employment feasible in 5 years	Would prefer to be self-employed now (Table 1)	self-employment feasible in 5 years	Would prefer to be self-employed now (Table 1)
<b>CZ</b>	10	30.5	25	29.6	15	32.1
<b>HU</b>	42	42.3	27	42.8	19	38.9
<b>PL</b>	42	51.1	48	51	36	49.2
<b>SK</b>	17	29.4	39	35.9	22	25.6
<b>USA</b>	43	60.3	44	61.1	36	54.8

“Regardless of whether or not you would like to become self-employed, would it be feasible for you to be self-employed within the next 5 years??” (Q6 in 2004, 2007 and Q4 in 2009)

Although the 2007 results showed an increase (compared to 2004) in the proportion of respondents who considered it *very* or *quite* feasible to become self-employed in the next five years in all countries, save Hungary; the opposite trend was observed in 2009, in all countries the proportion of respondents who considered it *very* or *quite* feasible to become self-employed in the next five years has decreased. In all countries, the proportion of respondents – not (yet) self-employed – who considered it *very* or *quite* feasible to become self-employed in the next five years was lower than the proportion of non-self-employed respondents who would like to be self-employed.

The closing index, which evaluates the time and cost of bankruptcy proceedings, remained virtually unchanged in all countries. The differences between the USA and the V4 can be explained by two components of the index. One, the **cost** of the bankruptcy proceedings, which is recorded as a percentage of the estate’s value, is twice as high in the V4 countries as in the USA. The second, the **recovery rate**, expressed in terms of how many cents on the dollar claimants recover through the bankruptcy or insolvency proceedings is twice as high in the USA as in the V4. Unlike the previous two indexes, here the higher the number, the better it is. In the USA and in Poland the index decreased, the recovery rate fell in both countries, but it fell drastically, by nearly by 50%, in Poland. Since this index has remained virtually unchanged in all the examined countries, I argue that it has the

least impact on the size of the potential entrepreneurial pool, as potential entrepreneurs do not attach great significance to closing costs when entering into business.

**Table 8. Closing index**

	2004	2005	2006	2007	2008	2009	2010	Change	Potential entrepreneurs	
									2004	2009
<b>CZ</b>	42.2	44.2	42.2	42.2	42.8	42.4	42.4	<b>0</b>	30.5	32.1
<b>HU</b>	55	55	53	57	55.4	55.4	55.4	<b>+0.4</b>	42.3	38.9
<b>PL</b>	75	52	52	53	52.8	52.8	52.8	<b>-22.2</b>	51.1	49.2
<b>SK</b>	62.8	62.8	61.9	70	67.2	67.9	67.9	<b>+5.1</b>	29.4	25.6
<b>USA</b>	88.5	88.5	88.5	84.5	84.4	85.2	85.2	<b>-3.3</b>	60.3	54.8

## CONCLUSION

This study is limited not only because it is based on only three surveys, but also that not all questions were asked or were identical in the three periods and some were phrased differently. In the three surveys often US respondents were given only one answer choice, while in the EU multiple answers were allowed making fair comparisons difficult. Future surveys using the same questions and answer choices will allow for longitudinal studies. A follow-up using the focus-group method, a variation of the in-depth interview, would provide a more nuanced picture of entrepreneurial attitudes. Another limiting factor is the World's Bank Doing Business indicators, which are calculated for relatively large firms, defined as having up to 50 employees. However, most entrepreneurs start smaller businesses. Yet this study and the data shows the economies of the V4 became more open and transparent in the past twenty years, and especially since accession to the EU, and are on the way to meeting EU goals of reducing bureaucracy and red tape, even if this information has not spread to the public or believed by the potential entrepreneurs. While the V4 countries were judged ready and able to compete as equal partners by the EU in 2004, when they became full members, the standard of living in these countries was below that of the EU. Recent econometric studies prove that entrepreneurial activity is crucial to economic growth (Audretsch, Fritsch, 2002; Audretsch, Thurik, Verheul and Wennekers, 2002; van Stel, Carree and Thurik, 2002 and 2005). V4 countries must grow faster than the other EU member countries in order to diminish the differences between the standards of living between their citizens' and the rest of Europe, entrepreneurs, therefore, have to play a bigger role in the V4 than in Europe. Also, surveys cannot measure social and/or cultural variables which should be considered as determinants or controlling factors of entrepreneurship especially in cross-country studies.

A study by Zwan, Thurik and Grilo (2008)<sup>11</sup> proved that past "the age of 36 years the probability of at least thinking about embracing an entrepreneurial career decreases." All V4 countries face the problem of aging population, so potential entrepreneurial pool is, at best, constant.

# QUALITY AND PRICE IN MONOPOLY

**Sadik Gokturk and F. Masarani**  
**St. John's University, USA**

## ABSTRACT

*The market demand function for quality is derived from utility functions, by establishing a relationship between the number of units demanded, the price, and the quality level, for a given probability distribution of the income of the consumers. The existence of a solution to the monopolist's problem is proved from conditions on utility functions. It is also shown that demand is relatively more responsive to changes in price than it is to changes in quality. Finally, it is also shown that an increase in the quality cost and an increase in the cost of other inputs (which is assumed to be independent of quality) increases price, decreases quality, and, hence, decreases quantity supplied.*

## INTRODUCTION

This paper studies the determination of product quality, along with the price and quantity of that commodity, in a monopolistic market. We first derive the demand function for the commodity, as functions of price and quality. Next, we study the price and quality setting policies of a monopoly, which is producing that commodity. The paper concludes with a comparative statics analysis. While studies of quality determination are quite abundant in the literature, most of them are from the point of view of monopolistic competition, product differentiation, or advertising. Quality-setting by a monopoly however is studied rarely. The papers by Mussa and Rosen (1978), Sheshinski (1976), Spence (1975), and Masarani and Gokturk (1981), among others, do in fact study the problem of quality-setting by a monopoly. We extend in this paper the results of the latter paper.

## DERIVATION OF CONSUMER'S DEMAND FUNCTION FOR QUALITY

Consider a good A, of which a consumer buys only one unit. The quality of the good, as judged by the consumer, is a continuous variable, which is denoted by  $q$ . For the purpose of describing the preferences of the consumer for quality, we consider another good B, which is divisible and of uniform quality. Let  $U(x, q)$  be the utility derived by the consumer from consuming one unit of A of quality  $q$  and  $x$  units of B. Assume that  $U(x, q)$  is a twice continuously differentiable function and that it is an increasing function of each variable separately. The portion of the income  $I$  of the consumer left over after buying a unit of A will be spent completely on B. To simplify the exposition, assume that the price per unit of B is 1. Then, if the consumer does not buy A, his utility will be  $U(I, 0)$ . Let  $c = U(x, q)$  be the indifference curve  $\Gamma$  for the consumer, for which the value of the constant  $c$  is  $U(I, 0)$ . We assume that  $\Gamma$  has the shape shown in Figure 1. We examine now the implications of the shape of  $\Gamma$ . Since  $U(I, q)$  is constant for  $q \leq a$ , the consumer is indifferent between  $I$  units of B and not possessing A, on the one hand, and  $I$  units of B and possessing a unit of A with quality less than or equal to  $a$ , on the other. Hence, the consumer will not purchase A, if the quality of A is less than or equal to  $a$ .

We see by a similar argument that the consumer will not purchase a unit of A, if the quality of A is greater than  $b$ . Thus, the consumer will purchase a unit of A, if and only if  $a < q \leq b$ .

To find out how much the consumer is willing to pay for a unit of A when  $a < q \leq b$ , consider the point with  $q$ -coordinate  $q_1$  on the curve  $\Gamma$ . If the consumer gives up  $I - x_1$  units of B to purchase A at quality  $q_1$ , he will be indifferent between possessing A and not possessing A. Hence, the price of a unit of A must be less than

$I - x_1$ , so that the consumer will be induced to purchase a unit of A at that price and of quality  $q_1$ . Let  $p_1 = I - x_1$ . It is clear that as  $q_1$  increases from  $a$  to  $b$ ,  $p_1$  increases from 0 to  $v$ . Thus, the consumer will not purchase a unit of A, if the price of A is  $v$  or more, irrespective the quality of A. At price  $p < v$ , the consumer will purchase a unit of A, if and only if the quality of A is at least  $q_p$ , where  $U(I - p, q_p) = U(I, 0)$ . Figure 2 shows the graph of  $q_p$  as a function of  $p$ .

## DERIVATION OF THE MARKET DEMAND FUNCTION FOR GOOD A

We make the following assumptions on the utility function  $U(x, q)$ :

- (1) The price  $v$  and the quality levels  $a$  and  $b$  are increasing functions of the income  $I$  of the consumer. We denote them by  $v(I)$ ,  $a(I)$ , and  $b(I)$ , respectively. Assume that each one of these functions vanishes at the origin and tends to infinity, as  $I$  tends to infinity.
- (2) For every pair of positive numbers  $p, q$ ,  $U(p, 0) > U(0, q)$ . This assumption implies that the consumer prefers to do without product A, rather than having to do without product B, irrespective how small a quantity  $p$  of B he ends up with and irrespective how high the quality  $q$  of A is.
- (3)  $U_{xx}(x, q) \leq 0$  and  $U_{xq}(x, q) \geq 0$  and at least one of  $U_{xx}(x, q)$  and  $U_{xq}(x, q)$  is not zero for all  $x \geq 0$  and  $q \geq 0$ .

PROPOSITION 1: For every pair  $p_0, q_0$  of positive numbers satisfying

$$b(v^{-1}(p_0)) \leq q_0,$$

there exists a positive number  $x_0$ , such that

$$U(x_0 + p_0, 0) \leq U(x_0, q_0).$$

PROOF: Assume that  $b(v^{-1}(p_0)) \leq q_0$ . Let  $I_0 = b^{-1}(q_0)$ .

Then

$$p_0 \leq v(I_0)$$

and

$$q_0 = b(I_0).$$

A consumer with income  $I_0$  buys a unit of A at price  $p_0$ , if and only if its quality is at least  $q_1$ , where

$$U(I_0, 0) = U(I_0 - p_0, q_1)$$

and  $q_1 \leq b(I_0) = q_0$ . Since the utility function is increasing in each variable,

$$U(I_0 - p_0, q_1) \leq U(I_0 - p_0, q_0).$$

Therefore,

$$U(I_0, 0) \leq U(I_0 - p_0, q_0).$$

Letting  $x_0 = I_0 - p_0$ , we obtain

$$U(x_0 + p_0, 0) \leq U(x_0, q_0). \quad \text{Q.E.D.}$$

PROPOSITION 2: If  $q_0 \leq a(v^{-1}(p_0))$ , then  $U(x_0 + p_0, 0) > U(x_0, q_0)$ , for every  $x_0 \geq 0$ .

PROOF: We show first that at price  $p_0$  and level of quality  $q_0$ , no consumer will buy a unit of the product. To see why this is so, note first that, if a consumer with income  $I$  were to buy such a unit, we must have  $p_0 \leq v(I)$ . Hence,  $v^{-1}(p_0) \leq I$ . Therefore,  $a(v^{-1}(p_0)) \leq a(I)$ . It follows from the hypothesis of this proposition that  $q_0 \leq a(I)$ . Hence, the consumer will not buy a unit of A at price  $p_0$  and of quality  $q_0$ . Thus, the consumer must prefer  $p_0$  units more of product B and do without a unit of A to obtaining a unit of A of quality  $q_0$  and  $p_0$  units less of B. This implies the inequality to be proved. Q.E.D.

PROPOSITION 3: Let  $\Omega = \{(p_0, q_0) | U(x_0 + p_0, 0) > U(x_0, q_0) \text{ for every } x_0 \geq 0\}$ . Then no consumer buys a unit of product A at price  $p_0$  and of quality  $q_0$ , if and only if  $(p_0, q_0) \in \Omega$ .

PROOF: Obvious.

Q.E.D.

PROPOSITION 4: *The set  $\Omega$  is a non-empty proper subset of  $\mathfrak{R}_+^2$ , where*

$$\mathfrak{R}_+^2 = \{(p_0, q_0) | p_0 > 0, q_0 > 0\}.$$

PROOF: Follows from Propositions 1 and 2.

Q.E.D.

PROPOSITION 5: *For every point  $(p, q) \notin \Omega$ , there exists a unique level of income  $I = W(p, q)$ , such that a consumer with income  $I$  buys a unit of product  $A$  at price  $p$ , if and only if the quality of the product is at least  $q$ .*

PROOF: The proposition will be proved, once we show that the equation in I

$$(1) \quad U(I, 0) = U(I - p, q)$$

has a unique solution. To this end, consider the following function of  $x$

$$(2) \quad \varphi(x) = U(x + p, 0) - U(x, q).$$

Differentiating  $\varphi(x)$  with respect to  $x$ , we obtain

$$\varphi'(x) = U_x(x + p, 0) - U_x(x, q).$$

The above equation can be written as

$$(3) \quad \varphi'(x) = U_x(x + p, 0) - U_x(x, 0) + U_x(x, 0) - U_x(x, q).$$

Using the Mean Value Theorem, we get

$$(4) \quad U_x(x + p, 0) - U_x(x, 0) = U_{xx}(z, 0)p,$$

$$(5) \quad U_x(x, 0) - U_x(x, q) = -U_{xq}(x, w)q,$$

where  $z$  and  $w$  are numbers, such that  $x < z < x + p$  and  $0 < w < q$ . Substituting Equations (4) and (5) in (3) and using Assumption (3) on the function  $U(x, q)$  made at the beginning of this section, we conclude that  $\varphi'(x) < 0$ , that is,  $\varphi(x)$  is a decreasing function of  $x$ . Since  $\varphi(0) = U(p, 0) - U(0, q)$  is positive by Assumption (2) on  $U(x, q)$  and there exists  $x_0$ , such that  $\varphi(x_0) \leq 0$ , because  $(p, q) \notin \Omega$ , hence there must exist a unique value of  $x$ , call it  $x_1$ , such that  $\varphi(x_1) = 0$ . From Equation (2), we conclude that

$$U(x_1 + p, 0) = U(x_1, q).$$

Hence,  $I_1 = x_1 + p$  is a unique solution of Equation (1).

Q.E.D.

REMARK: *Let  $\Omega$  be the complement of  $\Omega$  in  $\mathfrak{R}_+^2$ . It is easy to see from the above results that  $\Omega$  is a closed proper subset of  $\mathfrak{R}_+^2$  with a non-empty interior.*

PROPOSITION 6: *The function  $I = W(p, q)$  is a decreasing function of  $q$  for every fixed  $p$  and an increasing function of  $p$  for every fixed  $q$ , provided  $p$  and  $q$  vary such that  $(p, q)$  remains in  $\Omega$ .*

PROOF: The partial  $\frac{\partial I}{\partial p}$  can be computed by differentiating Equation (1) implicitly with respect to  $p$ . We get

$$\frac{\partial I}{\partial p} = -U_x(I - p, q)[U_x(I, 0) - U_x(I - p, q)]^{-1}.$$

The square bracket on the left-hand side of the above equation is  $\varphi'(I, p)$ , where  $\varphi(x)$  is the decreasing function in the proof of Proposition 5. Since  $U_x(I - p, q) > 0$ , we conclude that  $\frac{\partial I}{\partial p} > 0$ .

For a fixed  $I$ , we have by implicit differentiation

$$\frac{dp}{dq} = -\frac{\partial I / \partial q}{\partial I / \partial p}.$$

Since  $dp/dq$  is positive for a fixed  $I$  by the results of Section 2 and we just proved that  $\partial I / \partial p > 0$ , the above equation implies that  $\partial I / \partial q < 0$ . Q.E.D.

**PROPOSITION 7:** Assume that  $(p, Q) \in \Omega$ . Then a consumer buys a unit of product A at price  $p$  and of quality  $Q$ , if and only if his income  $I$  is such that  $I \geq W(p, Q)$ .

**PROOF:** Let  $q_p$  be the minimal quality demanded by a consumer with income  $I$ , when the price of a unit of A is  $p$ . Then, by Proposition 5,  $I = W(p, q_p)$ . Now, the consumer will buy a unit of A at price  $p$  and quality  $Q$ , if and only if  $Q \geq q_p$ . Since  $W(p, q)$  is a decreasing function of  $q$  for every fixed  $p$ , we have  $Q \geq q_p$ , if and only if

$$W(p, Q) \leq W(p, q_p) = I. \quad \text{Q.E.D.}$$

**PROPOSITION 8:** Let the income of the population have a probability distribution, whose density function is  $f(I)$ . Assume that the population has  $D_0$  consumers. Then, the number  $D(p, Q)$  of units A demanded at price  $p$  and quality level  $Q$  is given by

$$D(p, Q) = D_0 \int_{W(p, Q)}^{\infty} f(I) dI,$$

provided  $(p, Q) \in \Omega$ ; otherwise,  $D(p, Q) = 0$ . Furthermore,  $D(p, Q)$  is a decreasing function of  $p$  for a fixed  $Q$  and  $D(p, Q)$  is an increasing function of  $Q$  for affixed  $p$ .

**PROOF:** Follows from Propositions 6 and 7. Q.E.D.

The following proposition is a technical result needed in the following section.

**PROPOSITION 9:** Assume that the random variable  $v(I)$  has a finite expectation. Then, for every positive number  $\eta$ , there exists a positive number  $k$  which may depend on  $\eta$  but not on  $Q$  such that

$$pD(p, Q) < \eta,$$

for all  $p \geq k$ .

**PROOF:** For any  $I = W(p, q)$ ,  $(p, q) \in \Omega$ , we must have  $p \leq v(I)$ . Let  $I_Q = W(p, Q)$ . Hence,  $p \leq v(I_Q)$ . Since  $v(I)$  is an increasing function of  $I$ , we must have  $v(I_Q) \leq v(I)$  for all  $I_Q \leq I$ . Therefore,  $p \leq v(I)$  for all  $I_Q \leq I$ . Hence,

$$p \int_{I_Q}^{\infty} f(I) dI \leq \int_{I_Q}^{\infty} v(I) f(I) dI.$$

From the above inequality and Proposition 8 we conclude that

$$(6) \quad pD(p, Q) \leq D_0 \int_{I_Q}^{\infty} v(I) f(I) dI.$$

By the hypothesis of this proposition we have

$$\int_0^{\infty} v(I) f(I) dI < \infty.$$

Hence, there exists a number  $\ell$  which does not depend on  $Q$  such that if  $I_Q \geq \ell$  then

$$(7) \quad D_0 \int_{I_Q}^{\infty} v(I) f(I) dI < \eta.$$

Since  $p \leq v(I_Q)$ ,  $I_Q \geq \ell$  if  $p \geq v(\ell)$ . Let  $k = v(\ell)$ . If  $p \geq k$ , then inequality (7) is true. Inequalities (7) and (6) imply that  $pD(p, Q) \leq \eta$  for all  $(p, Q) \in \Omega$ . If  $(p, Q) \in \Omega$ , then  $D(p, Q) = 0$  and certainly  $pD(p, Q) < \eta$ . Q.E.D.

REMARK: Note that since  $W(p, Q)$  is a twice differentiable function of  $p, Q$  on the interior of  $\Omega$  (follows from the derivation of  $W(p, q)$  in Proposition 5), so is  $D(p, Q)$ .

## SETTING THE PRICE AND THE QUALITY LEVEL BY A MONOPOLY

Consider a firm which is a monopoly faced by the demand function  $D(p, Q)$  for the good A derived in the previous section. Assume that the total cost function for the firm has two components. The first is the cost of quality; the second is the cost of other inputs. Suppose that each one of these costs is a linear function. Thus, let  $\gamma Q$  be the quality cost of one unit of A of quality  $Q$  and  $c$  the cost of other inputs for one unit of A which is independent of  $Q$ . Then, the profit function  $\pi(p, Q)$  of the firm when the price of a unit of A is  $p$  and its quality is  $Q$  is

$$\pi(p, Q) = (p - \gamma Q - c)D(p, Q).$$

Consider now the following optimization problem

$$(*) \quad \max_{(p, Q) \in \mathfrak{R}_+^2} \pi(p, Q)$$

PROPOSITION 10: Assume that there exists  $(p_0, Q_0) \in \mathfrak{R}_+^2$ , such that  $\pi(p_0, Q_0) > 0$ . Then, under the assumptions on  $U(p, q)$  of Sections 2 and 3, Problem (\*) has a solution.

PROOF: Take  $\eta$  in Proposition 9 equal to  $(1/2)\pi(p_0, Q_0)$  and let  $k_0$  be the corresponding value of  $k$ . Then

$$pD(p, Q) < \pi(p_0, Q_0)$$

for all  $p \geq k_0$ . Hence,

$$(8) \quad \pi(p, Q) < \pi(p_0, Q_0)$$

for all  $p \geq k_0$ . Let  $T$  be the closed and bounded subset of  $\mathfrak{R}_+^2$ , defined by

$$T = \{(p, Q) \in \mathfrak{R}_+^2 \mid p \leq k \text{ and } p - \gamma Q - c \geq 0\}$$

and let  $S$  be the closed and bounded set  $T \cap \Omega$ .  $S$  is not empty because it contains  $(p_0, Q_0)$ . Furthermore,  $\pi(p, Q)$  is continuous on  $S$  since  $D(p, Q)$  is continuous on  $\Omega$ . Hence,  $\pi(p, Q)$  has a maximum over  $S$ . Let  $(p^*, Q^*)$  be a point in  $S$  at which  $\pi(p, Q)$  attains its maximum value. We claim that  $(p^*, Q^*)$  is a solution of Problem (\*). To prove this claim we need only show that

$$(9) \quad \pi(p^*, Q^*) \geq \pi(p, Q); (p, Q) \in \hat{S},$$

where  $\hat{S}$  is the complement of  $S$ . But,  $(p, Q) \in \hat{S}$ , if and only if one or more of the following conditions hold

$$(10) \quad p > k,$$

$$(11) \quad p - \gamma Q - c < 0,$$

$$(12) \quad D(p, Q) = 0.$$

Condition (10) implies (8) which implies (9), since

$$(13) \quad \pi(p^*, Q^*) \geq \pi(p_0, Q_0).$$

Conditions (11) and (12) imply that  $\pi(p, Q) \leq 0$ . Hence, (9) must be true, since (13) and the hypothesis that  $\pi(p_0, Q_0) > 0$  imply that  $\pi(p^*, Q^*) > 0$ . Q.E.D.

We assume in the rest of this paper that a solution of Problem (\*) occurs at an interior point of  $\Omega$ . Let

$$\varepsilon_p(p, Q) = - \frac{p}{D} \frac{\partial D}{\partial p}$$

and

$$\varepsilon_Q(p, Q) = - \frac{Q}{D} \frac{\partial D}{\partial Q}$$

be respectively the price and quality elasticities of demand.

**PROPOSITION 11:** *Assume that a solution of Problem (\*)  $(p^*, Q^*)$ , at which the profit is positive, occurs at an interior point of  $\Omega$ . Then*

$$-\varepsilon_Q(p^*, Q^*) < \varepsilon_p(p^*, Q^*)$$

and

$$\varepsilon_p(p^*, Q^*) > 1.$$

**PROOF:** The first-order conditions for profit-maximization can be obtained by differentiating the profit function

$$\pi(p, Q) = (p - \gamma Q - c)D(p, Q)$$

and setting the first partials equal to 0. Thus, at the solution  $(p^*, Q^*)$  we must have

$$\begin{aligned} \pi_p(p^*, Q^*) &= (p^* - \gamma Q^* - c)D_p(p^*, Q^*) + D(p^*, Q^*) = 0, \\ \pi_Q(p^*, Q^*) &= (p^* - \gamma Q^* - c)D_Q(p^*, Q^*) - \gamma D(p^*, Q^*) = 0. \end{aligned}$$

The above two equations imply

$$(14) \quad \varepsilon_p(p^*, Q^*) = \frac{p^*}{p^* - \gamma Q^* - c},$$

$$(15) \quad -\varepsilon_Q(p^*, Q^*) = \frac{\gamma Q^*}{p^* - \gamma Q^* - c},$$

$$(16) \quad \gamma D_p(p^*, Q^*) = -D_Q(p^*, Q^*).$$

Since  $p^* - \gamma Q^* - c > 0$ , because  $\pi(p^*, Q^*) > 0$ , and  $p^* > p^* - \gamma Q^* - c$ , it follows from Equations (14) and (15) that

$$(17) \quad -\varepsilon_Q(p^*, Q^*) < \varepsilon_p(p^*, Q^*)$$

and

$$(18) \quad \varepsilon_p(p^*, Q^*) > 1. \quad \text{Q.E.D.}$$

**REMARK:** *Proposition 11 contains results that were obtained by us in another quality model (See Masarani and Gokturk (1981)).*

Inequality (17) shows that at the optimum level of profit, the demand is sensitive to changed in price more than it is sensitive to changes in quality. Inequality (18) agrees with the classical result for a monopoly that the price elasticity of demand at the optimum level of profit is greater than one.

## COMPARATIVE STATICS

The purpose of this section is to investigate the effect of changes in the parameters  $\gamma$  and  $c$  on a solution of Problem (\*).

To this end we assume that  $U(x, q)$  satisfies all the assumptions made in Sections 2 and 3 and that there exists a price-quality setting policy  $(p_0, Q_0)$  at which total profit  $\pi(p_0, Q_0)$  is positive. Then, Proposition (10) of Section 4 guarantees the existence of a solution  $(p^*, Q^*)$  to Problem (\*). We will assume further that  $(p^*, Q^*)$  is an interior point of  $\Omega$  and the determinant  $\Delta^*$  of second cross partials of  $\pi$  is not zero.

PROPOSITION 12: Assume that  $\frac{\partial^2}{\partial Q \partial p} \frac{1}{D} > 0$  for all  $p$  and  $Q$ . then

- (a) As  $c$  increases,  $p^*$  increases while  $Q^*$  decreases.
- (b) As  $\gamma$  increases,  $p^*$  increases and  $Q^*$  decreases.

PROOF: Straightforward.

Q.E.D.

REMARK: Since the firm supplies an amount equal to  $D(p^*, Q^*)$  of the good  $A$  and since  $D(p^*, Q^*)$  is increasing in  $Q^*$  but decreasing in  $p^*$ , the amount supplied by the firm decreases as  $c$  increases or as  $\gamma$  increases.

# **MANAGEMENT ACCOUNTING IN PORTUGUESE HOTEL ENTERPRISES: THE INFLUENCE OF ORGANIZATIONAL AND CULTURAL FACTORS**

**Conceição Gomes, Nuno Arroteia and Luís Lima Santos**  
**Polytechnic Institute of Leiria, Portugal**

## **ABSTRACT**

*Management accounting has evolved in order to respond to the increasing challenges imposed by the hotel and lodging industry. This study has the objective of characterizing management accounting in the Portuguese lodging industry, particularly in hotels, identifying the techniques adopted, the deepness of their use, and understand the extent to which the industry adopts and use the Uniform System of Accounts for the Lodging Industry (USALI). It is also objective of the study to identify organizational structure and culture factors that influence management accounting, applying the contingency theory.*

## **INTRODUCTION**

Management accounting techniques have evolved in order to respond to the complexity of the organizations environment. Nevertheless, the traditional techniques have been the ones with vastest use and adoption, with the contemporary techniques being adopted at a slower rate (Adler et al., 2000; Jones, 2008; Slessor, 2010).

This study has the objective of characterizing management accounting in the Portuguese lodging industry, particularly in hotels, identifying the techniques adopted, the deepness of their use, the degree of satisfaction of management with these techniques and their adequacy for the decision-making process, understand the extent to which the industry adopts and use the Uniform System of Accounts for the Lodging Industry (USALI). It is also objective of this work identify the factors that influence management accounting. We are going to use the contingency theory to support this study. We focused our study on the organizational structure and culture factors.

The present research project has selected as object of the study hotels in Portugal. The sample includes 35 hotels, which were analyzed in the years 2009 and 2010, equally distributed in the sub categories of hotels, apartment-hotels and hostels.

## **LITERATURE**

According to Pavlatos and Paggios (2009), there is a growing desire to understand the practice of management accounting in hotels, because the management accounting techniques have an important role in their decision making process (Oliveira et al., 2008). The organizations make decisions based on information provided. It is important the use of management accounting information to allow the optimization of the decision making processes by hotel managers, due to the fact of them facing a big competition (Downie, 1997).

As a consequence of several specificities of the hotels, the information required by managers to make decisions is different from other industries. Hotel units face direct and indirect competition (Mia and Patiar, 2001). Hotels have two sources of information: market research and accounting information. The ideal is that this information could be aligned and coordinated thus supporting the managers (Downie, 1997).

Kaplan and Cooper (1998) have developed the design of systems costs and performance measures model, which describes the four stages that a company has to go since the traditional costing to the activity-based costing. The stage I is characterized by the existence of an inadequate system for preparing financial reports. In stage II, it is possible to prepare financial reports, distorted cost product reports and to accumulate costs by responsibility centers, but not by activity, processes and customers. In stage III, there is a traditional financial system working fine, and this system elaborates the financial accounting and prepares reports for short periods of time where it is showed the cost of sales and stock valuation. The activity-based costing is used to remove information from financial documents and allocate it to products, services, customers and processes. In stage IV, there is integration of accounting with financial reporting. The activity-based costing systems and operational feedback are integrated, providing information to prepare financial documents. The activity-based costing becomes the basis for the company's budget. So the activity-based budget is used to make comparisons with the real information of the year.

The management accounting techniques, according Ferreira (2002) may be divided into traditional and contemporary (Table 1).

**Table 1: Traditional versus contemporary management accounting techniques**

Traditional techniques	Contemporary techniques

Source: adapted from Ferreira (2002).

The Greek hotels use more traditional management accounting techniques than contemporary management accounting techniques (Pavlatos and Paggios, 2008) as well as the hotels of the western region of Portugal (Santos et al., 2010). Jones (2008), Phillips (1996), Pavlatos and Paggios (2008) and Uyar and Bilgins (2011) refer that *Budgeting* and *Budget deviation analysis* are the management accounting techniques more used in the lodging industry. Vaugh et al. (2010) refer that activity-based costing was implemented with success in a kitchen in a Las Vegas casino, which allowed understand a hotel's cost structure.

The organizations give more importance to traditional management accounting techniques than to contemporary management accounting techniques. According to Fowler (2010), it doesn't mean that the contemporary techniques are irrelevant, because in several cases they are not adopted due their high costs of implementation.

USALI as a framework is also gaining support particularly among multinational hotel chains. However, Faria (2007) presents that less than a half of hotels use the USALI. Pavlatos and Paggios (2007) found few national hotels utilizing de USALI in Greece.

In the literature there may be found several studies that refer the determinants that make one company adopt for some management accounting techniques, supported by the theory of contingency. The contingency theory is base on the premise that the management accounting techniques are not used equally by all organizations (Haldma and Laats, 2002). These techniques depend upon the specific characteristics of an organization, like as organizational context and structure. The contingency theory helps to explain the impact of factors in management accounting. Several authors use this theory when examined divers factors (Haldma and Laats, 2002; Cadez e Guilding, 2008). According to Hayes (1977), there are three subgroups factors that influence the organization management, such as internal factors, interdependency factors and environment factors. Haldma and Laats (2002) subdivided into two general groups: external and internal factors. The internal factors are organizational aspects, technology and strategy. The fact of company being in a highly competitive market (Tayles and Walley, 1997), organizational variables such as communication, coordination, decentralization and formalization (Elmore, 1990; Luft and Shields, 2003) and business strategy and market

orientation (Cadez and Guilding, 2008) influence management accounting techniques adopted by companies worldwide.

According to Tamina and Bates (2010) the organizational structure can be mechanistic or organic. The mechanistic organization is related to a stable environment and an organic organization is related to an unstable environment. This can influence the usage rates of management accounting techniques. Uyar and Bilgin (2011) refer that the differences in management accounting were attributable to hotels sizes, complexity of operations, uncertainties, coordination and communication among departments.

Schmidgall et al. (1996) analyzed if culture influence the use of management accounting techniques but they didn't arrive an affirmative answer for the Budgets, but they verified this for Strategic planning. A majority of hotel chains in both the USA and Scandinavia use budgets and budget variance analyze. The budgets are elaborated by a bottom up approach. However, USA hotels prepared budgets for five or more years but Scandinavia not. The USA hotels have a tighter control over food costs and beverages costs, while Scandinavia has got a tighter control over other costs. According to Libby and Waterhouse (1996), Gosselin (1997), Granlund and Lukka (1998), Anderson e Young (1999), Chenhall (2003) and Baird et al. (2004), the organization culture influences the management accounting practices.

## Hypotheses

According to the literature, we found that the traditional management accounting techniques have a higher utilization compared to contemporary management accounting techniques. The USALI has a little use in the hotels of Greece. So, we can say that the most companies is in the stage II of the design of systems costs and performance measures model, since the companies that are in the stage III already use contemporary management accounting techniques. The main objective of management accounting technique is the decision making process for the most companies.

There are studies that refer several determinants supported by the theory of contingency that influence the management accounting from a hotel. In this study we opted to analyze the organizational and cultural factors. Particular, we are going to study the vertical differentiation, decentralization, formalization, standardization and organizational culture. Damanpour (1991) noted that de vertical differentiation has a positive association with managerial innovations. The centralization/decentralization is a factor indicated by many authors (Elmore, 1990; Libby and Waterhouse, 1996; Luft and Shields, 2003; Chenhall, 2003). However, there are different opinions. The rate of use of management accounting techniques increases with decentralization or centralization? The same happens with formalization. However the most of the authors refer that bureaucracy and formalization influence the implementation of new techniques (Elmore, 1990; Luft and Shields, 2003). According to standardization, Drury and Tayles (2005) refer that higher is standardization, higher is the utilization rate of management accounting techniques.

In the light of these conclusions, we developed the following hypotheses:

Hypothesis 1: The proportion of use of traditional management accounting techniques is higher than the proportion of use of contemporary management accounting techniques in lodging industry.

Hypothesis 2: The most of the Portuguese hotels is located at stage II.

Hypothesis 3: The function chosen by most companies as a main objective of management accounting is the decision making process.

Hypothesis 4: Less than fifty percent of hotels use the USALI.

Hypothesis 5: The higher the vertical differentiation in the hotels, the higher the rate of utilization of management accounting techniques.

Hypothesis 6: The higher the decentralization in the hotels, the higher the rate of utilization of management accounting techniques.

Hypothesis 7: The higher the formalization in the hotels, the higher the rate of utilization of management accounting techniques.

Hypothesis 8: The higher the degree of standardization in the hotels, the higher the rate of utilization of management accounting techniques.

Hypothesis 9: The culture of hotel influence the utilization of management accounting techniques.

## METHODOLOGY

According to Yin (2003), it was decided to adopt the method of questionnaire through of personal interviews. These was made by groups of students of the Tourism and Hotel management degree at Escola Superior de Turismo e Tecnologia do Mar/ Instituto Politécnico de Leiria, supervised by the teachers of the scientific fields of financial accounting and management accounting. The questionnaire structure was adopted from Gomes (2007).

The data was processed using SPSS (Statistics Packages for Social Sciences). In order to characterize the management accounting at the Portuguese lodging industry we utilized the univariate analysis. The relationships defined in the hypotheses were tested by univariate and bivariate analysis, for example, we have utilized: mean, mode, Spearman's Rho, Mann-Whitney test and Kruskal-Wallis test. According to Pestana and Gageiro (2003), Spearman's Rho measures the intensity of the relation among variables, and is commonly used to describe the relation among two ordinal variables or one ordinal and other scale variable. Due to the fact that this coefficient is not sensitive to asymmetric distributions, it does not require normal populations.

In order to reduce the variables related with management accounting and to contemporary management accounting, we conducted a factor analysis. To apply the factor analysis should be a correlation between the variables. According to all traditional management accounting techniques, the Kaiser-Meyer-Olking (KMO) measure of sampling adequacy was 0,627 and the Bartlett test of Sphericity was 97,781,  $p < 0,001$ . According to contemporary management accounting techniques, the Kaiser-Meyer-Olking (KMO) measure of sampling adequacy was 0,8 and the Bartlett test of Sphericity was 98,493,  $p < 0,001$ . The Cronbach alpha coefficients were 0,756 for the tectradicional (traditional management accounting techniques) and 0,849 for the teccontemporanea (contemporary management accounting techniques), which indicates satisfactory internal reliability for the two variables. So we can construct two indices, calculated by the arithmetic mean of the eight individual variables that characterize the management accounting techniques, traditional and contemporary, respectively.

## FINDINGS AND DATA ANALISYS

In this study were analyzed 35 hotels from different categories and regions from Portugal. From these, 11 belong to national chains, 2 are subsidiaries of multinational hotel chains. The annual turnover ranges from 16.000€ to 60.000.000€. Of the 35 inquiries, 85,7% (30) have implemented and use management accounting processes. The 5 units that do not use this practice are small hotels that are not subsidiaries of either national or multinational hotel chains.

The traditional management accounting techniques are more used than contemporary techniques. Both the mean and the mode are higher in the traditional techniques. The traditional management accounting most used by the Portuguese hotels are *Budgeting*, *Budget deviation analysis* and *Strategic planning* with 76,7%, 66,7% and 66,6% respectively. Concerning the contemporary management accounting techniques, almost all of the techniques has a score of mean use below the null value, except for the *Activity-based budgeting* with a mean of 4,23. The **Hypothesis 1: The proportion of use of traditional management accounting techniques is higher than the proportion of use of contemporary management accounting techniques in lodging industry** is not rejected.

Analyzing the findings we verify that none of the Portuguese hotel has reached to the stage IV. It is necessary some further developments in hotel management accounting in order to reach the final stage. The largest proportion of hotels is at stage II (36,7%) and III (36,7%), which leads us to reject **Hypothesis 2: The most of the Portuguese hotels is located at stage II** because we have the same number of hotel units at stage III.

The hotels use management accounting mainly with the purpose of supporting their decision making process (65,7%) and the budgeting process (60%) too. Having present that the information supplied by management accounting is adequate to several management functions, we conclude that the functions to which this information is more adequate are Support the decision making process and Estimate cost of products/services, with a score of 5,43 and 5 respectively. So we can say that the **Hypothesis 3: The function**

chosen by most companies as a main objective of management accounting is the decision making process is not rejected. The process of decision making is priority.

The **Hypothesis 4:** *Less than fifty percent of hotels use the USALI* is not rejected, since only 42,9% (15) use USALI. All hotels that use USALI have implemented management accounting and have a high turnover. We have verified that all the subsidiary hotels of foreign enterprises use USALI.

To test the following hypotheses, where we will analyze if there are factors that influence the utilization rate of management accounting techniques in hotels, we have chosen *Spearman's Rho* in order to make a correlation analysis, as we are in the presence of ordinal variables. We present only the techniques that have a significant association for  $p < 0,05$ .

The **Hypothesis 5:** *The higher the vertical differentiation in the hotels, the higher the rate of utilization of management accounting techniques* is not rejected for *sales break-even* (0,418), *strategic planning* (0,52) and *traditional management accounting* (0,454) techniques in general. According to Spearman's rho correlation analysis, there are a significant positive association between the techniques and the variable vertical differentiation.

The **Hypothesis 6:** *The higher the decentralization in the hotels, the higher the rate of utilization of management accounting techniques* is not rejected for *budgeting* (0,449), *budget deviation analysis* (0,39) and *activity-based budget* (0,491). According to Spearman's rho correlation analysis, there are a significant positive association between the techniques and the decentralization.

The **Hypothesis 7:** *The higher the formalization in the hotels, the higher the rate of utilization of management accounting techniques* is not rejected for *sales break-even* (0,408), *strategic planning* (0,46), *product profitability techniques* (0,397), *activity-based costing* (0,38), *product life cycle costing* (0,418), *benchmarking* (0,367), *traditional management accounting techniques* (0,495) and *contemporary management accounting techniques* (0,425). According to Spearman's rho correlation analysis, there are a significant positive association between the techniques and the formalization.

The **Hypothesis 8:** *The higher the degree of standardization in the hotels, the higher the rate of utilization of management accounting techniques* is not rejected for *sales break-even*, *strategic planning*, *budgeting*, *product costing techniques*, *product profitability techniques*, *activity-based budgeting*, *activity-based costing*, *target costing*, *product life cycle costing*, *benchmarking*, *traditional management accounting techniques* and *contemporary management accounting techniques*. According to Spearman's rho correlation analysis, there are a significant positive association between the techniques and the standardization.

Thus we can conclude that the higher the standardization of work process in the hotels the higher the rate of utilization of traditional management accounting techniques (0,434) and contemporary management accounting techniques (0,426), mainly *sales break-even* (0,592) and *product profitability techniques* (0,382). The higher the standardization of skills in the hotels the higher the rate of utilization of traditional management accounting techniques (0,613) and contemporary management accounting techniques (0,577), mainly *sales break-even* (0,595), *strategic planning* (0,482) *product profitability techniques* (0,566), *budgeting* (0,397), *activity-based budget* (0,485), *activity-based costing* (0,4), *target costing* (0,362), *product life cycle costing* (0,577) and *benchmarking* (0,505). The higher the standardization of results in the hotels the higher the rate of utilization of traditional management accounting techniques (0,662) and contemporary management accounting techniques (0,585), mainly *sales break-even* (0,565), *strategic planning* (0,441), *product costing techniques* (0,416), *budgeting* (0,367), *product profitability techniques* (0,487), *activity-based costing* (0,42), *target costing* (0,509), *product life cycle costing* (0,573) and *benchmarking* (0,513).

To test the **Hypothesis 9:** *The culture of the hotel influence the utilization of management accounting techniques*, we analyzed a set of variables that characterize the organizational culture. The ordinal variables are "hesitation in expressing disagreement with their superiors", "hierarchical level that makes decisions", "attitude towards risk" and "teamwork". The nominal variable characterizes the decision making of top management.

In relation to "hesitation in expressing disagreement with their superiors" we cannot find a significant association to management accounting techniques. According to the nominal variable we realized the Kruskal-Wallis test, but we cannot draw conclusions.

We find a significant negative association between the contemporary management techniques (-0,373) and the budgeting (-0,451) with "hierarchical level that makes decisions". It means the higher the decisions are making at the level of operational management the higher is the utilization of contemporary management

accounting techniques, mainly *activity-based budget* (-0,432), *activity-based costing* (-0,378) and *benchmarking* (-0,364). We find a significant positive association between the traditional management accounting techniques (0,553) with “attitude towards risk”. It means the higher the hotels are lovers of the risk the higher is the utilization of traditional management accounting techniques, mainly *sales break-even* (0,568), *strategic planning* (0,386) and *product costing techniques* (0,449). We find a significant positive association between *the product profitable techniques* (0,449) and *tableau de bord* (0,371) with “teamwork”.

Through the last four hypotheses, we have concluded that organizational structure and cultural factors influence the management accounting. However, this influence changes according to the techniques in question. The techniques of management accounting have different characteristics, so it is natural to be influenced by different determinants.

However, it is interesting to analyze the traditional management accounting techniques against the contemporary management accounting techniques, since it was possible to obtain a variable that featured all the traditional techniques as well as a variable that featured all the contemporary ones.

Thus we can say that traditional management accounting techniques are influenced by vertical differentiation, formalization, standardization and culture of the hotel. When there are a higher degree of standardization, formalization and vertical differentiation, the hotels are likely to implement the traditional management accounting techniques. According to the culture organizational, there is only one variable significantly associated with the use of traditional management accounting techniques, the “attitude toward risk”. The hotels that are lovers of risk have a higher degree of utilization of traditional techniques.

The contemporary management accounting techniques are influenced by formalization, standardization and culture of the hotel. When there are a higher degree of standardization and formalization, the hotels are likely to implement the contemporary management accounting techniques. According to the culture organizational, there is only one variable significantly associated with the use of contemporary management accounting techniques, the “hierarchical level that makes decisions”. The more decisions are taken at the lowest level of the organization, the higher the rate of utilization of contemporary management accounting techniques.

## CONCLUSIONS

This research allows us to conclude that, nowadays, management accounting is a tool incorporated in the daily management practices of hotels, and useful to support the decision making process in several aspects. The Portuguese hotel managers believe in that, because most of the hotels that have answered our inquiry use management accounting techniques, with the main purpose of providing information to decision making process.

The traditional management accounting techniques are used frequently, but in contrast some of the contemporary techniques are not known and not adopted by the hotels. In Portugal, there is a weak use of USALI. It is not fully expanded yet across the hotels. It is more used in the large hotels and in hotels with a foreign influence.

The largest proportion of hotels is at stage II and III of the design of systems costs and performance measures model from Kaplan and Cooper (1998). The Portuguese hotels have a traditional financial system working fine, and this system elaborates the financial accounting and prepares reports for short periods of time where it is showed the cost of sales and stock valuation.

We verified that there is a moderate association between organizational structure and culture factors and the degree of adoption management accounting techniques. There are two variables that stand out, the formalization and the standardization. Both have a significant positive association with the utilization of traditional and contemporary management accounting techniques. This is supported by the contingency theory.

# **THE PROCEDURE OF CHOOSING A MARKET SEGMENT IN THE AREA OF POSTAL SERVICES OFFER**

**Biljana Grgurović and Slavica Štrbac, Higher ICT School, Serbia  
Dejan Marković, Faculty of Traffic and Transport Engineering, Serbia**

## **ABSTRACT**

*This paper describes a possible, step by step, procedure of grouping micro segments formed on the basis of confirmed common features and value of key categories significant for the buying process. According to the data from an available database, and bearing in mind the fact that one micro segment or a group of them may have a small volume at a moment, but that they also may have a tendency of growth in the future, a decision on the segment size is made by adjoining territories where users are located into a single entity.*

## **INTRODUCTION**

The development of technologies that enable different ways of communication made the decrease of using letter mail inevitable. The existence of competition in the area of universal services is no longer unknown to any postal directorate. It is especially noticeable in big city areas. However, if we focus on commercial services, that contain all postal services except the universal ones, including value added services, we can easily notice that the competition most often occurs in express and courier services market. There is no subvention from the part of the state, and, therefore, no financial security for this area. Market liberalization cleared the path for a whole range of new participants (J. Van Duijnhoven, 2009). This is a highly profitable market where those who want to survive and make profit must fight for their share. The reason for rather inferior position of many postal directorates in the development of this area lies in the wrong initial steps based on the belief that those kinds of services were not a part of postal practice. That made a large space, now hardly recoverable, for private providers who base their business activities on market directedness, future-orientation, applying latest technologies and commercial principles.

The current trend in the area of postal traffic implies: a large number of providers, harsh requirements when it comes to the structure and quality of services, heterogeneous group of users with specific characteristics significantly complicates the process of segmentation, i.e. the choice of target market and formulating the adequate marketing strategy. The exclusive applying of some standard methods of demographic and psychographic segmentation leads to general grouping, most commonly based on assumptions. On the other hand, various spatial data, combined with the geographic information system can be very successfully used in the case of the segmentation of postal services market (Grgurović et al. 2010).

The specific information used in this paper was obtained from the researches conducted on the level of Postal Service Directorate at the Public Enterprise of PTT Communications "Serbia" (2008). The idea of the author was to use the existing information for finding an alternative way of choosing a market where this provider could offer some of its commercial services.

The paper is organised as follows: part 2 defines the postal services market, part 3 gives some basic directions related to the process of segmentation, part 4 explains the suggested procedure of choosing the market segment where business should be started and part 5 gives the author's concluding comments.

## **DEFINING THE POSTAL SERVICES MARKET**

Regardless of the fact that postal services are variable category, the definition of the market itself must be based on the sum of all services that appear and disappear according to the demand of the market. The adequate definition of the basic categories of the services offered within the postal system (2005) as well as the basic structure of users and the characteristics of their demands (Marković et al. 2010), are the prerequisite for a proper market definition and further successful implementation of the segmentation process (figure 1).

**Figure 1 – The postal services market**

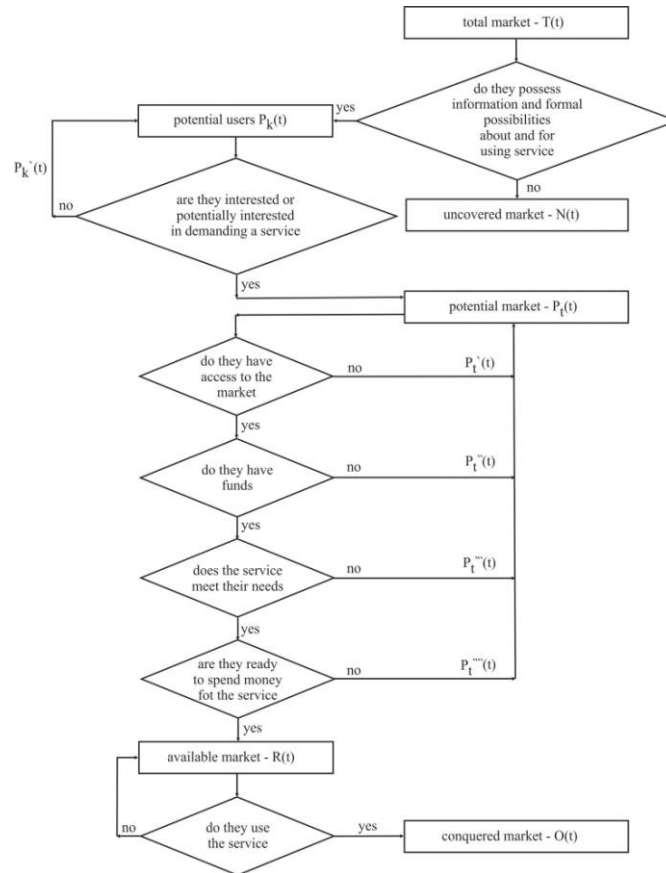

The members of the organizational market often buy services from other operators as well, which is another characteristic of business activities in city areas. Bearing that information in mind, it is possible, in a certain phase, to determine the direction and framework for promotional activities aimed at those user categories. The existing services cover certain users' needs (Grgurović and Štrbac 2008). They can generally be described as follows:

- there is an adequate price range and the choice of an adequate transfer rate is possible,
- it is possible to achieve an adequate level of safety owing to the fact that a user is free to secure the content of a parcel by defining its value,
- owing to a large number of postal network units, their organizational forms and postal network resources dislocated over the entire territory of the country, as well as the courier service, an adequate level of availability and simplicity of service were achieved, i.e. the possibility of choosing the time and place of realization of a service,
- the range of the allowed weight of parcels and the allowed contents of parcels is sufficiently big,
- by using numerous special, additional and other services, as well as the services provided according to a special contract, it is possible to reach an extremely great number of various combinations which can satisfy diverse needs of the increasingly demanding customers...

The offered services must not be either too broadly or too narrowly defined. Too narrow a definition may limit some new business fields, which could possibly be opened owing to an adequate segmentation. For example, limiting of parcel services only to the group of parcels whose maximum weight and dimensions are defined by the Nomenclature of postal services would automatically disqualify a large number of legal entities who have the need to transport the so called industrial packages. On the other hand, too broad a definition could ruin segmentation. For example, postal directorates have business activities at the financial market where a number of banking organizations is also present. Taking into consideration the fact this is not the primary function of the post and that it cannot compete the banks on an equal level, it seems quite clear that including that kind of services as well would make the definition too broad.

On a properly made map of the market (Grgurovic and Štrbac, 2007) which is narrowing through different levels of elimination and acceptance from total to more narrow ones, it is possible to obtain the picture of the potential market of a company that offers services from the postal sector. This market represents the difference between the total number of potential users for the moment  $t$  and the number of users who, no matter they belong to this group, are potentially or not at all interested in buying this service. The volume of this market could be enlarged by innovating the existing or introducing some entire new services, potentially interesting to users.

The question is what is a really available market of providers whose maximum size can be equal to the size of a potential market. It consists of users who have access to the market, dispose of proper funds, the service would meet their needs and they are ready to spend money to obtain it. This question could be formulated another way too, trying to find the answer to what is the conquered market that consists of those participants in the available market who have not started using the observed services yet, taking into consideration the reasons for that (figure 2).

**Figure 2 – Market changes in the process of diffusion of postal services**

## THE SEGMENTATION PROCESS

A process of segmentation where a provider of postal services finds its potential users can be studied and implemented through three basic phases. The first phase, which implies understanding of market and the idea how to use it, requires creation of a basic segment structure of a market. It can possibly be observed through several steps and it is applied to the entire market activity. That practically means that beside the services one offers, the services from the competition should be included too. One should bear in mind that very few marketing tools and techniques, including segmentation, have sense unless there is a proper market definition (McDonald and Dunbar 2004). That is why we made the grouping of services that met the same need as the example for the postal sector in the previous part. While making a market map, it is possible to present the operating market in the form of a diagram and then determine the part or parts on the map where the segmentation is in process.

The second phase implies a good understanding of users and the transaction they require. Since their behaviour includes the research on their demands, how and where they demand, when and how often do they demand a service, why they do that, therefore the steps that follow one another should enable viewing any part of the diagram and obtaining the picture that illustrates who, what, where, when and how demands. After that follows considering the reasons why various services are demanded.

Only the third phase is what we generally imagine to be market segmentation. It is necessary to describe grouping (segment forming) techniques within it, so they can optimally fit together. In the end, the operating segments are chosen.

A process of this kind can be carried out by using the existing information, i.e. using global market information, bearing in mind the fact that removing shortcomings includes a more detailed market investigation.

## THE CHOICE OF A MARKET SEGMENT

### Features of a Postal Service as a Reason for Buying

It is possible to group the users with heterogeneous needs, wishes, demands etc. that make the available market into preliminary segments, according to a standard criterion applied in the segmentation process, and then group them into specific micro segments, primarily on the basis of the characteristics of a demand for a service, i.e. on the basis of defining features and key categories significant for the buying process. The number of micro segments is generally large, while their potential is inconsiderable or quite small, so it is necessary to adjoin them, starting from a common feature and respecting certain procedure and regularities, into a number of market segments where a provider can operate but not necessarily.

The question postal service providers are constantly trying to answer is how to make the selection of service features that shift users from the available market group to the market group where they have business activities and, thus, have or don't have influence on the achieved results. If we start from the well known fact that one service can satisfy different needs, it is quite clear that within buying categories for certain service may also be defined different features accompanying some of 'what', 'where', 'when' and 'how' questions (Grgurović et al. 2010). That becomes increasingly evident, especially within modern business conditions where needs, along with everything users consider to fall under that category, are constantly changing. This paper explains service features through the example of express parcel (Grgurović et al. 2009).

Speed is an important component that makes users choose an express service. It implies an interval of time that consists of specific partial time periods that may have different importance for them. During the evaluation of this feature, users may speak about speed in the following way:

$B_{E1} = f(\text{demand occurrence time, courier arrival time})$

$B_{E2} = f(\text{demand occurrence time, service realization time})$

$B_{E3} = f(\text{demanded deadlines, realized deadlines})$

.....

From user's point of view, simplicity may mean both the possibility of using courier service – arrival of a courier at a certain address for taking over/delivering a parcel and nearness and adequate working hours of a Post office for those who hand in parcels personally, precise definition of the conditions of parcel transport etc.

$J_{E1} = f(\text{demand occurrence time, courier availability})$

$J_{E2} = f(\text{demand occurrence time, Post office working hours})$

$J_{E3} = f(\text{demand occurrence place, Post office location})$

.....

Flexibility is related to the ability of quick adaptation to changes, i.e. possibility of changing and supplementing a service for the purpose of meeting functional and additional users' needs. In the case of express services, flexibility can be described through response and reaction rate for new demands of the existing or new users), response and reaction rate for changed demands (e.g. deadline for taking over the parcel is shifted from 2 pm to 6 pm), degree of service compliance to new demands, trouble solving rate etc.

$F_{E1} = f(\text{new sort of demand / changed demand occurrence time, demand realization time})$

$F_{E2} = f(\text{custom service, new demands})$

$F_{E3} = f(\text{trouble occurrence time, trouble solving time})$

.....

Reliability of a working process is described through the probability of demand realization and user's expectations. In the case of express services, reliability may mean that the demanded service and offered service are equal, that the expected service is equal to the realized service, that the sold (realized) service is identical to the demanded service, that complete security for a parcel and its content is provided when it comes to confidence, the possibility of following the parcel through all technological phases of the transport process etc.

$P_{E1} = f(\text{demanded service, offered service})$

$P_{E2} = f(\text{expected service, realized service})$

$P_{E3} = f(\text{demanded service, realized service})$

.....

Reliability of the complete express service can be presented through the following equation:

$P_E = P_{E1} \times P_{E2} \times P_{E3} \times \dots \times P_{En}$

Availability can be described through the market coverage of a distribution network, service availability, transport and operating means availability, courier availability. From the point of view of an express service user, availability is described through the information about the service coverage of his/her place of living, does the Post office dispose of sufficient number of means of transport, is the number of couriers adequate so one does not have to wait longer than the agreed time for his/her arrival, is the agreed time for taking over the parcel respected etc.

$R_{E1} = f(\text{demanded place, covered place})$

$R_{E2} = f(\text{demand occurrence time, demand realization time})$

$R_{E3} = f(\text{available means of transport, necessary means of transport})$

.....

Frequency is defined as number of possible realizations of a service for the observed time period, i.e. time interval between two successive service realizations. From the point of view of the observed service user, frequency can be described through the possibility of realization of a single/group demand, i.e. demanded number of services per unit of time, or daily, periodically, rarely etc., i.e. through distribution of time between two services, as demand of specific day, specific hours etc. This feature has a great influence on the organization of providers' business activities, engagement of employees, number of transport means and other working means etc.

$U_{E1} = f(\text{number of demanded service realizations, observed time period})$

$U_{E2} = f(\text{number of realized services, observed time period})$

$U_{E3} = f(\text{time between two services, observed time period})$

Parcel content as a feature is frequently an important qualifier that determines especially large users with specific demands. Its meaning can be observed in the following way:

$S_{E1} = f(\text{needed allowed weight, offered weight})$

$S_{E2} = f(\text{parcel weight, demanded packaging and sealing})$

$S_{E3} = f(\text{parcel weight/volume, possible parcel damaging})$

.....

Means of payment is a significant component tightly connected with user's decision making about the choice of express service provider. Defining this feature is equally influenced by the quantity of demanded services, frequency of demand, availability of service with a specific provider, service flexibility, as well as the possibility of obtaining commercial discounts or some forms of privileges. If user's criteria are satisfied, he/she will opt for signing a contract and more precise definition of means of payment and, thus, 'binding' to a specific provider.

$NP_{E1} = f(\text{expected service, realized service})$

$NP_{E2} = f(\text{expected discount, realized discount})$

$NP_{E3} = f(\text{expected privileges, realized privileges})$

.....

Security may mean trust in service quality offered by certain provider, well trained couriers, efficient complaint solving, respecting agreement, existence of bank guarantees etc.

$Si_{E1} = f(\text{promised service, realized service})$

$Si_{E2} = f(\text{expected service, realized service})$

$Si_{E3} = f(\text{promised quality, realized quality})$

Other features important for the users of this and other postal services can be presented in a similar way. It is very important for a marketer to know which way a user estimates and evaluates a service feature in particular situations. Different users that form different segments demand different features that describe the same service in different ways.

The probability of discovering all unsatisfied needs is very small and there is always a possibility for some of them to remain undiscovered. Although this may be expected, it is still necessary to carry out a more detailed poll in user groups where a dilemma is present.

On the basis of the express service demand on the territory of the Republic of Serbia, it is possible to define the segments that include legal entities – large users as dominant ones, along with the segments that include legal entities whose needs are spotted but not yet satisfied. The research carried out in 2008 shows that the proportion between legal entities and physical persons as express service users is 60%:40%. On the basis of the newly defined features attributed to particular characteristics preferred by individual users from the group, it is now possible to form new subsegments within them.

It is necessary to distribute buying categories 'what', 'where', 'when' and 'how' important for the buying process, i.e. to align them according to a proper order that will depict their significance at the same time. The main goal – meeting user's needs, is possible to achieve through the evaluation of importance that each need, marked by a user, has for that particular user. Thus it is possible to expand what seems important, and what different users consider from different points of view, by adding adequate features that can be adjoined. Now it becomes possible to properly determine the dividing point that will separate important items for buying process from those less important. Those items important for the buying process are called key buying categories – KBC.

During the priority determining procedure, as a consequence of the fact that it is possible to attribute different characteristics to certain service features within a micro segment, it is highly probable to occur a situation where the priorities within a segment are not identical. For example, when it comes to 'security' as a service feature, one user may speak of it as a confidence in service quality, another as effective dealing with complaints, some other as respecting the agreement or existence of banking guarantees etc. Thus the total number of KBC is enlarged, and the final result will be a series of KBC lists, one (if the users completely agree about what they expect from a service, which is not very probable) or more, for each preliminary segment. By adjoining different KBCs from all micro segments, a new list for the entire market that offers certain service can be compiled in the end. Once we identify the tendencies and habits of a user in a market segment, a provider may start organizing the company's resources in order to meet the spotted needs of its users in the most complete and efficient way.

## **The Size and Number of Market Segments**

Sizes of market segments as well as their number are not random values. Two most important factors for their definition are the following: which number of users should make a segment where business activity is economical, i.e. what is the quantity of a service that is placed in it that would define it as a segment with business potential and which number of segments is appropriate for a company or a business branch.

Thorough analysis of these two values should decide on the choice of one of the following alternatives:

- Alternative 1 – starting on a market segment,
- Alternative 2 – giving up a market segment.

As it was said before, what we should bare in mind is the fact that a micro segment or a group of them together may have small volume, but they may have the tendency of growth in the future. For the purpose of avoiding their adjoining to another micro segment, and, thus, having them out of sight, it is recommendable working with the projected demand volume that maintains their real potential. A good example for this are micro segments whose needs are not completely satisfied due to nonflexibility of the procedure of providing certain service related to, for example, content of a parcel and delivery time or parcel price in case when users expect certain discounts for regular demand of a larger number of services. Changing those service features may bring a significant increase of the demand volume. The analysis of viability of offering the projected volume of a postal

service enables a provider to make a cross-section and reach the conclusion about what is economically viable business, where savings could be made, which segment should be paid attention to etc.

The available data from a database, obtained by using the geographic information system, facilitate deciding on the size of segments by adjoining territories where individual users are located into a unique whole (Marković et al. 2010). Thus it would be possible, for example, for the segment of legal entities – large users, in case of express services, to define special courier teams and means of transport that would serve this group.

Each micro segment can be described in different ways – through structure of consisting users, their needs and wishes related to defined service features, key categories related to buying process, market potentials etc.

For the process of grouping micro segments itself, it is best to find the micro segments with the highest correspondence according to key buying categories, and then, within them the appropriate level of similarity according to the geographic criterion (a standard criterion that proved to be the most applicable in the area of postal traffic related to commercial services) (Grgurović and Štrbac, 2009). The step-by-step grouping procedure is possible to carry out in the manner described by the algorithm in the figure 3.

Buying categories defined by legal entities, as the dominant market for the group of express services, enable their classifying within a certain number of groups with the same buying categories. The simplest variant, that occurs rarely, is the situation when values and position of buying categories are identical within those groups. Much more probable is the situation when their values and position are different, so it is necessary to make a new alignment where the basic division criterion would be the next buying category with the highest value.

The research carried out on the example of legal entities showed that speed is one of service features that users mostly pay attention to (60% of users). This characteristic would, at the same time, serve as the basic criterion for grouping, while the other values would enable additional separation within a group, if it is necessary. Beside those segments there is another significant category consisting of segments of legal entities who estimate that security is the most important feature.

This way of grouping leads to a number of segments that may be acceptable, but not necessarily. Some of them will immediately stand out as those one can count on, some will be on the border of accepting and rejecting, some will imply the possibility of additional grouping, while some, by their size, number of services and characteristics will not be able to meet the basic criteria of business viability. The segments that meet the required criteria are put aside, while the others will go through additional regroupings if possible. This procedure is possible to repeat until the moment when differences among segments can be respected and provided, which would also demand various market strategies, homogeneity within them, profitability as a consequence of the relative importance of segments, measurability of segments in the form of volume of demanded services or number of users etc. (McDonald and Dunbar 2004).

As it was already said, the size of market segments and their number are not random values. Among the newly formed groups it is necessary to put aside only those where it is reasonable to make an offer, i.e. those that are suitable for starting business, their number is suitable for this sort of activity and, at the same time, the provider has the possibility to adjust its organization and functioning to those segments in due time.

## CONCLUSIONS

The postal market is not homogenous. Instead of it there are significant differences in the user structure. The users' demands related to more comfortable performing transactions are increasing daily. Regardless to the fact that postal system is a public service that meets the needs of public interest in the area of parcel transport, their maximum effort in sale should be put in those segments that have the greatest potential for developing the existing, improved or new services. This goal cannot be achieved without applying some marketing strategies, which implies carrying out the process of market segmentation.

category. As a result of increasingly fast and frequent changes in all life areas, there are also changes in demands and behaviour of users as well as changes in competition. Therefore it is necessary to observe all changes in the surrounding and, simultaneously, reconsider and change the existing segments according to the changed assumptions upon which they were based.

The goal of this paper was to define a clear procedure for forming homogenous groups, whose final result would be reaching certain market adaptability level.

The suggested procedure, that implies applying new technologies in some phases, primarily the geographic information system, is an attractive alternative to the traditional segmentation process which usually gives only one solution for a certain period of time and that could lead to occurrence of loss or unused potentials in case of some greater change in business conditions. The model is completely open for wide range of use, but it is necessary to define certain performances preferred by users following specific procedures for each service. Analysis is thus performed faster, cheaper and better and, owing to the simplicity of the feedback monitoring methodology, the results of the process' success are quickly visible.

