*The article discusses, re an European corporate tax, the problems of the quality of the EU regulatory process, the cultural differences, and the fiscal sovereignty of the Member States. The article concludes that the autonomy of the Union is, on its own, no goal, and, an corporate income tax does not create a bond between the EU and its citizens. Besides that, the corporate income tax is hard to monitor by the European Court of Auditors and it will take, if possible at all, many years to harmonize the corporate tax base.*

## INTRODUCTION

On September 7, 2010, José Barosso, President of the European Commission of the European Union (EU), delivered his first State of the Union Address. As emphasized in the Preamble to the Treaty of Rome of 1957, one of the goals of the Union has been to create an ever-closer union among the peoples of Europe. Since the Treaty of Rome, and especially after the Treaty of Lisbon that entered into force on December 1, 2009, the EU has become a real legislator (Voermans, 2009a), thus making an annual address by its president appropriate.

Since matters relating to financing go to the very heart of the common undertaking, the revenues of the EU played a role in Barosso's Address. The present system has two major drawbacks. First, it leads to the infamous *juste retour* thinking by the Member States: emphasis is placed on net contributors and net recipients among the Member States. Member States do not look at the added value of expenditures for Europe as a whole. The EU, therefore, seeks a greater degree of autonomy *vis à vis* the states. Second, the EU has evolved from a mere union of states to a union of states and citizens. A direct bond between citizens and the Union is the next logical step. A EU tax, paid to the EU by its citizens, would solve both problems.

A EU tax is a bold idea, but a problematic one. It is bold because the EU shows courage in letting its citizens pay directly to the EU. It makes the burden of taxation visible to the citizens and makes the EU more accountable to its citizens and hence more democratic. Notwithstanding the fact that in history it was often the goal of governments to hide the burden of taxation as much as possible for its citizens, or at least give them the impression that other people do pay. It is problematic since it brings to the forefront the tension between those who want the EU to become the United States of Europe and those who want to maintain the *status quo*. In other words, a EU tax emphasizes the debate regarding the fiscal sovereignty of the Member States.

How can the EU cope with these problems regarding one of the recently proposed new EU tax by the European Commission ((Brussels, 19.10.2010; SEC (2010) 7000 final)): an EU Corporate Income Tax (EUCIT)? The paper takes a perspective on and tries to play a role in the public discussions on the issue of

corporate income taxation in the multicultural environment of the EU. An EU tax is for the up-coming years for sure one of the biggest challenges public policymakers do face and of direct relevance to the EU business community.

The paper does not look at the question if corporations should (Bird, 1996) or even can be taxed in a real sense (Friedman, 1972). The first since corporations benefit from the one internal market in the EU. The last since only real persons do pay taxes. No matter the fact that companies are operating as legal persons, there is still a difference between artificial persons and real ones. As far as taxation of corporations go, it are either the corporation's employees, customers or stockholders that do pay taxes. The tax incidence will be different, also in time, and does depend on market conditions (Buchanan, 1999). In fact, the corporation is a pure intermediary through which the money is forwarded to the taxing authorities. For Friedman (Tax Reform Panel, 2005) the best tax would be a flat rate tax on consumption. This since it is the simplest and the most efficient system and it does not discourage savings. The greatest virtue, and also the reason that it will never exist, for Friedman, is that it limits what governments can do to influence the economy. This will probably also be the reason why it will be so hard in the EU to harmonize the tax base to apply the common EU tax rate on.

## **OWN RESOURCES OF THE EUROPEAN UNION**

A long-held goal for the EU is to beget a genuine system of own resources. As Article 201 of the Treaty of Rome states, "the Commission shall examine the conditions under which the financial contributions of Member States provided for in Art. 200 could be replaced by the Community's own resources." Furthermore, as Article 311 of the Treaty of Lisbon states, "[w]ithout prejudice to other revenue, the budget shall be financed wholly from own resources." Nowhere does the Treaty define, however, what is meant by own resources. It merely states how the decision-making process regarding the own resources is to proceed: the Council, the European Parliament, and the Parliaments of the Member States, all must come to an agreement. Decision-making in the European Council, as a special condition, must be unanimous.

In 2009 a leaked draft report of the European Commission sparked a false start of the discussion on EU budget reform. In the autumn of 2010, as Barosso mentioned in his address, following a period of consultation with citizens, scientists, and politicians, the Commission has presented a new approach to the Union's own resources. Presently, 85% of the revenue is funded by direct contributions of the Member States, based on a percentage of their Gross National Income (GNI). Though all revenues, by definition, are called own resources, not all of the EU's own resources are created equal. In fact only custom duties and agricultural levies, which amount to 15% of the EU's revenue, are actually owned by the EU. Thus, the *juste retour* thinking makes its mark on GNI-based contributions of the Member States.

The European Commission states that own resources are revenue flowing automatically to the European Union budget, pursuant to the treaties and implementing legislation, without the need for any subsequent decision by national authorities. How this definition relates to the fiscal sovereignty of Member States remains unclear. For fiscal sovereignty is also by the EU an agreed on cornerstone principle for any future system of the EU's own resources.

The Treaty of Rome's choice to classify custom duties, and subsequently agricultural levies, as the EU's own resources was a logical one. Both revenues, which are now called traditional own resources, are directly correlated to EU policy. They relate to the EU's goals of becoming self-supporting with regard to food, as well as the creation of a common market with a unified border. Hence, it is said that any new EU resource too should be inherently linked to a fully developed central European policy. By which is meant those activities that could not feasibly exist outside the EU context.

## **QUALITY OF THE REGULATORY PROCESS**

At present, the EU is thinking about direct taxes on consumption, transport, communications, financial services and corporate income (European Commission, 2010). One problem with the newly proposed taxes concerns the quality of the legislative process. Next to that, there is also the matter of legality: did all parties participate in the process and can their respective expectations be fulfilled (Voermans, 2009b)? More

specifically, on the subject of the quality of the regulatory process, the problem is the long shopping list of criteria an EU tax would have to fulfill. Both the Commission and the European Parliament have mentioned visibility, simplicity, financial autonomy, efficiency, sufficiency, cost-effectiveness, stability of revenue, equity, and added value for Europe as potential criteria. Next to that there are some specific EU-criteria to take care of, like the existence of border crossing external effects, the mobility of the tax base, the volatility of the proceeds, and if it is hard to state the contribution of an individual Member State in the proceeds of a certain tax. With so many criteria, in fact anything goes. Hence, the tax actually chosen will, most likely, be an *ad hoc* political choice. A choice, that is probably based on an odd, spur of the moment, political compromise.

In order to facilitate a rational discussion that will fulfill the quality demands of both national and international law, the EU must arrive at a manageable list of criteria. For the problem is of course not only the sheer endless list of criteria but also that the Member States do give different weights to the criteria (Radaelli, 2004). The same goes for the European Commission (Cattoir, 2004) and European Parliament (1997), they, too, do give different weights to the criteria. Besides that it is an open door to state that criteria that do work in a country with a relative homogeneous population not automatically do work in a union as diverse as the European Union. As has been said, in the future it is no longer the primary goal to strengthen the unity of the Union, but, on the contrary, the diversity between the Member States should be emphasized and taken care of (Krüger, 2006).

In a cynical sense, though that even does give a norm by which to judge the budget, it can even be said that the budget is only lubricating oil to streamline the process of much more important political decisions. For that reason it is said that the EU budget makes compromises possible or that it is just a means to enlarge the popularity of the EU (Figueira, 2008).

## **FISCAL SOVEREIGNTY**

The reasoning behind the EU's own traditional resources, the way how they belong to the EU is convincing. They are the direct result of the existence of the EU and its policies. The new European taxes proposed by the EU, however, are not the direct result of EU policies, unless one artificially strains the argument. Member States interpret these new resources as a, not to be taken, loss of fiscal sovereignty. Hence, in order to get agreement with the Member States, the EU emphasizes that full fiscal sovereignty will remain with the Member States. This is, however, not really convincing.

Firstly, how are own resources defined? In the Treaty of Rome of 1957 it was stated explicitly, Art. 201, that own resources would be the goal. In art. 311 of the Treaty of Lisbon it reads too that "[w]ithout prejudice to other revenue, the budget shall be financed wholly from own resources". However, what those own means are is nowhere to be told. It is only said that the Member States together with the European Parliament has to decide about them (Ehlermann, 1982). Own resources, however, are described as sources of income which belong to the Union forever and for which no decision of the separate Member States is necessary. At present only the custom duties do adhere to this description.

Secondly, from an economic perspective, the eternal socialization of an asset's return is the same as the socialization of the asset itself. *Mutatis mutandis*, the same goes for the temporary pooling of taxation revenue, which also entails a loss of fiscal sovereignty for Member States.

For the Union, however, it is a fact, as just-said, that as far as new own resources of the Union go, the fiscal sovereignty of the Member States have to be respected. The right to collect taxes remains with the Member States. The Union is mandated by the Member States to profit from a national tax for a limited time period. A decision that can be recalled at any moment (European Parliament, 2007). However, how all this relates to the definition of own resources and the temporary pooling of taxation revenue and hence means for the fiscal sovereignty of the Member States remains unclear.

## **CULTURAL DIVERSITY**

In introducing a one size fits all EU tax the existing divergence of national tax preferences is not taken into account. On the basis of the data of the European Values Study Foundation & World Values Survey Association, real differences in value judgments related to tax system preferences can be shown. Southern Europe Member States, for instance, give a relatively low weight to efficiency compared to equality. At fields where competition is the driving force, e.g., corporate taxation, there is some convergence in tax rates, in other fields, however, e.g., inheritance taxation, there is evidence of continuing tax preference heterogeneity (Heinemann, cs, 2008). The present system of national contributions does give Member States free choice of how to finance their contributions to the EU budget based on their own value systems.

In line with this, it is also said that if the goal is to make the EU more visible to its citizens it is not necessary at all to introduce one common EU tax. It is enough just to show to the citizens the amount paid by a Member State to the Union in a national tax. Every Member State can choose its own "Euro" tax; this is called a declaratory tax (Ceasar, 2001). For instance, in one Member State, when shopping, on each receipt the national contribution as a certain percentage of the value-added tax to the EU is visible to every citizen. In another Member State, however, it can be shown as a part of the income tax paid by its citizens. The advantage is that no time-consuming process of harmonization with regard to the tax base between the Member States is necessary. Besides that there are no extra EU collection costs. Also the quality of the tax authorities in a Member States is of no importance. The national contribution of a Member State is independent thereof, since the amount to be paid is fixed. In short, with a declaratory tax, the form to collect the required amount is not prescribed by the Union to the Member States. Member States can choose the national EU tax that works best for them. Member States do have the best knowledge of what works and does not work in their country.

## **EU CORPORATE INCOME TAX**

An EU Corporate Income Tax (EUCIT) would, for the European Commission (2010), first require a common corporate tax base. A uniform EU corporate tax rate could then be applied to the common corporate base. Member States could continue to apply a national rate to this new base, or the EUCIT could be a percentage of each national company tax.

Corporate income tax represents on average between 2% and 3% of GDP in the EU so that in the scenario of a new compulsory base for all companies with part of the revenues accruing to the EU, there would be enough revenues to finance the EU budget with an EU tax rate of about a quarter or less of the harmonized tax base. This since the goal of the EU is that own resources would furnish about half of the EU budget of about one percent of total GDP. However, the amount raised would fluctuate with the taxable profits of the EU private sector and would be difficult to predict.

If a common basis replaced current national rules and bases, this could, as the Commission states, lead to substantial efficiency gains (fewer tax distortions in investment decisions) and help to reduce compliance costs for companies operating cross-border in the internal market. In addition, it could contribute to a "clearer" distribution of tax bases for multinationals across Member States.

The challenges to implement an EUCIT are considerable. The work on a possible EU common tax base, which was first suggested in 1962, is notoriously difficult. This given the competences of Member States in taxation, as it relates to essential differences in Member States. Even the completion by the European Commission (2011), this year, of a for corporations optional Common Consolidated Corporate Tax Base (CCCTB) has proved to be very controversial. This base, however, has not been conceived as a possible basis for a new corporate EU income tax. It is meant for companies operating in more than one Member State in the Internal Market. In this way companies would benefit from a one-stop-shop system for filling their tax returns and would be able to consolidate all the profits and losses they incur across the EU. Member States, however, would maintain their full sovereign right to set their own corporate tax rate. This however is, as just-said, an optional choice for companies operating in more than one Member State. It is to be chosen for at least a period of five years.

Besides that, given the different qualities, and---not the least---morality, of the tax institutions and payers in the EU Member States, an EUCIT as an percentage of the proceeds of corporate income taxes would

hardly do justice to horizontal (fiscal) justice between the corporations in the Member States. Hence a surcharge, a declaratory tax also, that would furnish the by the EU required contribution to the EU, on the proceeds of the existing corporate income tax in the Member States could be in this regard be a better solution.

## **The autonomy of the European Union**

For the Commission, EU taxes would be the answer to the problem of the *juste retour* behavior of the Member States. Member States do focus on their net budget position with regard to the Euro budget. They do look at what they do give and what they get back in money from the Union. The victims of this behavior are the real European collective goods; they do become underfinanced.

But a greater autonomy can never be a goal on its own for the EU. Though this seems to be the case for the Union (European commission, 2004; European Parliament, 2007). Autonomy can be a means to secure typical European collective goods like an EU policy against illegal immigration. Financial autonomy can be of help to ascertain these goals that otherwise would not be accomplished (Cieślukowski, 2006). However there is no direct link between the goal of securing European collective goods and financial autonomy.

Besides that, even in the recent history of the Union, in the eighties of the last century, when direct financial contributions from the Member States to the Union were almost completely absent, there were fierce fights over the EU budget. With, as the absolute climax, the words of Margaret Thatcher, the English Prime Minister, *I want my money back* at the 1984 EU-summit in Fontainebleau

## **The bond between EU citizens and EU institutions**

The Union, at least for the European Commission, has developed from a union among nations to a union among nations and citizens. So, in taxing too, there should be a direct bond between citizens and the EU institutions. The bond would also make the EU more accountable to its citizens and hence would raise the democratic level of the EU. Though it is also said that the real problem is not that there is no bond between EU citizens and the EU institutions, but that because the EU budget at present is not used to finance real European goods, citizens do not support the EU. If, however, the EU would supply real European collective goods, citizens would feel connected with the EU and be in favor of European taxes (Iozzo cs, 2008). Though, on the other hand, since taxes are never popular, a visible EU tax, it is said, would diminish the support for the Union (Mutén, 2001).

In a sense, however, the Union shows a lot of courage to introduce a visible European Tax. Though in the case of a corporate income tax, by not taxing individuals directly by their income or consumption, the EU is probably relying on the misleading common wisdom of citizens that others do pay by taxing corporations. This, whatever the often heard equity reasons for taxing corporations are. For the EU, it follows from the benefit principle that those benefiting from current policies ought to pay for the policies. As far as the EU and corporations go, in the present case, corporations benefit from the Single Market and from the euro. The former through the expansion of the domestic market and the latter as a result of price transparency and enhanced competition (European Commission, 1998).

The present way of financing the Union, in fact, concurs to this old ideal of making taxes as invisible as possible. Custom duties give 15% of the EU budget. Direct contributions of the Member States do furnish the remaining part of the budget. A contribution that is *grosso modo* based on the Gross National Product of the Member States. For 2011, the total budget is 126.5 billion euro. That is about 1.24 percent of the total GNP of the 27 Member States. Both of these resources are not related to the daily life of the average European citizen. A situation that will not be improved with a corporate income tax. A corporate tax would not be visible to citizens as consumers but only as owners of firms. Probable the accountability of the EU to its citizens would not be enhanced.

## **Time path of implementation and control by the European Court of Auditors**

A practical problem for the introduction of an EU corporate income tax is that the harmonization of the base will take a long time. In all previous reports of the EU (e.g., European Commission, 1998) the severest difficulty for corporate taxation to become a new own resource is the diversity of the existing national tax bases upon which the tax is going to be levied. This pertains to the diverse accounting rules, depreciation rules, and rules re loss compensation in the Member States. The harmonization process for the EU value-added tax base lasted more than ten years. Though differences do still exist. A problem too is that for the European Court of Auditors the tax is difficult to verify. The tax receipts depend on the tax habits and morals in the different Member States. Not every Member State in the EU collects the tax revenues it should with regard to the existing tax rates. One EU tax rate would also not automatically mean equality of payment to the EU for its citizens or corporations (Schneider, 2007).

## CONCLUSION

The ability of the EU forerunner, the European Coal and Steel Community (ECSC), to collect its own taxes with its own tax administrators on steel and coal producing companies is still an unattainable ideal for the European Union. An EU corporate income tax, however, might not be the ideal own resource the EU seeks. Firstly, it does not create a bond between citizens and the Union. Secondly, though it will enable the growth of EU autonomy, and with that the possibility of EU policies with a real added value to Europe as a whole, the lessons of history do not support that expectation. Severe negotiations about the EU budget are of all times, no matter how the budgets are financed. Given the fact that, at present, a harmonized base for corporate income taxes is virtually non-existent, to create one, will at least for its short-time introduction be an insurmountable hurdle. Besides that Member States do not want to lose their fiscal sovereignty given the wish to fine-tune business taxation based on national interests and cultural differences.

# PARTICIPATION OF LOCAL RESIDENTS IN ARTS FESTIVAL: THE CASE OF MACAU

Wengsi Lei and Weibing Zhao  
Institute for Tourism Studies, Macau

## ABSTRACT

*Motivations of festival attendance have been researched traditionally from a tourism perspective; tourists' motives have long been recognized. However, arts festival is considered as community and cultural related. The participation of local residents to a large extent defines the event success. Local attendees' expectation, perception on festival's value and benefits are of little known in the field of event research studies. Thus, this study is formed to examine a range of pull and push factors that influence Macau local residents to participate in the annual Art festival. A survey was conducted with 160 usable responses. Statistical analysis was conducted and important factors, such as convenience of purchasing tickets, personal curiosity about unique performances, and interest in arts appreciation are revealed to exert influence on local attendees' participation.*

## INTRODUCTION

Importance of understanding tourists' motives have long been recognized in the tourism literature (Crompton 1979, Iso-Ahola 1982). The same principle applies to event's marketing strategies. Many previous studies examine tourists' motivation in attending events (Uysal, Gahan, and Martin 1993, Yuan, Cai, Morrison and Linton 2005, Saleh and Ryan 1993, Lee, Yang and Lo, 2008); nevertheless, many loyal return event participants are local residents (Getz, 1991). However, studies on motives for local participants attending event are rarely found, except the study conducted by van Zyl and Botha (2004) for the annual Aardklop National Arts Festival in South Africa. With the aim to fill this research gap, the research objective of this study is to explore the motivational factors of local residents in attending a festival.

## MOTIVATION FOR FESTIVAL ATTENDANCE

The research importance on event motivation as stated by Crompton and McKay (1997): 1. It is a key to design event product and service; 2. Motives and satisfaction are interrelated; 3. Motives help to understanding event attendees' decision making process, are well recognized. However, special events come in different themes, features and settings. Different studies have identified different motivational factors in attending event. For example, the study conducted by Uysal, Gahan and Martin (1993) revealed that escape, thrill, event novelty, socialization, family togetherness are the most prominent factors for the event attendees. Bowen and Daniels (2005) studied a music festival – Celebrate Fairfax, an annual music festival held in Virginia (USA) identified another set of motivational factors, namely discovery, music and enjoyment. Indeed, multiple needs are satisfied when an event attendee participates in a special event (Crompton and McKay, 1997).

In general, event novelty and socialization seem to be the most influential motivational factors across studies (Uysal, Gahan and Martin 1993, Formica and Uysal 1996, Crompton and McKay 1997, Nicholson and Pearce 2001, van Zyl and Botha 2004, Guzman, Leones, Taipa, Wong and deCastro 2006). In the study conducted by Nicholson and Pearce (2001), four factor groupings: socialization, novelty, escape and family are revealed. They are prominent factors among the four events that Nicholson and Pearce compared in the South Island, New Zealand. Besides, two types of socialization are identified in the study by Crompton and McKay (1997). They are known-group socialization which referred to interaction with existing friends or acquaintances, and external socialization referred to interaction with visitors who were unacquainted prior to the

festival. Event planners should surely pay attention to this factor when designing event process and atmosphere. In addition, event novelty is another important motivational factor revealed among earlier studies (Uysal, Gahan and Martin 1993, Formica and Uysal 1996, Faulkner, B., Fredline, E., Larson, M., and Tomljenovic, R. 1999, Nicholson and Pearce 2001, van Zyl and Botha 2004, Guzman, Leones, Taipa, Wong and deCastro 2006). Event novelty contributes significantly to the product element of an event, which is considered as the core service to attract attendees. Site selection, programme uniqueness, packaging with other services, physically setting of an event site and other relevant marketing aspects of an event are important attribute to an event novelty level (Allen, O'Toole, McDonnell, and Harris 2008).

In understanding motivation for festival attendance, one could separate factors between push and pull. Push factors are internal to an individual and refer to the sociopsychological benefits that a festival's facilities, attractions and people offer (Crompton, 1979, Dann, 1977). These factors refer often to the desire or forces arising in an individual self, and they are mostly intangible. For event participants, examples of push factors include socialization, escape, community pride and cultural exploration (van Zyl and Botha 2004, Guzman et al, 2006). Pull factors are external to an individual and refer to the tangible attributes of an event (Crompton 1979, Dann, 1977), such as transport, food and beverages, information, and entertainment (van Zyl and Botha 2004). In summary, we attempt to identify the two types of motivational factors – pull and push in this study. We believe that event marketing planning and management process could be further developed and enhanced by understanding the push and pull factors of festival attendance.

The choice of festival researched in this study is the Macau Art Festival. It is a festival covering the categories of community (Allen et al. 2008) and cultural (Shone and Parry 2004). According to the events and festivals calendar of Macau (Macau Government Tourism Office 2010), cultural festivals, sport and business events are the dominant events taking place in the city. Business and sport events impose certain barriers for local participation. Thus, cultural festivals, including religious, art related and important civic occasions are considered deemed appropriate for the research. The Macau Art Festival is of particular relevant to the research objective stated earlier, which is to explore the motivational factors of local residents in attending festivals. More importantly, this art festival falls into the category of community and cultural type of events, and in which local participation is not limited by religious belief. In addition, it is one of the oldest cultural festivals being organised for more than two decades in Macau.

## **THE MACAU ART FESTIVAL**

The Macau Arts Festival is one of the three annual art-related festivals hosted in Macau, Special Administrative Region (S.A.R.). The Macau Arts Festival is organized by the Cultural Affairs Bureau of the Macau S.A.R. Government. The festival has been held for the past twenty years. The festival is a kind of combined arts festival, which is defined as arts festival containing more than one genre of artistic performance, for example, music, drama, and visual arts event (Finkel, 2006). However, published reports on factors motivating event participants or event-related studies are not found. Little has been known regarding what local residents expect, how they perceive/evaluate the festival. Getz (1991) states that local residents dominate festival attendance and they, are part of the host community. Thus, certain level of understandings, particularly on attendance motivation is deemed necessary to sustain the event organization and success. We hope that by understanding the motivational factors, including push and pull ones, the festival management organization (the Culture Affairs Bureau of the Macau S.A.R. Government) could further develop the Macau Arts Festival, attract more non-participants and even tourists in the future to enhance the overall sustainability and success of the festival.

## **RESEARCH METHOD**

A survey was conducted on local residents attending the 2009 Macau Arts Festival. Questionnaire items were developed based on literature review and in-depth interviews with six local residents who had attended the Macau Arts Festival in the previous years. The questionnaire was composed of four sections. The first section was mainly used to collect demographic information. The second section of the questionnaire was about pull factors. In the third section, the intrinsic motives of festival attendees, i.e. the push factors, were investigated.

Questions in the last section were concerned with each respondent's extent of involvement in the festival, level of overall satisfaction, and behavioral intentions. Extent of involvement was indicated by the number of performances watched and the amount of money spent. Overall satisfaction was measured on a seven-point Likert scale. Behavioral intentions had two indicators. One was the likelihood to attend next year's festival. This indicator was also measured on a seven-point Likert Scale. Another was the amount of money each respondent was willing to spend in future.

The survey was administered in the first week after the end of the festival in order to ensure that the respondents' memory was still fresh. The convenience sampling method was used. A group of trained research assistants were sent to major streets of the city where pedestrians were randomly intercepted. Initial screening made it sure that only local residents, and in addition, those who had attended the 2009 Macau Arts Festival, were eligible for this study. Finally, a total of 159 valid responses were collected for statistical analysis. The statistical software employed was SPSS.

## RESEARCH FINDINGS

### Profile of the respondents

Male respondents accounted for 50.9% of the sample. Contributing to 33.8% of the sample, the age category 25-34 included the largest number of respondents, followed by 15-24 (26.1%), 35-44 (23.6%), 45-54 (14.6%), and 55 or above (1.9%). The educational attainment of the sample was considerably higher than that of the general public, indicating a strong relationship between education and arts festival participation. Specifically, up to 62.8% of the respondents had received tertiary education by the time of the survey, while the percentage based on the whole population was just around 10%.

With respect to monthly income, 33.6% of the respondents earned not more than MOP 10,000 (US\$1 is equal to MOP8), 50.6% within MOP 10,001-20,000, 14.5% within MOP 20,001-30,000, and 1.3% more than MOP 30,000. In terms of the times each respondent had attended the annual Macau Arts Festival, the sample could be divided into three groups, namely first time festival attendees (one time only), occasional festival attendees (two or three times), and frequent festival attendees (at least four times). The proportion of each group in the sample was 20.1%, 44.7%, and 35.2% respectively.

### Pull factors

Table 1 summarized the descriptive statistics on the respondents' perception of each festival feature. All the features except ticket pricing and effectiveness of publicity were rated well above 3, showing that in general Macau residents felt satisfied with the organization and operation of the festival. However, there was still much room for improvement since only two items were rated above 3.5 and none above 4.

The most highly recognized aspect of the festival was accessibility of performance venues. This research finding is not surprising because the organizer of the festival has been complimented for its creative efforts to integrate different types of arts performances with local culture, seeking to produce unique atmosphere and experience for the audience. A large proportion of performances were actually not held in the theatre but in historic houses and other heritage sites, most of which are distributed in the city center.

The least recognized pull factor was effectiveness of publicity. Despite that the festival has been long established by the Macau government as an important annual event of the city, it seems that the accessibility of local residents to festival-related information is still quite limited. A detailed analysis of the channels through which respondents got to know about the festival revealed that almost all respondents relied on multiple sources of information. The leading source was newspaper (mentioned by 76 respondents), followed by brochures (75), family and friends (71), billboard (69), Internet (58), TV (51), radio (46), and others (4). The prominence of family and friends as a source of information to some extent reflected the ineffectiveness of current marketing campaigns. It is somewhat unexpected that Internet, a powerful mass media and communications tool, was

relatively unimportant in this study. This might be explained by the small territory of Macau, which, less than 30 square kilometers, made the application of virtual and long distance technologies not so necessary.

**Table 1: Subjective perceptions of local attendees about the pull factors of the 2009 Macau Arts Festival (n = 159)**

<b>Pull factors (festival features)</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>Mean</b>	<b>SD</b>
Performance number	3.2%	9.7%	37.7%	42.9%	6.5%	3.40	0.874
Performance variety	1.9%	11.5%	44.2%	38.5%	3.8%	3.31	0.800
Performance class	1.3%	4.5%	46.8%	42.9%	4.5%	3.45	0.714
Aesthetics of stage setting	0.7%	6.6%	50.0%	37.5%	5.3%	3.40	0.721
Accessibility of performance venues	0%	9.7%	29.0%	53.5%	7.7%	3.59	0.770
Performance scheduling	2.6%	7.7%	32.7%	50.6%	6.4%	3.51	0.831
Convenience of purchasing tickets	0.6%	14.7%	38.5%	39.7%	6.4%	3.37	0.835
Ticket pricing	5.1%	23.6%	40.8%	25.5%	5.1%	3.02	0.951
Effectiveness of publicity	5.7%	19.7%	49.0%	22.9%	2.5%	2.98	0.861

Further analyses were conducted to determine if there were any statistically significant differences among the subgroups of the sample based on demographic variables. In other words, do different types of people have different perceptions of those festival features? Either ANOVA or independent T tests were used, depending on whether or not the variables in question were dichotomous. Where a significant difference was found using ANOVA, the Tukey test was then used to determine which groups were different.

Income made a difference (after re-grouping to combine the 20,001-30,000 and 30,000 plus categories) with regard to accessibility of performance venues and ticket pricing. Compared with middle-income respondents (with monthly income of 10,000-20,000), high-income respondents (with monthly income of more than 20,000) felt much more satisfied with the transportation to performance venues. The difference might be due to the fact that high-income people are more likely to have private vehicles or use taxi services. These two subgroups of the sample also exhibited differences in ticket pricing: the perception of high-income respondents on the ticket pricing level was significantly lower than that of middle-income respondents. The reasoning behind is straightforward: the more one earns, the less important a certain fixed amount of money for him/her.

Another variable found to be significant is that of festival participation frequency. The three subgroups of the sample (i.e. first time attendees, occasional attendees, and frequent attendees) displayed significant differences in performance number, performance variety, aesthetics of stage setting, and effectiveness of publicity. Specifically, the means of performance number for first time attendees and occasional attendees were significantly lower than that for frequent attendees, and the mean of performance variety for first time attendees was significantly lower than that for frequent attendees. With respect to both aesthetics of stage setting and effectiveness of publicity, the means for first time attendees were significantly lower than those for occasional attendees and frequent attendees.

Principle component analysis (PCA) using orthogonal rotation (VARIMAX) was conducted to examine if any internal constructs among the pull factors existed. Three factors emerged, which accounted for 68.74% of the total variance. The factors were named "program quality", "convenience", and "program quantity"

respectively. The final solution was detailed in Table 2. Two festival features, namely ticket pricing and effectiveness of publicity, did not load on any factor due to their poor loading values.

**Table 2: Factor analysis on the pull factors of the 2009 Macau Arts Festival**

<b>Pull factors (festival features)</b>	<b>Program quality</b>	<b>Convenience</b>	<b>Program quantity</b>
Performance class	.78		
Aesthetics of stage setting	.67		
Accessibility of performance venues	.62		
Performance scheduling		.85	
Convenience of purchasing tickets		.76	
Performance number			.88
Performance variety			.68
Eigenvalue	1.67	1.64	1.50
Variance explained (percentage)	23.84	23.45	21.45
Cumulative variance explained (percentage)	23.84	47.29	68.74

## Push factors

Table 3 presented responses to the question: "How important were the following goals to you when attending and participating in the 2009 Macau Arts Festival?" In general, there were various reasons for local residents to attend the festival. Each goal had a mean above 3; in addition, all the goals had more than 40% of the respondents rating 4 or 5. Local attendees of the 2009 Macau Arts Festival were most driven by personal interest in arts appreciation. The mean of this goal was the highest. Two other goals, namely to improve arts skills and knowledge and to satisfy curiosity about unique performances, were also quite important. They had the third and fourth highest means respectively. The prominence of these three goals indicated that in Macau the level of interest in art itself was a critical factor affecting the participation of local residents in the festival. Another finding worth mention was that "to be together with family", a very popular goal as revealed in many other festival studies (Uysal, Gahan and Martin 1993, Crompton and McKay 1997, Nicholson and Pearce 2001, van Zyl and Botha 2004, Guzman, Leones, Taipa, Wong and deCastro 2006), was the least recognized one in this study. This may reflect a major difference between local residents and visitors in motives. Staying in usual living environment, local residents have daily interactions with their family and friends, so may not consider family togetherness or local social life special or stimulating.

**Table 3: The push factors of local attendees in the 2009 Macau Arts Festival (n = 159)**

<b>Push factors (intrinsic motives)</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>Mean</b>	<b>SD</b>
To meet my personal interest in arts appreciation	1.3%	7.0%	27.8%	52.5%	11.4%	3.66	0.820
To improve my arts skills and knowledge	1.9%	12.7%	24.1%	48.1%	13.3%	3.58	0.939
To kill time	7.6%	13.3%	33.5%	36.1%	9.5%	3.27	1.055
To relax	1.3%	7.6%	30.4%	50.6%	10.1%	3.61	0.820
To be together with my family	6.3%	22.2%	30.4%	29.7%	11.4%	3.18	1.097
To socialize with my friends	1.9%	17.1%	32.3%	38.6%	10.1%	3.38	0.948
To experience the atmosphere	0.6%	19.6%	31.6%	41.1%	7.0%	3.34	0.894
To satisfy my curiosity about unique art performances	1.3%	12.0%	30.4%	44.3%	12.0%	3.54	0.900

Similar to the analysis of pull factors, either ANOVA or independent T tests were used to determine if there were any statistically significant differences in push factors among the subgroups of the sample. Gender and age (after re-grouping to combine the two categories of 45-54 and 55 plus) demonstrated significant differences. Compared with male respondents, female respondents felt more motivated by meeting personal interest in arts appreciation. The respondents in the age category of 25-34 rated the motive "to improve my arts skills and knowledge" much more highly than those in the age categories of 35-44 and 45 plus. In addition, factor analysis was conducted. Four factors were identified, and explained 66.43% of the variance. They were named "education", "leisure", "novelty", and "socialization" respectively. The final solution was detailed in Table 4.

**Table 4: Factor analysis on the push factors of the 2009 Macau Arts Festival**

Push factors (intrinsic motives)	Education	Leisure	Novelty	Socialization
To meet my personal interest in arts appreciation	.78			
To improve my arts skills and knowledge	.86			
To kill time		.75		
To relax		.75		
To experience the atmosphere			.77	
To satisfy my curiosity about unique art performances			.79	
To be together with my family				.67
To socialize with my friends				.84
Eigenvalue	1.55	1.26	1.26	1.24
Variance explained (percentage)	19.36	15.79	15.77	15.52
Cumulative variance explained (percentage)	19.36	35.15	50.91	66.43

## Festival participation, satisfaction and behavioral consequences

As for the number of performances watched, on average the respondents watched 2.57 performances, and the median was two. Up to 32.9% of the sample watched only one performance, while less than 9% watched five or more. Those who watched two, three, or four performances constituted 21.4%, 18.2%, and 18.2% of the sample respectively. The maximum number of performances watched was ten. Regarding expense, the amount of money individual respondents spent during the festival ranged from nil to MOP 1,000, with the mean and median being MOP 212 and MOP 132.50 respectively. Notably, 63.3% of the sample spent not more than MOP 100. For up to 18.4% of the sample, their participation totally relied on free tickets provided by either the festival organizer or family and friends. Although the average number of free performances watched was just 0.85, majority of the respondents (52.5%) had watched at least one free performance during the festival. Without surprise, the number of performances watched and amount of spending were significantly correlated, indicating that the more performances watched, the more money spent.