# **PARTICIPATION IN PHYSICAL ACTIVITY: PERCEPTIONS OF INDIVIDUALS LIVING IN A LOW INCOME NEIGHBORHOOD**

**Wynand Grobler, Andrea Garnett and Joseph Sekhampu  
North West University, South Africa**

## **ABSTRACT**

*Engagement in physical activity has long been recognised as an important factor contributing to positive health and its associated benefits. Citizens living in socioeconomically disadvantaged neighborhoods are at a heightened risk for physical inactivity, but research on the correlates of physical activity of this group is limited. Public policy makers need to consider a variety of perspectives when assessing the health of their citizens and participation in physical activity is an area that requires some considerable intervention on their part. This study aimed to empirically determine the self-reported participation in and perceived benefits of physical activity amongst respondents in a low income neighborhood of South Africa. A quantitative research method was deployed and a stratified random sample of 350 questionnaires was administered. By using exploratory factor analysis, three factors regarding respondents' perceptions of the associated benefits of participating in physical activity were extracted. The participation in physical activity was very low although perceived benefits of such activity were high. Limited recommendations concerning the way forward were outlined, with contextual avenues for future research.*

## **INTRODUCTION**

There are numerous benefits to participating in physical activity. This is a well-established fact (Fein *et al.*, 2004), illustrated by numerous organisations across the world, such as the US Department of Health and Human Services (1996) who denote especially the health benefits derived from regular participation in physical activity. Many people in the developed world do not maintain the recommendations made for physical activity participation (Barr *et al.*, 2006; Bauman *et al.*, 2001), and this may be even more of a concern in the developing world, as Salmon *et al.* (2002) and Gidlow *et al.* (2006) point out that people who live in socioeconomically disadvantaged neighborhoods are at an increased risk of inactivity, regardless of their individual economic situation.

Although the extent of participation in physical activity is well-documented, little is known about what participants in such studies perceive to be the benefits of participating in physical activity, and whether their perceptions of such have any influence on their own participation in physical activity, also attributable to their low income neighborhood environments. Public policy makers make considerable efforts to document and market the benefits of physical activity, yet little research has been conducted on whether these marketing campaigns are having the desired impact. Are residents of low income neighborhoods receiving the message regarding the benefits of physical activity? And are they participating more frequently in physical activity as a result of this?

This paper aims to report on the results of a study which documents the self-reported participation in physical activity of a group of respondents living in a low income neighborhood in the developing country of South Africa. The paper will also document the perceived benefits denoted by the respondents with regard to physical activity participation. The responses on the benefits will then be correlated with the extent of the self-reported participation in physical activity of the respondents. This would be to determine whether the

respondents' participation in physical activity corresponds with their perceptions of the benefits associated with it. The understanding of the perceptions of low income groups towards physical activity could provide direction towards theory development and policy decisions related to planning and funding recreational activities across many of South Africa's urban townships.

## **BACKGROUND OF THE LOW INCOME NEIGHBORHOOD**

Bophelong is a former black township on the outskirts of the industrial town of Vanderbijlpark. It was established in 1955. The area belongs to the Emfuleni Municipality, on the southern tip of the Gauteng Province in South Africa. In the late nineties, the area was extended with 10,000 new low cost (RDP) houses. Most of the people who settled in the new houses were poor – those who could not previously afford a house. The population in Bophelong is estimated at 37,779, and the number of households is estimated at 12,352. The average household size in Bophelong, calculated from Statistics SA data (2007) is three persons per household. The average household size for Emfuleni as a whole is 3.52. Several studies have found increased levels of poverty in Bophelong. Sekhampu (2004), in his study found 62 percent of the population to be living below the poverty line. A follow up study by Slabbert and Sekhampu (2009) revealed that 66.3 percent of the residents of Bophelong are poor and that the unemployment rate is 62.2 percent. Fifty four percent of the poor were found to be female. Dubihlela (2011) found a poverty gap index of 0.53 among female-headed households in Bophelong, meaning that on average, households have a shortfall of 53 percent of their income to be placed on their respective poverty line.

## **RESEARCH METHODOLOGY**

This study aimed to analyse perceptions of respondent's living in typical low income neighborhoods regarding their self-reported participation in physical activity. The research is based on a quantitative survey method using questionnaire interviews. Maps were obtained for the different areas of Bophelong and a stratified sample was compiled by taking into account the geographical distribution and concentration of people in different areas of the township. The areas were divided into different extensions and the questionnaires were distributed evenly among the inhabited sites.

### **Participants**

A total of 350 households were interviewed by 4 fieldworkers in March 2011. All households approached were willing to participate in the study. To obtain a sample size that would supply statistically reliable results and be representative of the population of the area, the researchers relied on the experience and convention regarding similar surveys (Sekhampu, 2004; Slabbert and Sekhampu, 2009; Dubihlela, 2011) conducted in similar locations in South African townships.

### **Instrument and procedures**

A measuring instrument was designed pertaining to the different modes of physical activity as well as the perceived benefits of participating in physical activity based on a literature review and previous research in the field. Items which were perceived to be ambiguous or product anomalous statistical deviations were refined or eliminated for use in the final questionnaire. Participants were required to indicate the extent of their agreement with a set of statements regarding their perceived benefits of participating in physical activity on a 29-item Likert scale. The corresponding responses to the questionnaire items were subjected to exploratory factor analysis. Using varimax with Kaiser normalization, the factor analysis matrix was rotated orthogonally. An eigenvalue criterion with a cut-off of 1 was used.

## **LITERATURE REVIEW**

Engagement in physical activity has long been recognised as an important factor contributing to positive health and its associated benefits (including economic benefits). The variations in health between people with different socio-economic statuses have been attributed to a number of factors; structural, cultural and behavioural

factors (Hart *et al.*, 1995). Attempts have been made to explain the cumulative effects of health damaging or health promoting physical and social environments during an individual's entire lifetime as important explanations for health differentials among groups. Calnan (1994) and Cornwell (1984) write on how living and working conditions shape health beliefs and style of life. The assertion is that social parameters of health significantly affect the way people interpret their health and illnesses. The general conclusion on people's understandings of health and illness is that health is a deeply social phenomenon (Bury 2000). It is lived and experienced in the contexts of everyday life, as members of community and of society (and of family).

Physical Activity is essentially influenced by various socio- economic and psychographic variables. This includes gender, socio-economic status, perceived exercise benefits, self esteem, self efficacy, motivation, knowledge etc. (Li *et al.*, 2005). According to Kendig *et al.* (1998), the level of education, social class and socio-economic indicators can be regarded as significant predictors of Physical activity. Gidlow *et al* (2006) indicate that in socio economically disadvantaged neighborhoods a higher risk of inactivity can be expected. This research is in line with the work of Sallis and Owen (2002) who refer to physical inactivity and the modifiable risk factors for chronic conditions. Gidlow *et al* (2006) further indicate that lower education, lower income levels, working status in low status occupations and unemployment may contribute to physical inactivity.

Behavioural theories, as documented by Sallis and Owen (2002) attempt to explain behaviour regarding physical activity to be influenced by individual factors, social factors and physical environmental factors. Positive correlations between these social, individual and environmental factors and physical activities were shown in the works of Sallis and Owen (1999) and Trost *et al* (2002).

Research points to growing concerns between class and health, and the fact that poorer people have shorter, more illness-ridden lives than their more affluent counterparts (Davey Smith *et al.* 1990, Davey Smith and Morris 1994). The general conclusion is that people and particularly certain groups are not as active as they should be and that school and recreational programmes should be designed and funded to enhance their participation (Roberts, 1996).

## **RESULTS**

### **Characteristics of the sample group**

The sample group contained a fairly even spread across gender. Of the 350 respondents in the survey, there were 179 (51.6 %) males and 168 (48.4%) females, and three respondents did not report their gender. The age of the sample group is a majority of the participants under the age of 35 and was classified as follows into the categories of 17-25 years (28.3% of the respondents); 26-35 years (31.4%); 36-49 years (23.7%); 50-65 years (8.9%) and 66-75 years (7.7 %).

The sample was chosen to be representative of a low income group, in a low income neighborhood, with 9.4 percent of respondents earning between 800-5 000 ZAR (\$100-\$625) per month, 16 percent earning between 5 001-10 000 ZAR (\$625.1-\$1250) per month, 0.6 percent earning above 10 000 ZAR (\$1250) per month, but 74 percent of respondents declined to answer this question for personal reasons.

### **Participation in physical activity**

The respondents were requested to rate the time per week in minutes that they spent on doing various types of physical activity in the following categories:

- (1) Strenuous physical activity (SPA), which constitutes any activity which causes the heart to beat rapidly, such as running, soccer, vigorous swimming, etc.
- (2) Moderate physical activity (MoPA), which is not exhausting, such as fast walking, easy cycling, volleyball, dancing, etc.
- (3) Mild physical activity (MiPA) requires minimal effort, such as yoga, fishing, bowling, golf, etc.

Table 1 represents the categories of the sample, rated according to the self-reported physical activity they indicated during the survey

**Table 1: Characteristics of the sample according to the time per week (minutes) spent on strenuous physical activity (SPA), moderate physical activity (MoPA) and mild physical activity (MiPA)**

<i>n</i>	<i>SPA (mins per week)</i>			<i>MoPA (mins per week)</i>			<i>MiPA (mins per week)</i>		
	0	1-180	≥ 181	0	1-180	≥ 181	0	1-180	≥ 181
	%			%			%		
350	84.0	11.14	4.85	88.86	8.86	2.29	95.71	4.0	0.29

At least eighty-four percent of the sample reported no weekly SPA, 88.86 percent reported no weekly MoPA and 95.71 percent no weekly MiPA. This is indicative of very low levels of physical activity among the sample group, even though the majority of the sample group is made up of younger participants.

Respondents were further asked to confirm their level of physical activity by indicating the frequency at which they participated in physical activity in a seven day period long enough in order to build up a sweat, on a four-point Likert scale, ranging from often (1) to almost never (4) as indicated in Table 2.

**Table 2: Frequency of participation in physical activity**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	1	8	2.3	2.5	2.5
	2	46	13.1	14.2	16.7
	3	37	10.6	11.5	28.2
	4	232	66.3	71.8	100.0
	Total	323	92.3	100.0	
Missing	System	27	7.7		
Total		350	100.0		

As seen in Table 2, the majority of the candidates rated the extent of their participation in physical activity as almost never ( $n = 232$  or 71.83 percent of the respondents), which is a confirmatory measure of their self-reported participation reflected in Table 1.

The respondents were asked then to rate what they perceived as the benefits of participating in physical activity on a thirty-two item, five-point Likert scale, ranging from strongly disagree to strongly agree. Questions such as *I will get to meet new people* and *I will get to build on my muscle strength* for example, were included in the questionnaire. The reliability of the scale computed a Cronbach Alpha co-efficient of 0.958, well above Nunally's (1978) acceptable range of 0.7. The scale was factorised into three factors (each item loaded higher than a 0.5 on the corresponding factor), after the deletion of three items, leaving a 29-point scale. We classified the three factors of the perceived benefits as *Social/Wellbeing improvement (Factor D1)*; *Physical health Benefits (Factor D2)* and *Enhancement of self esteem/attractiveness levels (Factor D3)*. The means for the three factors for the entire sample group are reflected in Table 3.

**Table 3: The perceived benefits of physical activity**

	N	Minimum	Maximum	Mean	Std. Deviation
Factor D1	348	1.00	5.00	3.7222	.70047
Factor D2	348	1.31	5.00	3.9778	.60240
Factor D3	348	1.17	5.00	3.7817	.64204

	N	Minimum	Maximum	Mean	Std. Deviation
Factor D1	348	1.00	5.00	3.7222	.70047
Factor D2	348	1.31	5.00	3.9778	.60240
Factor D3	348	1.17	5.00	3.7817	.64204
Valid N (listwise)	348				

Table 3 shows that participants consider all three of the factors as beneficial, but the highest mean was computed for Factor D2, meaning that participants were most inclined to consider the *Physical Health Benefits* factor as being the most important perceived benefit of participating in physical activity. Although the benefits of participating in physical activity are recognised by the respondents, the results show that nonetheless their participation therein is very low.

The extent of participation in physical activity indicated by the respondents was then compared to their responses on the perceived benefits of participating in physical activity scale (classified according to the sample group they were placed in – mild, moderate or strenuous participants in physical activity). This is reflected in Table 4.

**Table 4: Analysis of variance (ANOVA) between the different sample groups**

		Sum of Squares	df	Mean Square	F	Sig.*
Factor D1	Between Groups	5.264	3	1.755	3.599	.014
	Within Groups	155.022	318	.487		
	Total	160.286	321			
Factor D2	Between Groups	6.490	3	2.163	6.164	.000
	Within Groups	111.603	318	.351		
	Total	118.093	321			
Factor D3	Between Groups	7.430	3	2.477	6.293	.000
	Within Groups	125.153	318	.394		
	Total	132.583	321			

\*Based on a 0.05 significance level

There are no significant differences between the different sample groups (the mild, moderate or strenuous participants) on how they perceive the benefits of participating in physical activity. All groups perceived similar benefits of participating in physical activity, regardless of their own actual self-reported participation.

## DISCUSSION AND CONCLUSIONS

The purpose of the study was to determine the extent of participation in physical activity by a group of respondents in a low income neighborhood. Coupled with this, the study aimed to determine the respondent's perceptions of the benefits associated with physical activity and correlate them with the extent to which respondents participated in physical activity.

The study found as anticipated, that the participation rates in any form of physical activity are alarmingly low. This is concomitant with the findings on other such similar research as conducted by (De Knop, 1998; Kruger *et al.*, 2002), although our study found lower rates than reported in any other previous studies. Furthermore, even though the respondents in the survey recognise that there are numerous benefits (specifically physical health benefits) associated with participating in physical activity, this has apparently not influenced them to attempt to participate to a greater extent in any form of physical activity: mild, moderate or strenuous.

The study was limited to a cross sectional study design which means that causality cannot be attributed. A larger number of experimental studies which investigate longitudinal or intervention-related influences on physical activity among participants living in low income neighborhoods are needed. All the measures were also

self-reported and therefore prone to recall and similar biases, but internally reliable, previously published measures were used where possible.

## MANAGERIAL IMPLICATIONS

We consider our study to be the first to look at physical participation in a low income neighborhood in South Africa: although limited in scope to a single community in Southern Gauteng, we believe that its results are at least somewhat relevant to a substantial cross-section of South African society. Policy makers need to be strongly concerned about the low levels of participation in physical activity which we found to be present in the low income neighborhoods surveyed in the study, as it has far-reaching implications for the status and well-being of the larger society. It is likely that this trend would also be present in other low income neighborhoods in the country.

Future research could focus on a sample group in a middle income or even high income neighborhood and be compared with the results found in our study, to determine whether the trend for the low incidence of participation in fact attributed to the low income neighborhood as initially envisaged. It is unlikely that increased awareness campaigns would be very useful in increasing the participation in physical activity as respondents seem to be well aware of the benefits thereof. They also acknowledge that participating in such activities would be likely to bring about the benefits discussed, regardless of whether they themselves are involved in physical activity. It is likely that campaigns aimed at improving individual's *motivation* to participate, perhaps by means of incentives could be one alternative to consider, or consider mechanisms that may encourage mild participants to increase their physical activity to the moderate or strenuous category.

We are undertaking further research into the *barriers* which impede physical activity in such a low income neighborhood to shed more light on the mechanisms which could be deployed to improve physical activity participation.

# SUSTAINING COMPETITIVE ADVANTAGE THROUGH CUSTOMER KNOWLEDGE MANAGEMENT AND INNOVATION

Wafa BelKahla Hakimi and Abdelfattah Triki  
University of Tunis, Tunisie

## ABSTRACT

*The present paper introduces the concept of Customer Knowledge Enable Innovation capability (CKEI capability) as a source of competitive advantage that the organization should master for superior performance goals. The CKEI is a new construct that has been proposed on the basis of extend literature review and a bank case study. The aim of this research is to substantiate it and reveal its dimensions. The CKEI translates the degree to which the organization is endowed with expertise and skills of managing customer knowledge in order to enhance innovation performance. A qualitative research is undertaking, more specifically a case study research. Data was collected on the basis of triangulating three qualitative techniques: observation, documentation and informal interviews with managers. The CKEI capability is found to be composed of three dimensions: an integrative capability, a structural capability, and an internal management capability. The implications and limits of the research as well as the research agenda are underlined.*

## INTRODUCTION

The concept of knowledge has emerged with Michael Polany (1962) who made the distinction between explicit knowledge and tacit knowledge. Nevertheless, research in knowledge management field has not reached its pick up until the years between 1990s and the 2000s. During that period, the marketing literature was characterised by an intensification of academic research studies dealing with knowledge management in general and customer knowledge management and its relationship with innovation in particular. This was stressed by the definition of knowledge as the main intangible resource for sustaining competitive advantage.

In both business practice and theory, knowledge management capabilities, in general, and customer knowledge management capabilities, in particular, were stated to be crucial factors of successful innovation management and consequently competitive advantage (Lettl and Herstatt (2004), Derllyiski and Frohlich (2004), Lawer (2005), Soparnot (2006), Rollins and Aino (2005), Salojarvi and Aino (2008)). However, in the literature review, there are only a few research studies that examined the way organizational capabilities can be facilitated by knowledge management. These studies have shown the relationship between customer knowledge management and innovation capabilities to be complex, which underlines the need to understand in greater depth the specific interplays between them. Most of the above mentioned research studies have limited their attention to studying customer knowledge management from the potential synergies of integrating ideas from customer relationship management (CRM) and knowledge management (KM) (Rollins et al, 2005), without focusing on how concretely a company should hold a competence in managing customer knowledge for innovation purposes.

The aim of the present research is to focus on the role of customer knowledge management in leveraging and enhancing innovation. Consequently, our **fundamental research question** is: How could a company hold a customer knowledge enabled innovation capability in order to sustain competitive advantage?

Our research is aimed at exploring such processes for the proactive understanding of customer needs and for understanding how customer knowledge is transmitted within the firm in a way that encourage innovation initiatives.

## THEORETICAL BACKGROUND

## Customer Knowledge Management and Innovation based capabilities

Firm capability has been defined from multiple view points and new definitions are still being formulated (Jain, 2007). Among these are dynamic, integrative, absorptive, relational, multiplicative capability,...etc in the marketing literature. The labels differ from one author to another and from one context to another but, in reality, they converge towards the same meaning and they are classified under the same umbrella: the organizational capability of the firm. This endows the firm with skills that are built and are conducive to organizational distinctive competitive advantage. Knowledge-based Organizational capabilities are originated in the knowledge based view as an extension of the resource based view (RBV). According to the resource based view, firms are seen as “bundles of resources”. These are defined as both tangible and intangible assets that are tied to the firm in a relatively permanent fashion (Liao et al, 2009).

Similarly in knowledge management and innovation research, several converging view points are offered to shed light on the construct of dynamic organizational capability with its relationship to Knowledge management and innovation (Liao et al (2009), Wang and Ahmed (2007), Ramaswami et al (2009), Lawer (2003), Lettle and Herstatt (2004)). In fact, previous research has shown that building better goods or services must be supplemented by organizational capabilities (Teece et al (1994), Cohen and Levinthal (1990)).

Li & Calantone (1998) have shown that customer knowledge is an intangible resource that is difficult to imitate by competitors as it is often embedded in an organization's processes. Hence, customer knowledge is considered as a main resource which may create a long-term competitive advantage for an organization. The following table presents, in short, previous concepts related to innovation and knowledge based capabilities, as given in the literature review.

Organizational capability	Authors	Definition	Dimenions
<b>Knowledge integration capability in product development</b>	Revilla and Cury (2008)	<i>“the capacity of the firm to integrate dispersed knowledge of different natures in an innovative manner”</i>	(1)Shared knowledge of customers (skcust) (2)Shared knowledge of providers (sksuppl)
<b>Knowledge-enabled customer relationship management</b>	Al Shammary (2005)	<i>Implementation of knowledge based CRM which is a set of knowledge resources, productivity, and procedures that could maintain a unified and integrated customer view with greater levels of detail and accuracy</i>	(1)Enterprise data warehouse (EDW)//(2)Operational customer relationship management (CRM)//(3) Analytical CRM.
<b>Customer knowledge management competence</b>	Rolling and Aino (2005)	<i>“the ability to integrate customer information and knowledge into an organization's CRM processes and operations”.</i>	Not mentioned
<b>Knowledge enabled innovation competence</b>	Van Winkellen (2008)	Not mentioned	-collaboration (internal and external collaboration)-organizational learning (creating a learning organization and reusing existing knowledge)-managing innovation (learning from innovative activities and recognizing opportunities to innovate)
<b>Dynamic capability</b>	Wang and Ahmed (2007, p35)	<i>a firm's behavioral orientation constantly to integrate, reconfigure, renew and recreate its resources and capabilities and, most importantly, upgrade and reconstruct its core capabilities in response to the changing environment to attain and sustain competitive advantage.</i>	-adaptive capability -absorptive capability -innovative capability
<b>Intellectual capital</b>	Martin-de-Castro et al (2009, p 635)	<i>« the combination of intangible assets that allows the company to operates »</i>	-human capital -structural capital -customer/Relational capital

Table I: KM, CKM and innovation based capabilities

As shown in the table, there is a lack in conceptualizing customer knowledge and innovation based capabilities. In fact, previous research has deeply explored the relationship between innovation and customer knowledge management but they have failed to demonstrate how to manage adequately and effectively customer knowledge in order to enhance innovation success. They have either defined the customer knowledge

management capability without connecting it to innovation or they have defined the knowledge management based innovation capabilities with ignoring the customer component. Based on that, we propose the customer knowledge enabled innovation capability (CKEI capability) as an integrative construct that connect both customer knowledge management and innovation approaches.. In the following section we describe the methodology that was adapted in order to substantiate it and reveal its dimensions.

## RESEARCH METHODOLOGY

Our research is exploratory in nature. It has three main objectives:

- (1) To define the theoretical underpinning of the CKEI capability
- (2) To reveal its dimensions through exploring CKM and innovation practices.
- (3) To show how could the firm sustain a competitive advantage through this capability

To attend these objectives, a qualitative research is undertaken. It is the methodology of choice when there is a lack of theory or when a current theory fails to effectively explain a phenomenon (Merriam, 2002).

More precisely, we have adopted the case study method. Our choice is justified by the need to access to “hidden” data in organizational processes (Lettl and Herstatt, 2004). It was absolutely mandatory to proceed with an “immersion” in reality in order to be able to capture the entire depth and benefit from sources of multiple comprehensions.

Different strategies have been presented in the literature in order to give authors guidelines for performing case study research. Yin’s case study protocol (1984) and, Eisenhardt’s eight –step roadmap (1989) are good examples of research that have been given to address issues of validity and reliability. The two authors present the steps to follow in order to propose a good quality of case study. For the sake of simplicity, we have adopted Yin (2003)’s case study protocol in the present research which is a detailed plan for the research. It is a document in which full details of the case study research must be specified as it is used for replication purposes. It is composed of four steps: (1) an overview of the case study project focusing on the objective of the case study, In our research, (2) field procedures (different data collection techniques used in the case study), (3) case study questions (the specific questions that the case study investigator must keep in mind in collecting data) and (4) the case study report (results and analysis).

### Overview of the case study project

The case in hand is a Tunisian commercial bank that was created on 1982.

The choice of a bank is justified first, by the relational and innovative capacity of the bank and by the extent to which customers are integrated in the day to day activities, and second, by the fact that the need for innovation in this sector is deemed urgent. In fact, the main problem of the banking sector resides in the way organizations could implement a strategy of differentiation in a context characterized by the multiplication of services and products. The increasing rate of “multi-bancarisation”, added to the increasing rate of customers’ exit, push banks to imitate each other in order to survive. Most of the time, they copy each other and launch products that are similar to the other banks. In general these products can’t respond to real customer needs because the customer is not taken into account as an active co producer in the new product development process.

Keeping in mind our objectives, we have spent a period of six months in the bank. As it was difficult to analyse simultaneously all new products in the bank, we chose three new products developed during our immersion period: a new credit card, a technological pack, and a new saving account.

For the credit card, it is a “youth card” addressed to young people and considered as a radical innovation in the Tunisian banking sector. The choice of this product is interesting because young people were involved in the innovation process through the bank blog, market studies and focus groups. This gives us the chance to explore and to analyse how and to what extent customers are integrated in innovation projects within the organization. Concerning the technological pack, it offers a list of 11 configurations of IT packs consisting of an operational computer with internet connection and original software with home delivery. The saving account is a new device and is still in its diffusion phase which enable us to witness the launching of a new product with the different distribution channels, the partners of the bank in this phase, the meetings between managers about the strategy to be adopted in the diffusion of the new product, the meetings with the consultancy bureau to decide about how to attract the target customers, the meetings between managers and customers in order to generate information and collect feedback.

## Data collection techniques:

Our case study is based on triangulating three techniques: observation, documentation and informal interviews. Yin (2003) has discussed six main sources of evidence to apply the case study method. These sources are documentation, archival records, interviews, direct observations, participant-observation and physical artefacts. In this study, the three sources of evidence that are deemed valuable are direct-observation, documentation and informal interviews.

-a-Observation: Observation focused on internal management of customer knowledge within the organizations and the way it is disseminated and used in the three new product processes described above. We observed more precisely the sharing of information and knowledge between employees, employees' behaviour, work atmosphere, the degree to which the bank is endowed by a creative and innovative competency, the degree to which customers' needs are taken into consideration, how customer knowledge is collected and analyzed, the technologies and techniques that are used to collect and structure customer knowledge, etc. This was observed during meetings and workshops between employees as well as meetings between employees and customers whether face to face or online meetings.

b/ Documentation: Consulted documents were mainly related to customer knowledge. They included every document related to customer knowledge generation, dissemination, transformation and use. This was based on internal and external company documents such as market studies (customer satisfaction studies, market segmentation studies, post-campaign studies...), statistics of new products, company's annual reports and official web site, new product brochures, online discussion forums and blog reporting, etc. The goal was to achieve a better insight into the way the company manages external knowledge in order to enhance innovation. Documentation offered us the opportunity to obtain a good understanding of the innovation capability and the use of customer knowledge as a specific type of external knowledge.

C/Informal interviews: The most commonly used interview method in case studies is open-ended and takes place on a face to face basis (Yin, 2003). In our case, 14 informal interviews were carried out with top, middle and key employees who participated to the development of the three new products cited above. Respondents were managers in charge of activities such as marketing; information processing, new product range, strategic planning studies, pre-post campaign studies, distribution channels, electronic banking, etc. We have recorded, transcribed and analysed all interviews on the basis of content analysis.

## The case study questions

We didn't use an interview guide during the immersion period. Questions were relevant to each manager domain, competence and knowledge, and answered to our information needs. To analyse managers' purposes, we have adopted, as mentioned above, the content analysis technique which is consisting in coding and interpreting verbatim in order to identify the main facets that could represent a customer knowledge enabled innovation capability.

The main questions kept in mind when collecting data were:

- Who are the main partners of the bank in the innovation process based on the three new products under study? (focus on the role of customer)
- Are customers integrated in those innovation processes and how were they involved? (identify object, stages, level and modes of integration)
- How is customer knowledge generated, disseminated, transformed and used within the organization?
- How is this knowledge managed in order to constitute an innovative capability?

## Case study report: results and analysis

Drawing on the case study and the previous research on knowledge based capabilities, organizational capabilities, and user involvement (Battor et al, 2008; Rollins and Aino 2005; Wang and Ahmed 2007, Jaratt 2008, Lettl and Herstatt 2004, Lawer (2003, 2005), Rollins 2005), we define CKEI capability as the capacity of the organization to propose new products and services on the basis of an effective management of customer knowledge. In other words, it reflects the degree to which the company is endowed with the expertise of managing properly customer knowledge in order to enhance innovation. It is believed that CKEI may endow the company with a set of organizational competences and management skills as well as by a mindset of customer

knowledge acquisition, dissemination, transformation and use for the sake of securing new products performance.

All in, eight facets are seen to contribute to the making of CKEI: customer active/passive integration in the innovation process, stages of customer integration, customer knowledge structuring, customer knowledge sharing, continuous learning, creativity promoting culture, and effective communication of customer knowledge. Following previous research on organizational capabilities, the resource based view and the knowledge based theory (Eisenhart and Martin 2000; Teece *et al.* 1992, 1997; Barney 1991), we summarize these eight facets in three main dimensions believed to encompass the CKEI capability: integrative capacity, structural capacity and internal management capacity.

## **Integrative capacity**

The firm's integrative capacity of customer knowledge is a specific representation of its absorptive capacity. It is defined as the capacity of the organization to involve customers in the innovation process in order to benefit from their knowledge. During informal interviews with the bank managers, we have asked them about the sources of innovation in their company. Customers clearly appeared as the main source.

Based on Allam and Perry (2002)'s definition of customer involvement and on the case study analysis, we admit that the integrative capacity of the firm depends largely on the level of customer integration in the innovation process (active versus passive integration) and the stage of customer integration (the step of the innovation process he is involved in):

- *A/1- Active versus passive integration:* in passive integration, customers are assimilated to simple information providers, while in active integration, they are considered as co-producers and co-creators of value. In passive integration, customers participate in the innovation process *indirectly*. This type of knowledge is almost knowledge about customers such as knowledge residing in databases. The case study has shown that this type of knowledge is collected through several techniques such as the customers' complaints analysis, their purchase frequencies, their socio-demographic features,...etc. It is, in general explicit knowledge about customers that is coded in data bases. However, in active integration they participate *directly* in the innovation process. The principal methods used in the bank are: focus groups with customers, market studies, online discussion forums, blog, lead users technique (lead users were identified in the case in hand through events such as competitions and challenges proposed to customers. They are annual contests meant to stimulate customers' creativity and innovativeness in order to integrate them in the innovation process.

*A/2- The stages of customer integration:* customer integration varies according to the innovation process (from idea generation to feedback). According to the case study, customers are in general integrated in the idea generation phase and in the feedback phase (through post-campaign studies). This is confirmed by the use of market studies in the bank such as market segmentation and customer satisfaction studies, on the one hand, in order to identify real customer needs and post campaign studies, on the other, in order to collect feedback from customers after the launch of new products. Feedback allows the bank managers make adjustments in order to adapt their products and services to customers' desires.

## **Structural capacity**

It is the capacity of the organization to structure knowledge about, from and for customers and to classify it in data bases in order to transform it into easily sharable knowledge. Managers argue that IT software are needed for data processing and structuring. They recognize that some products have failed in the bank because there was no information safeguarding and follow up related to customer preferences, habits and attitudes towards these products. To structure customer knowledge, data warehousing and data mining are needed (Rolling et al, 2005).

We admit that the structural dimension of CKEI capability is reflected to a large extent in (1) the technology infrastructure of the organization and (2) the employee competence in using technology. In fact, the case in hand has shown that the failure of the youth card is caused, on the one hand, by the lack of information technologies such as CRM systems and, on the other hand, by the lack of employees competence in using existing technologies such as intranet. According to the marketing manager "*We always use intranet to share customer knowledge between different departments and employees. However this is not sufficient, other IT applications are needed such as CRM to ensure knowledge tracking and updating*"

According to the data processing manager: “Initiating employees to use and exploit appropriately data bases is more important than purchasing IT applications”.

## Internal management capacity

It reflects the organizational culture basis and the values the firm want to set up among its employees in order to effectively manage customer knowledge and foster innovation. In fact, it is not sufficient to integrate customers in the innovation process, effective management of the generated knowledge is also needed to succeed in new products development and launch. We admit that the internal management capability of the firms is largely reflected in knowledge sharing between employees, continuous learning from past experiences, the creativity promoting culture and communication effectiveness.

*Knowledge sharing:* Knowledge sharing reflects the bank employees’ competence in disseminating and utilizing customer knowledge in order to enhance innovation. Based on the case study, knowledge is always shared during employees’ workshops, training sessions and seminars.

- *Continuous learning:* It is a core component of CKEI. In fact, to disseminate and manage appropriately customer knowledge, a firm must have the ability to learn from previous experiences. In the present research, feedback is considered as a main source of learning from past experiences. According to the case in hand, this kind of information is collected from customers through different techniques: communities of users, post-campaign studies, service recovery... Continual learning is also practised in the bank by other techniques such as listing the “best practice cases”; preparing previous experience reports (forces and weaknesses), and built on them to minimize mistakes and respond to customers’ needs in the best way.

- *Creativity promoting culture:* It refers to the firm competence in infusing an organizational culture that supports and promotes creativity and innovativeness. In the case before hand, the creativity promoting culture is focused on encouraging employees’ creativity by reward and evaluation systems such as proposing the “excellence prize” for the most innovative employee. Creativity is also sustained by reinforcing awareness of the staff and hierarchy of responsibilities and tasks.

- *Effective communication:* finally, an organization which is endowed by a CKEI capability must have the ability to communicate internally (to its employees) and externally (to customers and other partners) all tasks related to new products. Internal communication is encouraged by the creation of an in-house magazine entitled “the bank News” which is a weekly internal document presenting new procedures used, new products/services launched by the bank, memos, competitors, training programs for the staff,...the magazine is distributed through the bank intranet. For external communication, the bank uses different networks to communicate new products, services and events in order to enhance reputation and attract customers (advertising, blog, web site,...).

### ➤ Verifying the quality of the case study design:

Respecting the case study validity and reliability criterions as given by Yin (2003), we present in the following table the application of those tactics in ours case in order to check and judge the quality the generated results.

Tests	Case study tactics	Application of those tactics in our case study
<b>Construct validity</b>	-use multiple sources of evidence -establish a chain of evidence -have key informant review draft case study report	-Triangulation of techniques -Hold an information data base through transcription of collected information -Transmit this data base for other reviewers to ascertain objectivity
<b>Internal validity</b>	-Do pattern matching -Do explanation building -Adress rival explanations -Use logic models	-Use content analysis for collected data interpretation (reporting and analysing observation and documentation, transcription of interviews, codification, interpretation of verbatims)
<b>External validity</b>	-Use theory in single case study -Use replication logic in multiple case studies	-Use theoretical background (customer knowledge management, innovation and organizational capabilities’ literature, user involvement) -Going to and fro between literature review and case study material
<b>reliability</b>	-Use case study protocol -Develop a case study data base	-In the case study protocol we have presented the research objective, the data collection techniques, the questions asked to managers, and the case study report -hold a case study data base

Table V: Criteria for judging the quality of the case study design, Adapted from Yin (2003) and Cepeda and Martin (2005)

## CONCLUSION

The CKEI capability is the capacity of the organization to propose new products and services based on effective management of customer knowledge. This capability could be at the basis of sustaining a competitive advantage and to do so, an organization should be characterized by three main specific competencies: it should integrate customers actively and from the very early stages, in the innovation process. It should also be characterized by a competence of structuring knowledge about, from and for customers. Finally, it should manage internally (across employees and departments) customer knowledge, through knowledge sharing among employees, continual learning, creativity promoting culture and effective communication of knowledge. We argue that those findings are a valuable extension to existing researches as shown in the literature review section, the case study analysis and the discussion section.

The theoretical contribution of the present research consists in presenting a new theoretical construct combining KM/CKM, innovation and organizational capabilities theories.

The managerial implications consist in the fact that the paper proposes to managers guidelines that allow them to handle new product development projects properly on the basis of their collaboration with customers. Managers have to give more attention to customer integration in the innovation process, to structuring knowledge about, from and for customers and to establishing an organizational culture that reinforces customer knowledge sharing between employees, continuous learning from past experiences related to innovation, employees creativity and effective communication, motivating employees to collaborate between each other and with customers who should be considered as a real partner and co-creator of value.

The results presented in this research are based on a single case study. The use of multiple case studies may enrich our results and generate more substance on the CKEI capability. Also, it might limit the risk of subjectivity. Also, and as the construct is new, further in-depth interviews or focus groups are needed to generate scale items for its measurement. Besides, empirical quantitative research is needed in order to explore the generalized scale items and to assess them reliability. Further research is needed also in order to integrate the CKEI construct in a general model of CKM and innovation.

# THE CORRUPTION-ECONOMIC GROWTH NEXUS: EVIDENCE FROM FOUR BRIC COUNTRIES BASED ON THE PANEL DATA APPROACH

Yuan-Hong Ho and Chiung-Ju Huang  
Feng Chia University, Taiwan

## ABSTRACT

*This paper utilizes panel unit root, panel unit cointegration, and panel error correction model techniques to examine the corruption-economic growth nexus in a panel of four BRIC countries (Brazil, Russia, India, and China) over the 1995 to 2009 period. The empirical results show that there is a significant positive relationship between corruption and economic growth in the short run. However, in the long run, corruption is no longer the most important factor that affects economic growth. Instead, foreign direct investment and the degree of economic openness are the key factors that influence a country's economic growth.*

## INTRODUCTION

Corruption is a global issue faced by all countries, governments, and communities. There is not a single description for corruption as it takes on different shapes accordingly to specific culture, ethnicity, government type and scale, economic development, and public behavior. For example, Transparency International (TI) defines corruption as “the misuse of entrusted power for private benefit,” International Monetary Fund (IMF) describes corruption as “the abuse of public authority or trust for private benefit,” and the Asian Development Bank (ADB) defines corruption as “the abuse of public or private office for personal gain.” Jain (2001) further introduces three types of corruption phenomena that occur in a democratic nation. For example, grand corruption involves corruption among high level executives in government, legislative corruption involves corruption among representatives of the general public, and bureaucratic corruption involves corruption among government officials and staff. Regardless of its type, corruption hinders economic and social development, causes political instability and government inefficiencies, and deteriorates the close bond between a nation and her democratic ideals. In response, both emerging market economies and democratic developed countries have begun to seriously consider the social, political, and economic harm corruption brings, and to invest in resources to prevent and control corruption. Similarly, international organizations have also established various anti-corruption plans and departments for this cause. Among the anti-corruption organizations, the international non-government, global civil society organization, TI, stands out as one of the most influential and well-known entities.

While the effects of corruption can be clearly observed, they are often hard to quantify. Obtaining accurate information pertaining to corruption in specific nations is difficult, and quantifying the respective damage is less likely. Social and cultural differences, different standards and tolerance towards corruption also contribute to the complexity of formulating a standardized way to quantify corruption. However, several international organizations have attempted to create metrics to evaluate and quantify a nation's corruption. For example, TI created the Corruption Perceptions Index (CPI) and the Global Corruption Barometer (GCB); Business International came up with the Business International Index (BI); Political Risk Services, Inc. designed the International Country Risk Guide Index (ICRG); and World Bank developed the Governance Indicators. The CPI from TI is known for its accuracy and is currently the most frequently used method for measuring corruption. Following the CPI in popularity, is the World Bank's corruption index (Governance Indicators). In this study, Transparency International's CPI is used as the explanatory variable for its empirical study.

Recent global economic activity has been largely dominated by emerging market economies. The performance of Brazil, Russia, India, and China's economic markets have especially stood out among the others and are now known as the BRICs. In fact, Goldman Sachs' 2003 publication, *Dreaming with BRICs: The path to 2050* projected that within the next forty years, based on population, productivity and capital, and the conventional economic growth model, the BRICs will have a combined economy larger than that of the G6 or the six major industrialized nations, including the United States, Japan, England, Germany, Italy, and France. In addition, the publication states that by 2050, only the United States and Japan, amongst the old G7, will have economies large enough to compare with those of the BRICs. One of the major distinguishing characteristics that differentiated the BRICs nations with others is their scale. More specifically, each of the BRICs nations has belong to the six nations with highest population (the United States and India being the other two), the seven nations with the largest land mass (Canada, United States, and Australia being the other 3), and the eleven nations with the largest economy (the G7 nations being the other seven). None of the other emerging markets countries, such as the Next-eleven (N-11), which includes Bangladesh, Egypt, Indonesia, Iran, Mexico, Nigeria, Pakistan, The Philippines, South Korea, Turkey, and Vietnam, or the VISTA, which includes Vietnam, Indonesia, South Africa, Turkey, and Argentina, compare in scale with the BRICs.

Table 1 displays the relationship between CPI and both the average global GDP growth rate and the GDP growth rate of the BRICs. The statistics show the BRICs as having higher growth rates than the global average, but a CPI score falling towards the end of the list. This seems to suggest that for the BRICs, there is a short term, positive correlation between corruption and economic growth. However, how might corruption and economic growth relate to each other in the long run? This paper intends to examine both short and long run relationships between economic growth and corruption for the 4 BRICs. By using the panel unit root test, the panel cointegration, and the panel error correction model, we will be able to consider cross-country information, which will yield higher testing power and more accurate estimations that surpass the results of using traditional time series approaches.

## **LITERATURE REVIEW**

Due to growing concern over corruption's harmful effects on economic and social development, numerous studies have been devoted to explore the relationship between economic growth and corruption. Determining how corruption affects economic and social development is more than an intellectual exercise because the results may potentially contribute towards the discovery of multiple solutions to the problem corruption.

According to Tanzi (1998) and Ackerman (1999), corruption negatively impacts a nation's competitiveness by not only decreasing financial investments, economic growth, and government expenditures on education and health, but also leading to imbalanced expenditures, misguided market incentives and poorly allocated national resources. Such negative impact has been well documented by existing studies. Mauro (1995) was the first to publish empirical analyses on the relationship between corruption and economic growth. Cross-country empirical studies suggest that severe corruption significantly deters investment and economic growth. Brunetti et al. (1997), Brunetti and Weder (1998), Campos et al. (1999), and Wei (2000) also published empirical evidence documenting corruption's negative impact on the investments and Porison (1998) and Leite and Weidmann (1998) published empirical evidence document corruption's negative impact on economic growth. However, Mo (2001)'s cross-country analyses initially shows that corruption has a significant negative effect on economic growth; but after factoring variables such as investment, human capital, and political instability into the analyses, has a diminishing impact and becomes statistically insignificant. Monte and Papagni (2001) study the case of Italy municipality shows that corruption not only directly limits the average labor income, but also decreases private investments, which in turn, decreases the efficiency of public investment expenditures and slows down economic growth. Gyimah-Brempong (2002)'s study on African countries show that corruption not only decreases economic growth but also contributes to unequal income distribution. Neeman et al. (2004)'s study shows that the extent that which corruption has a negative impact on a country's economic growth, is determined by the "openness" of the specific country. Svensson (2005)'s re-visit of Mauro (1995)'s study similarly supports the finding that corruption negatively impacts economic growth. Finally, Gyimah-Brempong and de Camacho (2006)'s study shows that while corruption has a negative impact on economic growth, there are significant countries-specific effects. For example, corruption's negative impact is most significant among African countries and least significant among Asian and OECD countries.

Although most empirical studies agree that corruption negatively impacts economic growth, there are some scholars that believe corruption to have the opposite effect. The belief is that corruption heightens the administrative efficiency of government agencies and decreases the transactions cost of time, positively influencing economic growth. Leff (1964), Bayley (1966), and Huntington (1968) suggest that under certain circumstances, individuals or corporations may bribe policy makers to turn around unfavorable situations caused by existing law and regulations and other political inflexibilities and bolstering economic efficiency. In fact, Lui (1985)'s empirical study shows that political bribery has lead to shortened political processes. Similarly, Klitgaard (1988) and Acemoglu and Verdier (1998) both used the theoretical model to prove that when a nation is pursuing the maximization of national output, an optimal level of corruption exists. The studies suggest that while the optimal level may be relatively low, it still does exist because anti-corruption efforts represent a cost in itself. Wedeman (1997) discovered that many countries enjoy rapid economic growth despite facing corruption. Colombatto (2003)'s study suggests that in certain developing countries or totalitarian countries, corruption helps eliminate certain factors that hinder economic development. Furthermore, Glaeser and Saks (2006)'s study on the United States and Treisman (2007)'s cross-country study both show that corruption's impact on economic growth as not being statistically significant. While previous empirical studies on the relationship between corruption and economic growth have led to inclusive results (various results and interpretations), this study attempts to contribute to this line of research by using the newly developed panel unit root tests, panel cointegration tests, and panel-based error correction model to investigate the relationship between economic growth and corruption among the BRICs.

## DATA AND METHODOLOGY

## Data

Our empirical analysis employed annual data on economic growth rate (growth), foreign direct investment (fdi), the degree of economic openness (open), corruption perception index (cor) and share of government expenditures relative to GDP (ge), for Brazil, Russia, India and China over the sample period of 1995-2009. All data were obtained from the data bank of International Monetary Fund (IMF), United Nations Conference on Trade and Development (UNCTAD), United Nations (UN), World Trade Organization (WTO) and Transparency International (TI) respectively.

## Methodology

Ever since Nelson and Plosser (1982) published their seminal work, various studies have been devoted to the investigation of potential non-stationary characteristics of important macroeconomic variables. Researchers have been especially interested in the time-series properties of real output levels. As pointed out by Nelson and Plosser (1982), the modeling of real output levels as either a stationary trend or a difference stationary process has important implications for macroeconomic policy making, modeling, testing and forecasting. Therefore, studies on this issue are of concern to not only empirical researchers but also to policymakers.

While numerous studies support the use of the unit root test of real output levels, critics claim that the drawing of such conclusions may be attributed to the fact that conventional unit root tests typically have lower power. More recently, it has been reported that conventional unit root tests not only fail to consider information across regions, therefore leading to less efficient estimations, but also have lower power when compared to stationary alternatives. It is not surprising that these factors have cast considerable doubt on many of the earlier findings that have been based on real output levels from unit root tests. A tangible approach for increasing the testing power of the unit roots is to consider the use of panel data.

### Levin, Lin and Chu Panel Unit Root Test

Levin, Lin and Chu (2002) found that the panel approach substantially increases power in finite samples when compared with the single-equation ADF test. They proposed a panel-based version of equation (1) that restricts  $\hat{\beta}_i$  by keeping it identical across cross-sectional regions, as shown below:

$$\Delta X_{i,t} = \alpha_i + \beta X_{i,t-1} + \sum_{j=1}^k \theta_{ij} \Delta X_{i,t-j} + \varepsilon_{i,t} \quad (1)$$

where  $\Delta$  is the first difference operator,  $X_{it}$  is the variables deal with,  $\varepsilon_{it}$  is a white noise disturbance with a variance of  $\sigma^2$ ,  $t=1,2,\dots,T$  indexes time periods, and  $i=1,2,\dots,4$  indexes cross-sectional regions. LLC tested the null hypothesis for the existence of a unit root (i.e. the series is non stationary) with  $\beta_1 = \beta_2 = \dots = \beta = 0$  against the alternative of  $\beta_1 = \beta_2 = \dots = \beta < 0$ , based on the test statistic:

$$t_{\beta} = \frac{\hat{\beta}}{se(\hat{\beta})} \quad (2)$$

Where  $\hat{\beta}$  is the OLS estimate of  $\beta$  in equation (1), and  $se(\hat{\beta})$  is its standard error.

### Maddala and Wu Panel Unit Root Test

Using Fisher (1932)'s results and the  $p$ -values from individual unit root tests, Maddala and Wu (1999) develop a panel unit root test. Let  $\pi_i$  as the  $p$ -value of a unit root test from cross section units, the test statistic of Fisher is defined as:

$$-2 \sum_{i=1}^N \log(\pi_i) \rightarrow \chi_{2N}^2 \quad (3)$$

In addition, it demonstrates that:

$$Z = \frac{1}{\sqrt{N}} \sum_{i=1}^N \Phi^{-1}(\pi_i) \rightarrow N(0,1) \quad (4)$$

Maddala and Wu (1999) reports both  $\chi_{2N}^2$  and standard normal statistic values using ADF and Phillips-Perron (1988) individual unit root test, the null hypotheses of them are the same as the Im, Pesaran and Shin (2003) test.

## Pedroni Heterogenous Panel Cointegration Tests

Pedroni (1997, 1999) developed a number of statistics based on the residuals of the Engle and Granger (1987) study. Pedroni supported heterogeneity among individual members of the panel, and included heterogeneity in both the long and short-run cointegrating vectors. By so doing, Pedroni developed seven panel cointegration statistics for varying intercepts and varying slopes. Four of them qualify as pooled panel cointegration statistics that have within-dimension characteristics. The other three, group mean panel cointegration statistics, have between-dimension characteristics. The pooled panel cointegration test statistics are as follows: panel v-statistics, panel rho-statistics, panel PP-statistics and panel ADF-statistics. The group-mean panel cointegration test statistics are as follows: group rho-statistics, group PP-statistic and group ADF-statistics

Pedroni (1997) argued that for cases with longer time spans (such as,  $T > 100$ ), the sample size distortion tends to minimal, while retaining a very high testing power across all seven statistics. However, for shorter panels, alternative statistics appeared to yield conflicting evidence. Pedroni (1997) showed that in terms of testing power, the group-ADF statistic has the best performance in general, followed by the panel-ADF. The panel-variance and group-rho statistics performed poorly in comparison.

## Panel Vector Error Correction Model

When real government revenues and expenditures are co-integrated, a long run relationship exists between them. We can use the vector error correction model to characterize both long run equilibrium relationships and short run dynamic adjustment processes between government revenues and expenditures. The vector error correction model for Brazil, Russia, India and China with heterogeneous panels is shown as follows:

$$\begin{aligned} D(growth)_{i,t} = & \alpha_1 + \sum_k \theta_{11i,k} D(growth)_{i,t-k} + \sum_k \theta_{12i,k} D(cor)_{i,t-k} \\ & + \sum_k \theta_{13i,k} D(fdi)_{i,t-k} + \sum_k \theta_{14i,k} D(ge)_{i,t-k} \\ & + \sum_k \theta_{15i,k} D(open)_{i,t-k} + \lambda_{1,i} \varepsilon_{i,t-1} + \eta_{i,t} \end{aligned} \quad (5)$$

Where  $k$  is the lag length,  $\varepsilon_{i,t-1}$ , and  $\eta_{i,t}$  are error correction terms and statistical noises respectively.  $\lambda_i$  is the speed of adjustment to long-run equilibrium.

## EMPIICAL RESULTS

Table 2 reports the results of the non-stationary tests for growth, fdi, open, ge and cor variables using LLC, ADF-Fisher and PP-Fisher tests. Each data series is non-stationary in terms of levels but stationary with respect to first differences, suggesting that all of the data series are integrated of order one. Having established that growth, fdi, open, ge and cor variables are  $I(1)$  in their level form, the long run relationship is estimated using panel cointegration tests. The panel cointegration models are used in order to draw sharp inferences since the time span of an economic time series are typically short. The estimated Pedroni's test statistics are given in Table 3. The results presented in Table 3 show that the null hypothesis of no co-integration among the series of growth, fdi, open, ge and cor is rejected by the five test statistics at the 1% significance level, except for the

panel v-statistic and group rho-statistic. These results suggested that the corruption perception index (cor), foreign direct investment (fdi), the degree of economic openness (open), and share of government expenditures relative to GDP (ge) are helpful in explaining GDP growth for BRIC countries in the long run, vice verse.

The empirical results of the panel error correction model are reported in Table 4. With the focus on equation (5), the estimated coefficients of  $D(\text{growth})_{t-1}$ ,  $D(\text{cor})_{t-2}$ ,  $D(\text{fdi})_{t-2}$ ,  $D(\text{ge})_{t-1}$ ,  $D(\text{ge})_{t-2}$  and  $D(\text{open})_{t-1}$  are not significant. Thus there is not enough evidence to support that short run causality exists between government expenditures and economic growth. The significance of the speed of adjustment,  $\lambda$  (i.e. the coefficient of  $\mathcal{E}$ ), explains the long run relationship observed during the co-integrated process. We reject the null hypothesis  $H_0 : \lambda_i = 0$  for all  $i$  in equation (5). Therefore, long run equilibrium exists between GDP growth and fdi, open, ge and cor variables for four BRIC countries.

## CONCLUSION

The commonality between the BRICs is that they represent large countries with huge populations that are able to generate immense need and buying power. China, India, and Russia benefit additionally from their immense man power, while Russia and Brazil enjoy bountiful natural resources. In the recent years, these four countries have experienced such miraculous economic growth not only because of the above reasons, but also because they have exported large amounts of products, services, and resources and have rapidly cumulated foreign reserves. However, each of the BRIC countries faces other economic issues, such as a large income gap between the rich and the poor and money debt resulting from political corruption. Despite having a lower corruption perception index on average and thus are countries known to be facing significant corruption, the BRIC countries still enjoy high economic growth rates likely accelerated by huge foreign investments.

In this study we use panel unit root, panel unit cointegration, and panel error correction model techniques to examine the corruption-economic growth nexus in a panel of four BRIC countries (Brazil, Russia, India, and

China) over the 1995 to 2009 period. The empirical results of this study show that among the various variables behind economic growth, direct foreign investments and economic openness represent the most influential factors, with economic openness having a significant, negative correlation with corruption. It is also found that the corruption perception index with lag one period and lag two periods have a positive correction with current period economic growth. However, this correction is only statistically significant for the lag one period. In addition, the empirical results suggest that government expenditure and economic growth do not have a statistically significant direct correlation. In the short run, estimations from the panel error correction models show that there is a significant positive relationship between corruption and economic growth in the short run. However, in the long run, corruption is no longer the most important factor that affects economic growth. Instead, foreign direct investment and the degree of economic openness are the key factors that influence a country's economic growth. We are unable to validate the claim that higher corruption is beneficial to economic growth because economic growth depends on country-specific factors such as direct foreign investment and market openness.

Although the empirical results of this study do not show the corruption level as having a significant influence on the investments, expenditure, and economic openness, in the long run, when the economy grows to a certain level and government corruption still has not receded, these emerging market economies may likely cease to flourish.

# **BREAKING THE SILENCE-CONSIDERATIONS AND POLICY GUIDELINES FOR THE MANAGEMENT OF THE WHISTLE BLOWING PROCESS IN AN ORGANIZATION**

**Natasja Holtzhausen**  
**University of South Africa, South Africa**

## **ABSTRACT**

*The purpose of this paper is to explore considerations relating to the effective management of whistle blowing in organizations, more specifically the South African public sector. Key to the management is the creation of mechanisms such as policies and hotlines to facilitate the whistle blowing process and to create a more positive organizational image and culture. This paper provides an overview of the indicators of effectiveness of whistle blowing and provides guidelines for the establishment of a whistle blowing policy and process.*

## **INTRODUCTION**

According to Calland (2004:2), "... whistle blowing is about basic issues which lie at the heart of human activity. It covers loyalty and the question of dubious practices. It concerns communication and silence. It is about practicing what one preaches and about leadership. It focuses on responsibility toward others and the accountability of those in charge. It is where public and private interests meet". In the current turbulent times it is imperative that the challenge of whistle blower protection be adequately addressed. Whistle blowing in itself is turbulent, but essential in the fight against corruption. When disclosures are made, organizations should have the opportunity to deal with allegations of wrongdoing in order to establish if it is in fact wrongdoing. Organizations should be informed timeously if they are to be able to act proactively, and should have a whistle blowing process in place to facilitate such proactive action.

When considering legislation aimed at encouraging whistle blowing, policy makers have chosen to use the generic term disclosure when referring to whistle blowing (such as the South African Protected Disclosures (PDA) Act 26 of 2000 and the United Kingdom's Public Interest Disclosure Act of 1998). Whistle blowing is much more than a disclosure, because the person making the disclosure has to be specific. In addition, there is a difference between authorized (following the rules and regulations of the organization) and unauthorized (not according to organizational channels or even in public, e.g. to the media) disclosures. Whistle blowing is regarded by Vinten (1994) and Bakman (2005) as an "... unauthorized disclosure of information that an employee reasonably believes is evidence of the contravention of any law, rule or regulation, code of practice, or professional statement, or that involves mismanagement, corruption, abuse of authority, or danger to public or worker health and safety". This paper will describe the effectiveness of whistle blowing within the South African public sector and explore possible strategies and provide policy guidelines for consideration. The success story of South African Mike Tshishonga will be explored to learn valuable lessons. The paper will further briefly describe components in the whistle blowing process and conclude by elaborating on the effects of whistle blowing on the organizational image and the creation of a whistle blowing culture.

## **EFFECTIVENESS OF WHISTLE BLOWING**

The effectiveness of whistle blowing may be defined in a variety of ways. Legal scholars tend to define the effectiveness of the outcome in terms of the win/lose ratio of lawsuits involving whistle blowers (Terpstra and Baker in Near and Miceli 1985). The focus here is primarily on whether the whistle blower has accomplished what he or she set out to achieve, namely, the initiation of organizational change as opposed to obtaining a judgment. Therefore, the effectiveness of whistle blowing is defined by the extent to which the questionable or wrongful practice (or omission) is terminated at least partly as a result of whistle blowing and within a reasonable time-frame. Near and Miceli (1985) recommend that the operationalization of effectiveness should be addressed. Obviously, reasonableness (in terms of resolution time) involves judgment and perception, and it is likely that it varies from situation to situation, as well as from person to person. There should be concrete evidence that an action has been halted (e.g. corrected financial reports accepted by an outside authority), that termination is attributable to the whistle blower's action, and that the time period is reasonable (e.g. by a certain deadline).

According to Near and Miceli (1995) and Mbatha (2005) there are five primary factors that influence the termination of wrongdoing. Firstly the nature of the whistle blowing event; secondly the disposition of the complaint recipient; thirdly the character of the wrongdoer; fourthly the aspects relating to the act of wrongdoing; and lastly the characteristics of the organization. Five sets of variables affect these factors. Some are individual variables (pertaining to the whistle blower, complaint recipient and wrongdoer), and others are situational variables (organizational and wrongdoing variables). An effective whistle blowing process may have implications for an organization's future (Farrell and Petersen in Near and Miceli 1985). One potential long-term outcome is organizational performance (Perry in Near and Miceli 1985). Although it is generally assumed that corporate wrongdoing harms an organization's performance, empirical results suggest that this is not always the case (Near and Miceli 1985). If the public discovery of corporate wrongdoing does not reduce long-term performance, then executives have little incentive to terminate the wrongdoing. Alternatively, where wrongdoing harms the organization (for example fraud), it will clearly benefit the organization if the wrongdoing is terminated.

The organization's choice also affects a second long-term outcome – its ability to control the external elements in its environment (Near and Miceli 1995), *i.e.* other organizations and constituents. For example, the organization sued for wrongdoing may be viewed with somewhat greater suspicion by regulatory agencies. In the context of the elements that inhabit its external environment, the organization's ability to control the demands of these elements (Near and Miceli 1995) may be impaired or enhanced by its response to the reporting of wrongdoing. Moreover, society may be influenced by whether an organization terminates a particular case of wrongdoing, but society is also influenced by potential changes in the nature of the relationship between the organization and its external environment (e.g. when an organization implements an employee-involvement programme to prevent wrongdoing in the future).

## **The Case Of Mike Tshishonga**

The first successful claim before the South African Labor Court for compensation arising from the PDA is the case of Mike Tshishonga vs. the then Minister and Director General of Justice. In October 2003 Mike Tshishonga (employed at the South African Department of Justice for 30 years and the managing director of the Master's Office Business Unit) leveled serious accusations at former Justice Minister Penuell Maduna. Tshishonga was responsible for addressing corruption in the liquidation industry. The case concerned the appointment of a liquidator in the Retail Apparel Group (RAG) that was liquidated in May 2002. Tshishonga alleged that Maduna had a "questionable relationship" with Enver Motala, a private-sector liquidator. The supposedly nepotistic relationship had led to Maduna's alleged "abuse of the infrastructure and staff of the Justice Department for the purposes of advancing his personal interests," and of endangering South Africa's criminal justice system. Motala was dissatisfied with the manner in which he was sidelined in the appointment of liquidators (Davids 2007).

Tshishonga was in the process of restructuring the Master's Office and the appointment of liquidators. Motala attended a merger meeting of the insolvency practitioner's bodies at the request of the former Minister where other liquidators were excluded. The former Minister met with Tshishonga and expressed his dissatisfaction with the fact that Mr Motala had not been appointed as a liquidator. Minister Maduna then instructed the Master in the Pietermaritzburg Office to appoint Motala. Mr Tshishonga, unhappy with the appointment, acquired a legal

opinion as to the Minister's powers. The appointment of Mr Motala was successfully challenged in court and it was established that the Minister did not have the power to appoint liquidators. The Minister then appointed a subordinate of Mr Tshishonga's, without discussing it with him, to oversee the appointment of liquidators in Pietermaritzburg in the RAG case, and Mr Motala was appointed as the fifth liquidator. Former Minister Maduna thereafter removed Mike Tshishonga as head of the unit and refused to meet with him. Subsequently, Mr Tshishonga enquired from the previous Director General how a politician could instruct an administrator and how the instructions could be executed without following proper procedure, but no reasons were provided. The issue of poor performance was raised, but at a later disciplinary hearing the former Director General stated that poor performance was never an issue and that Tshishonga had in fact sent a clear message of good governance (Davids 2007 and Holtzhausen 2007).

The former Director General commissioned a forensic investigation into Tshishongas' corruption allegations but did not react to the report received. Mike Tshishonga then called on the Office of the Public Protector and when nothing was done about the complaint, he went to the Auditor General. Again, as in the case of the Public Protector, nothing was done. At last, the Public Protector referred the matter of Tshishongas' poor treatment to the Public Sector Commission while the Public Protector investigated the allegations of irregularities. As a final resort Mr Tshishonga discussed the matter with the Minister in the Presidency who stated that a meeting would be set up between the Minister and Director General of Justice and Mike Tshishonga. This meeting never took place. Only then did Mike Tshishonga set up a press conference as a last resort. He was suspended a week later for divulging sensitive information and two weeks after that, he was charged with misconduct. He successfully challenged the suspension in the Labor Court and was reinstated to his previous position. The Department of Justice, however, did not comply with the court order and still continued with a disciplinary hearing where an independent chairperson had found Tshishonga not guilty. The former Director General refused to reinstate Mr Tshishonga and instead offered him a settlement and terminated his employment as agreed by both parties (Davids 2007 and Holtzhausen 2007).

The court found that the disclosure made by Tshishonga to the media was reasonable, as the media disclosure was the fifth disclosure he made, that the correct procedures had been followed and that all the requirements of the PDA had been complied with. The Minister of Justice and the Justice Department were ordered to pay Tshishonga one year's salary as well as the legal costs. The Department of Justice received negative publicity and embarrassment. The court said of this case: "... a defence that the employee breached confidentiality has to be approached so cautiously that it does not strip the PDA of its content" (Davids 2007). In December 2011, at a gathering at the University of Johannesburg, Mike Tshishonga said: "The Protected Disclosures Act was, in the end, what saved me from the ruthless actions of the Justice Department. The way the PDA is set out, makes something that is by no means an easy task, something that if it is done within the prescribed guidelines of the PDA a legal and bearable means of fighting corruption." When analyzing the Tshishonga experience it is clear that strategies must be in place for not only disclosing wrongdoing, but also for the management of the whistle blowing process.

## **A WHISTLE BLOWING STRATEGY TO ENSURE A POSITIVE ORGANIZATIONAL IMAGE**

Whistle blowing might be perceived as a deficiency in the organizational system that should be provided for in an accountable manner. Organizations must have a communication strategy in place to deal with whistle blowing in an effective and proactive manner, informing all stakeholders about whistle blowing (options, procedures, possible consequences, and possible responses). In order for internal whistle blowing to be effective, an internal system must exist within the organization. This system must include the following (Barker and Dawood 2004):

- access to independent advice, for example the Open Democracy Advice Centre;
- proper channels of communication to document and address wrongdoing in the organization;
- a clear statement that unprofessional conduct is taken seriously and an indication of what is perceived as unprofessional conduct;
- penalties for making false allegations of wrongdoing;
- a verifiable whistle blowing procedure;

- an internal committee to facilitate the whistle blowing process and to take account of good practice, or establish an anonymous hotline;
- guidelines to employees on raising concerns outside of the organization if necessary;
- the use of itinerant organizational lawyers as a channel of communication;
- respect for the confidentiality of the discloser if the disclosure is made outside the line management structure to other parties, or providing alternate avenues; and
- management's commitment to the process of whistle blowing and to supporting whistle blowers.

An internal whistle blowing strategy will help to prevent employees from blowing the whistle externally and thus cause embarrassment and negative publicity as experienced by the Department of Justice in the illustrated case. External disclosures are better avoided, since they could raise ethical as well as legal issues in terms of confidentiality and might affect the relationships between the organization, the media and the government. External whistle blowing will only be protected if for example all the internal channels have been exhausted (as was the situation in the Tshishonga case). In addition, external disclosures could involve regulatory issues requiring intervention, and could lead to negative publicity, especially since anonymous disclosures are almost impossible to investigate (Dehn and Borrie 2001), especially if the anonymous disclosure was made through a hotline. A hotline offers anonymity for those reporting corruption, and may be more convenient and less threatening but it should be noted that it is more difficult to verify information received via a hotline. During the Jali Commission of Inquiry investigation on corrupt practices in South African prisons, most the information received was through hotlines. It is necessary that policy guidelines exist to give effect to the PDA and the unique characteristics of each organization-a one size fits all approach will not be appropriate as organizations differ.