Either ANOVA or independent T tests were used to determine if there were any statistically significant differences in the extent of involvement among the subgroups of the sample. Age, income, and festival participation frequency made a difference. Compared with other age categories, respondents in the age category 15-24 spent much less. The poor spending of this part of sample might be closely related to their low financial status. People aged at 15-24 are usually unemployed or have just worked for a couple of years, so their consumption must be relatively more constrained. With income being the grouping factor, ANOVA analysis revealed that the subgroup with the lowest level of income spent the least, a finding exactly consistent with the above explanation on age. Furthermore, it seemed that festival participation frequency influenced both the number of performances watched and the amount of money spent. It was found that the more times a respondent had participated in the festival, the more performances watched and the more money spent. In addition, the differences in both indicators between frequent attendees and the other two groups (first time and occasional

festival attendees) were significant. These findings suggested that the festival had been successful in attracting and maintaining a certain number of loyal attendees.

To explore the relative importance of the factors affecting participation, multiple linear regression was employed, with extent of involvement being the dependent variable. The independent variables included all pull and push factors, plus age, income, and festival participation frequency. Since the dependent variable had two indicators, namely number of performances watched and the amount of money spent, two multiple linear regression models were constructed. As summarized in Table 5, the same set of independent variables entered the two linear regression models. In addition, the ranking of importance of the independent variables was also exactly the same in both models. The Beta column demonstrated that festival participation frequency had the largest impact on the extent of involvement, followed by convenience of purchasing tickets, satisfying personal curiosity about unique performances, and meeting personal interest in arts appreciation.

**Table 5: Two multiple linear regression models on extent of involvement**

Method: Stepwise

Independent variables	Dependent variables			
	Number of performances watched		Amount of money spent	
	B	Beta	B	Beta
Festival participation frequency	.879	.395	114.668	.390
To satisfy curiosity about unique performances	.463	.249	62.679	.251
Convenience of purchasing tickets	.332	.163	52.298	.191
To meet personal interest in arts appreciation	-.312	-.156	-42.215	-.160
(Constant)	-.919		-277.304	

The respondents were asked to indicate their overall satisfaction with the festival, based on a 7-point Likert scale. The distribution of the responses to this question was as below: 1 (0), 2 (0.6%), 3 (10.8%), 4 (27.8%), 5 (33.5%), 6 (22.8%), 7 (4.4%). The mean was 4.80, suggesting that festival attendees generally felt satisfied. To figure out the most important factors impacting on satisfaction, multiple linear regression using the stepwise method was run. The dependent variable was overall satisfaction with the festival, and all pull and push factors formed the set of independent variables. Three independent variables entered the final model, namely performance variety, ticket pricing, and improving arts skills and knowledge. The standardized coefficients (i.e. the beta values) were 0.309, -0.274, and 0.190 respectively.

Regarding behavioral intentions, the sample expressed a clear inclination to return next year: the mean was 5.20 out of 7, with 47.1% of the respondents rating 6 or 7. The level of satisfaction on the part of festival attendees was expected to have a positive impact on their intention to return, a causal relationship well entrenched in the marketing literature. The data accorded strong support to this causality: the correlation coefficient of intention to return and overall satisfaction was significant at the 0.01 level. An examination of the planned expense for next year's festival showed that up to 79% of the respondents were willing to spend more, 15.3% would like to maintain the current consumption level, and only 5.7% chose to decrease their spending. The mean and median of the planned expense for next year's festival were MOP 375.23 and MOP 300 respectively, both considerably higher than their counterparts in 2009 (MOP 212 and MOP 132.50). This also indicated that for majority of the respondents, their experience with this year's festival was much desired.

## DISCUSSION AND CONCLUSION

This study reveals important push and pull factors to motivate festival attendance. Accessibility of performance venue is the most important pull factor. Macau is a very small city having an area of 29.5 sq. km. and the Historic Centre of Macau was successfully inscribed as a World Heritage Site. The Historic Centre of Macau is an urban area within the old city of Macau spanning eight squares and 22 historic buildings (Macau Cultural Affairs Bureau 2010). This finding demonstrates that the effort spent by the event organizer – housing

art performances in historical and unique venues is highly appreciated and motivate festival attendance. This effort should be promoted immensely not limited to local residents but tourists in order to make the most of Macau being a World Heritage Site. On the other hand, effectiveness of publicity is revealed as the weakest pull factor. It is a serious shortcoming in event marketing management. Multiple sources of communication channels are identified. They all share similar weight, except *newspaper* and *family and friends*. Newspapers are certainly an important communication channel to retain; while referral programme, group ticket purchase discount are suggested to further exploit *family and friends* being an important source of information.

When analysis was conducted based on demographic variables, participation frequency displayed significant differences among the three subgroups of the sample (i.e. first time attendees, occasional attendees and frequent attendees). A general trend was identified on all four pull factors (performance number, performance variety, and aesthetics of stage setting and effectiveness of publicity): the more times a respondent had participated in the festival, the higher his/her rating on each pull factor.

Three factors were generated from conducting the PCA as discussed in the findings section. They are *Program Quality*, *Convenience* and *Program Quantity* reflecting the construct of the pull factors in this study. Program quality is the most important factor composed with the variables of *performance class*, *aesthetics of stage setting* and *accessibility of performance venues*. Convenience being another factor is composed with *convenience of purchasing tickets* and *performance scheduling*. The results here indicate that program quality and convenience offered are important features to motivate participation.

The findings from the push factors reveal that *personal interest in arts appreciation*, *improve art skills and knowledge to satisfy curiosity about unique performances* are important factors driving female individuals to attend the festival. In addition, *Education* is revealed as an important push factor rather than socialization which was revealed in many previous studies (Uysal, Gahan and Martin 1993, Formica and Uysal 1996, Crompton and McKay 1997, Nicholson and Pearce 2001, van Zyl and Botha 2004, Guzman, Leones, Taipa, Wong and deCastro 2006). This research study was conducted in Macau, an Asian city, targeting local people, while many other previous studies were conducted in the western world and targeting tourists, except the study on Kenting Wind Chime Festival in Taiwan (Lee et. al. 2007). Thus, the result reveals that motivational factors for tourists and local people differ. In addition, Getz (1991) illustrated that many loyal return event participants are local residents, as a result, motivational factors concerning local participants are deemed for further investigation and study. Furthermore, this research finding provides important marketing information to the festival organizer. If the goal of the festival is to diffuse art education to the local, then the festival has achieved its goal and been doing a good job. On the other hand, if the goal of the festival is to enhance social cohesion, then the organizer may consider to offer programmes which are children and teenager friendly because Macau is a child-centric city. According to WHO (WHO2010), the total fertility rate was 1.0 birth per woman (aged 15-49) in 2009 and the population of aged 0-14 was 12.8%.

The finding reveals that several push and pull factors are important variables to satisfy participants. Performance variety and ticket pricing are the outstanding pull factors. In addition, the push factor – improving arts skills and knowledge has significant influence on the overall satisfaction level. In general, participants of the art festival are satisfied. It is an encouraging finding. Together with the 0.01 level of correlation coefficient of intention to return, these provide important insights on the event marketing strategic planning. As repeat participants are expected in the future, the festival organizer is suggested to maintain the variety of programming offerings and the ticket pricing scheme in order to retain repeat participants. Meanwhile, service quality of the entire festival organization is deemed for further consideration; for example, transportation arrangement and other supplementary services, namely availability of ticket distribution channels and performance information dissemination and etc. Experienced event participants are generally expecting more services when attending events. Although service quality dimension of the festival was not under the research framework of this study, it is an important research path to be cultivated in order to reveal important factors enhancing the festival popularity in the future.

This study seeks to understand the participatory behaviors of local residents in urban arts festivals, a research topic largely neglected in the previous literature. The survey produced a sample primarily consisting of young and middle-aged, well educated, and middle-income respondents. The overwhelming majority of the sample was returning festival attendees, and the proportion of male respondents was slightly more than that of

female respondents. Statistical analyses have been applied to a diversity of factors and outcomes relating to the participation of the respondents in the festival and the various relationships existing among them.

The pull-push analytic framework, which is widely adopted in marketing and consumer research, has proved appropriate and useful for researching arts festival participants. As evidenced by Table 5, both pull and push factors can greatly influence the extent of participation of local festival attendees. Also, there are two pull factors and one push factor entering the final regression model on overall satisfaction. This study also suggests that it is meaningful to treat local residents and visitors separately in festival management and research. In the case of Macau, local attendees did exhibit some important characteristics and behaviors that might be distinct from those of visitors. Future research should be encouraged to make more direct, systematic comparisons between the two types of festival attendees.

# **THE IMPACTS OF HUMOROUS ADVERTISING AND FEAR APPEALS ON THE ADVERTISING ATTITUDES - THE MODERATING EFFECTS OF REGULATORY FOCUS**

**Yaonan Lin, Fu-Jen Catholic University, Taiwan**

**Chih-Chung Chu, Lunghwa University of Science and Technology, Taiwan**

**Pei-Ling Lin and Yu-Shan Tsao, Fu-Jen Catholic University, Taiwan**

## **ABSTRACT**

*This study assesses the impacts of three humorous advertising categories of cognitive mechanism (incongruity humor, incongruity-resolution humor, and non humor) and fear appeals (high/low) on advertising attitudes. Regulatory focus (promotion /prevention) was used as the moderate variable. The researchers developed different designs of ads in incongruity humor, incongruity-resolution humor, and non humor and fear appeals (low/high) to evaluate the ads attitudes. A total of 346 respondents participated in this study. An experimental method was used in this study, and data were analyzed by performing three-way ANOVA. There are three major findings in this study: (1) The ads of incongruity humor and incongruity-resolution humor have higher advertising attitude than the ads of non humor; (2) The ads of low fear appeals have higher advertising attitude than those of high fear appeals; (3) Regulatory focus does not moderate the impact of humorous ads on advertisement attitudes. This study suggested that advertisers should use humorous advertising matching appropriate level of fear appeals and apply distinct regulatory focused messages in the ads according to different kinds of products.*

## **INTRODUCTION**

Humorous ads account for 10-30% of the total expenses in America each year (Weinberger, Spotts, Campbell, & Parsons, 1995). It reveals the importance of humorous ads. Speaking of the humor type, the frequent classified way is from Spotts, Weinberger, & Parsions (1997), which classify humorous ads as three kinds: affective, cognitive and interpersonal. However, each type of humorous ads more or less contains incongruity elements, and the previous research proves that the affective and interpersonal type of ads often have unsteady results. As a result, we adopt the cognitive mechanism as the main classified method. On the other hand, fear appeal is another means for advertisers. Recently some advertisers have found that fear appeals in the ads is extremely effective (Shiv, Edell, & Payne, 1997). However, about the fear intensity, now there is still no consensus. Some researchers think high fear appeals would attain better advertising effectiveness (Sutton, 1982), and some researches approve low fear appeals. In addition, Janis and Feshbach (1953) point out the medial level of fear intensity is the most effective. The moderate variable is regulatory focus, it distinguishes the regulatory focus theory between promotion-focused and prevention-focused consumers, who possess different anticipations and perceptions due to their goal orientations. The promotion-focused individuals tend to pursue their ideal goals and are more sensitive to the positive results. Contrarily, the prevention-focused individuals would avoid unwanted outcomes and are more sensitive to negative results. The usage of the two kinds of messages is the other main point. This study attempts to assess the impacts and mutual effects among three humorous advertising categories of cognitive mechanism (incongruity humor, incongruity-resolution humor, and non humor) and fear appeals (high/low) in the design. Also, regulatory focus (promotion /prevention) was used as the moderate variable.

## **THEORETICAL BACKGROUND**

## Humorous Ads

Humorous ads mean ads containing humor ingredients and can make people feel interesting or laugh, and it could change customers' attitudes toward the ads, the brands, or the products into more positive. Speaking of the classification, Spotts, Weinberger, & Parsions (1997) classify humorous ads as three kinds of mechanism: affective, cognitive and interpersonal. Affective mechanism involves a release of energy, a safety valve for forbidden feelings (Freud, 1905:1960). The second mechanism is cognitive mechanism related to the structure of the message. Incongruity and rhetorical irony (Stern 1990) are characteristic cognitive devices. The incongruity theory was developed by McGhee (1979), which defines humor as a mental experience that could find or sense funny, absurd, or inconsistent things, thoughts or situations, and generally surprise or inconsistency is the most frequent way to produce humor. Furthermore, incongruity and incongruity-resolution are the two main kinds of the incongruity theory. Incongruity means an un-resolved discrepant condition containing funny, absurd or inconsistent things. In addition, incongruity resolution is a structural feature of humor characterized by the introduction of an incongruity which can be completely resolved (Galloway, 2009), and the need to process and resolve discrepant information from incongruity could cause more humor (Suls, 1983). In other words, it would give audience a sense of incongruity then solves the problem in the end to release customers' nervous feeling. We focus on the incongruity-resolution mechanism in this research. The last one is interpersonal mechanism relating to the social context. Laughter is the result of feeling superior to others (LaFave, 1972).

## Fear Appeal

Fear appeal is an advertising and marketing strategy that seeks to instill some degree of anxiety in consumers then offer a means of alleviating that anxiety by purchasing a specific good or service. And it often applies the following procedure: arouses consumers' attentions then change consumers' minds about the product in the advertisement. Finally, they might implement practical buying behavior of this product. Johnston & Warkentin (2010) claim that the required elements of fear appeal are inferences to the *severity* of a threat, the individual's *susceptibility* to the threat, as well as statements of *efficacy* in terms of a recommended response and the ability of the individual to perform the recommended response. Nowadays, it has been used in various areas such as hygiene, AIDS, sexual behavior, smoking, and so on. What's more, according to the design of the ad content, generally it can be divided into three degrees: high, medium, and low fear intensity to arouse consumers' distinct ad responses.

## Regulatory Focus Theory

Higgins (1997) distinguishes the regulatory focus theory between promotion-focused and prevention-focused consumers, who possess different anticipations and perceptions due to their goal orientations. What's more, regulatory focus system could be divided into the following categories: The first one is nurturance versus security needs (e.g., Chernev, 2004a; Friedman & Forster, 2001). The second category is ideals versus oughts (e.g., Chernev, 2004a; Friedman & Forster 2001), and gain- versus loss-related situations (e.g., Kim 2006) is the last one. According to the distinct focus of the subject, the promotion-focused group concentrates on the positive outcomes. On the contrary, the prevention-focused group would attend to negative outcomes (e.g., Aaker & Lee, 2001). The tendencies and the different focuses of these two groups relate to different emotional dimensions, such as cheerfulness for the promotion-focused groups or quiescence/agitation for the other groups (e.g., Higgins, 1987, 1997).

## Advertising Attitudes

According to the research of Lutz et al. (1986), it defines "advertising attitudes" as the preferences of responses to the stimulation of ads. Gardner (1985) mentions it's the opinions from audience after they receive the advertising messages. Speaking of "advertising attitudes", we talk about "advertising effectiveness", an important standard as measuring the effectiveness of advertisements through distinct media. Advertising effectiveness refers to market response to a firm's (or a brand's) advertising. Researchers have also examined the effects mentally like consumer awareness, attitudes, beliefs, and intentions.

# HYPOTHESIS

The Incongruity theory from McGhee (1979) defines humor as a mental experience which could find or sense funny, absurd, or inconsistent things, thoughts or situations. Surprise or inconsistency is the most frequent way to produce humor. What's more, incongruity-resolution and cognitive mastery theory mention that the need to process and resolve discrepant information from incongruity could cause more humor (Suls, 1983). On the other hand, According to the research of 1000 broadcasting ads from Stewart & Furse (1986), it found that the humorous content could increase the understanding of ads. McCollum & Spieman (1982) also point out the score of persuasiveness for ads which apply humor inside are higher than the total average score. Attributing to the above inferences, we therefore propose the following hypothesis:

H1: The incongruity-resolution humor ads have higher advertising attitudes than the incongruity humor ads; The incongruity humor ads have higher advertising attitudes than non-humor ads.

Fear appeal seeks to instill some degree of anxiety in consumers then offer a means of alleviating anxiety by purchasing a specific good or service (Carol & Thomas, 2008). In addition, the researches about fear appeals have different outcomes. Some think high fear appeals could attain the best advertising attitudes (Sutton, 1982), but some research outcomes reveal that excessive fear appeals would result in negative effects. For example, Leventhal & Niles (1964) point out extreme fear appeals may contribute to bad responses and even not take any action because of fear. On the other hand, low fear appeals would not cause extreme afraid behaviors. Furthermore, when individuals are in the negative emotions, it would push them to think more careful and systematical about the messages and consider relevance to themselves. Accordingly, the messages would be more persuasive. Therefore, we propose the following hypothesis:

H2: Low fear appeals have better advertising attitudes than high fear appeals.

According to the regulatory focus meter from Lockwood, Jordan, & Kunda (2002), it expresses the promotion-focused individuals prefer pursuing their own ideal results; whereas, individuals of prevention-focus favor avoiding their unwanted outcomes. In this research, we use humor ads and fear appeals simultaneously as the variables and emphasize the functions for the products. As a result, the negative messages which fear brings would urge customers adopt systematic and careful thinking to deal with the messages and consider the relevance for products to themselves (Morris, 1989). Attributing to this, comparing with the ads containing promotion-focused messages, consumers would attend to the prevention-focused messages emphasizing the curing effects for the product, and it also matches the design of fear appeals including two parts: the display of dangerous messages and suggestions to avoid the danger (Hovland, Janis, & Kelley, 1953). Therefore, we propose the following hypothesis:

H3: The prevention-focused messages have better advertising attitudes than the promotion-focused messages.

Leventhal & Niles (1964) mention that extreme fear appeals might contribute to bad responses and even not take any action. Accordingly, we think as the consumers see the high fear appeals ads, they might try to avoid because of fear. On the other hand, the regulatory theory from Cantanzaro (1990) points out when individuals are urged to have a kind of emotion, individuals could sense the emotion and try to apply some ways to change their behaviors or cognitions to deal with the emotion. Overall, we propose that the negative emotion produced by seeing the ads of high fear appeals could make them shift attention to things containing positive emotions like humor part in the ads which would make people feel happy and laugh. As a result, the incongruity-resolution and incongruity humorous ads would have higher advertising attitudes than non humor ads as individuals see ads of high fear appeals. We propose the following hypothesis:

H4a: Under high fear appeals condition, the incongruity-resolution humorous ads and incongruity humorous ads would have better advertising attitudes than non-humorous ads.

Low fear appeals promote people to adopt protective motions and automatically estimate the relevance of messages to themselves, and it would become more persuasive (Geuens & Pelsmacker, 1999). On the other hand, Schwarz & Clore (1983) mention that negative emotions such as fearful feelings would urge people to deal

with the received messages more effective and systematic. It matches “the model of cognitive regulatory theory” which describes people would focus on the messages and think systematically with the central route thinking mode. Especially for the incongruity-resolution humor ads, they are in the incongruity condition and would urge people to think cognitively. The application of frequent thinking and association with product to understand humor in the ads would contribute to better positive emotions. As a result, we propose the following hypothesis:

H4b: Under low fear appeals condition, the incongruity-resolution humor ads would have better advertising attitudes than incongruity humor ads and non-humor ads.

Keller, Lipkus, & Rimer (2003) point out that as consumers sense fear, they would try to avoid and refuse to think about the messages in detail. Under this condition, consumers have low considerations about the messages. On the other hand, Leventhal & Niles (1964) mention that extreme fear appeals might contribute to bad responses like ignore the messages or even not take any action. Accordingly, consumers would not observe the ads in detail no matter what kind of regulatory focus messages it applies. Therefore, we propose the following hypothesis:

H5a: Under high fear appeals, the promotion- focused and the prevention-focused messages have no difference in advertising attitudes.

Fear is defined as a negative emotion reflecting the degree of discomfort about a possible future goal-incongruent outcome, and people worry that if they could escape or avoid an unpleasant outcome. This negative emotion would promote people to do some changes in cognition or behavior for solving the negative condition. On the other hand, the prevention-focused messages emphasize the curing and prevention effects of the products, so it would offer a solution to the threat in the ads. Consequently, the prevention-focused messages would have better advertising attitudes than the promotion-focused messages, so we propose the following hypothesis:

H5b: Under low fear appeals, the prevention-focused messages would have better advertising attitudes than the promotion-focused messages.

The research from Higgins (1997) mentions the promotion-focused messages apply positive thinking and words like promote or increase to emphasize the benefits of the products, and it would be prone to arouse the customers’ positive emotions. Worth & Mackie (1987) also point out that as customers have positive emotion, they tend to not think about the received messages in detail. As a result, we suppose that the incongruity-resolution humor ads and incongruity humor ads would have no difference in advertising attitudes. On the other hand, we suppose the promotion-focused messages could combine with the humor ads because they all contain positive messages, so the incongruity-resolution humor ads and incongruity humor ads would have better advertising attitudes than non humor ads. Due to this, we propose the following hypothesis:

H6a: Under the promotion-focused messages, the incongruity-resolution humor ads and incongruity humor ads would have better advertising attitudes than non humor ads.

The research from Higgins (1997) describes the prevention-focused messages utilize negative thinking ways and apply negative words like decrease or prevent to confer the healing effects of the products. It’s similar to the negative words used in the negative messages from the concept of message framing developed by Levin & Gaeth (1988), and it’s easier to arouse the negative emotion of the customers. In addition, “the model of cognitive regulatory theory from Morris (1989) mentions that when people have negative emotion, they would be suspicious about everything surrounded because of sensing unsafe feeling. Furthermore, they would deal with the messages by analytical and systematic thinking. Consequently, customers would concentrate on it with the central route thinking model. This is similar to process of “incongruity-resolution” inclined to the central route thinking. As a result, we develop the following hypothesis:

H6a: Under the prevention-focused messages, the incongruity-resolution humor ads would have better advertising attitudes than incongruity humor ads and non humor ads.

# RESEARCH METHODS

## Pretest

The first part is the pretest of humorous ads. The goal is to make sure respondents identify the manipulation of the experiment. This study designs the following three kinds: incongruity, incongruity-resolution, and non-humor and undertake the pretest after 54 respondents see the plane ads. In the pretest questionnaire, there are 8 questions about the degree of humor and 3 questions about comprehension of humor ads. What's more, the pretest is launched with the followings: (1) make the degree of humor no difference among incongruity, incongruity-resolution, and non-humor ads; (2) the result of Post-Hoc reveals that both of the congruity and incongruity-resolution are better than non-humor ads. The result is found for support ( $p=.008^{**}$ ). The ads of incongruity humor ( $M=3.771$ ) and incongruity-resolution humor ( $M=3.667$ ) have higher advertising attitudes than the ads of non humor ( $M=2.116$ ). The second part is the pretest of fear intensity. This study designs the following two kinds of ads: high fear appeal and low fear appeal, and undertake the pretest after 54 respondents see the plane ads. In the pretest questionnaire, there are 5 indexes according to the research from Ruiter et al. (2003) and King & Reid (1990). What's more, the pretest is launched with the following rules: (1) make the degree of fear intensity no difference between high and low fear appeals ; (2) the result of Post-Hoc reveals that the ad of high fear appeal is better the ad of low fear appeal. The result is found for support ( $p=.000^{***}$ ). The ads of high fear appeals ( $M=3.270$ ) has higher advertising attitudes than the ads of high fear appeals ( $M=2.807$ ). The following is the result of the pretest of the fear intensity:

## Formal Test

345 participants from college students and graduate school students participated in the study. They were randomly assigned to cells of a 3 (cognitive ads : congruity, incongruity, and non humor)  $\times$  2 (fear appeals: high and low)  $\times$  2 (regulatory focus: promotion focused and prevention focused). A fictional brand of natto (for lowering cholesterol) was chosen as the experimental product. In order to measure and compare the advertising attitudes result from the different variables, this research designs 12 simplified versions of plane advertisements containing distinct combination of variables in the questionnaires. In addition, the complete draft is selected by specialists and professors in ads marketing to ensure the degree of humor of the following three designs: incongruity, incongruity-resolution, and non-humor. On the other hand, about the fear intensity, this research designs two kinds: high and low depending on the subjects of the ads and undertake a pretest to make sure that whether the fear intensity lives up to real feelings from respondents. Speaking of the moderate variable, prevention-focused messages and promotion-focused messages are added in each version along with items in the questionnaires to measure the regulatory focus tendency of respondents. Questionnaires are sent out in the class, and students are asked to fill in the questionnaires after they look at the advertisements for 30 seconds.

This hypothesis 7 is not supported. Significant direct preference are found for support , ( $F_{(2)=.845}$  ,  $p=.430$ ), These three variables: cognitive mechanism of advertising categories, fear appeals, and regulatory focus have no evident mutual interaction. The following Table 1 is the total results:

**Table 1: The Mutual Effects of Cognitive Mechanism of Advertising Categories, Fear appeals, and Regulatory focus**

		Source	Sum of Squares(df)	F	P-value
advertising attitudes		Cognitive mechanism of advertising categories	162.124(2)	4.451	.012
		Fear appeals	145.802(1)	4.003	.046
		Regulatory focus	76.310(1)	2.095	.149
		Cognitive mechanism of advertising categories	9.548(2)	0.262	.770

× Fear appeals			
Fear appeals			
× Regulatory Focus	486.622(1)	4.201	.000
Cognitive mechanism of advertising categories × Regulatory focus	15.434 (2)	13.361	.655
Cognitive mechanism of advertising categories × Fear appeals × Regulatory Focus	30.782(2)	.845	.430
Errors	3.987(762)		
* $p < .05$ ; ** $p < .01$ ; *** $p < .001$			

This hypothesis 1 is part supported. Significant direct preference are found for support ( $F_{(2)}=4.451$  ,  $p=.012^{***}$ , Sum of Squares=162.124), the ads of incongruity humor ( $M=29.659$ ) and incongruity-resolution humor ( $M=30.049$ ) have higher advertising attitudes than the ads of non humor ( $M=27.387$ ). This hypothesis 2 is supported. Significant direct preference are found for support, ( $t_{(1)}=-1.961$  ,  $p=.046^*$ , Sum of Squares=162.124), the ads of low fear appeals ( $M=29.8046$ ) has higher advertising attitudes than the ads of high fear appeals ( $M=28.5000$ ). This hypothesis 3 is not supported. Significant direct preference are found for support, ( $F_{(1)}=-1.354$  ,  $p=.176$ , Sum of Squares=162.124), the promotion-focused ads ( $M=28.7069$ ) and the prevention-focused ads ( $M=29.8046$ ) have no difference in advertising attitudes.

About the mutual interaction between variables, this hypothesis 4 is not supported. Fear appeals don't affect the cognitive mechanism of humor advertising categories on advertising attitudes. Significant direct preference are found for support ( $F_{(2)}=.262$  ,  $p=.770$ ), under high fear appeals condition, the incongruity-resolution humorous ads and incongruity humorous ads would have better advertising attitudes than non-humorous ads. On the other hand, hypothesis 6 is also not supported. Significant direct preference are found for support , ( $F_{(2)}=.424$  ,  $p=.655$ ), regulatory focus doesn't affect the cognitive mechanism of humor advertising categories on advertising attitudes. This hypothesis 5a is supported. Significant direct preference are found for support , ( $F_{(1)}=2.040$  ,  $p=.155$ , Sum of Squares=88.729), under high fear appeals, the promotion- focused ( $M=29.249$ ) and the prevention-focused ( $M=27.816$ ) messages have no difference in advertising attitudes. This hypothesis 5b is supported. Significant direct preference are found for support , ( $F_{(1)}=16.077$  ,  $p=.000^{***}$ , Sum of Squares=476.788), under low fear appeals, the prevention-focused ( $M=31.448$ ) messages have higher advertising attitudes than the promotion- focused messages ( $M=28.175$ ).

## GENERAL DISCUSSION

According to the results, we find that humorous ads have higher advertising attitudes than non humor ads. Nevertheless, the incongruity-resolution humor ads don't have higher advertising attitudes than incongruity humorous ads. Accordingly, hypothesis 1 is partly supported. Attributing to the reasons, it is because the incongruity resolution humor ads focus on the resolution of the products' functions in the ads, but it would not affect audience preferences toward the ads resulting from the humor in the ads. On the other hand, about the use of fear appeals, the advertising attitude of low fear appeals is higher than which of high fear appeals. Hypothesis 2 is supported. We propose appropriate fear appeals would fortify the advertising attitudes. About the regulatory focus, hypothesis 3 is not supported, which means the prevention-focused messages in the ads don't have better advertising attitudes than the promotion-focused messages. This may because the regulatory focus of the audience themselves might influence the results, and the negative words like treat or decrease would make them

tend to escape and not choosing this kind of ads. Exploring the mutual effects of the cognitive mechanism of humor advertising, fear appeals, and regulatory focus, there is no evident difference between them. The result of the mutual effect between the cognitive mechanism of humor advertising categories and regulatory focus is the same. What's more, there is evident difference between fear appeals and regulatory focus. To explain it clearer, we find that under high fear appeals, the promotion- focused and the prevention-focused messages have no difference in advertising attitudes. On the other hand, under low fear appeals, the prevention-focused messages would have better advertising attitudes than the promotion-focused messages, so hypotheses 5a and 5b are supported. In conclusion, this research proves that humorous ads, appropriate fear appeals are useful and effective to increase the advertising attitudes toward the ads, and the advertisers could design promotion-focused or prevention-focused messages in the ads depending on different kinds of products.

# **THE RELATIONSHIPS AMONG GELOTOPHOBIA, HUMOR, SELF-ESTEEM, PLAYFULNESS, AND INNOVATIVE BEHAVIOR**

**Yaonan Lin and Yun-Chieh Liu, Fu-Jen Catholic University, Taiwan**  
**Chih-Chung Chu, Lunghwa University of Science and Technology, Taiwan**

## **ABSTRACT**

*The research purpose is to evaluate how the innovative behaviors of employees affect the organizations, and the relationship with gelotophobia, humor, self-esteem, and playfulness. Data were collected from 230 employees. The research model was analyzed using a rigorous structural equation modeling (SEM) which is being applied to examine the relationship of gelotophobia, humor, self-esteem, playfulness, and innovation. The findings have important implications for studying the development of innovation organization and the effect on cultivate the positive atmosphere in work place that utilize corporations. In addition, practical implications are discussed and directions for future research are suggested.*

## **INTRODUCTION**

Nowadays, “innovation” is an important issue toward individuals, groups and organizations in the development of knowledge economy. This study explores the employees’ behavior which affects the innovation of organizations. The ability of innovation is one of the main ideas of the knowledge-driven economy.

In the research of organization and corporate culture, gelotophobia is the latest research (Ruch & Proyer, 2008c). Individual behavior, including humor, playfulness, and innovation are often affected by people’s endurance of others’ laughter. Especially, people with unique perspective and innovation are different from normal people; they have to face others suspension as they show their viewpoints or perspectives. However, the reaction of fear of being laughed impedes the development of innovation and creativity. People who with continuous gelotophobes are hard to feel humor and laughter that show relax as well as happiness. They are always afraid of being laugh, causing low self-esteem, less activities, spontaneity, enjoyment and so on (Titze, 2008). For example, the more afraid of being laugh, the less humor, and that will affect the development of innovation and positive emotion.

Humor is necessary to develop a positive organization atmosphere. Organizational researchers claimed that a sense of humor is an important factor in determining the degree which also maintains whether an organization is productive and competitive or not. Some researches exhibited that sharing of humor among members of an organization is an important aspect of successful corporate culture (Clouse & Spurgeon, 1995). The advocacy of humor in the workplace often increases the levels at work which result in lots of benefits, including greater teamwork and cooperation, social interactions between workers and managers (Martin, 2007).

People feel self-confident, relax leisurely and change a frame of mind, and they may get some inspiration in work times. Moreover, there are many similarities between humor and play (Bergen, 2002). The concept of playfulness is compatible with work, encouraging people as confronting challenges or pressures. People incline to high playfulness showing unintentionally, and put more concentration into work. At the same time, Play and humor are both enjoyable, and they share similar characteristics regarding motivation, control, and reality.

As will be discussed, this study makes several contributions. The purpose of this study is to evaluate how the innovative behaviors of employees affect the organizations, and the relationship with gelotophobia, humor, self-esteem, and playfulness. Then, the study used to test these relationships is described and the findings reported. A discussion of the research and managerial implications of the findings concludes the paper.

## CONCEPTUAL BACKGROUND AND HYPOTHESES

Kaplan (1980) declared that youngsters with low self-esteem have frequently undergone unsatisfactory experiences in the conventional society-experiences that have created painful feelings of doubt about ridiculousness, and avoid improper performance in social situation. Hence, they carefully avoid situations as feeling of impending exposure to others (Titze, 1995, 1996). This fear can be traced back to early childhood experiences, and interactive relationship was confirmed between laughter and mental health, which can alternatively be highly positive or deeply negative (Ruch & Proyer, 2009). Furthermore, higher self-esteem appears to buffer individuals from stress (Guindon, 2002), and is significantly related to physical and mental well-being (Witmer & Sweeney, 1992). Besides, people who with consistent gelotophobes tend to misunderstand positively motivated smiling and laughter, and have lower values. That doesn't represent that they lose all components of humor. In addition, they have a low propensity to joy and a character to experience shame as well as fear, inclining to being introverted and neurotic, and they underestimate their own potential while not actually being less capable. Therefore, Gelotophobia makes people depressed or annoying, and sometimes might cause mental problems.

Rosenber (1972) indicated that people with high self-esteem have a positive attitude toward themselves; on the contrary, low self-confidence may have negative attitude. People with lower self-esteem may be gelotophobes that tend to misunderstand positively motivated smiling and laughter (Titze, 1995). They have a low propensity and self-confidence to joy, show energetic, and lack spontaneity which possibly lead to gelotophobia. Besides, Ruch and Proyer (2008) also provided preliminary evidence for the low self-esteem which shows the accuracy of gelotophobia (the fear of being laughed at) and hard to develop social ability.

### H<sub>1</sub>: Self-esteem is related negatively with Gelotophobia

Self-esteem is the basic need of human being, and important symbols of the environment adaption as well as mental health. People who possess a strong sense of self-worth appear to be adjusted, happy, competent, and the evaluation of self-esteem is an initial step toward better understanding human motivation (Gilberts, 1983). Self-esteem can be negative, neutral and positive, and it even covers the personal values and self-concern. Generally speaking, self-esteem is composed by internal and external. Internal means generation of beliefs, ideas, and behaviors in their mind; while external implies the effect of outer environment (Branden, 1994). Therefore, self-esteem can extend to be an adaption of lives. Besides, humor motives people to laugh, to smile and to have pleasant emotion in widely spread situations. That means humor can develop amusement in our lives, improving skills of interpersonal relationship and also inseparable from mental and physical health. The humorous person seems friendly to be with, and cheers people up as they suffer pressure or have problems.

Martin & Lefcourt (1983) stated that humor is the same as the positive personality, and is able to make people adapt different environment. As a result of having self-confidence, people may have higher assessment of themselves. Humorous people considered to be with higher self-esteem (Martin & Kuiper, 1993). Therefore, enhancing value of people can generate humor and alternative emotion. In addition, Kuiper & Martin (1998) also supported the idea of high relatives between high self-esteem and humor that impact people on a positive way. In the research of Nezlek & Derks (2001), they pointed that people with high self-confidence must have humorous character. Therefore, people with high self-esteem tend to high humor (Martin, 2001).

### H<sub>2</sub>: Self-esteem is related positively with humor.

Self-esteem has main or moderating effects on job performance, especially creativity. Self-esteem can be an overall positive or negative evaluation of oneself (Brown, 1993), and should be related to job performance (Pierce & Gardner, 2004). In addition, individuals with high self-esteem are motivated to do well on the job to maintain cognitive consistency with their high self-evaluations. High self-esteem provides a buffer as facing difficulties which impede workplace motivation and performance (Brockner, 1988). Additionally, the ability of innovation is an important issue toward organizations, and individual as well as groups provide appropriate

solutions as encountering great difficulties or challenges. Enhancing the innovative abilities of employees can increase corporate success through the creation of new corporate ventures (Pinchot, 1985; Kuratko & Montagno, 1989). Slappendel (1996) claimed that the point of newness is essential to the concept of innovation, serving to differentiate innovation from change, and the latest theme is especially closely linked between innovation and entrepreneurship which emphasize its substantial role in new venture creation and management.

Self-esteem has positively related to innovation in working performance. Besides, in order to maintain the positive self-esteem, people who regard creativity as personal identity will put them in the innovation. Furthermore, individuals who possess high self-esteem are not only in the work performance but also everything that they want to be innovative. Sternberg & Lubart (1995) claimed that innovation has closely connection with personality, including self-esteem, acceptance of challenge, etc. The self-esteem is positively associated with innovation employees with high self-esteem perceive themselves as important, meaningful, and worthwhile members of their employing organization, and then showing high innovation (Pierce et al., 1989, 1993)

H<sub>3</sub>: Self-esteem is positively related with innovation.

Gelotophobia is well-defined as the pathological fear of appearing to social companions as an object of laughter (Titze 1995, 1996, 1997), and considered as a specific change of shame-bound anxiety. Gelotophobes constantly fear being screened by others for evidence of oneself value, and directly impact on individual behaviors. On the contrary, people join in humor and laughter that arise spontaneously in the course of our normal relations with other people in daily life (Kuiper & Martin, 1998). In addition, they will feel more delight and joy, and then it can reduce pressure, annoyance. In general, in the research of humor, the scholars claimed that humor is the concept of multiple domains. It consists of the following six dimensions: appreciation humor, creative humor, public relation humor, coping humor, manner humor, and smile tendency.

People who are more afraid of being laughter lead to lower humor. However, showing higher humor, people may turn serious situation into relax, and they accept the stimulus of humor to generate laughing activities and enjoyment (Apter & Smith, 1977). Besides, gelotophobia seems humor or laugh as threat or negative emotion. Then, Titze (2008) conducted a research that mentioned gelotophobia cannot assess smile as well as laughter positively. Therefore, their fear leads to lack of humor in daily life. Ruch, Beermann, & Proyer (2009) stated that gelotophobia are hard to naturally express humor and participate in social activities, because they seldom perform humor and lack lively attitude. They researched that gelotophobia and humorlessness are being related.

H<sub>4</sub>: Gelotophobia is related negatively with Humor.

Humor is an essential part of developing effective organizations, and an enjoyable and playful activity which amuses people with happy feelings. Besides, it motives people to laugh, to smile or having pleasant emotion in a wide variety of situations. Martin and Lefcourt (1983) stated that the emotional-expressive component of humor is smiling and laughter. Humor and laughter are universal aspect of human experience, occurring in all cultures and virtually all individuals throughout the world (Apte, 1985).

In the present, modern people expect to enjoy careers and find pleasure in their jobs. Barnett (1991) indicated that the sense of humor scale is significantly correlated with a number of general playfulness in children, lending further support to the close link between humor and play. Humor originated in play and gradually becomes differentiated from other forms of play as the child's cognitive abilities develop (Bergen, 2003). The general characteristic of playfulness relates positively to individual creativity and to more exploratory behaviors during interactions with tasks (Glynn & Webster, 1992).

Lieberman (1977) advocated that humor is one of essential factor of playfulness. Besides, Papousek (1979) also provided that the development of playful experience which is not just the process, but also the foundation of creativity and humor. People who like to interact with others, express humor or talk jokes are often with playful character (Starbuck & Webster, 1991). In the work aspect, good humor and moderate playfulness is inseparable and working environment full of laughter benefits employee and work a lot (Gouldson, 2000). Wilson (2000) found that playfulness would encourage or support employee with humor, laugh and self-expectation. Therefore, people with high playfulness are considered with high humor.

H<sub>5</sub>: Humor is positively related with playfulness.

The concept of “playfulness” defines as the developing of enjoyable jobs. Playfulness is emerge at the similar age in infants, which means the quality of playing, and is the unintentional as well as spontaneous characteristic while children are playing or doing some leisure activities (Lieberman, 1974). The general characteristic of playfulness relates positively to individual creativity and to more exploratory behaviors during interactions with tasks (Glynn and Webster, 1992). That is to say, regardless of the tedious jobs, people with higher playfulness can through individual imagination, relax attitude or engaging on events interesting; further, jobs become pleasing as well as desirable and people will put more in that.

Innovation is considered as a basic component of entrepreneurship and a key element of business success. Drucker (1985) noted that mostly every definition of innovation focuses on the concept of newness. Generally, individual innovation has been conceptualized in terms of individual characteristics, traits, behaviors, and products (Goldsmith, 1986). The current study seeks to develop and test a multi-dimensional measure of individual innovative behavior. The general dimensions of innovative behavior with the following five factors seeming best to categorize behaviors associating with individual innovation: Opportunity exploration; Generativity; Formative investigation; Championing and Application. Base on above said, individual innovation contains multiple dimensions in a various way.

Lieberman (1977) claimed that playfulness is the necessity of innovation. Amabile (1997) also stated that the characteristic of creativity is obviously exhibited in playfulness. Additionally, people with creative skills are generated from innate imagination and playful ability. In the research of investigating American 300 different-region adults, Glynn & Webster (1992) found that playfulness, self-cognition as well as creativity are related. Another research in factors of playfulness shows that individually creative behavior is highly related to work performance. In other words, appreciating innovation in organization can create playful atmosphere and benefit people on work performance.

H<sub>6</sub>: Playfulness is related positively with innovation.

## RESEARCH METHODS

The researcher constructed the conceptual framework outlined above through intensive literature review. Quantitative research methodology was adopted for the empirical testing of this conceptual framework. Survey methodology was utilized for primary data collection. The conceptual framework is as Figure 1:

Figure 1: The Conceptual Framework

## Measures

Each construct in the model consisted of items measured using 5-point Likert scales, ranging from “1” (strongly disagree) to “5” (strongly agree). The research instrument was developed in English, translated into Chinese, and back-translated into English. The face validity was evaluated by four bilingual (English and Chinese) employees. The scales for self-esteem are measured by 10 items of the Rosenberg Self-Esteem Scale (Rosenberg, 1989). Academic self-esteem (our specific self-esteem) is based on a 3-item index. The scales for perceived Gelotophobia (Ruch & Proyer, 2008) are measured by 15-item questionnaire for the subjective assessment of the fear of being laughed at. The scales for a sense of humor is a 39-item questionnaire were from (Lin, 2010) , and scales for the behavior of innovation (Tsai, 2004) measured by 6-item questionnaire for the

assessment of employees' innovative behaviors. The items for perceived playfulness of (Yu, 2004) are measured by 29-item questionnaire for the subjective assessment of enjoyment in work.

## RESULTS

### Samples Collection

The sampling frame is a convenience sample. 250 questionnaires were distributed to different generations in Taiwan. An introductory letter explaining the research purpose and survey instruction was included in the questionnaire. After the filter questions to select the respondents, 230 valid questionnaires were obtained. Responses from these representative samples of consumers in Taiwan were analyzed. Descriptively, most of them are male (62.2%); ages are ranging from 18 to 24 (39.1%); education is at college (55.2%); their occupation level is most of basic employee (73.9%) and their average personal monthly income is between \$25001 and \$40000 NT Dollars (33.9%). Most of their working experience is over 7 years (34.3%).

### Reliability

Internal consistency is the extent to which tests assess the same quality. It is a measure of the precision between the observers or of the measuring instruments used in a study. The data analysis of Cronbach Alpha accessed the reliability of the above dimensions: (1) Humor (.928); (2) Gelotophobia (.933); (3) Self-esteem (.864); (4) Playfulness (.935); (5) Innovation (.204). All Reliability Coefficients Alphas are more than .60, according to Cronbach (1951). We believe the constructs have good internal reliability.

### Model Estimation

To evaluate confirmatory factor analysis, the constructed model was examined with Structural Equations Modeling (SEM). The items applied the above result scale are with the 99 items, five dimensions: humor, self-esteem, Gelotophobia, playfulness, innovation, as the above mentioned. As Table 3 indicated that the fit indices of the model are acceptable level as follows: the  $\chi^2 = 698.49$  ( $p < .05$ ); Comparative fit index (*CFI*) = .90; Incremental fit index (*IFI*) = .90; Non-normed fit index (*NNFI*) = .88; Root mean squared error of approximation (*RMSEA*) = .14; Standardized root mean residual (*SRMR*) = .11; and Parsimony Goodness of Fit Index (*PGFI*) = .57. The other fit indices are below the recommended cut-off as the previously notes: *GFI* = .74; *NFI* = .90; *PGFI* = .57. Excluding  $\chi^2$ , *GFI*, *SRMR*, *RMSEA*, *NNFI*, and *AGFI*, most indices fit the following overall model standards.

**Table 1 : Overall Model Fit**

Fit Indices	$\chi^2$	<i>df</i>	$\chi^2/df$	<i>GFI</i>	<i>SRMR</i>	<i>RMSEA</i>
Model	698.49	145	4.82	.74	.11	.14
Overall Model Fit Standard	$p > .05$		$< 3$	$> .90$	$< .06$	$< .08$
Fit Indices	<i>NFI</i>	<i>NNFI</i>	<i>CFI</i>	<i>IFI</i>	<i>PGFI</i>	<i>AGFI</i>
Model	.88	.88	.90	.90	.57	.66
Overall Model Fit Standard	$> .90$	$> .90$	$> .90$	$> .90$	$> .50$	$> .90$

Furthermore, in the following Table 4, the results in the study supported some hypotheses in path diagram. The details are as follows: (1)  $H_1$  examines the influence of Gelotophobia on humor. It is supported by our empirical results (standardized  $\gamma_1 = -0.22$ ,  $t = -2.99$ ), which indicates that employees who have higher Gelotophobia will have lower levels of humor. (2)  $H_2$  examines the influence of self-esteem on Gelotophobia. It is supported by our empirical results (standardized  $\gamma_2 = -4.47$ ,  $t = -0.31$ ), which indicate that employees who perceive higher levels of Gelotophobia will have lower levels of self-esteem. (3)  $H_3$  examines the influence of self-esteem on humor. It is not supported by our empirical results (standardized  $\gamma_3 = 0.44$ ,  $t = 5.04$ ), which indicate that employees who perceive higher levels of self-esteem will not have higher levels of humor. (4)  $H_4$  examines the influence of self-esteem on innovation. It is not supported by our empirical results (standardized  $\gamma_4 = 0.54$ ,  $t = 5.97$ ), which indicate employees who perceive higher levels of self-esteem will not have higher levels of innovation. (5)  $H_5$  examines the influence of humor on playfulness. It is supported by our empirical results

(standardized  $\gamma_5=0.92$ ,  $t=5.21$ ), which indicate that employees who perceive higher levels of humor will have higher levels playfulness. (6)  $H_6$  examines the influence of playfulness on innovation. It is supported by our empirical results (standardized  $\gamma_6=0.36$ ,  $t=3.47$ ), which indicate that employees who perceive higher levels of playfulness will have higher levels innovation.

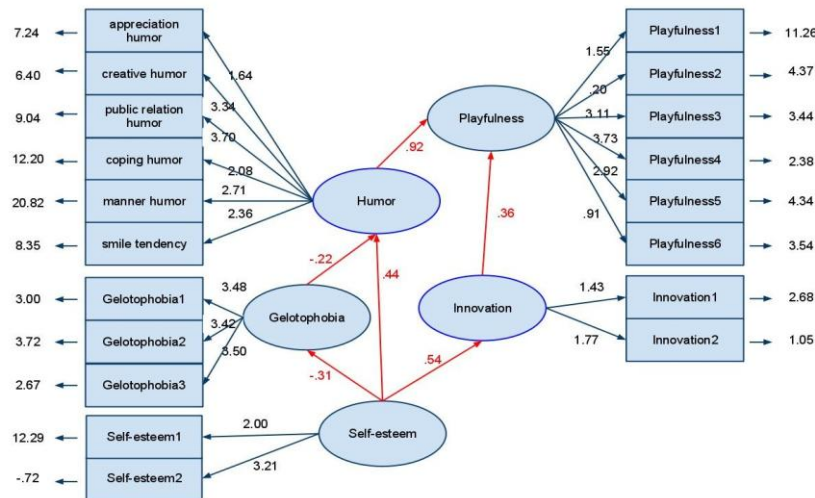

Figure 2: The Path among Humor, Gelotophobia, Self-esteem, Playfulness, and Innovation

Table 2: Estimation Result Path Model

Hypothesis	Parameters	Standardized Coefficients	t-value
H1	Gelotophobia -> Humor	-.22	-2.99**
H2	Self-esteem -> Gelotophobia	-.31	-4.47**
H3	Self-esteem -> Humor	.44	5.04**
H4	Self-esteem -> Innovation	.54	5.97**
H5	Humor-> Playfulness	.92	5.21**
H6	Playfulness -> Innovation	.36	3.47**

## GENERAL DISCUSSION

The results of this study indicate that when gelotophobes constantly fear being laughed, people show lower levels of humor. It demonstrated that gelotophobia and humorlessness are being related (Ruch, 2009). And, lower self-esteem leads to high gelotophobia. Individuals who show lower self-esteem may misunderstand positive motivation of laughter possess gelotophobia (Titze, 1995). That shows gelotophobia will cause negative inclination of the establishment of innovative behavior. In the contrary, higher self-esteem contribute to higher levels of humor and innovation. People with higher self-confidence must have higher sense of humor (Nezlek & Derks, 2001). Higher level of humor generates higher playfulness. Also, higher playfulness brings about higher innovation. Playfulness is the necessary element of innovation (Lieberman, 1977). Finally, the contributions of this study to further research are twofold. First, the findings of this study weren't thoroughly discussed before, and this study provides corporations an opportunity to evaluate how the innovative behaviors of employees affect the organizations. Second, this study could make an important contribution to the organizational culture as they want to build an innovation atmosphere. In addition, there are several future research directions that will further an understanding of the relationship between individuals and innovation. It's important to establish good atmosphere in organizations, especially in the knowledge-driven economy. The good atmosphere can make the employees more cohesive. People are encouraged to cultivate the positive emotion, including humor, playfulness and no gelotophobia that are the essential characteristic in workplace. The working environment while workplace full of humorous issues, playfulness, and laughter, it will easily gain more innovative ideas and creativities. Therefore, both optimistic employees and great working environment are substantial to the development of innovation.

# THE ROLE OF SACRIFICES IN COMPLAINT HANDLING

Martti Lindman, University of Vaasa, Finland

## ABSTRACT

*Value which can be created for customers has become the key issue in terms of customer management and is generally considered a precondition of customer satisfaction. An ability to produce more value for customers than competitors implies that complaint management becomes topical because dissatisfaction of customers may lead to exit and/or negative word-of-mouth. In this respect the moderating effect of sacrifice upon the relation between perceived complaint handling and future buying behaviour has been investigated. The results indicate that when factorized a set of key complaint handling variables can explain future buying behaviour as one may expect but, as to the applied moderating variables, no statistically significant effect could be identified.*

## INTRODUCTION

Generating and delivering superior customer value is universally considered as the key of firm success (e.g. Payne and Holt, 2001; Slater and Narver, 2000) suggesting that the better customers are served and managed the higher perceived customer value can be achieved. By definition value can be added in many ways through a firm's product offering, pricing strategy or delivery systems which together form the overall platform or value chain along which generation of customer value can take place (e.g. Chernatony *et al.*, 2000; Gilmore *et al.*, 1999). As Smith and Colgate (2007) more precisely state, organizations can create four major types of value namely, functional/ instrumental value, experiential/ hedonic value, symbolic/ expressive value and cost/sacrifice value. Functional/instrumental value is largely related to the product characteristic and attributes once the two next value types have their origin in the mental world of customers. The last suggested type of value, the benefits/costs models in turn presume that customers can make judgments regarding the price and expected benefits (e.g. Sánchez-Fernández and Iniesta-Bonillo, 2007). Under this state of affairs customer value is generally considered an assessment which results from the difference between benefits and sacrifices which emerge in the purchasing of a given product (e.g. Tam, 2004; Woodall, 2003; Lapierre, 2000).

As a whole, from theoretical point of view, a clear shift has taken place from the context of value-in-exchange towards the one where customers produce value through value-generating-processes when products are consumed and used (Grönroos, 2006). The central claim of the underlying service dominant logic of marketing - that value is co-created - means that application and integration of resources is not only the function of firms but also of the customers, individuals and households (e.g. Vargo and Lusch, 2004). As a whole, one may expect that the actual experience from the product or service may cause a considerable change of the original value assessment which led to the purchase (e.g. Meyer and Schwager, 2007; Homburg *et al.*, 2006). Any failure accordingly has a clear potential to strongly damage the positive value which may have reached in earlier phases of the purchasing. Because human behaviour by its very nature is apt to cause mistakes in businesses too (e.g. Bolkan and Daly, 2008; Uusitalo *et al.* 2008), avoidance of all subsequent undesirable effects a product or service failure may bring with becomes topical. Even if customers generally may accept occasional failures one cannot avoid the risk that without proper handling of customer complaints customers may be lost (e.g. Schneider and Bowen, 1999).

## IMPETUS OF COMPLAINT HANDLING

When consumers in particular are in focus, some common definitional ground of value can be found if it is agreed that value is basically perceived and it is focused on in the context of user situations. Given the dimensions of human value formation (e.g. Schwartz, 1992; Maio and Olson, 1995; Higgins, 2006), a number of mental images and cognitive representations underlie the value creation and the final consumer purchase and choice (e.g. Sánchez *et al.* 2006; Bowman and Ambrosini, 2000; Chernatory *et al.* 2000). Such aspects as search of ideas, inspiring knowledge, hunting a good bargain, enjoying shopping atmospheres, the possibility of a social presence, imaging one's home decoration or simply the pleasure of owning a product typically create considerable value personally (e.g. Smith and Colgate, 2007; Cox *et al.*, 2005; Baumgartner and Steenkamp, 1996; Lai, 1995). As to the corresponding context of failure, it is by definition subject to the precondition that consumers have to acknowledge the failure at first which is why the understanding of the antecedents of customer recovery becomes the basis of effective complaint management. In the background, the so-called recovery paradox is also worth noticing in stating that customers may be even more satisfied after a strong recovery than in case the whole failure had never happened (Priluck and Lala, 2009).

In linking their customers, products and available resources in different ways, companies do not only define what are their views regarding the needs of their customers and what they do value but, also create customer experiences through their company offerings (Meyer and Schwager, 2007). According to Verhoef *et al* (2009) customer experience forms a holistic construction, which includes different phases of consumption. As customer value is perceived in each phase (Sweeney and Soutar, 2001), the overall customer value is reflected by the differences between the total benefits and total sacrifices which are due to the consumption as a whole (e.g. Lam *et al.* 2004; Sánchez-Fernández and Iniesta-Bonillo, 2007). In this respect benefits typically comprise a number of quality attributes, services, solutions or product attributes with corresponding outcomes once sacrifices comprise all possible monetary and non-monetary costs like psychological or relationship costs in addition to the time and effort the purchasing may require (Woodall, 2003). Based on disconfirmation theory, negative value and hence dissatisfaction is basically created every time when customer expectations and reality do not match be it then whatever operational mistake, inconvenience of purchasing or unfriendly personnel (e.g. Hansemark and Albinsson, 2004; Eggert and Ulaga, 2002; Raval and Grönroos, 1996).

Having the risk of value loss the basic idea of complaint management is to normalize and sustain the customer relationship in case of failure. There is some evidence indicating that over half of the dissatisfied customers might repurchase if their complaints are managed satisfactorily (Singh and Widing II 1991). However, not all customers complain which may be due to the fact that consumers consider that complaining is not worth attempting and managers besides tend to doubt the honesty of complaining (e.g. Huppertz 2007, Bosch and Enriquez 2005, Stephens and Gvinner, 1998). In any case poor recovery may lead to the loss of customers (e.g. Maxham III and Netemeyer, 2002) once well-managed customer complaining can increase both customer satisfaction and retention (Nyer, 2000, Broadbridge and Marshall, 1995). Accordingly, lenient complaint practises may turn out to be useful in order to get dissatisfied customers to speak about their experiences (e.g. Huppertz, 2007). Much depends on to which extension retailers are interested in investing their time and effort in complaint management and, correspondingly, are willing to encourage or discourage their customers to make complaints (e.g. Bell and Luddington, 2006; Davidow 2000). Whatever the case the prior purchasing value can differ considerably from the value which is constructed later, because customers may apply different attributes and value base depending on the stage of their buying process (e.g. Woodruff, 1997). Perceived value by definition presumes an interaction between the customer and product which takes place always when customers and products meet, be it then of physical or mental origin. As a consequence also retailing comes to the fore too because there is a strong interaction between the consumers' decision-making processes and retailers (Grewal and Levy, 2007). The topics is approached here by reporting the results of a consumer survey focusing on the perceived complaint handling in the context of furniture retailing in Finland.

## **RESPONDING CUSTOMER COMPLAINTS**

According to Davidow (2003) organizational response dimensions of complaint handling consists of timeliness, facilitation, redress, apology, credibility and attentiveness which all has an impact on the repurchase intension and company attitudes customers may perceive. Timeliness refers to the speed of response, facilitation to the policies and procedures which are effective in complaint handling once redress regards compensation in

one way or another. Davidow more specifically takes it for granted that apology too should be perceived as compensation but now as a psychological one. Credibility again refers to any explanations indicating what happened and why and, finally, attentiveness deals with the interaction of the customer relationship. As a whole one may expect that recovering perceived customer value and sustaining a high level of customer satisfaction has a favourable impact on future purchasing behaviour (e.g. Varela-Neira *et al.*, 2010; Rigopoulou *et al.*, 2008; Boehm and Brady, 2007; Zairi, 2000). Ravald and Grönroos (1996) in particular suggest that not only value adding strategies are worth consideration but customer relationship costs too are the sacrifice which one has to try to minimize because customer satisfaction and hence future buying behaviour depends on sacrifice too. According to the authors sacrifice comprise a number of possible indirect and psychological supplier costs which incidentally emerge without that the customer has been aware of them in making the decision to buy. As a consequence incidental costs emerge as moderating variables which shape the overall evaluation of the total value and satisfaction of purchasing.

By definition moderating variables either in the form or strength have some effect upon the relationship between the dependent and independent variable (e.g. Walsh *et al.*, 2008). In this respect as relevant moderating sacrifices could be applied the monetary value of the purchase, the time and effort of searching and finding a proper product and the psychological supplier costs which are due to the waiting time of any redelivery. As to the actual quality of the retailers' complaint handling, the response dimensions of Davidow (2003) as the basis a set of corresponding variables indicating how customers have perceived complaint handling were defined in line with preliminary discussions with two local furniture manufacturer's sales managers and a small number of selected consumers which had experienced a failure. The level of quality by variables was measured in a scale of 1-5 (fully agree – do not agree at all). Variables are presented in Figure 1.

As any value loss can by social exchange and equity theory depend on the magnitude of failure (Smith *et al.* 1999), the key premise of this study is that the higher the incidental sacrifice the bigger the magnitude of perceived failure. Some products are more important than others just because they are more expensive (e.g. Blodgett *et al.* 1995) but also time and effort which is spent in the search and identification of a proper product may represent considerable indirect costs in addition to the supplier psychological costs a long redelivery time can in many ways cause as to human stress and frustration.

Given the quality of complaint handling, the moderating variables and their underlying logic of effect in case of failure is summarised as follows:

**Figure 1.** Sacrifices as moderating variables

The applied survey questionnaire was open for two weeks' time in spring 2010 in two furniture retail chains' web pages, yielding in total over 1000 customer responses comprising about 200 customers which had faced a failure. However, it turned out that one third had never told about the failure to the retailer which is why the actual number of acceptable responses remained 130. As a whole, 12 % of the failures were observed even before the product was taken out from the package, about half of the failures were found immediately after the delivery when the package was opened and around 26 % of the failures were found when the product was started to use. Only some 10 % of the failures were observed when the product had been used for a longer time.

## RESULTS

Pearson Correlations in Table 1 express to which extent each variable indicating the perceived practice of complaint handling can explain the future buying behaviour. All figures are significant at 0.01 level (2-tailed) and positive except the variable A 8 which logically has a negative value. As it can be seen, starting the corrective actions immediately and trying to make one's best can explain most of the future buying behaviour either in terms of intending to buy further or being ready to recommend the store to others

**Table 1.** Future buying behaviour by degree of explanation by perceived complaint handling in case of failure

Variables of complaint handling		Future buying behaviour	
		Repurchasing	Recommendation
		$r^2$	$r^2$
A 1.	Corrective actions were started immediately	.608	.663
A 2.	Origin of failure and consensus of compensation was easy to reach	.572	.608
A 3.	Instant compensation could be easily agreed with sales people	.450	.539
A 4.	The reason of the failure was told exactly	.416	.525
A 5.	They attempted to compensate what had happened	.319	.473
A 6.	They made their best to correct the failure	.667	.781
A 7.	It was easy to contact the personnel	.441	.488
A 8.	They were ready to listen	.548	.621
A 9.	They were unwilling to orientate the matter	-.478	-.434
A 10.	They were sorry about the failure	.485	.570

As it is indicated in Appendix 1, all variables A1-A10 were highly inter-correlated implying that the variables were basically measuring the same thing. The internal consistency of all variables was hence tested via Cronbach's Alpha too, the numerical value of which (0.863) was clearly above 0.60 considered in general an acceptable minimum (e.g. Metsämuuronen 2006). Against this background an exploring factor analysis was made for the next leading to a one factor model (F1) with an initial eigenvalue of 5,567 and the capability of explaining 55,7% of the total variance of the future buying behaviour. Given that the minimum acceptable numerical value of communality of a variable is generally considered to be 0,3 (e.g. Sass, 2010; Tabachnik and Fidell, 2000; Tinsley and Tinsley, 1987), all incoming variables were reasonably loaded to one factor only having the values A 1. = .763; A 2. = .495; A 3. = .582; A 4. = .345; A 5. = .351; A 6. = .770; A 7. = .353; A 8. = .721; A 9. = .322 and A 10. = .428. All other factors had eigenvalues < 1.00 and where hence unacceptable under the thumb rule that the minimum acceptable eigenvalue is 1.00 (e.g. Metsämuuronen, 2006).

Acknowledging that a moderating effect of a factor  $z$  to  $b$  can be expressed in the general form  $y = b_0 + b_1 x + b_2 xz + \epsilon$ , a corresponding regression analysis was made based on the established factor F1. In this respect over 50 % of the variance of future buying behaviour ( $R^2 = .0506$ ) could be explained, indicating that the quality of complaint handling is not at all meaningless. However, as to the moderating variables, none of them had any statistical effect as to their interaction between the practice of complaint handling and corresponding impact on future buying behaviour. Variables were excluded as the summary statistics of the stepwise procedure in Table 2 indicates. Beta coefficients remain in a relatively low level and the statistical significance of all four moderating variables is according to t-test far away even from the significance level of 0.05.

**Table 2.** Regression analysis: summary statistics (N= 114).

Model	Excluded variables			
1	Variable	Beta	t	Stat.Sig.
	B1	-.043	-.642	.522
	B2	-.039	-.510	.611
	B3	-.032	-.473	.637
	B4	-.052	-.781	.436
	Interaction F1x B1	.081	.468	.641
	Interaction F1x B2	-.192	-.981	.329
	Interaction F1x B3	.312	1,559	.122
	Interaction F1x B4	-.099	-.515	.608

Predictors in the model: Factor 1 (F1)

Dependent variable: Future buying behaviour (C1 + C2)

## CONCLUSIONS

As in any human affair, also purchasing and delivery of consumer products may cause customer dissatisfaction due to inherent product or delivery failures. In case of failure it is generally expected that by handling complaints properly retailers can gain confidence and sustain their reputation (e.g. Broadbridge and Marshall, 1995). By applying a set of 10 variables as indicators of the perceived complaint handling of customers a one factor model could be established explaining over half of the total variance of the future buying behaviour. The quality of the retailers' complaint handling accordingly has an impact on customer's future buying behaviour as in fact has been found elsewhere by largely applying a similar type of quality indicators (e.g. Rigopoulou et al. 2008). However, the key premise of the study - the higher the incidental sacrifice the higher its effect will be upon the perceived complaint handling and its impact on future buying behaviour (cf. Roehm and Brady 2007) - is not supported by the results. In line with the views of Raval and Grönroos (1996) and Smith *et al.* (1999) the applied incidental moderating variables - indirect or supplier psychological costs in terms of money, time, effort and redelivery time – seem to have a negative impact but nevertheless it is not strong enough to create reasonable statistical significance. In short, the quality of the customer complaint handling has statistically significant impact on customer's future buying behaviour independent of the level of incidental sacrifices.

In case the time and effort used in searching for a proper product is in question one has to be cautious because there are people who instead of sacrifice rather enjoy shopping and hunting for bargains (e.g. Cox *et al.* 2003). Also worth noting is that despite the fact that benefits and sacrifice may be perceived universally by human beings on a global basis there are also cultural differences which define which specific things are valued most and vice versa. In this respect it is highly recommended that a similar type of study will be done separately in each market. Also a much larger audience would be desirable in order to identify considerably larger number of customers who have experienced a failure just in the near past because the inherent problem in this respect regards the human memory. Also the measurement basis of sacrifices deserves to be studied more in detail by adding a number of other relevant sacrifices in addition to the few ones applied in this study.

### Appendix 1. Correlation matrix variables A1 - A10

	A 1	A 2	A 3	A 4	A 5	A 6	A 7	A 8	A 9	A10

# STRATEGIC ALLIANCE GOVERNANCE

**Renato R. Lyra and T. Diana L. van Aduard de Macedo-Soares**  
**Pontifical Catholic University of Rio de Janeiro, Brazil**

## ABSTRACT

*The aim of this article is to present the results of a bibliographical investigation, which sought to provide guidelines regarding recommended governance practices for firms involved in strategic alliances at domestic and international levels, by identifying the principal factors that should be considered when choosing the most appropriate governance form for a new strategic alliance. This article contributes to the body of knowledge regarding factors that influence the choice of governance form in strategic alliances, by seeking to incorporate concepts and proposals available in the internationalization and corporate governance literature to the alliance governance field. In addition, it intends to be a source of guidance for executives involved in the development of international partnerships.*

## INTRODUCTION

The main studies of alliances between firms focus on the formation of strategic alliances, how alliances create value and the evolution of strategic alliances. In contrast, relatively little research has been carried out on alliance governance. Yet, as Kale and Singh (2009) argue, governance plays a key role for the successful management of strategic alliances. This is relevant because many alliances fail (Bamford, Gomes-Casseres and Robinson, 2004) and one of the reasons is a lack of alliance management mechanisms, especially governance mechanisms (Kale and Singh, 2009), and another reason is a member's opportunistic behavior (Das 2005).

The objective of this article is to present the results of a bibliographical investigation, which sought to identify the principal factors that should be considered when choosing the most appropriate governance form for a new strategic alliance. Thus it intends to be a source of guidance regarding governance practices and forms for executives of domestic and international firms involved in strategic alliances.

This article has a particular concern with international alliance governance because there are differences between countries that influence the governance forms adopted by firms. These differences are typically related to cultural aspects, legal systems and the enforcing of laws (Smirnova, Naudé, Henneberg, Mouzas and Kouchtch, 2011, Wang, 2007, Naicker and Saungweme, 2009).

## STRATEGIC ALLIANCE GOVERNANCE

The research at issue here used Gulati's (1998) definition of strategic alliances: **strategic alliances** are voluntary arrangements between firms involving the exchange, sharing or co-development of products, technologies and services. According to Thorelli (1986), strategic alliances are quite common in international business, due largely to the importance of trust in trade between nations. Other motives are the risks and difficulties associated with international trade.

**Corporate governance** (Carvalho, 2006) refers to a system that organizes and balances organisms and powers within a firm. The term is usually related to the management, control, and distribution of rights and responsibilities between a firm's various participants and the monitoring mechanisms established by its controlling shareholders. Carvalho observes that the different definitions of corporate governance agree that it

consists of “a set of principles and practices that seek to minimize potential conflicts of interest between the firm’s agents”.

Carvalho’s analysis of corporate governance suggests that the study of governance between two firms began with **Agency Theory**. According to this theory, an alliance or network consists of an association of firms with a network of explicit and implicit contracts that establish the functions, rights and duties of all participants. In this case, companies use imperfect contracts to achieve balance between conflicting objectives, given that it is difficult to foresee all potential future conflicts between shareholders and a firm’s management. According to this theory, a governance structure’s main concern is to develop efficient mechanisms that assure alignment between member firms.

In an alliance or network, governance involves the use of authority and collaboration structures in order to manage resource allocation, and to coordinate and control actions of the organizations involved (Provan and Kenis, 2008). In recent years, the analysis of governance mechanisms in strategic alliances has focused on contracting efficiency, in which a trade-off between contractual and hierarchical arrangements determines the form of governance, the latter typically considering joint venture formation (Mitsuhashi, Shane and Sine, 2008).