## POLICY GUIDELINES

Although legislative measures (if followed correctly) protect the whistle blower and an ethical code of conduct provides guidelines, it is important that the organization set up a policy for whistle blowing. The South African Public Service Commission (s.a) created a guide for public managers (that could be useful for managers in both the private and public sector) to promote accountability, implementing the PDA. This document contains certain suggestions on how to put a whistle blowing policy in place. It should be remembered that a policy should be viewed as a way of complying with legislation, a mere aid to creating an environment where employees understand their responsibilities and management demonstrates its accountability. The policy must be actively implemented and employees must be aware of all the protected disclosure avenues available to them. Consensus-based policy includes a consultative process where both managers and workers understand that it is acceptable for them to make a disclosure and that they will be protected. Procedures and rules for reporting alleged wrongdoing must be in place and if not, a consultative process should be used to establish such rules and procedures. It should be noted that if employees feel that they may be victimized, they might make a general disclosure to the broader public which is not ideal as it might prove embarrassing to the Department concerned (see illustrated case) or might even be false. If allegations are made, they should be investigated and responded to within a reasonable time-frame. In cases where a protected disclosure is made, care should be taken that the discloser is not victimized by any other person under the managers' control. This could mean that the identity of the whistle blower stay confidential. It is advisable to appoint a senior official in the organization to whom disclosures can be made and this individual should have the necessary authority to deal with the issue at hand if the line manager is unable to do so. Success stories should be publicized as it will contribute to the creation of a positive whistle blowing culture. Managers need to understand that employees have the right to make disclosures and should know how to deal with such disclosures. If there is a need for it, an independent advice centre can be used to create awareness and provide training to help employees understand and utilize relevant legislation. A policy on whistle blowing should be introduced and promoted.

In order to *understand the issue* it is advisable to involve all employees to promote, display and ensure good practice. Wrongdoing should be explained to the employees as well as the effects and forms of serious wrongdoing. Employees' views on what is perceived as right and wrong should also be considered. For *employees to see the policy in action* it is necessary for them to know what actions are unacceptable and to feel free to ask management beforehand rather than afterwards whether certain actions would be appropriate. Serious wrongdoing should be dealt with in a firm manner. *Openness to concerns* should be taken seriously as it is not

easy to report a concern, especially if it is about perceived corruption. Managers must be open to such concerns before they turn into grievances, and should act upon such concerns. If an employee requests confidentiality, it should be respected, and employees need to know that they will be safe from reprisals. Employees should know that there are other routes besides line management available to them, such as a Director General, the Public Service Commission, the office of the Auditor-General, the office of the Public Protector, the South African Revenue Services, the Institute for Security Studies and the Open Democracy Advice Centre. Employees must know that they can contact such a person in confidence. In *dealing with concerns* it should be kept in mind that there are two sides to a story and that all allegations must be thoroughly investigated. If employees have concerns about their own careers and safety, this should be respected. Deterring and victimizing employees for making a disclosure is a disciplinary offence. The whistle blower process is a serious matter, and abusing the system to make unfounded allegations with malicious intent would be a disciplinary matter. The discloser should be given feedback about the results of the investigation and any steps that might be taken (Public Service Commission s.a).

Policies create the broad outline of what a whistle blowing culture should entail. It then becomes important to develop the details in terms of the type of mechanisms that should be in place to affect the policy that has been created. A whistle blowing plan is crucial, since it will help curb corruption in the organization, thereby increasing productivity and moving away from a culture of fear towards a more open, transparent culture. An official channel (such as a dedicated e-mail) within the organization may not work (Martin 1999), as employees may feel threatened or fear that their identity will not remain confidential. However, Vinten (1994:51) stresses that "The argument that information disclosure poses a challenge to an organization's authority structure, may not be the case where disclosures are positively encouraged and a channel for reporting is available".

## **EFFECTS OF WHISTLE BLOWING ON THE ORGANIZATIONAL IMAGE AND THE CREATION OF A WHISTLE BLOWING CULTURE**

According to Transparency International in the 2010 (a) Global Corruption Barometer corruption levels have been on the increase globally and many citizens are of the belief that governments are unsuccessful in the fight against corruption. What is encouraging is that there is a belief among the public that they have a constructive role to play in the fight and that there is a willingness to act on corruption as it occurs (61% of respondents in Sub-Saharan Africa indicated that they would report corruption). It is important to create an ethical organizational culture that encourages whistle blowing so that corruption and any perceived wrongdoing can be exposed. It should be noted that South Africa is, according to Corruption Perceptions Index (2010b), 54 out of 178 countries identified and achieved a 4.5 average out of a 10 to indicate the level of corruption. The South African Public Service Commission Annual Report (2010) reported 1,430 cases of alleged corruption among provincial, national departments and public bodies for the year of 2009-2010. In the 2010 State of the Public Service Report, the Public Service Commission registered 1,204 cases of financial misconduct for the 2008-09 financial year showing a steady increase over the previous six years. This is a clear indication that South Africa still has a long battle to fight against corruption.

The 2010 Global Integrity Report evaluates a variety of integrity indicators. One of these indicators is whistle blower protection which scored a 77% average in South Africa. This is primarily because there are specific whistle blowing frameworks in place as well as a variety of mechanisms to disclose wrongdoing. However, the problem lies with the practical implementation of these internal reporting mechanisms. That is why the whistle blowing process should include appropriate, workable and accessible channels within the organization to report wrongdoing as well as alternative channels if there is any possibility that management may be implicated in the alleged wrongdoing (Barker and Dawood 2004). The Department of Public Service and Administration has issued Minimum Anti-Corruption Capacity for Departments and Organizational Components in the Public Service guidelines, which entail that all government departments create internal information systems to record claims, and ensure capacity to investigate them. An effective organizational culture of whistle blowing will have channels of communication in place for complaints and grievances to be aired (Dehn and Borrie 2001).

In order to create an organizational culture that encourages protected disclosures, necessary policies must be in place. For protected disclosures to become part of the organizational culture, employees need to know that they will be protected from occupational detriment and retaliation if they disclose wrongdoing through the appropriate channels. Managers should also know how to act when wrongdoing is disclosed. An organization should have a code of ethics, which is a formal document that discusses the practices of the organization and the way employees are expected to conduct themselves at work. The importance of a code of ethics is that its objective is to ensure that all employees uphold the morals and culture of the organization, by acting in the best interests of the organization and the public interest. This means that the whistle blowing culture that has to develop within the organization needs to be explicitly expressed within its code of ethics (Bakman 2003).

Clear procedures have to be put in place with regard to authorized disclosures. The managers and public officials of the organization have to understand and embrace what these procedures entail as part of their everyday work ethic. Once the organization has established a whistle blowing culture, it becomes more difficult to act in a wrongful manner, because the culture is able to straighten out incorrect procedures whenever they may occur. This means that a policy must be established within the organization that gives explicit information on the prevention of organizational wrongdoing (Bakman 2003). According to Cloete in Holtzhausen (2007) ethics in public administration can be defined as "the collection of moral principles, norms, values and obligations that serve as conduct rules to be observed by political office-bearers and officials to ensure openness, courtesy, responsiveness, respect for the law, excellence, efficiency and economy", thus a strong focus on behavior. Hunt (1998) states that organizations that behave unethically have similar experiences in terms of their cultural patterns and states that different cultures prevail within unethical organizations: A culture of hypocrisy (double standards and not practicing what is preached). From this culture develops a culture of fear, where subordinates fear confronting their superiors because it could lead to intimidation. The culture of fear introduces a *laissez-faire* attitude, resulting in subordinate complacency, where there is a tendency not to follow proper procedures or protocols. The culture of fear then develops into a culture of corruption, in which employees practice secrecy and conspiracy, and try to serve their own interests at the expense of the client.

Every organization needs to take the steps towards developing an ethical whistle blowing culture. However, this is not a concrete thing, but rather a way of thinking about living and communicating within the organization. Dehn (1999) discusses the components of a whistle blowing culture. It is important to understand the components of this culture, because corruption is rampant in society. The aim of a whistle blowing culture is to address organizational wrongdoing. The essentials of a whistle blowing culture involve having a strong and clear signal from the top of the organization that management is against corruption and is committed to going about its business lawfully. Secondly, the existence of a whistle blowing culture will help to ensure that whistle blowing to a designated authority will be protected. Thirdly, this will encourage managers to be receptive to concerns about corruption and to deal with them properly. Lastly, the culture that develops will address the particular circumstances in which a broader disclosure may be justified.

Managing whistle blowing is about breaking the culture of silence and fear. Legislation is often the first step taken in trying to break the silence; however, the culture of silence still exists, because whistle blower legislation often has too many loopholes for organizations to take it seriously. Mechanisms that are put in place should be multi-faceted, and should enable the individual to see the organization's point of view as well. Confidential reporting systems are one of the mechanisms that could help promote a culture of whistle blowing. Management should know that a confidential reporting system within the organization can be effective, and can help prevent organizational wrongdoing. However, if it is not correctly implemented, and management does not have employee buy-in, the system will not become an effective mechanism that can promote organizational competence and skilful employees (Bakman 2003), as was determined by the Global Integrity report.

## **CONCLUDING THOUGHTS AND RECOMMENDATIONS**

The purpose of this paper was to explore considerations relating to the effective management of whistle blowing in organizations, more specifically the South African public sector. Although the focus of this paper fell on South Africa, some of the implications might be useful to managers across the globe. Corruption is a global occurrence and on the rise and both public and private sector organizations are struggling in the fight against

corruption. One of the mechanisms that can be utilized in the fight is to create an ethical organizational culture. Part and parcel of this organizational culture is the protection of those who disclose perceived wrongdoing.

The case of Mike Tshishonga offers valuable lessons that can be learned. For a disclosure to be considered protected, the necessary channels must be followed, firstly internally and thereafter externally if a resolution cannot be found. It is only after all the internal channels have been exhausted, that the person can go outside the organization to regulatory bodies such as the Public Protector and the Public Service Commission and as a last resort the media. Tshishonga showed determination and perseverance and did not allow seniors, including a government Minister, to derail his mission in disclosing corruption-even after unfounded allegations were laid against him. The disclosure was also made in good faith and not with malicious intent and the process described in the PDA was followed. Managers must take note of this case in so far that four attempts were made to disclose the wrongdoing but nothing was done. The decision to blow the whistle is not an easy one and the allegations deserved to be investigated with the necessary respect, dignity and feedback must be provided in a timely fashion. It is unfair to launch counter allegations (to attack the credibility of the whistle blower) against those who make disclosures as this will only contribute to the culture of silence of fear and in the end a negative, distrustful organizational culture.

Key to the management is the creation of mechanisms such as policies, hotlines and dedicated personnel to facilitate the whistle blowing process and to create a more positive organizational image. This article provided an overview of the indicators of effectiveness of whistle blowing and provided guidelines for the establishment of a whistle blowing policy and process. The paper stated that policy need to be communicated to all employees so that they can be aware of the channels (internal and external) available to them that can be utilized to blow the whistle. Proper procedures have to be in place to ensure that concerns about wrongdoing are raised and addressed in the workplace.

A whistle blower must have a purpose, a clearly definable goal. This goal is to help fight corruption. This paper set out to describe various aspects in aid of the establishment of more effective whistle blower protection process. Suggestions for the establishment of a whistle blower strategy, policy and process were provided. It is vital that these aspects become part of the culture of the organization. An organizational culture characterized by employees who feel safe to disclose wrongdoing-without fear of retaliation and where action is taken to investigate the allegations.

The author is keenly aware of the limitations of this paper. To construct the process of whistle blower protection in limited space is a mammoth task and therefore this paper only presented an overview of the identified points of discussion. An additional weakness is the lack of an exploration into the ethics debate that is closely associated with the topic under discussion. Future research ventures could possibly address ethics and a specific discussion on organizational culture and climate. It is hoped that this paper will stimulate discourse on how to actually and practically create an ethical culture. In a book on his ordeal, "Whistleblower-the whistle blower society" Mike Tshishonga quotes the following: "What is the lesser of the two evils-if the wicked carry on their wicked ways or if good men and women stand idly by and simply let it happen?" For good men and women to be able to contribute in the fight against corruption, it is imperative that those who want to disclose wrongdoing, be encouraged to do so and the allegations be treated with the consideration it deserves.

# INCOME INEQUALITY AND ECONOMIC GROWTH IN ASIA

**Chiung-Ju Huang and Yuan-Hong Ho**  
**Feng Chia University, Taiwan**

## ABSTRACT

*This study utilizes the Panel Vector Error Correction Model (PVECM) over the 1990 to 2008 period to examine the relationship between economic growth and income inequality experienced within ten Asian countries with varying levels of democracy; classified as “Free” countries, “Partly Free” countries, and “Not Free” countries. The empirical results show that the impact of income inequality on economic growth is positive but not significant among any of the Free, Partly Free, and Not Free countries. Meanwhile, the impact of economic growth on income inequality is significantly negative in Free countries and insignificantly positive in Partly Free and Not Free countries. In addition, the impact of economic growth on the degree of freedom is significantly positive in Free countries, significantly negative in Partly Free countries, and insignificantly positive in Not Free countries. The degree of freedom in Free countries could reduce the income inequality, while at the same time, decrease economic growth. An increase in the degree of freedom in Partly Free and Not Free countries could decrease economic growth and increase the income inequality. However, the impacts of the degree of freedom on economic growth and income inequality are not significant among the Free, Partly Free, and Not Free countries.*

## INTRODUCTION

Although Southeast Asia has experienced significant economic growth in recent years, it has also experienced an increase in its wealth and the income inequality. The *Key Indicators 2007* reported by the Asian Development Bank (ADB) validate this finding, stating that while Southeast Asia has the fastest growing economy, it also has the most serious income inequality. The income inequality is most severe in China, Cambodia, India, South Korea, and Taiwan. According to Kuznets (1995), economic inequality increases over time while a country is developing, and then after a certain average income is attained, inequality begins to decrease. Kuznets showed an inverted U curve to demonstrate the relationship between income inequality (usually representing by the Gini coefficient) and economic development (usually representing by per capita incomes). However, Kuznets hypothesis may not apply in all cases. For example, some Asian such as Taiwan and South Korean have experienced economic growth accompanied with higher per capita rates and less severe income inequality during their development. Only after a certain level of economic development was met, did these countries begin experiencing high income inequality along with high economic growth.

A large number of empirical studies have attempted to explore the relationship between income inequality and economic growth; such as Samanta and Heyse (2006), Jomo (2006), Ricardo (2006), Alfranca et al. (2003), Panizza (2002) Psacharopoulou et al (1995), Janvry and Sadoulet (2000) Barror (1996), Alesina and Rodrik (1994), and Persson and Tabellini (1994) etc. While most studies explore how OECD countries, European countries, Latin America, or Americas have experienced rapid economic growth accompanied with increasing economic inequality, there are few studies that focus on Asian countries. This study examines the relationship between economic growth and income inequality experienced within ten Asian countries.

Some political scientists propose that economic development is the essential condition of democracy, where economic development directly leads to democracy. As it is, many highly developed countries such as US, UK, France, Canada, Germany, Australia, New Zealand and Japan are in fact democratic nations. However, some political scientists believe the opposite; that it is democracy that leads to economic development. Thus, a large number of empirical studies have attempted to explore the relationship between income inequality and

economic growth. However, there are still only few studies that discuss the role of democracy or the degree of freedom in the economic growth and income inequality relationship. In this study, we incorporate the degree of freedom variable while investigating the impacts of democracy on economic development and income inequality.

*Freedom in the World*, the annual report published by the US-based Freedom House, reports on the degree of democratic freedoms in nations, and assesses the current state of civil and political rights on a scale from 1 (“most free”) to 7 (“least free”). This ranking is highly correlated with several other ratings of democracy also frequently used by researchers. In this study we apply the “civil liberties” score published by the Freedom House to classify the ten Asian countries as “Free” countries, “Partly Free” countries, and “Not Free” countries in order to examine the relationship between economic growth and income inequality experienced within ten Asian countries with varying levels of democracy.

## DATA AND ECONOMETRIC METHODOLOGY

### Panel Unit Root Tests

A variety of procedures for the analysis of unit roots in a panel context have been developed in an attempt to combine information from the time-series dimension with that of the cross-sectional dimension. Given that many interesting findings involve relatively short time-series dimensions, and that conventional unit root tests turn out low power results when applied to single time series the well-known low power of conventional unit root tests when applied to a single time series, four panel unit root tests which are Levin, Lin and Chu (LLC) test, Im, Pesaran, and Shin (IPS) test, ADF-Fisher test, and PP-Fisher are employed in this study.

One of the popular panel unit root tests is that of Levin, Lin, and Chu (2002). Their test is based on analysis of the equation as shown below:

$$\Delta y_{it} = \alpha_i + \beta y_{it-1} + \gamma_i t + \sum_{j=1}^k \theta_{ij} \Delta y_{it-j} + \varepsilon_{it} \quad (1)$$

Where  $\Delta$  is the first difference operator,  $\varepsilon_{it}$  is a white noise disturbance with a variance of  $\sigma^2$ ,  $t=1,2,\dots,T$  represents time periods, and  $i=1,2,\dots,10$  indexes cross-sectional regions. This model allows for two-way fixed effects ( $\alpha$  and  $\theta$ ) and unit-specific time trends. LLC test involved the null hypothesis  $H_0: \beta_i = 0$  for all  $i$  against the alternative  $H_A: \beta_i = \beta < 0$  for all  $i$ , with auxiliary assumptions under the null also required about the coefficients relating to the deterministic components.

The Im, Pesaran, and Shin (2003) test extends the LLC framework to allow for heterogeneity in the value of  $\beta$  under the alternative hypothesis. IPS relaxed the assumption of identical first-order autoregressive coefficients of the LLC test and developed a panel-based unit root test that allows  $\beta$  to be different across regions under the alternative hypothesis. The null and alternative hypotheses are defined as:  $H_0: \beta_i = 0 \quad \forall i$ ;  $H_A: \beta_i < 0$ , for some  $i$ . IPS demonstrated that their test has better finite sample performance than that of LLC.

The Fisher-ADF test proposed by Maddala and Wu (1999) and the Fisher-PP test proposed by Choi (2001) assume an individual unit root process and compute probabilities by using an asymptotic Chi-square distribution. The advantage of the Fisher test is that unlike the IPS test, it does not require a balanced panel. Additionally, the Fisher test allows the use of different lag lengths in the individual ADF regression and can also be carried out for any unit root test derived. One disadvantage of the Fisher test is that the p-values have to be derived via Monte Carlo simulation.

### Panel Cointegration Tests

Pedroni (1997, 1999, 2004) developed a number of statistics based on the residuals of the Engle and Granger (1987) study. Pedroni’s panel cointegration procedure allows for considerable heterogeneity in the

panel and there is seven panel cointegration statistics for varying intercepts and varying slopes. Four of the statistics, known as the pooled panel cointegration statistics, are within-dimension based statistics, while the remaining three, known as the group mean panel cointegration statistics, are between-dimension based.

Pedroni argued that for cases with longer time spans, the sample size distortion tends to minimal, while retaining a very high testing power across all seven statistics. However, for shorter panels, alternative statistics appeared to yield conflicting evidence. Pedroni showed that in terms of testing power, the group-ADF statistic has the best performance in general, followed by the panel-ADF. The panel-variance and group-p statistics performed poorly in comparison.

## Panel Vector Error Correction Model

If variables in the empirical model are nonstationary and cointegrated, we can use the panel vector error correction model (PVECM) that is a restricted panel vector autoregression (PVAR) model with a cointegration built into its specification. The cointegration term is known as the correction term since deviations from the long-run equilibrium are corrected gradually through a series of partial short run adjustments. The PVECM is shown as follows:

$$\begin{aligned}\Delta GDPPC_{i,t} = & \beta_{1,0} + \sum_{k=1}^p \beta_{11,k} \Delta GDPPC_{i,t-k} + \sum_{k=1}^p \beta_{12,k} \Delta Gini_{i,t-k} + \sum_{k=1}^p \beta_{13,k} \Delta CL_{i,t-k} + \sum_{k=1}^p \beta_{14,k} \Delta G_{i,t-k} \\ & + \sum_{k=1}^p \beta_{15,k} \Delta I_{i,t-k} + \sum_{k=1}^p \beta_{16,k} \Delta FTD_{i,t-k} + \sum_{k=1}^p \beta_{17,k} \Delta HC_{i,t-k} + \lambda_{1,i} ETC_{i,t-1} + \eta_{1i,t}\end{aligned}\quad (2)$$

$$\begin{aligned}\Delta Gini_{i,t} = & \beta_{2,0} + \sum_{k=1}^p \beta_{21,k} \Delta GDPPC_{i,t-k} + \sum_{k=1}^p \beta_{22,k} \Delta Gini_{i,t-k} + \sum_{k=1}^p \beta_{23,k} \Delta CL_{i,t-k} + \sum_{k=1}^p \beta_{24,k} \Delta G_{i,t-k} \\ & + \sum_{k=1}^p \beta_{25,k} \Delta I_{i,t-k} + \sum_{k=1}^p \beta_{26,k} \Delta FTD_{i,t-k} + \sum_{k=1}^p \beta_{27,k} \Delta HC_{i,t-k} + \lambda_{2,i} ETC_{i,t-1} + \eta_{2i,t}\end{aligned}\quad (3)$$

$$\begin{aligned}\Delta CL_{i,t} = & \beta_{3,0} + \sum_{k=1}^p \beta_{31,k} \Delta GDPPC_{i,t-k} + \sum_{k=1}^p \beta_{32,k} \Delta Gini_{i,t-k} + \sum_{k=1}^p \beta_{33,k} \Delta CL_{i,t-k} + \sum_{k=1}^p \beta_{34,k} \Delta G_{i,t-k} \\ & + \sum_{k=1}^p \beta_{35,k} \Delta I_{i,t-k} + \sum_{k=1}^p \beta_{36,k} \Delta FTD_{i,t-k} + \sum_{k=1}^p \beta_{37,k} \Delta HC_{i,t-k} + \lambda_{3,i} ETC_{i,t-1} + \eta_{3i,t}\end{aligned}\quad (4)$$

$$\begin{aligned}\Delta G_{i,t} = & \beta_{4,0} + \sum_{k=1}^p \beta_{41,k} \Delta GDPPC_{i,t-k} + \sum_{k=1}^p \beta_{42,k} \Delta Gini_{i,t-k} + \sum_{k=1}^p \beta_{43,k} \Delta CL_{i,t-k} + \sum_{k=1}^p \beta_{44,k} \Delta G_{i,t-k} \\ & + \sum_{k=1}^p \beta_{45,k} \Delta I_{i,t-k} + \sum_{k=1}^p \beta_{46,k} \Delta FTD_{i,t-k} + \sum_{k=1}^p \beta_{47,k} \Delta HC_{i,t-k} + \lambda_{4,i} ETC_{i,t-1} + \eta_{4i,t}\end{aligned}\quad (5)$$

$$\begin{aligned}\Delta I_{i,t} = & \beta_{5,0} + \sum_{k=1}^p \beta_{51,k} \Delta GDPPC_{i,t-k} + \sum_{k=1}^p \beta_{52,k} \Delta Gini_{i,t-k} + \sum_{k=1}^p \beta_{53,k} \Delta CL_{i,t-k} + \sum_{k=1}^p \beta_{54,k} \Delta G_{i,t-k} \\ & + \sum_{k=1}^p \beta_{55,k} \Delta I_{i,t-k} + \sum_{k=1}^p \beta_{56,k} \Delta FTD_{i,t-k} + \sum_{k=1}^p \beta_{57,k} \Delta HC_{i,t-k} + \lambda_{5,i} ETC_{i,t-1} + \eta_{5i,t}\end{aligned}\quad (6)$$

$$\begin{aligned}\Delta FTD_{i,t} = & \beta_{6,0} + \sum_{k=1}^p \beta_{61,k} \Delta GDPPC_{i,t-k} + \sum_{k=1}^p \beta_{62,k} \Delta Gini_{i,t-k} + \sum_{k=1}^p \beta_{63,k} \Delta CL_{i,t-k} + \sum_{k=1}^p \beta_{64,k} \Delta G_{i,t-k} \\ & + \sum_{k=1}^p \beta_{65,k} \Delta I_{i,t-k} + \sum_{k=1}^p \beta_{66,k} \Delta FTD_{i,t-k} + \sum_{k=1}^p \beta_{67,k} \Delta HC_{i,t-k} + \lambda_{6,i} ETC_{i,t-1} + \eta_{6i,t}\end{aligned}\quad (7)$$

$$\begin{aligned}\Delta HC_{i,t} = & \beta_{7,0} + \sum_{k=1}^p \beta_{71,k} \Delta GDPPC_{i,t-k} + \sum_{k=1}^p \beta_{72,k} \Delta Gini_{i,t-k} + \sum_{k=1}^p \beta_{73,k} \Delta CL_{i,t-k} + \sum_{k=1}^p \beta_{74,k} \Delta G_{i,t-k} \\ & + \sum_{k=1}^p \beta_{75,k} \Delta I_{i,t-k} + \sum_{k=1}^p \beta_{76,k} \Delta FTD_{i,t-k} + \sum_{k=1}^p \beta_{77,k} \Delta HC_{i,t-k} + \lambda_{7,i} ETC_{i,t-1} + \eta_{7i,t}\end{aligned}\quad (8)$$

where *GDPPC* denotes economic growth measured as the real capital GDP, *Gini* standards for income inequality proxied by Gini coefficients, *CL* stands for democracy proxied by civil liberties scale, *G* is the real government expenditures as a percentage of GDP, *I* represents the real capital investment, *FTD* denotes the degree of dependence on foreign trade, human capital (*HC*) is measured as the secondary education enrollment rates, *i* represents the panel identity or cross-country identifier, *k* represents the lag length, whilst *p* represents the optimal lag length selected in accordance with the Akaike Information Criterion (AIC) and the Schwarz Bayesian Criterion (SBC). Finally, *ETC* represents the error correction term.  $\lambda_{j,i}$  and  $\eta_{j,it}$  ( $j=1,\dots,7$ ) represent the speed of adjustment to long-run equilibrium and the statistical noise, respectively.

## Data

Annual data involving 10 Asian countries from 1990 to 2008 was used in the analysis. We adopt the “civil liberties” scale to categorize the 10 countries with the overall status of “Free,” “Partly Free,” or “Not Free.” Countries with ratings averaging between 1.0 to 2.5 are considered “Free”, countries with ratings averaging between 3.0 to 5.0 are considered “Partly Free”, and countries with ratings averaging between 5.5 to 7.0 “Not Free”. Free countries consist of Japan, South Korea, and Taiwan. Partly Free countries include Indonesia, Malaysia, the Philippines, Singapore, and Thailand. Not Free countries are China and Vietnam. The higher “civil liberties” score a country gets, the less degree of freedom it has.

Data on *GDPPC*, *G*, and *I* are obtained from the Penn World Table. Data on *Gini* is obtained from the Central Intelligence Agency (CIA) World Factbook, World Development Indicators (WDI) databank, and each country’s Bureau of Statistics. *CL* is obtained from the U.S. Freedom House. Data on *FTD* is obtained from the United Nations (United Nations, UN) and each country’s Bureau of Statistics. Data on *HC* is obtained from WDI databank, Yearbook of Statistics Singapore, and the Ministry of Education Taiwan.

## EMPICAL RESULTS

The panel unit root tests were conducted using four techniques: LLC, IPS ADF-Fisher, and PP-Fisher. The results are reported in Table 1. For Free countries and Partly Free countries, variables except *Gini* are nonstationary according to all of the four panel unit root test statistics. *Gini* is stationary according to PP-Fisher test but is nonstationary according to the other three tests. Also, *Gini* is treated as a nonstationary variable. Therefore, all variables are nonstationary for Free countries and Partly Free countries. For Not Free countries, we were unable to reject the null hypothesis of unit root at the 1% level of significance according to four panel unit root tests. Thus, we observed that all variables are nonsationary in Not Free countries as well. Finally, the first differences of all variables were found to be stationary, although is not reflected in the findings below.

**Table 1: Panel Unit Root Test Results**

Country	Method	Variable						
		<i>GDP</i>	<i>Gini</i>	<i>CL</i>	<i>G</i>	<i>I</i>	<i>FTD</i>	<i>HC</i>

Notes: The level models have been specified with individual effects. \*, \*\* and \*\*\* indicate the rejection of null hypothesis of unit root at the 10%, 5%, and 1% level of significance.

To determine whether a cointegration relationship exists, the recently developed methodology proposed by Pedroni (1999) is employed. It employs four panel statistics and three group panel statistics to test the null hypothesis of cointegration. Table 2 presents Pedroni's test for potential cointegration among the following variables: *GDPPC*, *Gini*, *CL*, *G*, *I*, *FTD*, and *HC*. For Free countries, the panel cointegration results show that the null hypothesis of no cointegration among the series of *GDPPC*, *Gini*, *CL*, *G*, *I*, *FTD*, and *HC* is rejected by the five test statistics at the 5% level of significance, with the exception of the panel  $\rho$  statistic and group  $\rho$  statistic. The panel cointegration results for Partly Free countries and Not Free countries were found to be the same. Thus, it is evident that there is a cointegration relationship among the variables when dependent variable is *GDPPC* for Free, Partly Free and Not Free countries.

**Table 2: Panel Unit Root Test Results (with GDPPC as dependent variable)**

Test	Free Test Statistic	Partly Free Test Statistic	Not Free Test Statistic
<b>Panel v</b>	42.010***	131.613***	4.712***
<b>Panel <math>\rho</math></b>	1.627	1.307	0.733

<b>Panel ADF</b>	-2.049**	-6.874***	-2.183**
<b>Group <math>\rho</math></b>	2.219	2.7091	1.305
<b>Group PP</b>	-3.641***	-6.3341***	-1.959**
<b>Group ADF</b>	-1.928**	-3.971***	-1.973**

Note: \*\*\*, \*\*, and \* indicate significance at the 1%, 5%, and 10% levels, respectively.

Due to the fact that the variables included in the model are nonstationary and cointegrated, PVECM is adopted in this study. The results of PVECM for Free, Partly Free, and Not Free countries are reported in Table 3, Table 4, and Table 5 respectively. In this study, we focus on the relationship between economic growth and income inequality experienced within ten Asian countries with varying levels of democracy. The interactive effects of other variables are important and computed in Table 3, Table 4, and Table 5. However, the focus of this study is around the impacts of economic growth (*GDPPC*), income inequality (*Gini*), and the degree of freedom (*CL*).

Notes: The t-statistics are given in brackets. \*\*\*, \*\*, and \* indicate significance at the 1%, 5%, and 10% levels, respectively. The optimal lag length is 1 selected by SBC.

For Free countries, as shown in Table 3, the error corrective term has significantly positive coefficients on economic growth and income inequality equations, indicating that previous disequilibrium in the economic

growth and income inequality equations will be corrected in the current period. However, the magnitudes of the coefficients of the *ETC* in these equations are small, implying that the speed of adjustment to equilibrium in the economic growth and income inequality is very low. In the economic growth equation, the past level of economic growth has a significantly positive impact on the current level of economic growth, while the past level of income inequality and civil liberties have an insignificantly positive impact on the current level of economic growth. In the income inequality equation, the past levels of economic growth and Gini coefficient have a significantly negative impact on the current level of income inequality, while civil liberties has an insignificantly positive impact on income inequality. In the civil liberties equation, the past level of economic growth has a significantly negative impact on the current civil liberties, while income inequality has an insignificantly positive impact on civil liberties.

For Partly Free countries (in Table 4), the error corrective term has a significantly negative impact on economic growth. The past level of economic growth has an insignificantly negative impact on the current level of economic growth, while the past levels of income inequality and civil liberties have an insignificantly positive impact on the current level of economic growth. Meanwhile, in the income inequality equation, income equality is significantly affected by the past level of itself. The past level of economic growth has an insignificantly positive impact on the current level of income inequality and the past level of civil liberties has an insignificantly negative impact on the current level of income inequality. In the civil liberties equation, economic growth and income equality have a significantly positive impact on civil liberties.

Notes: The t-statistics are given in brackets. \*\*\*, \*\*, and \* indicate significance at the 1%, 5%, and 10% levels, respectively. The optimal lag length is 1 selected by SBC.

For Not Free countries (as shown in Table 5), the error corrective term has a significantly negative impact on income equality and civil liberties. Therefore, in the economic growth equation, the past level of economic growth has a significantly positive impact on the current level of economic growth, while the past level of income inequality and civil liberties have an insignificantly positive impact on the current level of economic growth. In the income inequality equation, the past level of Gini coefficient has a significantly positive impact on the current level of income inequality. The past levels of economic growth and civil liberties have an insignificantly positive impact and insignificantly negative impact on the current level of income inequality, respectively. In the civil liberties equation, income equality has a significantly positive impact on civil liberties and economic growth has an insignificantly negative impact on civil liberties.

## CONCLUSION

In recent years, several Asian countries have experienced rapid economic growth accompanied with increasing economic inequality. This study examines the relationship between economic growth and income inequality experienced within ten Asian countries with varying levels of democracy. Utilizing the civil liberties score published by the US-based Freedom House, we classified the ten Asian countries as Free countries (Japan, South Korea, and Taiwan), Partly Free countries (Indonesia, Malaysia, the Philippines, Singapore, and Thailand), and Not Free countries (China and Vietnam). This study utilizes the PVECM on data covering the period 1990 to 2008 and takes into consideration variables including economic growth, income inequality, real investment, government expenditure, trade dependency, human capital, and civil liberties.

The empirical results show that the previous level of income inequality has a significantly negative impact on the current level of income equality for any of the Free, Partly Free, and Not Free countries. The impact of income inequality on economic growth is positive but not significant among any of the Free, Partly Free, and Not Free countries. Meanwhile, the impact of economic growth on income inequality is significantly negative in Free countries and insignificantly positive in Partly Free and Not Free countries. These findings imply that an increase in the previous level of economic growth will cause a significantly decrease in income inequality in the Free countries but will cause income inequality become insignificantly worse in Partly Free and Not Free countries. In addition, the impact of economic growth on civil liberties is significantly negative in Free countries, significantly positive in Partly Free countries, and insignificantly negative in Not Free countries. These findings indicate that an increase in the previous level of economic growth in Free countries will cause a decrease in the civil liberties score that means an improvement of the degree of freedom. However, an increase in the previous level of economic growth will cause the degree of freedom decreased in Partly Free countries. Similarly, an increase in the previous level of economic growth in Not Free countries will cause the degree of freedom improving but the effect is not significant.

Overall, the higher the civil liberties score a country receives, the lower degree of freedom a countries has. Empirical results around the relationship among degree of freedom, economic growth, and income inequality, indicate that an increase in the degree of freedom in Free countries could reduce the income inequality, while at the same time, decrease economic growth. Likewise, an increase in the degree of freedom in Partly Free and Not Free countries could decrease economic growth and increase the income inequality. However, the impacts of the degree of freedom on economic growth and income inequality are not significant among the Free, Partly Free, and Not Free countries.

# WHAT'S FAIR IN FAIR TRADE? A CASE STUDY OF A BRAZILIAN COOPERATIVE

**Hélio Arthur Reis Irigaray and Vanessa Janni Epelbaum**  
**Unigranrio, Brazil**

## ABSTRACT

*This paper presents the results of the analyze of the practices of fair trade from the workers' perspective. Theoretically, fair trade correlates politically correct politics and markets; therefore, being an alternative to the commercial conventional system. Fair trade aims at eliminating the figure of self-regulating market, which is characterized by the compulsory search for marginal utility, self-interest, and profit optimization. But is fair trade feasible in practice or just a utopic dream? How do workers involved in these projects perceive fair trade itself? We found out that the in practice, at this popular cooperative, from the workers' standpoint, fair trade does indeed promote life quality, since it allows them to make money in the neighborhood (no waste of time in long commuting; facility to look after their children and house chores) and continuous learning (the women do have the time to learn new things and talk to each other).*

*On the other hand, these workers have no idea whatsoever of what fair trade is all about and they believe that they are "exploited" by the market. Moreover, the market logics prevail, since COOSTURART must produce goods demanded by the market. Consequently fair trade, as seen in the bibliographical and documentary research, is still incipient in Brazil and it is more rhetorical than practical.*

## INTRODUCTION

Fair trade, as it became known in international literature, was crystallized in the last 20 years gaining contours of social movement in its appearance, followed by principles of social economy and ultimately, its products and production processes now incorporate the cultural conventions of humanity and the principles of the International Labor Organization (ILO), the Charter of Human Rights and more recently the dimensions of sustainable development. Today, organizations for certification of products, importers, dedicated stores and trading mechanisms with incentives for social groups of small producers in southern countries and different prices for their products, consist of production and marketing strategies, which seek work on campaigns that denounce unfair commercial practices, organized by pressure groups in society that call attention to the need to change the unequal trade relations between North and South (MASCARENHAS, 2007).

Fair trade faces many challenges. In the political and ethical plan, which has mobilized over its scholars is the implementation of its principles, resulting from double condition of acting within and against the market. There are also those related to the issue of promoting solidarity between socially unequal economies, and therefore act in the opposite context of socio-economic and commercial as well as the question of how to provide meanings that generate solidarity, and how to make Fair trade more inclusive, that is, involving a larger number of producers and workers as beneficiaries of their own actions, since the number of producers in the South involved in this kind of trade is still small to meet the goals of a changing social and working life significant. In addition to these challenges to help confront the Fair trade, according to Schneider *apud* Fajardo (2010), a challenge for the operational plan is to achieve a fair return under the conditions of small producers, because for him, there is no working capital, neither cash. According to SEBRAE (2004), distribution and logistics are also challenges that can hardly be overcome in small structures, most often with few resources, lack of infrastructure and low professionalism. So there are the middlemen who use this vulnerability causing a vicious circle, but

according to Schneider *apud* Fajardo (2010), the producer who engages in fair trade attempts to break with this situation, trying to join in associations or cooperatives so they can raise funds with the NGOs or public institutions that support such initiatives.

The producers premises that those who produce search valorize what they offer to the market, but also their own personal and collective identity. On the other hand, those who buy and care for environmental and business ethics can finance an investment associate in order to ensure continuity of supply.

And those who consume establish a compromise with the producers and seek to know the origin and the conditions under which goods are produced. Therefore, viewed from a historical perspective, Fair trade attempts to rescue the original conception of the trade and exchange not only of goods but of ideas, concepts, customs and behaviors (FAJARDO, 2010).

In its turn, Fair trade emerged as a counterpoint to the problems of traditional trade. According to Araújo (2005, p.26) Fair trade is “an initiative that seeks to correct at least some of the losses suffered by small producers and workers exploited in an international context of failure, where the multinationals, motivated by the benefits, take the lead”. It is a model that can serve as a symbol of a distinct trade, where both producers and consumers wins.

Today Brazil distributes products through Fair trade organizations such as World Vision (northeast) to Fair trade shops in Europe, especially in the Netherlands. Textile products are exported to Europe through the NGO Onda Solidária / Brazil Social Chic (Rio de Janeiro). Some Brazilian products have been certified with the FLO, like orange and tangerine juices, coffee, Brazil nuts, among others. A movement of sophistication of the handcraft, can be seen in a prominent national and international scenario (BRASIL SOCIAL CHIC, 2010).

At the federal level of government, the current government through the Department of Economic Partnership (SENAES) under the Ministry of Labor and Employment, headed by economist Paul Singer, aims to create a specific focus for this sector of the economy that is growing inside and outside the country. Its goal is to develop economic policies supportive programs that can integrate various ministries and generate jobs in local communities. In this context it was formed in SENAES, a working group with the different actors of the Brazilian Fair trade, ministries and civil society, which has as its goal creating a normative that regulates public Fair trade in the country and is the starting point for construction of the Brazilian System of Fair trade.

The Fair trade movement by placing himself as an alternative to conventional trading system involves eliminating the figure of the self-regulating market, characterized by compulsive pursuit of marginal utility and self-interest, replacing it with a new market governed by principles based on solidarity.

The paper is structured into six sections including this introduction. Section 2 presents the Brazilian Cooperative: COOSTURART. Section 3 presents the Fair trade in Brazil and section 4 the research method. Section 5 concludes the paper and Section 6 presents the limitations and recommendations for future researchs.

## **THE BRAZILIAN COOPERATIVE: COOSTURART**

Founded April 28, 2002 with 39 associates, COOSTURART was legalized by obtaining registration in the CNPJ under number 05.405.502./0001-16 on 18/11/2002. Over the next two years, has formed partnerships with several institutions such as Viva Rio and the City Hall of Rio de Janeiro, which enabled the upgrading of facilities and procurement of machinery suitable for the activity of the Cooperative. A fundamental partnership to COOSTURART was with the West Zone Cultural Center, where the idea of the cooperative was born. In March 2003, COOSTURART was selected, through a notice, to integrate the process of incubation of the Technological Incubator of Popular Cooperatives - ITCP / COPPE / UFRJ. Over three years of their partners and cooperators participated in the courses offered and received advisory services accounting / finance, legal, economic and social development, as part of the incubation process.

In relation to its structure, thirty women are part of the cooperative, but the scalability is forty people working, "everything on demand". Although the goal of the Cooperative, is to have increased production so that it can absorb as many people as possible from the community.

Between 2002 and 2003 COOSTURART was looking for institutions that foster entrepreneurship . And in 2003 went through the process of incubation of the Technological Incubator of Popular Cooperatives - ITCP / COPPE / UFRJ. The incubation process lasted three years and it was interesting especially in legal and accounting aspects, promoting capacity building in these two areas. Incubation was done through technical visits, meetings and form filling. Meanwhile the share of production was not met according to the expectations of the Cooperative. An important aspect in the process of incubation was the opportunity to meet other groups that have caused the cooperative work and exchange of experience between them. It is noteworthy that before the incubation process the Cooperative had only twenty people, and after incubation, that number started to turn around thirty people

## **THE FAIR TRADE IN BRAZIL**

The Fair trade is an alternative to generating jobs and income for disadvantaged groups of production and commercial perspective in the context of these groups. In interviews with each of the eleven cooperative who are currently working in the cooperative, it was pretty clear that the cooperative is the "dream job" of those who are conscious of the quality of life that is afforded to those working in the cooperative (giving lunch to children, able to go home at any time in case of any problem). The Executive Secretary of FBES (2006) underscores the systemic efficiency of cooperatives that result in better quality of life and work for each and for all.

In the present context arises the need of considering social and economic alternatives that allow interactions between different individuals, depriving the capitalist system as the only one present in the scenario of the relationships within the society (Fernandes & Botelho, 2010)

In the same way Fleury (2002) proposes that the complexity of social problems, diversity of actors and existing conflicting interests are factors that explain the politics networks. That's because the networks bring a new organizational configuration, implicitly carry within them the traditional need of management and organizational theory to establish and define an order in the face of uncertainty as standards and rules of behavior need to be institutionalized within and for the organizations.

With a globalized economy, unfavorable terms of trade to Southern countries become more evident. The reduction of terms of trade in North X South trade is intensified by the loss of relative importance of raw materials and commodities exported by countries in the South compared to products with more technology, bundled services and capital from the north, as explained Mascarenhas (2007).

In recent years Fair trade incorporated the alternative trading organizations that went on to establish the contours of social movement with voluntary basis. Over the past 20 years this movement has crystallized into product certification organizations and importer with incentives for the development of small communities of workers in the South and different prices for products (RANSON, 2001 *apud* MASCARENHAS, 2007).

Among the internal aspects of COOSTURART, seemed that not all cooperatives have managed to incorporate the logic of cooperative work, when at the end of the month to demand payment, regardless of the production of the Cooperative.

Fair trade can contribute to the strengthening of collective economic organizations, focusing on the territories, and therefore represent a change project by another type of sustainable and democratic development in the world. Also not confined to trade relations, it also includes initiatives for cooperation between producers, importers and consumers.

The present study suggests that COOSTURART corroborates with some principles governing the Fair trade as seen in the research literature and documents, even incipient in Brazil.

## **RESEARCH METHOD**

In order to answer if fair trade is feasible in practice or just a utopic dream and how do workers involved in these projects perceive fair trade itself, we have conducted a research in a popular cooperative (COOSTURART), located in poor community, in the outskirts of Rio de Janeiro, Brazil. The relevance of this article lies upon the necessity of better understanding how the underprivileged Brazilians make a living out of the formal labor market. According to the municipal government of Rio de Janeiro (2006), 1.092.476 people live in poor communities, exposed to social violence, and the lack of social services (hospitals, schools, garbage pick-up); and consequently, excluded from the economic system. Fair trade rises as an alternative for work and income generation for those who are in disadvantage.

This research was carried out at COOSTURART, a popular cooperative which was founded April 28, 2002 by 39 unemployed women, whose only skills were sewing and embroidering. In March 2003 they were legalized as a formal enterprise by the city and started receiving managerial support from the Federal University of Rio de Janeiro. The project was to establish a cooperative that operated on the fair-trade logics.

This popular cooperative has served as a case study to (re) think, as well as correlate, the theoretical questions with the actual practices. COOSTURART represents an experience of international scope but, simultaneously, it portrays fair trade in the local scale.

In order to understand how these workers perceive fair trade itself we have spent 6 months in the cooperative, observing and interviewing all these workers. We have taken notes of our observations and recorded the interviews. These conversations were submitted to discourse analysis.

## CONCLUSIONS

The literature and the approach to the Cooperative COOSTURART contribute to the understanding one of the biggest challenges of Fair trade, which is the two conditions: to act against and within the conventional market, as Mascarenhas (2007).

COOSTURART represents an alternative to generating jobs and income for disadvantaged groups of commercial production which is in line with the current context where increasingly emerges the necessity of considering social and economic alternatives that allow interactions between different individuals, depriving the capitalist system as the only one present in the scenario of the relationships within the society (Fernandes & Botelho, 2010).

Among the internal aspects of COOSTURART, it seems that not all cooperatives have managed to incorporate the logic of cooperative work, when at the end of the month they demand payment, regardless of the production of the Cooperative.

The willingness to go through the process of incubation by the Technological Incubator of Popular Cooperatives - ITCP / COPPE / UFRJ signals the desire of COOSTURART to organize, strengthen themselves internally and have a better production. Furthermore the research shows that exists, a predisposition of the federal government to increase alternative forms of economic production in the country, initially with the creation of Secretariat of the Solidarity Economy (SENAES) under the Ministry of Labor and Employment. More recently have been promoting meetings and working groups to discuss and mobilize groups of small producers, industries and other organizations in the country with a view to build a Brazilian system of fair trade involving a larger number of local social groups, for the benefit of localities.

Fair trade can contribute to the strengthening of collective economic organizations, focusing on the territories, and therefore represent a change to another type of sustainable and democratic development in the world. Also is not confined to trade relations, it also includes initiatives for cooperation between producers, importers and consumers

The present study suggests that COOSTURART corroborates with some rules of Fair trade as seen in the research literature and documents is still incipient in Brazil and it is more rhetorical than practical.

## Limitations and Recommendations

Like all research, this study has limitations that suggest possibilities for future studies.

This work was based on the context of Fair trade, Solidarity Economy and the relationship between suppliers and customers, however, used only the experience of the cooperative COOSTURART to corroborate the theoretical.

Here it is a recommendation that other Brazilian experiences and even international, are examined in greater depth in future research aiming at demonstration that Fair trade is still incipient in Brazil.

Little is known about the effects of the investments made in the context of fair trade, considering that analysing the investments already made are not just enough, but also the results obtained and verify the results meet the expectations of stakeholders.

Another aspect that could be explored in future research is the question of the need to search for competitive advantage that is needed in the current context fully globalized.

This leads to the conclusion that, because it is a process still under construction, is full of successes and failures, difficulties and opportunities that must be adjusted along the route. Thus it is recommended that these aspects are explored in new research.

# FINANCIAL AND MONETARY ANALYSIS OF ENDOGENEITY AND EXOGENEITY OF MONEY SUPPLY IN A TRANSITIONAL ECONOMY: CASE OF THE REPUBLIC OF SERBIA

**Aleksandar Ivanović, Alexander College of Arts, Business & Management,  
Serbia**

**Petar Bojović, Union University, Serbia**

**Slobodan Spasić, Faculty of Applied Ecology “Futura”, Serbia**

## ABSTRACT

*This paper contrasts the monetarists' view of money supply exogeneity, causal impact of money on economic activities, and role of a central bank as money circulation regulator, with Neo-Keynesians' treatment of money supply as endogenous, causal priority of real economic flows, and a central bank as interest rates regulator. The structure and importance of monetary aggregates are illustrated in the case of Serbia. The empirical analysis of money demand in Serbia confirmed the results obtained in stability tests from other transitional countries, that early years of transition are characterized by instable money demand, while it achieves stability at its later stage.*

## INTRODUCTION

Monetary theory and relevant empirical studies of monetary phenomena have been mainly engaged in the effects caused by the amount of money (money supply) to other economic values – prices, investment, employment, and level of economic activity in general. Interest in researching those factors that, by their own changes, determine actual amount of money in circulation has been growing. This research begins with frequent debates lead on a theoretical level among the economists of Neo-Keynesian preferences and the members of the monetary current regarding the causes affecting the cyclical fluctuations in money supply movement. The supporters of monetary ideas find them in the monetary policy itself, arguing that cyclical movement occurs as the result of sudden and relatively large oscillations between (short-term) expansive and restrictive monetary policy actions on economic trends. Neo-Keynesians challenge the monetarist view by claiming that the cycles in the movement rate of money supply growth are endogenously determined by the behavior of banks and non-financial sector undertakings. The influence of these two economic agents blurred anticycling power of monetary policy on money supply movement.

Concerning the degree to which monetary conditions **dominate** over other factors affecting the movement of nominal income, the results of empirical research done in developed market economies point out that a correlation between the amount of money and nominal income eventually gave no precise answer to the question of causal link: whether amount of money influences nominal income or *vice versa*, if nominal income influences amount of money. Money supply circulation is not solely the result of monetary policy instruments' force but is also under influence of total economic system, as various economic variables may directly cause the changes in the money supply volume.

*First*, the volume of loans, which stands as the most important source of money creation, is determined by the economic entities' decisions in terms of their borrowing and the willingness of banks to lend their funds. Loan demand is higher in terms of increased economic activity and a higher general price level. Furthermore, it can be expected that loans demand be more pronounced in the periods of economic expansion than in the periods of economic recession, due to the fact that in the first case the risk of payment default by the

individual businesses is relatively small. *Second*, changes in the economic relations with foreign countries balance (including capital transactions – both short and long term) provoke the volume of reserve money by varying the amount of foreign exchange reserves in the banking system. *Third*, the impact on money supply can also be directed through certain financial behavior of the household sector manifested in its pursuit to keep a larger amount of cash hidden at home instead of investing it in the bank savings or converting it into other assets (increased liquidity preference). Therefore, the reduction in reserve money in the banks reduces the possibility of money placement and reduces the money supply through bank loans. *Finally*, in response to the effects of certain variables within the economic system caused by money supply circulation, monetary policy can trigger various instruments of monetary regulation. Thus, holders of monetary policy are given possibility to regulate the actual amount of money in circulation. Not only do different economic variables affect the money supply in several ways, but also some of them can act simultaneously in a completely opposite directions, e.g. higher prices will provoke, via credit expansion, an increase of amount of money in circulation, but will also decrease the money supply over the trade balance worsening (imports higher than exports) and the formation of contractive effect on banking system foreign exchange reserves.

Economic models contain two types of variables – exogenous and endogenous. The movement of the endogenous one is a result of the joint action of other variables in the model. Exogenous is the one whose value is assumed to be determined by the factors outside the observed model. Small models, whose purpose is to explain the behavior of a few variables, include a large number of exogenous variables. Wider models, intending to explain in more details functional relationship between relevant variables, have fewer of them. Exogenous variables do not require an explanation in the model, due to a common assumption that they are determined outside the model itself. Money supply is usually treated as endogenous (not engaging in the degree of endogeneity), as it contains the so-called ‘feedback effect’. It means the initial effect of changes in money supply moves from money to real trade flows and then returns back to the monetary sector. Money supply could be referred to as endogenous particularly in those cases where monetary authority allows the money supply changes to be adjustable simultaneously with bank reserve changes and money demand alterations occur under the influence of factors beyond its control (defensive action or passive monetary policy conduction). In the absence of appropriate (preventive) actions of central banks, it is fair to expect that autonomous factors produce unexpected (and powerful) changes in the money market.

Many economists of Neo-Keynesian orientation point out a number of institutional factors supporting an assumption of predominant endogenous nature of money supply. They underline that money supply is insufficiently controlled by the central bank if it implements one stabilization policy on the credit market; or if banks borrow unmeasuredly from the central bank, using central bank deferential attitude when it comes to loans of this kind; or if they alter the assets structure on liabilities side of their balance sheet, increasing the share of non-monetary liabilities over other financial features used as money. Stabilization credit policy implemented by the central bank in a developed market economy has main goals to keep fluctuations of interest rates at minimum and simultaneously maintain a low level of interest rates, to provide favorable conditions for investment activity development. The first objective minimizes uncertainty, while the other holds investment cost of funding on relatively low level, so that the state is able to finance its budget deficit with reduced costs. When increased loan demand leads to interest rates rise, the central bank will, in an attempt to stabilize the interest rates movement, sell the securities in the open market. *Vice versa*, when demand for non-bank loan decreases, the central bank will buy securities. These activities will cause reducing or augmenting the range of base money alternately. Stabilization credit policy mechanism ensures credit money affluence and satisfies demand for it in the short term. At a given goal in terms of interest rates levels, the scale of such alterations in the monetary base depends on the non-banking economic agents’ attitude. In the multibanking system, commercial banks can borrow liquid assets directly from the central bank, using *discount window* mechanism. Although it is assumed that the central bank takes care of the volume of such loans and limits them if they are not intended for any emergency needs, the practice often shows this assumption is not satisfied. In short term, once the demand for commercial loans is high, banks try to attract more funds in their deposit by raising the yield on (typically) highly profitable types of their non-monetary liabilities, such as various forms of time deposit and securities, whose owners are paid then relatively high interest rates.

If this is widespread, it is possible that majority of the banking system experience a gradual change in the composition of their liabilities, reducing the ratio between demand deposits and non-

monetary forms of liabilities. Since the reserve requirement for demand deposits is higher than for some forms of non-monetary liabilities, the same alteration of commercial banks liabilities structure leads to the partial release of their reserves from the regime of required reserves, providing certain amount of banks' *free reserves*, ready for new credit loans placement. This institutional laxity in sophisticated financial markets allows banks to act more freely in terms of creating a loan, which would be rather impossible in case of complete implementation of measures and restrictions imposed by the central bank. Under such conditions, changes in economic activity get much stronger weight in the process of forming money supply specific volume in relation to the monetary authority actions. Whether money supply is an endogenous or exogenous variable has a significant influence on the decisions taken by the central bank. If it is endogenous, the central bank has to take into account the above mentioned 'feedback effect' in making its policies. This also means the statistical evaluations of the link between money and income, derived on the basis of a model in which money is taken as exogenous, are not completely reliable, provoking a need for careful handling of obtained results in practice. Neo-Keynesians explain 'feedback effect' in money supply in the following way: when monetary authorities increase the quantum of money supply to stimulate economic activity, increased activity will cause an increase in money demand and interest rates. It overflows to the enlargement of bank's opportunity cost linked to holding cash reserves in excess of required reserves. As a result, banks tend to reduce their liquidity reserves to a minimum, offering free reserves, and thus create money, which leads to further enlarging of money supply volume. Although monetarists acknowledge the existence of 'feedback effect', they look at money supply as an exogenous variable for two reasons: they believe the effect that goes from the money to real trade flows prevails (the opposite i.e. refundable effects are very weak); and monetary authorities can control the behavior of the money in circulation and influence economic activity, regardless of the existence of feedback effects from the real to the monetary sector.

## **MONETARISTS' POINT OF VIEW**

According to the standard monetarist explanation, the money volume alterations are determined by the factors outside the economic system, the actions of monetary authorities based on independent, prudent monetary policy. Therefore, money volume is exogenously determined variable, whose changes are not a passive response to changes in demand for money resulting from fluctuations in the economic activity. This point of view is based on numerous empirical studies of monetary developments in the US economy during a long period 1867-1960 performed by Milton Friedman (1963). The first element of his claim that the changes in amount of money in the US economy in this period were largely determined by money supply refers to the fact that changes in money volume, by the rule, precede changes in the economic activity flows. Secondly, the most significant alterations in the money volume were in fact of exogenous character in the sense they were determined by money supply, which was realized through self-implemented monetary policy. Thirdly, the relationship between money and economic activity (represented by the size of nominal GDP) was stable, despite changes in the institutional factors that affected the cash circulation and despite changes in methods of monetary authorities aimed at controlling this circulation.

Orthodox monetarist position on the exogeneity of money supply is exposed to a numerous criticism. Money supply ( $M$ ) is multiplied amount of base money ( $B$ ) and its changes ( $M = m \cdot B$ ) are greatly influenced by the behavior of monetary multiplier ( $m$ ), which is a complex parameter, whose size depends on the behavior of two main ratios - ratio of cash (to bank deposits) and bank reserve ratio (to total bank deposits). Raising both ratios may deviate from the value required by the central bank to set monetary policy implementation. Within these limits, formulated by the range of primary money and control of total bank deposits, the particular size of the ratios of cash and bank reserves are determined by the preferences and behavior of economic agents and commercial banks. These behavioral ratios are susceptible to the effects of different factors. Although the primary money (monetary base) is, in principle, controlled by monetary authorities, economists (from among Neo-Keynesians) alert that the supply of the base money does not always have to be necessarily exogenous (in certain periods and at different combinations of autonomous flows in its creation). Changes in the supply of base money is exogenous only if it is initiated by the monetary authorities' independent action, and not as a response to alterations of one or more of the assumed exogenous variables, such as income or interest rate. Thus, for instance, monetary policy in Great Britain and, to some extent, in the USA in late 1970s and early 1980s was dictated by the efforts to achieve the

balance in foreign trade relations, to finance the changeable state deficit, and to avoid large fluctuations in interest rates, which was the monetary policy most general goal (Kaldor, Trevithick, 1981).

Goodhart (see: Struthers, Speight, 1986) contested on several grounds the ability of monetary authorities to determine accurately the base money supply. In his analysis, he starts from a given volume of the state budget deficit and argues that this deficit can be financed in three ways: first, by selling to the private sector of the economy a certain amount of securities (say, by issuing public debt); second, with the inflow of capital from abroad; and third, by direct borrowing from the central bank, which means creating a new quantum of reserve money. Thus, as the factors that determine changes in the monetary base during one period, the following three can be easily distinguished: the scope of the state budget deficit, the volume of securities of the public sector, which can be realized in the financial markets, and the size of foreign capital that is disposable to transfer into domestic economy. Size of budget deficit is determined by the state (public) spending and tax policies that are not subject to rapid change. Capital inflows from abroad responds moody to domestic interest rates, which also applies to the sale of securities in the private sector of the economy. In short, from all the above-mentioned flows affecting changes in the monetary base, one course is largely beyond the control of monetary authorities (budget deficit), while the other two react very unpredictably to interest rates level modifications. The only response to these factors' impacts on the reserve money movement, Goodhart acknowledges in their neutralization through compensatory changes in the public debt emission, or through open market operations. His analysis highlights the dilemma of monetary authorities in developed market economies that are caught between the appropriate budgetary policy, determining the necessary amount of money in circulation and control of interest rates. He concludes that successful monetary control is not workable with large budget deficit, unless the monetary authorities accept drastic raise of interest rates, but this enters the area of priorities selection in the implementation of certain monetary policy.

Monetarist view of money exogeneity does not rule out the existence of some feedback from business activities to the money supply during an economic cycle (Friedman, 1969, 1970). Friedman (1963) shows that the cyclical variation of currency and bank reserves ratios were largely responsible for the continuous changes (contraction and expansion) of the money supply at a given volume of the monetary base. However, monetarists believe these effects are secondary to the effect of base money, whose movement is of exogenous nature. Starting from the empirical relationship between the monetary base and money multiplier, Meltzer (1969) came to the result that 85% of variability in the current movement of money (monthly growth rates) result from changes in the movement of the monetary base and government deposits (treasury deposits) in the current and previous month.

Certain deviation from orthodox monetarist position regarding the exogeneity of money supply is brought by the members of the group sometimes referred to as "*open economy monetarism*", known for developing the modern theory of monetary approach to balance of payments. The thesis of money supply exogeneity holds ground within the closed (global) economy, but within an open economy starts from the premise that the obligation of maintaining a fixed exchange rate entails a loss of control over the quantum of money supply by domestic monetary authorities (Laidler, 1982). In spite of becoming an endogenous in an open economy with fixed exchange rates, being then not controlled by the central bank, the money supply changes following the global rate of monetary expansion and maintains the role of the independent factor with causal effect on the domestic nominal income.

## NEO-KEYNESIANS' POINT OF VIEW

The thesis the money is endogenous is usually associated (perhaps somewhat unjustly) with Kaldor (1970, 1981, 1982), but the views of the endogeneity of money in circulation are rooted back to Smith and Ricardo as well as in certain remarks of Keynes (although *The General Theory* assumes exogeneity of money). *The Report of the Radcliffe Committee* contains a clear position on the endogeneity of money, insisting that a sharp line between money and other forms of financial assets of economic subject cannot be drawn, as they all contain a monetary quality which is, of course, of different force from one form to another. If we try to limit the liabilities of certain financial institutions (e.g. banks), commercial units will access the creation of new financial institutions, whose liabilities will finance the desired volume

of consumption. Finally, monetary authorities cannot stop the creation of non-bank money generated by mutual lending to business units. Thesis of the endogeneity of money was highlighted by Cramp (1970) and Moore (1979, 1983) as well as discussed in the works of Tobin (1970) and Laidler (1981). For Neo-Keynesians, the central bank in a developed market economy has no ability to control the amount of money in circulation – either in long or in short term. While the monetarists adjust the money demand through changes in the money supply price level (controlled by monetary authorities, i.e. exogenously), Neo-Keynesians insist on the fact that money supply adjusts to money demand in the long run. The cash matches (reacts) to so-called “needs of trade”.

The postulate of Neo-Keynesians that the existing quantity of money is also endogenous in the short term is relatively new. According to Kaldor, in an economy where the majority of money supply takes the form of deposits there is no place for discrepancy between the amount of money required and actual amount of money in circulation. Monetary authorities cannot cause an increase of money holdings of non-banking economic agents over their desired level. An increase of the volume of money in circulation (monetary expansion) can be implemented either in conjunction with fiscal policy (by the monetization of government budget deficit) or through *open market operations*. In the first case, the excess of money in circulation will be followed simultaneously by raising the level of income of non-banking economic agents (through fiscal expansion – increased government consumption expenditures). Real economy consequences of monetary expansion are integrated into the Keynesian scheme of multiplier effects – expenditures (i.e. spending, especially investments) of non-banking economic agents react to the resulting increase in their incomes, provoking spiral multiplier effects. In another case, monetary authorities can step in front of non-bank economic entities with an attractive offer to buy bonds in their possession. However, the transaction will occur only if non-bank economic subjects want to get rid of the bonds they hold in their portfolios and to exchange this form of property for cash. They cannot be forced to keep more money in their portfolios than the volume they want. If they somehow received more money than they want to keep, there is a simple mechanism for canceling such a surplus of money, being a credit mechanism between the banking sector and the sector of non-banking economic agents. Since the debt to the banking sector is widespread among non-banking business entities (created on the basis of external funding of certain transaction parties – by raising loans from banks), this extra money will be used to repay such debt. The cancellation of money surplus will be full and automatically will go within a financial (or clearing) system recognizing the widespread use of an *overdraft* clause, allowing the owner of checks account an automatic debit with the bank, i.e. transforming his a vista deposit account into credit up to a limit stipulated with the bank. Money excess can never exist so long to influence the spending flows. Kaldor also excludes the possibility of scarcity of money, due to supposed central bank actions, providing an adequate level of macrosystem liquidity. If the central bank does not approve the current rate of monetary expansion, its reaction will be towards raising its discount rate, as the interest rate paid by commercial banks for money borrowed from the central bank. However, the central bank cannot strictly persist on a pre-fixed low level of base money without risking a collapse of the banking system (what is definitely not its intention). Thus, money supply is always determined by money demand, even at the chosen interest rate of the central bank. If these arguments are accepted, then the amount of money actually plays only a passive role in determining nominal income. By excluding the possibility of both money excess and scarcity of money in macroeconomic system, we also eliminate the basis for any transmission process leading from money supply to consumption, prices, and production. Nevertheless, Kaldor does not exclude the possibility monetary policy is used actively, i.e. interest rate policy is used to affect investments in Keynesian style. One of the factors that influence the fluctuations in money demand is interest rates changes (which can be induced exogenously). The thesis of money exogeneity of orthodox monetarism could be applied in an economy with commodity money, where money supply would not be completely elastic and within its boundaries, economic agents would have no opportunity to cancel any excess funds. However, in the economy where credit money works money exogeneity is impossible and causal relationship (with exogenous interest rate) goes only from money demand to money supply.

Moore has offered a similar view, based on the US economy experiences, but which may be applied to all developed market economies. He finds wrong the monetarist description of money supply, which takes the changes within exogenously controlled reserve aggregate (base money) as the cause of certain changes in money supply. Although there is a relatively stable relationship between the base money and money supply as well as between money supply and total nominal income, Moore argues a causal relationship is completely opposite, as both monetary base and money supply are, in fact, endogenous. He pulls one of main evidence for it out of degree to which the change of base money can be statistically explained with the alterations of

relevant economic variables, especially nominal wages. Economists have been trying for a long time to reach the best statistical adjustment of so-called "*reaction-function*" of the central bank in relation to the macroeconomic goals of economic policy, such as inflation, unemployment, the balance of payments, and interest rates. Econometric analysis (with US economy data) proved the growth rate of nominal wages to be the explanatory variable with the highest degree of significance (Moore, 1979). Moore's scenario shows that nominal wage grow even in the periods of labor productivity declining (due to the rigidity in the movement of wages downwards), which results in firms' illiquidity, forcing them to ask for bank loans to settle down their due financial obligations. If commercial banks have no free credit potential, the pressure is shifted towards the central bank, expected to provide the additional amount of money i.e. to expand the banks' credit potential, in order to prevent unemployment, which is considered unacceptable.