Another approach to alliance governance involves relational analysis. Morgan and Hunt (1994) distinguish between discrete transactions with a short duration and well-defined beginning and end, and relational transactions that are related to previous agreements and last longer. These authors suggest that commitment and trust constructs are essential to a relation because they help to preserve it, increase resistance to the adoption by one of the parties of alternatives outside the relation and reduce the risk perceived by both parties in the relation.

In line with these arguments, Das (2005), in an analysis of the risks of strategic alliances, considers that risk in alliances may be divided into performance risk and relational risk. The former is similar to what occurs naturally in a single firm (without considering the effects of an alliance or network), while the latter – relational risk – is typical of strategic alliances or networks. Relational risk in alliances and networks arises from the possibility of one of the parties behaving in an opportunistic or selfish mode, such as withholding or distorting information that is relevant to the partners, or failing to engage in activities or provide resources that are necessary for the alliance’s success.

In order to minimize relational risk, Das suggests the use of governance mechanisms designed to improve the relationship. These mechanisms involve contracts (supply relationships, R&D agreements, licensing), equity-based agreements (joint ventures or minority stakes), relationship specific assets, monitoring, a participative decision-making process and training on alliance processes and behaviors.

The academic terminology describing governance processes and structures has no consistent pattern, and the meaning of terms and classifications varies considerably. This research adopted a distinction used by Hoetker and Mellewigt (2009), characterizing governance in its formal and relational mechanisms. Other categorizations of governance used in the literature are “contractual governance” (Nielsen, 2010, Lee and Cavusgil, 2006, Ferguson, Paulin and Bergeron, 2005), “procedural governance” (Nielsen, 2010) “informal governance” or “informal control” (Dekker, 2004, Puranam and Vanneste, 2009). In some cases, the term relational governance describes alliance governance in general, not distinguishing between formal and informal alliance governance mechanisms (Macedo-Soares, 2011).

Formal governance mechanisms are non-personalized processes (independent of the people involved), based on objective metrics and supported by contracts. Relational governance mechanisms, on the other hand, are based on relations characterized by a high level of communication, exchange of information and trust. These relational mechanisms are usually linked to particular individuals and their relationships (Eisenhart, *apud* Hoetker and Mellewigt 2009). Some examples of relational mechanisms are the creating of inter-organizational teams, task forces, committees, direct inter-organizational contacts, a shared decision-making process, and alternative ways of resolving disputes or even the transfer of managers between alliance partners. In order to analyze relational governance mechanisms it is also necessary to define the concept of **relational capital** which refers to the level of trust, respect and friendship that develops between partners due to individual-level interactions between parties (Kale, Singh and Perlmutter, 2000).

# FORMAL GOVERNANCE MECHANISMS

According to the literature, the main formal governance structures in alliances and networks are joint ventures, contractual alliances and alliances with minority stakes. Equity-based alliances can be divided into joint ventures and alliances with minority stake (Gulati and Singh, 1998), with greater hierarchical control in the former than in the latter. Osborn and Baughn (1990) argue that equity-based alliances are the best formal governance structure to align objectives and to reduce the possibility of opportunistic behavior, as the partner companies distribute results (positive or negative) obtained through the joint venture. In addition, it is easier to implement monitoring mechanisms in a joint-venture as it does not require a complete specification of activities, behaviors or processes. These authors warn that it may be difficult to manage shared ownership in a joint venture, and this may lead to slower decision-making.

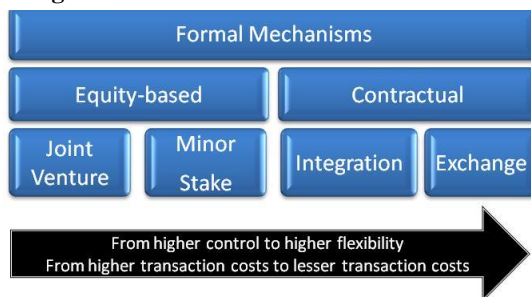

Another formal governance structure involves the use of contracts as a control mechanism. Some authors – for example, Chen and Chen (2003) – argue that the use of contractual controls offers advantages over the use of joint ventures, such as a greater flexibility, easier dissolution, lower public impact, easier negotiation (comparing to equity negotiation) and a lower legal liability. However, the effectiveness of using contracts as control mechanisms in alliances may be limited in cases where there is a significant concern with appropriation in the alliance. In this situation, a structure that allows a greater degree of hierarchical control may be desirable.

According to Das (2005), contracts determine the policies and procedures that should be followed by alliance partners, but their preparation is costly in terms of resources (managerial, legal or financial). As the contract gets more detailed, its marginal benefits become lower and its incremental cost becomes greater. In addition, it would be illusory to expect that contracts – no matter how detailed – could provide a complete protection against future uncertainties.

In addition to the distinction between alliances controlled through equity or contracts based on the transaction cost theory, Chen and Chen (2003) propose a second distinction within the contractual alliance group: alliances involving the exchange of resources and those involving integration, in which partners share resources. They argue that the exchange or sharing of resources influences the choice of the appropriate governance mechanism – joint venture or contractual.

Based on these classifications, Figure 1 shows different types of formal governance mechanisms. The level of control associated with each mechanism reduces as we look at Figure 1 from left to right, in opposition

**Figure 1: Formal Governance Mechanisms.**

to the flexibility of the firm in relation to the alliance. In other words, a joint venture is the formal governance mechanism that allows for a greater level of control, but at the cost of less flexibility. In contrast, contractual exchange alliances represent lower control levels, but are more flexible. The transaction costs associated with each governance mechanism are expected to diminish as the firm moves from joint ventures towards contractual governance mechanisms.

Regarding factors that lead firms to select a formal governance structure, Osborn & Baughn (1990) analyzed 153 alliances and verified that firms that wish to conduct research tend to form joint ventures to reduce the risk of appropriation – in line with other results presented in the literature (Teng and Das, 2008, Gulati and Singh, 1998). On the other hand, in environments characterized by high levels of technological uncertainty, firms prefer to use contractual structures owing to their greater flexibility.

In another study, Teng and Das (2008) examined 765 alliances in order to verify the influence of most critical factors in the choice of forms of governance, considering only formal mechanisms. In their sample, they verified that the following factors were significant: alliance objectives (e.g. R&D development or joint marketing), managerial experience on alliances and existence of international partners (international alliances

tend to be based on equity, a formal mechanism). Gulati and Singh (1998) show that when alliances involve international partners, European firms tend to have greater use of equity-based agreements, in contrast with Japanese and U.S. firms, where this behavior is not particularly significant.

## RELATIONAL GOVERNANCE MECHANISMS

Most studies of strategic alliance governance have analyzed the formal aspects of these relations. However, academics in the corporate strategy area are increasingly focusing on the relational aspects of governance. Dyer and Singh (1998), for example, who consider that one way of gaining competitive advantage in an alliance is through effective governance mechanisms, identified two relational factors that can facilitate effective governance. These are i) partners' skills in the use of self-enforcing mechanisms, i.e. those that do not involve third parties (e.g. trust and reputation), and ii) partners' skills in the use of informal mechanisms that sustain the alliance. They observe that governance based solely on contracts would rely on judicial or arbitration courts to solve conflicts, which is money and time consuming.

According to Dyer and Singh (1998), self-enforcing mechanisms are more effective than mechanisms that involve other parties (such as the judicial system, for example), because they reduce transaction costs and maximize initiatives that create value.

According to Kale *et al.* (2000), relational capital creates a basis for learning and the transfer of knowledge, as well as for reducing the risk of opportunistic behavior by one of the parties involved. Indeed, in a survey of 212 firms, Kale *et al.* (2000) verified that relational capital is significantly related to the degree of learning attained and that a conflict management process based on intensive contacts and communication is positively related to learning success. They also found a positive and significant relation between the use of relational governance mechanisms and the protection of proprietary assets.

**Figure 2: Relational Governance Mechanisms**

Trust constitutes one of the main aspects of relational capital. It influences governance structure and alliance performance, as shown by the study undertaken by Gulati and Nickerson (2008). They analyzed how preexisting inter-organizational trust influences the choice of governance structure and hence the relationship's performance, and found that a high level of inter-organizational trust increases the likelihood of a less formal (and less expensive) governance structure. These authors suggest that trust causes a substitution effect in the choice of governance structure, improves the relationship's performance and reduces the level of inter-organizational conflict, no matter which type of governance is used.

In a relational governance structure, various mechanisms allow conflicts to be resolved based on open communication and a preference for achieving solutions that benefit both parties (Kale *et al.*, 2000). However, a relational governance structure cannot be created overnight. A series of interactions between teams from each firm is necessary to develop personal ties that foster cooperation and growth in inter-organizational trust (Hoetker and Mellewigt, 2009).

Although the use of relational governance mechanisms has several advantages, one must not ignore the disadvantages. The first is that such mechanisms cannot be enforced (or are, at least, difficult to enforce) in relations between firms with a short history of contacts and that have not yet been able to develop the personal processes and relationships needed to establish relational mechanisms. Secondly, it may take longer to set up a relational agreement than a formal one. This is the case of relational societies that require a certain degree of trust between parties before a relation can be developed. Thirdly, firms may end up prolonging a low-performance relationship due to a greater acceptance of unexpected aspects (e.g. costs) in order to maintain the relationship (Hoetker and Mellewigt, 2009). However, we should point out that maintaining an underperforming relation is above all a managerial decision and not inherent to the relational governance model (although it may be induced by this model).

Adopting a different approach, Nielsen (2010) defines contractual governance as the distribution of rights between the alliance partners through the use of contracts, directly affecting the alliance's structure. He uses the term **processual governance** to describe the coordination of procedures and interactions related to the knowledge management process during an alliance's evolution. In his view, an efficient governance structure is the result of an adaptation process and that procedural governance refers to the continuous coordination between parties, through which the related firms learn to adjust their activities to those of their partners. The approach proposed by Nielsen addresses aspects of formal governance (in the contractual case) and relational governance (in the relational case) that do not conflict with the other proposals regarding governance presented above.

Based on these classifications, Figure 2 presents a list of relational governance mechanisms. Relational mechanisms of an organizational nature have a greater level of control than relational mechanisms of an individual kind. The latter are usually associated with executives (such as an account director) who manage to develop partnerships with other firms based on their personal relations.

## INTERNATIONAL CONTEXT

The relation between firms and the governance model adopted depends on the context of each country in which these firms are located. Although corporate governance typically deals with the relationships between stakeholders in a single firm, cross-border comparisons of governance systems may serve to illustrate countries' different characteristics. For example, in countries where family firms or small groups of shareholders with effective control of firms (in contrast to firms with diluted control) predominate, the level of conflict between a firm's shareholders and agents is relatively low. This is so because the person or group that controls the firm (controlling shareholder) also usually controls the firm's managers. In these firms, the greatest conflicts exist between the controlling shareholder and minority shareholders (Carvalho, 2006). This is the case in Brazil, where the corporate governance structure focuses on protecting minority investors. In countries which use the Anglo-Saxon corporate governance model, in which control is diluted among a large number of shareholders, the main conflict of interest addressed by the corporate governance structure occurs between a firm's managers and its shareholders.

Corporate governance systems also vary according to countries' respective legal environments, especially with regard to law enforcement. La Porta, Lopez-De-Silanes, Schleifer & Vishny (1998) classify corporate governance models according to the legal system: the common law system, which exists in most English speaking countries, and the French civil law system, which is based on Roman law. These authors consider that many countries have low levels of legal investor protection due to their civil law system.

This is the case of some Latin America and Southeast Asia countries, where a highly concentrated ownership structure involving a small number of shareholders characterizes the governance system. There is often a single controlling family and a clear separation between dividend and control rights (Carvalho, 2006).

Data from the World Bank's "Doing Business" project ([www.doingbusiness.org](http://www.doingbusiness.org)) is an evidence of the low level of protection afforded to investors in some countries. This project assesses the business environment in various countries and one of the main points assessed is contract enforcement. This indicator assesses the time, cost and number of procedures involved from the beginning of the court case to the end of the dispute, for small and medium-sized firms. Table 1 shows some examples of differences in the ease – or feasibility – of enforcing contracts in some countries or regions (2010 figures). Note that it takes an average of 300 days to resolve a commercial dispute in the USA - typically absorbing 14.4% of the amount claimed, and a court case in India takes on average 1.420 days and absorbs almost 40% of the amount claimed. Thus, contractual mechanisms are not particularly efficient in countries where it is difficult to execute these court cases or where the cost of doing so is remarkably high.

**Table 1: Ease of enforcing contracts (source: [www.doingbusiness.org](http://www.doingbusiness.org)).**

Economy	Num. of procedures	Amount of Time (days)	Cost (% claimed)
East Asia and Pacific	37.3	531.8	48.5
Latin America & the Caribbean	39.8	707	31.2
Australia	28	395	20.7
Brazil	45	616	16.5

Chile	36	480	28.6
China	34	406	11.1
Germany	30	394	14.4
India	46	1.420	39.6
Japan	30	360	22.7
Mexico	38	415	32.0
Russia	37	281	13.4
South Africa	30	600	33.2
Unites States	32	300	14.4

Besides each country's legal context, another factor to be considered is the fact that some markets – especially in emerging countries – are in a transition stage. For example, Smirnova *et al.* (2011) made a study of Russian firms and found that inter-organizational relationships were strongly influenced by the country's transition process, its business culture and personal relations. They called attention to the fact that trust between firms in present-day Russia is low, but can be compensated by interpersonal trust.

Nielsen (2007), in a study of Danish firms' alliances with foreign firms, also found significant differences between alliance performance and the characteristics of partner firms' countries of origin. In his research, he evidenced significant relations between alliance performance and factors such as collaborative knowledge, trust, complementarity and cultural distance – with this last factor showing how perceived cultural differences can affect an international alliance's performance.

Cultural aspects also play a prominent role in governing alliance structure, remarkably in societies that value inter-personal relationships in negotiations, as in the case of China, Japan and Brazil. It is thus argued here that, in such societies, companies should develop an appropriate balance between formal and relational governance, avoiding too formal governance structures based solely on contracts and monitoring mechanisms. This view contrasts with that of Johnson and Neave (2006), for example, who believe (based on a transactional approach) that managing cultural differences in cross-national alliances requires a higher degree of monitoring.

Wang (2007) highlights the differences between concepts usually addressed in the relationship between firms and the corresponding concepts used in China as, for example, in the case of the differences between relationship marketing and Chinese *Guanxi*, or between trust and *xinyong*. The term ***Guanxi*** (formed by the words Guan [door / gate] + xi [connection]) usually refers to social relationships or connections based on mutual interest and benefit, and a link between partners related to the existence of reciprocal obligations and the expectation of continuous cooperation. In the case of trust, Wang indicates that there are significant differences between the concept of trust and ***xinyong*** – the closest equivalent in Chinese – and that it has little impact on the development and maintenance of *guanxi* (in contrast to the central role usually attributed to trust in the study of relationships between Western firms). Wang suggests that, instead of trust between parties, obligations and mutual assurances guide the relationship in *guanxi*. In addition, the author emphasizes the universal nature of relationship marketing: the relationship network is open to other partners, especially as trust between the parties involved characterizes Western societies. In contrast, a more closed network characterizes a *guanxi* because Chinese society limits trust to those who are the closest ones (typically members of the same family).

In sum, besides the characteristics of different types of formal and relational mechanisms (with their advantages and disadvantages), the choice of governance model for an alliance or network between firms from different countries should take into consideration aspects such as the ease of enforcing legal contracts, cultural differences in relationships and other characteristics of the countries involved, such their level of development.

## STRATEGIC ASPECTS

The main issue regarding the governance of an inter-firm relation is to select an appropriate control mechanism. It should maximize results and minimize the risk of opportunistic behavior in the partnership. Academic literature illustrates different factors that influence the choice of governance mechanisms, such as alliance objectives, the industry in which the firm operates, its size, the level of technological uncertainty, the resources involved, inter-organizational trust and previous relationship ties (see examples in Table 2). These diverse factors are typically related to the efficiency of governance mechanisms in terms of their ability to reduce

transaction costs. However, academic research into firms' global strategies has shown that, when setting up alliances or networks, multinational firms are more concerned with establishing their global strategic positioning than with transaction costs per se (Osborn and Baughn, 1990).

In line with the issue of the influence of strategic factors on governance structures, Hoffman (2007) analyzes how firms manage a portfolio of alliances, using a classification of three different strategies that can enable them to face a complex environment characterized by change. Thus, firms can: 1) **adapt** reactively to changes in their environment 2) actively **shape** the development of the environment, or 3) seek to **stabilize** the environment, avoiding organizational change.

In order to develop the second strategy, firms may engage in a large number of alliances in order to develop new resources, new capabilities or exploit existing opportunities. In this situation, firms need to use flexible ways of managing this set of relations efficiently. Even in the case of an environmental adaptation strategy, firms need to enhance their resource use and flexibility without undertaking large investments. They also need to develop flexible mechanisms to manage the various alliances they establish. Only firms that are seeking to stabilize their environment can use more formal and rigid mechanisms, as in the case of longer term supply or distribution contracts.

Besides formal and relational aspects and those related to the firm's strategic goals, it may be necessary to consider the effect of the **organizational moment** on the choice of a form of inter-organizational governance. Mitsubishi *et al.* (2008) examined the choice of a form of governance in 1510 franchises operating in North America. They suggest that the form of organizational governance evolves over time. Therefore, the organizational moment – defined as the tendency to maintain or expand the emphasis and direction of previous strategic actions – may be used to predict the form of governance adopted by the firms analyzed and an explanation of the choice of the forms of governance should incorporate dynamic processes.

The question of the organizational moment can be associated with the use of relational governance mechanisms, which depend on the development of a minimum level of trust and communication between the firms involved that may not exist at the beginning of an alliance or network between firms. In this case, even if the firms consider that relational governance mechanisms are the most appropriate for the relation they are building, they may begin the relationship by instituting formal governance mechanisms. This would be the case

of a technology-development agreement characterized by a high level of innovation and uncertainty that, at the beginning would use more detailed contracts, stringent monitoring processes and conflict-resolution processes involving third parties.

This view is in line with Hoetker and Mellewigt (2009), who argue that formal governance mechanisms are not so dependent on pre-existing interactions, and suggest that the initial activities of an alliance should involve more agreements related to proprietary assets than knowledge-based assets. Firms could thus adopt relational governance mechanisms progressively, as trust and other relational attributes develop. This thesis is also corroborated by Mitsuhashi *et al.* (2008), who argue that even the efficient use of contracts (as a form of governance) does not take into consideration the dynamic processes involved in the evolution of a firm's governance. Reuer and Ariño's (2007) findings also support the idea that prior alliances between firms lead them to specify fewer provisions relating to the coordination of the alliance. This reduction in the contractual provisions for alliance coordination suggests that these provisions could have been replaced by relational governance mechanisms.

In relation to the progression from formal governance to relational governance (in situations where the latter is more appropriate), Gopalakrishna Pillai and Sharma (2003) observe that at each stage of the relation, both transactional and formal factors are present, and the factors linked to a relational approach may diminish after having attained a peak. This reduction in relational factors may signal the beginning of a disagreement or a change of strategy by one of the parties involved. The importance of complementing formal with relational governance mechanisms is also defended by Macedo-Soares (2011).

Finally, from the perspective of gaining sustainable competitive advantage through alliances or relationship networks, Dyer and Singh (1998) suggest that formal mechanisms are easier to imitate than informal ones (relational). The authors argue that informal mechanisms are socially complex, specific to each relation, and take longer to develop than formal ones, characteristics that contribute to the inimitability of informal mechanisms and consequently their competitive advantage.

**Figure 3: Main Governance Mechanisms.**

## FINAL CONSIDERATIONS

This article presents the results of research that identified the main factors that should be considered when choosing the most appropriate governance form for a strategic alliance. Special emphasis was put on international relations as they involve each country's different characteristics that may influence the choice of governance mechanisms. Existing governance mechanisms were classified into formal and relational mechanisms as this classification is simple enough to be used by other researchers and broad enough to classify any governance mechanism. A summary table with the main strategic alliance governance mechanisms is given in Figure 3 (Lower level classifications are not shown for the sake of simplicity, as they were presented in Figures 1 and 2).

In the literature, it became obvious that alliance management requires a suitable balance between formal and relational mechanisms. Therefore, firms in alliances should evaluate both their formal and relational governance mechanisms so as to strike the right balance between these and contribute to more effective alliance governance and, consequently, performance. Further research is thus recommended on how to carry out this assessment and ensure the desirable balance between governance mechanisms.

# SMALL AND MEDIUM-SIZED BUSINESS DEVELOPMENT IN LITHUANIA

**Antanas Makštutis and Juozas Vijeikis,  
Mykolas Romeris University, Lithuania**

## ABSTRACT

*The article provides an analysis of the condition of small and medium business (further SMB), factors conditioning the availability of financing, and obstacles in the availability of financing. An analysis of business development factors was carried out, and the role of the State in the policy related to the availability of SMB financing was assessed. With the application of statistical data, sociological research findings, graphical, grouping, data comparison and generalization methods, the factors that have an impact on the choice of business financing have been analyzed and SMB indicators were presented. The analyzed data of sociological research reveal the main problems of SMB financing, hindering the effective performance of this business sector. The work gives conclusions on the condition of SMB in Lithuania, the opportunities of financing; the main reasons, impeding the improvement in the availability of business financing, were put forward; the SMB development strategy, conclusions and proposals are presented.*

## INTRODUCTION

SMB is a sector, dynamically growing and taking a still more important place in the economy. Prior to the middle of the 20<sup>th</sup> century, this sector of the economy was treated as of no importance for the development of the country's economy, and today it creates more than a half of the added value of labour in the European Union (EU) countries and is considered as the basis of economic development. The SMB process is constantly changing; its participants adapt rapidly to the conditions of business environment and ensure the development of the sector in the global economy. SMB is very fast in evaluating changes in the market prices, adapts to them and selects the business strategy. In this respect, SMB reduces business risk and is important for the national economy and global business development. With account taken of SMB importance, the development of national economy, the competitiveness of markets in the EU and the world, the financing of this business is becoming an urgent problem. Attention for SMB financing is accorded by public and financial institutions, whereas the Lithuanian SMB participants have doubts as regards the stability of financing in the national and EU common market. At the present moment, an opinion is being formed and a question arises to the market players, whether SMB financing strategy, which will predetermine the SMB development in the future, is appropriate. In this situation, it is necessary to analyze the SMB financing perspectives and its environmental factors, to assess the shortcomings of financing and to predict the future opportunities for SMB development.

*The objective of research* is to analyze, evaluate and predict the environmental factors for Lithuanian SMB development, to identify the reasons for the availability of SMB financing, to reveal problems and prepare the trends in their solution, which would ensure the improvement of the conditions for SMB financing availability. *The object of research*: Lithuanian SMB development and financing environment. *Research tasks*: to conduct an analysis of the condition of small and medium-sized enterprises (SMEs), to evaluate the policy of public and financial institutions, to identify the needs of business support and services, to formulate and provide conclusions and proposals. *Research methods*: comparative data analysis, sociological survey, graphical, analysis and synthesis, case analysis, and prediction.

*Methodology of effective management* is expressed by comparative efficiency computations with the application of mathematical model:  $k_E = A_R / A_N$ , where:  $k_E$  – coefficient of comparative efficiency, the value of

which is  $0 - 1$ ;  $A_R$  – real labour result of the use of human potential;  $A_N$  – real labour normative of the use of human potential.

## STATE POLICY ON SMB DEVELOPMENT

Lithuania, like other EU countries, have limited resources, therefore equal opportunities should be afforded for all business enterprises, while research results revealed that SMB development was necessary in the national economy and for that purpose the State support policy was required.

The opinion of the world researchers in respect of the State policy for SMB development varies. Two basic principles for SMB development, prevailing in Lithuania, may be distinguished: privileges (exceptions) are not adjusted to the competitiveness of the national market, therefore, the State regulation policy is unacceptable; upon the evaluation of the tendencies of the national market competitiveness in 2006–2010, it was determined that SMB development was a necessity. Lithuanian scientists and practitioners-experts in their works approve in the essence the SMB development, with consideration of the economic regional policy and local conditions in the country for the implementation of EU policy of equal opportunities (Adomaitienė, 2007, Bartkus 2010, Fleischhauer, 2007, Henriques, 2009, Kuizinaite, 2008, Rajan, 2003, Rudzki, 2007, Garuckas, 2007, Stripeikis, 2004, 2007, 2008, Smagurauskienė, 2009, Šivickas, 2010, Štreimikienė, 2007, Žvinklys, 2006, Vijeikis, Makštutis, 2009, Vijeikis, Baležentis, 2010).

Currently, other forms of support by public institutions for SMB development have been already identified, and their impact will be determined in the future. State aid, direct and indirect, is presented in Fig. 1. (Kausteklienė, 2010).

**Figure 1: Distribution of State aid**

It was determined by research that SMB development is one of the most important goals in implementing State policy (Measuring, 2008). The State, while implementing this task, in 2008 adopted the amendment to the Law on SMB development (Law, 2010), where the following forms of SMB development were identified (SMB, 2010):

- tax relieves and relieves on charges;
- financial support (granting of loans on favourable terms, partial or full payment of interest);
- provision of guarantees (credit insurance, investment of risk capital);
- reduction of costs (expenses related to fees on incorporation and research, guarantee fees, credit insurance premiums, acquisition of quality certificates and compensation of other expenses, subsidies for creation of new jobs);
- consulting of the owners, managers and specialists of the enterprises, personnel training and qualification improvement or requalification on favourable terms;

- establishment of business incubators, business centres, and technology parks;
- establishment of risk funds.

*Direct aid*, when funds are allocated to the enterprise (grants, subsidies, compensations, micro-credits, preferential credits). *Indirect aid*, which does not grant funds to the enterprise, but offers tax relieves, regulates customs, and provides other guarantees (Chang, 2009).

Financial measures assist SMEs in achieving business development goals; therefore, it is necessary to analyze the conditions of the availability of SMB financing and their factors that create proper conditions for SMB development under the conditions of Lithuania in the EU common market.

## ANALYSIS OF THE CONDITION OF SMEs

At the present moment, SMEs in Lithuania account for 99.4% of all operating undertakings, whereas large enterprises represent just 0.6%; in the EU, SMEs average is 99.8% (Bartkus, 2010). In total, in 2010 in Lithuania 63840 enterprises operated, of which 63447 were SMEs and only 393 large enterprises. In the total number of SMEs, the major part belongs to very small enterprises with up to 10 employees. Within 2006–2010, very small enterprises constituted more than 70% of all SMEs operating in Lithuania. In 2006–2010, the number of registered enterprises exceeded the number of enterprises that were removed from registration. In 2010 in Lithuania 6405 enterprises were registered and 4593 enterprises were removed from registration; the difference was 1812 enterprises. The majority of all SMEs in Lithuania constituted private limited liability companies (PLLC) and individual enterprises (IE). In the period under analysis they generally covered over 97% of the total number of SMEs in Lithuania: part of PLLC in the total SMEs in 2006–2010 accounted for 54.5% – 71.4% (in total: 14509 enterprises); part of IE in the total SMEs in 2006–2010 was 42.8% – 26.4% (reduction amounted to 16.4%, 7421 enterprises were closed). It is a fact that part of IE was replaced by PLLC, Table 1.

**Table 1: Number of SMEs in 2006–2010**

<b>Year</b> <b>Legal form</b>	<b>2006</b>	<b>2007</b>	<b>2008</b>	<b>2009</b>	<b>2010</b>	<b>2010–2006 changes, %</b>

<b>Total:</b>	<b>56451</b>	<b>59712</b>	<b>63187</b>	<b>65232</b>	<b>63447</b>	<b>112.4</b>

Source: <http://www.stat.gov.lt/lt/pages/view/?id=1126>, LSD, February 15, 2010.

According to the Classification of Economic Activities (EVRK), in 2010 the major part of all SMEs constituted: retail trade 25%, wholesale 13%, construction of buildings and specialized construction 12%, land transport and transportation by pipes 8.3%, catering and supply of beverages 4.8%, enterprises, involved in other activities 36.9%. SMEs in Lithuania are distributed very unevenly. The greater part of SMEs is concentrated in the regions, siting the major cities of Lithuania. In the Vilnius region, in 2010, SMEs accounted for 37.5% of the total number of SMEs in the country, whereas in the Kaunas region 20.5%, the Klaipėda region 12.9%, and in the remaining 7 regions of the country 29.1%

Changes in SMEs predetermined the number of the personnel. In 2010, 910.9 thous. employees were employed in the national economy, constituting: in SMEs 720.5 thous. employees, large business enterprises (LE) 190.4 thous. employees (average per LE is over 250 employees). The biggest number of SMB employees in 2010 was in medium-sized enterprises (ME) 39.5%, small enterprises (SE) 38.2% and very small enterprises (VSE) 22.3%. SMB accounts for 60% of the added value created in the national economy (increasing with every year), and the remaining 40% of added value belongs to large business. It has been determined that SMEs create more jobs and higher added value, but the activity of large enterprises is more effective, since here the added value created per employee is twice as much.

**Presumptions for evaluation of the availability of business financing.** With the application of research methods, like statistical data analysis and questionnaires, in July 2010 the evaluation of the availability of SMB financing was performed. *Research sample.* To define the size of the sample, the statistical register of enterprises was used. According to the data of the Lithuanian Department of Statistics, 84,574 enterprises participated in business in 2009, of which SMEs numbered 65,252 (77.15%). In the course of research, 402 SMEs were surveyed, of which 312 SMEs were selected for the activity data eligible for research (74.29%). SMEs respondents in the questionnaire survey were subdivided according to three specific features of business entities: size, activity duration and venue, and this predetermined the reliability of research under the conditions of Lithuania in the EU common market.

**Evaluation of support for SMB development.** After conducting research, it was established that the SMB development programme by size of enterprises (Fig. 2) was best evaluated by the medium-sized enterprises (46 %) and was worst evaluated by micro-enterprises (33%). Over 40% of micro-enterprises and 39% of small enterprises gave evaluation of business support for small enterprises as necessary, only up to 15% of SMEs estimated it as partly necessary, and it was not determined whether support was unnecessary.

**Figure 2: Evaluation of business support by size of SMEs (%)**

Making analysis of support by activity duration of SMEs (Fig. 3), the interdependence of factors has become evident. SMEs, possessing small experience in their activity, estimated business support as very necessary (47%), 44% SMEs (operating for 3–5 years) estimated as very necessary, SMEs (operating over 10 years) acknowledged business support as necessary (49%), SMEs, operating for less than a year and for 5–10 years recognized business support as partly necessary. Evaluation of support by SMEs activity venue (Fig. 4) varies conditionally. Most necessary is business support for SMEs, operating in the Šiauliai (68%), Utena (63%) and Panevėžys (57%) regions. SMEs (75%) in the Telšiai region evaluate support as necessary. SMEs in the Šiauliai (33%) and Tauragė (25%) regions evaluated business support as partly necessary. As unnecessary the support was evaluated by SMEs in the Telšiai (24%) and Klaipėda (12%) regions.

**Figure 3: Evaluation of business support by activity duration of SMEs (%)**

Evaluation of SMEs being made according to three criteria: size, activity duration and venue, it has been established what support is needed for SMEs and how they evaluate State aid for SMB development under the conditions of Lithuania in the EU common market.

**Figure 4: Evaluation of business support by activity venue of SMEs (%)**

SMEs, involved in services business (Fig. 5), evaluated support as partly necessary (3.0) and necessary (4.0). They distinguish the support from the EU structural funds, State subsidies, relieves on local charges and corporate tax relieves, personnel trainings on favourable conditions, support from local municipal institutions, SMEs support funds, and preferential credits from commercial banks. SMEs distinguish as partly necessary support: loan guarantees, loan repayment, and information from information centres on SMB development under the conditions of Lithuania in the EU common market.

After analysis of support factors that had an effect on SMEs in 2010 (Fig. 6), one may notice that all factors were evaluated as partly positive. It is possible to distinguish the benefit of support to an SME and less beneficial support (2.6). The main obstacles (Fig. 6), which hinder the use of State aid, are: bureaucratic obstacles, lack of information, non-conformity of support to SMEs and SMB development under the conditions of Lithuania in the EU common market.

**Figure 5: Real evaluation of State aid (mean)**

**Figure 6: SMEs satisfaction with State aid in 2010 (mean)**

Exploratory results revealed that obstacles of financing have a direct effect on SMB development under the conditions of Lithuania in the EU common market. Conclusions and proposals for improvement of SMB development under the conditions of Lithuania are provided.

## CONCLUSIONS

1. The State and local municipal institutions must improve the efficiency of management and transfer the decision-taking and designing, their implementation at the level of local communities to the municipalities, with the better use of the EU support funds at the level of local national resources under the conditions of the EU common market.

2. The role of the State policy on SMB development is of special importance for establishing business priorities in the economic regions of the country, implementing the policy of business development in the regions and applying the EU priorities in terms of implementing equal opportunities for business development policy while rationally using all local national resources.

3. The main financial measures of the State policy on support, which today are used by SMEs, are the support from the EU structural funds, State subsidies, relieves on local charges and corporate tax, personnel trainings on favourable conditions, support from municipal SMB support funds and preferential credits from commercial banks.

4. The main obstacles, which hinder the use of State aid for SMB development in Lithuania are bureaucratic risks related to the receipt of support, lack of information, the quality of support for SMEs, professional skills in the provision of support, receipt of credits, prices for services provided by the banks and conditions for the receipt of the services.

5. After performance of statistical data analysis of SMEs activity and SMB development factors, it has been established that in 2010 SMEs in Lithuania represented 99.4%., large enterprises 0.6% percent of the total business environment, whereas in the total number of SMEs the major part belongs to very small enterprises with less than 10 employees, which in 2006–2010 constituted over 70% of all the SMEs operating in Lithuania.

6. SMEs in Lithuania created the major part of added value, in 2010 the added value created by SMEs accounted for 60%, whereas large enterprises created the remaining part, amounting to 40%, and that part is on the decrease with each year, but SMEs by their efficiency do not equal large enterprises, therefore the added value per employee in large enterprises is twice as much than the added value created per employee in SMEs.

7. During data analysis it has been established that SMEs evaluate the availability of financing as unsatisfactory due to high interest rates of credits and stringent requirements for asset pledges, complicated documentation and a long procedure of execution, this making a negative effect on the financial condition of SMEs, which increases the SMEs development risk.