Consequently, the monetary authorities give in under the pressure of commercial banks, allowing for new loans creation. Moore concludes that in conditions where money supply is basically "politically endogenous" (in developed market economies), the central bank cannot maintain too rigid attitudes in monetary policy, due to the political pressures imposed by the emergence of unemployment. Monetarists agree with Moore's theory, but point out that the central bank should not alleviate views regarding pre-agreed monetary policy in case of unemployment. Hence, the behavior of nominal wages (as integral part of demand for firms' working capital and as the determinant of workers' disposable personal income) plays a central role in determining the demand of non-banking economic entities for bank loans. In Moore's opinion, the credit market is the field for monetary adjustment process induced by nominal wages increase. The actions of the central bank (as the center of the monetary system of a country) are aimed only to let the money supply adjust to increased demand for bank loans. The ability of central banks to control the rate of growth of monetary aggregates depends more on their ability to control the growth of banking loans than of the monetary base. However, the ability of monetary authority to control the rate of expansion of bank loans is limited. Each sudden increase of wages shows it is tough for the central bank to limit the rate of monetary growth. Money supply is an endogenous variable and the behavior of nominal wages is the most important determinant of its cyclical movement. For orthodox monetarism, the exogeneity of money and causal impact of money on a number of economic activities are two related features and a central bank is usually represented as money circulation regulator. For Kaldor, Moore, and other Neo-Keynesians, the endogeneity of money and causal priority of various economic variables in relation to the flows of money and credit are two closely related features, and a central bank is presented as a subject that is called upon (in the active sense) just for one reason – to bring the interest rates to a certain level.

## **ASSESSMENT OF DIFFERENT THEORETICAL VIEWPOINTS**

In modern monetary theory the most acceptable concept seems to be the one based on the interconnections and interaction of real and financial flows in the reproduction process and which stresses that it is impossible to establish a one-way causal relationship between the changes in the amount of money, on one side, and the volume of production, employment, and price levels, on the other side. There are no econometric findings that would strongly confirm either pure exogeneity or endogeneity of the existing money volume. True money supply volume is jointly determined by the actions or behavior of both monetary authorities and the private sector of the economy, including non-banking economic entities, commercial banks, and other financial institutions. Private sector portfolio behavior is crucial in mediating between the central bank monetary policy and the actual outcome in terms of given money supply volume handed by the economic agents. If the transactional money amount held by economic agents is perceived more as an average target cash holdings over certain period, rather than fully balanced cash holdings that strictly meets the economic agents' portfolio balance requirements at any time (what is accepted more and more by contemporary monetary economists), then the exogenous change in the real volume of money supply in relation to the aggregate representing the sum of average target money holdings will cause progressive effects of adjustment over longer period. At macro level, during the process of adjustment, economic agents will keep real funds that are either above or below the sum of their average targeted amounts of money. In the case of money surplus, the firms will hold a larger amount of real funds than they want, until some combination of lower interest rates, higher prices and higher real income brings the balance between desired funds (aggregately observed) and real volume of money supply. In the case of money shortage (when current real

funds of economic agents are below their target level), the economic agents will gradually try (by increasing their income and/or reducing their spending) to form their own average targeted amounts of real funds. If these changes in the behavior of economic agents (caused by the decreased amount of money in circulation) are present on a larger scale, it will have certain impact on real economic movements – a reduction in nominal income growth and these effects will be present until the moment of final balancing between money demand and the existing money supply volume. If money holdings of certain firms fall below the level needed to maintain their liquidity, and assuming they are unable to economize (e.g. through an increased usage of trade credit, in case they are enough credit-worthy) or to re-contract their earlier financial obligations, or to do it quickly enough, then a number of firms will not be capable of fulfilling due obligations, thus spreading the problem of illiquidity through macrosystem and endangering the normal functioning of the financial system. Particular combination of certain economic agents' impact may also result in the exogenous character of money supply. If monetary authorities have firmly defined target in terms of reaching certain volume of monetary expansion and are prepared to repurchase at any price from the economic agents in open market operations the amount of securities necessary to realize the defined objectives, then the money expansion is truly independent of the portfolio decisions of banks and non-banking economic agents in the economic system.

## THE CASE OF SERBIA

The example of Serbia (with dinar – RSD as the domestic currency) can be presented on the developments of its monetary aggregates in 2009, in which **reserve money** grew by 3.8% in nominal and declined by 2.6% in real terms. Dinar-denominated reserve money shrank by 77% of the amount by which the foreign currency component rose. Thus, reserve money creation was realized via the foreign exchange and withdrawal via the dinar channel. Net foreign assets rose by RSD 196 bln, of which the gross foreign exchange (FX) reserves of the National Bank of Serbia (NBS) were up by EUR 2.4 bln and total FX liabilities by around EUR 1 bln. NBS gross FX reserves swelled because of regular inflows and the drawdown of two IMF loan tranches, SDR allocation, and the privatization of the Serbian Oil Company (NIS). The outflows were driven by NBS's sale of foreign currency in the interbank FX market. At the year-end, the NBS gross FX reserves reached EUR 10.6 bln. The withdrawal of reserve money through the national currency channel was effected mainly via repo sale of NBS treasury bills to banks. In spite of several cuts in the key policy rate during the year, the repo stock in bank portfolios rose by RSD 73.9 bln. The modified structure of required reserves allocation, i.e. reduction in the dinar portion of allocated FX required reserves gave an additional boost to bank investment in securities. Tighter fiscal policy led to a RSD 51.8 bln increase in government funds in NBS accounts. The third factor contributing to reserve money withdrawal was the reduction in other NDA, induced by increased NBS capital and exchange rate gains. Within the structure of dinar-denominated reserve money, the largest decline was recorded with bank reserves (RSD 67.8 bln), mainly due to the reduction in the dinar portion of required reserves (RSD 53.4 bln) for banks signatories to the Vienna Initiative. Bank excess funds declined by RSD 14.5 bln, whilst currency in circulation rose by RSD 5.4 bln from end-2008.

**Total money supply M3** (consisting of money supply M2 and FX deposits), driven by an increase in FX savings with banks, recorded a mild year-on-year rise. The velocity of circulation of monetary aggregates M1, M2, and M3 was declining over the year, which points to a gradual rise in demand for money. **Money supply M1** (comprising of the currency in circulation and transaction deposits) increased by 7.4% nominally (or 0.7% in real terms) from end-2008. Against the background of heightened operational risk during the economic downturn, firms held more funds in their current accounts, which provided the strongest contribution to a rise in this M1 component (RSD 12.2 bln). A RSD 24.1 bln rise in savings and term deposits impacted not only on growth in M1, but also on nominal growth in **money supply M2** (including M1 and dinar savings and term deposits) – 10.6% (or 3.7% in real terms). Up by 21.5% nominally (13.9% in real terms), M3 displayed the sharpest growth dynamics in 2009. Raising of the government-guaranteed amount of savings deposits (from EUR 3,000 to EUR 50,000) and an increase in bank interest rates during the “Savings Week” led to the return of household FX savings (withdrawn by end-2008) into the banking system and their further rise. New household FX savings rose by EUR 1.2 bln, outstripping the amount withdrawn in earlier months (EUR 960 mln) and reaching close to EUR 6.0 bln. The ratio of NBS FX reserves to M3 rose by 73.1% in 2008 to 84.3% in 2009, whereas the ratio of overall banking sector FX reserves to M3 increased from 81.4% to 95.7%. Movements in net domestic and foreign assets led to M3 creation. Bank loans, notably to the corporate sector, gave the

strongest contribution to M3 growth. Government borrowing via T-bills sale to banks exceeded the increase in deposits on accounts with the NBS, providing further contribution to money creation.

A slowdown in **bank lending**, in train since the second half of 2008, continued into the first half of 2009. In the second half of 2009, most notably in the third quarter, loans to the corporate and household sectors were on a moderate rise, although the rate of growth was much slower than in 2008. Bank external borrowing continued to be the dominant source of finance for bank lending, whereas household and corporate FX deposits were the main domestic source of lending growth. Bank claims on the non-financial sector rose by 16.1% nominally (RSD 181.2 bln). Excluding the effect of exchange rate differentials (cca. 75% of loans are foreign currency-clause indexed), the real increase equals around 10%. Relative to end-2008, bank loans in the domestic market increased by 8.8% in real terms (including the exchange rate effect), of which corporate and household sectors were up by 12.8% and 1.5% respectively. A sectoral breakdown shows that trade and industry enterprises received most loans. Within household lending, housing and consumer loans witnessed the strongest growth. In March, banks began to extend subsidised loans within the Government's Programme of Measures to Ease Negative Effects of the Global Financial Crisis. They approved around EUR 1.1 bln in such loans, mainly liquidity loans to the corporate sector. By end-2009, banks were approving subsidized housing construction loans, which led to a mild increase in the share of housing loans in total newly extended loans. The share of subsidized in newly extended bank loans moved around 10% on average (Annual Report, 2009: 31–34).

Most transitional countries have faced problems of extensive external debt, high budget deficit, and high inflation rates, as well as the instable money demand (as shown by stability tests) in early years of transition, while at a later stage the stability of money demand was achieved and interest rates became increasingly important as the transition mechanism tool, because monetary policy makers started using them to a greater extent rather than the rate of exchange for the purpose of monetary targeting. The results of the empirical analysis of the stability of the money demand function in the Republic of Serbia and factors influencing it in short and in long term also proved that money demand in the entire period observed showed signs of instability and could not be used for efficient targeting monetary aggregates (Maravić, Palić, 2005).

# FINANCIAL ANALYSIS OF MONETARY–CREDIT MULTIPLICATION IN A TRANSITIONAL ECONOMY: CASE OF THE REPUBLIC OF SERBIA

**Aleksandar Ivanović, Alexander College of Arts, Business & Management, Serbia**

**Petar Bojović, Union University, Serbia**

**Slobodan Spasić, Faculty of Applied Ecology “Futura”, Serbia**

## ABSTRACT

*The factors reflecting the behavior of a central bank, commercial banks, households and corporate sector and affecting the changes of monetary multiplier, banks' credit potential, and credit multiplier have been identified. Several issues on the impact of money multiplication on monetary policy have been discussed. Main monetary aggregates and other parameters have been analyzed on the case of Serbia as a country where banks have relatively high credit potential. Empirically proven instability of money demand points to the sensitivity of Serbian economy to external shocks. One of the reasons for an unstable money demand function are dynamic changes in the financial system, with newly introduced or changed institutions, banking products, payment instruments, and savings drive.*

## INTRODUCTION

Banks perform many functions and provide various services. Not all banks perform the whole spectrum of possible functions neither do they all provide the same services. Still, it is generally considered that the core activities of the bank consist of three functions: (1) banks are creators of money, (2) banks are financial intermediaries, and (3) banks form the main route for transferring the effects of monetary policy through the economic system. Of course, these three functions are interrelated and it is obvious that the last two result from the first of these functions. In modern market economies, there are a number of different institutions (other than banks), which are financial intermediaries – i.e. institutions that mobilize the free cash in the economy, or transfer funds from the accumulation, from economic entities (sectors) that accumulate more than they invest, to the economic entities (sectors) that invest more than they accumulate. In most countries, banks are the main institutions that perform this function. The traditional role of the banks as the guardian of the liquid assets of economic entities and the main source of loans within the microsystems has provided the banks with a special status in public, which they continue to have to this day. Lending activity of banks, which “creates” liquidity, i.e. the fact that the liabilities of banks include deposits that represent money, makes banks different from other financial institutions. Banks are only able to serve as a source of “reserve” of liquidity for other economic entities (including other financial institutions).

Banks constitute the core of financial institutions whose liquidity has a significant impact on the functioning of financial markets and the availability of money and loans. Therefore, by developing instruments of monetary policy, central banks have paid special attention to those instruments that allow the impact on liquidity position of banks. The most obvious example is using the mechanism of banks' reserve requirements. The tendency of economic entities to deposit an increasing share of available funds in the banks (a process that began nearly two centuries ago) has resulted in the demand deposits – as a form of liabilities in the balance of commercial banks – being gradually recognized and finally accepted as the equivalent of cash (banknotes and coins). The importance of banknotes and coins as monetary instruments is being more and more suppressed. In modern economies, banks (with their demand deposits, which can be transferred) constitute the backbone of the system of payment, and final account of economic and financial transactions in these economies is taking place

in the banking books. Moreover, the system of commercial banks is able to create their own liabilities through the process of credit expansion. Specifically, the banks (as a system) can influence the increase or decrease of the volume of credits available for the macrosystem – i.e. they can expand or restrict their loans and thus increase or decrease the amount of money available. All this happens through the offer of available liquid assets that exist within the banking system as a whole. The financial potential of the banks represents the total assets that the banks have collected as deposits or created by their credit activity. Financial potential is based on the total credit and business activities of banks. All sources of funds of banks are on the liabilities side of the balance sheet of banks, and investments are on the side of the banks' assets. Investments and resources generally must be in balance, with free and chargeable assets of banks being located on the bank account with the Central Bank.

## **FACTORS AFFECTING MONETARY MULTIPLIER CHANGES**

Different influences and behavior of individual institutional sectors should be taken into account, both within the process of the monetary multiplication and in the overall process of money creation. Different functions, types of economic activities, motives, etc. determine different role and influence of certain institutional sectors in these processes. In this regard, four main groups of economic entities should be distinguished:

- The Central Bank, including the impact and operation of the Central Government;
- Other monetary institutions, i.e. financial institutions involved in the process of money creation;
- Non-monetary local entities, which can be further classified as non-monetary financial institutions and non-financial entities, and these further classified as: companies, limited local public administration, population, etc;
- Foreign countries, including financial obligations and demands by domestic entities from foreign entities.

The following six ratios reflect four groups of determinants of the monetary multiplier. The coefficient of liquid reserves of commercial banks  $r_1$  ( $R_1/D_b$ ) reflects the behavior of the commercial banks sector. The behavior of population, companies, and other non-banking economic entities are reflected in the movement of cash coefficient  $g$  ( $G/D_B$ ) and the coefficient  $d_m$ , represented by the relationship between the deposited money and total deposits ( $D_m/D$ ). The effects of fiscal and quasi-fiscal policy on monetary behavior of non-banking economic entities are represented by the coefficient  $l$  ( $D/D_b$ ). The coefficient of required reserves  $r_0$  ( $R_0/D_b$ ) represents the impact of the Central Bank (monetary authorities) on monetary multiplier (also the impact on base money). Finally, the coefficient of other funds deposited by commercial banks with the Central Bank  $r_2$  ( $R_2/D_b$ ) is of hybrid nature, because it largely expresses the influences on the changes of monetary multiplier that come from the monetary authorities, and to a lesser extent, the impacts resulting from certain monetary behavior of commercial banks.

### **The Behavior of the Central Bank and Commercial Banks**

The Central Bank influences the monetary multiplier and the entire process of money creation by:

- Deciding on the emission of base money and the structure of the instruments of such emission;
- Determining the rate of reserve requirements of monetary institutions with the Central Bank;
- Decisions on the compulsory deposits of monetary or non-monetary entities with the Central Bank; and
- Foreign exchange transactions, including financial transactions with foreign countries and the purchase and sales of foreign currencies in relation with other monetary institutions, having impact on the difference between foreign assets and liabilities of these institutions (F).

Commercial banks and other monetary institutions affect:

- The use of the maximum credit potential i.e. whether their domestic investments (K) will reach the maximum amount or will remain below this amount;
- Holding the base money on accounts at the Central Bank over the amount that corresponds to the rate of required reserves, which affects, more or less, the absorbing of the base money to ensure liquidity (R); and
- The use of instruments for base money emissions below the framework offered by the Central Bank (B).

Three coefficients below reflect the behavior of the banking sector:

- 1) The first of them is the coefficient  $r_0$ , as the ratio of required reserves of commercial banks ( $R_0$ ) and their total deposits ( $D_b$ ). This coefficient expresses the changes (controlled by the monetary authorities) in the structure of deposits, either those limited i.e. falling under the regime of reserve requirements or those free from it.
- 2) The ratio  $r_1$  expresses the changes in money multiplier caused by the change in the amount of funds on the bank accounts held at the Central Bank. Assets of banks on their accounts at the Central Bank consist of two primary components: the minimum amount of assets that must be kept in their business account to ensure the liquidity of the bank (determining its liquidity or illiquidity – the so-called liquidity reserves) and excess liquidity assets of commercial banks, that represent the assets available for investment. The amount of the total liquid assets of commercial banks is conditioned by the behavior of these banks in terms of maintaining the necessary level of liquidity reserves and the tendency for minimizing the unused (free) assets at their disposal, in long-term sense.
- 3) The coefficient  $r_2$  includes the changes of other deposited funds of the commercial banks with the Central Bank. This category of funds of commercial banks includes heterogeneous components: funds invested in treasury bills issued by the Central Bank and the bank funds deposited with the Central Bank on other bases.

## The Behavior of Households and Corporate Sector

Domestic non-monetary entities may affect:

- The use of the investments of monetary institutions underneath the framework offered by these institutions (in the case of lower loan demand than the supply);
- Keeping cash in circulation ( $G$ );
- Deciding on keeping money at all (money demand), which also means deciding on the spillover of money into non-monetary financial forms, or vice versa, the spillover of non-monetary financial forms into money ( $N$ ).

The behavior of the households sector is represented with the ratio of total amount of cash, which is in the possession of this sector, to total deposits at commercial banks ( $g = G/D_b$ ). The increase of cash in circulation slows down the process of monetary multiplication. Change in the structure of money supply in terms of relatively rapid growth of cash in relation to deposits (the process known as *currency drain* or *currency leakage*) depends on the financial behavior of the population, i.e. preferences of holding the available financial assets in the form of cash and holding other forms of financial assets. The Central Bank does not directly regulate the amount of cash that people keep in their financial holdings, neither does it directly regulate the increase of cash in successive time intervals. The supply of cash is provided by commercial banks under their liquidity reserves held with the Central Bank. Several basic factors influence the preference of the population to hold a certain proportion of their financial assets in cash:

- 1) Keeping the cash for the population means the possession of the means of payment that is available at all times to be used to purchase goods and services or to carry out other duties. Accordingly, the holding of financial assets in the form of cash means keeping perfectly liquid assets that can be used directly as a means of payment.
- 2) Cash is not an interest-bearing financial asset for the households sector. Under the assumption of rational financial behavior of the population, interest rate effect will act to reduce the holding of cash in the structure of total financial assets of the sector. It should be expected that the population would retain only a small part of total financial assets that may be needed for operational current payments in the form of cash holdings. The proportion between cash and interest bearing financial assets of the population, under the above assumption, tends to move more and more in favor of the latter, if the level of interest rates is higher.
- 3) Between the criterion of the necessary for the sum for current payments and high interest rates, there are a number of other factors whose effects influence the formation of the actual proportions of holdings of cash and interest-bearing forms of financial investments within the total financial assets of the population. They relate to both the rationality of financial behavior of the population (different inertial factors, traditions, speculative motives) and the organizational ability of financial institutions (especially banks) to attract financial sector surplus from them.

Taking the value of  $D_b$  in the denominator of the quotient, which represents the coefficient  $g$  and not the value of  $D_m$  (deposited money), or at least  $D_m$  plus savings deposits at banks, will partly reduce the expressive possibilities of this coefficient, in terms of analyzing the factors of change in the amount of money in circulation. The total deposits in commercial banks ( $D_b$ ) also include, in addition to deposited money (as a component of money supply), other non-monetary deposits – other demand deposits, termed deposits, restricted deposits, the

so-called associated assets, funds for housing and utilities building, and one non-specific amount of other liabilities of banks. However, some of these non-monetary deposits, primarily restricted deposits, are primarily determined by the appropriate monetary policy measures. Restricted deposits are a special category of demand deposits, which can be used only for some specific objectives or after the expiration of a certain period, in accordance with the legislation under which they were formed. Why is the value of  $D_b$  used after all? This was done in an effort not to burden the expression of monetary multiplier with large number of coefficients, as it already contains a relatively large number of coefficients. Expressing the coefficient  $g$  through the values of  $G$  and  $D_m$ , for example, would require increasing the total number of parameters within the money multiplier  $m$ , which would not only further complicate deriving its value (in the technical sense) but it would be even more difficult to analyze this multiplier (viewed from the standpoint of available econometric methods).

The behavior of the sector of business organizations is represented as a coefficient  $d_m (D_m/D)$ , where  $D_m$  represents the deposit money, the largest share of which is in the hands of corporations. Demand for deposited money for these economic entities has the characteristics of transactional demand for money.  $D$  marks the total deposits with monetary institutions - the Central Banks and commercial banks. The division into two coefficients  $g$  and  $d_m$ , for the two main non-banking sectors, corresponds to the institutional system according to which the largest amount of cash is in the hands of the population and the companies hold the largest amount of deposits.

## BANKS CREDIT POTENTIAL AND CREDIT MULTIPLIER

Credit potential of a bank means the maximum amount of bank investments in terms of rational liquidity policy. Therefore, we can talk about the bank credit potential in the net and gross amount. In the net sense, the credit potential means the maximum amount of investments at a certain point. In the gross sense, it means the maximum amount of new investments in a given period. Credit potential of banks depends primarily from:

- The amount of collected funds;
- Term structure and stability of collected funds;
- Necessary amount of non-invested funds to ensure the bank liquidity; and
- The credit potential of the bank in the gross sense (the amount of new loans) depends on the maturity structure and the collectibility of existing investments.

The amount of the collected assets is determined, on the one hand, by the savings and financial savings of non-monetary entities, and on the other hand, by the possibility of investments of financial savings in financial forms issued by non-bank entities (state firms), which is contributed to by the development of the financial market. In circumstances of underdeveloped financial market, most of the financial savings of non-monetary entities is aimed at banks. However, on the relatively low level of economic development, it is necessary to consider the relatively low financial savings, which acts in contradiction to the credit potential of banks. Since then, in the countries with less differentiated financial structure, the credit potential of banks is relatively higher than in developed economies.

Regarding the term structure and stability of the collected funds, for most of them are significant conditions of depositing with banks. It is logical to expect a greater preference of the investors to the liquid (short-term or non-termed) deposits. However, the policy of incentives for longer-term deposits can significantly alter the behavior of investors (higher interest rates, ability to raise deposits if necessary, special advantages in terms of obtaining loans, etc.). It is normal for banks to stimulate termed investment, with longer terms, because it allows for a higher credit potential and long-term investments: firstly, as a result, they may invest most of the funds collected (less holding liquidity reserves); secondly, the long term stability of the deposit allows investments with a longer terms, without the risk of insolvency.

The amount of bank funds not invested and their holding in liquid form on the bank business accounts with the Central Bank depends on several factors:

- The maturity structure of bank assets and stability of the behavior of investors, especially in possible emergency economic conditions, in terms of holding-withdrawal of the deposits with the banks;
- Additional sources of liquid assets, in case of emergency, that banks can use to improve their liquidity; and
- The liquidity structure of bank investments and the possibility of their rapid reduction in the event of

emergency needs (the maturity structure of investments).

In general, the credit potential of banks depends on two groups of factors: the inflows or outflows of banking assets and the credit multiplier, but also on their schedule. The monetary multiplier reflects various combinations of the credit multiplier ( $m_k$ ), non-monetary spillover multiplier ( $m_n$ ), and multiplier of foreign currency transactions ( $m_f$ ). Therefore, the size of the credit multiplier cannot be directly linked with the size of the monetary multiplier: in case of a higher (or increased) credit multiplier, a lesser (or decreased) monetary multiplier can exist, depending on the movement of the other two multipliers.

As for the numerical value of credit multipliers, generally the same remarks as with the monetary multiplier apply. With credit multiplier, minor deviations below one can be logically assumed, especially below zero (negative values). In fact, the possible influence is excluded, in that direction, coming from the side of the overflow of money into non-monetary instruments of monetary institutions ( $N$ ), as well as the influence of foreign assets and liabilities of these institutions ( $F$ ). It is present with the monetary multiplier, but not in the credit multiplier. However, on the other hand, greater variations of credit multiplier than the monetary multiplier can be assumed in their positive values and at a higher level than the level of monetary multiplier (assuming that the algebraic sum of  $(F-N)$  is generally negative). Infinite value of the credit multiplier in the absence of primary emissions ( $B = 0$ ) does not have any sense here either, as it does not have with monetary multipliers, either.

## MONEY MULTIPLICATION AND MONETARY POLICY

The questions about the role of institutional sectors in the monetary multiplication process and the overall process of money creation are related to the aforesaid issue of the level of efficiency of control of these processes by the Central Bank. The basic question that arises here is: how is it possible to achieve effective control of the movement of money (which is an essential task of monetary policy), if its motion is influenced by other institutional sectors having autonomous behavior in this field, both other monetary institutions and non-monetary entities? How it is possible to control oscillations in the money supply? Which strategy of monetary control should monetary policy holders accept? What immediate determinants of money supply should be the focus of the attention of the monetary policy holders in order to ensure the desired changes in the amount of money in circulation by handling them? The answers to these questions depend on the reliability of the adopted theory of money supply and the importance of the results of empirical tests of its basic assumptions in the particular circumstances of an economy.

Monetary multiplier ( $m$ ) as a variable that connects the monetary base ( $B$ ) with the monetary supply ( $M$ ), is largely presented as an endogenous variable, whose direct determinants cannot be easily and quickly managed by using the adequate instruments of monetary regulation. Holders of monetary policy are left with the control of the monetary base as a most feasible way to successfully regulate the amount of money in circulation. The monetary base is a key determinant of money supply. Hence, the strategy of monetary control, which should be adopted by the monetary policy holders, could be easily formulated as the following rule: control the monetary base in order to control the money supply changes.

Can the analysis of changes in the amount of money in circulation proceed from the assumption that the variable  $B$  is one exogenous, determined variable, determined by monetary policy measures? Such an assumption would mean that the holders of monetary policy are able to determine the amount required size of  $B$  at any moment.

In short, we can say that the above assumption is not correct if you take a statement derived strictly on the basis of such assumption. Discretionary monetary policy measures of the Central Bank are not the only factors that lead to the generation or withdrawal of reserve money, but decisions of non-banking entities and banks can also contribute to oscillations in the variable  $B$ . The amount of base money depends partly on the actions of the Central Bank (especially loans to other banks, and direct loans to customers), and partly on endogenous factors - foreign exchange transactions with foreign countries, deposits of non-banking entities - which involve a considerable uncertainty in the movement of the total amount of base money. Therefore, it would be right to start from the hypothesis that the net changes in the amount of base money ( $B$ ) are within the limits that are controlled by the holders of monetary policy.

## THE CASE OF SERBIA

Most parameters necessary for the analysis of credit potential and monetary multiplication in Serbia (with dinar RSD as the national currency) could be found among the following inflation determinants, presented in the Inflation Report (February 2011: 11–31) of the National Bank of Serbia (NBS) for the last quarter of the year 2010:

- **Money market interest rates.** They mirrored the rise in the key policy rate and deposit rates, particularly after the implementation of incentives offered by banks during the November “Savings Week”, while lending rates picked up slightly. Banking sector liquidity improved in response to a reduction in dinar required reserves, banks’ waning interest in repos, and seasonal, end-of-year growth in excess reserves, which gave the boost to the overnight interbank rate. A hefty rise in effective rates on T-bills continued from the previous quarter and a hike in up to 6-month rates may be correlated with the large issue of short-term bills coming up to almost 80% of total bills issued.

- **Monetary aggregates.** As reserve money declined through the foreign exchange channel by 1.4% in real terms, dinar transactions prompted its issue. Net FX reserves exceeded the threshold set by the IMF program by EUR 940 mln. A reduction in bank investment in repo securities was the key generator of dinar liquidity. The government ended the year with rising balances in accounts with the NBS, which dampened the growth in reserve money. In real terms, M1 and M3 gained 1.5% and 1.4% in the fourth quarter respectively, while M2 lost 1%. During the year, money supply rose at a slower pace than prices, inducing by the year-end a real drop of 11.1% and 14.9% year-on-year in M1 and M2, while M3 was up just 2.4% year-on-year in real terms, remaining below its long-term trend. Higher household FX savings were the main factor behind rising FX deposits. To encourage saving in dinars, the NBS offered a reduction in dinar reserve requirements, but dinar household savings recorded no major increase and FX savings prevailed as the favorite option among Serbian citizens. Relative to the third quarter, *monetary multiplier stayed unchanged as reserve money and dinar deposits increased proportionally*. The velocity of money remained comparable to the previous quarter levels. Throughout 2010, the velocity of money moved above the 2009 values, confirming the incipient recovery of economic activity. Bank lending to non-governmental sectors (mostly to the corporate sector) continued to provide the strongest impetus to M3 growth (5.9%). Growth in net government borrowing, both via FX borrowing from domestic banks and the issue of T-bills pushed M3 up by 1.8 percent.

- **Bank lending.** Banks stepped up their lending, particularly to the corporate sector. Quarter-on-quarter, corporate lending rose 6.5% in real terms, while household lending gained 1.6% and, due to a faster pace of lending – relative to end-2009, total lending increased by a real 16.2%. Among domestic sources of funding, the largest contribution to quarterly growth in lending came from the growth in savings (3%), especially growth in household FX deposits in November in response to attractive rates traditionally offered by banks to mark the Savings Week. Banks reduced their holdings with the NBS (1.2% contribution), mainly at the expense of investment in repos. The rise in net foreign borrowing contributed 2.7% to overall lending activity. The loans in greatest demand were those for liquidity and investment purposes. Investment loans stepped up from the third quarter, but remained second to liquidity loans, which shows maintaining liquidity continues to be one of the main difficulties for Serbian economy. Firms continued reducing their foreign financial debt, net trade loans declined, household lending eased, and growth in housing loans proceeded, while the use of consumer and cash loans and current account overdrafts decreased.

- **Foreign exchange market movements.** Relative to the third quarter, dinar depreciated 1.3% on average against the euro. Depreciation pressures reflected an increased corporate demand for foreign exchange, increase in the key policy rate, an upgrade in the outlook of the country’s credit rating, the fall in risk premium measured by EMBI (*Emerging Markets Bond Index*), and new reserve requirement policy. To ease excessive daily volatility of the exchange rate, the NBS intervened by buying foreign exchange from banks on several occasions. By contrast to the first three quarters, net foreign capital inflow was somewhat higher than the current account deficit, which reflected on movements in the IFEM. As the current account deficit was relatively low thanks to increased remittances, capital inflow was sufficient for its financing and for giving a boost to the NBS foreign exchange reserves.

- **Capital market trends.** Substantial growth in trading in the domestic capital market was reinforced by a pick-up in stock exchange indices. Higher returns on the government bonds weighed down on market capitalization.

- **Aggregate demand.** In terms of impact on GDP outturn, the decline in domestic demand, reflecting lower capital investment and government spending (due to the fall of labor costs in public sector), outweighed the

positive impact of increased net exports and foreign demand. The drop in real household income, mainly in real wages, weakened household spending, domestic consumption, and retail trade turnover. Achieving their pre-crisis level for the first time, exports outpaced imports, exerting a positive impact on overall economic activity.

- **Economic activity.** Following certain growth in previous quarters, it contracted and negative output gap widened. The fall in GDP was mainly due to a contraction in manufacturing, as industrial output recorded a decline.

In the Table 1 below, main monetary aggregates in the Republic of Serbia are presented for 12-years period from 1999 to 2010, with values in millions of dinars at the end of period i.e. at the end of each year from this period.

**Table 1: Main Monetary Aggregates in the Republic of Serbia, 1999-2010** (in millions of dinars, end of period)

Year	Currency in circulation	Bank dinar reserves with NBS	Dinar reserve money	Total reserve money	Demand deposits	Time dinar deposits	M1	M2	M3	Foreign exchange reserves of NBS (EUR m)	Foreign exchange reserves of commercial banks (EUR m)
	1	2	3	4	5	6	7	8	9	10	11
1999	6,707	1,989	8,696	11,971	8,072	3,897	14,779	18,676	24,946		
2000	10,933	7,931	19,013	34,026	16,093	5,868	27,026	32,894	65,204		
2001	25,266	16,256	41,643	58,052	32,967	9,864	58,233	68,097	125,414		
2002	43,719	25,732	69,543	101,908	50,096	17,081	93,815	110,896	191,491	2,186	678
2003	42,979	27,947	72,267	115,430	56,324	25,591	99,303	124,894	244,731	2,836	669
2004	45,165	32,092	82,383	147,948	66,093	34,951	111,258	146,209	322,876	3,104	595
2005	53,650	40,703	100,341	247,808	91,299	47,231	144,949	192,180	458,870	4,922	547
2006	68,461	65,463	143,409	396,972	131,629	78,876	200,090	278,966	634,470	9,020	518
2007	77,000	82,076	169,020	439,172	171,873	141,612	248,873	390,485	903,871	9,634	1,222
2008	90,075	218,857	319,781	514,125	150,669	154,281	240,744	395,025	992,151	8,162	920
2009	95,519	151,030	254,268	533,776	162,908	178,341	258,427	436,768	1,205,570	10,602	1,425
2010	91,750	87,412	188,161	537,338	161,536	157,209	253,286	410,495	1,360,777	10,002	1,684

The **stability of money demand** indicates the effectiveness of monetary policy and growth of a particular economy. The increasing money demand generally shows a country's improved economic situation, as opposed to the falling one, being usually a sign of deteriorating economy, because the rising money demand brings about the increase in production and/or causes the rate of money circulation to decline, while the falling money demand is the result of the contracted output in real terms. The growing production relates to the long-term aspect of money demand or the need for money (transaction demand), as the increased issue of money which is consistent with price stability may solely be achieved in the long run if it follows the growth of output. In the short term, a decreasing rate of money circulation may cause money demand to rise irrespective of the movements in real production. However, the ongoing increase in money supply regardless of the trends in production leads to the stronger inflationary pressures.

The rising discount rate and required reserve ratio result in increased interest rates, which in turn cause money demand to decline. Money demand affects economic activity and exchange rate stability thereby creating the background for applying a transmission mechanism bringing the objectives in line with the instruments of monetary policy, used by the central bank to influence money demand, mainly indirectly pursuing its monetary policy. Money demand as money in real terms i.e. money supply deflated by general price level (retail price index or GDP deflator) is (positively correlated) function of the overall economic activity (presented e.g. by the industrial production index, as earnings increase in parallel to its growth, causing the rising number and volume of transactions and a more pronounced need to hold money) and (negatively correlated) to the set of variables reflecting the opportunity cost of holding money (the higher need to hold money, the higher opportunity cost), typically measured by the deposit interest rate which might be earned (own rate of money), inflation expectations, and fluctuations in exchange rate.

The results of the empirical analysis of the stability of money demand in Serbia and factors influencing it, based on well-specified both long- and short-term models, proved that money demand in the entire observed period showed signs of instability, which points to the sensitivity of Serbia's economy to external shocks. In practice, the relation between money supply and inflation rate proves much more complex than the results of simplified model analysis suggest. Applying the Johansen's procedure and error-correction model pointed to the strong cointegration between the real money, overall economic activity, inflation, and interest rates. The long-term earning elasticity is close to one and the opportunity cost variables have expected designations. The short-term model shows that the money demand is still mostly affected by the expected inflation, which is only normal for this stage of transition.

This analysis also showed that the interest rate payable on short-term highly liquid transaction deposits, as the instrument of monetary policy, has not yet had a significant role in Serbian circumstances. The significance attached to the exchange rate variable in the short-term proves high level of euroization of both balance sheet assets and liabilities. To a certain extent, the above facts cause the instruments of monetary policy to be less efficient.

One of the reasons for an unstable money demand function is the dynamic nature of changes in the Serbian financial system in the last several years. During the transition period newly introduced institutions and banking products have brought about changes in the payment instruments and savings drive, all pointing to the conclusion that the money demand could not be seen as a fully predictable and that the central bank could not determine the money supply rate comparable to the prices stability. Nevertheless, access to timely information, as well as application of modern methods of analysis could greatly aid the central bank in enhancing its assessments and monitoring the reaction of the economy and citizens to its monetary policy measures. (Maravić, Palić, 2005).

# FOREIGN DIRECT INVESTMENTS AND INCENTIVES FOR THEM: THE CASE OF SERBIA

**Aleksandar Ivanović**

**Alexander College of Arts, Business & Management, Serbia**

**Leonora Fuxman, St. John's University, USA**

## ABSTRACT

*The Republic of Serbia, as an internationally recognized leader in business reforms, as well as a proven investment location in the South-Eastern Europe, has attracted over US\$ 20 billion of inward foreign direct investment in the last decade. It offers highly capable intellectual capital and customs free access to the 15% of the world market with over billion consumers. It has a favorable geographical position and represents an excellent logistics base, with modern telecommunications and transportation infrastructure and competitive transport and utility fees as well as other overhead costs. Attractive tax regime, conducive to doing business, includes a competitive standard VAT rate, a number of various tax incentives, and the corporate income tax of 10%, being the second lowest in Europe. Financial incentives mean considerable non-refundable state grants and other financial support offered by the Government for new foreign investment projects in Serbia.*

## FOREIGN DIRECT INVESTMENTS TO SERBIA IN FIGURES

### Foreign Direct Investments (FDI) to Serbia until the Year 2000

Foreign direct investments to Serbia had been severely restricted during the years of the economic embargo in the last decade of the previous century. As soon as UN sanctions were lifted, a number of foreign investors (mostly from the neighboring countries, Russia, and Asia) expressed a considerable interest in capital investment. The main sectors attracting the largest interest of first foreign investors were metal manufacturing and machinery, infrastructure improvement, agriculture and food processing, as well as chemicals and pharmaceuticals. It was highly important that foreign investors could hold majority shares in Serbian companies.

Serbia was then still a member of the two-country federation with Montenegro, called formerly Yugoslavia, and later on – Serbia and Montenegro. In 1997, foreign direct investment (FDI) inflows into Serbia and Montenegro reached US\$ 740 million, but dried up with the onset of the conflict in Kosovo. FDI inflows averaged US\$ 122.5 million in 1998 and 1999, but fell down to only US\$ 25 million in 2000 ([1]).

### Amount of FDI to Serbia since 2001 by Years, Countries, and Industries

Since major political changes in 2000 and the onset of economic reforms, Serbia has grown into one of the premier investment locations in Central and South-Eastern Europe. It has attracted over US\$ 20 billion of inward foreign direct investment in the last decade (see Figure 1).

The world-class companies and banks, such as FIAT, Telenor, Strada, US Steel, Michelin, Gazprom, Siemens, Intesa Sanpaolo, and many others top a list of leading foreign investors in Serbia. Serbia's strong FDI track record is also substantiated by internationally recognized awards for local Greenfield investors. Between 2004 and 2006, OECD awarded Greenfield projects in Serbia as the largest investments of this type in South-Eastern Europe. The first Award was presented to Ball Packaging Europe (headquartered in USA), followed by METRO Cash & Carry (Germany), and Israeli Africa-Israel Corporation – Tidhar Group for their Airport City Belgrade real estate project.

**Figure 1: Foreign Direct Investments ([2])**

Inward FDI by Industries (2005-2009)	
Industry	Investment Value (USD million)
Financial Intermediation	5,294.4
Manufacturing	3,161.3
Transport and Telecommunications	2,681.6
Real Estate, Renting	2,060.9
Wholesale, Retail, Repairs	1,829.2
Mining and Quarrying	578.6
Construction	351.8
Hotels and Restaurants	178.8
Other Utility, Social and Personal Services	166.0
Agriculture	131.2
Public Administration and Social Insurance	95.9
Electricity, Gas and Water	13.0

Source: National Bank of Serbia

**Figure 2: Foreign Direct Investments by Industry**

Regarding the FDI country structure, investors from the European Union top the list, accounting for about 70% of the total FDI influx. The leading position on the country list is held by Austria, followed by Greece, Norway, Germany, the Netherlands, and Italy, while major investor countries also include Slovenia, France, Hungary, the Russian Federation, and Luxembourg. The actual amount of the USA investment is significantly higher than the official figure as American companies invest primarily through their European affiliates. This also holds for Belgium, Denmark, Israel, and a number of other countries ([3]).

Over the past five years, service sectors have proven to be the most attractive to the international investors. Banking and Insurance recorded the largest FDI inflow of US\$ 5.3 billion. Manufacturing industries held the second position with US\$ 3.2 billion, followed by Transport and Telecommunications, Real Estate and Renting, as well as Trade (see Figure 2).

## THE LIST OF REASONS TO INVEST IN SERBIA

There are a number of reasons why foreign investors should invest in Serbia. It offers:

- most improved business environment and highly recognized investment location;
- customs duty-free access to the 15% of the world market with a billion consumers;
- unique and very competitive combination of high-quality skill-set and low-cost workforce;
- favorable geographical position, logistics base, modern telecommunications and transport infrastructure, with competitive transport and utility fees as well as other overhead costs;
- attractive tax regime, conducive to doing business, with competitive standard VAT rate, a number of tax incentives, the corporate income tax being the second lowest in Europe; and
- considerable financial incentives through non-refundable state grants and other support.

### Improved Business Environment and Recognized Investment Location

According to the Economist Intelligence Unit, "Serbia is forecasted to make the largest improvement in the business environment in the region of Eastern Europe between 2009 and 2013. Out of 16 countries included in the research, Serbia will be leading the region in terms of business reforms by a wide margin." Pricewaterhouse Coopers ranked Serbia as the third most attractive manufacturing and the seventh most attractive services FDI destination among emerging economies. Ernst & Young recorded nearly 150 inward investment projects in Serbia in 2007, 2008, and 2009 – being the second best performance in the South Eastern Europe region.

Serbia hosted some of the largest international investors, too, including the biggest Greenfield projects in South East Europe for three consecutive years awarded by OECD:

- Ball Packaging Europe, USA, in 2004,
- Metro Cash & Carry, Germany, in 2005, and
- Airport City Belgrade, Israel, in 2006.

Belgrade, the capital of Serbia, was awarded as the City of the Future for Southern Europe in 2007 by the fDi Magazine. The selection criteria were: economic potential, transport, cost effectiveness, human resources, IT and telecommunications, quality of life, and FDI promotion. In 2008, the municipality of Indjija was ranked by the same magazine among the top 25 most attractive locations for foreign direct investment in Europe ([4]).

## Duty-Free Access to 15% of the World Market with a Billion Consumers

### *Local and Global Market*

Serbian local market, with 7.5 million people, is the second largest in South East Europe. Before the general financial and economic crisis, the average net monthly salary rose from € 194 in 2004 to € 402 in 2008, which – coupled with rapid consumer loan expansion – fueled a significant increase in local demand, particularly reflecting in a double-digit surge in retail trade turnover on an annual basis. International retail chains have opened up dozens of new stores in Belgrade and across the whole country, so that from 2004 to 2009 total retail and wholesale foreign investment reached more than € 1.6 billion. However, locating and starting a business in Serbia means much more – the opportunity of exporting to a more than one billion people market without paying any customs duties. Namely, Serbia can serve as a manufacturing hub for duty-free exports to a huge market including the European Union, the United States of America, the Russian Federation, Kazakhstan, Turkey, South East Europe, the European Free Trade Agreement members, and Belarus. This customs-free regime covers most key industrial products, with only a few exceptions and annual quotas for a limited number of goods. Upon the completion of negotiations with Egypt, the territory with duty-free access for Serbia would increase by the population of additional 77 million. This can be seen from the Figure 3 ([5]).

Serbia's Preferential Trade Agreements		
Market	Trade regime	Number of inhabitants
European Union	Preferential Trade Regime	494,070,000
United States	Generalized System of Preferences	302,558,000
Russian Federation and Kazakhstan	Free Trade Agreement	158,950,800
Southeastern Europe	Free Trade Agreement	29,990,542
Belarus	Free Trade Agreement	9,689,800
EFTA*	Free Trade Agreement	13,000,000
Turkey*	Free Trade Agreement	75,000,000
Total Market Size		1,083,259,142

\*Free Trade Agreements with Turkey and EFTA likely to take effect by the end of 2010.

Figure 3: Serbia's Free Trade Agreements

### *Trade Liberalization and Free Trade Agreements (FTA)*

It is very important that Serbian exports to the **European Union** market are free-of-customs according to the Stabilization and Association Agreement. Only for several food products (such as baby beef, sugar, and wine) export quantities are limited by annual quotas. On the other hand, imports from the European Union are pursued based on the Interim Trade Agreement, as part of the Stabilization and Association Agreement, providing for the progressive abolishment of import customs duties for industrial and certain agricultural products from the EU countries by 2014. This FTA is in force since February 1, 2010 ([6]).

Bilateral trade with the **United States** of America is pursued under the Generalized System of Preferences (GSP) and its benefits provide for a preferential duty-free entry for approximately 4,650 products, including most finished and semi-finished goods and selected agricultural and primary industrial products. Certain sensitive goods (e.g. most textile products, leather goods, and footwear) are not eligible for duty-free exports. The list of goods eligible for GSP treatment is reviewed and adjusted twice per year, with input from US industries, and it can be checked up on the official site of the Office of the US Trade Representative ([7]).

Serbia is the only country outside of the Commonwealth of Independent States that enjoys a Free Trade Agreement with Russia. This Free Trade Agreement, signed in August 2000, makes Serbia particularly attractive to foreign investors in the manufacturing sector. It stipulates that goods produced in Serbia, with over 50% value added in the country, are considered to be of the Serbian origin. For the need of exports to Russia, the FORM A Certificate is required as a proof of goods' Serbian origin. The only tariff charged is the customs record keeping tariff, amounting to 1% of the goods value. The list of products, excluded from the Free Trade Agreement, is revised annually. For instance, in 2009 the duty-free regime was extended to the following goods: all drugs, confectionery products, apple juice, malt beer, fresh grape wines, all soaps, wool clothing, refrigerators, freezers and all refrigerating devices, washing and drying machines, wooden upholstered seats, wooden office furniture, sleeping bags, sheets, and similar goods.

Serbia is a member of the Central European Free Trade Agreement (CEFTA) comprising of a free trade area with 29 million people, being also the region with the highest growth rate in Europe. CEFTA is the trade agreement between the following countries in **South Eastern Europe**: Albania, Bosnia and Herzegovina, Croatia, FYR Macedonia, Moldova, Montenegro, Serbia, and the United Nations Interim Administration Mission (UNMIK) in Kosovo. The Agreement, in effect as of July 2007, envisages the abolishment of customs restrictions for industrial and agricultural products in the CEE countries by 2010. In addition, it stipulates accumulation of products origin, meaning that products exported from Serbia are considered of the Serbian origin if integrated materials originate from any other CEFTA country, the European Union, Turkey or EFTA members (see below), provided that such products have undergone sufficient processing (if the value added there is greater than the value of the materials used in Serbia). For exports to CEFTA members, the EUR 1 Certificate is required as a proof of goods origin ([8]). The full version of the Agreement can be found on the official site of the Stability Pact for South Eastern Europe ([9]).

The Free Trade Agreements with Turkey, EFTA members, **Belarus, and Kazakhstan** envisage mutual abolishment of customs and non-customs duties in trade between the countries. There are only a few exceptions to the Agreement with Belarus, including sugar, alcohol, cigarettes, as well as used cars, buses, and tires.

Since September 1, 2010, trade between Serbia and **Turkey** has been regulated upon the model implemented in trade with EU ([10]). Industrial products originating in Serbia can be exported to Turkey without paying customs duties. Imports of industrial products into Serbia are generally customs-free, but for a large number of goods customs duties are to be progressively abolished over the six-year period, from 2010 to 2015. For trade in agricultural products customs duties remain in effect, with certain Most Favored Nation reductions for a number of products.

Serbian industrial products exported to EFTA member countries (Switzerland, Norway, Iceland, and Liechtenstein) are exempted from paying customs duties, except for a very limited number of goods, including fish and other marine products. Customs duties for imports of industrial products originating in EFTA states will be gradually abolished by 2014. Trade in agricultural products is regulated by separate agreements with each of **EFTA members**, providing for mutual concessions for specified products. This Agreement, in force since October 1, 2010, should enable export of Serbian products customs free to a market of 13 million people ([11]).

Serbia is also a signatory of a partial scope agreement – the Protocol on Trade Negotiations (in force since 1973) along with: Bangladesh, Brazil, Chile, Egypt, Israel, Republic of Korea, Mexico, Pakistan, Paraguay, Peru, Philippines, Tunisia, Turkey, and Uruguay ([12]).

## Competitive Combination of Highly Qualified and Low-Cost Workforce

The labor force in Serbia combines working efficiency with sizable labor supply, skills and high quality with low costs. Throughout years of cooperation with blue-chip companies such as Siemens, Alcatel, Fiat, and IKEA, Serbian workers have received specific know-how and adopted advanced technology applications and rigorous quality control standards. Having vast experience in both manufacturing and management, local staff requires minimum training to adopt cutting-edge technologies and assembly processes. There are also a significant number of Serbian experts, returning to the country after gaining top-quality expertise in international companies around the globe.

Highly qualified staff is widely available. Labor supply is yearly increased by approximately 75,000 high school graduates as well as 35,000 university and 2-year college graduates. Of the total number of graduates, technical universities account for approximately 30% and technical education is particularly strong, as high school students are among the best performers at world contests in natural sciences, while Serbian engineers are well known for their expertise. ScienceWatch.com, an open Web resource combining the newest Science Watch@newsletter material, data, analysis, interviews, and commentary source data drawn from Essential Science IndicatorsSM, for past two years has rated Serbia as a Rising Star in a broad spectrum of sciences ([13]).

Management education has also been accelerated by the introduction of joint graduate and post-graduate courses organized by local universities and renowned Western business schools such as the French HEC and Grenoble, British Heriot-Watt and Sheffield University, and Californian Lincoln University. International as well as local headhunting agencies operate in major Serbian cities, offering a full range of consulting services, including executive search, staff training, and salary surveys. In addition, Serbia boasts the highest English speaking proficiency in Eastern Europe. Finally, international elementary and high schools are widely available in Serbia, offering curricula in English, German, French, and Russian.

Average salaries in Serbia are low enough to ensure cost-effective operating. Total costs for employers stand at merely 50% of the level in EU countries from Eastern Europe. Social insurance and Salary Tax amount to roughly 65% of the net salary but the tax burden for employers can be reduced through a variety of financial and tax incentives available.

## Favorable Logistics Base, Transport Infrastructure and Utility Fees

### *Transportation Infrastructure*

Serbia as a logistics base is almost perfect location for a company to efficiently serve its customers from the EU, South Eastern Europe or Middle East. It borders the EU, at the Hungarian, Bulgarian, and Romanian state lines, although offering the benefits of operating outside the EU, while being able to provide services and goods transport in projected and flexible time frames. Owing to its position on the geographic borderline between the East and West, Serbia is often referred to as a gateway of Europe. Two important European corridors, No. VII – the River Danube and No. X – the international highway and railroad, intersect on the Serbian territory providing excellent transportation connections with Western Europe and the Middle East. The summary of its transportation infrastructure can be seen in Figure 4 below.

By using well-developed road connections, a shipment from Serbia can reach even the remotest parts of Europe in less than 72 hours. Goods can move rapidly cross-country, too. The road network features 498 km of toll motorways and 136 km of toll semi-motorways. By the end of 2012, a total of €2.9 billion will be invested in the construction of the six major highways.

Main railway lines account for 50%, 35% of the network is electrified (in particular main lines), while 7% of the lines are double-tracked. The main lines are designed for freight trains of 1,000–1,200 t and 120 axles, i.e. train lengths of 600 m plus locomotive as well as passenger trains of 600 t, and for a maximum speed of 120 km/h except for the Belgrade – Bar (80–100 km/h), Niš – Preševo, and Niš – Dimitrovgrad lines. However, the present permissible train speeds are below the designed speeds on most lines and line sections – e.g. the average permissible speed on the Corridor X lines is limited to 82 km/h. The major part of the main lines are of the class D4, i.e. permitting an axle load of 22.5 t and 8 tons/m, which applies generally in Western Europe. The government plans modernization and reconstruction of the railway lines on the Corridor X in order to increase the average speed, along with electrification and construction of the double-gauge railway tracks on certain sections. The total amount of investment funds is estimated at around €1.7 billion.

Serbia offers also an outstanding potential for river transportation. A highly cost-effective way of transport can be pursued on three rivers, giving a total of 959 km of safe navigable routes. The international River Danube, in the length of 588 km, can be used throughout the year, while artificial canals Rhine–Main–Danube, allowing barge traffic between the North Sea and the Black Sea, and the canal Danube–Tisa–Danube in Serbia create a network of routes providing access to all Danube basin countries. The Danube River features a total of 12 ports: Apatin, Bačka Palanka, Belgrade, Bogojewo, Kovin, Novi Sad, Pančevo, Prahovo, Šabac, Senta, Smederevo, and Sremska Mitrovica. The Sava River links the following countries in the region: Slovenia, Croatia, Bosnia and Herzegovina, and Serbia, and is in the process of gaining the status of the International Navigable Route.

Transportation Infrastructure	
Length of road network	40,485 km
Length of railway network	3,809 km
Length of navigable routes	959 km
Number of river ports	12
Number of international airports	2

**Figure 4: Transportation Infrastructure**

Telecommunications Infrastructure	
Fixed telephony penetration rate	42%
Fixed telephony digitalization level	97%
Number of fixed telephony providers	3
Mobile telephony penetration rate	130%
Number of mobile telephony providers	3
Internet penetration rate	22%
Number of Internet service providers	>200

**Figure 5: Telecommunications Infrastructure**

Serbia can be reached by air using one of two available international airports – in Belgrade and Niš. There is a Civil Airport Bor and 16 sports airports, too. Transport by air to and from Belgrade is possible to almost every destination in the world, directly or by layover ([14]).

## Telecommunications: Fixed and Mobile Telephony and Internet

Serbia has a good voice telephony access and a strong Internet penetration rate (see Figure 5). Telekom Srbija (49% owned by the Serbian Government) is the major provider of fixed telephony services. Telenor (owned by the Norway's Telecommunications Group) obtained the second fixed telephony license in January 2010, while local company Orion Telekom recently became the third fixed telephony operator. The cost of basic telephone services is very competitive relative to that of most countries in the region. There are also more than 40 VoIP operators in Serbia, providing low-cost solutions for making international calls.

Mobile phone networks are widespread, covering 90% of the country geographically. There are three mobile telephony service providers: Telekom Srbija, Telenor, and VIP Mobikom (the subsidiary of Austrian Mobikom). The three operators support second and third generation mobile networks, while mobile phone operators in Serbia boast the lowest prices for domestic calls as compared to other European countries.

There are various types of Internet access possibilities through the usage of different new technologies, such as CDMA, HSPDA, and IPTV. The usage of frequency bands on 2.4GHz and 5.8 GHz in Serbia is free-of-charge. With more than 1.7 million Internet users, the country has a penetration rate of around 22% ([15]).

## Utility Fees

The 100% state-owned Electric Power Industry of Serbia is the sole electricity supplier now. The electricity price varies according to the consumption category and daily tariff rate, ranging between €0.0112 and €0.0487/kWh. As a natural gas supplier in Serbia, the state-owned company Srbijagas pursues its pricing policy in accordance with world prices of oil derivatives and the US dollar exchange rate fluctuations. The price of natural gas is set every 15 days, currently standing at €0.3057/m<sup>3</sup> (see Figure 6 for distribution of major utility fees in 2010). The waterworks in Serbia are operated at the municipality level with water prices set by local authorities ([16]).

Major Utility Fees ( March 2010)	
Item	Amount
High Voltage Electricity for Industrial Consumers (€/KWh)	0.0112-0.0336
Middle Voltage Electricity for Industrial Consumers (€/KWh)	0.0123-0.0369
Low Voltage Electricity for Industrial Consumers (€/KWh)	0.0162-0.0487
Gas for Industrial Consumers (€/m <sup>3</sup> )	0.3057
Water for Industrial Consumers (€/m <sup>3</sup> )	1.2800

1 Based on a sample of 22 municipalities

Figure 6: Major Utility Fees

## Corporate Tax Policy and Tax Incentives Attractive for Foreign Investors

The summary of favorable tax environment in Serbia is represented in Figure 7 below. The **Value Added Tax** (VAT) rates are as follows: the standard VAT rate – 18% (for most taxable supplies) and the lower VAT rate – 8% (for basic food stuffs, daily newspapers, utilities, etc.). The standard VAT rate is lower compared to most other countries in the region and among the most competitive in Central and (South) Eastern Europe (Figure 8).

Principal Tax Rates in the Country	
VAT	Standard rate – 18% Lower rate – 8%
Corporate Profit Tax	Flat rate – 10%
Withholding Tax	20% (for dividends, shares in profits, royalties, interest income, capital gains, lease payments for real estate and other assets)
Personal Income Tax	Salaries – 12% Other income – 10%
Annual Income Tax	10/15% (for annual income below or above 8 average annual salaries)
National Insurance Contributions	Pension and disability insurance – 11% Health insurance – 6.15% Unemployment insurance – 0.75%
Property Tax	Progressive rates ranging from 0.4% to 3%, plus a fixed amount

Figure 7: Principal Tax Rates in Serbia

Standard VAT Rate	
Serbia	18%
Slovakia	20%
Bulgaria	20%
Czech Republic	20%
Poland	22%
Croatia	23%
Romania	24%
Hungary	25%

Figure 8: Comparison of Standard VAT Rates

**VAT Exemptions in Free Zones** – Income generated through commercial activities in the Free Zones in Serbia is exempted from VAT. There are six Free Zones, currently operating in the country: Subotica, Novi Sad, Zrenjanin, Šabac, Kragujevac, and Pirot. Three more zones are being prepared in Niš, Smederevo, and Užice. Foreign companies can establish a privately owned Free Zone based on the project approved by the government.

**Corporate Income Tax**, paid at the uniform rate of 10%, is the second lowest in Europe and much lower than in other countries in the region, as it can be seen from Figure 9 ([15]). Non-residents are taxed only based on their income generated in Serbia. The investors can use various *tax incentives*:

**Corporate Income Tax Holiday** – Companies are exempt from Corporate Income Tax for a period of ten years starting from the first year in which they report a taxable profit if they invest in fixed assets an amount exceeding approximately €8 million, or if throughout the investment period they employ at least 100 additional employees.

**Corporate Income Tax Credits** – The amount of tax payable can be reduced by 20% or by 80% of the amount invested in fixed assets for the respective tax period. This reduction cannot exceed 50% of the total tax liability for a single year. If not used entirely in the course of one year, this tax credit can be carried forward for a maximum period of five years.

**Corporate Income Tax Holiday for Concessions** – A five-year tax holiday is granted for the concession-related investments, from the day it has been completed. No corporate income tax is due if income is derived before the completion of the concession investment.

**Carrying Forward of Losses** – The tax loss stated in the tax return report can be carried forward and offset against future profits over a period of up to five years.

**Avoiding Double Taxation** – If a taxpayer already paid tax on the profit generated abroad, he is entitled to a Corporate Income Tax credit in Serbia to that already paid amount. The same right is enjoyed by a taxpayer who earns revenue and pays Personal Income Tax in another country, provided there is a Double Taxation Treaty with that country.

**Figure 9: Comparison of Corporate Income Tax Rates**

**Figure 10: Personal Income Tax Rates Compared**

**Withholding Tax** is not applied to dividend payments between Serbian entities. For non-residents of Serbia, a 20% withholding tax is calculated and paid on certain payments such as dividends, shares in profit, royalties, interest, capital gains, lease payments for real estate and other assets.

The **Personal Income Tax** rate is 12% for salaries, which is much lower than in the region (Figure 10).

The **Annual Income Tax** is taxed for non-Serbian citizens if their annual salary exceeds the amount of threefold the average annual salary in Serbia. The tax rate is 10% for the annual income below the amount of six times average annual salary in Serbia, and 15% for the annual income above the amount of six times average annual salary in Serbia. The taxable income is further reduced by 40% of an average annual salary for the taxpayer and by 15% of an average annual salary for each dependent member of the family. The total amount of deductions cannot exceed 50% of the taxable income.

The mandatory **Social Insurance Contributions** rates are: 11% for pension and disability insurance, 6.15% for health insurance, and 0.75% for unemployment insurance, calculated on the gross salary. The employer who hires certain categories of workers on a permanent basis is exempt from paying the Personal Income (Salary) Tax as well as Social Insurance Contributions over the periods of three or two years, depending on the category of workers hired:

*Other, non-tax incentives* for foreign investors include:

- *customs duty-free imports of raw materials and semi finished goods* for export oriented production, and this benefit can either be achieved by operating in one of the free zones in Serbia or by a permit from the Customs Office for outward processing production, but in both cases finished products must be 100% designated for exports;

- customs duty-free imports of equipment and machinery which represents the share of a foreign investor in the capital of a company in Serbia; and

- a wide array of *regional and local incentives*, available at the local level, varying in scope and size from one city to another – the major ones comprise the following: city construction land lease fee exemptions or deductions, including the option of paying in installments, with the prior consent of the Serbian Government; city construction land development fee relief such as fee exemptions or discounts for one-off payments; and other local fees exemptions or deductions (e.g. from the fee for displaying the company's name). Some personal exemptions are listed in Figure 11 ([17]).

3 years	For apprentices aged under 30 and registered as unemployed with the National Employment Service.
	For disabled persons.
2 years	For persons aged under 30 who have been registered as unemployed with the National Employment Service for more than 3 months.
	For persons aged 50 or older who have been registered as unemployed with the National Employment Service for more than 6 months and receive salary compensations.
	For persons aged between 45 and 50 (an 80% exemption).

**Figure 11: Exemptions from Personal IncomeTax and Social Insurance Contributions**

## Significant Financial Incentives and Support for Foreign Investments

Investment incentives also include financial incentives, such as support schemes offered by the **National Employment Service**, encompassing three programs listed in Figure 12 ([18]), as well as SIEPA (Serbia Investment and Export Promotion Agency) grants, offered for Greenfield and Brownfield projects in all industries except for retail, tourism, hospitality, and agriculture. To date, 114 foreign and local companies have already been approved €47.3 million of non-refundable funds for the projects worth €635 million providing for 17,194 new jobs. This financial assistance by the Government of Serbia is shown in Figure 13 below.

For standard-scale Greenfield and Brownfield projects in the manufacturing and export-related services sectors, non-refundable state funds are offered in the range between €2,000 and €10,000 per new job created. For large investors, a special financial package is available: if a project's value exceeds €200 million, with the minimum of 1,000 new jobs created, the state may cover even 25% of the investment. Investments of over €50 million that create the minimum of 300 new jobs can be subsidized for 20% of the project's value.

Financial Grants						
Eligible Projects	Manufacturing and Export-Related Services		Manufacturing		Export-Related Services	
	Large-Scale Projects		Projects Realized in Devastated Regions and Regions of Special State Interest	Projects in Automotive, Electronics, IT Industries Realized in Regions of Special State Interest	Projects Realized in Other Regions	Projects Realized in Any Region
	25% of the total investment	20% of the total investment	€4,000-10,000	€5,000-10,000	€2,000-5,000	€2,000-10,000
The National Employment Service Grants						
Program	The Employment Subsidies Program	The Apprentice Program	The Re-training Program	Minimum Investment Amount	€200 mn	€50 mn
Grant Amount per Employee	€850-1,700	€170-210	€850	Minimum N° of New Jobs Created	1,000	300
					€0.5 mn	€0.5 mn
					€1 mn	€0.5 mn
					50	50
					50	10

**Figure 12: Employment Incentives**

**Figure 13: Government Grants**

For large-scale projects, the amount of non-refundable state funds is determined by the government, depending on the investment's importance, value, and term. In the case of standard-scale projects, state funds are awarded upon the scoring based on the following criteria: an investor's references, participation of domestic suppliers in the final product and the investment effect on local companies, investment sustainability, effects related to R&D, effects on human resources, environmental impact, the value of international turnover for investments in the services sector, imports substitution, effects on the development of the local community, and

municipal support related to deduction of local fees. Upon the project assessment, the funds for selected projects are paid out in four increments throughout the project's lifetime: the 1st increment – after concluding the contract for sale or lease of land; the 2nd increment – after obtaining the construction approval; the 3rd increment – after obtaining the right-to-use permit; and the 4th increment – after achieving full employment envisaged by the investment project ([19]).

One can **conclude** there are a lot of good reasons and true incentives to invest in Serbia.

# INFORMATION SOURCES AND DECISIONS FOR HOUSING PRODUCTS AND SERVICES: AN EXAMINATION IN THE EMERGING MARKET OF MONGOLIA

**Burmaa Jamiyuansuren , Ider University, Mongolia**  
**Dana-Nicoleta Lascu , University of Richmond, USA**

## ABSTRACT

*For over two decades, Mongolia has experienced an unprecedented economic, political, legal, and social transformation: since the demise of Communism in the 1990s, the process of transition to a market economy, privatization, reform, deregulation, and foreign direct investment have fully changed the Mongolian housing landscape, with the transformation most pronounced in Ulan Bator, the capital. This study assesses the Mongolian government's and the real estate industry's approach to providing and marketing housing for a rapidly increasing urban population in Ulan Bator, and evaluates related consumer aspirations. The study also examines the extent to which consumers seek information from various service providers and other sources in their housing search.*

## INTRODUCTION AND LITERATURE REVIEW

### Background

Housing policy is becoming an important consideration for the government of Mongolia in the process of adapting to a double-digit economic growth and the resulting population influx into the capital city in the past decade. The government and international development organizations have worked extensively, for the past six years, to improve the living conditions of the population by initiating several programs for developing the local housing market and by supporting private sector efforts through loans.