# **THE VALIDITY OF THE EMULMENT ATTACHMENT ORDERS OBTAINED BY CREDIT PROVIDERS AGAINST CONSUMERS WHEN APPYING FOR A LOAN**

**Nkhangweni Jerry Malange**  
**Tshwane University of Technology, South Africa**

## **ABSTRACT**

*Since the beginning of our constitutional democracy, many consumers have applied for loans and the credit providers are exploiting the situation. When the consumers apply for loans, they are made to sign consent to judgement by credit providers and thereafter (credit providers) apply for default judgement and proceed with the attachment emolument order to deduct the monthly installment from the consumer's salary. This paper will examine the problems encountered by the consumers and the debt counselors during the debt review applications. The paper adopts research approach of literature review. The paper becomes more relevant, when one considered that hitherto, the research opinions of academics have not had much influence on the issue of the validity of the emolument attachment orders by credit providers when consumers apply for loans. This paper is concluded on the outcome of the research findings that if ever possible to do; section 58 of the Magistrate Act 32 of 1944 court should be amended (South Africa).*

## **INTRODUCTION**

The word “emoluments” basically refers to a wage or salary. An emolument attachment order is granted by the clerk of the court in the magistrate’s court. It grants the creditor the opportunity to receive weekly or monthly instalments from the debtor/consumer through a process of monthly deductions made from the debtor’s wage or salary by the debtor’s/consumer’s employer before the debtor receives such wage or salary. The debtor’s employer is obligated by court order to make such deductions, and in this instance is referred to as the garnishee-employer. The garnishee-employer pays the deductions directly to the creditor or his legal representative e.g. attorney.

Section 34(1)(b) of the Basic Conditions of Employment Act, 1997 states that an employer may not make any deduction from an employee’s remuneration unless the deduction is required or permitted in terms of a law, collective agreement, court order or arbitration. Section 34(4) of the same Act stipulates that an employer who deducts an amount from an employee’s remuneration for payment to another person must pay the amount to the person in accordance with the time period and other requirements specified in the agreement, law, in accordance with the time period and other requirements specified in the agreement, law, court order or arbitration award. The deductions must comply with these provisions.

The situation is different when dealing with government employees. In terms of Public Finance Management Act 1 of 1999 the employer can refuse the deduction if the emoluments attachment order would cause more than 40% of the employee’s salary to be subjected to deductions. This does not apply to employees in the private sector.

## **THE PURPOSE AND OBJECTIVES OF THE STUDY**

The objectives of this paper were:

- To make a detailed analysis of the processes for obtaining and dispersing garnishee orders.
- To identify the gaps/loopholes; finding solutions and recommendations;
- To conduct a literature review and the relevant legislation on the scale of the garnishment of wages and its potential risk areas for irregularities in South Africa.

## **LITERATURE REVIEW, CASE LAW AND LEGISLATION**

A literature study of the relevant legislation and procedural requirements for obtaining emoluments attachment orders by creditors at court, including competencies of courts and court officials was conducted. The relevant sections of the Magistrate's Court Act, 1944 (as amended), the National Credit Act, 2005, the Basic Conditions of Employment Act, 1997 (as amended), and the Public Service Act, 1994 (as amended) were examined. The Treasury Regulations of 2001 were also visited.

The procedures used for the enforcement of an emoluments attachment were examined by attending court proceedings where emolument attachment orders were applied for. This involved the studying of the legal requirements, duties and responsibilities, including legal relationships, of all stakeholders involved in the process. A number of relevant reports, academic articles, textbooks and sources from the internet were examined.

## **GUIDELINES ON HOW THE EMOLUMENT ATTACHMENT ORDERS SHOULD BE HANDLED**

There are guidelines developed by legislation, literature and reports and are summarized as follows:

### **The drafting, issue and service of emolument orders**

Section 65J(3) of the Magistrates Act 32 of 1944 provides an emolument attachment order is drafted by the creditor or his Attorney and signed by either the judgment creditor or his attorney and thereafter sent to the clerk of the civil court for issuing. The clerk of the court must also sign it. It should be served on the garnishee-employer by the sheriff of the Court in terms of the rules of the court. The issue of the jurisdiction is always ignored by both the judgement creditors and clerks of court. As a result, orders were issued by the wrong courts. Sometimes false orders are processed through fraudulent documentation forwarded to employers. In some instances, service is not made by the sheriff but by an agent or lay person. These are some of the incidences of undesirable practices relating to emoluments attachment orders in South Africa.

Many emoluments attachment orders perused contained alterations effected in pen. It was unclear whether these were effected before or after issuing of such orders and who was responsible for these alternations. In some cases, more than one judgement and/or more than one emolument attachment orders arising from the same debt were obtained. This is a duplication of orders on the same debt.

### **Requirements for obtaining emolument attachment orders**

Section 65(J) (2) provides that emoluments attachment orders may be granted in the following three instances:

#### **(a) Where the judgment debtor has consented in writing to the emoluments attachment order**

The consents can legally be obtained when the debtor arranges for payment or consents to judgment conditionally in terms of section 57, unconditionally in terms of section 58 or after judgment in terms of section 65.

In *Russells (Ceres) v Manyashe en 'n ander* 2005 (4) SA 380 (C) the Cape Provincial Division upheld an appeal arising from consent to judgment in terms of section 58(1) and consent for the granting of an emoluments attachment order.

The magistrate held that consent to emoluments attachment order could only validly be granted after judgment had already been granted. On appeal the high court held that the Magistrate's Court Act did not prohibit the debtor from consenting before judgment to an order for the payment of the future judgment debt in instalments and to the issuing of an emoluments attachment order in terms of section 65J.

Most clerks of court issue emoluments attachment orders without default judgements. Orders obtained by the creditors immediately after granting loans are void if default judgements were not obtained first.

## **(b) Where the court authorises it**

In terms of section 65(A) (1) of the Magistrate's Court Act 32 of 1944 a judgment debtor is by way of a notice in terms of required to appear in court where an enquiry into his financial position is held. The court may then make an order for periodic payments and authorise an emoluments attachment order. The judgment debtor may upon receipt of such notice make an offer of payment by way of periodic instalments coupled without an emoluments attachment order. The court may in terms of section 65E (1) (C) grant an emoluments attachment order. T

his means that an emolument attachment order obtained by the creditor immediately after granting a loan is invalid and can be rescinded by the court on application.

## **(c) Notice in terms of section 65(A) (2)**

If a written consent from the debtor or authorisation by the court is not obtained as referred to above, the judgment creditor or his attorney must first send a registered letter to the judgment debtor at his last known address advising him of the amount of the judgment debt and unpaid costs and warn him that an emoluments attachment order will be issued if the said amount is not paid within 10 days of the date on which the registered letter was posted.

Thereafter, the judgment creditor must file an affidavit or affirmation or a certificate by his attorney confirming the sending of such registered letter as well as setting out the amount of the judgment debt, the specific instalments due, costs payable from date of order, payments received and the outstanding amount.

This section cannot be applied for emolument attachment orders obtained by creditors against the debtors immediately after approving their loans.

# **GROUND FOR GRANTING DEFAULT JUDGEMENT IN THE MAGISTRATE'S COURT:**

## **(a) Failure to serve notice of intention to defend by the Defendant/debtor**

If the creditor/plaintiff issues summons against the defendant/debtor, the defendant/debtor must immediately after receipt of same enter appearance to defend the action against him/her. If he fails to do so, the plaintiff creditor is entitled to request default judgment within the prescribed period of five court days.

The clerk of the court may grant default judgment if the claim is for a liquidated amount, for example claims for the purchase price of goods sold and delivered. If the claim is for an unliquidated amount, for example claims for damages, the matter is referred to a magistrate for judgment. In the proceedings before the magistrate the plaintiff has to provide oral or written evidence in the form of an affidavit stipulating the quantum of the claim.

If the creditor and the debtor agree that the debtor will pay the approved loan by monthly instalment, he must do so without fail. If he defaults, the creditor may apply for default judgement against him. The creditor cannot grant a loan to the debtor and immediately apply for default judgement and emolument attachment order. If he does this, the order will be illegal and can be rescinded by the court.

## **(b) Section 58 of the Magistrates Court Act 32 of 1944 -Consent to judgment**

In terms of section 58 of the Magistrate's Court Act 32 of 1944, upon receipt of a letter of demand or summons claiming an outstanding debt, the defendant may give an unconditional written consent for judgment in favour of the judgment creditor. The Defendant/debtor provides his/her unconditional consent to judgment. The creditor or his legal representative may make an application to the clerk of the court requesting judgment for the debt amount and the cost of the summons or letter of demand. A copy of the demand, if there is no summons, should be brought with the application, along with the written consent of the judgment debtor. The judgment debtor may also consent to judgment for the repayment of the debt and agreed costs in specified instalments. The debtor may also at this stage consent to an emoluments attachment order. The method of the letter of demand followed by obtaining consent to judgment by the debtor and consent to an emoluments attachment order is frequently used.

Concerns were raised about credit providers utilising section 58 to obtain judgment against consumers without these consumers being afforded adequate protection under the provisions of the National Credit Act. There were also concerns that clerks of the Magistrates Court were simply acting as a rubber stamp in granting judgment without looking at the lawfulness of the credit agreement.

Section 58 of the Magistrates Courts Act (consent to judgment proceedings in the Magistrates Court) is a quick and cost effective method for credit providers to obtain a judgment against consumers. The main feature of the section 58 procedure involves consumers providing written consent to the credit provider applying for judgment against them.

In *African Bank Limited v Magistrate Myambo* and others case no.34793/2008 the court held that the commencement of the National Credit Act, 34 of 2005, did not repeal section 58 of the Magistrates' Courts Act, 32 of 1944 or render it nugatory in respect of debts to which the National Credit Act applies. In order to obtain judgment in terms of section 58 of the Magistrates' Courts Act, where the original cause of action was a credit agreement under the National Credit Act, a plaintiff must comply with the provisions of section 58 of the Magistrates' Courts Act and attach to the request for judgment (Form 5B) a true copy of the section 129-notice contemplated in the National Credit Act. Such a plaintiff must in the summons or letter of demand, as the case may be, deal with each one of the relevant provisions of section 129 and 130 of the National Credit Act and allege that each one has been complied with. It is not sufficient to make a general allegation that "section 129 and section 130 of the National Credit Act have been complied with".

The court further held that in cases to which the National Credit Act applies, clerks of the court may refer the request for judgment in terms of section 58 to the court in terms of rule 12(7) of the Magistrates' Courts' Rules. In many instances clerks of the court must refer such requests to the court, especially when they are uncertain as to whether the consumer has been given the full benefit of protective measures provided for in the National Credit Act. Where a plaintiff seeks judgment by consent in terms of section 58 of the Magistrates' Courts Act, magistrates are entitled to interrogate the application for judgment and in so doing they may require proof by a plaintiff of any fact or document pertaining to the underlying cause of action so as to determine whether a credit agreement under the National Credit Act is at issue.

Where a plaintiff seeks judgment by consent in terms of section 58 of the Magistrates' Courts Act, based on a cause of action arising from a credit agreement under the National Credit Act, magistrates are entitled to interrogate the application for judgment and they may require proof by a plaintiff of any fact or document so as to enable the court to determine whether the granting of the credit in question was an instance of the granting of reckless credit or not.

Where a plaintiff seeks judgment by consent in terms of section 58 of the Magistrates' Courts Act, based on a cause of action arising from a credit agreement under the National Credit Act and where it is alleged that the defendant is over-indebted, clerks of the court must refer the application to the court. In such a case, magistrates are entitled to interrogate the application for judgment and in so doing they may require proof by a plaintiff of any fact or document so as to enable the court to determine whether it should act in terms of the section 85 of the National Credit Act.

Where a plaintiff seeks judgment by consent in terms of section 58 of the Magistrates' Courts Act, based on a cause of action arising from a credit agreement under the National Credit Act, magistrates are entitled to interrogate the application for judgment and in so doing they may require proof by a plaintiff of any fact or document:

-so as to enable the court to establish whether the plaintiff is registered as a credit provider with the National Credit Regulator

-pertaining to the computation of the admitted debt .

This only applies when the debtor is in default. Some credit providers process the loan applications, approve them and thereafter obtain default judgements and emoluments attachments orders against the debtors without their knowledge. Such orders are void.

After judgment has been granted in the debtor's absence, the creditor or his lawyer should immediately inform the debtor of such order by way of registered mail. The creditors who obtain judgments against the consumer immediately after granting those loans do not inform them as they are supposed to do.

### **(c) Section 57 of the Magistrates Court Act 32 of 1944 -Consent to judgment**

The Defendant/debtor can give his conditional consent to judgment in terms of section 57. The Defendant/debtor may after receipt of a letter of demand or a summons admit liability to the plaintiff for the amount of the debt and costs claimed in the letter of demand or summons or for any other amount. In the event of the debtor failing to pay, the creditor may without further notice to the debtor apply for default judgment. Such request for default judgment is accompanied by an affidavit from the creditor, alternatively a certificate by his attorney confirming non-payment. This applies only in the event the debtor failed to pay the monthly instalments as per agreement or the order of the court.

### **(d) Where the defendant consents to judgment in terms of rule 11 of the Magistrate's Court rules**

The Defendant/debtor may in the prescribed form upon receipt of summons or after entry of appearance in order to settle the claim or part thereof; consent to judgement in terms of the Magistrates Court Rule 11. The debtor files the consent to judgment with the clerk of the court who then records the judgment on the file and this is not applicable to the debtors who applied for loans and pay instalments without fail.

### **(e) Failure by the party (either Plaintiff or Defendant) to appear at the hearing**

Rule 32(1) and (2) of the Magistrates Court Rules provides that default judgment can be granted against a party should he fail to attend a hearing or any other court proceedings personally or by way of legal representation. This is not applicable.

### **(f) Defendant fails to serve plea within the prescribed period**

This occurs when the defendant/defendant failed to serve his plea within the prescribed period after serving his notice of intention to defend. The creditor is required to serve a notice of bar in terms of rule 12(1)(b) on the defendant giving him five days to serve his plea, failing which he/she can apply for default judgment. The clerk of the court will grant default judgement. This is not applicable.

## **THE NATIONAL CREDIT ACT 34 of 2005 AND ITS EFFECT ON EMULUMENT ORDERS**

In terms of section 4 of the National Credit Act, the Act only applies to credit agreements between parties dealing at arm's length made within or having an effect within the Republic. The credit agreement is defined in section 8 as a credit facility, credit transaction, credit guarantee or a combination.

If an agreement qualifies as a credit agreement in terms of the Act, the general enforcement procedures are expanded in terms of the section 129 and section 130 of the National Credit Act.

This effectively means that it is expected that certain extra requirements must be adhered to before a credit provider/creditor may commence with enforcement procedures. Namely:

(a) Section 129(1)(a) provides that if a consumer is in default under a credit agreement, section 129(1)(a) states that the credit provider may draw the default to the notice of the consumer in writing and inform the consumer of certain rights that he has in terms of the Act. The credit provider must propose that the consumer refer the matter to a debt counsellor, alternative dispute resolution agent, consumer court or ombud, with the intention that the parties resolve any dispute or agree on a plan to bring the payments up to date.

This section states that the credit provider "may" bring the default to the notice of the consumer, and section 129(1)(b) states that a credit provider may not commence any enforcement proceedings before providing such a notice.

(b) In terms of section 130 of the Act, a credit provider may only approach a court for an order to enforce a credit agreement if the consumer is in default and has been in default for at least 20 business days and at least 10 business days have elapsed since the section 129 (1) notice was sent to the consumer. These two periods may run concurrently.

## CONCLUSION

In this regard, the study focused on the Magistrate's Court Act 32, 1944 and the Magistrate Court Rules as well as the National Credit Act 34, 2005.

The emoluments attachment orders obtained by credit providers against consumers immediately after granting them loans are legal if the consumers voluntarily signed written consents to judgments either in terms of sections 57 or 58 of the Magistrates Act 32 of 1944.

My findings and recommendations are as follows:

-Lack of basic financial and legal literacy skills and knowledge by consumers.

They fail to challenge defective or fraudulently obtained orders. The National Consumer Regulator is supposed to educate the public in terms of the National Credit Act but it is not doing enough.

-Irregularities regarding an abuse of processes by the creditors or credit providers and the clerks of court.

There is an abuse of judicial oversight and control by some clerks of the courts. Clerks of the court lack the necessary knowledge and skill to effectively and efficiently administer these orders.

- There are gross irregularities concerning consent to judgment by defendants/debtors. In many cases the debtors never signed consent to judgment even though judgment was granted. Some debtors sign by duress or misrepresentation by signing blank consents and incomplete documentation.

-Section 65J (3) of the Magistrates Act 32 of 1944 requires the emoluments attachment order to be served on the employer by the sheriff and is not served on the employee. The debtor will hear about judgment granted against him/her for the first time when he/she receives the pay slip from the employer. The need for amending this section is necessary so that the order can be served on both employer and the employee/debtor.

-There is a lack of statutory cap on amount to be attached. Regulation 23.3.6 in terms of the Public Finance Management Act 1 of 1999 caps the emoluments attachment to 40% of the state employee's salary. No such cap exists for debtors employed in the private sector. Caps are applicable in most European countries including the United States of America.

-The debtors are exploited by some creditors because they apply for default judgement and thereafter emoluments attachment orders immediately after granting consumers loans.

- They always ignore the issue of the jurisdiction. As a result, orders were issued by the wrong court, mostly for the sake of the collector's convenience frustrating redress. Sometimes false orders were processed through

fraudulent documentation forwarded to employers. Service is, in some instances, not affected by the sheriff but by an agent or lay person. These are some of the incidences of undesirable practices relating to emoluments attachment orders in South Africa.

-The manner of service of the emolument attachment order. In some instances, service is not made by the sheriff but by an agent or lay person. These are some of the incidences of undesirable practices relating to emoluments attachment orders in South Africa.

- In some cases, more than one judgement and/or more than one emolument attachment orders arising from the same debt were obtained. This is a duplication of orders on the same debt.

# **LEARNER PREGNANCY: THE LEGAL IMPLICATIONS**

**A Marais, SK Mokoena, MS Mukhola, A Mji, I Mokgobu  
Tshwane University of Technology, South Africa  
and  
CN Phiri, Venda University, South Africa**

## **ABSTRACT**

*In South Africa, as in a number of other countries, concern exists about the number of learners at school falling pregnant, and dropping out of school as a result of this pregnancy to have, and care for, the baby. This paper will investigate the legal issues surrounding learner pregnancy, in terms of schooling, access to social grants and pregnancy as a result of rape or sexual assault. The research methodology used will be a combination of qualitative and quantitative methods based on literature studies and questionnaires distributed to 387 learners in the Mpumalanga- and Limpopo provinces of South Africa.*

## **INTRODUCTION**

Teenage pregnancy is not an unusual occurrence in South Africa, especially under the poor black and coloured population of the country. The majority of learners falling pregnant are between 17 and 19 years of age. Statistics South Africa released data on teenage fertility in 2007 indicating that 54 teenagers out of one thousand fall pregnant. For most of these girls the pregnancy is an unplanned event, hugely impacting on their young lives. Even if the learner planned the pregnancy it often was an uninformed decision, which has an adverse effect on them.

Falling pregnant whilst still at school has various implications for the teenage mother. Many learners drop out of school after falling pregnant and giving birth to the baby. This negatively impacts not only on their future, but the future of their baby as well. In a country with a 25% unemployment rate it is extremely difficult for young people to find employment if they did not complete their schooling. A number of learner mothers do not return to school after the birth of the child because they feel they are discriminated against by their peers, educators and the community.

In a society still plagued by many people living in desperate circumstances of poverty, young girls often have to choose between their economic survival and their health. In these cases the learner will then trade sex for material benefits, such as food or shelter. In these circumstances, the female has no say in whether contraception is used, or even if she is a willing partner, or not. This creates an increased risk of teenage pregnancy.

## **RESEARCH METHODOLOGY**

This paper will make use of a combination of qualitative and quantitative research methodologies. Literature studies will be utilised to discuss the legal rights pregnant learners are entitled to. Relevant legislation, programmes and policies, which impacts on learner pregnancy will also be reviewed. Questionnaires were distributed to 387 female learners, with a median age of 18 years, in the Nkomazi region of Mpumalanga and the Makhado region of the Limpopo Province. The questionnaire included a section on biographical data, as well as

open and closed questions on different aspects of learner pregnancy, as this paper forms part of a discussion on the impact of learner pregnancy on various aspects of the learner's life, health, education, legal rights and relevant legal issues pertaining to the topic.

## PLANNED VS UNPLANNED PREGNANCY

It is important to determine whether the pregnant learner planned to fall pregnant, or not, as different legal implications exist for both instances. The vast majority of the learners interviewed indicated that they did not plan the pregnancy (figure 1). Nearly two thirds of the learners strongly disagreed with the statement that she planned to fall pregnant. Only a relatively small number of learners (12.9%) indicated that they actually planned the pregnancy.

**Figure 1: Frequency distribution in percentages to the question: I planned to fall pregnant**

## RELEVANT LEGISLATION

### Constitution of the Republic of South Africa, 108 of 1996

The Constitution of South Africa is the supreme law in the country, meaning all legislation, policies and programmes must meet the fundamental values on which the Constitution is based, namely equality, freedom and dignity. Section 9(1) of the Constitution expressly states that “*Everyone is equal before the law and has the right to equal protection and benefit of the law*”. Section 9(3) and section 9(4) further continues to name the grounds on which the state and any other person may not unfairly discriminate. Pregnancy is included in the list of grounds, together with sex, gender, marital status and age. Even though the highest law in the country provides for equal treatment of female, pregnant learners, the reality is that these girls often feel discriminated against, as indicated by their responses on the questionnaires. 27.5% of female learners felt strongly that their peers, in other word fellow-learners, discriminated against them because of the pregnancy (figure 2).

**Figure 2: Frequency distribution in percentages to the question: Other learners discriminate against me because of my pregnancy**

The inequality between men and women in the South African society becomes clear in the responses of the learners on whether the father experiences the same type of discrimination as the mother. Nearly 31% of the girls experienced more discrimination than the father as a result of the pregnancy (figure 3).

**Figure 3: Frequency distribution in percentages to the question: I experience more discrimination, because of the pregnancy, than the father**

In a largely Christian society falling pregnant out of wedlock is not the ideal situation, which leads to stigmatisation of the learner who fell pregnant. 28.4% of the respondents indicated that they feel stigmatised by the community as a result of the pregnancy (figure 4). Stigmatisation by the community also affects the learner's constitutional right to have her dignity respected and protected, as provided for in section 10 of the Constitution.

**Figure 4: Frequency distribution in percentages to the question: Learners who fall pregnant are stigmatized by the community**

The South African Constitution also includes, in section 29, the right of every person to basic- and further education. Any legislation or action by a governmental department, or school governing body, which forces a girl to leave school as a result of being pregnant, is unconstitutional and therefore void.

Section 12(1)(c) of the Constitution entrenches the right of all persons in the country to have security of the person, including the right to: "...be free from all forms of violence from either public or private sources". If a learner is raped, or sexually assaulted this is an infringement of section 12(1)(c) of the Constitution.

The right to social security is entrenched in section 27(1)(c) of the Constitution. Social security includes the right to receive social assistance from the South African government if a person is unable to support themselves and their dependants.

All these sections of the South African Constitution directly affect the life of a pregnant learner, as will become clear from the discussion on various pieces of legislation that was implemented to give effect to the South African Constitution as the supreme law in the country.

## South African Schools Act, 84 of 1996

**Figure 8: Frequency distribution in percentages to the question: I plan to continue with my schooling after the birth of the baby**

## Criminal Law (Sexual Offences and Related Matters) Amendment Act, 32 of 2007

UNICEF found in their 2006 Report that up to 40% of pregnancies in the age group 15 to 24 years are the result of forced sexual intercourse.

In South Africa, research conducted by the Medical Research Council estimates that there are an estimated 500 000 cases of rape occurring in South Africa on an annual basis. Only about 10% of these rapes are reported by the victims. Approximately 30% of adolescents reported that their first sexual encounter was in the form of rape or sexual abuse. Nearly 26 % of the learners interviewed for this paper indicated that their pregnancy is a result of rape (figure 9) to at least some extent, whilst nearly 30% of the girls felt that their pregnancy was a result of some other form of sexual abuse (figure 10).

**Figure 9: Frequency distribution in percentages to the question: The pregnancy was a result of rape**

**Figure 10: Frequency distribution in percentages to the question: The pregnancy was a result of sexual abuse**

To give effect to section 12 of the Constitution in which a person's right to live a life free from violence is entrenched, the Criminal Law (Sexual Offences and Related Matters) Amendment Act was introduced by the South African government. This legislation defines rape (in section 3) as: "*Any person ("A") who unlawfully and intentionally commits an act of sexual penetration with a complainant ("B"), without consent of B*".

Any person, including learners, who are the victim of a sexual offence, must report the incident to the South African Police Service (SAPS), in order to have the case investigated and the perpetrator brought to justice.

## Social Assistance Act, 13 of 2004

The Social Assistance Act was implemented by Parliament to give effect to section 27(1)(c) of the Constitution. With more than a quarter of pregnant learners indicating that access to the child support grant played some role in their decision to fall pregnant, or in the decision not to terminate the pregnancy, it is necessary to discuss the child support grant in more detail.

The primary caregiver (in most cases, the mother) of a child up to the age of 16 years, can access the child support grant if certain requirements are met, including the means test. From January 2012 the age restriction will include children up to the age of 17 years. As of 01 April 2011 the child support grant is R260 (approx. \$40) per child per month. This amount will increase to R270 per child per month, from 01 October 2011. Once the child support grant is accessed for a specific child, this child automatically qualifies for free basic education as well as free health care services.

Although this amount does not seem very high, it can make a big difference to a person living in extreme circumstances of poverty. For this reason it may look like a good idea to fall pregnant, for a young girl. The downside to this argument is unfortunately that many of the children born into poverty to access child support grants never have the opportunity to break the cycle of poverty.

The perception exists that many young girls from poor backgrounds fall pregnant deliberately to access the child support grant through the Department of Social Development. 24.5% of learners indicated that this was the case to a greater extent. 8.3% of the girls showed that access to the child support grant was to a lesser extent a motivating factor in falling pregnant (figure 11).

## CONCLUSION AND RECOMMENDATIONS

Although statistics indicate that learner pregnancy is decreasing there are still too many girls at school who fall pregnant, and thereby limiting future opportunities to improve their living standards. In a country that prides itself on the huge steps it took to overcome apartheid, various other forms of discrimination apply in society today. Pregnant learners experience one such form of discrimination in their communities, by members of staff at school and by their peers, as a result of the premature pregnancy.

The South African government put all the relevant legislation in place to afford pregnant learners the same opportunities as their counterparts who did not fall pregnant. The reality is that these pieces of legislation

do not seem to apply in the world of the pregnant learner. Although various intervention programmes to prevent learner pregnancy exist, the efforts by government and NGO's need to be escalated.

**Figure 11: Frequency distribution in percentages to the question: I decided to fall pregnant to get the child support grant**

Too many girls who fall pregnant whilst they are still pursuing their education feel the need to drop out of school to care for the baby, either due to a lack of child care, or because of the stigma that exists surrounding teenage pregnancy. The fathers of these children get off relatively scot free. Education on the consequences of premature pregnancy and the lack of completed quality education on the life of the pregnant learner is the only way in which this phenomenon may be curtailed. Learners who do fall pregnant must receive the support from their schools, peers and community they need to complete their education.

The fact that many girls fall pregnant because of rape and other forms of sexual abuse is worrying. The low number of reported rape cases against the actual presumed cases of rape indicates that the South African government needs to investigate the reporting procedures of rape incidents. If a girl indicates that the pregnancy is the result of a sexual offence the community must support her in bringing the perpetrator to justice. The pregnant learner must not be the one that carries the blame.

The phenomenon of learner pregnancy is negatively affecting the lives of too many young women. As a society, with the help of governmental structures, this issue must be addressed as a matter of urgency to allow these young women to reach their full potential.

# ARE GENE SEQUENCES PATENTABLE SUBJECT MATTER?

**Michael J. Maran, European Affairs Committee, USA**

## ABSTRACT

*The U.S. District Court has decided Association for Molecular Pathology v USPTO, 702 F. Supp. 2d 181 (2010). The question decided in the case: Are the BRAC1 and BRAC2 gene sequences patentable statutory subject matter? The sequences can be used to identify the presence of the specific mutations in the genes of a tested woman that correlate with a high risk of developing breast or ovarian cancer. The court held that gene sequences were not patentable under the products of nature doctrine. The decision should allow researchers to conduct basic or upstream research without the restrictions that are imposed by patents. The plaintiffs contend that prior law harmed patients by allowing the patentee to charge monopoly prices and prevent additional upstream research that could improve genetic tests and find new uses for the patented genes. The first section of my paper introduces the problem, the second section analyzes the product of nature doctrine under 35 USC 101, the third section discusses the problem of patent thickets which can arise when the United States Patent and Trade Mark Office (USPTO) grants to many gene sequence patents, the fourth section presents my proposal to add a new subsection (j) to 35 USC 271 to solve the problem of patent restrictions on basic research and the final section presents my conclusions.*

## INTRODUCTION

The U.S. District Ct. S.D., New York has rendered its decision in the case of *Association for Molecular Pathology v USPTO*, 702 F. Supp. 2d 181 (2010). The court decided that an isolated DNA (deoxyribonucleic acid) molecule which contains all or portions of the BRAC1 and BRAC2 gene sequence is not patentable subject matter under 35 USC 101. The court also held that the patentee's method claims were invalid. My paper will not discuss this aspect of the court's decision. A person's entire collection of genetic material is known as her or his genome. Every human cell contains a copy its genome in the form of structures called chromosomes which are made up of DNA. A DNA molecule consists of two long chains each made up of smaller molecules called nucleotides. A DNA sequence refers to the order of its nucleotides. A gene is a full-length DNA sequence that encodes or reads a complete protein. A molecule is isolated when it is removed from its naturally occurring environment. A gene sequence is a fragment of a gene and it consists of nucleic acid molecules whose sequence corresponds to a portion of the full-length DNA sequence. The fragments are called expressed sequence tags (ESTs) or single nucleotide polymorphisms (SNPs). Myriad Genetics Laboratories is the assignee of the challenged patents. Specific mutations in the BRAC1 and BRAC2 genes can dramatically increase a woman's risk of developing breast and ovarian cancer. The BRAC1 and BRAC2 gene sequences can be used to identify the presence of the specific mutations in the genes of the tested woman that correlate with a high risk of breast and ovarian cancer. An effective diagnostic test must use the full gene sequence. Myriad's patents are broad and there is no way of working around them because the gene sequences are unique to the human genome. The patents allow Myriad to be a monopoly provider of the full-sequence BRAC diagnostic test and to charge monopoly rents and limit access to the test.

## PRODUCTS OF NATURE ANALYZED UNDER 35 USC 101

A section 101 analysis consists of two steps. First the court determines whether the claimed invention constitutes patentable subject matter and second whether the claimed invention possesses utility. The court in *Association for Molecular Pathology* did not undertake the second part of the analysis because both sides agreed that the BRAC1 and BRAC2 gene sequence possessed utility. The inquiry regarding an invention's patentability

“...is a threshold inquiry, and any claim of an application failing the requirements of sec. 101 must be rejected even if it meets all of the other legal requirements of patentability. ...Sec. 101 states three requirements: novelty, utility, and statutory subject matter. ...Thus questions of whether a particular invention is novel or useful are questions wholly apart from whether the invention falls into a category of statutory subject matter.” It is a freestanding inquiry that is to be decided without reference to novelty and utility. Despite the wording of the statute, case law has held that novelty will not be considered in a section 101 analyses. The court found that the isolated DNA was not markedly different from DNA found in human cells and therefore it was an unpatentable product of nature. The decision revives the “products of nature” doctrine which was followed by earlier cases. The doctrine arises from the inherent truth that something cannot be new if it already exists in nature. “[M]ere purification of known materials does not result in a patentable product,” unless “the product obtained in such a case had properties and characteristics which were different in kind from those of the known product rather than in degree.” *In re Merz*, 97 F.2d 599, 601 (1938) (quoted in *Association for Molecular Pathology*). In *Funk Brothers v Kalo Inoculant*, 333 U.S. 127 (1948), the Supreme Court found that a mixture of six bacteria used to inoculate a wide variety leguminous plants were not patentable because “[t]heir qualities are the work of nature. ...[P]atents cannot issue for the discovery of the phenomena of nature. ...If there is to be invention from such a discovery, it must come from the application of the law of nature to a new and useful end.”

There have always been critics of the “products of nature doctrine.” Mr. Justice Frankfurter in *Funk* opined that “it only confuses the issue, however, to introduce such terms as ‘the work of nature’ and the ‘laws of nature.’ For these are vague and malleable terms infected with too much ambiguity and equivocation. Everything that happens may be deemed ‘the work of nature,’.... Arguments drawn from such terms for ascertaining patentability could fairly be employed to challenge almost every patent.”

The “products of nature” doctrine controlled until the Supreme Court decided *Diamond v Chakrabarty*, 447 U.S. 303 (1980). The court held that a genetically engineered strain of bacteria capable of breaking down multiple components of crude oil was patentable subject matter. The bacterium was human-made and did not exist in nature. The court compared the invention claimed in *Funk* with the invention claimed by Chakrabarty. “There, the patentee had discovered that there existed in nature certain species of root-nodule bacteria which did not exert a mutually inhibitive effect on each other. He used that discovery to produce a mixture capable of inoculating the seeds of leguminous plants. ...Here, by contrast, the patentee has produced a new bacterium with markedly different characteristics from any found in nature and one having the potential for significant utility. His discovery is not nature’s handiwork, but his own; accordingly it is patentable subject matter under sec. 101.” The Court also relied on the Committee Reports accompanying the 1952 Patent Act which indicated that Congress intended the statutory subject matter to “include any thing under the sun that is made by man.” The court maintained its fealty to existing law by stating that “it is well established that products of nature are not patentable.”

The decision, despite its fealty to the products of nature doctrine, was interpreted as a rejection of that doctrine regarding patentable subject matter. In *Amgen, Inc. v Chugai Pharmaceutical Co.*, 927 F. 2d 1200 (1991) the court found that a DNA sequence that existed in nature was patentable subject matter because it was “purified and isolated” from its naturally occurring counterpart. The reader should note that it was the U.S. Court of Appeals, Federal Circuit, and not the U. S. Supreme that rejected the products of nature doctrine. The Supreme Court has not changed its view in regard to the products of nature doctrine. “This Court’s precedents provide three specific exceptions to sec. 101’s broad principles: ‘laws of nature, physical phenomena, and abstract ideas.’ ...[T]he exceptions have defined the statute’s reach as a matter of statutory *stare decisis* going back 150 years.” *Bilski v Kappos*, 130 S.Ct. 3218, 3221 (2010). The product of nature doctrine was not an issue in *Bilski*.

The words “discover” or “discovery” does not mean the same as “invent” or “invention” as used in the Constitution and the early patent laws. An “invention” is a new creation that is consciously sought and successfully reduced to practice by the inventor. A “discovery” is the fortuitous finding of something new that already exists in nature. Thus, an ‘invention’ and a ‘discovery’ share the requirement that the inventor create something original; the difference between the two is that an ‘invention’ is consciously sought, while a ‘discovery’ is created unexpected. A discovery isn’t the subject of a patent. As stated *In Re Kemper*, “it will be found, by a careful perusal of the Constitution and laws of the United States upon the subject of patents for useful arts, etc., that it (discovery) is not there used in this sense, but always, always as synonymous with

invention.” No discovery will entitle the discoverer to a patent which does not in effect amount to the contrivance or production of something which did not exist before; or in other words, to an invention. A law of nature can be discovered but it can not be invented. When discovered, a law of nature may be utilized in an invention relating to patentable subjects, such as processes, machines or compositions of matter. It is the invention of one or more of these subjects, for the purpose of utilizing a law of nature, and not the discovery of that law, that may be rewarded with a patent.

Recital 16 of the Directive 98/44/EC of the European Parliament and Council of the European Union of 6 July 1998 [the Biotech Directive] states that the mere discovery of a human gene sequence cannot be patented. A gene sequence is not an invention. However, Recital 20 states that “...an element isolated from the human body or otherwise produced by means of a technical process, which is susceptible of industrial application, is not excluded from patentability, even where the structure of that element is identical to that of a natural element...” Article 3 states that “inventions which are new, which involve an inventive step and which are susceptible of industrial application shall be patentable even if they concern a product consisting of or containing biological material or a process by means of which biological material is produced, processed or used.” It is clear that the decision in *Association for Molecular Pathology* creates a difference between European and US law. The Biotech Directive’s requires the applicant to show an industrial application which means that the applicant must identify which portion or part of the protein is produced or what function it performs (Recital 24 of the Biotech Directive). The requirement limits the patentability of gene sequences. The Biotech Directive has been incorporated into laws of the member states.

The USPTO and European patent offices acknowledge that gene sequences are a natural phenomenon and that they are the body’s way of carrying information as to how proteins are to be constructed. However, extracting genetic information encoded by a DNA sequence is not just a matter of gaining knowledge about a natural phenomenon: it involves the use of cloning techniques to create an artificial molecule in such a way that it includes much the same genetic information as is to be found in the natural phenomenon. The scientific knowledge concerning the genetic information has been discovered through the creation of the artificial molecule. Without isolating and cloning a gene, it is not possible to identify the sequence bases of which it is comprised. The purified and isolated gene is new because it was not previously available in a purified and isolated form. Virtually all gene sequence patent applications submitted to the USPTO attempt to avoid the products of nature objection by claiming that the gene sequence is isolated and purified. The process by which the gene sequence was made can be patented. The isolated and pure molecule is a composition of matter and it can be reproduced outside its natural environment. Unlike the BRAC1 and BRAC2 gene sequence, the isolated molecule is used to treat rather than diagnosis a disease. The discovered genetic information is considered an invention and the product of human handiwork.

The plaintiffs raise the issue of patent thickets in *Association for Molecular Pathology*. The court doesn’t decide whether not patent thickets exist or whether they are having an adverse effect on research and the development multiplex testing kits. The plaintiffs cite the Cho study, “Effects of Patents and Licenses on the Provision of Clinical Genetic Testing Services,” *Journal of Molecular Diagnostics*, v 5(1); Feb. 2003, to support the existence of patent thickets and their adverse effects. The majority of genetic tests are offered as laboratory developed tests, rather than as downstream developed testing kits. Unless this trend changes, very few genetic test developers (i.e., only those creating kits) will be able to conduct developmental research on patents without being liable for infringement. Test manufacturers are eager to develop and clinicians are eager to use multiplex tests rather than single gene tests, to carry out genetic testing. These tests would be more efficient than conducting a series of individual tests. Patent claims on isolated genes and associated patent claims appear to have already created a thicket of intellectual property rights that may prevent innovators from creating these multiplex tests. Similar concerns arise when envisioning the clinical application of whole-genome sequencing. Patents on genetic discoveries do not appear to be necessary for either basic genetic research or the development of available genetic tests.

## PATENT THICKETS

Patent thickets or an anticommons could arise when multiple owners each have a right to exclude others from a scarce resource, and no one has an effective privilege of use. It is necessary to distinguish between

upstream and down stream inventions. In the context of *Association for Molecular Pathology*, the BRAC1 gene is an example of an upstream invention or research tool while a testing kit developed using the BRAC1 gene is an example of a downstream end product invention. Nearly 20 % of human genes are explicitly claimed as US IP [United States Intellectual Property]. Some genes have up to 20 patents asserting rights to various uses and manifestations including diagnostic uses, single nucleotide polymorphism (SNPs), cell lines and constructs containing the gene. By way of illustration, the BRAC1 gene has 12 assignees for 14 patents. Developing multiplex tests will depend on acquiring rights to multiple patents on genes. Negotiating licenses to all relevant patents would be expensive, and, under current law, there is little to prevent the holder of a needed patent from refusing to deal or from charging exorbitant rates. Even if all patent holders provide a reasonably priced license, the cumulative cost of multiple licenses could make products unmarketable. A substantial number of genes are protected by patents. Ownership of these patents is spread over a large number of assignees. The existence of so many patents protecting genes, spread among various assignees, creates a patent thicket which is a dense web of overlapping intellectual property rights that a company must hack its way through in order to actually commercialize new technology.

Prior to the passage of the Bayh-Dole Act of 1980 (35 USC 200-203) which allows universities to patent and license inventions that are the product of research funded with federal dollars to private sector firms, upstream inventions were customarily placed in the public domain. The goal of the Act was to facilitate the transfer of upstream technology that was developed with public funds to private firms who would then fund the development of downstream commercial products. Universities have taken the opportunity to file patent applications on basic research discoveries, such as new DNA sequences, protein structures, and disease pathways, which are primarily valuable as inputs into further research. The act does not distinguish between downstream inventions that lead to commercial products and upstream inventions that enable additional scientific investigation. Upstream researchers seldom sought to patent their inventions prior to the passage of the Bayh-Dole Act. Research followed a commons model in which the government sponsored upstream research and encouraged the broad distribution of the results in the public domain. Unpatented upstream inventions were freely incorporated in downstream products that diagnosed and treated disease. Researchers shared their information and published their findings in peer reviewed journals in order to gain the recognition of their peers and advance their academic careers. Upstream researchers did not concern themselves with patent infringement because it was assumed that patented inventions that were used for research, academic or experimental uses enjoyed a common law exemption from infringement. In *Madley v Duke University*, 307 F3d. 1351 (2002), the court characterized the exemption as the experimental use defense. "...[M]ajor research universities, such as Duke, often sanction and fund research projects with arguably no commercial application whatsoever. However, these projects unmistakably further the institution's legitimate business objectives, including educating and enlightening students and faculty participating in these projects." So long as the use of the patented invention furthers "the alleged infringer's legitimate business and is not solely for amusement, to satisfy idle curiosity, or strictly philosophical inquiry, the act does not qualify for the very narrow and strictly limited experimental use defense." The court held that there was no general research exemption that shielded academic researchers from infringement liability. The *Madley* decision has effectively ended the experimental use exemption as a defense for patent infringement by academic institutions.

Although the *Madley* decision in combination with the Bayh-Dole Act would seem to have created a perfect storm for the creation of patent thickets, patent thickets have not developed. Patents are not typically used to restrict access to the knowledge that biomedical scientists require. To begin with, few academic bench scientists currently pay much attention to others' patents. Only 5%...regularly check for patents on knowledge inputs related to their research. Only 2%...have begun checking for patents since the *Madley* decision. Patentees tolerate patent infringement by universities because litigation is costly, the risk of bad publicity is great and the risk of a court holding their patents narrowed or invalidated is high. It is not cost effective to sue academic researchers for infringement. Academic scientists have not changed their approach to research, delayed the completion of an experiment or abandoned a line of research because of patent infringement concerns. Research suggests that the law on the books need not be the same as law in action if the law on the books contravenes a community's norms and interests.

Patent thickets could be problem in the future because academic researchers display a lack of awareness or concern about the intellectual property (IP) right of others. The status quo could change dramatically as institutions become aware that they no longer enjoy protection from infringement liability and take more active

steps to raise researcher's awareness about the IP rights of others or even try to regulate their activity. Alternately, patentees aware that universities are no longer shielded by law from patent infringement liability could take active steps to enforce their IP rights. As scientists increasingly employ automated techniques to study the properties of many genes or proteins simultaneously, the burden on the investigator to obtain rights to the IP could become insupportable.

Upstream patents of gene fragments that are closely linked to human health and licensed to downstream private sector firms or laboratories affiliated with universities that provide DNA genetic tests are more likely to be aggressively enforced by patentees. Milred Cho conducted a telephone survey of 132 directors of laboratories that perform DNA based genetic tests. Seventy five percent of these laboratories held patent licenses; 65% had been contacted by a patent or license holder regarding the laboratory's potential infringement of a patent by performance of a genetic test, 25% had stopped performing a clinical genetic test because of a patent or license, and 53% had decided not to develop a new clinical genetic test because of a patent or license. Seventy one percent of directors of private sector laboratories versus 24% of directors of university laboratories reported that they had been prevented from performing a test.

## **ARE PATENTS NECESSARY?**

The traditional rationale for granting a patent is to impede the emergence of competition to some newly invented product and thereby provide the inventor with the potential to earn revenues by exploiting the invention himself or by granting a license so that another can exploit the invention. The inventor hopes that the earned revenues will be sufficient to allow him to recoup his investment and to earn a profit. Revenues will quickly disappear if free-riders can copy the invention. The government grants an inventor ownership of the invention for twenty years from the date that the patent application was filed in exchange for the disclosure of information about the invention in the patent application. This is the tradition patent bargain made between the government and the inventor. Gene patents embody information. The consumption of that information is nonrivalous. Once the inventor releases the information, he cannot prevent others from using that information whether or not they pay. Information will be under produced without patents. The patentee is not required to use or license the invention. If a patentee refuses to license the patented gene it would be an act of infringement for researchers to attempt to reproduce the patentee's original research or use the BRAC1 and BRAC2 gene sequences to search for new uses for the genes not identified in the original patent

The possibility of realizing profits provides a limited incentive to upstream academic researchers because most basic genetic research is funded by the National Institute of Health (NIH). [30] Although the Bayh-Dole Act encourages upstream researchers to obtain patents, the NIH recognizes that most patents won't yield revenues sufficient to provide a profit. The NIH awards research grants based on the rationale that the discoveries produced by upstream research will confer substantial social benefits that can not be internalized by the researcher. The NIH subsidizes upstream research because otherwise that research would not be undertaken and society would lose the social benefits conferred by that research. The possibility of realizing profits provides a limited incentive to upstream researchers working in the laboratory of a private company because the cost of that research is borne by the company and any inventions that result from that research are patented by the company rather than by the researcher.

Are patents necessary to develop genetic tests which are defined as DNA-based tests to predict or diagnose disease? Data from the already referred to survey conducted by Mildred Cho indicate that laboratory directors of clinical laboratories performing genetic tests think that gene patents hinder rather than facilitate genetic testing. Chou's finding here and elsewhere demonstrates that laboratories are able to quickly translate published data into clinical tests without the incentives provided by patents and that laboratories are stopped from performing tests after patents issue. (It usually takes two years for a patent to be issued after an application is filed with the USPTO. During the interval anyone is free to use the information revealed in the application). This suggests that patents are not critical for the development of an invention into a commercially viable service when the invention is the finding of an association between a genetic variant and a particular condition. Laboratory directors are of the opinion that gene patents have increased the costs both to laboratories and to patients. The result is that fewer laboratories are performing genetic tests which will lead to less test innovation

and less clinical research. Cost increases will also limit patient access. The opinions of laboratory directors are consistent with microeconomic theory which holds that monopolies raise prices and restrict output.

The European Patent Convention (EPC) provides a legal framework for the granting of a European Patent. A patent applicant who is seeking patent rights in all of the member states of the European Union can obtain those rights with the submission of a single application to the European Patent Office (EPO). The patent is automatically registered in each of the member states when it is issued with the exceptions of Spain and Italy. The European Patent creates a collection of national patents that are governed by the national laws of each member state. The national patent systems of each of the member states are not superseded and there is no guarantee of uniform treatment of the European Patent by each of the member states. The European Patent has the same effect and is subject to the same conditions as patents that are granted by the member states. Article 31 (a) (b) [Article 27 (a) (b) of the 1989 version] of the Convention for the European Patent for the Common Market 1975 (CPC) grants an exemption for “acts done privately and for non-commercial purposes” and for “acts done for experimental purposes relating to the subject-matter of the patented invention.” Despite the fact that the CPC has not entered into force and thus does not provide a legal exemption, the relevant language of Article 27 has been incorporated verbatim into most of the national laws of the member states. The Biotech Directive does not contain an experimental use exception.

## THE RESEARCH EXEMPTION

The problems that upstream researchers face can be addressed by adding a new subsection (j) to 35 USC 271. The new subsection will limit the reach of 35 USC 271 (d) (4) which provides that “[n]o patent owner otherwise entitled to relief for infringement or contributory infringement of a patent shall be denied relief or deemed guilty of misuse or illegal extension of the patent right by reason of his having...refused to license or use any rights to the patent...”

The text of the proposed subsection (j) reads: It shall not be an act of infringement to make or use a patented invention solely for the purpose of research, experimentation, academic or philosophical inquiry unless the invention is a research tool as defined by the National Institute of Health. It shall not be an act of infringement to conduct research on a research tool to improve it, investigate its properties including the validity and the scope of its patent, and create a new process or product including alternatives and substitutes for the research tool. It shall be an act of infringement to conduct research with a research tool to develop a final marketable product which may or may not incorporate the research tool unless the patentee grants a license. A patentee of a research tool used as described in the previous sentence shall not unreasonably deny a request for a nonexclusive license.

The problems that have been identified justify a reduction in the patentee’s right to exclude. Given that basic genetic research is largely funded by the federal government, the public has paid for a right of access to the inventions generated by that research. Denying access means that the public pays once for the research and then pays a second time in the form of higher prices and restricted output. Arguments that are made by proponents of drug patents are not relevant to the patenting of gene sequences. Large pharmaceutical companies argue that they need patents to attract capital to pay for the creation and testing of new drugs. Private investors supply the capital and it is used to pay the salaries of research and development (R&D) scientists, the cost of animal research, the cost of human clinical trials and the cost of obtaining FDA approval. None of these costs are incurred in the R&D of gene sequences.

The first sentence of the proposed amendment seeks to preserve the narrow *Madey* exemption. The NIH has defined research tools to include cell lines, monoclonal antibodies, reagents, animal models, growth factors, combinatorial chemistry, DNA libraries, DNA clones and cloning tools, methods, equipment and machines. 64 Fed. Reg. 72090, 72091 (Dec. 23, 1999). A measure of flexibility is added to the definition of research tools by allowing the NIH to define the definition because the definition of a research tool will change over time. The second sentence of the proposed subsection reflects the distinction drawn between experimenting “on” versus “with” a research tool made by Judge Pauline Newman, concurring and dissenting in part, in *Integra Lifesciences v Merck*, 331 F. 3d 860 (2003). A researcher should not have to ask the permission of the patentee to experiment on an upstream research tool because this frustrates the purpose of the patent law’s

required disclosure. Courts will have to draw the line between experimenting “on” or “with” a research tool because there is no bright line that separates the concepts.

The patentee will face difficult pricing decisions since the value of upstream research will be difficult to determine before it is commercialized. Should the patentee charge a licensee a large upfront payment or a minimal payment coupled with a reach-through licensing agreement to receive a royalty based on sales or usage of a downstream product created with the upstream research? The amount of potential revenues that a patentee can claim will depend on the scope of his patent. The patentee and the licensee will have to find common ground regarding the probability of successfully commercializing upstream research. While startups prefer exclusive licenses because they are seen by venture capitalists as the best way to generate revenues, nonexclusive licensing is necessary to prevent the harm to patients described in *Association for Molecular Pathology*. There, patients were denied coverage by insurance companies because of the high cost of Myriad’s diagnostic tests and its exclusive license also meant that patients were unable to obtain a second opinion. These are issues of life and death for the patient. The NIH recommends that “whenever possible, non-exclusive licensing should be pursued as a best practice.” This should be of less concern in the European Union because Recital 35 of the Biotech Directive states that human diagnostic methods are excluded from patentability. Unfortunately, there is no implementing article.

The value of a patented research tool will not be destroyed by the proposed subsection’s nonexclusive licensing requirement; however, the prospect of competition will lessen the ability of the patentee to earn a monopoly rent. Venture capitalists will still be able to earn normal profits which should provide sufficient incentives to develop and disseminate new commercial products. The first firm to obtain a nonexclusive license will also benefit from first-mover and learning-curve advantages. A nonexclusive license makes the research tool widely available and encourages downstream development. An exclusive license can prevent nonlicensees from improving and discovering new uses for upstream basic research. This can be a problem because an applicant for a patent need not disclose or know every use of his invention (35 USC 112). Uses discovered by licensees and third parties are automatically included in the applicant’s claim. *Regents of the University of California v Eli Lilly and Company*, 119 F.3d 1559, 1569 (1997). The USPTO can minimize this problem by granting patents of limited scope.

The authority of the federal government to grant patents is derived from Article 1, section 8, clause 8 of the Constitution. It reads, “To promote the Progress of Science and useful Arts by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries.” “Science” refers to copyrightable subject matter while “useful Arts” refers to patentable subject matter. However we choose to define “invention” and “discovery,” it is clear that the purpose of a patent is to encourage invention and discovery. The Constitution did not create a financial instrument that would be used to raise capital in order to produce and exploit inventions.

The Supreme Court’s decision in *Merck HGAA v Integra Lifesciences*, 545 U.S. 193 (2005), has expanded the exemption of 35 USC 271 (e) (1) to include drugs and the use of patented compounds in experiments that are not ultimately submitted to the FDA. Lower courts have yet to determine the boundaries of this decision.

The United States has signed the Agreement on Trade-Related Aspects of Intellectual Property (TRIPS) which does not define invention. Signatories have considerable freedom to determine what should be deemed an invention and to exclude from patentability any substance that exists in nature. Would the proposed subsection (j) violate TRIPS? Art. 27.1 provides, subject to some exceptions that, “patents shall be available and patent rights enjoyed without discrimination as to the...field of technology.” The intent of this article was to prevent the exclusion of patent protection for certain type of patentable subject matter (i.e. drugs, agrochemicals and foodstuffs). Article 30 provides that “members may provide limited exceptions to the exclusive rights conferred by a patent, provided that such exceptions do not unreasonably conflict with a normal exploitation of the patent and do not unreasonably prejudice the legitimate interests of the patent owner, taking account of the legitimate interests of third parties.” The proposed subsection provides limited exceptions to the exclusive rights conferred by a patent for upstream inventions and accommodates Art. 30’s three prong test. The parameters of the test will have to be defined by the courts. The third prong of the test permits the interests of third parties, including

patients, to be considered. When interpreted against the backdrop of the legislative debate and other proposals, it seems likely that it [Article 30] was intended to allow exceptions for infringements conducted for: (1) private, non-commercial purposes; (2) research; (3) experimentation for testing and improvement; and (4) educational purposes.

TRIPS' Article 27.3 (a) allows diagnostic tests to be excluded from patentability. The courts should take advantage of this article to eliminate one of the harms to patients identified in *Association for Molecular Pathology*. Article 27.2 allows signatories to deny patentability of a particular invention on the grounds that it is contrary to the public interest (*ordre public*). It is in the public interest to deny patents to gene sequences because such patents restrict upstream R&D and deny patients access to diagnostic tests.

The language of Article 30 tracks the language of article 13 which addresses limitations or exceptions to the legitimate interests of the right holder. Article 13 states, "Members shall confine limitations or exceptions to exclusive right to certain special cases which do not conflict with a normal exploitation of the work and do not unreasonably prejudice the legitimate interests of the right holder." Article 13 has been interpreted to include a fair use exemption. The courts should incorporate the fair use exemption of copyright law into Article 30. Fair use in copyright law turns primarily on the degree to which the use is transformative. Its incorporation would introduce copyright's transformation test into patent law. A use that is transformative would allow an accused infringer to defend by arguing that his research has added something new to the patented invention. Some type of patent fair use is not only permissible but also expected under TRIPS. The introduction of a fair use exemption into American patent law would be a major change and its boundaries would need to be defined by the courts.

## CONCLUSION

Gene sequences are discovered or invented by automatic sequencing machines that require little human effort. The discoveries are a product of nature. The discoverer seldom knows the utility of his discovery. Isolating and purifying a gene does not change its biological information. It is simply copying it into another format. It is hard justify the granting of patents to such discoveries. The status quo restricts access of some patients to diagnostics tests because insurance companies refuse to pay monopoly prices. Patients can not get second opinions. Patents restrict the development of downstream products. Patent thickets can be a problem. The Constitution provides the federal government with the authority to issue patents. The purpose of a patent is to encourage invention and discovery. The Constitution did not create a financial instrument that would be used to raise capital in order to produce and exploit inventions. Adding a new subsection (j) to 35 USC 271 can change the status quo.

# AUSTRALIA-CHINA AND STERN HU: COLD WAR, CORRUPTION OR COOLING OF RELATIONS

**Bruno Mascitelli, Swinburne University of Technology, Australia**  
**Mona Chung, Deakin University, Australia**

## ABSTRACT

*China's economic growth over the last decade has been spectacular. Australia has been a beneficiary of this Chinese growth especially in terms of China's demand for resources and the strength of Chinese exports. Pundits even suggest that Australia avoided the global recession as a result of this trade relationship. Trade relations between Australia and China have resulted in China becoming Australia's key trading partner. The arrest and imprisonment in 2009 of four Rio Tinto executives (including Stern Hu the head of Rio's operation in China) based in China case has raised fears of posing a strain on this vital economic relationship. Moreover China's inability to takeover of Rio Tinto and the significance and consequences of this incident are at the core of this paper. This paper asks whether these events reflect the uncertainties of doing business in China or whether they demonstrate China's sovereign right to enforce anti-corruption legislation. While China has embraced the international business community, the consequences of the arrest of Stern Hu has placed pressures on the Australian-China trade relations which may go beyond normal country to country tensions.*

## INTRODUCTION

In July 2009, four Rio Tinto executive were arrested by the Chinese government for allegations of bribery and stealing state secrets. Stern Hu, the head of the Anglo-Australian miner's Shanghai office, and three of his Chinese colleagues, Wang Yong, Ge Minqiang and Liu Caikui were sentenced on the 29<sup>th</sup> of March 2010 to ten, fourteen, eight and seven years prison respectively. The four were convicted of accepting bribes totaling about \$US14 million and stealing trade secrets throughout the period of iron ore negotiations between the China Iron and Steel Association (CISA) and Rio Tinto (Mcdonell, 2010).

The arrest of the Rio Tinto executives occurred after Rio rejected an offer of \$US20 billion from the state owned Chinalco and the collapsed iron ore negotiations ("Timeline" 2010). The charges were supported by the confiscation of inside information and data which Stern Hu and others had in their possession on Chinese Steel Mills which was interpreted as a threat to China's national security. News of the arrest and later the trial of Stern Hu ultimately involving Australian companies and executives produced media frenzy in Australia. A brisk and firm Australian government response took little time to arrive. To raise the tension level, Australia complained about the trial being closed to the public. Australia's Prime Minister challenged the Chinese government stating 'The world will be watching how this particular court case is conducted' (Dodd 2010). It fed into the resurfacing of 'jingoistic' fears of China of once upon a time which had been expressed some months earlier by the opposition finance spokesman Barnaby Joyce soon after Chinalco made an offer to takeover Rio Tinto. Joyce stated:

'The Australian Government would never be allowed to buy a mine in China. So why would we allow the Chinese government to buy and control a key strategic asset in our country? Stop the Rudd government from selling Australia.' (O'Brien 2009).

The case has raised fears of posing a strain on the vital economic relationship between Australia and China. China's Foreign Affairs ministry was taken aback by the campaign emerging in Australia in Stern's defense and warned Australia against 'politicising' the trial over the court's decision to hear the charges of infringement of commercial secrets in a closed courtroom session. With the trial ended the spotlight is back on China's desire to secure access to its resources for its surging economy. This incident also draws attention to the

extent that China cannot allow market forces to totally determine its commercial relationships. Specifically Australia, the beneficiary of China's thirst for resources, and the home of the mineral giants Rio Tinto and BHP have tried to shift blame and focus of this incident away from themselves and on to the Chinese political and legal system. One need ask if we are replaying Cold War tensions, or is it a scenario of the uncertainties of doing business in China. Corruption is at the centre of the arrests deeply involving Australian firms, resources and ultimately the Australian relationship. What will be the impact of these events on this special relationship?

The aim of this investigative paper is to offer a critical analysis of the strategic significance of these events. Specifically the two areas are examination are impact on firms doing business in China and second the Australia-China relationship. China is a relatively new player in capitalist trade and its adherence to the market principle is unique and contradictory. The Chinese Communist Party is the ultimate power and while many commercial operations will take place independently, when they come to a sticky end, often the Party's firm hand will come to the fore. While acts of corruption and industrial espionage are at the fore of these events, do they simply cloud over greater events occurring in the relationship and the exchange between the Chinese and Australian firms? Can a deal gone wrong like this one make the corruption accusation simply a front for deeper and more far reaching matters of principle in the background?

## **DOING BUSINESS IN CHINA**

On the whole China has been an enormous beneficiary of economic globalisation within the global economic system. Since the mid 1990s, Beijing has promoted China on the global stage and welcoming to foreign businesses. Beijing's message has been that its political values will not dilute the existence of a rule-of-law environment within which foreign businesses operate. For the most part, especially in the low-technology manufacturing and export industries, this remained true.

However doing business with China has not been an easy task which has been discovered by many international MNCs (multinational corporations) after heavy financial losses. One of the major challenges has been the cultural differences and hence the impact of such differences on its business practices. The first and the very fundamental difference is its economic system. China has 'a market economy with socialist characteristics'. This is a unique system with a centrally planned fiscal system administrated by the central government with aspects of a 'free market economy'. This unique structure is difficult to comprehend by firms and organisations especially those which come from well established market economic structures abroad (Chung 2008). However, cultural differences are often hard to comprehend as they are less tangible compared to technical and marketing issues. Corporations without culturally-suited strategic planning usually end up paying huge costs for failures that result (Chung 2008). To draw a medical analogy; all seems well on the outside, because culture lies under the skin, but it remains at the heart of everything and can bring the whole system down because of a massive heart attack (Chung 2010).

The lack of understanding and transparency of the Hu's case increased fear among executives and observers that the risk of doing business in a country with a huge market but at the same time close ties between the ruling Communist Party and the State authorities. Some foreign companies at the forefront of advocating closer political and economic engagement with China in order to get a slice of the pie could soon change their minds. It certainly has raised the questions among foreign companies whether the arrests might indicate that regulatory, protectionist and the political environment in China is changing and possibly becoming difficult for foreign companies to see the advantage of continuing to invest in China.

At the same time, the Chinese government re-iterated that Hu's arrest was not politically motivated or related. It was their insistence that illegal activities, including corruption would not be permitted while conducting business in China. Moreover the reaction of Chinese business community as a whole on this matter and the media reaction towards Hu is important. Hu is in the category of that of many Chinese who went overseas and did well and as such found themselves assisting foreign companies. In some cases the media used the description of 'traitor' to describe him and illustrate a dissatisfaction of Chinese working for foreign firms. Is there any element of the 'red eye' syndrome (envy and jealousy) one would ask (Chung 2008).

In short, doing business in China is a challenge for all international organisations. The complication of its political and economical system together with the different way of doing business in China makes all

transactions multi-dimensional therefore careful assessments of situation and capacity to handle these business transactions with the Chinese way are crucial for doing business in China.

## **RIO'S RELATIONSHIP WITH CHINESE**

Cultural differences influence the interpretations of the goals of the negotiating parties which may differ dramatically from their actual goals. For instance, when the Chinese make gestures to Westerners that they cannot agree to certain things because, the outcome may result in the Chinese losing face. If the Westerners do not understand the significance of this cultural nuance, the negotiation process may be jeopardised or experience difficulties. A real example of this situation was the negotiation of the iron ore prices in 2006 between Rio Tinto and BHP and Shanghai Bao Steels and other Chinese steel mills. Historically, the international iron and steel market has been self regulated in a way that once the leading suppliers and purchasers negotiated and agreed to an international market price, it is to flow on to the rest of the market. Up till most recently, Japanese and European steel mills have been the larger and/or largest steel purchasers. Earlier in 2006 the world's biggest iron ore producer, CVRD a Brazilian company won a price increase of 19 percent with European steel mills for 2006-2007 contract prices. This flowed on to contracts signed with both CVRD and Rio Tinto with Japanese steel mills in May 2006 of a 19 percent price increase (Wyatt 2006).

China was furious after the announcement of the news. Having become the biggest steel producer, consumer and iron ore consumer in the world, China found itself in a politically face losing position that they have failed to perform the role of the largest purchaser in the world in leading the price adjustment. Worse still was China's loss of face to the Japanese. By the 18th of May 2006, China was in a difficult situation. BHP, Rio and CVRD went on to negotiate with the rest of the world steel mills to secure 57 percent of the world market with a 19 percent price increase in order to force China into a corner to agree to the price increase. By the 29th of May, China, however, was hinting the possibility of opting for the spot market price in order to save face (Wyatt, 2006). China was finally forced back on to the negotiation table and signed the contract for the agreed rate of increase in price in June. After the signing of the contract, Chinese media launched a major campaign denouncing Australians as the 'evil capitalists' who were taking advantage of the Chinese and its rapid economic development. This has caused major set backs for the relationships between Chinese and Australian iron ore producers.

The 2009 negotiation is almost a repeat of 2006. Since Stern Hu's arrest, the negotiation has collapsed and China is currently paying the spot market rate. This is causing a great deal of uncertainty for the Chinese steel industry.

One other cultural character of the Chinese is their long-term memory especially on insults and hurt feelings. There is a Chinese saying 'A gentleman's revenge is not late even if he has to wait for 10 years.' The Australian negotiators might have won their negotiations in 2006, and have forgotten about the glory in 2009. Chinese will not (Chung 2009). Will the Australians be getting the quantity and the price they need to keep the economy at a manageable rate is yet to be answered.

If we had the magic to reverse the globe like we do in movies, the companies should have sought for advice on the cultural understanding of 'the face issue'. The entire negotiation could have been handled very differently to avoid the negative publicity and still achieve the desired results. One Chinese official remarked that such actions violated international rules and conventions, he said: 'This will not be helpful in building long-term and stable cooperative relations between suppliers and buyers' (Chen, 2006). The China Iron and Steel Association also suggested that 'negotiating rules' were broken during this year's price discussions and a 'stable long-term co-operative relationship' was clearly not built well enough by the Australian producers (Freed, 2006). What was most humiliating to the Chinese was the loss of face rather than the price increase. Australian negotiators often puzzled by the fact that Chinese negotiators might bargain so hard on the price in a negotiation and then sign a contract with a different company with a higher price. Bargaining of price sometimes may be the smoke screen for the Chinese attempting to tell the Westerners of other problems, often it is an issue of lose face (Chung, 2008 p. 53).

Though China joined the WTO in 2001 and has only over the last three decades encouraged inward investment into its own country, it has seen fit to not allow this openness to be an invitation to act with

unnecessary aggressiveness by western powers and economies. In many respects the Hu incident is merely an opportunity for China to remind Rio who is in charge of this relationship in their own country (Chung 2009). However, the unique market situation has created opportunities for Hu and his colleagues to engage in illegal activities. Rio entered the Chinese iron ore market in 2001. From 2003, the market changed from a seller's market to a buyer's market. Rio enjoyed a large portion of the Chinese iron and ore market. Previously, large steel mills such as Bao Steel and Capital Steel would negotiate and purchase iron ore from Rio and then on going to sell to smaller steel mills at double the price. To some small steel mills, they might only gain access to iron ore through third-hand transaction ("胡士泰受贿案揭钢铁巨鳄黑根原" 2010).

## **AUSTRALIA'S RELATIONSHIP WITH CHINA**

Australian relations with China were established in late 1972 after decades of Cold War standoff. The last decade, primarily through the resources boom and the strength of Chinese exports, trade relations with China have been strong. They were further strengthened with the election of a mandarin speaking Prime Minister, Kevin Rudd in 2007.

Though the incident over the Stern Hu arrest has brought out bad habits of the past in Australia and appears to have continued the stalemate of the Free Trade Negotiations between China and Australia, (Callick, 2010) the two countries have nonetheless reached even greater trade achievements in the past 12 months. In late 2009 (four months after the arrests), it was announced that China had overtaken Japan to become Australia's biggest trade partner. Trade between the two countries in 2008-09 reached a staggering \$A76.3 billion (DFAT 2009). Australia shipped \$A22 billion in iron ore alone to China in 2008-09, or approximately 42 per cent of Chinese iron ore imports (DFAT 2009). In 2009 China purchased \$53 billion of iron ore last year – the equivalent of both Japan and Korea's total purchase. This relationship is delicate and dependable (Chung 2009).

The Australian Minister of Trade, Simon Crean, warily highlighted that the trial and confessions of the Rio Tinto executives would have no impact on Australian trade relations with China nor on Australia's resource trade with China or sensitive iron ore sales negotiations (Callick 2010). The Minister stated: 'If there were links you would have expected the trade had fallen, yet last year China became our largest trading partner. The two matters are separate (Taylor & Regan 2010).

This line has also been maintained consistently by the Chinese government. A constant message that has been sent by the Chinese government to the foreign companies was that they are welcome to do business in China. They are also welcome to enjoy profits however it must be based on legitimate conduct. The judge presiding over Hu's case, Justice Liu Xin, said the four men had seriously damaged the competitive interests of Chinese steel companies. He said their actions forced Chinese steel companies into an unfavorable position in price negotiations and this led to the collapse in iron ore price negotiations in 2009 (McDonnell 2010). The irony in all of this is that Kevin Rudd is the first Prime Minister to speak Chinese which he has flaunted during the lead up to his election and after in government. He even referred to himself as a Chinese business consultant before being elected (Chung 2009). At the same time, the Australia-China political relationship is at its historical low since the 1970s.

## **IMPLICATIONS FOR BUSINESS**

The fact that parts of the trial was behind the closed doors and the rejection of Australian government representatives' participation relating to the commercial secrets allegations makes foreign businesses feeling uneasy. The argument of transparency and uncertainty for those doing business in China has increased. Australian opposition Foreign Affairs spokeswoman Julie Bishop expressed that this is an issue of great concern to many companies from Australia and also from around the world (McDonnell 2010) however no government official has ever been able to identify exactly what the concern is.