Mongolia's current growth has been unprecedented in its history. Its market economy is extremely vulnerable to volatility in global commodity prices, given the concentration of growth in mining and herding; the collapse in copper prices and the global financial crisis has deeply affected the country's economy in 2009, such that the International Monetary Fund had to step in to provide a \$224-million loan (IHS Global Insight, 2011). Today, however, Mongolia is on its way to a strong recovery. Its current economic growth is largely attributed to the construction of the Oyu Tolgoi copper and gold mine, the world's largest underdeveloped copper-gold project launched as a result of a joint investment by the Mongolian government and a British, Australian, and Canadian mining consortium, and to the herding of livestock, which represents the second largest share of domestic output, employing 30% of the labor force (IHS Global Insight, 2011).

Mongolia continues to receive substantial help from donor aid that is essential in the process of maintaining economic stability, especially as the country is often subject to severe weather conditions, which could create economic risks at any given time (IHS Global Insight, 2011). Its population is small, at 2.76 million, projected to be 2.85 in 2015 (IHS Global Insight, 2011) and its nominal GDP per capita is at \$2,546 in 2011, making it one of the world's poorest countries – ranked 166, just ahead of the West Bank; however, nominal GDP is projected to reach \$5,045 in 2015 (Gluckman 2011), placing it comfortably at the level of a middle-

income country. Mongolia's stock exchange, still the world's smallest, rose 125 percent in 2011, and conservative forecasts (by the International Monetary Fund) are for double-digit GDP growth rates, with less conservative ones predicting an overall economic output that would quadruple by 2013 (Gluckman 2011).

The Mongolian government is keeping a close watch on the country's rapid economic development, attempting to control inflation and to address negative growth outcomes. For example, the government has recently approved the Fiscal Responsibility Law, aimed to restrict rapid spending growth from mining revenues and to prevent excessive borrowing against future wealth (IHS Global Insight, 2011). It is also ensuring that the influx of new businesses and population to support these businesses are appropriately supplied with the necessary housing.

The next section addresses the builders' considerations for developing housing for the Mongolian population, their branding strategies, and their use of service providers to communicate their strategies to consumers. Following, we present a study where we address consumer aspirations and sources of information used in the process of their home purchase decision. Finally, we offer insights into strategies that the government and firms involved in housing development could use in the process of addressing the housing needs of working consumers.

## **A New Era of Consumer Spending**

In the early 1990s, Mongolia had just emerged from seven decades under the Soviet umbrella. Today, its capital city, Ulan Bator, looks very much like a Chinese boomtown, with exploding property prices, huge capital inflows, concerns about corruption, widening gaps in income disparity, and expensive automobiles (Gluckman 2011). Popular and expensive Western brands are invading the Mongolian landscape, many wooing the luxury consumer. For example, Louis Vuitton opened in the posh Central Tower in the proximity of Sukhbaatar Square; there, a glass cabinet holds a horse saddle encrusted in gems, and a crocodile purse priced at \$20,000 is within proximity of watches that are well over \$10,000 (Gluckman 2011). This is very much in contrast with Mongolia's standard of living, which is among the world's lowest – at least for now.

## **The Mongolian Housing Market**

Since the 1990s, when Mongolia transitioned from a planned economy to a market economy, the construction of new buildings has increased sharply and 3,725 families moved to new apartments in Ulan Bator (Battulga 2009). More and more individuals are moving to the city in search of better education and job prospects, and more and more need housing.

The Mongolian government currently has engaged in several projects aimed at providing solutions to the housing challenge. One such endeavor was setting up the Sustainable Development Tasks Force, and providing support for the "40,000 Family Housing Project" between 2004 and 2009; the Project helped build new apartments for families working for the government of Mongolia (Bayarsaihkan 2010).

Between the years 2000 and 2009, construction companies and private businesses have built from 680 to 8574 apartments annually (Bayarsaihkan 2010), many for investment purposes. According to the Population and Housing Census, 22.8 percent of the population owns housing units with plumbing, electricity, and separate bathrooms and kitchens; and yet, with all the construction, only 12,000 individuals have moved to these apartments, with the rest in dire need of new homes (Bayarsaihkan 2010). More than half of the total population of Mongolia lives in Ulan Bator. Here, the majority of residents live in the outskirts of the city in courtyard-type buildings known as ger or yurt, built on one level. They are comprised of 1 or 2 room houses with electricity, but with no plumbing and heating – they rely on coal for heating, which creates a high level of air pollution. It is a high priority for the Mongolian government to move the population from these court-yard-type buildings into high-rise apartments with central heating systems.

In addition to high-rise apartments, individuals who can afford it are also able to purchase single family two-story houses and townhouses. Many are able to purchase these homes and apartments with remittances from

family members working abroad – nearly one fifth of the labor force works abroad (Lee 1993) and sends remittances to facilitate the purchase of apartments or houses.

## Building the Builder Brand

When searching for an apartment, Mongolian consumers evaluate their prospective purchases on many of the same dimensions as Western buyers – prices, apartment style, neighborhood, number of rooms, and so on. The builder's reputation in particular is an important consideration. Builders are keen on finding available lots in the center of Ulan Bator, in the Tool River basin, and the Bogd Khan Mountain area, a protected park located in the Red Nature Book of Preserved Lands, a scenic area 15 miles from the center of Ulan Bator. There appears to be a hierarchy of builders, from the point of view of Mongolians, with the top-ranking construction companies from Japan, followed by Korean and then by Chinese companies.

Builders advertise their building projects on television, in weekly newspapers, and on billboards in the city center, and offer open houses to market their homes to prospective buyers. They also use real estate agencies to market new apartments, homes, and even districts. To differentiate their offerings, builders have created new communities marketed as "Japan town," "Marshal town," or "Digital town". Mongolian names often have references to traditions – for example, "Sun Rise town", "Krystal town," and "Rich Mongolian town." This is in sharp contrast to names under the socialist rule, where districts were designated using numbers, such as first, third and forty thousand neighborhood, to name a few.

In 2006, the "Japan town" district offered homes with a price of \$650 per square meter, with the kitchen installed and with built-in entertainment center furniture. Then, a competing Mongolian Construction Company followed suit to offer garages for cars to the first families who purchased. In 2009, builders also focused on creating playgrounds, sheds where the elderly could congregate, a more modern interior design, and so on. In creating these new living environments, builders largely ignored the middle class consumer. The government is keenly aware that low-income families are underserved when it comes to housing opportunities. As Table 1 indicates, prices for apartments in Ulan Bator have practically doubled in the last decade, making the purchase of an apartment a challenge for most middle-class families.

**Table 1:**  
**Number of Apartments and Prices in Ulan Bator**

Year	Number of Apartments Commissioned (by families)	Price per Square Meter (\$)
2000	978	\$300
2001	816	\$340
2002	1285	\$309
2003	2041	\$348
2004	2955	\$350
2005	2935	\$461
2006	5863	\$502
2007	4832	\$580
2008	4216	\$650
2009	4562	\$850

## METHOD

### Sampling and Procedure:

The data was collected in the capital city, Ulan Bator, using a street-intercept procedure. Fifty trained investigators were hired to collect data from the State Department Store, the Central Post Office, the South Grocery Market, the Sunday Market Department Store and the Bayunzurch Market. A total of 500 data collection instruments, written in Mongolian, were administered, and 450 were deemed as usable questionnaires. A total of 500 individuals were approached and 99.8 % agreed to complete the questionnaire; such a high response rate is explained by the fact that the respondents were keen for their opinions regarding housing to be widely known and disseminated: the present study was presented as an international survey and the respondents were informed that the aggregate responses in the study would be made known internationally, as well as locally.

## **Research Instrument/Operationalization of Variables**

The research instrument comprised of a survey questionnaire. The specific questions asked to collect the data on different operational variables and performance measures are described below. Respondents were first asked if they lived in a single-family house, an apartment, a ger or yurt with a yard, or a ger/yurt in someone else's yard. They were also asked the number of rooms in their dwelling and whether their home was in Ulaan Baatar City. Respondents had to indicate if they planned on buying a new home in the following three to five years. If so, they were asked about the number of rooms of the intended apartment and the price they were willing to pay using five categories, namely, \$250-\$500 per square meter, \$501-\$700 per square meter, \$701-\$900 per square meter, \$901-\$1,100 per square meter, or \$1,200-\$1,500\$ per square meter.

They were asked what sources of information they would likely consult for the apartment – friends, television advertisements, newspaper advertisements, street posters, or the services of a real estate firm. They were then asked to indicate the extent to which the following factors would influence their decision to buy an apartment using a 5-point semantic differential scale; the factors are: price, location, neighborhood, bank loan interest, reputation of the building company, apartment quality, construction and design of the apartment, structure and plan of the rooms, demand for apartments, and the supply of apartments. Respondents were also asked to indicate their age category, their gender, the number of family members, whether they lived in Ulan Bator, in a town in the provinces, or in the countryside. Finally, respondents had to indicate whether they worked for the state government, for a nonprofit organization, for a private employer, whether they owned their own business, if they were unemployed, or retired, or if they were students.

## **RESULTS AND DISCUSSION**

The respondents were evenly distributed with regard to age, with 137 (30.4%) under the age of 25, 165 (36.7%) between 26 and 35, 119 (26.4%) between 36 and 50, and 29 (6.4%) over the age of 51. In a relatively young country, where the average 21 and 70% of the population is under the age of 35 (www.mongoliatoday.com 2011), this distribution is deemed as appropriate. Of the total respondents, 176 (or 39.1%) are male, and 274 (or 60.9%) are female. Family size, defined as the number of family members living together, ranges between 1 and 11, with a mean of 3.86. With regard to employment, most respondents self identify as entrepreneurs or working in the private sector – see Table 2. A total of 431 respondents (95.8% of respondents) live in the capital city of Ulan Bator, with only 16 living in the provinces/village center and 3 living in the countryside.

The study attempted to identify if there were differences between respondents depending on whether their current dwelling was a single-family house, an apartment, a traditional home (ger or yurt) with a yard, or a ger or yurt in someone else's yard. We found that the type of dwelling did not significantly determine the sources of information individuals used to find housing. However, we did find that most respondents relied either on newspapers (197) or on television advertising (120) out of 442 valid respondents, rather than on friends or real estate services. Not surprisingly, real estate services are rarely used as information sources, as they constitute a new service in the market, and consumer are not used to consult them in the process of searching for housing.

**Table 2: Respondents' Employment Information**  
**Employment**

	Number	Percent
Government organization	40	8.9
Nongovernmental organization	58	12.9
Private sector	117	26.0
Entrepreneur/Business Owner	168	37.3
Unemployed	11	2.4
Retired	18	4.0
Student	38	8.4
Total	450	100.0

On the other hand, we found that one's current type of dwelling was an important determinant of the price of the apartment sought (Chi-Square=32.74,  $p<.01$ ). It also appears that price was more of a consideration for individuals living in apartments and those living in a ger/yurt in someone else's yard. Individuals living in a ger/yurt in someone else's yard have fewer financial resources than those owning a home or a ger/yurt with their own yard and thus perceived price as a more important consideration. Surprisingly, the reputation of the building company, the design and structure of the apartment, and the location were not related significantly to the type of dwelling owned.

The number of rooms one currently owned, however, appeared to be an important information variable, determining the source of information individuals consulted (Chi-Square=30.55,  $p<.05$ ). It appears that the more rooms individuals have, the more sources of information – other than friends – they are likely to consult, in particular, newspapers, television advertising, and real estate information. It is important to note that real estate services are more frequently considered for those who owned more rooms, compared to those who owned fewer rooms. Alternatively, the fewer number of rooms individuals had, the more they were likely to rely on information from friends for their housing decisions. Also, the more rooms individuals had, the less they considered price as an important variable (Chi-Square=100.33,  $p<.01$ ), and the more they considered the construction and design of the apartment (Chi-Square=47.87,  $p<.01$ ). Also, the fewer rooms one currently owned, the more important the mortgage interest charged by the banks (Chi-Square=37.86,  $p<.01$ ).

Surprisingly, there was no relationship between the number of rooms one had and the importance of the reputation of the builder. This suggests that there is, for the time being, a minimal concern with the builder brand in Mongolia. This is explained by the fact that there is substantial demand for housing and very limited supply. As such, the majority of Mongolian home purchasers are concerned with the availability of new homes, rather than with the added value that builder perception could potentially provide. As more builders compete for consumers and more building stock becomes available, the builder will increasingly become an important consideration.

## MANAGERIAL IMPLICATIONS AND CONCLUSIONS

The study presented herein attempted to offer insights into the housing market of Mongolia, and into the related services and sources of information. It attempted to illustrate how consumers approach information sources, related services, and decision making related to house ownership. An attempt was made to uncover the sources of information consulted in the process of purchasing a home – friends, television advertisements, newspaper advertisements, street poster, or consulting with real estate services. They were then asked to indicate the extent to which price, location, neighborhood, bank loan interest, reputation of the building company, apartment quality, construction, and the design of the apartment, the structure and plan of the rooms, the demand for apartments, and the supply of apartments influenced their decision to purchase an apartment.

The study found that the type of the current dwelling of the respondent and the number of rooms of the respective dwelling constituted important determinants of whether price was an important consideration in the consumer decision making. However, the type of dwelling that one had appeared to have only a minimal relationship to the sources an individual used for information on housing. On the other hand, the number of rooms one owned in his/her current dwelling appeared to determine the sources of information individuals consulted. That is, the more rooms individuals had in their current dwelling, the more sources of information –

other than friends – they were likely to consult. In particular, they were likely to consult newspapers, television advertising, and real estate services and information. Also, the more rooms individuals had in their current dwelling, the less they were likely to consider price as an important variable, and the more they appeared to take into consideration the construction and design of the apartment.

This finding is relevant, as buyers are more likely to pay attention to company communication in the form of television advertisements, magazine and newspaper ads, and billboards, and to publicity. These consumers are less likely to rely on price as a key decision variable. Rather, they are more likely to respond well to branding strategies that focus on company reputation and design.

An important finding of this exploratory study is that the reputation of the building company, although deemed important, did not particularly stand out as an important determinant of purchase in general. As the Mongolian market matures and consumers have more choices with regard to builders, the builder brand will clearly become an important consideration. Similarly, the respondents appeared not consider real estate services as important in their decision process. This too is an issue related to the fact that such services are relatively new in the Mongolian market and individuals have yet to learn that they provide an important service to consumers in their process of searching for a new home.

This was primarily an exploratory study of housing purchase behavior; future longitudinal studies or studies with post-hoc debriefing should attempt to capture more comprehensively the processes involved in the home purchasing decision-making process of the Mongolian consumer.

# **THE ROLE OF TECHNOLOGY POLICY IN LEVERAGING AFRICA GROWTH ACT BENEFITS TO THE COMMON MARKET OF EASTERN AND SOUTHERN AFRICAN MARKET**

**Martin Kaggwa**  
**Tshwane University of Technology, South Africa**

## **ABSTRACT**

*To sustain benefits emanating from participation in the America's Africa Growth Act (AGOA) dispensation, the Common Market of Eastern and Southern Africa (COMESA) economies have to become competitive. However, competition policy rather than competitiveness has received more attention in regional trade discussions. This could be attributed, in part, to the assumption that an effective competition policy ultimately leads to competitiveness. Achievement of competitiveness is a complex process that cannot be achieved indirectly via a competition policy in isolation. Focussing on competitiveness brings to the fore the role of technology and nature of enabled investment in the assessment of current and future benefits of the AGOA dispensation. The pivotal role of technology in determining competitiveness is expounded and the fact that when it comes to competitiveness, investment is not homogeneous is highlighted. The paper recommends that COMESA should implement its trade policy, under which AGOA falls, in tandem with a technology policy. Otherwise benefits emanating from AGOA will be limited and short lived.*

## **INTRODUCTION**

Benefits from trade to a country's or regional economy are not contested. Nonetheless, for trade to effectively contribute to regional economic growth, it has to be sustained over a long period of time. Discretionary and time-bound interventions such as the Africa Growth Act (AGOA) can play an important role in triggering external trade, but they neither guarantee sustainability nor growth in the enabled trade. Sustainability and growth of trade depends largely on competitiveness, irrespective of preferential trade arrangement in place. Regional economies need to take deliberate steps to achieve global competitiveness within the period they are receiving preferential trade treatment. Competitiveness need not be sought in everything, but in niche products in which a region has dynamic advantage. The preferential treatment period should be used to test the quality of such products and acceptability in the developed country markets.

The Common Market of Eastern and South African market (COMESA) is one of the many regional groupings that are beneficiaries of AGOA. Under AGOA, beneficiary countries and regions are allowed to export products to the USA market duty free with few exceptions. Specific to the COMESA, there is debate on how to increase regional benefits emanating from participation in the AGOA dispensation and on how to sustain such benefits when the dispensation ends. The region recognises the need to achieve international competitiveness in its vision statement. However, competition policy rather than competitiveness has been the major focus of discussions. This could be attributed, in part, to the implicit assumption that competition policy ultimately lead to competitive markets, which in turn result into regional competitiveness (Nankunda, 2011). Although related, competitiveness and competition policy are different. Competitiveness looks at the process through which economic actors within a country or a region attain capabilities to produce goods and services that meet global standards at relatively lower prices. Competition policy on the other hand focuses on ensuring competition in domestic markets and the realisation of benefits of competitive markets for domestic consumers

and the economy as a whole. Achievement of competitiveness is a complex process that cannot be achieved indirectly via a competition policy in isolation.

In his State of Union address of January 2011, President Obama highlighted the importance of competitiveness in America's quest to overcome its economic challenges and to remain the world economic leader. He stressed that America had to acquire capacity to out-compete other countries in innovative ideas and entrepreneurship. Irrespective of America's noble intentions to support economic growth in the other regions of the world through interventions like AGOA, improving its own competitiveness has been set as its top priority.

If one party to AGOA dispensation has made competitiveness its priority it makes logical sense that the other parties involved, enhance their own efforts to achieve global competitiveness. For regional groupings in Africa like the COMESA to become active participants in global trade, they need to graduate from 'improvised competitiveness' to being globally competitiveness in their own right. Trade dispensations like AGOA should be used to support individual countries and regions to attain global competitiveness. There is a need to refocus on regional competitiveness and clearly articulate on how it relates to trade policy. What it means to be competitive? What does it take to be competitive? Can one look at trade policy in isolation of competitiveness? These are some the questions that need to be answered in COMESA's quest to get the best of AGOA.

## **COMPETITIVENESS, TECHNOLOGY AND TRADE**

Competitiveness refers to the ability of firms or industries within a country or region to increase in size, market share and profitability. It is the degree to which a nation can, under free and fair market conditions, produce goods and services that meet the test of international markets while simultaneously maintaining and expanding the real income of citizens (Clark and Guy, 2000). This definition takes cognisance of the welfare effects of increased productive activities as a region captures bigger market shares. Some other authors have linked the definition of competitiveness with an increase in per capita income and employment (Oughton, 1997). They argue that competitiveness is a product of increased productivity. To achieve it, output per each factor of production, including labour has to increase. Assuming perfect market conditions or at least market conditions that support a positive correlation between reward for factor inputs and productivity, wage rates payable will increase with productivity. Competitiveness will therefore lead to an increase in Gross Domestic Product (GDP) per capita and overall improvement in national welfare.

One cannot, however, talk about competitiveness without technology. Technology is a key determinant of production efficiency and subsequently for competitiveness. Technological advances, innovation and competitive advantage are connected in multidimensional relationships (Lengnick-Hall, 1992). Competitiveness depends on average production costs. Production costs are a function of price and non-price factors, some of which are the ability to adopt and use new technologies. Sustainable competitiveness depends on the ability of a region or production units within a region to offer comparative products to its competitors at lower prices on an open market. It requires that a region or industry is able to lower its production costs without sacrificing quality. Technology innovation offers one of the most practical ways to reduce production costs while at the same time maintaining or even increasing product quality.

Technology determines the actual value of the physical resource endowment (Stumpf and Vermaak, 1996). Through its value adding, technology augments the value of regional resource base and enhances its competitiveness, holding other factors constant. Therefore, there is general agreement that countries seeking to enhance their international competitiveness, have to engage in domestic R&D and subsequent innovative activities (Wint 1998).

Based on the Chinese experience, Fan (2006) contends that development of innovative capability and self-developed technology are the key factors leading to domestic firms catching up with multinational corporations. She emphasises that domestic firms need to prioritise building innovative capabilities from the beginning in order to withstand competitive pressure from multinational companies as well as other domestic companies.

Ultimately, competitiveness, technology and trade are intertwined. Without competitiveness, trade cannot be sustained, and without technology, long run competitiveness is unlikely. Trade is an implicit indicator of competitiveness, while technological progress is subtle indicator of progress toward competitiveness.

Without technical ability, competitiveness pressure is likely to lead to outcompeting of domestic firms; ultimately overall reduction in their participation in international trade (Figure 1-Loop B). Advocates of competition policy tend to focus on how trade leads to competitiveness pressure in the local market, motivating efforts to achieve competitiveness, and subsequently increase in trade (Figure 1- Loop A). They however, overlook the role of technology, if the sequence captured by Loop A is to be realised.

Figure 1: Trade and competitiveness causal loop map

Trade performance data indicates that most of the COMESA countries have been experiencing increasing trade deficit despite the AGOA dispensation implying that there has been limited progress towards global competitiveness in the region at least in the short run. A part from the DR Congo, which is a mineral rich country, trade balance has been consistently deteriorating among COMESA countries since 2000 (Table 1).

Table 1: Trade balance for selected COMESA countries 2000-2008  
(Million US dollars)

Country/Year	2000	2005	2006	2007	2008
Burundi		-11.9	-15.3	-15.5	-21.6
Comoros		-21.0	-22.2	-24.7	-32.1
D R Congo	13.9	14.3	17.5	12.6	13.8
Djibouti	-31.6	-33.6	-36.5	-48.9	-51.9
Ethiopia	-1.7	-22.7	-23.7	-20.2	-19.8
Kenya	-10.0	-11.4	-14.5	-15.7	-18.6
Madagascar	0.0	-11.7	-9.7	-13.6	-19.8
Rwanda	-9.2	-9.2	-9.6	-8.4	-9.2

## COMPETITIVENESS AND INVESTMENT

When it comes to competitiveness, investment is not homogenous. It is the investment in R&D and innovation related activities, rather machinery and equipment, which has a greater likelihood to lead to competitiveness. Research and development can be broadly defined as a formal improvement-driven undertaking to discover new knowledge about products, processes and services. It comprises of the bulk of creative systematic activities undertaken to increase a stock of knowledge and the subsequent use of this knowledge to devise new application (Frankema and Lindblad, 2006). In the 21 century, knowledge-based economies are most progressive and competitive.

Investment R&D has a powerful positive correlation with industrial profitability, product quality, return to investment, hence overall competitiveness (Merrifield, 1989). Activities related to R&D generate knowledge, which is a factor of production, as such an indirect input in the neo-classical production function (Özçelik and Taymaz, 2004).

The current conventional thinking is that the link between R&D and competitiveness is via its effect on technological development and subsequent innovation. Innovation, technological advances and country competitive advantage happen to be connected by complex multidimensional relationships (Lengnick-Hall, 1992). The logic applied here is that competitiveness depends on average production costs. Production costs are a function of price and non-price factors, some of which are R&D capabilities and the ability to adopt and use new technologies. Overtime, non-price factors have become more important in the reduction of production costs as well as in contributing to overall output increase.

In the appraisal of how AGOA has contributed to the attraction of investment in the COMESA, it is therefore useful to consider the nature of enabled investment as this has a bearing on the competitiveness objective. Regional investment data indicates that overall FDI as a percentage of COMESA countries' GDP has been on increase (Table. 2):

Table 2: FDI for selected COMESA countries – 2001-2008 (US per capital

Country/Year	2001	2005	2006	2007	2008
Burundi	21.1	49.3	56.7	60.6	63.0
Comoros	48.8	63.9	48.6	68.9	56.4
D R Congo	4.7	30.0	34.2	19.8	25.7
Djibouti	75.4	91.9	140.3	134.8	142.3
Ethiopia	16.3	25.6	25.6	32.6	41.2
Kenya	14.5	21.0	25.6	35.0	35.1
Madagascar	23.2	51.8	41.8	48.1	44.0
Rwanda	36.7	64.2	63.9	76.4	95.7
Tanzania	36.3	38.4	45.8	68.3	54.9
Uganda	32.6	41.5	52.4	56.7	52.3

Source: African Statistical Year Book 2010

Table 2 does not, however, identify the specific form of investment enabled. As such, it is not particularly useful in making a qualified statement on how the increased investment was supporting the regional competitiveness objective. Given the regional deteriorating trade balance, it is likely that most of investment was not competitiveness enhancing.

## COMPETITIVENESS AND AGOA

From the preceding discussion, a number of questions need to be answered as regards COMESA's competitiveness and the AGOA dispensation. What does AGOA offer the region by way of technology acquisition as an important pre-requisite of competitiveness? How relevant is this technology to competitiveness effort of respective countries? Is there local capacity to man the technology? Is there alternative local technology that could be used independently or supplemented with imported technology?

In number of policy documents and discussion forums on AGOA, competitiveness is mentioned but without divulging into it in detail. Lack of production capacity in Africa to produce competitive goods and services due to supply side constraints and low levels of research and development on continent were some of the constraining factors for efficient performance highlighted at 8th AGOA Forum held in Nairobi in 2009. These two factors are related to long term competitiveness. In the AGOA Acceleration Act of 2004, the USA

undertook to take deliberate steps to build trading capacity among beneficiary countries, through studies to identify potential sectors of growth, identify barriers to expected growth and subsequently provide technical assistance to each country to overcome such barriers. This support has taken the form of seconding policy advisors to African country governments. These advisory services fall far short of what is required to make African economies competitive and stand on their own in the long term. The previous Structural Adjustment Programmes (SAPS) the brainchild of IMF and the World Bank had many policy advisors dispatched to African countries but many of these countries still have the same development challenges.

The African Global Competitiveness Initiative (AGCI) which provided 200 million USD to improve competitiveness of Africa countries and build trade capacity focussed on providing technical assistance that advances competitiveness and support of to activities that contribute to this objective. Given the complexity and national effort required to put a country on a competitive path, AGCI scope also falls short of what African countries need to be propelled to global competitiveness.

Under AGOA Acceleration Act of 2004, the Secretary of Commerce was to continuously monitor surges in imports from beneficiary countries in Africa with a possibility to recommend withdraw of duty free consideration when imports reach a particular threshold. By implication, African countries were only to benefit from the AGOA up to a point. Countries and regional groupings were not expected to increase their trade capacity with the USA infinitely. Beyond a particular point, countries were expected to compete at equal terms with imports from other non-AGOA beneficiary countries. To have significant effect on economic growth of African countries, external trade should be significant and inclusive of large sections of a countries' population. Such significant trade is less likely to be supported by the AGOA conditions that restrict duty-free trade after some point. Thus, it is imperative that countries or regions be competitive in their own right if they are to reap benefits of external trade.

It is also notable that the major export, under AGOA, has been oil from Nigeria and Angola. Oil is a non-renewable resource whose export cannot be sustained indefinitely. Moreover, its exploitation has significant negative effect on the environment of the exporting country which is often discounted when quantifying benefits there from. Export performance under AGOA seems to indicate that for a country to significantly benefit from the dispensation, it has to be exporting a natural resource. Specific to oil, given its global demand, it is less likely that a special incentive was required for its export to developed countries. Unlike a number of agricultural products in many African countries, there has always been a demand for oil in the developed countries' markets. In other words international competitiveness of oil is not in question but COMESA is not predominantly oil exporting economy.

In all, in order to sustain benefits of the AGOA to the COMESA, a strong link between the dispensation and regional competitiveness has to be forged recognising the complexity of putting any economy on a competitiveness trajectory.

## **CONCLUSION AND RECOMMENDATION**

Trade without competitiveness is superficial, unsustainable and a charity. This is contrary to the COMESA's vision of creating an integrated regional economic community that is internationally competitive and that has improved living conditions of its people. As long preferential trade arrangements with the region, such as AGOA, do not explicitly support regional competitiveness, benefits there from will remain limited and their long term impact on region development will be insignificant.

A valuable criterion for judging usefulness of any preferential trade agreement between COMESA and the external world should be how such a dispensation supports regional progress to global competitiveness. Assessment of the value of AGOA to COMESA should not be limited to regional trade performance within the dispensation period. It should include evaluation of how trade will be affected post AGOA period. Will the region be able to sustain the enabled trade or will it be compelled to ask for extension of the dispensation? Will the region seek for new preferential treatment altogether? These are some of the key questions that COMESA development strategists need to reflect on. Attainment of competitiveness is at the centre of all these questions. In this regard, issues pertaining to nature of investment, technology acquisition and management, human

resource and indigenous knowledge need to be on the agenda of discussions on how to improve AGOA benefits to the region. These are key determining factors for COMESA's progress to global competitiveness and subsequently sustaining regional benefits from AGOA. These factors lie more in the domain technology rather than trade policy. Hence, the recommendation that the COMESA region should consider implementing trade policy, under which AGOA literally falls, in tandem with a technology policy.

# ANALYSIS OF ALTERNATIVE ROYALTY STRATEGIES FOR A BOT PROJECT FROM A NEGOTIATION PERSPECTIVE

Chao-Chung Kang, Providence University, Taiwan  
Cheng-Min Feng, National Chiao Tung University, Taiwan

## ABSTRACT

*This study constructs the royalty negotiation model via bi-level programming problem and develops the algorithm for the BLP. The factors of concession rate, learning effect, and time value have been taken into the algorithm to reflect authentic negotiation process. This paper presents a case study to simulate the negotiation behavior for two parties and discusses about alternative royalty strategies. Results reveal that the two parties acquire the best the concession negotiation at the sixth negotiation, and the operational revenue-based royalty model is preferable for the government; while, the operational output-based royalty model is preferable for the concessionaire.*

## INTRODUCTION

The Build, Operate and Transfer (BOT) approach is one of the public-private financing structures for many public infrastructure project methods. The BOT concept is that the private sector obtains a granted concession for building and operating a specific project independently at its own cost or expense and in turns the concessionaire can receive the revenue from the BOT project to cover the expenditure cost during the concession period; however, the ownership of the project must be returned to the public sector once it is completed (Yang and Meng, 2000). The BOT scheme shows higher efficiency in construction and operation than the government executing one does; hence, many public infrastructure projects, including transportation infrastructures, energy, park, and environment projects, have been undertaken by the BOT approach in many developed and developing countries. For example, the Eurotunnel project which is a cross-English Channel link between the United Kingdom and France; the Euro Disneyland project in Paris; the 80 km elevated toll expressway in metropolitan Bangkok in Thailand (Walker and Smith, 1996).

In practice, the legal framework, the concession agreement or contract will be set up or signed for two parties to clear the mechanism for adjusting the third parties' actions, reserving of the government, etc. Especially, the BOT concession contract is a project financing agreement which can be allocated risks and returns among the parties. Thus, construction firm can bear the construction risks or competition risk; operator can bear the operation risks and so on. An example is that the Treaty of Canterbury signed the Channel Tunnel project between the government of France and UK. Another examples are in Taiwan; many infrastructure projects, including the High Speed Rail Project (HSRBOT) and Taipei Port Container Logistic BOT Project, have also been carried out using the BOT approach according to the Act for Facilitation of Private Participation in Infrastructure Projects (AFPPIP) enacted by the Ministry of Transportation and Communications (MOTC). The royalty which the concessionaire pays the government for operating a project during the concession period is one of the cost expenditure items of project discount cash flow for a BOT project. Some important items, including toll price determine, concession period, royalty and so on, should be written in the BOT agreement through the negotiation by both private and public parties. Obviously, it can be regarded as revenue sharing scheme through a bargaining process for a good royalty determination method between the government and private sectors. There are many royalty computation methods that the government or private sector can adopt (Chiou and Lan, 2006), such as pre-tax profit-based royalty, total revenue-based royalty, lump sum royalty,

patronage-based royalty, operational output-based and so on. For instance, the levied lump-sum royalty is NT\$ 30 billion which is calculated according to the fixed royalty method of the 101 Skyscraper BOT Project in 1998. The other case, the levied royalty is US\$ 10 Million based on the fixed royalty method for the Malaysia north-south highway BOT project.

As for royalty formulas, some studies constructed them using mathematical programming, simulation, or financial engineering methods. For example, Chiou and Lan (2006) developed many royalty models based on pre-tax profit, total revenue, and patronage, etc. using mathematical programming to determine royalty for a BOT project. Kang et al. (2004, 2007) constructed a financial decision-making model for describing the royalty relation between government investment and private investment using mathematical programming. The contributions of Kang et al. (2004, 2007) for analyzing the royalty amounts for BOT projects are beneficial for both the government and private sectors. Most previous studies, however, ignored methods for investigating determinative royalty amount from the viewpoint of the bargaining.

In recent years, some studies have adopted the game theory or BLP (Bi-level programming) approaches to determine the price, the operational output level, or to identify the concession period of a BOT project. For example, Yang and Meng (2000) explored the toll scheme of highway networks using BLP under the BOT mechanism. Xing and Wu (2001) used BLP to construct the Stackelberg Game Model for determining the price and production output of a power utility in a BOT project. Shen et al. (2007) used the Bargaining Game theory to identify the concession period of a BOT project. The authors proposed a BOT concession model to identify a specific concession period which takes account of the bargaining behavior of the two parties engaged in a BOT contract. Additionally, Kang, Feng and Kuo (2008) also employed a royalty model using the BLP approach to determine the royalty for a BOT project. Their proposed royalty model is based on the total revenue of a BOT project; whereas, the other royalty computation methods have not been further investigated. It is a worthy investigating issue to clarify which royalty method suits government and which royalty model suits private sectors. The purpose of this paper is to determine the royalty amount and to compare alternative royalty strategies from the negotiation viewpoint. The remaining part of the paper is structured as follows: Section 2 constructs three royalty negotiation models and a solution algorithm. Finally, a discussion of findings is presented and conclusions are drawn

## METHODOLOGY

Assumptions for developing the model were made as follows:

- (1). This study assumes that the lump-sum royalty, operational revenue-based royalty, and operational output-based royalty methods can be adopted by both parties to determine the royalty amount for a BOT project; and assumes that the three models are independent.
- (2). Two parties, the government and the private investor, establish contractual relationship with in a BOT contract through appropriate negotiations conducted with rational behaviors. Rational behavior means that both parties will calculate and adequately compare all the possible outcomes for protecting their own interests and profit making objectives.
- (3). The two parties are both entitled to the same full and frank disclosure of relevant information in regards to the BOT project concerned. Furthermore, the parties should endeavor to ensure they communicate to each other clearly and effectively.

### Concept of financing BOT project

The concept of financing projects proposed by Kang et al. (2004) was utilized to describe the annual royalty relationship between the government investment and private investment. The concept is shown in Figure 1.

Fig.1 Concept of annual royalty of BOT projects, the operational output-based case

Figure 1 indicates that the fund resource for both construction and operation in a BOT project comes from the concessionaire and the government. The construction cost of the project comprises  $C_{gt}$  and  $C_{pt}$ ; where  $C_{gt}$  and  $C_{pt}$  represent the government investment cost and the private investment cost at time  $t$  during the construction period, respectively; and  $K_t$  is the nominal operation cost at time  $t$  during the operation period. The concessionaire pays  $B_t + g(1+\phi)^t Q_t + D_t$  to the government according to the operational output and affiliated business income, where  $B_t$  is the land use rent at time  $t$ ,  $Q_t$  is the operational output at time  $t$ , and  $D_t$  is the tax at time  $t$ . The  $B_t + g(1+\phi)^t Q_t + D_t$  term in Fig. 1 is the sum of the land use rent, royalty, and tax. Let  $g$  be the proportion of the operational output of BOT project during the operating period, and  $\phi$  is the annual growth rate of  $g$ . As shown by the  $g(1+\phi)^t Q_t$  term, the royalty amount variation depends on variables  $g$ ,  $Q_t$ ,  $\phi$  or  $t$  change. It will increase as  $g$ ,  $Q_t$ ,  $\phi$  or  $t$  increases. As seen in Figure 1, there exists a causal relationship among royalty, government investment, private sector investment, and government finance recovery ratio in cash flow for a BOT project. The government finance recovery ratio was defined as “the government income divided by the government investment cost; the government income includes royalty, land-use rent, and tax to cover its investment cost” by Kang, Feng, and Huang (2007). In their perspective, government can use this ratio to replace the traditional evaluation index, such as Net Present Value (NPV), for assessing the recover ability in finance project. From this point, if the royalty change beside the land-used rent and tax, then it will be a huge effect in government finance recovery ratio and net income for government and private sectors, respectively.

Similarly, we use the concept of Figure 1 to illustrate the relationships among royalty, government investment and private investment for the operational revenue-based royalty and the lump-sum royalty.

## The Model

Following the concepts of Figures 1, the royalty amount could be computed by three ways: first, royalty is based on the operational output of the BOT project; second, royalty is based on the operational revenue of the BOT project; and third, royalty is the lump-sum fee of the BOT project. Three royalty models are described as follow:

- A. Model I (the operational output-based royalty model): Royalty depends on the operational output of the project; the annual nominal royalty computed based on  $g(1+\phi)^t Q_t$ . Variable  $g$  through the negotiation for the two parties can be obtained.
- B. Model II (the operational revenue-based royalty model): Royalty depends on the operational revenue of the project; the annual nominal royalty is computed based on  $\theta(1+\alpha)^t R_t$ . Variable  $\theta$  through the negotiation for the two parties is determined and then the royalty also can be obtained.
- C. Model III (the lump-sum royalty model): Royalty is lump sum franchise fee of the project; the annual nominal royalty is computed based on  $F(1+\beta)^t$ . Once the variable  $F$  is determined through the negotiation for the two parties, the lump-sum royalty is obtained.

When the concession period changes, price regulation, price flexible, or price adjustment schemes of output will result in revenue changes for private sector during the operation period. In general, the price cap scheme and the minimum guarantee output of production or operation will be signed or bargained in the BOT contract in order to improve the efficiency or reduce uncertain operation factors for private sectors. Considering the factors of concession period of a project and minimum guarantee output scheme from government will result in huge

variation in the operational revenue although operational revenue is an output function; the operational revenue-based and operational-output based models in this paper should investigate the royalty and negotiation behavior for two parties. In order to develop the royalty negotiation model for the operational output-based case, this study assumes that the concession period of a BOT project is made up of both the construction period ( $t = 0 \sim n$ ) and the operation period ( $t = n+1 \sim N$ ). We also assume that the government doesn't offer affiliated business income, joint-development income, subsidies to the private sector, and the salvage value of the fixed asset of the BOT project is not considered. After the concession period expires, the facilities of the BOT project should be returned to the government unconditionally. Moreover, we assume that the government investment is totally capitalized by debt and the planning cost of government is not considered. And we also assume that the royalty is not tax-deductible. The capital cost of BOT project is evaluated by the Weighted Average Cost of Capital (WACC) method. As seen in Figure 1, there exists a causal relationship among royalty, government investment, private sector investment, and government finance recovery ratio in cash flow for BOT project. The government finance recovery ratio was defined as (Kang et al., 2004, 2007)

$$\Pi_{g,Q}(k) = \frac{1}{C_g} [r_g + g_u(k) \times f_{g,Q}] \quad (1)$$

Where  $r_g = \sum_{t=0}^N \frac{B_t + D_t}{(1+i)^t}$ ;  $f_{g,Q} = \sum_{t=h}^N \frac{(1+\phi)^{t-h} Q_t}{(1+i)^t}$ , which is a discount factor of the operational output-based royalty

model for the project;  $P_C = \frac{C_p}{C} = \frac{C_p}{C_g + C_p}$ ;  $P_C$  stands for the rate of concessionaire's investment cost;  $C$  is the

sum of present value of construction cost which is discounted to the first year of the construction period;  $C_g$  is the sum of present value of construction cost financed by government investment, and the cost is discounted to the first year of the construction period;  $C_p$  is the sum of present value of construction cost financed by private investment, and the cost is discounted to the first year of the construction period; and  $i$  is the interest rate of government bonds.  $g_u(k)$  represents  $g$  value which regards the proportion of the operational output of BOT project during the operating period at the  $k$  negotiation of the government; that is,  $g_u(k)$  is a decision variable of the upper level programming problem at the  $k$  negotiation. Equation (1) represents the government finance recovery ratio  $\Pi_{g,Q}(k)$  at the  $k^{th}$  negotiation. There exists a positive relationship between  $\Pi_{g,Q}(k)$  and  $(r_g + g_u(k) \times f_{g,Q})$ . That is, the more the royalty, tax, and land-use rent for the host utilities is, the higher the  $\Pi_{g,Q}(k)$  is. Thus,  $\Pi_{g,Q}(k)$  goes up when variables of  $r_g$ ,  $g_u(k)$ , and  $f_{g,Q}$  increase. Conversely,  $\Pi_{g,Q}(k)$  decreases as  $P_C$  increases or variables of  $r_g$ ,  $g_u(k)$ , and  $f_{g,Q}$  decrease. Furthermore, let  $\Pi_{p,Q}(k)$  be the profit index of the concessionaire:  $\Pi_{p,Q}(k) = \frac{N_I - g_\ell(k) \times f_{p,Q}}{C_p}$ . Where  $N_I = \sum_{t=n+1}^N \frac{R_t - C_t - B_t - D_t}{(1+d)^t}$ ,  $N_I$  is the total revenue of the BOT

project, which includes operation revenue and non-operation revenue;  $g_\ell(k)$  represents  $g$  value which regards the proportion of the operational output of BOT project during the operating period the at the  $k$  negotiation of the private sectors;  $g_\ell(k)$  is also a decision variable of the lower level programming problem at the  $k$  negotiation. Additionally,  $f_{p,Q} = \sum_{t=h}^N \frac{(1+\phi)^{t-h} Q_t}{(1+d)^t}$ ,  $d$  is the risk-adjusted discount ratio after tax of the concessionaire

and let  $d > i$ ; it can be estimated by the WACC with corporate tax as  $d = d_B \times (1 - T_c) \times \left( \frac{B}{S+B} \right) + d_S \times \left( \frac{S}{S+B} \right)$ . Where

$d_B$  is the cost of long-term debt of the BOT project for the private firm;  $d_S$  is the cost of equity of the BOT project for the private firm;  $B$  is the market value of the debt of the BOT project for the private firm;  $T_c$  is the marginal tax ratio of the BOT project; and  $S$  is the market value of the equity of the BOT project for the private firm. The  $\Pi_{g,Q}(k)$  is net operation income minus royalty at the  $k^{th}$  negotiation, and the denominator of  $\Pi_{g,Q}(k)$  is the investment cost of the concessionaire for a project during the construct period.  $\Pi_{g,Q}(k)$  stands for the profitability of private sector at the  $k^{th}$  negotiation. It indicates that the concessionaire pursues its maximum financial profit at the  $k^{th}$  negotiation if the private sector is a rational decision-maker.

Following Equation (1), the government finance recovery ratios for the operational revenue-based model and the lump-sum royalty model can be defined as Equations (3):

$$\Pi_{g,R}(k) = \frac{1}{C_g} [r_g + \theta_u(k) \times f_{g,R}] \text{ and } \Pi_{g,F}(k) = \frac{1}{C_g} [r_g + F_u(k) \times f_{g,F}] \quad (3)$$

Equations (3) represents the  $\Pi_{g,R}(k)$  and  $\Pi_{g,F}(k)$  at the  $k^{th}$  negotiation. Thus, both of  $\Pi_{g,R}(\cdot)$  and  $\Pi_{g,F}(\cdot)$  are functions of  $k$ . Eq. (1) implies that the more royalty, tax, and land-use rent the host utilities acquire, the higher the government finance recovery ratio is. In addition, we defined the profit index of the concessionaire for the operational revenue-based royalty model and the lump-sum royalty model:

$$\Pi_{p,R}(k) = \frac{N_I - \theta_\ell(k) \times f_{p,R}}{C_p} \text{ and } \Pi_{p,F}(k) = \frac{N_I - F_\ell(k) \times f_{p,F}}{C_p} \quad (4)$$

Where  $f_{p,R} = \sum_{t=h}^N \frac{(1+\alpha)^{t-h} R_t}{(1+d)^t}$  and  $f_{p,F} = \sum_{t=h}^N \frac{(1+\beta)^{t-h}}{(1+d)^t}$  are the discount factor of the operational revenue-based

royalty model and lump-sum royalty models, respectively. Both of  $\theta_\ell$  and  $F_\ell$  are function of  $k$ . According to Wen and Hsu (1991), the BLP is a stackelberg game associated with leader and follower conception. This model can illustrate a sequential decision for two players who pursue their own maximized aims which subject to another decision-making strategy. The host utility can be regarded as the higher-level problem of BLP because the royalty was first announced by the government in the BOT tender document. Then, the private sector will negotiate with the government about the royalty. Hence, the private sector can be regarded as the lower-level problem of the BLP. The higher-level problem and the lower-level problem were formulated as

Model I: The operational output-based royalty model

[Higher-level problem]:  $\text{Max}_{\{g_u(k)\}} \Pi_{g,Q}(k) = \frac{1}{C_g} [r_g + g_u(k) \times f_{g,Q}]$

$$s.t. \ g_u(k) \times f_{g,Q} + C \times \Pi_{G0} \times P_C \geq C \times \Pi_{G0} - r_g; \ g_u(k) \leq (N_I - P_C \times C) / f_{p,Q}; \ g_u(k) \geq V_\ell(k); \ g_u(k) \leq W_u(k) \quad (5)$$

[Lower-level problem]:  $\text{Max}_{\{g_\ell(k)\}} \Pi_{p,Q}(k) = \frac{N_I - g_\ell(k) \times f_{p,Q}}{C_p}$

$$s.t. \ g_\ell(k) \times f_{p,Q} + C \times \Pi_{G0} \times P_C \geq C \times \Pi_{G0} - r_g; \ g_\ell(k) \leq (N_I - P_C \times C) / f_{p,Q}; \ g_\ell(k) \geq V_\ell(k); \ g_\ell(k) \leq W_u(k) \quad (6)$$

Where  $V_\ell(k)$  is the lower bound value of feasible solution at the  $k^{th}$  negotiation for the lower-level problem;  $W_u(k)$  is the upper bound value of feasible solution at the  $k^{th}$  negotiation for the higher-level problem;  $g_\ell(k)$  and  $g_u(k)$  are decision variables of the BLP problem. Both definitions of  $g_\ell(k)$  and  $g_u(k)$  are defined as those of Eqs. (5) and (6). The objective function of the higher-level problem illustrates that the host utility maximizes his financial recovery rate for joining a BOT project. It means that the more royalty the government collects, the higher the  $\Pi_{g,Q}(k)$  index is. Constraints of the higher-level problem shows that the host utility should collect the above minimum royalty level from the concessionaire to meet the minimum financial recovery rate  $\Pi_{G0}$ . Moreover, let  $\Pi_{G0}$  be a constant value.  $g_u(k) \geq V_\ell(k)$  and  $g_u(k) \leq W_u(k)$  are the upper and lower bounded solutions for the higher-level problem, respectively. The objective function of the lower-level problem illustrates that the private sector hopes to reduce the royalty, and to maximize its profit in each negotiation. Constraints in the lower-level problem meanings that are the same as those of constraints; and  $g_\ell(k) \geq V_\ell(k)$  and  $g_\ell(k) \leq W_u(k)$  are the upper and lower bounded solutions for the lower-level problem, respectively. Following the concept of BLP of the model I, we formulate the BLP problems for model II and model III, respectively. And the BLP problem for the model II was formulated as

Model II: The operational revenue-based model

[Higher-level problem]:  $\text{Max}_{\{\theta_u(k)\}} \Pi_{g,R}(k) = \frac{1}{C_g} [r_g + \theta_u(k) \times f_{g,R}]$

$$s.t. \ \theta_u(k) \times f_{g,R} + C \times \Pi_{G0} \times P_C \geq C \times \Pi_{G0} - r_g; \ \theta_u(k) \leq (N_I - P_C \times C) / f_{p,R}; \ \theta_u(k) \geq V_\ell(k); \ \theta_u(k) \leq W_u(k) \quad (7)$$

[Lower-level problem]:  $\text{Max}_{\{\theta_\ell(k)\}} \Pi_{p,R}(k) = \frac{N_I - \theta_\ell(k) \times f_{p,R}}{C_p}$

$$s.t. \ \theta_\ell(k) \times f_{p,R} + C \times \Pi_{G0} \times P_C \geq C \times \Pi_{G0} - r_g; \ \theta_\ell(k) \leq (N_I - P_C \times C) / f_{p,R}; \ \theta_\ell(k) \geq V_\ell(k); \ \theta_\ell(k) \leq W_u(k) \quad (8)$$

Model III: the lump-sum royalty model

The BLP problem for the lump-sum royalty model was formulated as:

[Higher-level problem]: 
$$\begin{aligned} \max_{\{F_u(k)\}} \Pi_{g,F}(k) &= \frac{1}{C_g} [r_g + F_u(k) \times f_{g,F}] \\ \text{s.t. } F_u(k) \times f_{g,F} + C \times \Pi_{G0} \times P_C &\geq C \times \Pi_{G0} - r_g; F_u(k) \leq (N_I - P_C \times C) / f_{p,F}; F_u(k) \geq V_\ell(k); F_u(k) \leq W_u(k) \end{aligned} \quad (9)$$

[Lower-level problem]: 
$$\begin{aligned} \max_{\{F_\ell(k)\}} \Pi_{p,F}(k) &= \frac{N_I - F_\ell(k) \times f_{p,F}}{C_p} \\ \text{s.t. } F_\ell(k) \times f_{g,F} + C \times \Pi_{G0} \times P_C &\geq C \times \Pi_{G0} - r_g; F_\ell(k) \leq (N_I - P_C \times C) / f_{p,F}; F_\ell(k) \geq V_\ell(k); F_\ell(k) \leq W_u(k) \end{aligned} \quad (10)$$

The decision variables of the model II are  $\theta_\ell(k)$  and  $\theta_u(k)$ ; while both of  $F_\ell(k)$  and  $F_u(k)$  are decision variables for the model III.

## Algorithm for BLP

Many algorithms for the BLP problem including the vertex enumeration or the Kuhn-Tucker transformation approach have been proposed for finding the optimal solution (Wen and Hsu, 1991). The vertex enumeration approach involves the simplex algorithm for finding the feasible solution for the higher-level problem of the BLP problem, while the Kuhn-Tucker transformation approach converts the objective function of the lower-level problem into constraints of the higher-level problem. However, to find the comprisal solution for operational output-based royalty model, we develop the heuristic algorithm for the BLP problem. The steps of the heuristic algorithm are shown below:

Step 0: Let  $k = 0$  and  $k = k + 1$ ; Step 1: Find the feasible solution for the higher-level problem; Step 2: Find the feasible solution for the lower-level problem; Step 3: Converge the test for these feasible solutions for the BLP problem; If all of solutions converge, then it is the comprisal solution; otherwise, go to Step 4. In this Step, we set the convergence test with which the differences in royalty expected by the government and that the private sector is willing to pay is smaller than a tolerance of error tolerated. The condition is defined as:

$$\left| \frac{\theta_u(k) - \theta_\ell(k)}{\theta_\ell(k)} \right| \leq \delta \quad \text{and} \quad \left| \frac{\theta_u(k) - \theta_\ell(k)}{\theta_u(k)} \right| \leq \delta \quad (11)$$

where  $\delta$  is the tolerated error; and we assumed  $\delta = 0.01$ . If the solutions of BLP satisfy the convergence test condition, then the royalty negotiation is ceased. In addition, Eq. (11) was replaced by (12) and (13) for the operational output-based royalty and the lump-sum royalty model, respectively.

$$\left| \frac{g_u(k) * f_g - g_\ell(k) * f_p}{g_\ell(k) * f_p} \right| \leq \delta \quad \text{and} \quad \left| \frac{g_u(k) * f_g - g_\ell(k) * f_p}{g_u(k) * f_g} \right| \leq \delta \quad (12)$$

$$\left| \frac{F_u(k) - F_\ell(k)}{F_\ell(k)} \right| \leq \delta \quad \text{and} \quad \left| \frac{F_u(k) - F_\ell(k)}{F_u(k)} \right| \leq \delta \quad (13)$$

Step 4: Set initial concession rates for two parties, and let  $k \neq 0$ . Substitute concession rates into Eq(40), (41) and (42), and find  $V_\ell(k+1)$  and  $W_u(k+1)$ . Step 5: Find the concession rates at the next negotiation,  $r_u(k+1)$ ,  $r_\ell(k+1)$  and find  $g_\ell(k+1)$  and  $g_u(k+1)$ . Step 6: Repeat Step 0 to Step 5. The solution of the BLP problem will be obtained if convergence test of solution holds, if not, there is no solution, and stop the algorithm.

Although Chen and Chang (2000), Xing and Wu (2001), Yang and Meng (2000) utilized the bi-level programming model for determining the price (or toll) and the capacity using different algorithms under the BOT scheme, they do not explore the effect of learning effect, concession rate and time value discount of player changes. Nevertheless, these factors which are regarded as factors of bargaining cost, addressed by Cross (1965), are very important impact factors for the bargaining process. Thus, these factors of a bargaining cost have incorporated into the BOT bargaining model studies (Shen, et al., 2007; Lin and Chaing, 2005). Following the concept of Cross (1965), we defined the concession rate of the government and the private firm, respectively. The concession rate for both parties were shown in Eqs. (14).

$$r_u(k) = \frac{(buvr_\ell(k-1) + (ab(1 - \frac{v}{2})(1 + \frac{u}{2}) - uv)r_u(k-1))}{(ab(1 + \frac{u}{2})(1 + \frac{v}{2}) - uv)}; \quad r_\ell(k) = \frac{(auvr_u(k-1) + (ab(1 - \frac{u}{2})(1 + \frac{v}{2}) - uv)r_\ell(k-1))}{(ab(1 + \frac{u}{2})(1 + \frac{v}{2}) - uv)} \quad (14)$$

Where  $r_u(k)$  and  $r_\ell(k)$  are concession rates at the  $k^{\text{th}}$  negotiation for higher-level and lower-level programming problems, respectively; similarly,  $r_u(k-1)$  and  $r_\ell(k-1)$  are the concession rates at the  $(k-1)^{\text{th}}$  negotiation. Variables of  $a$  and  $b$  are the time value discounts of the higher-level and lower-level programming problems,

respectively. Let  $a$  and  $b$  be constant values. Let  $\mu$  and  $\nu$  be the learning rates for higher-level and lower-level programming problems, respectively. And we also assume that  $\mu$  and  $\nu$  are constant. Equation (39) describes that the concession rate at the  $k^{\text{th}}$  negotiation for the higher-level programming problems was affected by  $r_\ell(k-1)$ ,  $r_u(k-1)$ ,  $u$ ,  $\nu$ ,  $a$ , and  $b$ . Similarly,  $r_\ell(k)$  in Eq. (40) was affected by  $r_\ell(k-1)$ ,  $r_u(k-1)$ ,  $u$ ,  $\nu$ ,  $a$ , and  $b$ . Obviously, it implies that royalty negotiation of the host utility or concessionaire was reflected by the concession rate of two parties. Then, we substituted Eqs.(15) and (16) and modified  $W_u(k+1)$  and  $V_\ell(k+1)$  of higher-level and the lower-level programming, respectively.

$$W_u(k+1) = W_u(k) - W_u(k) \times r_u(k); V_\ell(k+1) = V_\ell(k) + V_\ell(k) \times r_u(k) \quad (15)$$

$$W_u(k+1) = W_u(k) - W_u(k) \times r_\ell(k); V_\ell(k+1) = V_\ell(k) + V_\ell(k) \times r_\ell(k) \quad (16)$$

Where  $W_u(k)$  and  $V_\ell(k)$  are the upper and lower bounded value at the  $k^{\text{th}}$  negotiation for higher-level and the lower-level programming, respectively. And  $W_u(k+1)$  and  $V_\ell(k+1)$  are the upper and lower bounded value at the  $(k+1)^{\text{th}}$  negotiation, respectively.

## CONCLUSION AND SUGGESTIONS

Chiou and Lan (2006) did not explore royalty determination from a negotiation perspective, even though they analyzed many royalty computation methods via mathematical programming. Additionally, they did not identify which royalty models are preferable for governments and private sector firms. The contributions of this study differ from those of Chiou and Lan (2006). This work constructs three novel royalty negotiation models—the lump-sum royalty, operating revenue-based royalty, and operational output-based royalty—using the BLP approach from a negotiation perspective, and develops a novel heuristic algorithm to solve the BLP problem for governments and the private sector. Concession rate, learning rate, and the time value discount rate for both parties are incorporated into this heuristic algorithm. These negotiation factors are very important variables, as demonstrated by the case study. These factors were not considered by Chiou and Lan (2006). The proposed royalty negotiation models can be utilized to explain negotiation behavior. Concession rate, learning rate, and the time value discount rate of two parties impact the heuristic algorithm for solving the BLP problem. However, studies must survey data for the time value discount, concession rate, and learning rate of two parties in each negotiation when royalty negotiation models are utilized to investigate royalty determination in real BOT projects.

The following issues can be explored in future studies. (1) Some assumptions of the operational output-based royalty model this model can be released. Although concession rate, learning rate, and the time value discount rate of two parties for solving the BLP problem are given to simplify analysis, these factors can be reexamined in future studies. Researchers can survey data for these factors via a questionnaire. (2) Other studies can utilize this analytical framework to investigate other royalty strategies, such as a mixed royalty method combining two or more royalty strategies. Additionally, multiple issues in the bargaining model and multi-level programming problem can be addressed in future research to explore multi-party negotiation issues for BOT projects. (3) The Rubinstein bargaining model can be used to analyze different royalty strategies for two parties because the BLP problem.

# AN INVARIANCE ANALYSIS OF THE UTAUT MODEL

**Myung Soo Kang, Hansung University, Republic of Korea**

**Il Im, Yonsei University, Republic of Korea**

**Seongtae Hong, Sangmyung University, Republic of Korea**

## ABSTRACT

*A recently proposed model in the area of technology adoption, “Unified Theory on Acceptance and Use of Technology (UTAUT)” integrates eight theories on technology adoption and provides a comprehensive view of the factors related to users' adoption behavior. In this study, invariance of the measures of the UTAUT model is tested in three different dimensions – countries, technologies, and gender. The data were collected from two countries (Korea and the U.S.) for two technologies (Internet banking and MP3 players). The results show that the UTAUT model is robust across different conditions overall. However, the results show that in order to apply the UTAUT model to different conditions and groups, especially when cross-country or cross-technology comparisons are conducted, the possible differences due to measurement non-invariance should be taken into account.*

## INTRODUCTION

Adoption of technology has been one of the most important topics in the Information Systems field. The technology acceptance model (TAM), theory of reasoned action (TRA), theory of planned behavior (TPB), and other theories have been used to explain users' behavior with regard to technology adoption. Recently, a unified model of technology adoption was proposed by Venkatesh et al. (Venkatesh et al. 2003). The model, “Unified Theory on Acceptance and Use of Technology (UTAUT),” integrates eight theories on technology adoption and provides a comprehensive view of the factors related to users' adoption behavior. The original UTAUT model consists of four main constructs – performance expectancy, effort expectancy, social influence, and facilitating conditions – and four moderating variables – gender, age, experience, and voluntariness of use.

One main reason for studying technology acceptance is to compare behaviors across various conditions – technologies, user groups, and occasions. In order to be able to compare technology acceptance precisely across different conditions, the measures of the model must be invariant across those conditions (Deng et al. 2008; Steinmetz et al. 2009). Otherwise, it is difficult to determine whether the differences, if there are any, exist because of the conditions being compared or because of differences in the measurements (Lai et al. 2005). Invariance analysis is a statistical method to test reliability and validity of measurement instruments across individuals, groups, and contexts using multi-group confirmatory factor analysis (Billiet 2002; Doll et al. 1998; Jöreskog et al. 1993; Klenke 1992).

Invariance of TAM measurements has been tested in past studies (Lai et al. 2005), while invariance of the UTAUT model, to the best of our knowledge, has not been rigorously tested yet. Only a few studies have tested the validity of the measurement instruments of the UTAUT across countries (Oshlyansky et al. 2007), but a full-range invariance analysis has still not been performed. In this study, invariance of the measures of the UTAUT model is tested in three different dimensions – countries, technologies, and gender.

# THE UTAUT MODEL

The main constructs of the UTAUT model are performance expectancy (PE), effort expectancy (EE), social influence (SI), facilitating conditions (FC), behavioral intention (BI), and use behavior (UB). The relationships of these constructs and their measurement instruments are shown in Figure 1.

Although invariance analysis can be conducted on any constructs of the UTAUT model, the main focus of this study lies on the four independent constructs – PE, EE, SI, and FC, because the two dependent constructs, BI and UB, have been repeatedly tested in previous TAM studies and the moderating variables are not of main interest in most studies on technology adoption.

**Figure 1. The UTAUT Model**

## HYPOTHESIS DEVELOPMENT

There can be various conditions under which the UTAUT model is tested. In this study, three conditions that are thought to be compared frequently are considered – culture (country), technology, and gender. Data from two countries (the U.S. and Korea) on two different technologies (MP3 players and Internet banking) were collected and invariance analyses on the three dimensions were conducted. The hypotheses for the invariance test were developed as follows:

### H1 – Invariance across countries

- H1-1: The Performance Expectancy instrument is invariant across U.S. and Korean samples
- H1-2: The Effort Expectancy instrument is invariant across U.S. and Korean samples
- H1-3: The Social Influence instrument is invariant across U.S. and Korean samples
- H1-4: The Facilitating Conditions instrument is invariant across U.S. and Korean samples

### H2 – Invariance across technologies (Internet banking and MP3 players)

- H2-1: The Performance Expectancy instrument is invariant across both technologies
- H2-2: The Effort Expectancy instrument is invariant across both technologies
- H2-3: The Social Influence instrument is invariant across both technologies
- H2-4: The Facilitating Conditions instrument is invariant across both technologies

### H3 – Invariance across gender

- H3-1: The Performance Expectancy instrument is invariant across genders.
- H3-2: The Effort Expectancy instrument is invariant across genders.
- H3-3: The Social Influence instrument is invariant across genders.
- H3-4: The Facilitating Conditions instrument is invariant across genders.

## INVARIANCE ANALYSIS

There are several conceptual definitions of and methods for invariance analysis. In many studies invariance analysis is also referred to as measurement invariance analysis (Deng et al. 2008; Lai et al. 2005; Steinmetz et al. 2009). Measurement invariance analysis refers to testing if the same measurement can be used across different groups, which includes invariance of measurement parameters such as factor loadings and

measurement errors, response biases, and the relationship between observed mean and latent mean (Deng et al. 2008; Lai et al. 2005; Steinmetz et al. 2009).

**Figure 2. Types of Invariance Test**

Among the studies about invariance analysis, those that test six or seven possible sources of invariance (Steinmetz et al. 2009) are most comprehensive. Other studies employ simpler approaches that test only a few sources depending on their main focus. The most comprehensive seven-step approach covers the seven dimensions of invariance:

1. Invariance of configural loadings (configural invariance)
2. Invariance of factorial loadings (metric invariance)
3. Invariance of variance of latent variables
4. Invariance of covariance of latent variables
5. Invariance of item intercepts (scalar invariance)
6. Invariance of latent mean of latent variables
7. Invariance of random measurement errors

Configural invariance analysis assesses whether same pattern of factor loadings exists across different groups (Murray et al. 2007). It implies the equal number of factors in each group and the equal pattern of fixed and free parameters (Steinmetz et al. 2009). Metric invariance analysis assesses whether the factor loadings are identical for each scale item across groups. It implies equal factor loadings across groups (Murray et al. 2007). Factor variance invariance and error variance invariance analysis examine whether the factor loadings and error variances are identical for each scale item across groups (Murray et al. 2007). Invariance of factor variance is assumed when groups have the same variances in their respective latent variables (Steinmetz et al. 2009). Factor covariance invariance analysis assesses whether the correlations among factors are equal (Murray et al. 2007). Invariance of factor covariance implies equality of the associations among the latent variables (Steinmetz et al. 2009). Scalar invariance (item intercept invariance) analysis examines whether there is consistency between

cross-group differences in latent versus observed means by imposing equal intercept constraints (Murray et al. 2007). Scalar invariance addresses the question whether there is consistency between cross-group differences in latent means and cross-group differences in observed means (Steenkamp et al. 1998). Different types of invariance tests are summarized in Figure 2. Among these, the most basic and common things tested in the majority of invariance analysis studies are configural invariance and metric invariance.

## Data

The data were collected from two countries (Korea and the U.S.) for two technologies (Internet banking and MP3 players). The two technologies were chosen because they represent different types of technologies – an online service and a physical good. The initial questionnaire was developed based on the original UTAUT model (Venkatesh et al. 2003). The questionnaire was refined through two rounds of pilots. The first pilot was to validate the questionnaire items. The questionnaire was reviewed by two experts to check the content validity. In the second round, the questionnaire was administered to participants in order to analyze the statistical reliability and validity.

The respondents to the main survey were undergraduate students and part-time MBA students in a university on the East coast in the U.S. and undergraduate students and office workers in Korea. Since most part-time MBA students are working full-time, the two samples from the U.S. and Korea are compatible in terms of background and job experience. Among the 660 distributed questionnaires, a total of 550 responses were collected. A total of 501 responses were used for the final analysis after invalid responses were removed. Among the 501 respondents, 363 were from Korea and 138 were from the U.S., and 250 were on Internet banking, while 251 were on MP3 players. Female (253) and male (248) respondents were almost the same in number.

## Analysis

For the invariance analysis in this study, the method commonly used in previous studies (Lai et al. 2005) is employed. Before the main analysis, the validity and reliability of the dataset were tested. A confirmatory factor analysis (CFA) was conducted and all constructs have Cronbach's alpha greater than 0.7 except for FC. In the main invariance analysis, thus, an item from FC (fc3) was deleted according to this reliability test result.

## Invariance of Configural Loadings

The first step of invariance analysis is running the model to sub-groups and check configural loadings invariance. The analysis results are summarized in Table 1. The statistics for the entire sample were acceptable ( $\chi^2 = 505.150$ , GFI = 0.876, RMR = 0.085, CFI = 0.919, RMSEA = 0.100).

Table 1 also shows that the indices of model fit across groups (country, technology, and gender) are similar. This implies that the configurations of the model (number of factors and their structures) across groups are compatible, which indicates that configural invariance exists. Configural invariance is the basis of other types of invariance.

**Table 1. Invariance of Configural Loadings**

Dimensions	Subgroups	$\chi^2$	df	P	RMR	TLI	CFI	RMSEA
	Entire Sample	505.15	84	0.000	0.08	0.90	0.92	0.10
Nationality	Korea (n=363)	431.33	84	0.000	0.08	0.88	0.91	0.11
	U.S. (n=138)	158.56	84	0.000	0.08	0.92	0.93	0.08
	Stacked Model	589.88	168	0.000	0.08	0.89	0.91	0.07
Type of Technology	Internet Banking (n=250)	304.01	84	0.000	0.08	0.89	0.91	0.10
	MP3 Players (n=251)	310.01	84	0.000	0.09	0.89	0.92	0.10
	Stacked Model	614.02	168	0.000	0.08	0.89	0.91	0.07
Gender	Female (n=253)	323.13	84	0.000	0.09	0.88	0.90	0.11
	Male (n=248)	297.08	84	0.000	0.09	0.90	0.92	0.10
	Stacked Model	620.21	168	0.000	0.09	0.89	0.91	0.07

## Invariance of Factorial Loadings

The next step is to test invariance of factorial loadings. As Table 2 shows, the factor loadings across nationality and gender are invariant, while those for technology type are not ( $p = 0.000$ ). In the table, the rows labeled as “2” show the results of the invariance analysis on entire constructs, and the rows labeled as “2.1”, “2.2” and so on show the results of invariance analysis on individual constructs. From the table, we can see that the sources of difference were PE ( $p = 0.001$ ) and SI ( $p = 0.001$ ).

**Table 2. Invariance of Factorial Loadings**

Group	Model	$\chi^2$	df	$\Delta\chi^2$	$\Delta df$	P	RMR	TLI	CFI	RMSEA
Nationality	Default Model	589.88	168				0.08	0.89	0.91	0.07
	2 (all factor loadings constrained)	599.59	179	9.71	11	0.556	0.08	0.90	0.91	0.07
	2.1 (only PE is constrained)	593.42	171	3.54	3	0.316	0.08	0.89	0.91	0.07
	2.2 (only EE is constrained)	590.17	171	0.29	3	0.962	0.08	0.89	0.91	0.07
	2.3 (only SI is constrained)	593.85	171	3.97	3	0.265	0.08	0.89	0.91	0.07
	2.4 (only FC is constrained)	591.80	170	1.93	2	0.382	0.08	0.89	0.91	0.07
Type of Technology	Default Model	614.02	168				0.08	0.89	0.91	0.07
	2 (all factor loadings constrained)	655.72	179	41.69	11	0.000	0.10	0.89	0.91	0.07
	2.1 (only PE is constrained)	629.74	171	15.72	3	0.001	0.09	0.89	0.91	0.07
	2.2 (only EE is constrained)	617.86	171	3.84	3	0.279	0.09	0.89	0.91	0.07
	2.3 (only SI is constrained)	630.84	171	16.81	3	0.001	0.09	0.89	0.91	0.07
	2.4 (only FC is constrained)	619.14	170	5.11	2	0.077	0.09	0.89	0.91	0.07
Gender	Default Model	620.21	168				0.09	0.89	0.91	0.07
	2 (all factor loadings constrained)	628.76	179	8.55	11	0.865	0.09	0.90	0.91	0.07
	2.1 (only PE is constrained)	623.52	171	3.31	3	0.769	0.09	0.89	0.91	0.07
	2.2 (only EE is constrained)	621.38	171	1.18	3	0.416	0.09	0.89	0.91	0.07
	2.3 (only SI is constrained)	623.70	171	3.49	3	0.743	0.09	0.89	0.91	0.07
	2.4 (only FC is constrained)	620.75	170	0.54	2	0.973	0.09	0.89	0.91	0.07

## Invariance of Variance-Covariance of Latent Variables

The invariance of variance-covariance of latent variables was tested as summarized in Table 3. The results show that there is invariance of the variance and covariance of latent variables across technology type and gender. However, there are differences across countries. Covariances among constructs are related to the constructs’ meaning or validity. Therefore, unequal covariances imply inequality of construct meanings (Steinmetz et al. 2009). The analysis of individual constructs shows that the sources of difference across countries were EE and FC.

## Invariance of Item Intercepts and Mean of Latent Variables

In the invariance tests discussed above, model 2 (factor loadings constrained) was used as a reference model. Model 2, however, cannot be compared with model 6 in Table 4 because they are not nested models. Therefore, AIC is tested instead of RMSEA. Most applications of structural equation modeling focus on the covariance part of the model. In such cases, the model assumes zero indicator intercepts and zero latent means. Therefore, scalar invariance and invariance of latent means are tested only when the researcher is interested in comparing means and intercepts across groups (Steinmetz et al. 2009). That is why invariance of intercepts and mean of latent variables is thought to be relatively less important than other types of invariance.

**Table 3. Invariance of Variance-Covariance of Latent Variables**

## Invariance of Random Measurement Errors

If the factor loadings and variances of the latent variables have been shown to be equal, then the error variances are equivalent to the reliability of the indicators (Steinmetz et al. 2009). In order to test invariance of random measurement errors, model 2 (factor loadings constrained) and model 3 (model 2 + error variances constrained) were compared. The test results in Table 5 show that there is non-invariance (difference) across all sub-groups. Examination of individual constructs shows that the sources of difference were EE and FC for nationality, PE and FC for technology type, and EE, SI, and FC for gender.

**Table 5. Invariance of Random Measurement Errors**

Group	Model	$\chi^2$	df	$\Delta\chi^2$	$\Delta df$	P	RMR	TLI	CFI	RMSEA

## Summary and Discussion

Overall, the UTAUT model is invariant across countries, technologies, and gender in most dimensions of invariance. The most important ones, configural loadings invariance and factorial loadings invariance, were proved to exist except for technology type in the category of factorial invariance. However, some differences exist in other dimensions of invariance. Most notable is the non-invariance across countries, probably because cultural differences have profound impacts on the responses. The difference probably comes from various sources such as psychometrical disagreement and wording. The sources of non-invariance need to be investigated further.

## CONCLUSIONS

This paper tests invariance of the UTAUT model across two countries, two technologies, and gender. Invariance of a model is critical when the model is to be applied to different conditions and groups. This study showed that the UTAUT model is robust across different conditions overall. However, some dimensions of the model differ across sub-groups. In order to apply the UTAUT model to different conditions and groups, especially when cross-country or cross-technology comparisons are conducted, the possible differences due to measurement non-invariance should be taken into account. This study has limitations due to the nature of the data and research methods, and future extensions are recommended. First, although the data sample is fairly large, further study is desirable with a larger dataset. Second, this study only tested the existence of invariance and did not investigate the causes of differences. Further study on the causes of the differences would provide valuable information about applying the UTAUT model.

# LEADING MULTICULTURAL WORK GROUPS FOLLOWERS' ATTRIBUTIONS AND PERCEPTIONS IN AN INTERCULTURAL SETTING

**Helmut Kasper, Jürgen Mühlbacher, Georg Kodydek and Stefan Schilcher  
Wu, Vienna University of Economics and Business, Austria**

## ABSTRACT

*This paper contributes to implicit leadership theories in intercultural settings. We investigate general assumptions of cultural differences within leadership perceptions and followers' attributions of multinational work groups. We intent to understand challenges in an intercultural, task-related setting with students from different countries. Moreover, this study was conducted in an experimental class setting at WU (Vienna University of Economics and Business) in which international students work together over the course of a semester in a senior-level management class. Participants were 26 business students with different national and cultural backgrounds and a fairly even gender split.*

*Participants' attributions, perceptions personality dimensions were assessed following a 10-item short version of the Big Five Inventory (Rammstedt & John, 2007) and a modified version of the Performance-Maintenance (PM) theory (Chong & Thomas, 1997). Results are discussed with relation to leadership and team effectiveness, and cross-cultural differences. The paper also highlights implications of these findings for future research, teaching and development in the field.*

## INTRODUCTION

Many companies operate internationally and hire people from different countries to benefit from diverse backgrounds, different views and positions (House, Hanges, Javidan, Dorfman & Gupta, 2004). Diverse work groups and teams are becoming widespread and the challenge is to successfully lead diversity. For this reason, recruiters want the best talented graduates and professionals for their companies. The global business environment demands high professional young leaders who can lead multinational work groups and teams in multicultural organizations. So, the dealing with diversity, especially a diverse workforce, has played a prominent role in recent years (Pless & Maak, 2004). Potential applicants need to have several competences and have to be internationally oriented (Breaugh & Starke, 2000). Research considers intercultural competence as an important condition for the success of internationally operating companies. In any case, it can be identified as a strategic organizational competence for organizations (Bartel-Radic, 2006). So, finding an internationally oriented and multicultural educated staff is a major challenge for globally operating firms. "Given the fact that diversity is essentially about cultural norms and values, appropriate reflection work becomes a fundamental task to create a truly inclusive work environment where people from diverse backgrounds feel respected and recognized." (Pless & Maak, 2004: 129)

At the same time is argued that working in a multicultural team is a mandatory demand and even an indispensable competence for young professionals (Mühlbacher, 2007). Thereby, young people face two major challenges. Firstly, they need to persist in multicultural environments and be able to perform at the highest stage. Thus, graduates have to speak several languages and need to be able to adapt to fundamental intercultural differences quickly (Welch, Welch & Piekkari, 2005). Secondly and even more challenging than working in a multicultural team is the leadership of a diverse team. Students and young professionals need to inherit

leadership responsibility and develop cultural sensitivity for international settings to effectively perform global leadership tasks and activities. Young leaders need to focus on the implications of cultural differences for a variety of issues (Javidan, Dorfman, Howell & Hanges, 2010). “Identifying the characteristics within people’s leadership schemas is thought to be important because the content of leadership schemas dictates who is perceived as a leader and who is not.” (Javidan, Dorfman, Howell & Hanges, 2010: 340)

Although some negative aspects of culturally diverse teams are discussed occasionally (Stevens, Plaut & Sanchez-Burks, 2008) the positive potential of multicultural teams with their positive dynamics and outcomes are an important factor of a company (Stahl, Mäkelä, Zander, & Maznevski, 2010). The advantages of diversity-based work groups with people from different nations and culturally imprinted differing perspectives, interpretations and approaches are the different approaches and views that are developed and often integrated in the organizational culture after a certain time (Bachmann, 2006). The challenge of cultural differences could lead to unique and potentially valuable capabilities, foster learning and innovation. Cultural diversity contributes significantly to organizational outcomes – especially within globally operating firms (Stahl, Mäkelä, Zander & Maznevski, 2010).

Multicultural work groups and teams vary in terms of diversity along a range of dimensions such as nationality, ethnicity, or religion (Zander & Butler, 2010). In order to lead multicultural teams effectively, leaders need to know the cultures with which they interact and also appreciate their group and teams members’ personalities, conflict behavior, and life experiences. An understanding of communication processes that are necessary to develop high-performance work groups and teams is an important factor and needs to be developed in an organizational context (Matveev & Nelson, 2004). Reaching a high level of team effectiveness and team performance is an important objective of every leader. Hence, a successful and strong leader who can lead a multicultural team has to have the appropriate skills and competences which need to be developed at an early stage (Mühlbacher, 2007). “Cultural groups may vary in their conceptions of the most important characteristics of effective leadership.” (Den Hartog, House, Hanges & Ruiz-Quintanilla, 1999: 225) Hence, the performance of a leader in some cultures will vary accordingly. Some strong decisive actions will be regarded as a successful leadership, whereas a democratic approach will be preferred in other cultures. Moreover, the leader behaviors and characteristics will be perceived unequally in different cultures (Den Hartog, House, Hanges & Ruiz-Quintanilla, 1999).

## **IMPLICIT LEADERSHIP THEORIES**

Leadership is one of the most discussed research topics in social sciences (DeRue, Nahrgang, Wellman, & Humphrey, 2011). Many researchers have noted that there is no consistently agreed-upon definition of “leadership”, and no clear understanding of the boundaries of this important topic (Dickson, Den Hartog & Mitchelson, 2003). In this paper, we focus on the implicit leadership theories (ILT) and concentrate on the eyes of the followers (Holmberg & Åkerblom, 2006). In a social influence process of implicit leadership theories, a leader and a follower are involved (Foti, Knee & Backert, 2008). This leadership approach is “a means of understanding leader perceptions and attributions, as well as a source of error in measurement of leader behavior.” (Keller, 1999: 589) The focus in this paper is on the follower’s cognitive mechanisms that mediate the influence process. “Several factors are important to the leadership perception process – specifically, the cognitive knowledge structures of followers, the context in which leader behaviors are embedded, and multiple pieces of information occurring simultaneously and over time.” (Foti, Knee & Backert, 2008: 178) Interactions between leaders and followers in the workplace can be influenced by the implicit leadership theories. Especially graduates’ and young professionals’ leadership expectations provide a basis for interpreting the behavior of others and a foundation for generating behavior. It often happens that the expectation and perceptions of the leader and the follower completely differ from each other (Keller, 2003). An important influence of a leader perception is the degree of fit between the leader’s behaviors and their own implicit leadership theory which is the basis for the labeling of individuals at the same time (Holmberg & Åkerblom, 2006).

Followers categorize a leadership style and compare their attributes with the attributes of the “prototypical leader” within their schema. For a consideration of being a leader it is important that a follower’s attributes match between leader prototype (Javidan, Dorfman, Howell & Hanges, 2010). Based on the attributes

of the followers the leader will be seen as a person with ability to motivate and direct others (Konst, Vonk & Van der Vlist, 1999). The ethnic identity of leaders and followers are further important factors and can influence the effective interaction between the two groups – especially in an intercultural setting (Chong & Thomas, 1997). The national diversity is a substantial influence of a person's ethnic identity and can be defined as the distribution and number of team members' national backgrounds and it reflects the trend toward globalization. The international work groups we analyzed during our experiment experience differences in communication styles and patterns, different norms about information sharing and group effectiveness (Dahlin, Weingart & Hinds, 2005).

In our study we mainly focus on the intercultural differences in the perceptions of the followers to their leaders in an experimental setting. We concentrated on two different groups, participants from Europe and North America in one group and people from Asian countries in another. In this paper, we use the term "Confucian Asian countries" following the term of the GLOBE study (Gupta & Hanges, 2004). Our goal was to find reasons and answers for the following research question: *"How does the national culture of leaders influence the perceptions of followers in multicultural teams?"*

## METHODOLOGY

In our study we analyzed the perceptions of students concerning their leaders during a group task in an experimental setting. Participants were 26 undergraduate students. The sample ( $N = 24$ , 8 male and 16 female; mean age = 25,58 years) represented twelve countries. Moreover, two additional students were selected as leaders in this experiment. These leaders had the same cultural background and spoke fluent English.

At the beginning of the study we divided the participating students into two multicultural work groups. One group was dominated by members of Western countries such as countries of the European Union and North America. The others consisted of a significant group of people who were mainly nationals of Confucian Asian countries. Basically, Gupta & Hanges (2004) indicate China, Hong Kong, Japan, Singapore, South Korea, and Taiwan as a country cluster identified as Confucian Asia.

Two instructors observed the two work groups in two separate rooms. The task was handed over by the observers. The assignment was to design and produce greeting cards within 60 minutes. The leadership style and the working process were not specified by the instructors. After 60 minutes the leaders of the work group handed over the output of the group to the instructor. Afterwards the participants were asked to complete a survey asking them to identify the leader of the group and to rank their own personal view of their group performance.

The questionnaire consisted of 31 items containing personality and implicit leadership theory measures. All items in this questionnaire were rated on a five-point Likert-scale, ranging from "disagree strongly" (response score = 1) to "agree strongly" (response score = 5). Demographic information regarding age, sex, and nationality was also collected. The first ten items were based on the BFI-10 of Rammstedt and John (2007). With the Big Five dimensions (BFI-10) we focused on certain basic aspects of personality structure. With the BFI-10 we concentrated on personal assessments and ratings of the participants to explore possible differences of the multicultural group members in an intercultural setting. We emphasize that the Big Five dimensions do not imply to reduce personality differences to five traits (Benet-Martínez & John, 1998). Every dimension (Extraversion, Agreeableness, Conscientiousness, Neuroticism, and Openness) includes a number of specific personality characteristics and the Big Five dimensions represent personality at the broadest level of abstraction." (Benet-Martínez & John, 1998: 730)

The participants were asked to respond to questions concerning their leadership perceptions and about their satisfaction adapted from Chong & Thomas, 1997. The 21 items based on a modified version of the Performance-Maintenance (PM) theory developed by Misumi & Peterson (1985) and Smith, Misumi, Tayeb, Peterson & Bond (1989) and were adapted for our experiment and research context. We have two reasons for using this theory for measuring leadership perceptions in an intercultural context. First, in contrast to traditional U.S. leadership theories, the PM theory refers to leadership behavior as experienced by followers. Second, the impact of contingencies, as the nature of the task, employee tenure, and demographic variables etc., is assumed to be reflected in the follower responses to the questionnaire. Consequently, the results that are reported are not

being compared to an absolute level of leadership but are relative to the levels the employee perceives as necessary, given the personal and situational context. In brief, in this theory the leader is not in the center of attention, but the followers and the external conditions are. Therefore, this theory is more than adequate for a study regarding different cultural perceptions of leadership by followers (Chong & Thomas, 1997).

The PM theory consists of two main dimensions: (1) The performance dimension (P), which covers behavior directed toward achieving group goals and can be subdivided into (1a) pressure-type leadership behavior and (1b) planning-type leadership behavior and (2) the maintenance (M) dimension. The maintenance dimension refers to behavior directed at group maintenance and preservation. As the focus is placed on the perception of leadership behavior by the followers, the results regarding the two dimensions are not to be seen as an additive function. For example, a high scale value regarding pressure-type leadership may create resistance among followers. However, in combination with a high scale value regarding the maintenance dimension of leadership, the pressure-type leadership behavior may be interpreted as being part of the leader's support in facing external threats (Chong & Thomas, 1997).

## RESULTS

Our first step was the analysis of the Big Five Inventory (BFI-10). Regarding the Big Five Inventory a similar self-evaluation of the participants of both culture groups was observed. It offered interesting self-ratings by the followers and was a great fit for the needs and intentions of this study. The results of the first part did not show significant differences within the own ratings of the students. Moreover, the participants of both groups rated themselves all about the same.

The analysis of the second part consisted of the items that outline leadership perceptions and satisfaction with the leader. As regards the perception of the leader, there were no significant differences of the maintenance dimension (2) and the planning type leadership behavior (1b). Results about performance and maintenance dimensions are indicated in Figure 2 below. However, the perception of the pressure type leadership behavior (1a) was significantly different. This result matches without a doubt with the observations of the instructors. Despite the competitive character of the experiment, in the Confucian Asian dominated group no hurry was observed by the experiment supervisor. Furthermore, the final products lacked in quantity as well in quantity compared to the Western dominated group. Consequently, the Western leader of the Confucian Asian dominated group must have failed to put pressure on his followers.

**Figure 1. Analysis of Performance and Maintenance dimensions**

Dimension	Country	Mean	T-Test	Sign.
(1) Performance Dimension				
(1a) Pressure Type	Western	33.68	2.07	0.05
	Confucian Asian	28.37		
(1b) Planning Type	Western	32.31	1.28	0.21
	Confucian Asian	29.00		
(2) Maintenance Dimension				
(2) Maintenance Dimension	Western	38.12	1.15	0.26
	Confucian Asian	35.50		

The significant items of our analysis about pressure type factors are indicated below in Figure 2. The findings of the survey showed a significantly different perception between the groups of the leader's ability to give instructions and orders (Item 27). Furthermore, in contrast to the Western group, the Confucian Asian dominated group stated that their leader failed to set clear deadlines (Item 25). Moreover, the Confucian Asian dominated group noted that their leader failed to make them work to the max (Item 23). We argue that low ratings of the perceived pressure-type leadership behavior were caused by the language barrier. As the leader of this group spoke fluent English, he showed a strong tendency to speak quickly and use complex sentence structure and advanced vocabulary. As a result he failed to adapt to the English level of his followers. Consequently, the Confucian Asian participants started to form small subgroups to discuss the meaning of the

given instructions/orders using their own mother tongue. This led to the situation that the leader found himself many times excluded from the group and failed to stress out the competitive character of the setting and to set clear deadlines (Hackman & Wageman, 2005).

**Figure 2. Significant Pressure Type Factors**

	Item:	Country	Mean	T-Test	Sign.
Pressure Type	The leader of the task				
	23....makes me work to the max.	Western	3.87	2.64	0.02
		Confucian Asian	2.75		
	25. ... sets clear deadlines	Western	3.68	2.05	0.05
		Confucian Asian	2.62		
	27. ...gives instructions/orders	Western	4.31	2.24	0.04
		Confucian Asian	3.50		

## CONCLUSION AND MANAGEMENT IMPLICATIONS

After interpreting the results of this study we can answer our research question. The significant differences of the items “treats members as equal”, “makes me work to the max.”, “sets clear deadlines”, and “gives instructions/orders” that we identified with the PM theory, showed obvious differences in the perceptions of followers with different backgrounds. The participants from Western countries evaluated the leadership style and performance differently than the Confucian Asian students. The different nationalities led to varied attributions and perceptions of the leaders in this experiment.

This experiment highlights the impact of cultural differences on intercultural interactions between leaders and followers. We analyzed that the international followers indicated different perceptions of the leadership styles. Based on the results, we argue that the national culture of leaders affects attributes and perceptions of followers significantly. We underline this finding by reference to the behaviors of leaders that are learned and developed in their own culture. Setting clear deadlines, giving instructions and motivate people to work to the maximum is often part of a leadership style that is observed in a specific culture. Differences of leadership styles and leader performances can vary enormously. As mentioned before, strong decisive instructions and decisions will be regarded as successful leadership. In other cultures and nations this approach will be assessed negatively (Den Hartog, House, Hanges & Ruiz-Quintanilla, 1999).

Young people need to experience the responsibility for a group of people as soon as possible after their job entry. The international direction of companies leads to multinational personnel with different cultural backgrounds. On the one hand, organizations have to support the understanding and sensitizing of cultural differences by offering preliminaries, coaching, and team development trainings. Otherwise, young leaders have to understand the important cultural values and aspects and consider them accordingly to assess the attitudes of their followers. We also recommend the general assessment of successful leaders of specific nations and cultures someone works with. It gives you the chance to understand the fundamental perceptions of your followers of a certain culture and nation.

## LIMITATIONS AND FUTURE DIRECTIONS

This experiment was a pre-test for an upcoming experiment. The results and the observations lead to an interesting approach in implicit leadership studies and the perceptions of followers in an intercultural context. For a more extensive study it is important to specify clear variables and operational measures for an effective experimental setting. We also suggest including a team perspective with a focus on team effectiveness and personal contributions to the success of the team. In our upcoming experiment, the study groups need to be more comparable and stable at the same time. Hence, the number of the persons of the participating countries needs to be the same in order to guarantee a similar approach. One limitation of our study is a relatively small data

sample. A larger sample gives more details and provides more data to make stronger claims in this field. We also consider the effects of more intensive observations.

# **AN EVALUATION OF MOBILE PHONE USAGE FOR EDUCATIONAL PURPOSES AND ITS IMPACT IN SOUTH AFRICAN PRIMARY SCHOOLS: PERSPECTIVES FROM THE USERS**

**Tumo Kele, Tshwane University of Technology, South Africa  
Phumzile Mlambo-Ngcuka, Umlambo Foundation, South Africa**

## **ABSTRACT**

*Cell phones are now equipped with access to internet, functionality which was initially limited to only desk-top and laptop computers. Due to this technological advancement, there are many learning benefits that could be derived from mobile phones in developing countries where access to information is scarce mainly in the rural areas. Since learning can take place at any location, time and circumstances, using cellular phones as a form of reaching certain target users can be beneficial. The greatest benefit could be derived from cell phone's mobility, portability and personalisation. Dr. LOLS, a mobile learning project designed to assist primary school teachers and learners to ease the communication link about life orientation and life skills was piloted and implemented in South Africa in year 2010. This paper examined the degree of Dr. LOLS' usefulness to both the teachers and learners. For this paper, researchers interviewed teachers and learners from four provinces in the country including students training to be teachers at one urban university. As a result of Dr. LOLS' implementation in schools, teachers and learners approved this newly established way of interaction as an efficient educational support system.*

## **INTRODUCTION**

It is now almost a decade since mobile devices have been equipped with technological advancements to access internet. To mention but a few, laptops, iPads and cellular phones can now enable users to access internet from almost anywhere in many parts of South Africa. There is a growing trend of research initiatives on cell phone usage in South Africa and other underdeveloped countries (Donner, 2008). Most of these studies focus on the better use mobile devices to disseminate educational information (Kreutzer, 2009). Also, a statistic of 72% of learners between the ages of 15-24 years owning cell phones was reported by Kreutzer (2009). This finding could be supported by a wide visibility of learners carrying cell phones at schools and presumably everywhere they go. It is therefore imperative that teachers view cell phones from a positive perspective and exploit the benefits they can provide to learning (Sharples, 2003). As the literature above suggest, usage of cell phones could be important in delivering knowledge, especially in subjects where learners feel afraid to ask their teachers. In this study, life orientation and life skills was taken as an exemplary subject where learners could be afraid to ask about sensitive life issues.

With this background in mind, researchers' assessment of the acceptability and importance of Dr Life Orientation and Life Skills (LOLS) to its users became the aim of this study. Life Orientation and Life Skills is a subject taught throughout the schooling years in South Africa with its content designed to prepare learners for meaningful and successful living. The project, Dr LOLS, uses the chat platform, MXit, to tutor learners in the area of life orientation and life skills. Through Dr LOLS, e-tutorials were set where teachers and learners were involved. Learners sent questions and teachers answered, both groups were sitting in remote locations and used their cell phones equipped with enabling software to communicate.

Citing Traxter (2005), Scanon, Jones and Waycott (2005) define mobile learning as *any educational provision where the sole or dominant technologies are handheld or palmtop devices*. It is with this premise that this paper considers Dr LOLS a platform where knowledge is made available to learners through the use of their cell phone and exploitation of the most popular social network, MXit. Almost the same as Scanon et al., (2005), researchers' approach to this paper was not on the technology itself, but on the knowledge being made available to learner everywhere they are through technology. As Traxler (2009) accedes, in many parts of southern Africa mobile learning is used to alleviate challenges of infrastructure, poverty and scarcity.

Through interviews, researchers investigated opinions of teachers and learners who use Dr LOLS as one of the means to relay life orientation and life skills subject content to learners. They further assisted in assessing the project's effectiveness in developing knowledge about the subject content. These interviews allowed researchers to gauge teachers and learners' perceptions and acceptance of cell phone technology in education and its assistance in the effective delivery of knowledge. Additionally, they brought awareness of the difficulties experienced by users for possible future effective implementation of strategies of facilitating the adoption and utilisation of information communications technology (ICT) by educational administrators in the country (Jebeile, 2003).

## **LIFE ORIENTATION AND LIFE SKILLS AS A SUBJECT**

Life orientation and life skills (LOLS) is a compulsory subject in South Africa for grades R to grade 12 (National Curriculum Statement, 2010). LOLS teachers are assigned the role of exposing learners to life skills that will give them a good orientation to life (Senge, 2007). It is not a subject that is taken seriously by both learners and teachers. However the increase in social challenges faced by young people, who include growing number of children who have no adult care givers and a growing number of child headed households (Bloch, 2009), the relevance of the subject is increasing.

Schools are increasingly expecting LOLS teachers to play an important role in guiding learners who are facing challenging situations. The topics that are part of the learning areas in the in the LOLS curriculum include, decision making, nutrition, peer pressure, bullying (including cyber bullying), physical fitness, sexuality, substance abuse and reproductive health ( Jordaan, Steyn, Sithole, 2005) all of which are relevant for the learner's development.

## **OVERVIEW AND OBJECTIVES OF Dr LOLS M-LEARNING PROJECT**

M-learning is ubiquitous which makes learning flexible for the learner and teacher. It is made possible by small portable devices (Kukulska-Hulme & Traxler, 2005) with and without the internet. The internet enabled devices such as the mobile phones and hand held computers make it possible to learn and teach any time anywhere, and to be taught by teachers located anywhere in the world. Learners can also learn to be self directed in their learning (Sharples 2003). In Dr LOLS there was a combination of self directed tutors and teachers facilitated learning with the guidance given in the tutorials followed up in class. That took the exercise of mobile learning from possibly being informal to formal e-learning that could be assessed by tutors and the teachers.

The Dr LOLS project has been established for the purpose of addressing problems identified by the researcher and for testing the assumptions thereof. The identified problems and assumptions are as follows; the teaching of LOLS is poor and most teachers have little interest in the subject whose immediate relevance is not so clear to them. In general teachers fear technology and have limited ICT skills (Taylor, 2001), which means they cannot use technology to make learning and teaching more interesting. They miss a unique moment to transmit ICT competencies to learners, which are an essential 21<sup>st</sup> century life skill, and they are also unable to take advantage of the learner's interest, excitement attraction to technology (Buston & Nussbaum, 2007). Whereas ICT literate teachers could see the opportunity presented by web enabled mobile phones that are available to the poor schools (Ford, 2009). Using m-learning could also help the teachers overcome their fear of

technology and to acquire and improve their ICT skills in a continuous professional development context (Lennon & Mauer, 2003).

The format of the Dr LOLS tutorials is one-on-one question and answer, done through instant messages between learners and educators from mobile phones and computers respectively. A 'Chat Call Center and Teach online (C3TO)' platform, owned by Center for Scientific and Industrial Research (CSIR) facilitates the interactions. The learners used web enabled phones that have an instant messaging program called Mxit and the tutors connect using computers that have the internet. Both learners and teachers crossed the digital divide in the process. The wide availability of web enabled mobile phones to learners creates an instant possibility for e-learning for a large number of learners in South African public schools. LOLS is the subject, the online mobile tutorial is what makes the tutorial happen in real time.

The tutorials were conducted in the four schools in the provinces of Kwa-Zulu Natal, Eastern Cape, Limpopo, and Gauteng by tutors made up of teachers and principals of the participating schools, university teacher's trainees, and experienced LOLS experts and online tutors. Thirty five tutors, sixteen of whom were teachers and principals and two hundred and twenty two learners were recruited for the study. Initially the tutorials were for two hours, fortnightly and after four months into the program the demand grew increasing the tutorials to two hours every week. The interactive nature of action research and workshops provided occasion to review and adjust the program creating the iterations as direct by the research participants.

In the tutorials learners asked wide ranging questions beyond what is in the LOLS curriculum they expected instant answers, which placed pressure on the tutors to improve their ICT skills and their knowledge of LOLS. The tutors had to search for information on and off the internet and built a community of practice amongst themselves in particular to support one another the teachers (Wenger, White & Smith, 2009).

Through m-learning Dr LOLS provided a scalable platform because the system has no limit in the number of tutors it can accommodate, recruiting tutors who are teachers or volunteers needs to be managed. It is also cost effective because it used existing resources mostly, provided professional development for teachers without requiring much movement outside the school. Even with only 26% ownership of phones by learners there was universal access, learners shared phones worked in groups and took turns to chat and learn in line, they brought phones from home and the researcher was also able to find sponsorship for the schools. Through mobile learning it was possible to introduce affordable e-learning to both learners and teachers (Butcher, 2009). However it is doubtful whether a program of this nature is possible without a degree of project management from within the school, district or external facilitation similar to that provided by the researcher in the absence of fully enabling policy environment and resource limitations.

## **DESCRIPTION OF THE EVALUATION OF THE PROJECT**

The study to assess the efficiency and effectiveness of Dr LOLS's usage of cell phone to deliver subject content was conducted among eight teachers, one student teacher at an urban university, five learners. These participants were selected randomly from four Dr LOLS participating schools which are located in four provinces in South Africa. After teachers and learners were selected, they were interviewed separately to give their personal assessment about Dr LOLS. The evaluation of Dr LOLS was done at two stages:

- i) The usefulness and efficiency stage: at this stage, the usefulness of cell phones and Dr LOLS m-learning project was evaluated.
- ii) The usability or difficulties stage: at this stage, the usability and friendliness of the Dr LOLS m-learning project was evaluated.

A sample of the questions that were asked to both the teachers and learners are the following:

- i) Did Dr LOLS help you in your teaching and learning?
- ii) What do you think the learners have learnt that they could not do before?
- iii) Do you see any development in the manner in which learners understand the taught material?
- iv) What have you learned about mobile phones and computers through this project?

- v) What problems have you encountered with Dr LOLS?

## ASSESSMENT RESULTS

Below the researchers present responses obtained from the teachers and learners who took part in the study. The learners and teachers had both similar and different experiences.

### Teachers

On the involvement of additional tutors teachers felt that was positive contribution by the project, one teacher explained “Through Dr LOLS, there are more teachers assisting learners so they get knowledge from various sources, there is a significant improvement in correct English usage among learners; this is noticeable when they debate because they will refer to a source they got from Dr LOLS”. Teachers also appreciated what they had learnt from other tutors both content and about technology.

Teachers also found that they and the learners together learnt to search for information from the internet. Teachers used the skill to research and to do lesson plans which they were proud to share on line with other tutors in power point format.

There were also teachers motivated to acquire ICT skills in order to cope with the demands of tutoring and they also got help from the learners especially in relation to use the cell phones. ‘They even helped me (the teacher) though I had cell phone long before them’. The desire to learn and improve technology usage was demonstrated by teachers demand and requests for help to improve their computer literacy, that was organised halfway into the program as the teachers wanted it given urgent attention. They had overcome the fear of technology and now wanted to learn more and to become better tutors. During tutoring learners pressured tutors to do better and coached the teachers on the technology especially use of mobile phones. While the teachers helped learners with content and guided them through assignments. From the data logs it was shown that learners would demand of tutors to be faster, which placed positive pressure on the tutors.

Another teacher said ‘I was even encouraged to buy myself a laptop to log on to internet, before I had to make use of internet café’. She further made an observation that she also realised it is important to be organised as a tutor and teacher. Other teachers also emphasized the importance organizing reference documents to have within reach when needed during tutorials. Additionally, they appreciated the importance of not misplacing their passwords and to understand the netiquette of online learning.

Another principal observed that ‘educators who are involved with Dr LOLS can better handle technology than they use to.’

One university teacher trainee said ‘As university students, we are always looking for chances to interact with learners and this has just been an amazing opportunity because with our workload we don’t always have time to go out to schools. Dr LOLS brought the interaction opportunity home because I can get in touch with learners in my room, in my car and at the university itself, because everybody has MXit in their phone. It (MXit) can be such a negative thing (referring to cyber crimes associated with MXit) but Dr LOLS made it positive’. All the tutors said they made it their duty to always advise and warn the learners about internet safety. In the interviews with learners they confirmed that this was important advice that they got from Dr LOLS as they had not appreciated the importance of protecting their personal information.

Another said ‘As we look back at this project from where we started, we can confidently say that this project was not only a huge success, but that it was also significant in our own personal lives as well as in the lives of the learners that we tutored, as we changed our view of educating completely’ this referring to one-on-one tutorial and a learner directed lesson, in which the teachers had to teach what the learners wanted to hear and not what the teacher prepared’. We realized that one can, and should use technology to make a difference in the lives of our learners. We are in fact living in the 21<sup>st</sup> Century where technology has become a big part of our lives,” this referring to realisation that the mobile phone is a computer and a library that is their handbags and pockets. (<http://blogs.up.ac.za/jtk-2010/index.php?blog=180>, accessed 20 April 2011).

‘We did not only help the learners with formal academic work, but we could also guide them with more personal issues which they are facing. It feels good knowing that the learners take the advice and that we did in fact make a difference in some of their lives’. Many teachers were pleased at how much learners felt free to talk about things they never raised in class because they were very personal and embarrassing. Learners also shared their experience and benefits of Dr LOLS when they were offline in class which enabled the teachers to assess the interest of the learner. From the teachers perspective the surge in the interest in LOLS as a subject proved that mobile learning made learning more interesting to the learners.

Teachers said they learnt to use the internet for research and to prepare lessons. They could also direct learners to get information from their mobile phones. Their communications skills also improved according to the principals. One principal remarked on the confidence gained by LOLS teachers and an enhanced grasp of the LOLS subject. The impact of mobile learning was to change LOLS from being an ignored subject to an exciting subject learners could not wait to have teachers explained. The LOLS teachers did not only use m-learning to teach LOLS, they introduced it in all their subjects. They also shared their m-learning skills with other teachers and continue to do so in the post research Dr LOLS program that the four schools have decided to continue with.

## **Learners**

The direct responses from the interviews with learners were ‘I learned how to download information using my cell phone and *not* to give out personal details over the phone and how to protect myself from getting HIV.’

Another said ‘I learnt about careers that were not known to me before’. While the other attests that ‘I learnt career and personal development and about myself. Also, I learnt not to give my personal information to strangers’.

Like teachers, learners learnt to use the internet for learning from the mobile phones. They were already involved with MXit chat, unlike their teachers most of whom had never experienced chatting online. They found some of the tutors too slow and unable to keep up. During the tutorials they demanded tutors to respond faster. From reviewing the data logs it showed that the learners would say, in demand ‘faster, faster Dr LOLS. Are you there?’ This was a tipping point for teachers who realised they needed to improve their ability to interact online and meet or exceed the expectations of their learners. The use of mobile learning caused other teachers who were not in Dr LOLS to also develop interest in the mobile learning and to want to learn from Dr LOLS, since their learners were expecting all teachers to use m-learning.

Learners took upon themselves to organize phones from their parents mostly mothers where there were not enough phones. They enjoyed working in groups they said the small screen did not bother them.

They also indicated that they especially liked online learning as it enable them to be anonymous and that Dr LOLS ‘listened’ patiently to their issues and gave advise without judging them. They did not get into trouble for asking ‘naughty’ questions one learner said.

As most learners had no prior experience or easy access to computers they felt m-learning helped them not get an opportunity to experience what others got from computers and learn more about computers. They also felt they learnt grammar and spelling from Dr LOLS, they especially liked it when Dr LOLS them online homework which they could share with their teachers.

Most appreciated being advised not to give personal details to strangers online not even Dr LOLS which they had not generally consider as a serious risk. Dr LOLS helped them appreciate the risks and cyber crime.

## **LIMITATIONS**

The interruptions caused by the systems failure was by far the greater limitation that both learners and teachers pointed out. Though for most times it worked perfectly. Systems failure mostly emanated from the CSIR platform, poor reception and network and very rarely from MXit.

Tutors were particularly frustrated and disappointed by the system when it failed to allocate learners equitably to all tutors. In some sessions some tutors would be handling as many as five learners while others got nothing for the whole session.

All the schools needed assistance to get sponsorship for airtime and handsets which fortunately was not insurmountable. Without that help some learners would have been left out.

Given the dangers of internet, schools were concerned about possible negative impact of mobile learning. All the schools had policies that forbid bringing and use of mobile phones in schools which had to be adjusted to accommodate Dr LOLS. It also forced a rethink of the policy to enable measured use of mobile phones in schools for learning purposes. In the adjusted policies the concerns were not ignored..

The field of m-learning is still new and the study did not have as many lessons to draw from. There is a growing interest in developing countries on the usage of mobile technology and wireless to overcome problems of limited infrastructure, South Africa is one of countries with that growing interest. The policy environment still needs to improve. The demonstration of what can be done with wireless technology is encouraging.

Some of the problems which were stated by teachers and tutors were the following:  
The learners often use words that tutors had difficulty understanding which is typical sms or chat language. ‘This cause us (teachers) not to always understand clearly what the learners were saying’ eg “school is skewl,” “emotions is mtns” and use of expressions like ‘OMG for Oh my God’. Teachers were keen not to interrupt the flow of discussions by correcting spelling or asking for clarifications and to “appear unprofessional and unknowledgeable if we were to ask them all the time what they are saying”. Tutors did not wish to lose time on spelling and grammar and risk losing time and the interest of the learners on whose terms the one-on-one tutoring is meant to be. The social network is a social platform and it comes with its own informal manner of interactions tutors learnt.

A common frustration of tutors was not being able to follow up and to find closure on issues where learners needed a follow up. The tutors were not supposed to know the learners name or school and therefore could not take matters further.

The use of technology does not make up for underlying weaknesses such as grasp of content grammar etc and that was recognised by all tutors and the weaknesses were identified. An online program has more value when it exceeds expectations and at least does no harm at the very least.

## CONCLUSIONS

Mobile phones have filled in a technology gap in grade sevens of this resource constraint schools. The schools have inadequate ICT infrastructure and general ICT illiterate teachers. With the introduction of m-learning to the Life Orientation and Life Skills grade 7 classes; the challenge of inadequate infrastructure was significantly addressed by the use of mobile technology. Connectivity became possible and technology enhanced learning and teaching became possible. Even more important was overcoming the fear of technology by the teachers. They have since taken it upon themselves to acquire and improve their ICT skills including acquiring computers for themselves buying or getting the schools to buy them computers.

Both learners and teachers were able to e-learn and e-teach. Teachers learnt to teach online and acquired ICT literacy in process under the pressure of having to provide answers in real time. Learners taught teachers to use some of the applications on the mobile phones, and they also learnt from the answers given by tutors, and the assignments given in class which directed them to content.

Contrary to Danesh, Inkpen, Lau, Shu and Booth’s (2001:390) assertions that mobile learning was designed for adult public use in the work setting, this study proved that mobile technology could play a role in primary school education. Teacher skills were also improved and the Life Orientation and Life Skills as a subject were taught innovatively. Therefore, mobile learning can happen independently, anywhere, anytime, including the classroom. Mobile learning which is guided by the teacher has a better chance of addressing curriculum needs whose learning value can be assessed.

# **WESTERN HUMAN RESOURCE MANAGEMENT SYSTEMS INTO ISLAMIC PUBLIC SERVICES: ARE THEY APPROPRIATE?**

**Nasser Mohammed Al Khalifa**  
**London Metropolitan University, United Kingdom**

## **ABSTRACT**

*Throughout the Muslim World, countries seeking to improve governance often employ management systems developed in the West. This includes Human Resource Management (HRM). But people are the bearers of culture and cultural differences will most likely affect practices that involve people management. Consequently studies of international effects show significant differences when transferring HRM from one cultural setting to another. These often result in failure. This paper evaluates the theoretical underpinning of national culture and HRM and questions how appropriate it is to use systems developed almost exclusively in Western cultures and implant them into Islamic States.*

## **INTRODUCTION**

Visit or even better, work in any country around the world and you will soon notice cultural differences between your country and the country you are visiting. People from Islamic countries will certainly notice a difference in social attitudes between their own country and those in the West. Islam is a system of beliefs that permeates not only religious practice but also all daily life with a series of rules that govern society and all its members. As a result, the effects of Islamic teaching are far greater on daily and working life than is true in non-Muslim states. Significantly, and unlike most Western societies, Islam does not recognize differences between religious institutions and the state. Visitors may conform to local customs, but what goes on in their heads remains a private, well-constructed constant (Lewis, 2006). This is because, while part of superficial public behaviour is cultural in origin, they can usually be adopted without prejudice to a person's own core beliefs, although there may be exceptions.

If one accepts this proposition, then the same must be true of management styles and practices. While an organisation may adopt the superficial aspects of a management style developed in a culturally different country there will be aspects, perhaps significant ones, of practice and theory which will be unacceptable. Furthermore, it may not be simply unacceptable, but actively damaging to the local national culture, especially when taking place in public services. For public services occupy a special place in national culture that is not shared by private organisations. Ackroyd (1995) for example, argues that "*systems of public services are part of the social structure of advanced societies*". Edgar Schein (2010: 32) observe that though the essence of the group's culture is its pattern of shared assumptions, culture will also manifested itself at all levels. These will include observe all artefacts and shared, espoused values, norms and rules of behaviour. Many of these emanate from public services.

Often new management systems are introduced as part of government reforms. One of the most significant was the introduction of the New Public Management (NPM) reforms first developed in the United Kingdom (UK) in the early 1980s (Hood, 1991). When adopted by other advanced economic countries, predominantly OECD members, NPM has been relatively successful. Despite this, there is considerable national diversity between models of NPM used. This is particularly the case when one observes the differences between governance as one travels from north to south in the European Union. Consequently, European governments have formulated a "*contextual paradigm*" which is quite different from the "*universalistic paradigm*" of US management systems (Sotirakou and Zeppou, 2005).

NPM has since been exported worldwide often under pressure or tutelage from large-scale public organisations such as the OECD, World Bank and IMF. But when applied to countries where existing systems of government and social customs are very different from those in OECD countries, the literature shows that NPM has been far less successful, though as Monavvarian (2004) and Siddiquee (2006) both observe; differences between countries makes it difficult, if not impossible to extract some common criteria to assess the reform efforts. Siddiquee (2006) suggests by way of example that English-speaking and French-speaking countries in Africa have quite different systems of government while Arab countries have quite different needs based on their Islamic heritage. Sementelli (2007) suggests that governing bodies bear “family resemblances” to the religious and social institutions with which they co-exist. Furthermore, even ASEAN bloc countries differ substantially in public sector capacity and performance despite being located in the same geographic area (Zhang, 2003).

Unsurprisingly, the area of management most exposed to national culture is Human Resource Management (HRM) because it involves people, the carriers of culture. All governments have traditionally employed large numbers of workers in the public sector and so new HRM systems are often the first major reform when developing or improving government services. Yet lack of enthusiasm and resistant to change may be attributed to the reforms colliding with institutional norms and rules as a result of ambiguity of culture or when they threaten establish identities of the members of the organisation (Berg, 2006). As Turner and Hulme (1997: 2) observe:

*"Management systems, administrative techniques and organisational designs are not neutral value-free phenomena. Thus administrative reform and innovation and not simply a matter of installing some piece of managerial technology which has proved effective elsewhere"*

This paper will show the marked differences in national culture based on highly-validated findings of Hofstede (1980; Hofstede and Hofstede, 2005), correlated with work by Trompenaars and Hampden-Turner (1997), Lewis (Lewis, 2006) and others and how they could affect the introduction of Western developed HRM systems, especially in the public services, and possibly lead to further resistance against Westernisation.

## CROSS-CULTURAL HRM

HRM emerged as being identifiably different sometime in the mid-1980s. Early models included the Harvard Model by Beer *et al* (1984) and that of Fobrum, Tichy and Devanna (1984). The principles of HRM were soon imported into the UK from the USA, but even so cultural dissimilarities meant that new models were needed and developed by Hendry, Pettigrew and Sparrow (1990) with their Warwick model, Storey (1992) and Guest (1989; 1997). It was soon held that HRM should reflect prevailing beliefs and attitudes held in society about employees and the response of employees to public policy (Bratton and Gold, 1999: 6). As the paradigm spread to other advanced economic countries, significant variations were needed because of different cultural outlooks on employment. Australia and New Zealand developed approximately along the same lines as the UK with their predominantly Anglo-Saxon cultures, with broadly similar welfare oriented traditions. These were unlike the strongly managerialist USA with its functional focus (Teo and Crawford, 2005; Sheehan, 2005; Schick, 1998).

Continental Europe also had different cultural traditions and models unlike those of either the UK or America emerged as organisations conceptually modified HRM during their adoption (Brewster, 1995; Brewster, 2005; Brewster, 2007; Claus, 2003; Mayrhofer and Brewster, 2005; Rizov and Croucher, 2008). The cultural differences may be seen in figure 1.

With the differences between national cultures in mind, and bearing in mind that any organisational culture also has a strong national culture content (Schein, 2010: 14-16), it seems illogical to assume that any management theory developed in one culture should apply equally to all other cultures. If one considers the stages of development, socio-cultural and socio-economic differences and inherent capacity of administrative systems within any country, it is difficult to see how a 'one size fits all' approach can be successful. This is particularly the case with the most human-oriented management theories of all - those concerned with HRM. The academic literature is full of references to problems caused when different cultures meet in societal or

organisational settings, whether this is because of cross-cultural factors, diversity of the workforce, multiculturalism or the transnational transfer of knowledge and systems.

## COMPARATIVE MODELS OF NATIONAL CULTURE

The study of national cultures has largely taken place over the last 60 years. One of the earliest proponents was Clyde Kluckhohn (1951; Kroeber and Kluckhohn, 1952) who developed theories of cultural understanding and communication based on his Values Orientation Theory. Later Edward Hall (1959: 186-87) described how the "Silent Language" of culture influenced all individuals without their active knowledge. He suggested that culture is communication and communication is culture and that culture was not one thing, but many. Importantly he defined that "*There is no experienced independent of culture against which culture can be measured*". In other words experience is something that people project to the outside world and that they gain in a culturally determined form, as they will from learning management techniques developed in other cultures. Clifford Geertz added to knowledge with his description of culture as

*"a system of inherited conceptions expressed in symbolic forms by means of which people communicate, perpetuate, and develop their knowledge about an attitude toward life"*  
(1973: 89).

One of the most important works to emerge on the subject was that written by Geert Hofstede, a social anthropologist (Hofstede, 1980). This is one of the most widely tested works on the subject of culture, and although it has shortcomings, researchers have found its principles and findings valid in over wide variety of contexts and settings. Hofstede's main contribution was to define culture in a way that one culture could be compared to another. To do this he studied managers from 72 countries and developed a framework of four 'dimensions' which he named; 'individualism/collectivism' (IDV), 'power distance' (PDI), 'uncertainty avoidance' (UAI), and 'masculinity/femininity' (MAS). Later, working with Michael Bond he added a fifth, long-term/short-term orientation (LTO) (Hofstede and Bond, 1988). The importance of Hofstede's work is that each of the dimensions may be described numerically. While Hofstede's work has been criticised for reducing culture to overly simplistic assessment and failing to see that culture changes over time (Fracchia and Lewontin, 1999) it has nevertheless endured considerable research and scrutiny and remains an extremely useful measure for comparing one culture to another (Kirkman, Lowe and Gibson, 2006). However it must be accepted that there are variations within cultures - clearly not everyone is the same. Yet as a general measure, Hofstede remains valid. One advantage of reducing culture to numeric terms is that it avoids cultural relativism by removing any sense of moral judgement (Hofstede and Hofstede, 2005: 5-6). The principles used by Hofstede were adopted in another major study, the GLOBE Project (House et al., 2004). Instead of the five measures of national culture proposed by Hofstede, the GLOBE Project proposed nine. Some were directly related to those devised by Hofstede, and others differed. GLOBE's measures were 'power distance', 'uncertainty avoidance', 'humane orientation', 'collectivism I' (institutional collectivism), 'collectivism II' (in-group collectivism), 'assertiveness', 'gender egalitarianism', 'future orientation', and 'performance orientation' (Chhokar, Brodbeck and House, 2007: 30).

Just as there were differences between the UK, the USA and continental Europe, Figures 2 and 3 show there are even more significant differences between countries where most HRM theories developed, and Islamic

countries. In this case, the 'Arab World' used research from several countries including Egypt, Iraq, Kuwait, Lebanon, Libya, Saudi Arabia and the UAE. Here the masculinity index (MAS) is 52. In Western terms, women in the Arab World have noticeably different rights. The closeness of this dimension shows that the influence of Islam rather than individual cultures has most effect on this measure. Significant differences can be seen in all dimensions, although LTO was not measured for the region in Hofstede related research. The GLOBE Project shows a wide variation between LTO in the West and Muslim Countries (Chhokar, Brodbeck and House, 2007: 322). In Hofstede, there is a large difference between power distance (PDI), individualism/collectivism (IDV) and uncertainty avoidance (UAI). PDI indicates that strongly hierarchical system of both society and organisations is preferred. There is a striking difference between the 'individualist' UK and 'collectivist' Islamic countries. In collectivist societies this shows itself as a close long-term attachment to the member group, often family or tribe and loyalty to the group and its representatives is paramount in such collectivist countries. This often means that all the rules are put to one side for the sake of the group. High uncertainty indexes show that Islamic societies have a low level of tolerance for uncertainty. These are often compensated for by strict rules, laws, and policies to keep things under control. This inhibits change and makes society risk averse. These may be seen in contrast to both the US and UK cultures where PDI and UAI are much lower, and individualism is much higher. Each of these has fundamental effects on HRM.

**Figure 3 - Differences between the UK and some Islamic countries**

Data Source: Hofstede and Hofstede (2005)

**Figure 4 - Differences between USA and some Islamic countries**

Data Source: Hofstede and Hofstede (2005)

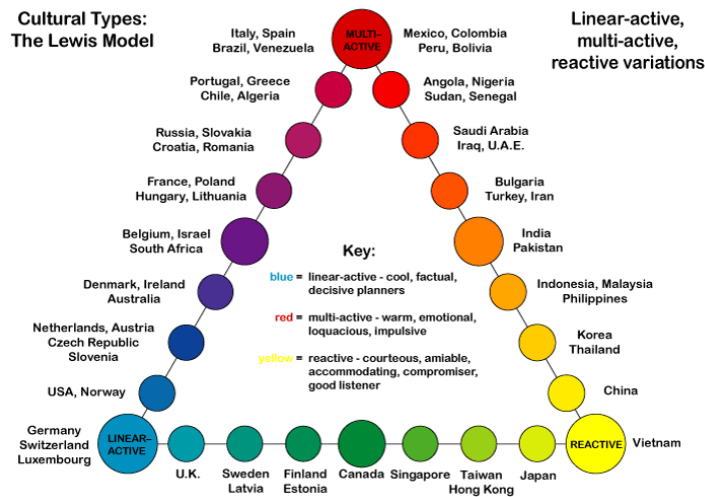

Where Hofstede (1980: 21) described culture as "the collective programming of the mind which distinguishes the members of one human group from another" Trompenaars and Hampden Turner (1997) took a different approach, though again building partly on the work of Hofstede. Instead they define culture as "*the way in which a group of people solves problems and reconciles dilemmas* (1997:6). Like many other culture researchers such as Edgar Schein (2010: 24; 1985: 9; 1992) , (Rousseau, 1990) Wilhelms, Shaki and Hsiao (2009) and Hofstede (Hofstede and Hofstede, 2005: 10-11) they noted that culture comes in layers. Trompenaars and Hampden Turner (1997:21-22) defined these as 'explicit products ', the outer layer; 'norms and values'; and 'basic assumptions ', the inner core. They went on to define culture in various dimensions. These were 'relationships and rules', 'individualism/communitarianism', 'affective/neutral', 'specific/diffuse', 'according of status', 'time orientation', 'orientation to nature' and 'individual/corporate' cultures. Just as with Hofstede, they measured each aspect of culture numerically and were able to compare one group of countries with another, showing marked differences between cultures in different combinations.

Richard Lewis (2006: 30-32) took a different approach from either Hofstede or Trompenaars. He pictured culture is a triangle bounded by three points - 'linear-active', 'reactive' and 'multi-active'. He saw each country resting at some point on a continuum between two of these three points (see Figure 1). Linear-active

cultures tend to concentrate hard on one thing and do it within the scheduled time period. In contrast, multi-active cultures are very flexible and believe they get more done than linear-active cultures. In such cultures people are not very interested in schedule is punctuality and consider reality to be more important than man-made appointments. Reactive (or listening) cultures rarely initiate action or discussion but prefer to listen to establish the other's position first, then reactively reformulate their own. Both linear-active and reactive cultures are introverted, whereas multi-active culture is extroverted.

In the Richard Lewis model (Fig.4), most Islamic countries are to be found on the multi-active/reactive axis. In contrast most Western, theory-originating countries are clustered around the linear active node.

## CONCLUSIONS

Whichever model is used, either of the three described, or that described by the GLOBE Project, or in many other descriptions Islamic countries stand culturally well apart from the countries of the West from where main HRM theory has been developed. Further analysis of Hofstede indices of all the predominantly-Muslim countries shows strong correlation between PDI, IDV and UAI. MAS is more variable and may be affected by other factors individual to countries involved. Taken together, the factors suggest that leaders have much more power and individual authority than in the West. They often enforced this power and authority with the use of rules and regulations – fundamentally important in HRM.

Power Distance (PDI) starts in family life. In Islamic countries children are far more obedient to what their parents and older children and respectful parents is seen as a basic virtue. This is far less true in the West and yet these are values carry through school into working life and so effects the way people must be managed. In Western HRM, there is a strong, underlying thread of total equality between employees, and to some extent between employees and their managers. This strong sense of equality covers many aspects including gender and nationality. Yet in large PDI cultures organisation centralised as much power as possible in a few hands and subordinate expect to be told what to do. This leads to strong hierarchical structures unlike the flatter structures found in Western management.

Individualist cultures (IDV) expect employees to act according to their own interest and so work is organised in such a way that this self-interest and the interest of the employer coincide. People are employed on their merits rather than who they are in an individualist culture. In public services, the use of family ties in relationships is strongly discouraged and often banned altogether. In contrast in the collectivist culture the employer never high as just an individual, but rather a member of a specific group. Employees are expected to put the interests of the group first, rather than their own. Thus in an individualist organisation management entails the management of individuals, while in Islamic collectivist cultures management is the management of

groups. Almost all Islamic countries are collectivist cultures, and almost all the countries where HRM theory develops are individualist.

Uncertainty Avoidance (UAI) is a subjective experience. In Muslim cultures, Islam provides a strong integrated framework for private, public and working life in a way missing in other societies. On the other hand, Islamic cultures tend to have a higher score for the UAI dimension. This leads to more intense feelings and people are more likely to express their positive and negative emotions. One of the important effects of higher UAI is the likelihood that employees will wish to stay much longer within an organisation and again, this affects HRM practice. High UAI societies are much more likely to rely on laws and regulations passed down from the top, unlike the much more laissez-faire attitudes found among Western managers and employees. This insistent on rules and regulations may have a negative side when those rules become ritualised. In which case, organisations can become inconsistent or even dysfunctional. While high UAI cultures may put much more emphasis on formal qualifications, lower UAI societies have an equally strong belief in common sense and generalism with far greater tolerance for ambiguity. This often makes high UAI cultures more innovative but less likely to go on to develop new services and ways of doing things.

One saw that historically, considerable problems arose when trying to transfer HRM practice even to closely related cultural groups such as the USA and UK and considerable adaption and the development of new models was necessary. The problems grew even worse when trying to transfer HRM to continental Europe. Such are the differences between the foundations of HRM which is strongly linked to culture that it seems illogical to expect that Western HRM practices would seamlessly transfer to Islamic countries. It clearly will not. There are several obvious differences between the two sets of countries that are shown in Figures 2-4. The difference in IDV alone is sufficient to signal a completely different type of society. Individualism is often regarded as the characteristic of a society which welcomes change takes risk, while collectivist (or communitarian) societies are normally far more in favour of traditional societies (Trompenaars and Hampden-Turner, 1997: 52). In other words Muslims have a completely and measurably different world-view from those in the West (Lewis, 2006: 400). This extends to how each sees the difference between what is right and what is wrong, what is logical and what is illogical and hence what is acceptable and what is unacceptable.

For the reasons described above, it is not surprising that throughout the Muslim world there is a growing resistance to Westernisation and particularly Americanisation of local cultures. This is because of the inherent inconsistency of the two cultures. This has often been brought about because of Western economic hegemony or military power, or the spread of the Coca-Cola and McDonald's type of cultural artefacts. It may be brought about by the apparent show of arrogance by the Americans, the British and other Europeans. Neal and Finlay (2008) describe American Hegemony and Business Education in the Arab World and the propagation of HRM theory and practice is a manifestation of this. This is because essentially, Western HRM was built on entirely different cultural foundations and traditions than those found in all Islamic countries. So managers and executives should approach implanting HRM with some considerable caution. Until a truly Islamic Model of HRM is developed, they must fully recognise the cultural, organisational and societal implications of using Western models.

# **CORPORATE SOCIAL RESPONSIBILITY REPORTING IN THE SOUTH AFRICAN HOSPITALITY INDUSTRY**

**Carina Kleynhans**  
**Tshwane University of Technology, South Africa**

## **ABSTRACT**

*Corporate social responsibility (CSR) and ethics are much debated and important management issues. However in the South African Hospitality industry these issues have not been addressed. This paper sets out to determine what Hospitality-related South African companies report on their CSR activities. Content analyses of annual reports of six companies were conducted. Socially responsible activities relating to charities were undertaken by most of the companies and large sums of money were spent on community involvement. All the companies reported sound environmental practices such as water and energy saving. The study identified various CSR activities in and opened up avenues for further research.*

## **INTRODUCTION**

Corporate social responsibility (CSR) and ethics are much-debated, important management issues, because of the magnitude and influence of modern organizations on society. However, in South Africa these issues have not been addressed extensively.

Actions of organizations do not merely have a significant impact on their daily business, but they can influence individuals, communities, the environment, countries and the whole world. Ethics, CSR and corporate governance should guide organizations towards being responsible citizens of the world (Holcomb *et al.*, 2010). Although research has been conducted in the management in general, very few studies have been carried out on CSR activities internally in hospitality and tourism companies. Hospitality-related CSR studies have focused mainly on environmental issues (Holcomb *et al.*, 2010).

The author's literature review reveals that, to date, no empirical study on CSR activities in the Hospitality industry in South Africa has been undertaken. McGehee *et al.* (2009) and Holcomb *et al.* (2007) state that CSR research is relatively new therefore reporting in the hospitality field, is limited.

## **OBJECTIVES OF THE STUDY**

The main objective of this study was to determine if Hospitality –related South African companies report on their CSR activities. Included in the objective was to investigate the level of reporting and to conduct a comparison between the different listed companies.

## **LITERATURE REVIEW**

Currently almost all business decisions involve social and environmental issues. Most organizations discuss the impact of social and environmental issues in their annual reports and on their Web sites.

Nevertheless, CSR has emerged as a significant business issue and is likely to gain increased importance over the next years (Montiel, 2008).

A business is accountable to its primary stakeholders. These include profit to the owners, achievement of goals, efficacy of the organization, productivity, promotion of the organization's image and public relations, quality of service rendered, as well as environmental management and control. These aspects are referred to as the internal dimension of CSR (Jones *et al.*, 2006). The external dimension (Jones *et al.*, 2006) or secondary stakeholders to whom a company is held accountable are the community and the country as a whole. Organizations can demonstrate corporate social responsibility in local communities through community development, low-cost housing, support of health and medical services, training and development, donations to churches and religious institutions and sponsorships for schools and sporting bodies. The potential benefits of CSR include improved financial performance and profitability, reduced operating costs, long-term sustainability for companies and their employees, sound relations with government and communities, accountable risk and crisis management, enhanced reputation and brand value, as well as forging closer links with customers and fostering greater awareness of their needs. There is consensus that CSR is the "right thing to do" (Jones *et al.*, 2006; Gan, 2006).

The global Reporting Initiative's guidelines have become the accepted international standard of sustainability reporting (King III, 2009). By issuing integrated reports, a company gains the trust and confidence of its stakeholders and manifests the legitimacy of its operations. Reporting can increase a company's business opportunities and improve its risk management. In an integrated report a company assesses its ethical stance, fundamental values and governance internally, while gaining the trust and confidence of external stakeholders. A company should gauge how it has impacted both positively and negatively on economic, social and governance issues (King III, 2009).

Corporate social investment in South Africa gained momentum in the early 1990s when political reforms that were implemented, accelerated social change in the country. In South Africa the state plays a crucial role in defining and driving CSR initiatives. CSR-related issues are given priority in the management hierarchy due to the South African state's transformation agenda. This has resulted in a scorecard that rates a company's performance against a range of black economic empowerment criteria (Hamann & Kapelus, 2004). Companies have to adhere to Broad-based Black Economic legislation and the JSE (Johannesburg Stock Exchange) SRI (Social Responsibility Investment) Index regarding corporate social investment (JSE, 2010). The JSE launched the SRI index in 2004. This tool, used by investors, identifies companies, that incorporate sustainability practices (King III, 2009). In South Africa CSRR receives a lot of attention (Hamman *et al.*, 2005).

Cabinet approved the International Tourism Growth Strategy in June 2003, of which one aim is to facilitate transformation and Black Economic Empowerment (BEE) in the local tourism industry (GCIS, 2010). BEE is a programme launched by the [South African government](#) to redress the inequalities of [Apartheid](#). Previously disadvantaged groups (black Africans, [Coloureds](#), [Indians](#) and some [Chinese](#) who are SA citizens) are given economic opportunities that were previously not available to them. These measures include [Employment Equity](#), skills development, ownership, management, socio-economic development and preferential procurement. On 9 February 2007, the first BEE Code of Good Practice was gazetted by the South African Government. This latest version of the Code is also known as [Broad-based Black Economic Empowerment](#) or [B-BBEE](#). The BEE legislation is supported and functions in conjunction with various other forms of legislation, such as the Employment Equity Act, the Skills Development Act and the Preferential Procurement Framework. Enterprises may be rated using various scorecards (Department of Trade and Industry, 2007).