Exactly what is the implication for business is a matter of debate between the Chinese government and Western businesses. Perhaps companies should first carefully examine their business conduct in China first before defending their positions like the case in Hu's situation. Rio's executive Sam Walsh defended Hu and his colleagues soon after their arrest stating 'our employees have acted properly and ethically' (Rio Tinto 2009).

Evidence that millions of yuan in bribes had been stuffed into bags and boxes for the accused was heard in court in March 2010 during the trial (Tang 2010). Hu also took money from small private steel companies, which before the global financial crisis were locked out of buying iron ore from Rio because the mining giant prioritised large state-run steel companies according to Mr Jin, Hu's lawyer (McDonnell 2010).

According to the Chinese media, Mr Du, the former head of Shangdong-based Rizhao Iron and Steel group, claimed he paid the Rio employees millions of dollars for preferential treatment in the area of iron ore (Xinhua 2010). Soon after the guilty verdict declared for Stern Hu and his three colleagues, Rio terminated their contracts (Rio Tinto 2010). In Australia, under the Criminal Code Amendment (Bribery of Foreign Public Officials) Act 1999, bribery is subject to maximum penalties of imprisonment for ten years or a fine of up to \$66,000 or both. Corporations can also be liable where their employees, agents or officers commit offences while acting within the scope of their employment. The penalty for a corporation which commits an offence can be as high as \$330,000 (Chung, 2009). To date, no one has asked the question whether Rio had knowledge of their ex-employees misconduct and whether Rio should be accountable for their actions in this incident as well as its China based employees.

The Chinese media has argued that in China Hu's case was non-political. The Chinese legal community highly praised the Chinese government on being able to keep its political and commercial activities separate and believed that the legal process was fair and proper. According to one source, China's legal practitioners were very pleased how well the Chinese government conducted the case (Tang 2010).

## CONCLUSION

China's engagement with the world community has been one of the key geo-strategic developments of the last decade. Moreover China's 'two system' nature, a development of the mid 1970s has been the driver of the insertion of China as a business player. Many nations and the western capitalist system however remain uncertain how to relate to this different reality. This has without doubt created uncertainties in terms of conducting business and relating to China. Another consequence has been the insistence from China that they will not allow their open country for business with lesser respect than that accorded to western nations. The events surrounding the Hu Stern case has allowed China the opportunity to send a message of enforcing anti-corruption laws meant not be taken lightly by western nations. A new protocol for relating to China has been sought and with all likelihood this incident which will first and foremost affect Australian trade with China. It will in our view not be the last.

# **GROUP LENDING: A MECHANISM FOR DELIVERING FINANCIAL SERVICES TO THE POOR HOUSEHOLDS: LESSONS FOR SOUTH AFRICA**

**Polly Mashigo**  
**Tshwane University of Technology, South Africa**

## **ABSTRACT**

*The provision of financial services, particularly credit, is expensive due to asymmetric information, collateral constraints and high transaction costs. Using data from developing countries, I find evidence of numerous theoretical models/mechanisms that consider group lending as a social technology of overcoming these barriers. Joint guarantees, collateral substitution, peer pressure, monitoring, mutual insurance and emergency fund are used to explain the success of group lending mechanisms. The paper compares the effects of group lending and social clubs in South Africa where poor people use social connections, trust and reputation to improve informational and enforcement advantages over formal lending. Random sampling was employed to draw a sample of five social clubs in the Soshanguve informal settlement where unstructured personal interviews were conducted to propose several principles of lending that improve the delivery of financial services.*

## **INTRODUCTION**

Formal financial institutions in South Africa focus on transaction costs, asymmetric information and collateral constraints to ration credit and enforce contracts. Nearly half of all South Africans live below the poverty line, the equivalence of \$1 per day and are unable to access credit (Bernier et al 2005; Wilson 1996; The World Bank 2008; Johnson and Rogaly 1997; Meagher and Wilkinson 2001). While such people were estimated at 57 % by Schwabe (2004), Southern African Regional Poverty Network [SARPN] (2008) estimates 8 million of them of the total 44 million of South Africans. However, given the \$1 poverty line, the argument here is that there are no indications of the degree of poverty, that is, how severe poverty is among the poor households when there is no money at all. A dollar a day in itself does not really describe the level or extent of poverty. Certainty about a dollar each day makes one to be better off than a dollar a day that is received in a very erratic and uncertain way. The absence of \$1 over a period of time provides uncertainty about future prospects and makes it impossible for the households to smooth consumption and insure vulnerability to shocks. Such shocks can only be insured by borrowing though at high costs which result to lower consumption and vulnerabilities. These costs become absent when the households are certain that the dollar is received on a continual basis. It is in this context that Whiteford and McGrath (2000) explain the poverty line to denote the financial requirements of members of a family if they are to maintain consumption, health and education and secure food to deal with shocks. They continue to live in poverty when their level or condition of poverty endures over a period of time due to lack of even a \$1 and they are unable to improve their circumstances over time or to sustain themselves through difficult times.

The poor households' illiquid nature of their assets which result in the absence of collateral, asymmetries of information and high transaction costs prohibit the financial institutions from delivering financial services to these households. The households therefore become uncertain about future prospects and unable to smooth consumption, develop their small businesses and/or mitigate the effects of shocks such as illness and death. This may, in the long run, amplify the poverty cycle. The social security assistance or handouts the poor households receive from the government in the form of social grants such as disability, child support grants, old

age pension grants, grants in aid for orphans and the terminally ill, and donations are also not sufficient enough to protect them against the shocks or sustain their livelihoods. These handouts, according to Yunus (2009), take away a sense of responsibility and initiatives from the households and make them economic prisoners who are unable to effectively provide minimal subsistence means for their families or smooth consumption. Theoretical models or mechanisms in Bangladesh, Indonesia, Ghana and Kenya embrace group lending as a possible alternative for lenders to overcome information asymmetries, collateral constraints and high transaction costs and also a mechanism to provide credit (and savings) to the poor.

The paper resumes by discussing asymmetric information, collateral and transaction costs which play an important role in financial contracts between lenders and borrowers. It proceeds with an analysis of group lending as a mechanism used by countries such as Bangladesh, Indonesia, Ghana and Kenya to deliver credit to the poor. Similar mechanisms that are equal in nature and character such as social clubs that operate in the poor communities in South Africa are also explored to determine the principles of lending used to smooth consumption and mitigate shocks. Conclusions and recommendations are provided at the end of the paper.

## **Research Objective and Methodology**

The objective of this paper is to determine how group lending can be used as an essential mechanism for the development of sustainable low-cost credit to assist the poor to improve their living standards in general and sustain their livelihoods. Using data from Bangladesh, Indonesia, Kenya and Ghana, I find evidence of numerous theoretical models/mechanisms that consider peer group lending as a social technology of overcoming the problems of high transaction costs, physical collateral and asymmetric information. These advocates believe lenders overcome these by harnessing social connections and using joint guarantees, collateral substitution, peer pressure, monitoring, mutual insurance and emergency fund (compulsory savings), capture the idea that social connections of shared locality successfully improve credit contracts in the poor communities. These successful practices can be instrumental in developing specialized lending mechanisms for the poor people who have been marginalized by the formal financial institutions in South Africa.

Comparison is made between group lending and social clubs that exist in the poor communities in South Africa and which also use social connections to deal with barriers to financial service delivery. However, these social clubs are not recognized or considered by formal financial institutions as far as credit contracts are concerned. The comparison seeks to establish the principles of lending that the poor use to cater for their day-to-day needs and mitigate shocks. Evidence is presented in this paper that these social clubs, if carefully considered in South Africa, can be used as the first point of reference to deal with collateral constraints, asymmetric information and high transaction costs as in the countries alluded to above. To establish the operation of these social clubs, fieldwork was conducted between March and July 2009 in the Soshanguve township situated about 35 kilometres North of Pretoria in the Gauteng Province of South Africa. Although the township is well established with a large permanent residential component, there exists an equally substantial informal residential component comprising mostly of the households living on the margins of unemployment and poverty. The findings were based on the primary data which was obtained in the informal settlement through interviews and audio tape recorder as data gathering techniques. Unstructured personal interviews which elicited descriptive data were first conducted with the five presidents of the five social clubs to guide explanations and discussions and thereafter with 50 members, 10 from each social club. Each social club composed of around 25 and 30 members respectively. The clubs were selected through random sampling since the population is homogeneous. The sample is representative of the population in the area. Several visits to the clubs were made to establish a rapport and trust relationship with the members. Access to the social clubs was gained through a relative who happened to be the president of one of the social clubs who then introduced other clubs and/or members. Interviews were first conducted separately with the presidents at different times and thereafter with the selected social club members. Interviews were also recorded on the audio tape recorder and thereafter transcribed for more formal analysis. Data analysis took place while the interviews were still underway as well as at the end of the interviews. A comparison has also been done to discover the connections between themes and finally integrate these themes and concepts into a theory that will offer comprehensive and accurate interpretation of how the social clubs operate in supporting credit contracts. The clubs constitutions/rules were also made available for scrutiny.

# ASYMMETRIC INFORMATION, COLLATERAL AND TRANSACTION COSTS

Information (about the borrower) plays a central role in the delivery of financial services, particularly in the provision of credit. The information intensity of financial contracts regarding the assessment of various systemic events underlies the importance of the distribution of information among the parties acting in the financial sector. Financial institutions, because of their incentive and ability, play a significant role in supporting economic development and improve the living standards of the poor households. Access to credit (or cash) is central in economic life to decrease exposure to shocks and to smooth consumption (Keynes 1936; Tobin 1958). The absence of information about the behaviour and character of the borrower leads to asymmetric information which is the main concern of the providers of credit. Asymmetric information is defined by Mishkin (1999; Teixeira 2001-03) as a situation in which one party to a financial contract has more or better information than the other. In such situations, the ignorant party may look for signals from the informed party, and this can lead to a variety of outcomes. Asymmetric information, therefore, hampers decision-making in financial contracts. There are limitations on human knowledge or lack of information particularly in the short-run to make informed decisions. The critique associated with Stiglitz and Weiss (1981) emphasises the existence of problems of asymmetric information and costly enforcement. This means that it becomes difficult and costly for the credit providers, particularly banks, to acquire information about borrowers. The lack of information and collateral, therefore, lead to high transaction costs of extending credit. This makes it difficult for financial institutions, especially banks, and borrowers to conduct lending and borrowing activities when the relevant information which is required is not available. If a bank possesses knowledge that permits accurate predictions to be made about the risk status of borrowers, then the accuracy of this prediction should be reflected in differential lending practice to low- and high-risk borrowers. Banks do not know with certainty, which borrowers will, and which ones will not repay their loans.

Adverse selection and moral hazard therefore contribute to an increase in asymmetric information and hamper rational decision-making. Without the information on prospective borrower's ability to invest loaned funds, or their creditworthiness, a situation may arise where a bank (lender) may choose a risky borrower. Bone (2003) points out that due to this lack of information, the particular characteristics of borrowers are unknown to the banks. This is referred to as adverse selection. The ignorant party lacks information while negotiating an agreed understanding of or contract to the transaction. Adverse selection occurs before the financial transaction takes place, when potential bad credit risks are the ones who most actively seek out a loan, for example, those who are the most likely to produce an undesirable or adverse outcome are most likely to be selected as borrowers (Mishkin 1999; Akerlof 1970).

Moral hazard may be defined as actions of economic agents in maximising their own utility, and where they do not enjoy the full benefits of their actions due to uncertainty and incomplete or restricted contracts (Baye and Jansen 1995). Incomplete contracts mostly arise in situations where the transaction costs of achieving complete contracts are too high relative to the return envisaged in enacting the contract. The ignorant party lacks information about the performance of the agreed-upon transaction or lacks the ability to retaliate for a breach of the agreement. A good example is when people are more likely to behave recklessly if insured, either because the insurer cannot observe this behaviour or cannot effectively retaliate against it by failing to renew the insurance. Moral hazard issues, therefore, arise between banks (lenders) and borrowers because their interests are not necessarily compatible. There is a tendency to take riskier decisions if protection from losses is guaranteed, and the possibility that individuals who are in debt will change the effort that they put into making the project successful and/or the type of project they undertake, for example, by changing the riskiness of the project (Mishkin 1999). The lender is thus subject to the hazard that the borrower has incentives to engage in activities that are undesirable from the lender's point of view, that is, activities that make it less likely that the loan will be paid back.

Collateral plays an important role in banks' exposure to loss. Collateral serves as a guarantee for the lender or bank for taking the risk in case the borrower will default in that it decreases the amortization period of and loss on the loan. When insolvent, the borrower is said to default on the loan, in which case the lender becomes the owner of the collateral (Banerjee and Newman 1993). The need for collateral as mechanism to decrease probable loss from especially first time borrowers provides constraints for the lender to serve the credit

needs of the poor households who do not have collateral or valuable assets that can be used to secure credit. This makes most of the formal banking products and distribution channels unsuitable to the needs of the majority of the poor households in South Africa. The poor households need small and regular loans randomly but the banks/financial institutions prefer to deal with periodic large loans (Schoombee 1998). The pricing of small loans therefore requires significantly higher rates than typical commercial lending products because of client characteristics and the relatively small size of transactions. The banking services are costly and have a complicated mix of charges, withdrawals and transaction fees. Pricing financial instruments like credit to reflect their full cost and providing reasonable return to the bank is essential for any bank operation. The poor's financial environment seems to be flooded by insolvable contradictions resulting in excluding them systematically from formal channels of credit (Greenwood and Jovanovic 1990; Banerjee and Newman 1993).

## Group Lending Mechanisms for the Poor: Findings and Discussions

In the presence of problems of asymmetric information, lack of collateral and high transaction costs, financial institutions may be dominated by risky and non-risky borrowers. This provides insight on how group lending can be used as a point of departure to overcome these problems. Borrowers differ in the likelihood that they will default and it is costly to determine the extent of the risk. Borrowers who are high risk or potential bad credit risks are more likely to take loans and most likely to produce an undesirable or adverse outcome. As the interest rate increases, there is a high probability of default (Hoff and Stiglitz 1990). Group lending may enhance the likelihood that borrowers undertake the actions desired by lenders and limits the consequences of information asymmetries. In forming groups, enforcement costs are low because of peer social sanction. An incentive of group lending is that social selection homogenizes the group, that is similar types, for example, non-risky members group together to ensure loyalty and trust (Hoff and Stiglitz 1990). Their selection is based on creditworthiness and commitment of members. Their probability of default will be low as they will be jointly liable to repay the loans which will result in expected gain.

Countries such as Bangladesh, Indonesia, Kenya and Ghana use innovative mechanisms of group lending aimed at reducing poverty through credit granted to borrowers who comprise small groups (Wilson 1996). Bosch (2002; Mashigo 2007) define group lending as a process whereby individual loans are disbursed to small group of borrowers who are collectively responsible for loan repayment. Group dynamics provide insurance against default at a relatively low cost. Bangladesh, through its Grameen Bank (GB), popularized a group lending model where community members voluntarily form small groups (Johnson and Rogaly 1997; Rahman 1997) which are informal in nature and used as social technology to access credit and mobilize savings. The GB was established from the lessons drawn from informal financial institutions that lend money to poor groups. Considerable evidence shows that the Grameen Bank used unconventional banking practice to lend money to the poor with a reasonable degree of financial self-sufficiency and repayment rates (Rahman 1997). The GB has been successful in using *collateral substitute*, referred to as social collateral (Conlin 1999) through the creation of a specialized banking system based on mutual trust, accountability, participation and creativity. In this case, credit is granted to borrowers who comprise small groups while using *joint-guarantees*. All members of the group are held responsible for repaying the loans (Bosch 2002). If one member defaults, all in a group are denied subsequent loans (Rahman 1997). According to Karlan (2007) a lender can benefit from *peer pressure* which is exerted by group members on each one to repay loans. Conlin (1999) uses the term *peer monitoring* as a borrower who agrees to pay the lender an amount owed by another borrower who defaults on a loan. However, a borrower who pays the loan may impose social penalties on the one who defaults and in this case the probability of loan repayment increases. Peer monitoring compels the borrower not to choose a risky project and the lender realizes high return on the safe project. The enforcement problem is solved by strict screening of members because of the perfect and comprehensive knowledge they possess about each other (Karlan 2007; Bosch 2002). Groups improve social ties and relationships and these relationships serve as *mutual insurance* (Conlin 1999) and there are also threats such as social sanction for defaulting. One of the important and effective mechanisms of a group is the use of *collateral substitute*. In this case, the Grameen Bank requires the group (as borrowers) to make monthly contributions to an *emergency fund* (forced or compulsory saving) which becomes insurance in cases of default or serves as substitute for or becomes collateral for the bank for taking the risk in case the loan will not be repaid. This reduces the asymmetric information problem and thus transaction costs of acquiring information about borrowers. Some of the successes of the GB were felt in Kenya, Indonesia and Ghana.

Kenya also considered the development of mechanisms of assisting the poor to access financial services and fashion its financial system in a group lending method where the formation of small groups was encouraged and which improve social ties and relationships. The groups started to hold compulsory weekly meetings where financial needs (how to access savings and credit) were being discussed. This socialisation mechanism binds groups together for a special purpose which is to contribute small amounts into a pool as savings (Kenya Rural Enterprise Programme Group, undated on-line). The Kenya Rural Enterprise Programme (K-Rep) was therefore established in 1984, and in 1987 it became a non-governmental organisation working in both rural and urban areas. The purpose of K-Rep was to facilitate poverty alleviation by developing mechanisms and institutions that enable the poor people to organise their lives financially. As in Bangladesh, groups *co-guarantee* repayment using the savings as substitute for collateral for accessing credit (Ghatak 1999; Murdoch 1999). If a member defaults, such a member forfeits all savings inclusive of interest earned. If insufficient, the group that the borrower belongs to forfeits an equivalent amount of the savings. If it is still insufficient, the member's pledged items are sold to recover the loan. Furthermore, and for sustainability purposes, a group of between 5 and 10 members with a common need from one locality must be registered and preferably operate a small enterprise/business and must be willing to open a joint bank account with K-Rep Bank. One of the requirements of K-Rep is that a group must operate its small business for at least a year where regular savings is contributed to the account before credit can be granted. A joint bank account is operated with a minimum balance equivalent to 10 percent of the loan amount to be borrowed for developing their businesses and cater for other needs. The group is collectively responsible over the performance and repayment of the loan (Kenya Rural Enterprise Programme Group, undated on-line). Additionally, in supporting the groups, Kenya has developed community credit and savings programs by providing training to group members on loan management and financial discipline.

Indonesia and Ghana also considered and encouraged the formation of small groups in their communities to meet the credit needs of the poor by creating *rural and/or semi-rural banks* to deal with perceptions of high risk, high transaction costs, low returns and asymmetric information. Indonesia uses the *savings-first- approach*, a mechanism similar to that of Bangladesh and Kenya before credit can be granted to any group. The savings is used as security for loans. None of the rural banks in Indonesia have a status imposed or controlled by the central bank. These rural banks organise their own funds transfer and develop training programs to equip the poor who constitute groups with the necessary financial skills. Some rural banks adopted an approach such as that of rural Islamic banks which focused on compulsory savings and credit is accessed with no interest. A substantial share of the group savings is deposited in long-term accounts for sustainability purposes (Ghatak 1999). These rural banks systematically disburse approximately 80 percent of their assets in the form of loans and expand the financial market by offering credit and using the saving as collateral (Wilson 1996). The banks made it possible to optimise supervision and monitoring efforts and achieve economies of scale with respect to training and technical support services for the poor group members. The rural banks in Indonesia placed more emphasis on development programs for the poor where operating procedures were simplified and strict lending rules were amended and relaxed as a result of increase in savings. This provided the opportunity for even the poorest households to access credit. For financial viability, and in dealing with the risk of loan default, village/rural authorities were made to share responsibility for compliance with the terms of loan contracts. In this case, village authorities and community groups establish relationships where financial matters and problems are discussed (Wilson 1996).

In Ghana, the rural banks operate as informal financial agents called the bank-susu collectors who act as mobile bankers (Jones et al 2000) and regularly visit the groups in their communities to collect savings. These groups are known as susu groups (Embassy of Ghana 1997). The successes of their systems are that these mobile bankers are able to take deposits that are often of low but regular value on a daily basis from susu groups over the course of a month after which the accumulated savings are returned to the group but keep one day's amount of savings as commission. As savings collectors, these banks are characterised by a large client base, large individual deposits, and high annual aggregate value of deposits. The banks also advance loans to their regular depositors which are usually low value, very short term (one month) and which are provided on an interest-free basis and no collateral is required and the loans are disbursed immediately upon request (Jones et al 2000). Advancing loans to regular depositors deals with the problem of asymmetric information because business is conducted with regular clients whose behaviour and character are known.

## SOCIAL CLUBS AS LOW-COST INSURANCE AND SUPPORT MECHANISMS IN SOUTH AFRICA

There exist similar lending mechanisms, as in the countries discussed above, in the poor (black) communities in South Africa in the form of informal groups known as social clubs which serve as insurance and support mechanisms for the poor. They seem to be efficiently structured to reduce the problems of asymmetric information, lack of collateral and high transaction costs. The paper attempts to determine, out of the factual data on international best practice of peer group lending alluded to above, the principles of lending used by social clubs as sustainable mutuality mechanisms on which to base the provision of credit to the poor. The main aim of these social clubs is to pledge mutual support to their members through the development of *social capital* as a principle for sustaining social clubs. Social capital has become a popular innovation for dealing with information asymmetries such as adverse selection, where banks cannot screen the risky borrowers from the non-risky and moral hazard, where the banks cannot monitor the behaviour of borrowers (Seibel and Torres 1999). Social capital is a network of trust, respect, reputation and reciprocity for improving a neighbourhood or investments in social relations by individuals to gain access to financial resources (savings and credit) (Seibel and Torres 1999). The social clubs operate as rotating credit and savings associations which contribute money to members on a weekly, fortnightly or monthly basis depending on the type of a social club.

The types of social clubs that have been found to exist in the poor black communities such as Soshanguve informal settlement include those that provide credit as well as savings to the households in order to bridge the effects of financial, economic and social shocks like funerals, deal with food insecurity, expensive events as well as day-to-day expenses. It was found that most of the clubs operate as *funeral/burial clubs*. It was also found that all of the households are members of funeral clubs and they revealed that monthly contribution made by the club members amounts to R50 (\$6.67), and in case of death of a member or family member, a lump sum of money is made available to the bereaved family to cover funeral expenses. The respondents mentioned that majority of them do not qualify for formal insurance schemes and as such the funeral club serves as an insurance scheme in cases of shocks like death in the family. A fairly large number of the social club members (68 percent) who were interviewed are also members of *kitchen/food clubs*. These households, who mostly consist of women, make informal arrangements in the form of kitchen or food clubs where they accumulate enough money to counter food insecurity or to buy food as well as household utensils. It was also found that most members, who are single female parents, support and raise their children. Each member contributes R30 (\$4) on a monthly basis with an objective of purchasing food or kitchen utensils on a rotational basis. The importance thereof is that purchases made are cheaper because food is bought in bulk at the end of the month or fortnight and each member is entitled to food (groceries) and/or kitchen utensils of a certain amount as stipulated by members themselves.

Of the total number of members who were interviewed, it was found that only 28 percent were members of *entertainment social clubs* which help them to cope with predictable but expensive events such as marriages (and/or birthday celebrations) that they cannot avoid. They mutually agree to make a monthly contribution of R30 (\$4) and when a member or family member is getting married (or it is his/her birthday), a lump sum of the contribution is used to buy food and refreshments for those who will be attending the event. Some of the money which was not used is also utilised for other purposes such as providing for education expenses for some parents who cannot afford to pay school fees and other school related expenses like books and uniforms for their children. If there is a pressing need for money, members agree among themselves to make money available to a member who is urgently in need of it. The accumulated amount which was not spent during the year helps the members to cater for end of the year festive season expenses that they would not have been able to afford (Mashigo 2007).

The important principle which was found to be playing a pivotal role in these social clubs was *socialisation*. It is a norm in the poor communities that social club members socialize through weekly, fortnightly, or monthly meetings (as in Kenya) as stipulated in their club constitution or rules to discuss financial matters and other related issues. These are flexible and simple rules or constitutions formulated by the club members themselves and according to which the club operates, that is, how much and when to contribute, for whom and when the benefits will be realized. This implies member control and *mutual monitoring* over the activities of the clubs as is the case with Ghana where rural banks are owned and managed by communities. The

information obtained from the respondents was that the constitution encourages members not to skip any financial contribution as this will result in, for example, non-payment in the case of death in the family. However, respondents emphasized that violation of the rules does not normally happen because of personal relationships, trust, loyalty and reputation among members. Any member who is found to be violating the rules is banned from the club. The members know that they depend entirely on the clubs in case of financial distress and, therefore, adhere to the set rules. Respondents mentioned that none of them would want to be seen by others as irresponsible or be banned from the club and therefore adheres to the loan agreements. They do this to maintain reputation, respect and trust in their own communities. Karlan (2007; Conlin 1999) point out that social technology is molded by and founded on specialized mechanisms that ensure continued trust and adhering to the rules of the game results in predictable behaviour. The principles further facilitate ongoing coordination and cooperation between members (cohesion and solidarity) for continued long run individual and mutual benefit, and living by rather than obeying the rules of the game.

These social clubs, given the support and consideration commensurate with their significance in reducing poverty and the problems of transaction costs, asymmetric information and collateral, can be used as a first point of reference when designing credit instruments for the poor households in South Africa. The financial contributions that the club members (group) make are a form of savings mobilization which can play a significant role in accessing credit.

## **Conclusion and Recommendations**

This paper provides an alternative explanation where some developing countries use group lending as a social mechanism of overcoming asymmetric information, collateral constraints and high transaction costs which prohibit the provision of financial services, especially credit, to the poor. It becomes difficult for formal financial institutions in South Africa to evaluate the actual risk and profitability of an investment project because they lack crucial information that borrowers may or may not disclose. The absence of such information increases transaction costs. Collateral constraints exacerbate the risk and without which there is no compensation for the lenders in case the borrowers default on the loans. It is in this context that the financial institutions are unable to serve the credit needs of the poor households. Lessons can be learnt from the major financial achievements in countries such as Bangladesh, Indonesia, Ghana and Kenya which use numerous mechanisms that consider group lending to overcome the barriers to the delivery of financial services to the poor. Cohesion and solidarity among group members, no matter the social technology (rules) involved, needs certain mechanisms that are critical to support the mutualism needed for insuring specific risk by specific behaviour (to act in terms of the rules) in financial transactions between members. The predictable behaviour makes it possible to hedge specific risk at low-cost and enables them to smooth consumption and sustain themselves. Mechanisms such as joint guarantees, collateral substitution, peer pressure or peer monitoring and emergency fund embedded in groups are used by these countries to explain the successes of group lending.

Peer monitoring has been proven to be an important mechanism used by groups to reduce moral hazard because it allows a group to know who can or cannot repay the loans. This cannot be done by formal financial institutions (or banks). Groups know that when an investment project fails, there is zero return. Compulsory saving is an effective mechanism that improves access to credit and reduces default rates. This savings serve as an effective collateral substitution for the poor for accessing loans. This is making the need for liquid assets as collateral obsolete. The Indonesian and Grameen Bank models use this as substitute for collateral where groups are forced to save money before loans are disbursed. Once the group defaults, then the savings serve as compensation for the lender.

Similar lending mechanisms in the form of social clubs have been found to exist in the poor (black) communities in South Africa and which seem to be effectively and well-structured to deal with financial constraints and that serve as support mechanisms for the poor. The pooling of social capital, an important principle used by social clubs, is a way of insuring knowledge of and information on members. Contributions made by the social club members in the form of savings play an important role of mitigating the effects of shocks like death (funeral clubs), and deal with food insecurity (food clubs) as well as catering for other financial needs (entertainment) or day-to-day needs. The savings makes it possible to advance credit, with no interest charged, to club members who experience financial difficulties. The successes of the social clubs are that

comprehensive and near complete information on the creditworthiness of borrowers prevail in a social clubs in which members belong. The provision of credit (or savings) is facilitated with a great deal of certainty on what future performance of the individual in group context is going to be.

The problem in South Africa is that these social clubs are not considered or recognized by formal financial institutions in credit contracts due to their informal nature of their operation. The institutions require valuable assets or physical collateral that can be used as security for loans which many poor people do not have.

If these social clubs can be carefully considered and supported, they can be used as a first point of reference design credit (and savings) instruments for the poor households in South Africa. Their spontaneous origin, development and existence and high propensities to save for precautionary purpose provide fertile ground for a mechanism that minimises costs.

In view of the above, it is recommended in this paper that South Africa carefully considers successful international lending practices through *group lending mechanisms* that have shown and proven beyond doubt that the problems of collateral, high transaction costs and asymmetric information can be dealt with in an effort to improve the provision of financial services/credit to the poor households and to assist them in improving their living standards in general.

It is equally important that financial institutions, authorities and policy-makers in South Africa establish relationships and linkages with social clubs and study their operation in comparison with mechanisms of group lending used in Bangladesh, Indonesia, Ghana and Kenya to create a conducive environment to establish rural banks that are able to make savings and sound credit judgements because of the knowledge they will have possessed on the local community groups in dealing with asymmetric information problem and enforcement of credit contracts. It is also crucial that South Africa encourages the establishment of mall groups in other poor areas which can be used, taking into consideration, the principle of *social capital* and/or savings to improve the delivery of financial services. Social clubs, through social connections, long-term relationships, reputation and trust have proven to decrease the transaction costs in their environments and help to remove the need for collateral when credit is advanced to a member because credit is available without interest. These minimize defaulting because members are close to and know each other very well and reduce the transaction costs of extending credit.

It is further recommended that South Africa carefully consider the adoption of *collateral substitution* mechanism in the form of compulsory savings (emergency fund) as demonstrated by Indonesia, Bangladesh and Kenya which is necessary to reduce poverty and improve access to financial services. Collateral substitution has been proven to be sustained by peer pressure, peer monitoring and social ties and relationships which serve as mutual insurance as seen in the narrative of data on group lending. The same mechanisms are applicable in social clubs. Obligations, norms, trust and long-term relationships embedded in the relations between members of a group can be used to ascertain predictable outcomes, individual gain or smooth consumption, risk averse behaviour in the group and collective gain for the group instead of using formal financial structures and mechanisms.

Of importance for South Africa, is to consider and take into account the informal rules or constitutions which social club members formulate and according to which the clubs operate when by-laws are to be created or banking laws reformed.

Finally, group lending mechanisms as well as social clubs, if given the necessary support and consideration by the government, financial authorities and other stakeholders in South Africa, can be used as a first point of reference to reduce transaction costs, remove the need for collateral and deal with asymmetric information which deter the provision of financial services to the poor households.

# INTELLECTUAL CAPITAL TOOL

**Florinda Matos and Susana Rodrigues, ,Polytechnic Institute of Leiria,  
Portugal**

**Albino Lopes, Technical University of Lisbon, Portugal**

**Nuno Matos, ICAA - Santarém, Portugal**

## ABSTRACT

*In the past, the organizations capital was easy to identify since it considered only its material characteristics. However, the current economy is experiencing a new phase in which the intellectual capital although immaterial, intangible, difficult to define, has become a new asset, which should be managed. Empirical research, previously concluded, identified a set of parameters for auditing intellectual capital management and confirmed the audit model – ICM - Intellectual Capital Model (Matos and Lopes, 2009). This paper Attempts to summarize the results of research conducted in 1107 Portuguese SMEs considered "SME leader" and has as objective to validate the ICM parameters. This paper also contributes to enhance the discussion around the value of organizations intangible assets.*

## INTRODUCTION

In the new paradigm, intellectual capital, seems to assume increasingly the role of principal asset of companies. It is this capital that allows information to be transformed into knowledge that can provide competitive advantage for organizations.

The multidimensional nature of intellectual capital has led to the emergence of many definitions, which are often unclear. Thus, according to this research, intellectual capital is an intangible element, resulting from interactions involving the expertise of each individual in the organization. This element is formed by the wealth of expertise of the employees, by their level of qualification, their experience, their level of information and by their readiness to evolve in the acquisition of knowledge - that is, by their individual talents. Intellectual capital management must verify if each individual is applying their knowledge for the benefit of the organization.

In the case of small and medium-sized enterprises (SMEs), the problem of intellectual capital management appears to be more complex because, normally, it is very difficult to measure and manage intangible assets, which, combined with the scarcity of resources, undermine competitiveness. Therefore, it is necessary to create reliable and accessible tools in this field.

Thus, intellectual capital management, in a form which is able to be audited and certified in order to control the quality and dynamism of the knowledge generated in the organization, will enable the partner organizations (customers, suppliers and lenders) to determine the capacity for innovation, and verify the conformity of their management parameters, compared to a reference standard.

Based on the ICM - Intellectual Capital Model (Matos and Lopes, 2009)., we developed a methodology that allows auditing the intellectual capital management.

The survey instrument used was a qualitative questionnaire, which will provide supporting information for the audit model.

The questionnaire was administered to a sample of 1107 Portuguese SMEs considered the “PME Líder”( SME leader), the best SMEs based in Portugal, in 2010.

This classification is awarded annually by IAPMEI - Portuguese Agency for SMEs and Innovation.

The “PME Líder” companies are proposed by one of seven major banks in Portugal and must obey certain criteria. These companies, in various sectors of activity, evidenced by the quality of its results and high competitive standards, with solid financial ratios and profitability above the national average.

These companies are actively contributing to the dynamics of development and employment in Portugal, being responsible for 37 000 direct jobs. Its turnover in 2010 exceeds 4.5 billion euros. This paper attempts to summarize the results of this research, emphasizing the qualities of the audit tool developed.

It shows that development degree of intellectual capital, can be audited in a credible way, using a methodology that allows measuring the ICM parameters.

## **LITERATURE REVIEW**

The growing importance of intellectual capital has its foundations in several studies carried out since the 70s, which focused on so-called invisible assets.

Among these studies highlight the works of Hiroyuki Itarni (1991). However, intellectual capital has gained prominence only after the works of Sveiby (1997), in Sweden. The author gave a new vision of intellectual capital in considering the intangible assets as the main strategic issue that should be put to the organizations.

Since then, several authors proposed models and methodologies for assessing the intellectual capital of organizations. The further development of these models was found with authors such as Edvinsson and Malone (Edvinsson and Malone, 1997).