According to the Tourism, Hospitality, Sport Education and Training Authority (THETA) tourism is the fastest growing industry in South Africa, contributing no less than 10% to the Gross Domestic Product (GDP) and comprising of five main sectors - accommodation, food and beverage services, recreation, entertainment and transportation and travel services. Tourism is regarded as one of the key economic sectors with excellent potential for growth. About 9,6 million foreign tourists visited South Africa in 2008, a 5,5% increase over the 9,1 million foreigners who visited the country in 2007. The contribution of

tourism to South Africa's GDP is estimated to have increased from R162,9 billion in 2007 to R194,5 billion in 2008. The estimated number of jobs created directly and indirectly in the economy through tourism increased by 10% from 946 300 in 2007 to 1 041 700 in 2008 (GCIS, 2010). Tourism has the potential to fuel the South African economy by creating jobs, reducing unemployment and improving the quality of life of all South Africans.

An increase in CSR activity will benefit hotels because both firm value and profitability will increase (Holcomb *et al.*, 2010). Most companies report that their CSR efforts to improve their image certainly pay dividends (Jenkins & Yakovelva, 2005).

## RESEARCH METHODOLOGY

Content analysis was used for exploratory research. The main purpose of exploratory research is to develop and clarify ideas, and to formulate questions for further investigation. Existing literature is perused to provide new insights into a problem. Content analysis can be applied to any form of communication (Adler & Clark, 2011). Content analysis refers to the gathering and analysis of textual content. Content refers to messages, e.g. words, meanings, symbols and themes. Text can refer to that which is written, spoken or visualized (Neuman, 2003). When qualitative content analysis is used the primary aim is to document the analysis verbally, rather than statistically (Adler & Clark, 2011).

The CSR dimensions that were used for this study is the same as those used by Holcomb *et al.* (2010) and Holcomb *et al.* (2007) namely, community, environment, marketplace, vision and values, and workforce. Additional dimensions relevant to the South African context are BEE levels, King III report on corporate governance, employment equity committee and employment training. Child care that appeared in the original workforce category was removed as no South African company reported on it. These themes relate to the activities reported by the hospitality companies.

All the hospitality-related companies listed under Gambling, Hotels, Travel and Tourism on the JSE were listed. Seven companies in these categories are listed on the JSE. These companies include casinos, horseracing, hotels and, a tourism and travel company. The latest annual report of the companies were used for content analysis. One of the companies had no electronic annual report. All the annual reports were read and information relating to CSR was gathered. Approximately 110 pages of documents were analysed for content from each of the companies. Reporting on the five main categories with their descriptors was tabulated in the form of a matrix. If a specific category was addressed, this was captured and marked with a ✓. The specific projects and descriptions of CSR that were captured will be presented separately in the results section. The websites of the companies were also visited to check whether any CSR activities had been reported. For the sake of ethical consideration the companies will be identified according to letters of the alphabet.

## RESULTS

Categories that were reported on by all six companies were the environment and workforce with, specific reference to conservation, BEE levels and the King III report on corporate governance. Most of the companies reported on their code of ethics and charity involvement. Only one company reported on providing jobs for the disabled (See Table 1)

## In-depth analysis of annual reports.

### Company A

Company A has 52 hotels, catering for four different market segments, ranging from hotels for the discerning guest, to catering for the guest who insists on value for money. This company reports in detail on its environmental responsibility. The company adheres to a code of ethics for efficient energy and water management, as prescribed by the World Tourism Organisation. Staff are encouraged to participate in the SOS initiative – Switch Off Something. Energy-efficient generators and lighting have been installed, and air conditioners automatically switch off 4 times per day.

Community involvement is evident in enterprise development, corporate social investment initiatives and socio-economic development. Charities that it supports are Operation Hunger, World Wildlife Foundation, SA Golf Development and Cuppa for Cancer. Employees who are involved in volunteer work, are encouraged to donate redundant stock.

Company A reports in the market place category on preferential procurement on DTI targets of 85% of procurement from empowered suppliers. A 24-hour business abuse hotline is in operation to deal with any unethical or corrupt behaviour when it is reported. HIV/Aids awareness is addressed by an HIV/Aids programme. The workforce is consistently being trained in different skills. Company A that adheres to the DTI codes of good practice, is currently the 27th most empowered company in South Africa and is ranked at number 2 in the Travel and Leisure sector.

### Company B

Company B provides gaming, hotel and entertainment facilities. The group comprises of 14 casinos in South Africa as well as 94 hotels (owned, leased and managed), primarily in South Africa, but also in 7 other countries across Africa and in the Middle East. The Group is split into 2 main divisions, - a gaming and hotel operation. In their report the group addresses their CSR involvement in the environment as follows: “The

company is committed to the preservation and conservation of the environment. All reasonable steps are taken to protect indigenous flora and fauna on site and to remove invasive alien vegetation.”

The company prioritises energy-saving in all forms and minimises wastage. On each shift the maintenance team inspects all ablution facilities to ensure that there are no water leaks. The results are recorded and leaks repaired immediately. Energy-saving globes have been installed where possible. All air conditioners are run on timers and are switched off during quiet periods. In one of the casino gardens indigenous species and fynbos that require little water to survive have been planted. Paper, cardboard boxes and plastic are sorted and collected by a recycling company.

During the reported year the group donated R24,9 million to CSI programmes. The group also supports a home-based care project to HIV/Aids families and orphans and it has contributed the construction of an international-standard ablution block at a sports field.

Company B reports in detail on their Responsible Gambling programme. Ongoing training and development of employees enhance the skills base and facilitate individual advancement, particularly for BEE employees. A training institute is in operation. Formal HIV/Aids policies protect the rights of infected employees and codify procedures for the management of ill health.

## **Company C**

This company invests in and manages 15 hotels, resorts and casinos in southern Africa and 2 in other countries. It focuses on the development, operation and management of its hotels, resorts and casinos. The total CSI spend was R20 million.

The group embarked on the implementation of the Heritage Environmental Management Programme. One of the casinos has been awarded with Platinum Certification by the Heritage Foundation in recognition of the achievement of sustainable environmental performance to international standards. A pilot energy management system aimed at reducing overall energy consumption at the facility is in operation. One of the Casino and entertainment centres received the Best Single Resource Award for their water management practices. An annual 17% reduction was recorded due to the use of recycled grey water irrigation on its golf courses and concerted efforts at resort level to reduce overall fresh water consumption. Another casino was awarded Platinum classification for its continued efforts to minimise environmental impacts.

A 71% increase in the number of personnel across the group completing formalised training in the regard of Environmental responsibility was reported. Guest and visitor awareness campaigns and initiatives were successfully implemented at a number of resorts and gaming operations.

The introduction of a central warehouse facility and greater supply chain management initiatives resulted in a decline of 34% in the number of deliveries being made each week. This has contributed to a lower carbon footprint for the resort. The company reported on their Social Responsible gaming programme. The company remains committed to the transformation of the South African economy through BBBE and was ranked 30 th in the Financial Mail’s survey for most empowered companies.

## **Company D**

This company has a network of hotels, residential resorts and vacation and private residence club destinations. The company accepts its obligations as a responsible corporate citizen. It aims to increase spending on skills development programmes to enhance job performance across the board. It is committed to achieving an employment complement that represents the demographics of this country in which employees enjoy equal rights. The company upholds the objectives of the Employment Equity Act.

The company is committed to the preservation and conservation of the environment and the natural resources of the regions in which it operates. The company conducts environmental impact studies prior to the commencement of construction thereby ensuring conservation of local fauna and flora. Their commitment to

conservation is evidenced in their eco-development strategies. The company acknowledges its social responsibility towards the communities in which it operates.

## **Company E**

Company E is listed under gambling on the JSE list. The business activities include horseracing and destination marketing. At this company, social responsibility is integrated into the day-to-day business practices. They have invested R1.2 into CSI projects.

The company continues to make progress with BEE and commits to the highest standards of corporate governance with high ethical standards and personal integrity. Its training, focuses on the development of managerial, financial, customer care and people management skills. A regular wellness newsletter is provided to all staff members. This company reported on the responsible gaming programme

Wherever possible water is recycled and if possible storm water is used. They report that they are aware of the need to preserve the biodiversity of its land and protect the birds and animals on their properties. The company has identified four specific areas through which it can contribute to the socio-economic development of South Africa. These are: skills development, enterprise development, preferential procurement and CSI. Procurement is done through suppliers that are controlled by entrepreneurs from previously disadvantaged groups. The main focus of their social investment programme is on the development of young people and the upliftment of the area in which their head office is located.

## **Company F**

The group operates in four major segments: Tour Operators, Retail Travel, Coaching and Touring, and Marine and Boating. It is committed to the highest standards of integrity, behaviour and ethics when dealing with its stakeholders.

The company asserts that it is committed to BBBEE as a socio-economic process, that directly contributes to the economic transformation of South Africa and brings about significant increases in the number of previously disadvantaged individuals that are able to participate actively in the country's economy. It is further committed to training black-owned SMMEs in their travel businesses. The company is involved in the implementation of a HIV/Aids prevention and impact management strategy. It is a member of the Travel Corporation Conservation Fund. Since 2008 this fund has donated over R14 million to various conservation projects worldwide.

# **DISCUSSION**

The research findings suggest that Companies A,B and C have the highest frequency of CSR reporting activities. All the companies address CSR activities in their annual reports. It is clear that most of the companies are committed to various CSR activities. This has emerged in other studies (Jones *et al.*, 2005). These findings are in contrast with other researchers' findings in which it is reported that, although many companies report a need to implement CSR, they are not committed to these activities (Jones *et al.*, 2006).

Only one of the companies consulted did not report involvement in charities. The results are supported by Holcomb *et al.* (2007). The companies spend a lot of money on charities, but very little is reported on the involvement of employees. It is noticeable that only one of the companies reports that their employees volunteer for community projects. It can be concluded that it is easier to spend money on projects without becoming involved. The companies report on CSR activities in areas including environment, community, market place, workforce, vision and ethical values. These activities correlates with the findings of other recent studies ( Jones *et al.*, 2006; Holcomb *et al.*, 2007).

There is a noticeable reporting on BEE aspects and HIV/Aids programmes, which are not usually present in other studies (Holcomb *et al.*, 2010; Holcomb *et al.*, 2007; Jones *et al.*, 2006). These issues are

relevant in the South African context. Diversity, whether it relates to employees or to procurement is a virtue (Holcomb *et al.*, 2007).

Environment is another category that features in reporting. Holcomb *et al.* (2007) report on conflicting evidence from their study on CSRR in hotel companies. Different methods of water and energy saving are reported and two companies tasked their employees to assist with these ventures. The UK gambling industry hardly mentions environmental issues (Jones *et al.*, 2009).

All the gaming companies report substantially on their Responsible Gaming Programme, while the majority of the UK's major gambling operations report on their commitment to CSR (Jones, *et al.*, 2009). The high frequency of reporting on training is gratifying. Most of the companies cite extensive training opportunities for employees. Having their own training institutes communicating CSR activities could give them a competitive edge in the process of recruiting and retaining employees (Holcomb *et al.*, 2007).

## CONCLUSIONS AND RECOMMENDATIONS

This paper has some limitations as an exploratory study, as only annual reports of the companies reported on. In-depth interviews with people responsible for CSR could have resulted in a more comprehensive study.

All the tourism- and hospitality-related companies listed on the JSE report on CSR. A marked variation in the extent, nature and content of reporting is evident. Similar areas are covered and a general commitment to empowerment of the previously disadvantaged, HIV/Aids support, environment issues and involvement in the community is common to all. Reporting on all CSR activities is commendable, but it is an open question whether CSR is solely a management responsibility or whether all company employees should be aware of, committed to or involved in these activities. This issue leaves ample opportunity for further research on involvement rather than on reporting only.

# THE IMPACT OF TRADITIONAL AND NATIONAL VALUES ON ATTITUDES AND WILLINGNESS TO BUY COSMETICS IN SINGAPORE

**Yamen Koubaa and Gaëlle Ulvoas**  
**The Brittany School of Management, France**  
**Patricia Chew, Unisim, Singapore**

## ABSTRACT

*The Chinese Singaporean woman has a two faceted identity. Singaporean she is, but also Chinese with a double commitment to her national and ethnic identities. This paper examines the double influence of traditional Chinese and national Singaporean values on the attitudes towards skin beauty and the buying intention of Chinese Singaporean women related to beauty care. Results from an empirical investigation reveal a dual effect of traditional Chinese and national Singaporean cultural values on the attitudes towards skin beauty and on the willingness to buy skin care cosmetics that varies across skin whitening products, skin smoothing products and skin anti-ageing products. The study relies on a structural modelling approach.*

## INTRODUCTION

As China represents almost a fifth of the world population today (CIA World Factbook, July 2010 estimate), the Chinese consumer has been the focus of increasing attention in the area of consumer behaviour research (Yau, 2001; Zhang and Jolibert 2003; Cheng and De La Robertie, 2009). Overseas Chinese communities in particular have developed throughout the world, especially in South East Asia. For instance, Chinese are the dominant ethnic group in Hong-Kong, Taiwan and Singapore and China towns are spreading across big cities around the globe. Unlike their fellow Chinese in mainland China, expatriate Chinese's culture has evolved under the shade of the host country's national culture. Culture is a main determinant of consumer behaviour (McCracken, 1986) and cultural values play a leading role in this scheme of influence (Kamakura and Novak, 1992; Luna and Gupta, 2001). Surveys have shown that different ethnic groups, as they hold different cultural values, display differences in their consumption patterns (Sekhon and Szmigin, 2009; Jung and Kau, 2004). Across researches, Chinese values were found to influence the search for information (Yang, 1989), learning and memorizing processes (Schütte and Ciarlante, 1998; Trompenaars and Woolliams, 2004; Usunier and Lee, 2005), aesthetics and country of origin perceptions, attitude and loyalty toward the product (Schütte and Ciarlante, 1998; Usunier and Lee, 2005) and purchase frequency (Zhang and Jolibert, 2003). The current study focuses on the effect of cultural values held by expatriate Chinese on their willingness to buy. Its objective is to investigate the influence of traditional Chinese and local national values on the attitudes and willingness of Chinese Singaporeans. The research is an empirical one. After defending the theoretical rigor of the study in the first section, we present the methods and the findings in the second section. The third section discusses the results and presents the implications. The paper ends with conclusions, limitations, and windows for future researches.

## CONCEPTUAL BACKGROUND

The influence of values on attitude and willingness to buy or intentional behavior has been clearly established (Williams, 1979; Neuman 1986; Homer et Kahle 1988). Homer and Kahle (1988) have developed a three level causality model: values, attitude related to nutrition and purchase(s) of healthy food. Results show that a causality link exists between values and buying behavior but that the link between values and attitude is

even stronger. McCarty and Shrum (1993) adapted Homer and Kahle's model (1988) to recycling activities and reached the same conclusions. Attitude thus becomes a mediator variable between values and buying behavior. Values are useful to explain behaviors such as donations to charities, blood donations, recycling, etc (Mc Carty et Shrum, 1993). In the area of ecology and environmental protection, several studies conducted between 1986 and 1995 highlighted the positive correlation between values and a positive attitude toward ecology. For instance, Grunert and Juhl (1995) demonstrated that a link exists between collective values and the green attitude of a person, which in turn influences the purchasing behaviour of organic products. The values-attitude-buying behavior link is therefore widely supported.

***H1: Consumers' cultural values impact their attitudes towards the product which in turn impact their buying behavior***

According to Kroeber and Kluckhohn (1952, p. 181), " culture consists of patterns, explicit and implicit, of and for behaviors acquired and transmitted by symbols constituting the distinctive achievements of human groups ... the essential core of culture consists of traditional ideas and especially their attached values". Values thus reflect and make the fundamental part of a culture. They shape beliefs and attitudes, and influence individuals' behaviors while providing a set of available solutions to problems commonly encountered (Hofstede, 2001). The two main characteristics of cultural values are their stability over time and their adaptability. Stability requires that a society's cultural values be strongly dependent upon its traditional values, which has been demonstrated for the Chinese culture (Yau, 2001). At the same time, seldom will a culture not receive external influences and adapt. In this sense, Luna and Gupta (2001) state that an individual behavior is the result of his cultural values system in a specific context. Hence, although ethnic cultures are quasi-stable over time, they also evolve in accordance with the context they develop in. Ethnic groups living outside their mother countries are good proofs of this evolution. Albeit they've kept many of their traditional values, Mexicans in the United States, Indians in the United Kingdom, North Africans in France, and Turks in Germany exhibit disparate cultural patterns and non-similar values from their fellows living in their mother countries. Overseas Chinese are no exception. However, while many overseas ethnic communities find their mother country's cultural values so flavored locally, Asians and specifically Chinese are known for being very preservative of their mother culture (Kurata et al, 1994). This never means that overseas Chinese could keep their mother country's values immune and away from local adaptation, it suggests that the extent of adaptation differs. Communities of overseas Chinese living in South East Asian countries, namely Chinese in Singapore, are not so far from mainland China. Grace to the intense economic, political and social exchanges between China and these countries, overseas Chinese in Singapore and other East Asian countries remain somewhat incarnated in their mother country's values and adapt with great care to mother values (Chew and Putti, 1993). Therefore, it is very likely that Chinese Singaporeans' attitudes are simultaneously strongly influenced by mother country's cultural values and local country's cultural values. Traditional Chinese philosophical and religious influences mainly come from three schools of thought: Confucianism, Buddhism and Daoism. Each of these three doctrines can have an impact on a specific aspect of Chinese people's lives. Confucianism's role would be greater on social life (relationships in general and family), Daoism on private life and Buddhism on spiritual life (Zhang and Jolibert, 2003). Confucianism has been the main cultural determinant of Chinese culture for over 2000 years. The key principles of Confucian ethics are the stability of society based on the hierarchy of relationships amongst people, the adoption of the family as the prototype of any social organization, a virtuous behavior toward others which consists in treating them as one would like to be treated, and virtue applied to one's own tasks in life (Hofstede and Bond, 1988). Confucianism, being a philosophy or an ethics code and not a religion, has left room for Asian religions to develop, especially Buddhism and Daoism, parallel to its principles (Liang, 1996; Hofstede and Bond, 1988). Buddhism aims at freeing man from the grasp of suffering issued from desires associated with material life and sins originating in an earlier life. Since Buddhists are only interested in their future life and compassion toward all humans, they lead a simple life on earth (Harvey, 1990). Daoism, however, teaches people a way of life that enables them to be in harmony with nature and to enjoy life. According to this school of thought, nature is a step above all other beings. When it comes to human action, Daoism is more interested in processes than results. It advocates the respect of nature and a life in harmony with it (Lao Zi, 6<sup>th</sup> century B.C.). The two manifest traditional Chinese religious philosophies present today in Singapore are Buddhism and Daoism. Besides, Singapore is a multiracial society where the preservation of each ethnic group's own unique culture, including religious values, has been encouraged along with national harmony (Jung and Kau, 200; Chinese Heritage Centre, 1998) thus enabling Chinese Singaporeans to freely practice their Buddhist and Daoism rituals and learning, and to refresh their traditional beliefs and values. However, even though only

Buddhism and Daoism are manifestly present in Singapore as Chinese religions, Confucianism has had a recognized historical influence on the development of the Singaporean culture and according to Kuo (1988) it should be considered as a strong cultural root. Since independence, both the construction of a Singaporean identity and the preservation of each ethnic group's own identity have been encouraged. The Singaporean identity was built on the ground of British legacy of Western tradition and that of shared values common to the three ethnic groups which make Singapore: Chinese, Malays and Indians. Shared values, which are more widely accepted by all ethnic groups, replaced Confucian ethics which had been previously taught to Singaporeans. They have led to what is now referred to as Singaporean values. Four waves of studies on Singaporean values conducted between 1991 and 2001 (Kau, Tan et Wirtz, 1998; Kau, Jung, Tambyah et Tan, 2004) have revealed the six following Singaporean values orientations: family, status, traditionalism, societal consciousness, materialism and entrepreneurship. Family values are love, care and concern, mutual respect, filial responsibility, commitment and communication. These values enable one to feel "appreciated and treasured" (Kau, Jung, Tambyah and Tan, 2004, p.18). Status consciousness translates into the type of house and car one owns, as well as clothing. Traditionalism refers to the respect of traditions, including celebrating festivals and being religious. Societal consciousness mainly translates into efforts to raise money or dedicate time to charities. Materialism focuses on money value and effectiveness such as the monetary value of a job and the belief that money can solve most of a person's problems. Entrepreneurship relies on self-confidence, creativity, realising one's full potential. Building on the dual effect of traditional Chinese and Singaporean values on the attitudes and behaviors of Chinese Singaporeans, and given that Singaporean values were historically inspired from traditional Confucian philosophy, we suppose that:

***H2: Attitudes and then behaviors namely buying behavior of Chinese Singaporean women are likely to be strongly influenced by both traditional Chinese cultural values and national Singaporean cultural values***

***H2a: Buddhist values influence Chinese Singaporean women's attitudes and buying behaviors***

***H2b: Daoism values influence Chinese Singaporean women's attitudes and buying behaviours***

***H2c: Confucian values influence Chinese Singaporean women's attitudes and buying behaviors***

***H2d: Singaporean values influence Chinese Singaporean women's attitudes and buying behaviors***

Women's aspiration for beauty is universal. However, the definition of beauty varies from one culture to another. In Asia, where white represents nobleness, mystery and secret, cultural variations are as numerous as ethnic, climate and geographic ones. Asian women however have a common desire: that is to have a fair skin. Three studies carried out on Asian populations show that the factors of greatest influence on the quest for a fair skin are a woman's geographic origin, age, culture and original cultural environment (Saito, 2001). Besides, fairness of the skin doesn't by itself make the ideal skin. It has to be associated with a smooth texture. The survey of Chinese women undergoing an intensive beauty care for the purpose of skin whitening and smoothing showed that these women enjoy the physiological benefits coming from the beauty investment on themselves as the result of the sense of accomplishment and personal merit associated with personal discipline (a traditional Confucian value) which they demonstrate throughout the « beauty diet » period. Saito (2001) speaks about the "ideal skin fairness" as the concept to be defined to better understand the beauty ideal sought by Chinese women. She suggests that women's aspiration for this "ideal skin fairness" is not only for their own individual satisfaction, but also because they desire to build harmonious relationships with their dear ones and the society they live in-the two being also traditional Confucian values. The survey of the purchasing behavior of a group of women in the traditional region of Beijing (Zhang and Jolibert, 2003) showed the influence of traditional Chinese values in this context. This influence translates in Confucian women's preference for prestigious brands, which reflect their status; the preference of Buddhist women for simple, rather cheap products; and that of Daoist women for natural and good quality products. Retailing data (Euromonitor 2010) shows that cosmetics sales are rapidly growing among Asian women and that face care cosmetics such skin smoothing, skin anti-ageing and skin whitening are among the best selling products for women in countries like Japan and Honk Kong for instance. Singapore is included neither in Saito's (2001) nor Zhang and Jolibert's (2003) surveys. Therefore, it is interesting to investigate whether the conclusions reached by these authors apply to Chinese Singaporean women. Building on these conclusions, we propose that:

***H3a: Traditional Chinese values impact Chinese Singaporean women's attitudes and their buying behaviors of skin care products designed for the purpose of skin smoothing, skin whitening, and skin anti-ageing***

***H3b: Singaporean values impact Chinese Singaporean women's attitudes and their consumption behaviours of skin care products designed for the purpose of skin smoothing, skin whitening, and skin anti-ageing***

## METHOD

First we checked for the scales' reliabilities to be sure about the adequacy of the scales used to measure the constructs studied. Then, we checked for the stability and the consistency of the measurement structures reproduced from previous researches via a confirmatory factorial analysis (CFA). Third, we conducted principal components analyses (PCA) for those inconsistent structures. The principal components analyses allowed us to extract new structures of measurement eventually more consistent with the Singaporean sample. Afterward, we conducted confirmatory factorial analyses to confirm the structures extracted via the principal components analysis. Finally, we processed the final model for each of the three skin care cosmetics products studied. The final model is a structural model (SEM) that links Singaporean values (e.g., national and traditional) to attitudes towards skin care beauty and then to their willingness to buy skin care cosmetics. Data was collected via questionnaire among Singaporean women between October and November 2010. 370 useful questionnaires were collected. Almost 50% of the respondents were aged between 20 and 29, 20% aged less than 20, almost 10% respectively aged between 30 and 39, 40 and 49 and 50 and 59. The age is quite dispersed across the various age group of the Singaporean women society. Almost 70% of respondents are single, more than 25% are married and less than 5% are living under another marital status. Almost 40% of respondents are living in households with three persons and 37% are living in households with four persons. 95% of respondents are having an educational level higher than senior high school and up to university level. Almost 40% of respondents are students and the remaining ones are having various occupations such as services sector, liberal professions, government employee, etc. Less than 50% are having a gross income of 1000 Singaporean dollar per month, 35% are having a gross income between 3000 and 5000 and the remaining ones are having a gross income superior to 5000 Singaporean dollar per month. Buddhism (34.1%) and Christianity (32.2%) are the dominant religions of the respondents. 11.9% are free-thinker. The remaining 23% are dispersed between Daoism, Islam and Atheism. All the constructs and measurements we have used in the research have been partially validated in previous researches. Table 1 presents the original sources of these measurements. Hence, after checking the scales' reliabilities, we move onto conducting confirmatory factor analyses (CFA) to check whether these structures are to keep invariant with the current research or need some refinements. We conduct a CFA for each multidimensional structure. That's to say 4 CFAs: one CFA for each of the cultural components. Note that the constructs of attitudes towards skin beauty as well as the willingness to buy skin care cosmetics were taken as one-dimensional structures. Table 2 summarizes the goodness of fit of the models used for measurement.

Alpha values support the reliability of the scales used. Except for the scale of attitudes towards skin ageing products (Alpha= 0.63), all the scales have Alpha values equal or superior to the cutting point of 0.7 (Nunnally, 1978). Alpha value of the scale measuring attitudes towards skin ageing is not that far from 0.7 and the scale can be regarded as a reliable one.

**Table 1 –Constructs and measurement tools**

<b>Constructs :</b>	<b>Measurements :</b>	<b>Remarks :</b>
Traditional Chinese values	Zhang and Jolibert's (2003)	Translated into English and validated in Singapore through the 2006 survey (Ulvoas, 2007)
Singaporean values	Kau, Jung, Tambayah and Tan (2004)	Used in the original version
Attitude toward skin whitening, smoothing and anti-ageing	Saito (2001) and partial validation through Ulvoas (2007)	Re-examined through the current study

**Table 2: goodness of fit of the models used for measurement (as presented in the theoretical background)**

<b>Model</b>	<b>CMIN/DF</b>	<b>GFI</b>	<b>RMR</b>	<b>RMSEA</b>	<b>HOELTER</b>
Buddhist	89.98	0.47	0.09	0.49	7
Daoist	211.29	0.41	0.13	0.75	4
Confucian	133.85	0.34	0.16	0.60	4
National Singaporean	69.60	0.25	0.11	0.37	8

The indices of goodness of fit in the table above show that all the models used to measure the constructs require refinement. In fact, GFI (goodness of fit index) which should be close to 1 and RMR ( root mean square residual) which should be close to 0 for a good goodness of fit are far from these values. RMSEA ( root mean square error of approximation ) which should be between 0.05 and 0.08 for the best fit and not so far from 0.1 for an acceptable fit is far from these values and HOELTER index ( sample adequacy index) values show that there is no problem with the sample size as HOELTER values are low (Byrne, 2001). Following these findings, we performed a principal components analysis with Varimax rotation to refine the measurements. In order to decide how many components to retain and what are the items to retain by component, we need to check three details: first, we need to check the communality of each item to see whether this item is strongly or weakly contributing to the extraction of factors (Stewart, 1981). Second we need to check the percentage of the explained variance of each of the factors extracted to decide about the number of factors to retain. Finally, we need to check the loading of each item on the factors retained to decide about the number of items to retain by factor and about the content of each retained factor. The principal components analyses reveal new structures slightly different from those supposed in the research background. Table 3 summarizes the outputs of the principal components analyses. Note that we have fixed the cut point of 0.5 for item extraction to judge the item as having a high communality and worth to retain. We believe that if the item is extracted for less than 50% (i.e. communality less than 0.5) it should not be considered as a viable one in the analysis and should be rejected from the outputs of the PCA. Likewise, we have fixed the cut point of 0.55 for the loading of the item on the factor retained. Items with a loading less than 0.55 will be rejected. We think that fixing high the cut point of items' loadings on factors is necessary especially with rode scales like the ones we are using in this research.

**Table 3: outputs of the PCA analyses**

<b>Construct</b>	<b>Items rejected for low communalities</b>	<b>Factors retained</b>	<b>Cumulative explained variance</b>	<b>Items retained and content of the component</b>
Buddhist values	B4	3	69.92	1:B1, B2, B3:equity and kindness 2:B7, B8: predestination 3:B5, B6: modesty
Daoist values	D1, D2, D3	1	49.5	D4, D5
Confucian values	C6, C7	3	64.76	1:C1, C2, C3:status 2:C4, C5:saving face 3:C8, C9: discipline
National Singaporean values	S12, S13, S20, S24	4	43.97	1:S1, S2, S3, S4, S5, S6, S7:family value 2:S17, S18, S19, S21:materialism 3:S8, S10, S11: environment value 4:S9, S14, S15: community value

PCA revealed new structures for the constructs. Nevertheless, the new structures are not that different from the ones defended in the background. Most of the changes occurring are due to the elimination of those items with low communalities. The contents of the new components were kept almost invariant comparing to those before the PCA. There was only reduction in the number of items retained as measures for the components. Note here that for the one-dimensional structures of attitudes towards skin beauty and the willingness to buy skin care cosmetics we haven't conducted PCA as the number of items is limited ( respectively 3 and 4). In a second stage and going to confirm the structures revealed by the PCA, we conduct a second round of confirmatory factor analysis to check the stability and the reliability of the structures we extracted. Table 4 presents the results of the second round of CFA.

**Table 4: goodness of fit of the models used for measurement (as extracted from the PCA)**

<b>Model</b>	<b>CMIN/DF</b>	<b>GFI</b>	<b>RMR</b>	<b>RMSEA</b>	<b>HOELTER</b>
Buddhist	9.53	0.88	0.04	0.15	65
Daoism	289.35	0.63	0.09	0.8	5
Confucian	5.93	0.92	0.03	0.1	104
National Singaporean	6.96	0.78	0.04	0.12	65

As shown in table 3, most of the structures got from the PCA are confirmed and exhibit strong reliabilities. Buddhist values and Confucian values are found to be tri-dimensional constructs. National Singaporean values construct is found to be four-dimensional construct. Worth to note here that the initial 32 items used to measure the National Singaporean values appear to be –to some extent- heterogeneous. In fact, the PCA revealed that in order to get 55% of the explained variance, we need to consider 7 different components with this construct. Less strong reliabilities however are found with the Daoist values. The last construct are proven to be one-dimensional constructs and this one-dimensionality may have contributed to the weakness of the overall goodness of fit of the measurement structure of the Daoism values' construct. After being sure about the robustness of the constructs and of their respective measurement structures, we moved onto processing the whole model. The whole model is the model that draws the link, from one side, between the Chinese and national Singaporean cultural values and the attitudes towards skin care beauty (Skin fairness, skin smoothness and skin ageing), and from the other side, between the latter attitudes and the willingness to buy skin care products (skin whitening products, skin smoothing products and skin anti-ageing products). We measured the buying behavior of respondents by the extent to which they are willing to buy the cosmetic product in question. Table 5 presents the goodness of fit indices s for the final models estimations.

**Table 5: goodness of fit indices for the final models**

<b>Model</b>	<b>CMIN/DF</b>	<b>GFI</b>	<b>RMR</b>	<b>RMSEA</b>	<b>HOELTER</b>
Skin whitening	12.85	0.66	0.04	0.09	52
Skin smoothing	13.96	0.76	0.05	0.09	69
Skin anti-ageing	24.09	0.64	0.07	0.11	44

Goodness of fit indices in table 4 show an acceptable goodness of fit for all the models. Even though GFI is not so close to 1, the sign of a goodness of fit, RMR and RMSEA values are both indicating an acceptable goodness of fit. In fact RMR is close to 0 and RMSEA is below the cut point of 0.1 except for the model of skin anti-ageing. Coupled with the Chi Square value, we think that –although the models are not showing an excellent goodness of fit- all the three models estimated are exhibiting acceptable goodness of fit that allow us to consider the results got from the structural equation modeling estimations.

## INTERPRETATIONS AND DISCUSSIONS

Results of the estimation via SEM show that cultural values significantly impact the attitudes towards skin beauty and then the willingness to buy skin care cosmetics. In fact, across the three types of attitudes (skin fairness, skin smoothness and skin ageing) and across the three types of skin care cosmetics (skin whitening, skin smoothing and skin anti-ageing), cultural values have had significant impacts on the attitudes towards skin beauty and the attitudes towards skin beauty in their turn have had significant impacts on the willingness to purchase skin care cosmetics. Hence H1, H2 and H3 are all confirmed. Traditional Chinese and national Singaporean values impact the attitudes of Singaporeans women towards skin fairness. However, with Chinese values, only Buddhist and Confucian values that had significant impacts on the attitudes towards fairness with Confucian value being the most influential (3.03). Note that Confucian values are the only traditional Chinese values that had a strong positive significant impact on attitudes towards fairness. Buddhism and national Singaporean values however had moderate negative significant impacts on attitudes towards skin fairness. As regard the effect of attitudes towards skin fairness on the willingness to buy skin whitening cosmetics, results support a significant positive effect of these attitudes on the willingness to buy skin whitening cosmetics. The latter effect has a size of 0.19. Coupling the findings about attitudes towards skin fairness and the willingness to buy skin whitening cosmetics, we conclude that the more the woman adopts Confucian values, the more she will hold a favorable attitude towards skin fairness and hence the more she will be willing to buy skin whitening cosmetics. In contrast, the more the woman adopts Buddhist and national Singaporean values the less she will hold favorable attitudes towards skin fairness, and hence the less she will be willing to buy skin whitening cosmetics. Therefore H2a, H2c, H2d, H3a and H3b are confirmed for skin whitening. Buddhist and national Singaporean values are the only cultural values that had significant positive impacts on the attitudes towards skin smoothness, with national Singaporean values being the most influential. Likewise, the attitudes towards skin smoothness had a significant positive effect on the willingness to buy skin-smoothing cosmetics of a size of

0.27. Coupled with the findings about attitudes towards skin smoothness, we conclude that the more the woman adopts Buddhist and national Singaporean values, the more she will hold a favorable attitude towards skin smoothness and hence the more she will be willing to buy skin-smoothing cosmetics. Therefore H2a, H2d, H3a and H3b are confirmed for skin smoothing. Only national Singaporean values had significant impact on the attitudes towards skin ageing. This impact is positive and of a size of 0.39. Likewise, the attitudes towards skin ageing had a significant strong positive impact on the willingness to buy skin anti-ageing cosmetics of a size of 21. Therefore, H2d, H3a and H3b are confirmed. Culture is an evolving phenomenon across time and across places. The current research proves that ethnic cultural values cannot be kept intact from the influence of the host environment. Expatriate ethnic groups like Chinese Singaporeans exhibit a culture mixing traditional ethnic values with the national values of the host country resulting in a mix of values different from the traditional ethnic ones and from the pure values of the host environment. It is then wise not to consider expatriate ethnic groups as an intact extension of the mother culture. These expatriate groups appear to develop new set of values that have disparate impacts on attitudes. Attitudes, and in line with previous findings, are found to be strongly influenced by cultural values. Cultural values are found to have a strong impact on attitudes towards face beauty. Both the traditional ethnic and the national values have shaped women's attitudes towards face beauty, although their impacts differ in significance and size across determinants of face beauty. Note that we have studied three facets of the Singaporean women face beauty namely the skin fairness, skin smoothness and skin anti-ageing. Confucian values which are one pillar of the Chinese traditional values have had only a strong significant positive effect on the attitudes towards skin fairness which is in line with the principles of Confucianism of nice appearance, transparency and the good face-good behaviour link. It might be interesting for marketers of skin fairing cosmetics products for Asian women, particularly those affiliated to the Confucianism philosophy, to stress transparency and virtuous behavior to communicate on their products. Buddhist values, which are one of the main religions in Singapore, have had relatively weak positive impacts on two facets of Asian face beauty namely skin fairness and skin smoothness. The positivity finds salience in the principle of harmony and compassion strongly encouraged in the Buddhist philosophy. The weakness of the effect is due to the lesser interest Buddhism gives to the actual life in favour of the future life. Buddhists aims at freeing men from the greed of this life and look at conducting a simple life on earth; and being too concerned about one's appearance would not let you enjoy a simple life. Based on the latter findings, we think that Buddhist values can't play a considerable role in orienting the attitudes of Singaporean women consumers towards face beauty. However, Buddhist values such as harmony and compassion for others may be used as complement techniques to anchor the desirable attitude in the minds of Singaporean women. The third pillar of traditional Chinese values studied in this research is Daoism. Daoist values are found of no impact on the attitudes of Singaporean women towards skin beauty namely face beauty. We think that the reasons of such findings are first the limited presence of Daoists among the Singaporean women surveyed, and second the assimilation of the principles of Daoism in the other two dominant Chinese philosophies -according to the results- namely Confucianism and Buddhism. Therefore, we suggest that Daoism values would not play any significant role in shaping Singaporean women attitudes towards face beauty. National Singaporean values, which are the values of the host country, are found to be the most significant. In fact, national Singaporean values have had statistically significant positive impacts -albeit moderate impacts- on the three determinants of face beauty, that's to say skin fairness, skin smoothness and skin ageing. The latter finding is not surprising. In fact, the Singaporean government has been working since independence on the establishment of common national values for all in order to create a national spirit common to the various ethnic groups forming the Singaporean society. Singaporeans are converging through time towards common national Singaporean values backed by a political will and a time effect. Through time, ethnic groups are getting more and more influence from the host country that contributes to strengthening of national values in detriment sometimes of traditional ethnic values. The moderate effects of national Singaporean values on the attitudes studied may find salience first in the relatively strong influence of traditional ethnic values on expatriate ethnic groups due to the developed social, economic and cultural exchanges Chinese Singaporeans are having with main land China and second in the limited period Singaporeans have had living together. Note here that Singapore got its independence in the late 60s, they have just 50 years of common life and the generation of common national values from heterogeneous groups is a time consuming process. Hence, currently, we believe that national Singaporean values and traditional ethnic values are almost equally shaping the attitudes of Singaporean women with more influence expected for the national values in the future due to the political will and to the time effect. These findings are reminiscent of what North Africans have experienced in France and of what Hispanic have experienced in the United States. It is then wise for marketers of face beauty cosmetics for Singaporean women to highlight and stress national Singaporean values such as luxury, value for money, social status to better and deeper get into the minds of Singaporean women.

The second link besides cultural values-attitudes is the effect of attitudes on the buying intention or the willingness to buy cosmetics products to keep the face beautiful. Here too, and in line with previous researches, attitudes have had significant impacts on the willingness to buy the products. The impacts revealed along this study were all positive. That's to say, more the attitudes towards skin fairness, skin smoothness and skin anti-ageing are strong, more Singaporean women are willing to buy skin whitening cosmetics to keep their faces fair, to buy skin smoothing cosmetics to protect the texture of their skins, and to buy skin anti-ageing cosmetics to keep the face young and of good appearance. These results prove that Singaporean women's willingness to buy skin care cosmetics passes through their attitudes towards face beauty. It is hence rigorous to target attitudes to get women willing to buy. The impact on the willingness to buy which will lead to the effective buying is an indirect impact that takes attitudes as mediators. Nonetheless, it is always of value to work on these factors affecting directly the willingness to buy such as the atmosphere in the point of sale, the salesperson skills, and the display; however, factors orienting and shaping attitudes should be given great interest from marketers. The link between cultural values, attitudes towards face beauty and willingness to buy skin care cosmetics is a structural link leading to the consideration of attitudes as a mediating variable between cultural values and buying intention.

## CONCLUSIONS

Culture is not static; it evolves across places and time. Expatriate ethnic groups such as Chinese Singaporean women are adopting a cocktail of cultural values mixing their traditional ethnic values with those of their host country, Singapore. These values have had disparate impacts in terms of significance and sizes and across the determinants of face beauty (fairness, smoothness, anti-ageing) on the attitudes towards skin beauty namely face beauty. Marketers are invited to design their actions in accordance to the roles played by each of these values on the attitudes towards the three determinants of face beauty among Singaporean women. Likewise, attitudes are found of strong effect on the willingness to buy. A pretty part of the willingness to buy skin care cosmetics is derived from the attitudes held in minds about the determinants of face beauty. Attitudes play a mediating role between cultural values and buying intention via a structural link. There are several points that deserve reconsideration in this research. First, even though the sample can be considered as large, we think that, regarding the number of variables we have in our model, it is wise to rely on a larger sample. Second, the research was about specific cosmetics products namely those related to skin care, we think it is judicious to extend the analysis to other categories and types of products. Third, to gain on the reliability of the findings and the research framework, it would be necessary to reproduce this study with different expatriate ethnic groups such as Turks in Germany and North Africans in France.

# **A REAL OPTIONS MODEL FOR ENERGY SERVICE CONTRACTING INTEGRATED WITH TRANSACTION COST ECONOMICS**

**Ahmet Can Kutlu and Seçkin Polat**  
**Istanbul Technical University, Turkey**

## **ABSTRACT**

*Energy service contracting, which can provide a cost-effective way to overcoming barriers to energy efficiency, is a form of outsourcing and should be considered as an economic problem rather than a technical one. However economics of energy service contracts have a very little attention in the energy related literature. In the study, energy service contracting decision is generalized as a make-or-buy decision and this choice of providing the energy service activities inside or outside of the firm is modeled by real options approach integrated with the transaction cost economics approach.*

## **INTRODUCTION**

The technological innovations and their impacts on the production processes, globalization, mobility of the capital in the international level and the developments in the communication field have caused an increase in the demand of energy and its consumption. This issue has brought the energy concept up in a strategic context since energy is an input for the organizations like manpower, raw materials, etc. for the organizations and the rise in the price of energy resources increases the energy costs of the firms. Therefore there is a need for energy efficiency which is defined as to decrease the share of the energy input in the production or producing the same outputs by consuming a lower amount of energy.

When firms begin to implement energy efficiency activities, they may reduce costs and gain competitive advantage by energy saving. Energy service contracting which is form of outsourcing can provide a cost-effective way to overcoming barriers to energy efficiency (Sorrell, 2007). The energy services can be outsourced to the energy service companies (ESCOs) or they can be handled inside the firm by investing to the necessary assets such as workforce, equipment, technology, etc. Energy service contracting can be chosen when the expected reduction in energy costs is higher than the transaction costs which occur during negotiating and managing the relationship with the energy service provider. As a result energy efficiency services should be considered from an economic point of view rather than a technical one as this case is known make-or-buy problem.

The economics of energy service contracts have little attention in the area of energy literature. In the paper the economics of energy service contracts will be analysed and modelled with a real options (RO) perspective that is integrated with transaction cost economics (TCE) approach. In next section, literature about energy service contracts and energy service companies are given. Later real options perspective and the applications of real options for the discussed field are explained. Subsequently the energy service contracts are modelled with an integrative approach and in the last section the paper is concluded.

## **ENERGY SERVICE CONTRACTING (ESC)**

Energy service contracting, which can be defined as the transfer of decision rights over key items of energy equipment under the terms and conditions of a long-term contract, including incentives to maintain and improve equipment performance over time, is the process of outsourcing one or more energy-related services to a third party (Sorrell, 2007). The energy services such as installing, commissioning and maintaining equipment, purchasing energy commodities and identifying energy saving opportunities can be classified in the scope of energy service contracting. There are various reasons for considering outsourcing and contracting services for an industrial energy consumer. Some of them are listed below (Helle, 1997).

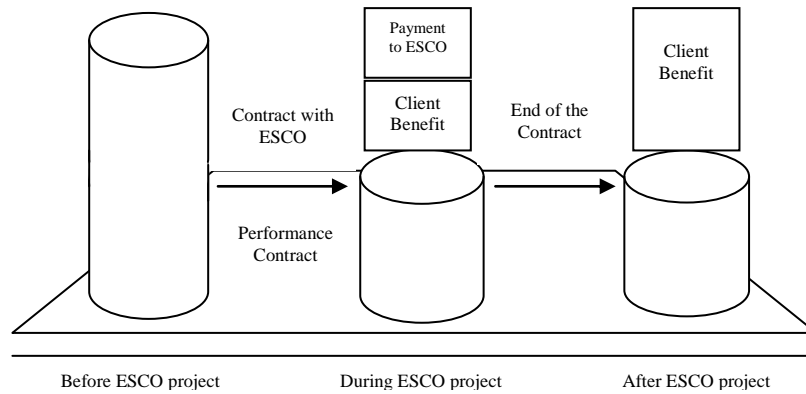

- The company does not possess the necessary know-how for the realization and is not experienced in managing complex energy investments.
- Financial restrictions are conceivable, too; the financial limits or the available financial resources respectively are exceeded or preferably spent for projects covering the company's priority sectors.
- Since contracting is an off-balance financing scheme, there can be reasons in favour of contracting with respect to corporate financial policy when drawing up the balance sheet.
- Due to its market strategies, a company attaches a high priority to outsourcing, that is to say in-house activities carried out in the company's non-priority performance sectors will be increasingly offered to external companies.
- The risks and (internal) transaction costs arising from projects outside the company's priority sectors are deemed too high. As a consequence, for example the levels of the required profitability of such projects may be high (that is to say short pay-off periods or high internal rates of return respectively); similar restricting conditions, such as expected amortization periods not exceeding 4 years, are quite widespread in the field of industrial energy management.

Two types of energy service contracting projects exist in general. First type is the conventional “turnkey” projects (Sorrell, 2007) or facility contracting projects (Helle, 1997) where the contractor is responsible for design, specification, construction, and commissioning and is paid on project completion. However the contractor may be liable if the equipment does not work or does not perform to specification, but has not any responsibilities for the operation of the equipment and has neither the incentive nor the means to optimise equipment performance subsequent to project delivery (Sorrell, 2007). The latter one is the energy performance contracts (EPC) which is a performance-based procurement method and financial mechanism for building renewal whereby utility bill savings that result from the installation of new building systems (reducing energy use) pay for the cost of the building renewal project.

## **Energy Service Companies (ESCOs)**

The companies that provide the activities involved in energy service contracts as are usually named energy service companies (ESCOs). ESCOs are the companies that operate in developing, installing and financing comprehensive, performance-based projects designed to improve energy efficiency or reduce maintenance costs for energy-consuming facilities over a certain time period (Cudahy and Dreesse, 1996; Dayton et al., 1998; Goldman and Dayton, 1996; Lee et. al., 2003; Vine, 2005). ESCOs that operate under an energy performance contracting arrangement, implement a project to deliver energy efficiency project, and has the income from the share of the cost savings, or the renewable energy produced, to repay the costs of the project (Okay, et. al. 2008). The process of an ESCO project with an EPC is illustrated in Figure 1. Before an implementation of an ESCO project, the client has a certain amount of energy cost. After the contracting, there is a reduction in the cost of energy due the efforts of energy efficiency activities taken by ESCO. The payment of the ESCO is given from a share of the saved energy and at this stage the benefit of client is small until the payments to the ESCO finish. At the end of the contract, the ESCO project finishes and since the ESCO gets paid in return of the project, the reduced energy cost is totally in benefit for the client. As a result, by the concept of performance-based contracting, ESCOs are fundamentally different from consulting engineers specializing in identifying and offering efficiency improvements, which are typically paid for their advice and undertake no risk that their recommendations will yield results (Okay, et. al. 2008; Lee et. al., 2003).

**Figure 1: Process of an ESCO Project**

Source: (Lee et. al., 2003).

## A TCE Approach to the Economics of ESC

The concept of transaction costs was first introduced by Coase (1937) and later developed by Williamson (1975, 1985). The unit of analysis in the transaction cost theory is the transaction, which “occurs when a good or service is transferred across a technologically separate interface” Williamson (1975, 1985). Transaction costs are defined by Williamson (1975, 1985) as the costs associated with an economic exchange that vary independently of the competitive market price of the goods or services exchanged. Transactions costs can be divided in two categories as the costs occurred during the contract such as drafting, negotiating, and safeguarding agreements between the parties to a transaction (*ex-ante* costs) and the costs occurred after the contract execution such as monitoring performance, maladaptation, haggling, renegotiation, establishment, operational, and bonding costs (*ex-post* costs).

Sorrell (2007) stated that contracting is expected to reduce overall production costs but increase overall transaction costs and can be chosen when the expected reduction in energy costs is higher than the transaction costs. In terms of energy concept, production costs is defined by Sorrell (2007) as the financing costs of any replacement conversion, distribution and control equipment, the staff and material costs for operation and maintenance and the purchase cost of energy commodities while transaction costs are the staff, consulting and legal costs associated with searching for a supplier, negotiating and writing the contract, monitoring contract performance, enforcing compliance, negotiating changes to the contract when unforeseen circumstances arise and resolving disputes. They also include the costs associated with opportunistic behaviour by either party, such as when a contractor fails to maintain equipment to an adequate standard (Williamson, 1985). In Sorrell’s model (2007) these variables is illustrated below;

$P_{CL}$  : Production costs incurred by client  
 $P_{CON}$  : Production costs incurred by the contractor  
 $T_{CL}$  : Transaction costs incurred by client  
 $T_{CON}$  : Transaction costs incurred by contractor  
 $PAY$  : Payments to the contractor

Additionally the three conditions for a viable contract are given in the following statements where IN and OUT superscripts refer to in-house and outsourced provisions respectively (Sorrell, 2007).

$$PAY \leq (PC_{CL}^{IN} - PC_{CL}^{OUT}) + (TC_{CL}^{IN} - TC_{CL}^{OUT}) \quad (1)$$

$$PAY \geq (PC_{CON}^{OUT} + TC_{CON}^{OUT}) \quad (2)$$

$$PC_{CL}^{IN} - (PC_{CL}^{OUT} + PC_{CON}^{OUT}) \geq (TC_{CON}^{OUT} - TC_{CL}^{OUT}) - TC_{CL}^{IN} \quad (3)$$

First condition explains that the contract payments are less than the total savings achieved by the client after the outsourcing. The second condition is that the contract revenues are greater than the total costs incurred by the contractor to be profitable. Finally the third condition, which is the main emphasis of the transaction cost economics approach, states that the total saving in production costs achieved through the contract must be greater than the total increase in transaction costs for making the outsourcing decision right.

# REAL OPTIONS

An option is the right, but not the obligation, to take an action in the future (Amram and Kulatilaka 1999). The development of real options theory has been based on the financial options theory in which the value of options on uncertain financial assets is assessed (Foss and Roemer, 2010). A financial options is defined as the derivative security whose value is derived from the worth and characteristics of another financial security or so-called underlying asset (Reuer and Tong, 2007). Basically two types of financial options are defined as call option and put option. A call option on an asset gives the right, with no obligation, to acquire the underlying asset by paying a pre-specified price (exercise price) on or before a given maturity while put option similarly gives the right to sell or exchange the underlying asset and receive the exercise price (Trigeorgis, 1996). In addition, a European option gives the right to exercise the option on the expiration date. However an American option gives the right to exercise the option on or before the expiration date.

The real options concept was developed from the seminal idea of Myers (1977). The idea is that one can view the discretionary investment opportunities of as a call option on real assets like a financial call option provides decision rights on financial assets (Reuer and Tong, 2007). As a formal definition, real options are the investments in real physical assets, as opposed to financial assets, which give the firm the right, but not the obligation, to take on the certain future actions (Reuer and Tong, 2007). Real options cover a systematic approach and integrated solution using financial theory, economic analysis, management science, decision science, statistics and economic modelling in applying options theory in valuing real physical assets in a dynamic and uncertain business environment. The options to delay the investment, to expand or contract a project, to abandon it or to switch the modes of production are considered when real option values are assessed (Roemer, 2004).

The real options theory which assesses the actual and potential resources of a firm including the value of flexibility is a dynamic approach that takes into consideration the changes in the future and supports the adaptations of the firm to the changes and uncertainties (Foss and Roemer, 2010). From the real options perspective, the firm can be viewed as a portfolio of real options instead of a conceiving the firm as a set of institutions, property rights or contracts as the traditional approaches propose (Roemer, 2004). Optimal flexibility covers an action plan that enables the firm to acquire the set of options which maximizes the net present value of the firm (Foss, 1998).

## Valuing Real Options

Different financial option pricing methods (Black and Scholes, 1973; Merton, 1973; Myers, 1977) have been used as the characteristics of financial options can be transferred to real investment issues to assess the value of real investment projects under uncertainty (Foss and Roemer, 2010). Black and Scholes (1973) developed a closed form solution for valuing a European option with one variable for continuous time. Merton (1973) extended the option valuation method of Black and Scholes (1973) considering the stocks with decreasing values due to dividend outflows to represent the option value of a product opportunity and defined a parameter that shows a rate of asset value erosion during the time. In addition the binomial lattice approach of Cox, Ross, and Rubinstein (CRR) (1979) is a powerful and flexible numerical procedure for valuing options for discrete time in the case of one variable. Boyle (1988) developed an extension of the CRR procedure for option valuation in the case of two state variables by using simulation technique.

## Real Options Perspective on Outsourcing Decision

There are several studies considering real options approach for the outsourcing decision. Cao et. al. (2007) used a binomial lattice option valuation method for R&D outsourcing decision. Nembhard et al. (2003) developed a financial model for assessing the option value for product outsourcing. They considered a three state-variable and used Monte Carlo simulation to estimate the value of option. Jiang et al. (2008) considered real options approach to valuate outsourcing contracts from the vendors' perspective. Their option valuation method is based on the general Brownian motion (GBM) standard setting in ROT and the continuous-time formulation of the random walk. Benaroch et al, (2010) developed a simplified real options models for

outsourcing and back sourcing under demand uncertainty considering internal and external fixed and variable costs. Datta (2005) used Black and Scholes formula with Merton's (1973) extension for calculating the option value for the outsourcing decision. When the option is in the money or in other words the option has a positive value, then it is right to exercise the option for producing the products or services in-house. Table 1 illustrates the option terms and their corresponding terms used as outsourcing concepts.

**Table 1: Option terms and corresponding strategic terms**

Option term	Strategic term
Time to expiry	Time horizon of the outsourcing decision
Stock price	Present value of cost of transacting with the market (purchase price + transaction cost)
Exercise price	Present value of cost of producing the services in-house
Volatility	Uncertainty of the cost of transacting with the market (arises due to fluctuation in transaction costs)
Dividends	Present value of cost incurred to maintain core strategic capability in-house during the outsourcing relationship

Source: Datta (2005)

## Integrating TCE and Real Options

Both real options analysis and transaction cost economics resemble each other in high degree and deal with similar issues while there exist some differences between the two streams of research especially with respect to uncertainty (Roemer, 2004). Considering the similarities Sanchez (2003) developed a theoretical framework for integrating transaction cost economics and real options theory. Table 2 shows the comparison of the main aspects of two approaches. ROT and TCE differ in their assumptions on rationality entailing a shift in the meaning of uncertainty. In contrast to the assumption of bounded rationality underlying the TCE framework, ROT uses an unbounded rationality perspective where contingent 'market' contracts can be concluded. There is no need for organization of the transaction within the firm. Furthermore, both approaches focus on different origins of uncertainty: While TCE concentrates on the safeguarding aspect of governance structures to reduce behavioral uncertainty; the real options approach mainly treats environmental types of uncertainty. (Roemer, 2004). On the other hand both approaches consider the same issue, sequential decision making under uncertainty (Trigeorgis and Mason 1987; Williamson 1985). Williamson (1991) emphasizes that asset specificity has a strong relation to the notion of sunk costs and the irreversibility problem that is taken in consideration in real options theory. The irreversibility of investments is worthwhile in the real options analysis. Dixit and Pindyck (1994) suggest that investment expenditures are sunk costs when they are firm or industry specific and cannot be recovered".

**Table 2: Comparison of Real Options and Transaction Cost Economics**

Topic	Real Options Analysis	Transaction Cost Economics
Unit of Analysis	Real Option	Transaction
Assumptions	Rationality, Perfect and Complete Capital Markets, Risk Averseness	Bounded Rationality, Opportunism, Risk Neutrality
Nature of Investments	Irreversible Investments	Specific Investments
Source of Uncertainty	Environmental Uncertainty	Behavioural Uncertainty
Optimization Criterion	Maximization of Option Values	Minimization of Transaction Costs
Decision Problem	Choice of Option Strategy	Choice of Governance Structure
Basic Statement	The higher environmental uncertainty, the more valuable an option becomes to the firm	The higher the specificity of assets, the more efficient is an internal organization of transactions
Application	Sequential Decision Making under Uncertainty	Sequential Decision Making under Uncertainty

## MODELLING ENERGY SERVICE CONTRACTS

### The Real Option Model for Outsourcing

Energy service contracting is an outsourcing form so that real options approach on outsourcing decisions is applicable for these contracts. The real options approach enables the firm flexibility for choosing the energy service contracting or providing the energy services in-house. The outsourcing decision can be conceptualized as illustrated in table 4. In the proposed model Datta's (2005) approach is considered by using Merton's (1973) equation for a European call option for a dividend paying stock is used as in the following:

$$c = se^{-qt}\Phi(d_1) - xe^{-rt}\Phi(d_2) \quad (8)$$

where

$$d_1 = \frac{\ln s/x - (r - q + \sigma^2/2)t}{\sigma\sqrt{t}} \quad (9)$$

$$d_2 = d_1 - \sigma\sqrt{t} \quad (10)$$

and

$s$  = the price of the underlying stock

$x$  = the strike price

$r$  = the continuously compounded risk free interest rate

$q$  = the continuously compounded annual dividend yield

$t$  = the time in years until the expiration of the option

$\sigma$  = the implied volatility for the underlying stock

$\Phi$  = the standard normal cumulative distribution function

$\Phi(d_1)$ ,  $\Phi(d_2)$  = the probability that a random draw from a standard normal distribution will be less than  $d_1$ ,  $d_2$

**Table 4: Integration of Real Options and Transaction Cost Economics**

Outsourcing opportunity	Variable	Call option
Present value of the cost of transacting with the market	$s$	Stock price
Present value of cost producing in-house	$x$	Exercise price
Estimated horizon of the outsourcing decision	$t$	Time to expiration
Time value of money	$r_f$	Risk-free rate of return
Uncertainty associated with the decision	$\sigma^2$	Variance of return on stock
Costs incurred to preserve the strategic capability in-house.	$q$	Dividend

Source: Datta (2005)

The cost of transacting with market ( $s$ ) has two components, the direct purchase price of the goods or service provided by the external supplier and the transaction costs and the exercise price ( $x$ ) is the cost of production in-house. Another variable is  $q$ , which is the cost that is incurred by the client to preserve a strategic capability in-house to produce the outsourced activities during or after expiration of the outsourcing contract. Most firms need to retain a ‘core’ employee capacity within the firm to bring the service back in-house, in case of a requirement (Datta, 2005). Variance in transaction costs is a source of uncertainty ( $\sigma$ ). The intrinsic value of the option is the difference between  $s$  and  $x$  and the horizon of the outsourcing decision  $t$  affects the value of the option in a positive way (Datta, 2005). When the value of the option is positive (*in the money*) the option should be exercised for producing in-house.

## Integrating RO Model and TCE Approach

The options valuation model for outsourcing used by Datta (2005) is integrated with the Sorrell’s (2007) TCE approach for energy service contracting. The cost of transaction market ( $s$ ) equals the sum of the purchase (paying to the contractor) and the decrease in transaction costs of the client after outsourcing decision. The exercise price ( $x$ ) is the difference in the production costs in-house and production cost when outsourced. This refers to the amount of energy saving costs.

$$s = PAY + (TC_{CL}^{OUT} - TC_{CL}^{IN}) \quad (11)$$

$$x = (PC_{CL}^{IN} - PC_{CL}^{OUT}) \quad (12)$$

Then the three conditions for a viable contract is transformed the inequalities as illustrated in Eq. 13-15.

$$s \leq x \quad (13)$$

$$s \geq (PC_{CON}^{OUT} + TC_{CON}^{OUT}) + (TC_{CL}^{OUT} - TC_{CL}^{IN}) \quad (14)$$

$$x \geq (TC_{CON}^{OUT} - PC_{CON}^{OUT}) - (TC_{CL}^{IN} + TC_{CL}^{OUT}) \quad (15)$$

The option value is calculated as shown in eq. 16. When  $c$  is positive, it is right to exercise the option. Otherwise as the total costs for outsourcing will be greater, the outsourcing decision should be made.

$$c \geq (PAY + TC_{CL}^{OUT} - TC_{CL}^{IN})e^{-qt}\Phi(d_1) - (PC_{CL}^{IN} - PC_{CL}^{OUT})e^{-rt}\Phi(d_2) \quad (16)$$

## CONCLUSION

In the study, the economics of energy service contracts which have little attention in the area of energy literature are modelled by using real options theory integrated with transaction cost economics. Transaction cost

economics and real options valuation are the approaches separately used in many studies dealing with the problem of outsourcing decision. In this study the approaches are integrated to develop a framework for analyzing the economics of energy service contracts from a make-or-buy view. Datta's (2005) real options valuation model for outsourcing decisions by considering Merton's (1973) expansion on Black-Scholes (1973) formula is combined with Sorrell's (2007) transaction costs model for the economics of energy service contracting. This new model enables the analysis the economics of the energy service contracting by a more comprehensive and broad view considering the firm flexibility and irreversibility nature of the contracts. This issue can influence the managers while making the outsourcing decision.

# **OBTAINING A COMPETITIVE ADVANTAGE BY UTILISING AN INTEGRATED LOGISTICS SUPPORT SYSTEM TO ENHANCE THE MAINTENANCE PERFORMANCE OF CAPITAL ASSETS**

**Keith Lambert**  
**Westinghouse Electric South Africa, South Africa**

## **ABSTRACT**

*The ever-changing business environment requires new and diverse methodologies to provide an organization with a competitive advantage.. An integrated logistics support system can provide this competitive advantage by efficiently and effectively maintaining and supporting the capital assets of the firm. The research contained qualitative and qualitative research components, from which a model and grounded technological rules are provided. Where these grounded technological rules can be utilized in the most complex of environments. A successfully implemented integrated logistics support system will result in reduced maintenance costs, life cycle costs, and total cost of ownership.*

## **INTRODUCTION**

The business environment is constantly changing and new and diverse methodologies are needed to provide an organization with a competitive advantage by adding value to the services they render. Significant leadership and management challenges exist in developing countries worldwide where resources are scarce: these are essential to successfully operate high technology complex systems. The scarcity is evident in skills shortages, where knowledge and experience is lacking, as well as in support systems. A fully implemented integrated logistics support system can be a mechanism to gain a competitive advantage by effectively and efficiently supporting the complex high technology assets owned and utilized by the organization, delivering products and services quickly and efficiently, and supporting long term customer requirements.

Complex technology systems, which have a high consequence of failure, require complex support infrastructures in order to support and maintain these systems throughout their designed or extended life cycle. Some high technology systems are designed for a life cycle of between 20 and 40 years, and even 60 years. These high technology systems require complex and integrated management systems during the planning, implementation and operation phases of their life cycle to ensure an integrated supply network. Some of these complex capital assets are more often than not used beyond their intended life cycle or suffer from obsolescence. These systems are then refurbished and/or upgraded to extend their useful life. Such is the case with systems which were brought into use in the late 70s and early 80s, which are a few technology gaps behind current technology. This is especially true where funding is limited to procure new systems.

## **HISTORY OF INTEGRATED LOGISTICS SUPPORT**

Integrated logistics support originated in the military environment, but has also been introduced into industry. Systems in industry currently using an integrated logistic support system approach include civilian radar, satellite earth stations, navigational aids, space shuttles, petrochemical plants and nuclear power plants. One such application in South Africa would have been the Pebble Bed Modular Reactor, the now defunct nuclear power plant project.

Various definitions of integrated logistics support exist from a variety of authors, including Blanchard (2004), Jones (2006), Hutchinson (1987), Quayle (1993), United Kingdom Ministry of Defence (2010), United States Department of Defense (1988) and Department of the Army (1999). These definitions vary due to the respective authors' backgrounds ranging from military to engineering (Marshall and Lambert, 2007). Lambert (2008:40) provides another definition of integrated logistics support, as follows:

*“A management responsibility which ensures that the most appropriate and reliable product/s and/or technical service/s supplied are of the highest quality and are both efficient and effective, are in the correct quantity, at the correct location, at the correct time to support a system throughout its intended or extended life cycle at the minimum cost.”*

The discipline of integrated logistics support consists of various sub-elements. These elements are provided in Table 1 below.

**Table 1: Integrated logistics support elements**

<ul style="list-style-type: none"> <li>• Maintenance support;</li> <li>• Manpower and personnel;</li> <li>• Packaging, handling, storage and transportation (PHS&amp;T);</li> <li>• Supply support;</li> <li>• Technical data and documentation;</li> <li>• Support and test equipment;</li> <li>• Computer resources;</li> <li>• Reliability, availability and maintainability (RAM),</li> <li>• Training and training devices;</li> <li>• Facilities;</li> <li>• System operational requirements;</li> <li>• Configuration management;</li> <li>• Obsolescence; and</li> <li>• Disposal.</li> </ul>

Source: Blanchard (2004), Jones (2006), Finkelstein & Guertin (1988), US DoD (1988), US Army (1999), UK MoD (2010), and Carpenter (1967).

A system can be regarded as a group of different components which are formed to provide a function. Haskins (2006:appendix-8) defines a system as ‘*a combination of interacting elements organized to achieve one or more stated purposes*’. A complex system, can be regarded as an integrated system, as it combines a vast amount of components and external elements to form an integrated whole, which is ultimately used to perform a specific function. The term “integrated” can be viewed as a group of components assembled to form a system. Once the human element is added, to support the system, the system becomes even more complicated, as the uncertainty and risk is increased. An integrated logistics support system is a complex system in itself, and needs to be implemented as soon as possible in the high technology systems life cycle. This requires commitment from all involved in the high technology system.

## RESEARCH APPROACH

The research consisted of three phases. The first phase entailed deconstruction of the available integrated logistics support literature. The second phase involved the deconstructing of six case studies of high-technology systems based in a developing country. The inputs to the final phase of the research consisted of shortcomings from phase one and two, resulting in aspects requiring further exploration by means of a questionnaire.

Design science implies the necessity for ‘prescription driven’ research (van Aken, 2004:236). The aim thereof is to develop knowledge used by professionals in designing solutions to solve problems in their specific field (van Aken, 2005). Mode 2 can be considered as knowledge generation in a particular situation, where theory generated is applied in practice (Burgoyne and James, 2006). Van Aken (2005) argues that the purpose of Mode 2 is to solve relevant and complex field problems. Mode 2 research establishes a connection between academic research at management level within a firm, where the objective is on ‘*the so-called field-tests and grounded technological rule ...*’ (van Aken, 2005:19). Glaser (1998:3) suggests that grounded theory ‘*is the*

*systematic generation of theory from data acquired by a rigorous research method*'. The aim is to provide grounded technological rules for the discipline of integrated logistics support which can be used in practice.

## **Phase 1: Literature deconstruction**

Phase 1 of the research consisted of deconstructing the integrated logistics support literature. Many sources were consulted for the literature review, as provided in Lambert (2008). A brief summary of this literature deconstruction is provided below.

A maintenance philosophy is used to generate the maintenance concept, which in turn provides inputs to the maintenance plan. The system operational requirements serve as an input to these maintenance documents. Personnel are required at the various support levels, in order to support the system throughout its life cycle. Training of personnel is also required, not just initial training, but continuous training as well. Support and test equipment is also required to support the system at the different levels of maintenance. Different support equipment is required at the various support levels. Spare parts are required to repair those items of equipment which are not discarded upon failure.

The aspect of packaging, handling, storage and transportation entails packing the item in order to reduce or eliminate possible damage. Sufficient handling mechanisms are required to move the items either mechanically or manually. Storage requirements include preserving an item for a predefined period of time, in order that the item is useable upon demand. Transportation involves the physical distribution of finished goods to suppliers and materials moved into the firm. A facility is required to support the system; this can range from a building to a tent depending on the specific function that needs to be performed in a specific environment. Technical data and documentation includes all the necessary supporting documentation such as technical manuals, and specifications required to support the system throughout its life cycle. This aspect also includes all data packs including supporting data media. Configuration management entails managing the baseline of items, which includes the identifying of items, controlling changes to these items, recording these changes, and conducting audits.

Computer resources entail all stand-alone or embedded computer hardware, firmware and software. Reliability, availability and maintainability provides the requirements for the system availability, the probability of a system functioning as specified, and a quantitative measure that the system will be restored to an operational state within a certain time period with the necessary resources at hand. Obsolescence occurs when an item is no longer available from the supplier. It not only affects spare parts, but also support and test equipment, and documentation utilized for system support. Disposal entails phasing-out a system from operational use.

## **Phase 2: Case study deconstruction**

Phase 2 of the research consisted of deconstructing case studies of the integrated logistics support aspects of six high-technology systems based in developing countries (Lambert, 2008). The high-technology systems ranged from military radar, military and civilian radio navigation systems, satellite earth station and a modular nuclear reactor. All the systems, except the modular nuclear reactor, are in the operational phase of their life cycle. The modular nuclear reactor sub-systems were in different design phases. One operational system is based in South America, the remainder of the systems are South African based.

The maintenance support aspect was well dealt with on all the systems. Although the systems have different levels of maintenance specified, the roles and responsibilities were clearly defined in five of the systems. Support and test equipment issues varied between the operational systems, in that the test equipment for some systems is readily available, but with two similar systems the test equipment was shared and delays occurred. Supply support concerns varied between the operational systems, where the spare parts were not always readily available in stock, and long lead times resulted in the system being unavailable.

The packaging, handling, storage and transportation element of these systems varied somewhat in the sense that all the systems were used in different locations, however the requirements to reduce or eliminate system damage were mostly adhered to. A case in point was the arrival of a damaged box full of repairable line

replaceable units from the end user of the system based in South America. This was quickly rectified. Technical data and documentation issues included the manuals of two systems, which became operational in the early 1980s, which were only available in printed format. Accidental shredding of technical manuals required to maintain the one system, resulted in a major recovery exercise. These manuals were subsequently converted to electronic format, which assisted the technical staff greatly as they no longer need to carry bulky manuals with them.

The facilities element differed per operational system, depending on the location of the system, and availability of fixed buildings. In some cases containers were required to store test equipment, and manuals. Personnel varied per system, primarily based on the type of technical system, and the required skill levels needed for each level of maintenance. Maintenance induced errors occurred in the system based in South America, due to their lack of English proficiency of the end users personnel in understanding the manuals. Training of personnel of the operational systems included initial training and on-the-job training. Their training also included classroom and practical training. Configuration management principles are applied to all the systems.

Obsolescence is a major concern in two of the systems, primarily due to the age of the system. In particular these systems were put into operation in the early 1980s and the spare parts are no longer available. These systems have undergone numerous technology upgrades over the years. Withdrawal from operational service of some of the systems within the one fleet started occurring in the late 1990's. These retired systems are being used for spares. A logistic support plan (LSP) typically contains information to support the system during operations and maintenance (Marshall and Lambert, 2008). Only four of the systems had logistic support plans in place.

### **Phase 3 : Quantitative research**

Phase 3 entailed quantitative research by means of questionnaires. Phase three inputs were identified as shortcomings from phase 1 and 2 which required further exploration. Two questionnaires were distributed, one for industrial personnel and one for military personnel. The overall response rate was 33% (187 responses). The military paper-based questionnaire response rate was 75% (122 responses), where the industrial web-based questionnaire had a response rate of 16% (65 responses). This difference in response rate could be as a result of differences between the industrial and military culture.

Two of the questions (job orientation, and knowledge and experience) were compared to the remainder of the questions in the questionnaires, in order to determine their dependence. Howell (1995) argues that contingency tables were used to determine whether two or more variables are dependent on each other. The Chi-square test was used to determine if two specific variables in the contingency table are dependent on each other. Cramer's V was used to measure the strength of association of these categorical variables in the contingency table. The value of the calculated Cramer's V statistic determines the strength of association: if V is close to 1 then the association is strong, and when V is close to zero there is a weak association (PlanetMath, 2011).

The respondents regarded analysis, in the form of logistics support analysis, as an important contributing factor in determining the maintenance philosophy, concept and plan. They also regarded a poorly defined maintenance concept causing maintenance induced errors. One aspect that the respondents regarded as needing improvement was the availability of test equipment. With regards to the economic facets of supply support, the respondents regarded the reliability of repaired systems as the most important aspect.

The respondents perceived the minimum handling of material as most important, while the dimensions and size of the handled material was perceived as least important. The application of configuration management principles was considered as important. Furthermore the respondents regarded it essential to compile maintenance and operator documentation which is easily understandable. With regards to storage facility requirements, the respondents deemed the impact on the product reliability as the most important factor. 85% of the respondents regarded attracting and retaining skilled personnel as either important or most important. While 75% of the respondents considered the defining of maintenance and operational personnel requirements.

The respondents regarded poor training and procedures and the highest contributing factor to maintenance personnel errors, while inadequate work layout or workspace was regarded as the least contributing factor. Reliability was regarded as the most important determinant of obsolescence, while new technology was regarded as the least contributing factor towards obsolescence.

## INTEGRATED LOGISTICS SUPPORT SYSTEM FRAMEWORK

The three phases of research were collated, where a single structure was critically reviewed to generate a framework and grounded technological rules. A high technology complex system has an estimated operational life of between 30 to 40 years, even 60 years. These systems are more often than not extended beyond these intended design life. In reality these high technology systems operate in complex environments which are far from the postulated theoretical environments. These systems require complex support structures, which can be rather challenging in developing countries.

A high technology system, the complex operational environment and the integrated logistics support elements each have a certain risk associated to them. The integrated logistic support system requires regular reviews (or a certain trigger, such as an upgrade) to re-assess its risk and effectiveness, which may affect one or more of the integrated logistic support elements (Lambert, 2008). The grounded technological rules derived from the three phases of research are provided in table 2 below. These rules which are postulated in theory can be applied successfully in practice.

**Table 2: Integrated logistics support (ILS) grounded technological rules**

ILS ELEMENT	GROUNDING TECHNOLOGICAL RULE
Maintenance	<ol style="list-style-type: none"> <li>1. Utilize the defined business strategy;</li> <li>2. Establish the organization's maintenance philosophy;</li> <li>3. Delineate the maintenance concept of the specific system and its linkage to other systems;</li> <li>4. Develop maintenance planning, including analysis;</li> <li>5. Document a maintenance plan for the specific system;</li> <li>6. Implement the maintenance plan across all maintenance levels;</li> <li>7. Conduct specific analysis of the system; and</li> <li>8. Ascertain the risks associated with the maintenance of the system and manage these risks.</li> </ol>
Support and test equipment (S&TE)	<ol style="list-style-type: none"> <li>1. Design of S&amp;TE and compatibility thereof with main system;</li> <li>2. Trade-offs, constraints and availability of S&amp;TE;</li> <li>3. Scheduling of multi-system S&amp;TE;</li> <li>4. S&amp;TE concept and plan;</li> <li>5. Support and maintenance (including calibration) of S&amp;TE.</li> </ol>
Supply support	<ol style="list-style-type: none"> <li>1. Define the system support strategy, philosophy, and concept;</li> <li>2. Derive the supply support ditto from the above strategy;</li> <li>3. Determine specific risks and calculate spares levels based on risks and cost effectiveness; and</li> <li>4. Document the supply support plan, defining the various processes and procedures required to efficiently and effectively manage the supply support function.</li> </ol>
Packaging, handling, storage and transportation (PHS&T)	<ol style="list-style-type: none"> <li>1. Define the PHS&amp;T (including packing, preservation, and labeling or marking) policies, procedures, requirements and specifications;</li> <li>2. Ensure stringent adherence to the PHS&amp;T (including packing, preservation, and labeling or marking) policies, procedures, requirements and specifications;</li> <li>3. Ensure adequate maintenance and support of the PHS&amp;T infrastructure, and equipment;</li> <li>4. Conduct analysis and trade-offs regarding PHS&amp;T mechanisms, in order to minimize and standardize PHS&amp;T interfaces; and</li> <li>5. Ensure comprehensible labeling and marking of items susceptible to vibration, shock, fragility, correct orientation, environmental constraints, etc.</li> </ol>
Technical data and documentation	<ol style="list-style-type: none"> <li>1. Ensure technical data and documentation are written for the skill level of its user;</li> <li>2. Ensure the above is sufficiently detailed to assist the end user in correctly following operator and maintenance tasks;</li> <li>3. Document all relevant technical data and documentation in order to endure efficient and effective support of the system;</li> <li>4. Apply strict configuration management principles to all technical data and documentation; and</li> <li>5. Document all relevant technical information into a technical data and documentation plan.</li> </ol>
Facilities	<ol style="list-style-type: none"> <li>1. Define the facilities requirements for the operational system as early as possible in the latter's life cycle;</li> <li>2. Define the support system infrastructure for the facilities requirements as early as possible in the life cycle of the system and support system (once the support system possesses sufficient information to define its respective</li> </ol>

ILS ELEMENT	GROUNDTECHNOLOGICAL RULE
	requirements); 3. Ensure adequate training facilities to simulate as closely as possible the actual operating environment; 4. Ensure the facilities requirements are documented into a facilities plan; 5. Regularly update the facilities plan with new knowledge; 6. Maintain the facilities at regular intervals; and 7. Ensure availability of facility resources.
Manpower and personnel	1. Define the operational and maintenance personnel requirements in accordance with the maintenance concept; 2. Attract and retain the applicable skills, knowledge and experience to support the system; and 3. Document all the manpower and personnel requirements, specifications, analysis in a manpower and personnel plan.
Training and training devices	1. Define the operational and maintenance personnel training requirements in accordance with the maintenance concept; 2. Specify the types of training to be conducted and the training aids that will be required; 3. Document all the training and training devices requirements in a training and training devices plan, including sustainment training; and 4. Develop a long-term plan to ensure trained resources are available when needed.
Computer resources	1. Utilize best practices in developing required computer resources that will meet performance requirements in complex environments; 2. Develop processes and procedures to effectively develop, test, audit operational software and other related aspects; 3. Ensure that the computer resources element is kept under strict configuration management and subjected to periodic audits; 4. Ensure all computer resources aspects are subjected to stringent security controls and stored in fireproof safes; 5. Ensure master copies and working copies of all computer resource related aspects are stored separately at different premises; and 6. Document all system computer resources aspects in a computer resources plan, describing the processes and procedures of software version control, security control of media, etc.
Reliability, availability, and maintainability (RAM) – Dependability	1. Develop an efficient and effective RAM analysis process taking reality into account and all possible constraints, variables, and variations, instead of a theoretical statistical projection; 2. Identify components with excessive failure rates, i.e. define reliability of components and system; 3. Reduce logistics delay times which have a high risk factor; 4. Calculate the operational availability of the system; 5. Ensure the system is maintainable and supportable.
Configuration management	1. Implement sound configuration management principles; 2. Conduct periodic audits; 3. Educate personnel regarding the purpose of configuration management, its use and benefits; and 4. Document the configuration management principles and audits.
Obsolescence	1. Implement an obsolescence programme (including processes and procedures) and plan for obsolescence; 2. Conduct regular technology scanning as part of risk review; 3. Manage the obsolescence constraint in order to improve system performance; 4. Ensure multiple suppliers of components, to eliminate single source supplier problems; 5. Ensure reliability data and component life cycle data is specific to the operating environment; 6. Attract and retain skilled and knowledgeable resources; 7. Establish excellent client relationships with suppliers; and 8. Ensure accurate obsolescence data and systems.
Disposal	1. Plan for system phase-out/retirement/disposal and manage effectively; 2. Plan and manage day-to-day disposal of components, consumables, and spare and repair parts; 3. Effectively manage the cost element of disposal; 4. Consider disposal of components in the design phase; and 5. Document all phase-out/retirement/disposal activities in a disposal plan.

Source: Lambert (2008: 297-299).

The grounded technological rules as provided above can be applied not just in third world countries, but also in the complex environments of first and second world countries.

## CONCLUSION

In the developing world, there are significant leadership and management challenges. The dynamic business environment presents an organization with constant challenges of finding new and diverse methodologies to gain and maintain its competitive advantage in the marketplace. One such mechanism is implementing an integrated logistics support system.

Advantages of implementing such a system include a reduction in the total life cycle cost and associated total cost of ownership, improving the firm's overall bottom line. The market share of the firm will increase as suppliers and customers appreciate the added value service. The risk of obsolescence and the effects of long lead

times will be reduced due to effective and efficient inventory management. Skilled staff will be attracted and retained by the firm, improving the necessary knowledge and skill sets within the firm. Refurbishment, upgrade, modification, cannibalization, and mothball programmes will be managed successfully. The system availability and reliability will be improved significantly (Lambert , 2008).

The integrated logistics support grounded technological rules are robust in nature, where they can be used in difficult environments and circumstances, not just in developing countries, but also in less complex environments.

# ACCOUNTING AND ORGANIZATIONAL CHANGE: AN AUTOPOIETIC VIEW

**Stewart Lawrence and Vida Botes**  
**University of Waikato, New Zealand**

## ABSTRACT

*A biological metaphor of an open system has been widely used to understand how organizations respond to the environment. This paper offers an alternative understanding. The theory of autopoiesis argues that all living systems are organisationally closed, autonomous systems of interaction whose only concern is self-reproduction. The purpose of this paper is to present an argument for the applicability of autopoiesis to social systems, such as organisations, and to draw out the implications for information systems, in particular, accounting systems. From the perspective of autopoiesis, accounting systems are not determined by the environment, but act to determine the boundary and environment for an organisation.*

## INTRODUCTION

Scepticism about business organisations and their motives for social and environmental reporting practices permeates the accounting literature (Adams, 2004; Milne, Tregidga and Walton, 2009). The continued pursuit of economic growth may mean that organisations are destroying the social and ecological environments on which we all depend. One theory that explains such myopic behaviour of organisations is that of autopoiesis. With origins in biological sciences, according to this theory organisations may be viewed as autopoietic, self-serving, 'closed' systems. If accepted as a basis for understanding organizational functioning, the theory of autopoiesis challenges the traditional way of understanding the use of accounting and information systems in organizations (Beeson, 2009, p.187; Huysman, van der Blonk and Spoor, 2009, p.201). It is the purpose of this paper is to present an argument for the applicability of autopoiesis to social systems, such as organisations, and to draw out the implications for information systems, in particular, accounting systems.

The argument in this paper is that accounting systems are not, as often portrayed, neutral collectors of objective information as an input to rational economic decision making. They are rather a part of the evolution of the organisation, creating the environment (medium) in which the organization changes. In this theory of autopoiesis, accounting practices may be viewed as component parts of the system that (re)produces itself; and as creators of the organization's boundary and identity. Perhaps the simplest way of understanding this perspective is to return to the classic paper by Ruth Hines about the nature of accounting in which she argued: "in communicating reality, we construct reality" (Hines, 1988, p.251). The external environment does not determine accounting practice, but rather accounting practice determines the environment. What elements of the environment are counted as part of the organization, and which parts of the environment are not included in the organization, depends on the application of accounting practice. In her illustration, the river that passes through an organization's physical boundary, and whose waters the organization uses, is not treated as part of the organization (ibid, p.251). Accounting creates the fictive entity called an 'organization' and its boundaries. There is no physical 'reality'.

*What we consider to be 'objective', what we consider to be 'rational', the way we think, the way we act, our theories, the way our society is structured – it's not real...If men define things as real, they are real in their consequences. We create a picture of an organization, or 'economy', whatever you like, and on the basis of that picture (not some underlying 'real' reality of which no one is aware) people think and act. And by responding to that picture of reality, they make it so: it becomes real in its consequences. (Hines, 1988, p.257)*

This view from Ruth Hines reflects the way information systems in autopoietic organizations operate. It is the information system that creates the organization's understanding of its 'environment' and which leads to action, for its own self-production. That is how organizations evolve. The environment does not exist objectively separate from the picture provided. To understand organizational change it is necessary to understand the inner workings of the information and communication systems inside the organization, and not look to external environmental influences. Autopoietic organizations exist for their own sake; their purpose is their own dynamic production. Relations with the 'environment' are self-referential and self-interested. As argued later, if the theory of autopoiesis is understood simply as a biological metaphor then it is possible to use this understanding to avert potential danger, and to introduce humanising influences to organisational life. If the theory is understood as a real description and explanation of self-serving life forces, the future may be grim. The paper presents a brief introduction to the theory of autopoiesis, and then provides a comparison of 'open' and 'closed' systems thinking to emphasize the differences from conventional understanding. It then raises questions about the traditional understanding of the role of accounting/information in organizations, before illustrating the application to empirical phenomena. The implications for research are discussed in the concluding section.

## **BRIEF INTRODUCTION TO AUTOPOIESIS**

Poiesis means 'dynamic production', while 'auto' means autonomous, independent or self-referential. The theory of autopoiesis evolved from Maturana and Varela's (1980) exploration of what distinguishes living systems from non-living; and how living systems persist despite changes in structure and components. In summary, an autopoietic systems approach focuses on:

- . autonomy realized through the process of self-referential re-production;
- . production of feasible responses to perturbations;
- . structural coupling between systems; and
- . how systems persist and maintain an identity despite changes in components and structure.

The theory gives an account of living beings from the simplest unicellular organisms ('first-order unities') to the most complex multi-cellular organisms ('second-order unities') and extends more tentatively beyond organisms to social systems ('third-order unities') (Beeson, 2009, p.185). Social organizations, such as business organizations, are examples of third-order unities of networks. An autopoietic system is a living system that exists as a network of relations and processes which continuously produces the components which are the reality (concrete form) of the network. The point about such systems is that they are organizationally (or operationally) 'closed'. The behaviour of the system is not specified nor controlled by its environment but by its own structure, which specifies how the system will behave under all circumstances.' Systems are not disconnected from their environments, but are in constant interaction with them, in an ongoing process that Maturana and Verela (1987, p.75) call 'structural coupling'. Changes in the living being are triggered by environmental factors but not determined by them. It is always the structure of the living being that determines the changes. There can be no 'instructive interactions' by means of which something outside the system determines behaviour. It is the organizational closure of living systems that produces their autonomy and their individuality. A disturbing consequence of the theory of autopoiesis for information scientists, and for accountants in particular, is the rejection of the notion that information received from the outside can directly affect the system's behaviour. There is a rejection of the idea that the system builds an internal representation of the world outside. Our theoretical models of rational cognitive planning are rejected. To explain the features of the alternative paradigm, a brief comparison of open systems and closed systems approaches is presented next.

## **OPEN SYSTEMS THEORY COMPARED TO AUTOPOETIC**

Traditional approaches to organization theory have been dominated by the idea that change originates in the environment (Morgan, 1986, p.235). A biological metaphor has been widely used to understand how organizations change as a response to the environment. An organization is typically viewed as an open system in constant interaction with its context. Changes in the environment are viewed as presenting challenges to which an organization must respond. Both contingency theorists and population ecologists believe that the major

problems facing modern organizations stem from changes in the environment Morgan (1986). Accounting systems within organizations too are viewed as responsive to environmental influences and must adapt to ensure organizational survival (Otley, 1980).

This section explicates an alternative systems approach developed from the work of the biologist Ludwig von Bertalanffy (1950) building on the principle that organizations, like organisms, are open to their environment and must achieve an appropriate relation with that environment if they are to survive. Changes in the environment present challenges to organizations requiring them to adapt to the new context in which they operate. General theories of environmental change abound. A favoured view is that of Toffler's (1970) 'waves of change'. Toffler (1970:4) conceived change as a process and the rate of change in society as exponential. The rate of change accelerated at the time of the second wave – the Industrial Revolution. New technologies replaced the old, and in the process societal and business structures became obsolete. Change in the environment is therefore the driver of change in organizations and their accounting systems. Much attention has been devoted to understanding the immediate 'task environment' defined by the firm's direct interactions, such as with customers, competitors, suppliers, labour unions, and government agencies, as well as the broader contextual or general environment. Contingency theory attempted to scientifically determine the external influences that determined the appropriate accounting system for any organization. Autopoietic theorists have a different view of the impact of the industrial revolution. Gregory (2006, p.962) explains:

*the industrial revolution marked a break-point point from pre-industrial society (characterized by the integration of economic activity with social, religious and political functions) to industrial society (characterized by the differentiation of economic and other functions into separate sub-systems). This differentiation, without an overall co-ordination and control function within society, has led to sub-systems (and organizations) becoming self-serving or pathologically autopoietic.*

Industrial society is characterized by the separation of society into a range of functional sub-systems (Gregory, 2006, p.963). According to Luhmann (1995) society approximates a self-producing or autopoietic system that is comprised of six sub-systems – the economy, politics, the law, science, religion and education. The industrial revolution marked this break-point from pre-industrial revolution society. The latter was characterised by the integration of economic activity with social, religious and political functions. The post-industrial revolution society in contrast is characterised by the differentiation of economic and other functions. These sub-systems have developed differentiated language and find it hard to speak to each other.

At the individual organization level, the main difference with open systems theory relates to the fact that the organisational boundary is permeable. Accounting systems provide the feedback information for the organization to be in equilibrium with its environment. In autopoietic systems, the boundary is an important barrier. Accounting information is used to differentiate, and in a sense define the organization as separate from its environment.

Figure 1 - Open and autopoietic systems (Adapted from Llewellyn (1994, p.11))

It has been suggested that there is a tension within the theory of autopoiesis between the notions of self-production and the closure of the system with the coupling of the system to its environment (Vanderstraeten, 2005). The autopoietic system is neither determined by its environment nor its internal operations alone – it is a product of the interaction of the two. Maturana and Varela (1987) refer to this relationship of mutual influence as structural coupling thus:

*The structure of the environment only triggers structural changes in the autopoietic*

*unities (it does not specify or direct them), and vice versa for the environment. The result will be a history of mutual congruent structural changes [ . . . ] there will be a structural coupling.*

The notion of structural coupling represents an important point of departure from the traditional open systems view that regards systems as being environmentally determined and stresses the importance of boundary between the living system and its environment. The tendency for autopoietic systems to look after their own interests and self-preservation comes with certain warnings. For example, Robb (1989, p.348) warns of:

*The subordination of all human aspirations and ambitions, values, and welfare to the service of preserving the unity of such systems, and not to any human end. Once formed such organizations appear to be beyond human control; indeed to be real-world systems*

Corporations that span the globe seem unconscious of the local context in which they operate except those to their advantage (Klein, 2000). Globalization would represent opportunities but also threats to the self-reproduction of autopoietic systems. Opportunities to operate in new markets and to take advantage of low cost production possibilities may be accepted; but there may be scant regard for national regulatory regimes. The lack of attention to regulatory schemes has been manifest in various industries, most notably and recently, the finance industry. Finance companies have demonstrated that the pursuit of autonomous self-reproduction can produce disastrous consequences for the wider social and economic environment. The interests of firms are often put ahead of costs to the physical or social environment, which is the condition referred to by Gregory (2006, p.962) as 'pathologically autopoietic'. The biological view as explained below may exclude ethics from consideration. The biological view is an a-moral view of life and organizational change. It is akin to Nietzsche's claim that life is driven forward by an *inhuman* principle of creation that is *immanent* or interior to life. Nietzsche referred to this drive as 'will to power' (Spinks, 2003). Spinks (ibid, p.5) explains that 'will to power' is an inhuman principle because it envisages *all life*, not just human life, as united by a common striving of becoming and transformation within which each form of life seeks to expand and increase its power. The aim of life from this perspective is not enlightenment, moral improvement or even self-preservation; it seeks 'power'. By this is meant that a particular form of life becomes powerful in so far as it appropriates other forces to its domain. As in the theory of autopoiesis, every movement of life bears within it a configuration of self-referential forces. The struggle between powers produces a hierarchy of stronger and weaker forces, which then leads to the creation of concepts. According to Spinks (ibid, p.5), Nietzsche argued what we call 'values' describe the domination of a particular perspective upon or interpretation of life. According to the biological understanding, there is no human consciousness that can prevent the competition of forces. Thus Robb, in the above quotation, refers to 'real world systems' beyond human control.

## **A SOCIOLOGICAL INTERPRETATION**

According to Maturana and Verela (1987) autopoietic systems are systems that define, maintain, and reproduce themselves. This is the essential characteristic of living systems. But it is contentious whether social systems can be regarded as natural living systems. There is disagreement about whether social organizations can be treated as if they were natural living systems, i.e., whether second-order and third-order unities (as described in section 2) are ontologically commensurate. According to Maturin (1980) a social system is: "a collection of interacting living systems that, in the realization of their autopoiesis through the actual operation of their properties as autopoietic unities, constitute a system that as a network of interactions and relations operates with respect to them as a medium in which they realize their autopoiesis while integrating it, is indistinguishable from a natural social system and is, in fact, one such system." (1980,p.11). Luhmann (1984) in describing society as is has argued for a theory of social interpretation of autopoiesis. However, he retains the non-human aspects of the theory employing a theory of communication rather than human agency (Seidl, 2009, p.135). This has been criticized by Habermas and more recently by Giddens (1984) whose structuration theory involves a dualism between agency and structure. A more humanistic and critical social theory interpretation is offered by Fuchs and Hofkirchner (2009). In their interpretation, humans coproduce and reproduce social structures. They describe a dynamic, dialectical process where society produces and reproduces man as a social being and Society and humans produce each other mutually.

Such a view of social organization and autopoiesis provides a means by which human values are reflected in the dynamic reproduction of organizations. The relentless non-human drive for power in all living

systems as described by Nietzsche, promoting this struggle over any moral considerations, is replaced by the possibility of human aspirations and ethical decision making, even in autopoietic systems.

Yet the reproduction of the systems is dependent on technologies employed. The process of organizing happens at the organizational boundaries and information systems play a role as 'gatekeepers' in deciding what information is imported and how it is interpreted (Llewellyn, 2006). The structural information collecting and processing systems of the organization have important effects on what signals (perturbations) are responded to (Scott, 1981, p.173). IT systems, including accounting, affect the understanding of what to attend to and how to interpret the environment.

The structural coupling between an organization and its environment means that organizations (as autopoietic systems) cannot be controlled or determined from the outside; nevertheless, they have to connect, or resonate, with their environment. Systems can react internally (resonate) to environmental event in accordance with their own structure but they are always changing. They constantly scan the environment for signals. Resonance is achieved whenever signals in the environment are translated into the system's self-referential operation mode. Governance can be achieved if sufficient signals are placed in their environment, usually in the form of law or money, but increasingly in the form of 'knowledge', and in the form of societal views such as in the area of corporate social responsibility. Signals will be picked up by organizations if they are both socially acceptable and in the system's interest. Kanter's research (2008, p.52) notes a change in global corporates, with a move away from the pure profit motive and traditional controls (including financial budgets) towards empowered engaged participative stakeholders. Twenty years earlier, Drucker (1988, p.51) had foretold that organisations would operate with fewer management levels, where all specialists shared a common vision. Kanter (2008, p.51) found that the need for tight internal controls had been superseded by autonomous empowered teams operating locally, enabling close collaboration and communication. Reflecting upon an organisation's control struggles might consider both the macro and micro socio-economic contextual factors contributing to why this change has come about.

## EMPIRICAL APPLICATIONS / IMPLICATIONS FOR ACCOUNTING

The theory of autopoiesis raises difficult questions for accounting. This section reflects on various understandings of 'accounting'. It raises questions and speculations about its employment within living systems such as organizations. Some issues, which were very evident in earlier literature, relate to the differences between formal and informal knowledge gathering and processing activities within organizations.

Preston (1986) under the title: *Interactions and arrangements in the process of informing*, described how the formal information systems in an organization are not the source of information for day-to-day actions and interactions. On a similar theme, Boland (1983) explained that as well as 'rational' systems, organizations operated with 'natural' systems. Roberts and Scapens (1985) differentiated between 'accounting systems' and 'systems of accountability', the former being the potential offered by accounting systems and the latter the actual use of those potentialities in everyday organizational life. All these researchers have indicated that the formal rational models informing the design of accounting and information systems do not capture the reality of day-to-day organizational functioning. Accounting literature through Institutional Theory attempts to explain accounting practices in organizations (Scapens, 2006). Institutional theory defines institutions as "a way of thought or action of some prevalence and permanence, which is embedded in the habits of a group or the customs of a people" (Hamilton 1932:84). They are settled ways of thinking common to members of an organization (Burns, 2000). Institutional principles are encoded in rules and routines which in turn are enacted in specific situations (Johnson et al. 2000). The resulting behaviour is reproduced by organizational members and becomes objectified and institutionalized. DiMaggio & Powell (1983, 1991) point out that organizations tend to model themselves after other similar organizations which have been found to manifest significant higher survival advantages. A problematical issue with institutional theory has been identified as its lack of dynamism and inability to explain change in organizations. Institutional theory has tended to emphasize organizational stability rather than change and to ignore human agency (see Lounsbury 2007, Seo & Creed 2002, Fieldman 2003). Though Greenwood & Hinings (1988, 1996) and by Barley & Tolbert (1997) have attempted to bring in agency into institutional theory but a paradox remains as to how new organizations are created (or changed) if

organizations are so set in their rules, norms and routines? In conventional theory an external 'jolt' is required to change the internal systems (Greenwood and Hinings, 1988). This problem echoes the issue in autopoiesis in explaining the process by which a system can be closed and yet achieve structural coupling with its environment. The institutionalization of habitualized practices does imply a stability of internal systems despite external changes.

Contrary to the prophecies of open systems theory, accounting systems may not adapt to environmental influences. The basis of contingency theory is that organizations are open to their environments and accounting systems must adapt to environmental influences to ensure organizational survival. Yet evidence suggests that when organizations change, the accounting systems do not necessarily change; they often continue the same (Kaplan 1999). Specific examples of lack of response of accounting systems to organizational change have been reported by Huysma, von der Blonk and Spoor (in Magalhaes and Sanchez, p.205) where a state-owned enterprise was privatized to commercial business, yet despite the massive changes in organizational context, the financial information system continued to be used unchanged. Internal factors may be more important than environmental contexts in determining the use of accounting. In mergers and acquisitions, the acquired company often has new accounting systems imposed by the acquirer no matter the fit or suitability of these to the organization's context. On an international scale, the push for 'harmonized' accounting reflects the needs of large global corporates. The discourse about 'international accounting', concerning local contextual influences on accounting, is claimed to have been a discursive formation that has come to an end (CPA, forthcoming). The needs of global capital have led to countries adopting IAS irrespective of the suitability to local needs. It is knowledge and intellectual capital, more than financial capital that more and more determines the wealth of organizations (Fraser and Hope, 2000). The translation of employees and their skills, knowledge and experience into 'intellectual capital', the benefits of which accrue to the organization, sits well with the notion of autopoiesis and the self-serving reproduction of organizational structures.

## CONCLUSION

The autopoietic view of organizations was compared to open systems view. In the open systems approach, organizations and their environments are in equilibrium as organizations respond to environmental necessities. Accounting systems assist in the necessary adaptation informing managers of how to respond in order to survive. Organizations are a part of their environment in a systemic view. This approach was contrasted with an alternative – that of the closed, or autopoietic system. Here the organization is an embedded, but differentiated, form of social life. The organization is embedded in society in its use of information about its 'medium' or environment but, at the same time, the organization is differentiated from society by managing its boundaries to maintain its own internal identity. The problem with autopoietic systems is their tendency to place their own survival above that of social and environmental considerations. There is a danger they will deplete the environment and damage society in the pursuit of their own self-reproduction. A pessimistic view is that sustainability of human and other forms of life has already been placed in jeopardy. There are no mechanisms to prevent organizations being 'pathologically autopoietic'.

It is somewhat disconcerting to have one's ideas challenged. A disturbing aspect of the theory of autopoiesis is the view that accounting (and other information systems) are not tools used to collect information about the environment, process this information and make a rational response. It may seem that way from the outside, but on the inside that is not what happens. After thirty and more years of research into the functioning of accounting in organizations, we are still lacking knowledge about the role of accounting in dynamic systems or organizational change. New research approaches may be necessary and autopoiesis is one that offers the possibility of new understandings.

# THE ARAB MAGHREB UNION: A CURRENT PERSPECTIVE

**Frank P. Le Veness, St. John's University, USA**  
**Jaime M. Beran, Loyola University of Chicago, USA**

## ABSTRACT

*The Arab Maghreb Union was created as a regional economic organization for the purpose of economic and political unity in North Africa in the late 1980s. While this merger was an advantageous and forward-thinking idea in theory, this organization has fallen victim to "stalled integration" in reality. These causes range from inter-state conflict to traditional AMU rivalries and vary significantly. These causes include diplomatic tensions, discrepancies with the rotation of the AMU presidency, territorial disputes between Morocco and Algeria over the Western Sahara's sovereignty, whether Libya's President Gaddafi's is genuinely supportive of the AMU's goals, and speculation of Libyan involvement in a recent coup attempt in Mauritania. Though these reasons are debilitating its progress and prospects for future growth, the recent events unfolding in North Africa and across the Middle East can serve as a catalyst in reviving this dormant economic organization.*

## INTRODUCTION

The concept of economic and even political integration has become more and more fashionable since the conclusion of the Second World War and the great independence movement which has transformed the map of the world with the virtual end of colonialism. Although this process was begun earlier, with the emergence for example, of the nations of India, Pakistan and The Philippines, to name but a few, it took on tremendous impetus after the war, and indeed, the 1960s might well be seen as the decade of independence for most of Africa and along with the 1970s, independence for countries throughout the developing world, or South nations, as they are sometimes known. This political independence led to a significant change in international economic relations. Much of the earlier period, literally for hundreds of years, had been colonial for much of the South. In essence that meant that the profits of the economy were directed away from the colonies toward the colonizing powers, perhaps best characterized by traditional mercantilism, which saw the shipment of raw materials, semi-processed goods, basic agricultural products, and labor from the colonies to either other colonies of the same colonizer or to the colonizing nation itself, exemplified by the so called triangular trade that the British colonies in America experienced throughout the 17<sup>th</sup> and 18<sup>th</sup> centuries. Though colonialism is not completely explained by economics, it is largely dominated by economic and financial concerns. Profit inexorably flowed to the nations of the North.

In the post-colonial period, efforts were made to continue that same international economic system, so that profits continued to drift to the North. While development certainly occurred in South nations, it was largely regulated and controlled by the North either by treaties and trade and aid agreements with individual nations, or through multinational arrangements. It is far beyond the scope of this paper to undertake an examination of these arrangements, but, for example, clear controversy has been raised concerning the policies of such international organizations as the World Bank Group and the IMF, and more recently, the World Trade Organization. In their stirring work *WTO: Whose Trade Organization?*, Lori Wallach and Patrick Woodall, claim that even for Americans, the "WTO is like a muscular pro-corporate, antienvironment, antiworker octopus...." (288). Criticism of insufficient development or poverty alleviation has been leveled against various other international agreements, such as the Lome and Cotonou (effective 2003) Agreements, between the African-Caribbean-Pacific (ACP) nations on the one hand and the European Union on the other. For an interesting study of globalization, presenting a well-balanced view, see Gilpin, *The Challenge of Global Capitalism: The World Economy in the 21<sup>st</sup> Century*.

Whether one accepts the positions of the Marxists and neo-Marxist scholars that there is a world-wide capitalist plot to maintain control over these South nations and to limit their development, and indeed, direct such progress made heavily toward the benefit of the nations of the North, or one takes a more moderate view that many such agreements are well-intentioned, but sometimes are drawn by North officials utilizing economic and financial principles more appropriate for more developed nations, as discussed, for example in Todaro and Smith's *Economic Development*. Whatever theory one accepts, the frustration level has reached new heights, as was evidenced when then United Nations Secretary General Kofi Anon announced at the famous and so hi-tech Johannesburg international conference that the world had engaged in sufficient conferences talk, and that it was clear that governments could not solve poverty by themselves, so it was time for business to rise to the occasion and take action (for a discussion, see Le Veness and Fleckenstein).

Whatever the answers to the above, and clearly those answers are most certainly vital in the solution to the problem of international economic inequality and poverty, the symptoms tend to be similar. Though the Maghreb Arab Union is of fairly recent vintage, the nations represented in its membership fall into the categories noted above. All were colonial entities for years until that post-World War II period. All emerged from colonialism with significant need for economic and, many would add, political development and with very significant and persistent levels of poverty. However, since the MAU itself, did not emerge until the later 1980s, it had the benefit of examining other models of regional development and also the root causes of poverty in other South nations.

In many respects, the conditions in most of the South nations were remarkably similar from an economic and financial standpoint. The Secretariat of the Caribbean Community and Common Market in 1973 drew up a list of the causes of that region's poverty which can be seen to readily pertain to the nations of the Maghreb Union: "(a) high rates of unemployment; (b) the vulnerability of the high-cost agricultural export sector; (c) the near-stagnation and, indeed, slow death of Domestic Agriculture; (d) the lack of 'forward and backward linkages' in the national economy – around Minerals, Manufacturing and Tourism; (e) continuing and growing foreign ownership and control of the economies; (f) low national savings, increasing tastes for foreign goods and high consumption levels of imported goods; (g) the failure to develop extra-regional exports of manufactures and new non-traditional agricultural exports; (h) the existence of few 'linkages between the national economies of the Region – whether measured by the proportion of intra-regional trade to total trade or by 'linkages' between the proactive sectors of the different national economies." It noted "the economies of the Region remain under-developed, fragmented and dependent on external decisions. Economic growth has not yet been generated from *within* the national economies of the region" with the result that it "is not soundly based" (Caribbean Community Secretariat, 10). While clearly the problems experienced by the MAU were not precisely the same as those of the Caribbean nations, as for example, problems of dealing with principally island nations and some extremely small nations both in terms of geography and population, nevertheless close comparison may be made with regard to most of these problems.

Those theorists utilizing a regional approach to self-development generally state that there is a need for local control not merely of the political and constitutional realm, but also of the economy of the nation involved. In other words, there cannot be reliance on foreign intervention, whether or not well-intentioned. Each nation must see to its own economic development, constructing a model designed to fit its particular needs and conditions, and thereby, in the words of the late Governor of Puerto Rico, don Luis Munoz Marin, creating an Operation Bootstrap, which is heavily reliant on local initiative. Regardless of one's opinion about the use of the Puerto Rican model, which may be criticized as too reliant on the mainland United States, it cannot be argued but that significant self-development is essential for the successful elimination of poverty. Once critical problem is often economy of size, which may be viewed from agricultural and raw materials to production to consumption perspectives. With this in mind, international regional cooperation has been engendered, commencing with more simple bi-lateral and multi-lateral treaties, and advancing to a free trade area, a customs union (which adds the dimension of common external tariffs), a common market (which acts in a fashion similar to a domestic market, though not always with free movement of labor), to a community or union (which adds non-economic dimensions such as services and foreign policy harmonization, and the like). In addition, there can be variations including common currency, such as the Euro of the European Union, resulting from the 1992 Maastricht Treaty or the Eastern Caribbean dollar, issued by the Eastern Caribbean Currency Authority from 1965, and since 1983, by the Eastern Caribbean Central Bank. It is with this background, that the paper examines the MAU..

# THE MAGHREB ARAB UNION

In light of the recent Jasmine revolution in Tunisia and the subsequent tidal wave of uprisings across the Middle East, the notion of regional economic integration in North Africa is worth reconsidering at this critical juncture in which several national governments are facing unprecedented pressures to institute democratic reforms. Considering that the causes of this region-wide dissension are rooted in high youth unemployment rates and inflation, among other various economic and undemocratic predicaments, correcting the problems plaguing Maghreb integration would aid in ameliorating the economic troubles and even the political tribulations the region is now facing. The Arab Union estimates that this stalled regional integration costs each country of the Maghreb two-percentage points of annual GDP growth, while the African Economic Commission suggests that if the Maghreb Union were functional, the five member countries would each gain five percent in GDP. Furthermore, the World Bank estimates that successful regional integration would have increased per capita real GDP in 2005-2015 by thirty-four percent for Algeria, twenty-seven percent for Morocco and twenty-four percent for Tunisia (Jaidi 2011). Considering the potential growth for not only its individual nations but also the region, revisiting the reasons for its stagnation and reviving this economic organization is certainly not only in the states but the region's interest.

Maghreb. Because the Maghreb has fallen behind on a global scale socially, economically, politically, and developmentally, it is vitally important the Maghreb states work together to improve the status of their region especially as the world becomes increasingly integrated and globalized. In brief, this paper explores the prospect of renewed economic integration in the Maghreb in wake of the sweeping call for democratic reforms region-wide and examines what affect a rehabilitated Arab Maghreb Union would have on the region economically and developmentally.

## **Why economic integration? The development and stagnation of the magreb arab union**

The Arab Maghreb Union (AMU) is the proposed economic integration of Algeria, Libya, Morocco, Tunisia, and Mauritania. The notion of Maghreb regional integration and security has existed since Morocco and Tunisia gained independence in the 1950s. Political differences and international disputes have kept this notion from becoming a reality. However, a plan for a common market, modeled after the EU's common market, to be established by 2000 was set forth in 1989 by these five nations. The Maghreb's main reason for establishing a regional organization was because of the threat the creation of the European Union posed to Maghreb-European trading partners. At that time, the Maghreb's trade with Europe accounted for two-thirds of its foreign trade and where inter-Maghreb trade was less than three percent. After Maghreb leaders finally realized that their inter-Maghreb trade was not being brought to its full potential, the AMU was proposed. Considering the wealth of natural resources within the Maghreb and also the depth of labor within the region, these five Maghreb nations sought regional integration to become a more competitive negotiating bloc with their European counterparts and also to overcome their own individual national economic crises. At this time, Libya and Algeria had become overly dependent on revenues from oil exports, which declined because of falling oil prices, while Tunisia and Morocco were undergoing a short-lived economic renaissance, and Mauritania was engulfed in high foreign debt and a stagnant economy.

The formation of a common market and integration consist of the adoption of common custom and financial legislations as well as extensive economic planning and coordination. For the AMU, this legislation included the removal of internal customs duties, the imposition of a common customs tariff for goods from countries outside the AMU, the creation of a Maghreb financial zone, Maghreb currency, Maghreb development fund, and Maghreb regional budget. Coordinated economic planning among Maghreb nations would include public spending, development and investment, and import-export policies within a liberal economic framework where the nation-state would play a secondary role to the regional organization. However, progress towards establishing this Maghreb regional organization has stalled. Although there were twenty-six cooperative agreements on taxation, customs, and central banking in the 1990s, the processes of the late 1990s fell behind of

schedule and have since been non-existent. Despite sharing a common culture and identity, there have been both a lack of political and economic will to power the AMU and also political and economic barriers to amounting Maghreb regional integration.

In political terms, while the AMU has existed for more than a decade on paper, its most important function as a common market have yet to become a reality because of multifaceted political issues in the region. A host of long-standing political issues and mistrust, including the territorial dispute over the Western Sahara, have plagued the negotiations and stalled progress toward integration since the mid-1990s. For Morocco, this former Spanish colony, which was administered for over three decades as Moroccan territory, was returned to Morocco as a result of a 1975 decolonization agreement with Spain. For Algeria, the territory must achieve independence as the Sahrawi Arab Democratic Republic (SADR) through a referendum organized by the UN. However, this avenue of resolution is now recognized as nearly impossible. The current proposal for a compromise between these two sides has been a resolution offered by Morocco in 2007, which proposed a special status of autonomy under Moroccan sovereignty. Thus far, the nationalist Polisario Front operating out of Algeria has refused to discuss autonomy as an option and has since failed to offer an alternative solution. As of recent, Morocco governs the majority of the disputed area as an integral part of its territory with regular participation by the population in both local and national elections, but the Western Sahara is officially designated by the UN as a “non-self-governing territory” pending final determination of its status. With the border still closed between Algeria and Morocco after fourteen years, the AMU will have to diligently work to bring about free movement between the two biggest economies of the AMU. While a lack of political will is just half of the problem of the AMU’s progress, the reemergence of old political conflicts coupled with the recent uprisings and ousting of political leaders is debilitating AMU development as well.

In economic terms, intra-Maghreb trade represented less than two percent of the sub-region’s combined gross domestic product (GDP) and less than three percent of the sub-region’s total trade in 2007. For the Maghreb region, annual per capita GDP growth from 1997 to 2007 was only 4.4 percent, much lower than the rate experienced by the countries of Association of Southeast Asian Nations (ASEAN), excluding Indonesia, and the countries of Central America that are parties to the Central America-Dominican Republic Free Trade Agreement (CAFTA-DR). Moreover, if the countries of North Africa maintain the growth rates of the past five years, it will take the region more than two decades to reach the current per capita income of less wealthy OECD members Turkey and Mexico (Jaidi 2011). Some of the reasons for this low economic activity include high barriers to trade, a lack of diversification, and political leadership decision-making. First, normally every regional economic organization has an economic leader; however, no North African nations have stepped up to fill that role. While Algeria in the 1990s battled civil war, Morocco and Tunisia focused on their economic relations with the EU. In addition, Tunisia and Morocco joined seventeen other Middle Eastern countries in the Greater Arab Free Trade Area (GAFTA) in 1997, which has made small steps toward freeing trade but covering only these two Maghreb nations. Nevertheless, regional economic integration has also been stalled by the different economic structures of each member nation. While Morocco and Tunisia have somewhat more liberal market-oriented economies, Algeria and Libya’s economies are centrally controlled. Mauritania’s economy, the smallest and poorest of the five, is still largely based on subsistence agriculture, and its gross domestic product is dismal in comparison to the other Maghreb countries. Moreover, progress towards a functioning AMU has been delayed partly because of overlapping bilateral agreements with one another. Even so, trade between the Maghreb nations, the Arab world, and globally, is relatively small, with exports concentrated in only a few commodities or products. If the nations of the Maghreb do not work to improve their economic relations, nations like Morocco and Tunisia will continue to trade abroad and the problems that impede AMU development will remain.

Despite the establishment of the AMU over two decades ago, the inherent lack of regional integration has also pushed these Maghreb governments to look elsewhere for economic activity. Typically the nations of the Maghreb have higher trade levels with the nations of the EU. Maghreb relations with the EU, however, have fostered an environment of reliance and a situation leaving Maghreb nations with little bargaining power in these bilateral trade agreements for a better trade status. Each country has opted to negotiate a separate economic agreement with the EU, rather than collectively negotiating for better terms. Similarly, ASEAN and CAFTA countries experienced similar dealings but have since realized their increased political bargaining power from regional integration. For the Maghreb, the EU accounts for 75% of Tunisia’s exports, 90% of emigrant workers’ remittances, 83% of tourism revenues and 73% of foreign direct investments. Likewise, 60% of Morocco’s

exports target EU markets, while 80% of tourism revenues and 90% of emigrant workers' remittances come from the EU (Achy 2010). Most significantly, these Maghreb nations are often left with trade policies chosen by these economically superior EU nations (White 2007). Nevertheless, this focus on trade with the EU provides an opportunity for individual Maghreb countries to lock in policies that would eventually help them harmonize policies within their own region if there were any sort of coordination or cooperation. Overall, the recent EU financial crisis should be of great concern for the Maghreb's reliance on trade with the EU as well as its public and private sectors as the EU's financial crisis will without doubt impact the EU's demand for Maghreb goods and services (Achy 2010). In order to avoid aftershocks of the EU's financial crisis and to grow economically, the Maghreb region must strongly reconsider revisiting regional economic integration.

Specifically, Jaïdi (2011) recommends that regional integration could contribute to higher economic growth in two ways. First, regional integration would create economies of scale, increase competition, and establish a market of more than seventy-five million consumers (Al-Ali 1999). This would, in turn, increase the attraction of foreign investors. Second, regional integration would decrease the number of independent bilateral trade agreements the EU has with Maghreb nations (2011). Jaïdi explains the reason for little intra-Maghreb trade in terms of market size, the similarity of economies, and an imbalance of imports and exports. He argues that Maghreb nations have in common a small market, a trade imbalance, and most notably the similarity of economies as demonstrated by the similar economies of Tunisia and Morocco. For example, for each nation's trade with the European Union, the Finger-Kreinin Index, which measures trade similarities, is more than seventy percent (Jaïdi 2011). In addition, an economic model analysis by the Peterson Institute of International Economics, "Maghreb Regional and Global Integration" suggests that a full-fledged free trade area among the Maghreb nations would produce a gain in total merchandise trade of approximately \$1 billion and would concurrently pioneer for future commercial relations in the region (Brunel and Hufbauer 2008). Moreover, free trade area between the EU or the US and the Maghreb would generate even larger gains.

#### *- EU and US economic development in the Maghreb -*

History has demonstrated over and over that economic integration and cooperation occurs when it becomes a platform across the territorial boundaries of the integrating countries. As of now, this has not occurred across the Maghreb for any head of state. However, other nations and regional organizations like the EU and US have attempted to reach out to the Maghreb region to encourage economic cooperation through bilateral agreements and infrastructure projects that promote North African regional integration. According to the Peterson Institute, total Maghreb trade would expand by \$4-5 billion (3-4.5 percent) if the EU or the US separately establish a free trade area with the AMU and by nearly \$9 billion (nearly 8 percent) if both establish regional free trade areas with the Maghreb based on gravity model calculations (2008). For instance, in an EU-US-Maghreb free trade area, total Maghreb inward foreign direct investment (FDI) stocks would increase by \$5.8 billion (75 percent), and total Maghreb outward FDI stocks would rise by \$3.9 billion (2008). Based upon these calculations and predictions by the Peterson Institute, both the US and EU stand to benefit from further economic cooperation with the Maghreb region.

While the European Union has attempted to bring the Maghreb together in a cooperative setting with the Euro-Mediterranean Partnership in 1995, the European Neighborhood Policy in 2004, and the Union for the Mediterranean in 2007, the European focus of these cooperative initiatives has been a European-led dialogue on trade and cooperation between both sides of the Mediterranean rather than a Maghreb-led integration of the North African region. Furthermore, the Barcelona Process, which is an EU initiative that hoped to establish a space of stability and security, economic prosperity with a free trade zone, and joint culture in the Euro-Mediterranean region, through further Euro-Mediterranean cooperation. Specifically, the Barcelona Process raised the amount of European funding available to North Africa and the EU through the European Neighborhood Policy that has allocated approximately \$3.4 billion to implementing the Action Plans of the nine North African economies over the next three years (Ulgen 2011).

Even though Maghreb nations hold free trade agreements with the US and other nations, free trade agreements are not enough in diversifying not just economic partners but the economy. Although Morocco signed a free trade agreement with the US in 2006 for industrial goods, agricultural products, and trade of services, it has failed to effectively influence Moroccan-US trade relations with the US accounting for no more than four-percent of Morocco's trade. Moreover, Morocco and Tunisia have signed free trade agreements with Turkey, the Arab Free Trade Agreement, and the Agadir Agreement, Morocco and Tunisia are still overly reliant

on their economic partnerships with the EU (Achy 2010). In looking towards the future, the nations that comprise the Maghreb should seek to diversify trade and their economic partners in order to break their heavily reliant economic ties with the EU. Jaidi argues that the creation of a single market would help wean Maghreb economic reliance on the EU and in turn foster investment opportunities for companies throughout the region (2011). Maghreb governments should aim to be as transparent as possible and in suit support private sector development, productivity, technology, and efforts to penetrate new markets. Moving forward, the Maghreb should seek to adopt a more flexible exchange rate in order to permeate new markets and attempt to remove all Arab trade barriers. By becoming more transparent in government and in customs and diversifying their economy in various ways, the Maghreb nations have much to gain. On the other hand, the EU and US can and should continue to build upon their already existent bilateral trade and economic cooperation structure in the Maghreb. For now, the US and EU can also look to create regional, private sector initiatives that promote foreign direct investment that focus on region-wide advancement instead of country specific projects. For instance, the US can opt to create mandates for regional projects in North Africa within the Trade Development Agency and the Overseas Private Investment Corporation. In the Maghreb, where both the US and EU have common interests, the two sides can and should coordinate projects to promote North African regional integration through revamping infrastructure. Projects like current efforts at high-speed train and motorway construction and crisis stabilization in the region should be proposed while other sectors like energy, agribusiness and banking are prime sectors for greater regional cooperation.

### *- Development within the Maghreb -*

The Maghreb is home to many natural resources: oil, gas, phosphates, agricultural land, a beautiful landscape that attracts millions of foreign visitors, and a young and eager population. However, with higher than twenty percent of the Maghreb population unemployed, thousands of migrants flee to Europe to find work and with that, eight billion dollars of private capital leaves the region every year. As the former governor of the Bank of Algeria, Abderrahmane Hadj Nacer, put it, North Africa's middle class is being formed outside its borders (Ghiles 2010). Tunisia's recent "Jasmine Revolution" has not only highlighted the upshot of endemic youth unemployment and the damaging effects that stagnant economies have had across North Africa, but also the complete lack of economic development and cooperation throughout the region.

Stability and security depends on the improvement of everyday socio-economic conditions and the development of society and the economy. An increase in employment opportunities is absolutely necessary for stability and to immobilize blanket disenfranchised youths and lower unemployment, feelings of alienation and desperation, and the threat of insecurity and terrorism across the Maghreb. Without heightened levels of economic cooperation and planning among the Maghreb nations and in partnership with the EU and US, North Africa will continue to fall behind in any efforts at regional security. In terms of building a secure Arab Maghreb Union, the EU and US through NATO are capable and should aid the nations of the Maghreb in the development of a security community starting with the reopening of borders and eventually with open road and rail services across North Africa and increasing the number of direct flights between Maghreb nations. In light of recent events, the livelihood of the citizens of the Maghreb more than ever before depends on the free movement of persons, goods, merchandise, and capital in a Maghreb common market that will eventually lead to regional integration that contributes to robust and revamped trade across the region (Bouaida 2010). With the border still closed between Algeria and Morocco after fourteen years, the AMU will have to diligently work to bring about free movement between the two biggest economies of the AMU. With coordinated responses to cross-border opportunities, the nations of the Maghreb would be able to take advantage of Euro-Mediterranean cooperation via the Mediterranean Union, and expand cooperation and trade with other parts of Africa and the Middle East.

One area of development that much attention should be paid to is the development of North Africa's infrastructure. Specifically, infrastructure development projects are of common interest and would require the involvement of various nations. Also, infrastructure projects are a simple way to get the region's political leadership and population unified and behind regional integration. Jaidi (2011) notes that joint transport ventures would have a strong political impact and maximum visibility, and would even unite Maghreb citizens. Given the Maghreb's wealth in natural resources and oil, energy and industrial sector projects could further the integration process and be developed in tangent with the EU. More specifically, the lack of economic integration in the Maghreb has a major impact on the energy sector. Ghiles notes, "Algeria is the third-largest provider of gas to the EU, after Russia and Norway. Additionally, the Maghreb's gas resources could be used to power desalination projects to bring more water to a region with a booming population and high urbanization and tourism rate.

Morocco has almost half the world's reserves of phosphate but to turn it into fertilizer, it needs energy, sulfur and ammonia: three things Algeria has in abundance, and at competitive prices" (Ghiles 2010). If Algeria and Morocco were able to compromise, jobs would be created and the Maghreb could attract further foreign investment and become the most competitive fertilizer producer in the world. Similarly in the auto manufacturing industry, Renault has invested in a new car plant near Tangiers to produce 400,000 vehicles a year by 2012 (Ghiles 2010). While Algeria stands to gain immense profit and employment from this deal, Algeria has yet to reach out and negotiate with other nations of the Maghreb to be a part of this venture. This is merely one example of lacking coordination and cooperation between nations of the Maghreb. Nonetheless, the nations of the Maghreb must look to involve and negotiate with one another in order to improve not only their individual nation's political and economic well-being but the region's global economic standing as well.

## CONCLUSION

In considering the recent tidal wave of revolutions that continue to sweep across North Africa, the first order of business on the road to a functional AMU must be to resolve interstate conflicts, like as the Algerian-Moroccan dispute over the Western Sahara and the issue of Gaddafi clinging to power and his human rights abuses in Libya. Without first fixing these political problems, the chance of a unified Maghreb is slim. Moreover, without a unified Maghreb and without such economic prospects in the region, the same economic instability that gave rise to the revolution in Tunisia and throughout North Africa will remain. A strategy for Maghreb regional integration will only succeed if political leaders make intelligent use of the many opportunities that are afforded to them in the wake of sweeping revolts and calls for democratic reform. It is far more effective for the nations of the Maghreb to speak and negotiate with their global economic partners with one unifying voice. Nevertheless, there is a sort of ambivalence that surrounds the notion of Maghreb integration, not just in politics and policy but within the public as well. What is needed is a charismatic political leader to champion this notion of Maghreb integration and win the hearts and minds of the leaders and people across North Africa. The decision to turn to greater cross-border cooperation in the region can only come from the highest levels in each country, and in this case that means the very personal attention of the heads of state. In the past, there has not been a political leader that has made the idea of regional integration across North Africa into a pet-project and ran with it. Despite these setbacks, many Maghreb national leaders, citizens and business leaders, continue to hope that the AMU will someday become a reality.

Last, Jaidi notes, "an integrated Maghreb is both a necessity and an opportunity" (2011). While several nations of the Maghreb are transitioning towards democratic government, reinvigorating Maghreb regional integration should go hand-in-hand with this process. Based upon authoritarian and corrupt government, high inflation, and endemic youth unemployment that the recent revolutions were rooted in, Maghreb nations could splinter and grow further hostile if the economic problems that plague the region are not resolved alongside its political problems as well.

## A FINAL NOTE

A final comment must be made concerning external factors. The fact is that the MAU, as any regional organization, does not exist in a vacuum, but rather faces multiple concerns from external nations. Clearly, in this post-colonial environment, with the number of French as well as other European and American companies involved in nations of the MAU, much of which revolves around oil and gas, it is interesting to see what course those nations will take with regards to the current upheavals in the area. On May 19, U.S. President Barack Obama delivered his speech "A Moment of Opportunity." In it he clearly refers to the new era of "self-determination" in the Middle East begun last December in Tunis and now spread far and wide, leading already to the downfall of the Tunisian and Egyptian governments and unrest and clashes between governments and their population in a number of other countries. President Obama noted that the "nations of the Middle East and North Africa won their independence long ago, but in too many places their people did not. In too many countries, power has been concentrated in the hands of too few." He added that "some nations are blessed with wealth in oil and gas, and that has led to pockets of prosperity. But in a global economy based on knowledge and innovation, no development strategy can be based solely upon what comes out of the ground" (Obama). The President noted that "we support political and economic reform in the Middle East and North Africa" and he

spoke to the need for free elections, end to dictatorship, end to sectarian conflict, and significant economic reform. With regard to the MAU nations, the President spoke clearly of Tunisia (as well as Egypt) in the creation of “enterprise funds” for investment, the fact that the Overseas Private Investment Corporation, in operations since 1971, will provide a US “\$2 billion facility to support private investment across the region, will work with the European Bank for Reconstruction and Development, and engage in a “comprehensive” Trade and Investment Partnership. This is of course, in addition to the free trade agreements already in place and noted earlier in the paper. Finally, President Obama called upon the International Monetary Fund to devise a plan for the forthcoming G-8 summit which would specifically address the needs of Tunisia and Egypt.

This is very much where one’s development views come into play. Can the MAU, unlike some of the other regional institutions, successfully achieve a substantial degree of economic independence? Even if the United States is sincere about these new initiatives, and there is little doubt but that many residents of the region would sincerely question that nation’s motives given its past support to dictators as well as other past policies in the Middle East and elsewhere, will this simply lead to more Foreign Direct Investment (FDI) of the type which continues to strip the region of much of its profits and limits regional development to servicing the economy of the North? Or, will it be the type of investment which truly builds a strong economy, integrating the various industries and nations of the area, increasing employment, and, ultimately seriously reducing the poverty that exists in so many quarters.

Then, there are a number of external issues which impact on the Middle East in general. In that same May 19<sup>th</sup> speech, the president recognized the severity of the Israeli-Palestinian dispute, and addressed the issue of the need for a Palestinian nation, suggesting that the 1967 boundary lines could be a starting place for negotiations, a position, which by week’s end had been rejected by Israeli Prime Minister Benjamin Netanyahu for reasons of national security. Thus, the stalemate appears to continue despite the president noting that the “Palestinian people must have the right to govern themselves, and reach their potential, in a sovereign and contiguous state.” On the other hand, the President noted that a return to negotiations will not be easy, particularly because “the recent announcement of an agreement between Fatah and Hamas raises profound and legitimate questions for Israel – how can one negotiate with a party that has shown itself unwilling to recognize your right to exist.” While this issue may not directly impact upon the MAU, it clearly impacts on the attitude of its member states toward regional and other non-member states and will affect those relationships.

Iran has become an increasingly important power in the region, particularly now with significant concerns about its nuclear potential. Clearly Iran is extremely hostile towards Israel and has effected efforts to significantly influence various Arab states as well as have an increasing role in Middle Eastern affairs. The impact of Iran’s influence on MAU trade and trade directions remains unclear.

Finally, a last word is necessary concerning the instability of the nations of the MAU, particularly that of Libya. At this point, the future of the government of COL Muammar Gaddafi’s is unclear, and if it, indeed, survives what direction it may take regarding the MAU, to say nothing of a host of other matters. An even greater question, if Libya was split, what would be the relationship of the two countries to the MAU? It is, quite frankly very difficult to see what direction a number of nations of the region, including members of the MAU, such as Tunisia, may take in the relatively short term. What will new governments be like? Will there be a rise of democratic regimes such as those sought in President’ Obama’s address? What will be the reaction to the radical Islamists? Will they be able to fill a power vacuum created by the ousting of dictatorial regimes in some Middle Eastern nations? Clearly, elsewhere for example, we have seen the impact of the administration of President Hugo Chavez Frias of the Bolivarian Republic of Venezuela on MERCOSUR, the so-called Market of the South (*Mercado Comunin del Sur*), endeavoring to have it work against the interests of the United States (*Chaves*), as well as his endeavoring to create a regional bank to rival that of the World Bank Group/International Monetary Fund, the *Banco del Sur* in 2009.

# AN EU CORPORATE INCOME TAX AS A NEW OWN RESOURCE TO FINANCE THE EU BUDGET

Auke R. Leen  
Leiden University, The Netherlands

## ABSTRACT

*The paper looks at the question if an European Union (EU) corporate income tax could become a new own resource of the Union to finance the EU budget. To overcome the *juste retour* thinking of the Member States and in order to get a direct relation with its citizens the EU wants new own resources. A tax directly paid tax by the EU citizens or corporations to the EU could be the answer. The tax would also give the EU a greater autonomy from the Member States.*