Edvinsson and Malone (1997), proposed a model, “Skandia Navigator”, which divides intellectual capital into two categories: human capital and structural capital. Thus, according to this vision, intellectual capital is the sum of structural capital and human capital, this being the basic capacity for the creation of high quality value.

Sveiby, (1997), developed a measurement methodology, “The Intangible Asset Monitor”, by dividing the intangible assets into three groups: individual competence, internal structure and external structure. This methodology is based on quantitative and qualitative indicators to assess the intellectual capital. The "Intangible Asset Monitor" is used by several companies around the world that offer an overview of intellectual capital. The “Skandia IC Report” is the result of that assessment. Sveiby (1997) recommends replacing the traditional accounting methodology with a new methodology that contains a knowledge perspective. For the author, this methodology is very important to complete the financial information and evaluates the company’s efficiency and stability.

Among the most relevant methodologies are also the Balanced Scorecard” (Kaplan and Norton, 1992, 1996, 1996a) the “IC Accounting System” (Mouritsen et al., 2001), the “Value Explorer” (Andriessen and Tissen, 2000), and the “Intellectual Capital Benchmarking System” (Viedma, 2001).

These different approaches are based on the measurement of organizations intangible assets. Andriessen (2004, 2004a) by applying the "theory of multidimensional value measurement" to the nations, gives a new vision to strategic intellectual capital management.

These models and methodologies will not be developed as this is not the objective of this paper. On the other hand, it is assumed that the readers of this paper will be able to access the different approaches in these models, easily.

The model used in this paper is the “Intellectual Capital Model” (ICM) (Matos and Lopes, 2009). The choice of this Model is linked to the need for being able to identify, in an integrated and consistent way, the complexity of the factors in the framework of organizational knowledge. Compared with other models, ICM seems to be more adapted to evaluate the intellectual capital management.

The ICM - Intellectual Capital Model - consists of 4 Quadrants specified by their parameters (Matos and Lopes, 2009). The Quadrant Individual Capital, Team Capital and Processes Capital are related to the company's internal environment, the Quadrant Clients Capital is related to the external environment. In ICM, is called Individual Capital the Tacit Knowledge / Human Capital Quadrant. It is the knowledge inherent to the individual himself, and containing the real source of value, talents and the skills to generate innovation. Here, one has included the theoretical and practical knowledge of the individuals and the capacities of different types, such as artistic, sporting or technical.

The Team Capital is the Human Capital / Explicit Knowledge Quadrant. The team shares the explicit knowledge. In this area, knowledge applies to the individual in the form of facts, concepts or tools. When the Explicit Knowledge is associated to Structural Capital, we are in the presence of applied experience, as the whole organization is the holder of formalized knowledge, able to be passed on, this is the Processes Capital. This Quadrant represents the ensemble of shared knowledge, summed up by experts (scientific community), recognized as the most advanced form of knowledge.

This type of knowledge covers, among other dimensions, the organizational routines or the organizational memory. Organizational memory represents the register of an organization, represented by a set of documents and artefacts. Its goal is to expand and amplify knowledge through its acquisition, organization, dissemination, usage and refinement. Organizational memory can be a way of registering tacit knowledge, making it explicit, so that through business processes it becomes part of the patrimony of the company, to be shared and recreated.

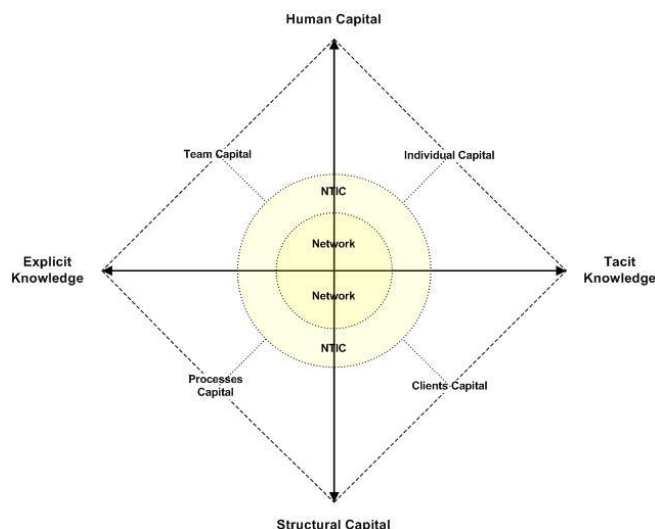

Figure 1: ICM - Intellectual Capital Model (Matos and Lopes, 2009).

The Clients Capital is the result of the interaction Structural Capital / Tacit Knowledge. This typology represents the organizational knowledge in its practical form and is already incorporated into the tacit experiences formalized in the team. This knowledge, although hidden, becomes accessible through interaction, and it is the principal characteristic of the performance of highly specialized teams.

In the Model presented the Network and NTIC are essential in the relationship between the 4 Quadrants. Thus, the companies that put the NTIC at the service of human resources have a great advantage, because they can reduce the administrative difficulties in solving simple problems, increase the quality of services and promote continuous improvement and personal growth.

The approach to the concept of Network is not a new concept. The network, as a social concept, is the genesis of the social constructs of individuals. More recent is the approach to the concept of network system as a factor in the acquisition of knowledge and innovative action. In conclusion, the NTIC are crucial to be effective Networks.

In the ICM, the relational capital is the result of various interactions that take place within the organization and that allows to transform tacit knowledge into explicit knowledge. This knowledge put to the service of customers and all stakeholders, allows organizations to achieve high performances.

**ICM parameters are:**

**I – Individual Capital Quadrant**

Training / Qualification and Talent management  
Valuation of Know - How and Innovation  
Investment in Innovation and Development (ID)  
Existence of a Policy for Talent Retention

**II – Team Capital Quadrant**

Training / Qualification  
Team Work  
Innovation in teams  
Leadership in teams

**III – Processes Capital Quadrant**

Processes Systematization  
Registration of Organizational Knowledge  
Existence of Certification, environmental and social policies  
Partnerships  
Investment in Innovation and Development (ID)  
The Brands Creation and Management  
Complaints System  
The existence of Awards

**IV – Clients Capital Quadrant**

Market Audits  
Management of the Clients' Satisfaction  
Complaints System dos clients  
New Markets

Use of New Technologies of Information and Communication - Use of NTCI and Networks are considered global parameters that allow us to connect the four quadrants.

## **METHODOLOGY**

The purpose of this research is to examine the psychometric properties (reliability and validity) of ICM parameters. According Carmines and Zeller (1979), reliability concerns confidence in the constancy of the results of several applications of the same test. To study the reliability of the questionnaire we have adopted the method of internal consistency by determining the *Cronbach's alpha* (Cronbach, 1951) coefficient that, according to Nunnally (1978), provides a good estimate of reliability. The value of this coefficient can vary between 0 and 1.

Construct validity will be determined by confirmatory factor analysis (CFA).

## **SAMPLE**

The initial sample consists of 1107 Portuguese SMEs considered the 'PME Leaders' (SME leader), the best SMEs based in Portugal, in 2010. From this total sample, at the date of completion of this article, we obtained a total of 89 responses, corresponding to the same number of subjects of analysis, which respects the rules of a minimum of 10 observations per item, proposed by Biddle, Markland, Gilbourne, Chatzisarantis and Sparkes (2001).

## INSTRUMENT SPECIFICITY

As a tool for validating these properties we used a questionnaire that has been developed by the authors (see Matos and Lopes, 2009, 2010 and 2011). The questionnaire consists of statements about the applicability of each parameter to the business context of each SME, according to a *Likert* scale of 5 points (1 = never applies, 2 = applies somewhat, 3 = moderately Applies 4 = applies very much and 5 = applies completely). This version follows the adaptation of the questionnaire proposed by Matos and Lopes (2011).

## STATISTICAL PROCEDURES

Initially, we carried out most of the descriptive statistics concerning the variables assessed using *Likert* scales, as mean (M) and standard deviation (SD).

Subsequently, we proceeded to determine the *Cronbach's alpha* and confirmatory factor analysis (CFA) using the ML method of estimation - *likelihood maximum*.

A confirmatory factor analysis was intended to verify that the structure factor tends to keep consistent.

For statistical data, we used the computer software *SPSS - Statistical Package for Social Sciences*, version 18.0.

The significance level adopted to reject the null hypotheses is  $p < .05$ , which corresponds to a probability of wrong rejection of 5%.

## DESCRIPTIVE STATISTICS

We tested each set of measures for reliability using *Cronbach's alpha* (Cronbach, 1951). A reliability estimate of 0.7, or better, is considered to be good for early stages of research, and an estimate of 0.8 is advised for basic research (Nunnally, 1978). Initially we applied the *Cronbach's alpha* in all issues of the questionnaire. The *Cronbach's alpha reliability* coefficients for the initial scales averaged 0.40 and 0.84.

With this methodology, we exclude issues that had *Cronbach's alpha* values below 0.6. A visual examination of the shape of the distribution showed that almost all the variables had a slight bias towards higher scores but they did not look very different from the normal distribution curve. We conducted twenty two confirmatory factor analyses (CFA) to explore the setting of the questions that allow you to check each factor. Each quadrant was examined individually to check the organization of parameters in the model (ICM).

We had attention to the soundness of the contents of each item, obtaining an instrument small enough. We used *LISREL 8.30* with maximum *likelihood estimation* for all tests CFA. Several criteria were used to assess the adequacy of the model for each analysis. The results of tests of discriminant validity, showed that although some items are correlated they were very different. Our selection criteria were to choose the items for each parameter, which were correlated, and delete items that appeared to be less distinct (Anderson & Gerbing, 1988). Thus eliminated factors with less representation for the construct (less than 0.6). Based on these analyses, we reduced the number of items constructs representing each parameter. The final *Cronbach's alpha* reliability coefficients parameters are averaged 0.76 and 0.93.

## CONCLUSION

The research seems to indicate that ICM parameters are robust approach to auditing the intellectual capital management in SMEs, as they meet the criteria for its psychometric properties. The research examines

the ICM parameters factor structure, also allowed us to verify a correlation between the parameters in each quadrant.

We can also conclude that the data indicate similarities with other researches (see Matos and Lopes 2011) which there are an adjustment of the parameters to the theoretical model (ICM). Due to the extension of the research, that was supported these conclusions, the results cannot be presented here, they will be presented in a publication being prepared for this purpose. Finally, the predictive validity tests carried out indicate a relationship between the instrument developed as a measure of intellectual capital management and other management measures such as organizational performance.

We found that the organizations that best balance the different ICM parameters, show a better performance, i.e. if we take a photograph at the analyzed companies we could say that organizations whose arithmetic mean of the parameters had higher values would be better able to ensure organizational stability. Of course, these conclusions can always be discussed, in particular because they are drawn to a given business environment at a given time. Therefore, more studies should be done in order to explore these findings. The results presented in this paper, are considered preliminary because the research is still ongoing.

Our expectation is that the final sample should not deviate much from the conclusions presented here, however we consider this situation.

# INTERNATIONALIZATION OF LABOUR AND ITS CHALLENGES: VIEWS FROM SOUTH AFRICA

**David Mello and Edward Rankhumise**  
**Tshwane University of Technology, South Africa**

## ABSTRACT

*Globalization has brought with it the need for countries to be more dependent on each other for politics, trade, and labor. Skills shortages in South Africa have created an opportunity for the South African government and its private sector to employ foreigners. The employment of foreigners and other social ills have resulted in Xenophobia and the unfortunate loss of lives in South Africa. The paper evaluates immigration policy of the Department of Home Affairs and its challenges. The paper also provides valuable recommendations to avoid the possible recurrence of Xenophobic attacks in SA. A qualitative method is followed in exploring this volatile situation.*

## INTRODUCTION

Internationalization of labor is mainly due to globalised capital and localized labor (Taylor 2009). Globalization pushes firms to expand and grow beyond their countries of origin in order to remain competitive (Tan 2006). Human capital is attracted by opportunities hence employees move across borders due to the expansion of multinational companies. Other employees move due to the high demands of specific skills. With the internationalization of labor, countries such as South Africa gain some skilled employees while at the same time it loses skilled employees due to demands and better salaries in first world countries. David Harvey in Taylor (2009) refers to the internationalization of labor as accumulation by dispossession. Countries that are able to accumulate more can keep what they have gained while third world countries remain losers as they cannot compete due to lack of resources.

South Africa has seen an influx of foreigners looking for better job opportunities in the past decade. These foreigners are either legal or illegal immigrants. The increase of foreigners coming to South Africa is a result of globalization and economic hardships suffered by South Africa's neighbors and other remote countries in Africa. South Africa's foreign policy and internal policies have a bearing on the ease with which foreigners are able to enter South Africa. This paper offer recommendations which are aimed at eradicating xenophobia in South Africa. The next section defines the concept xenophobia and contextualizes it with South Africa.

## CONTEXTUALISING XENOPHOBIA IN SOUTH AFRICA

Xenophobia is defined by the online Dictionary of Psychology (available at: <http://psychology.about.com> Accessed on 6/4/2011) as an excessive, irrational and intense fear of foreign people, places and objects. According to this dictionary, xenophobic people are more likely to display fear and aggression towards people who are foreign. This definition is a clear depiction of the South African situation. Xenophobia in South Africa reached its catastrophic point in 2008 when foreigners were attacked and displaced. Consequently, refugee camps were created. The attacks took place mainly in informal settlements and townships of Gauteng, Eastern Cape, and Western Cape provinces. Between 3 and 5 million foreigners lived in fear of being attacked.

Xenophobic attacks took the form of black on black violence as mainly foreign black people were attacked. We are tempted to ask the question, is it a manifestation of self-hatred when a person attacks someone who looks like him/her? (not that any form of attack is justified). A closer scrutiny of the situation reveals that the attacks were perpetrated by people from the lower class of the South African society. These are mainly

people with lower educational levels and have never travelled anywhere beyond the borders of South Africa. These attacks did not occur in middle class and affluent areas where other foreigners also live. Self hatred would for this reason not be the main motif for xenophobic attacks. The struggle for insufficient resources seems to be a plausible reason for the attacks. As countries become part of a global village, the struggle for jobs and other resources can be expected to intensify. Foreigners are unfortunately used as scapegoats for local people's frustrations.

## GLOBALISATION AND ITS IMPACT ON LABOUR

Globalization has advantages and disadvantages. This paper focuses on the disadvantages of globalization on human resources. The main threat arising from globalization is according to Auer (2000) the possible loss of jobs and people having to accept a lower quality jobs, labor market competition from low-paid migrants inequality associated with globalization and the internalization of employment. Globalization further brings about competition between countries for scarce skills. Countries that pay better and have attractive working conditions are more likely to benefit from the increasingly mobile labor market. Multinational companies are setting their sights on emerging economies such as South Africa where customs and tariffs are low in order to use such countries as a platform for export.

The following quote from Auer (2000) illustrate the nature of internationalization:  
In the manufacturing of the famous Barbie doll *"the raw material (plastic and hair) comes from Taiwan (China) and Japan: assembly takes place in the Phillipines, before moving to the lower-wage areas in Indonesia and China. The Moulds come from the United States, as does the last coat of paint prior to sale."* This quotation illustrates the extent to which a company will go in manufacturing a cheaper product for the international market. As there are winners and losers in internationalization, the net balance is difficult to establish.

A country's foreign policy serves as a framework upon which foreign relations are conducted. It determines the manner in which a country will interact with other countries, attract business and be receptive to migrant labor. Since South Africa is inextricably part of Africa and the world, it is important that its foreign policy reflects and promotes its interests and those of the continent (Dube, 2003 overview: South Africa's foreign policy in Africa, Available at: [http://www.ai.org.za/print\\_monograph.asp?ID=1](http://www.ai.org.za/print_monograph.asp?ID=1). 2/6/2010)

The Constitution of the Republic of South Africa, 1996 provides that the President is ultimately responsible for the foreign policy and international relations of South Africa. It is the prerogative of the President to appoint heads of missions and conduct interstate relations (South Africa Year Book 2005: 305). Section 84(2)(h and j) makes provision for the President to receive and recognize foreign diplomatic and consular representatives, as well as the appointment of ambassadors, plenipotentiaries, and diplomatic and consular representatives to strengthen the relationship between South Africa and other independent states.

The declared foreign policy of South Africa is aimed at a commitment to:

- Human rights,
- Promotion of freedom and democracy throughout the world,
- The principles of justice and international law in the conduct of relations between nations,
- International peace and internationally agreed mechanisms for the resolution of conflict,
- The interests of Africa in global markets, and expanded regional and international economic co-operation in an interdependent world (Henwood 1997. South Africa's foreign policy: principles and problems, Available at: <http://www.iss.co.za/Pubs/Monographs/No13/Henwood.html> 2/6/2010)

Furthermore, South Africa's policy is guided by amongst others, transparency; national interests, desire to participate in regional, continental and global multilateral organizations; that the security and equality of South Africans, as well as justice and international rule of law, peace, economic stability, and regional cooperation were some of the fundamental principles underlying the foreign policy of South Africa.

Henwood (Ibid), argue that the development of foreign policy since April 1994, was the emphasis on democracy, justice and human rights, which brought a new dimension of the declared foreign policy, namely that of morality. This posed important challenges for South Africa as it could lead to conflict between perceived

interests and the right decision, and has implications for the allocation of resources for essential foreign policy goals (national interests) as opposed to morally justifiable objectives that might, in the long run, negatively influence the material position of the state.

Any attack on a foreigner is a violation of South Africa's foreign policy its commitment to human rights, freedom and justice. South Africa's immigration policy is an integral part of the foreign policy. The next section explores South Africa's immigration policy in a globalised world.

## **SOUTH AFRICA'S IMMIGRATION POLICY**

Immigration policies across the world are a direct result of foreign policies, globalization, and the demand for foreigners to enter a country. The higher the demand the more stringent immigration control will be. South Africa's immigration policy is also influenced to a large extent by external factors as well as internal factors.

The Immigration Act 2002(Act 13 of 2002) forms the basis of immigration policy and control in South Africa. Immigration control is based on the premise that South Africa can only accommodate a certain number of immigrants. According to the Department of Home Affairs (Available at: <http://www.southafrica-newyork.net/homeaffairs/immigration.htm>. accessed on 5/6/2011), South Africa has a vast reserve of unskilled and semiskilled workers who are entitled to employment opportunities and to an economically viable lifestyle. To protect these citizens, foreigners in unskilled and semi-skilled categories cannot be accepted as immigrant workers.

The immigration policy as stated above, is intended to safeguard the rights of all South African citizens. It is for this reason that permanent residence permits may be issued to a foreigner who:

- Has an offer of employment,
- Employer certifies that there is a position which must be filled by such an employee (this applies mostly to multinational companies)
- Intends to establish a business in Republic of South Africa (Government Communication and Information Service 2010)
- Already holds a business permit to business in the Republic of South Africa, and
- Intends to invest in an existing business in South Africa.

To further protect South African citizens' interests, the Department of Home Affairs sets yearly limits of available permits prescribed for each sector of industry, trade and commerce. These limits are determined in consultation with the Departments of Trade and Industry, Labor and Education. Apart from the effort of the Department of Home Affairs in protecting the interests of South African citizens through immigration control, there is a high number of immigrants going through South Africa's porous borders to settle and work illegally in South Africa. Most of these immigrants are of an African origin. Bronwyn (2000) reports that black foreigners, particularly from Africa comprise the majority of victims of xenophobic attacks.

Xenophobic attacks takes place mainly because South African citizens (those who are unemployed) believe that foreigners take their jobs and enjoy other government services are should legitimately be enjoyed by citizens. The situation is exacerbated by employers who hire foreigners without proper residence permits. Such employees are often exploited and paid far less than South Africans because they cannot approach any institution to protect their rights. The possibility of employing a person illegally in South Africa points to the ineffectiveness of monitoring by the Department of Labor. The Department appoints labor inspectors who should among other things, take action against people employing illegal immigrants. The next section provides recommendations to avoid further attacks in South Africa.

## **RECOMMENDATIONS**

Xenophobic attacks in South Africa are a manifestation of South Africans' growing frustration with the rising levels of unemployment and the slow pace of service delivery. The South African government's quick response to xenophobic attacks was to use the South African Police Services and the South African National Defence Force to normalize the situation. Although this is necessary in view of the possible loss of more lives, the use of force is a temporary measure which does not guarantee recurrence. This paper makes the following recommendations with a view to prevent the recurrence of xenophobic attacks.

- Heavy penalties for employers who employ foreigners without valid resident permit
- Education campaigns which target the youth and people in informal settlements
- Vigilance by community policing forums
- Strict adherence to repatriation of illegal immigrants
- Tough stance against corruption and harsh sanctions against officials who are involved in corruption where foreigners get benefits such as free low-cost housing at the expense of South African citizens.

## CONCLUSION

Globalization and its consequence, the internalization of labor are processes that are irreversible irrespective of whether their impact on any country is negative or positive. South Africa has to maximize the positive impact of the internationalization of labor. Success in this regard can be gained if the country can be able to deal successfully with xenophobia. Government has to reassure its citizens that it has their interest at heart. This cannot be achieved by empty promises. Actions of the government in correcting the socio-economic challenges, strict patrols of the borders and enforcement of policies relating to immigration control and employment of illegal immigrants is likely to convince the average unemployed citizen that foreigners are not necessarily preferred over him or her.

# ISLAM AND ECONOMIC JUSTICE

Mehdi Mohaghegh, Norwich University, USA

## ABSTRACT

*Compared to other religions, Islam whether in its original archetype or in its current form intervenes more into a society's political and economic affairs. The purpose of this paper is to evaluate the philosophical basis, practical application, and ramifications of "Shariah,"-- Islamic Law-- in a 21<sup>st</sup> Century society and within the available body of economic knowledge that defines economic justice. This study provides historical evidence in support of this "Enlightenment" idea that only rapid economic growth resulting from efficient utilization of resources in a decentralized socio-political system can lead to greater economic justice in its broader sense of the word.*

## INTRODUCTION

It is "the best-of- times" and it is "the worst-of-times" in the greater Middle East. The long-lasting autocratic regimes in the region are falling one after the other. These tyrannical regimes have been mixed blessing in the region. For decades the governments of these police states created some sort of calmness and political stability in their countries but they were also responsible for decades of slow economic growth, high rates of unemployment, lack of liberty, human right violations and severe inequality in the distribution of income in their societies. Since the beginning of 2011, a golden opportunity has presented itself for the oppressed people of these ancient nations to choose a new economic and political framework. Like in Iran of thirty three years ago a market place of political ideas and ideologies is showcased by many groups of political activists in these countries. The young who organized and led the uprisings to their ultimate victories together with some secular elements from universities, military and civil organizations with ties to old regimes long for the creation of western style democracies. Islamists drawing their members from fundamentalists belonging to all layers of the society are cautiously working to incorporate some form of Islamic fundamentalism into the future political systems which is in the making in these countries. Not being impressed by Shiite version of Islam and due to suppression of dissent after the election in Iran, the chance that Arab nations would adopt an Iranian type Islamic regime for their countries is slim. A Saudi-type regime based on Vahabi sect of Islam will not be appealing to young revolutionaries either. This is due to the regimes reactionary nature and its pro-west standing since the beginning of its creation. In most of these countries, however, old-time Islamic parties such as Muslim Brotherhood that was banned under the now crumbling dictatorial regimes are becoming active again to direct the political process toward the creation of a government based on Islamic laws that they believe can bring justice and prosperity for Muslims. How successful they will be in their efforts will remain to be seen. The purpose of this paper is to show that that establishment of a new regime based on *Shariah* cannot improve economic justice and reduce the income inequality in a country. Economic theories and historical evidence are used to show that the formation of an Islamic regime in a country not only does not eliminate the economic inequality and injustice but it may very well lead to economic stagnation, universal poverty, greater income inequality, and slow social and moral progress in that country. A democratic form of government with its free-market underpinning which is equipped with the institution of separation of the church and state is what these countries need in order to achieve rapid economic growth. The accelerated growth rate can lead to social and moral progress in the forms of liberty, democracy, openness of opportunity; tolerance and diversity of ideas; economic and social mobility; and greater equality in the distribution of income.

**The Choice between Considerate Islamists and Intruding Westerners:  
Reckless Friends versus Wise Enemies**

You are better off dealing with a wise enemy than a reckless friend!  
The wisdom you learn from your wise enemy sets you in motion for a better life;  
The ignorance and rigidity of your reckless friend leads you to your demise!

Saadie, 14<sup>th</sup> century Persian Poet and Philosopher

Economic justice, in this paper, has a broader meaning than being merely concerned about the plight of the poor and achieving greater equality in the distribution of income. Autocracy combined with many years of unequal development and slow economic growth has created a large number of unemployed and underprivileged individuals in the Muslim nations of the greater Middle East that includes Northern Africa. Now that these tyrannical regimes are falling, these individuals can easily be convinced by Islamists to favor the establishment of an Islamic form of government in these countries. These groups may be led to believe that a new political system based on “Shariah”--Islamic code of life-- can protect their interests and help them live in a society characterized with economic justice. What follows represents a theoretical explanation of why adhering to tenets of Islam despite their progressive nature compared to those of Christianity would not be sufficient to address the problems of poverty and income inequality in a modernizing society of twenty first century. As the point of departure in this paper a broader definition of economic justice should be provided first. In the view of the author of this paper achieving greater equality in the distribution of income, although being a great achievement, is not an all inclusive goal for a society seeking economic justice. The economic justice that people in a developing country should seek must include the basic qualities of moral progress such as liberty, openness and transparency, tolerance of diverse opinions, vertical economic and social mobility, widespread economic opportunity, democracy, and finally greater equality in the distribution of income. Economic justice is not, however, a new topic for discussion. Since antiquity the Greek philosophers as well as religious thinkers of all sects have tried to address this important issue in one way or another. But only in the last two centuries the industrialized nations of the world have experienced some degree of social, political, and moral progress which is composed of a good portion of the above basic qualities. These countries’ relative success in moral progress and economic justice cannot be attributed to the principles of any religion. As it will be explained later it was because of the “Reformation Movement” and freedom from some strictures of Christianity that combined with accumulation of scientific discoveries led to rapid development of commerce and industrialization followed by moral progress and higher standards of economic justice in European continent and beyond. But freedom, better life, and greater equality for people living in the capitalist countries of the West has meant oppression and inequality for traditional societies of the Middle East. The Western nations’ gluttonous pursuit of power and profit had turned Middle Eastern nations into enslaved colonies, and their people into the playthings of economic forces beyond their control. The question is now, should the oppressed people of the Middle East follow the guidance provided by their fellow Muslim leaders and organize their new governments based on Islamic laws or they should adopt democratic form of governments role modeled after the administrations evolved in the lands of their former adversaries? Listening to Saadi whose philosophical view is the opening remark for this section, the people of Muslim countries are better off adopting their former enemies’ wisdom and style of government than forming administrations based on “Shariah” recommended by their thoughtful clerics and fellow Muslim leaders. Let’s see why?

## **Economic Justice throughout History**

Greek philosophers should be credited for starting the debate over economic justice. Socrates was the first classical philosopher who initiated an inquiry into economic justice by arguing that the nature of things requires the establishment of total communism (Combee and Norton, 1991). Aristotle while not disputing the moral validity of Socrates’ proposition rejected his idea on the ground that incentives matter and wicked human nature requires the motivations that a system of private property and production provides. Combee and Norton (1991) notice that in the cultural perspective of classical Greece, what we nowadays call “economic production” was in fact the output produced by slaves who were owned by households. It is within this context that Aristotle depicted and praised the ideal of the aristocratic gentleman as a man of *nobility* who should only engage in activities such as war, politics, and philosophy, and not economic activity. The condemnation of profit and usury in Aristotle’s writing to achieve economic justice can be understood from what constitutes this ideal human type. Combee and Norton (1991) go further to explain that “It is in the context of exaltation of the aristocratic

gentleman for whom economic activity is “unnatural” (at odds with the “virtue” that is the perfection of human nature) that Aristotle’s condemnation of profits and usury (the earnings of interest on money) must be seen. Usury is “unnatural,” according to Aristotle, because the true purpose of money is to serve as a medium of exchange. Aristotle explicitly argues from the promise that any use of a thing for something other than its “proper” purpose is “unnatural.” But Aristotle’s deeper meaning—and one that sounds less strange to modern ears—appears to be that profit and usury are “unnatural” because the motives that drive them clash with the notion of perfected *human nature* that he favored.”

Combee and Norton (1991) continue to explain how the Aristotle’s views on the justice of private property, profit and usury and on the moral effect of economic activities upon human beings had some impact on the way Christianity approached these issues and ideals of human characteristics. The Judeo-Christian scriptures have a lot to say on poverty and private property. The fathers of early church expressed some opinions on economic issues although their views seemed to be contradictory at times. St. Ambrose (340-397 A.D.) for example strongly argued against the claims of private property and wealth accumulation but the Clement of Alexandria (?-215 AD) clearly favored private property and urged that precondition for helping one’s fellow human is the possession of wealth and private property. During middle ages with the renewed availability of classical texts, the Christian thinkers tried to combine the moral power of Christianity with the intellectual force of Greek philosophy in an attempt to identify the dominant views of economic justice in Western civilization. This approach led to the belief that the ownership of private property and engagement in economic activity can be morally justified if they were limited to bare necessities. Combee and Norton (1991) have summarized the Middle Age views of economic justice as:

“In economics, at least, the human ideal type of classical Greek and medieval Christendom, otherwise so divergent, converged remarkably. The Greek gentleman viewed economic production as beneath dignity; the medieval monk, exalting poverty, considered work –with the aim of necessity, of course, and not profit—to be grim punishment. Though they lived worlds and ages apart, the Greek gentleman and the Christian monk both disdained the frankly economic motives that typify the modern era and would even receive theological sanction from a radically redirected, de-Hellenized Christian tradition.”

Extol for frugality, and praise for those who practiced asceticism was a continual theme in western religions until Middle Ages. So it was warnings about the dangers to human’s behavior and spiritual well-being that followed from devotion to money and luxury, or, even from wealth itself. These views and tenets could not be conducive to economic growth and the degree of social and moral progress that we observe in nowadays Western societies. As we will see later, these restrictive views changed radically as a result of very especial movements in Europe called “Reformation” and “Enlightenment” that took place in the era and in the aftermath of Renaissance. These movements initiated radical changes in people’s views of free-market capitalism, profit, and trade, unleashed a swift economic growth combined with high degree of moral progress and social development in European countries and North America. Let’s now consider the Islam’s views of economic activities and justice.

Islam is from the root “s-l-m”, meaning “peace” primarily but it also means selflessness. Its full implication is the peace that comes when one’s life is surrendered to God (Smith, 1991). Muhammad Iqbal (1979) summarizes the teaching of Koran in terms of God, Creation, the human self, and the Day of Judgment. He believes that these are the chief theological pegs on which the Koran’s teachings are hung. In spite of their importance, however, the Koran is a book that emphasizes deed rather than idea. The clergy and some Muslim economists who consider themselves as proponents of the so called “Islamic Economics” interpret the verses of *Koran* and *Hadith* (the Prophet’s words and deeds) to arrive at the following especial way that Islam looks at the “human material life.” In establishing a relationship between man and God, and man to man, Siddiqi (1991) and others give unequivocal supports for all the Islamic rulings such as condemnation of *riba* (i.e. usury), a sense of cooperation, fellow-feeling and brotherhood among Muslims, and adhering to virtue of simple as opposed to wasteful life in this world. Siddiqi also argues that the responsibility of state in an Islamic society is to look after the interests of the underprivileged through the social security system of Islam, and to emphasize the vital importance of *Shura* (assembly of experts) in all sorts of decisions affecting the community. Alhabashi (1991), without giving a definition for justice, indicates that adhering to the principles of justice is one of the most important determinants of economic activities in an Islamic society. As such, all the obstructions to its establishment should be removed. He goes on further to explain why hoarding, cheating, usury, etc. are prohibited in Islam. He also argues that Islam condemns the development of monopolies in both goods and

factor markets and rules that corruption and oppression should be avoided so that transfers and exchanges would take place in an environment of mutual consents and fairness. Along the same line, Smith (1991) explains that Islam is deeply aware of the physical foundation of life. Until basic needs are met, higher concerns cannot flower. Just as the health of an organism requires that nourishment be reached to its every segment, so too a society's wellbeing requires that material goods be widely and appropriately distributed. In its early days, the Koran, supplemented by *hadith*, proposed *measures* that categorically dismantled the barriers of economic caste and seriously reduced the injustices of special interest groups. Regarding the freedom of enterprise and job choice Smith explains that Koran does not discourage people from engaging in commerce and working harder than their neighbors, nor it has any objection to such people being rewarded with larger returns. The Koran simply insists that profit seeking and competition be balanced by the fair play and by compassion. As the way to prevent concentration of wealth in the hands of a few, Koran went after *primogeniture* which was the severest economic curse of the day and flatly banned it. Smith (1991) indicates that "By restricting inheritance to the oldest son, this institution had concentrated wealth in a limited number of enormous estates. In banning the practice, the Koran sees to it that inheritance is shared by all heirs, daughters as well as sons." Islam, although like Christianity praised asceticism and prohibited the taking of interest never created as much of impediment against the right to private property and earning profit from trade and other economic activities. What can explain, then, the relative economic backwardness, dawdling social and moral progress, and lack of economic justices in the Islamic nations of the greater Middle East? The answer to this question can be provided by looking at the history of commercialization and industrialization in the West and comparing it with the way the Muslim nations and their governments have tried to organize their economic activities and achieve social and moral developments.

## The Origin of Western Democracy and Socio-economic Progress

In his book, *The Moral Consequences of Economic Growth*, Benjamin Friedman (2005) provides a chronological description of how the accumulation of scientific discoveries combined with a new economic outlook unleashed a rapid rate of economic growth in the 18<sup>th</sup> Century Europe that spread around the globe and is continuing to do so to this date. The new economic outlook resulted from a new and different interpretation of the tenets of Christianity by "Reformists" and from the innovative ideas put forward by "Enlightenment" thinkers. Friedman also explains how faster economic growth in a society characterized with free-market capitalism can lead to greater social, political, and moral developments in that society. Let's have a detailed view of Friedman's ideas.

As it was explained earlier, praise for no extravagant life and admiration for those who adhered to self-denial was a continual theme in Christian Europe until "Renaissance" that initially appeared in Italy at the beginning of 14<sup>th</sup> century and spread all over the Western Europe during the next two centuries. Renaissance refers to the rich development of Western civilization from middle Ages to modern times. The incredible developments in science that resulted in commerce and economic expansion in Italy and other European countries, led to rapid progress in scholarship, literature, and the arts. All of these provided the background for having a new view of the world. Renaissance also brought a new meaning to individual expression, self-consciousness, and worldly experience. During renaissance, people in the emerging nation states began engaging in exploration and a revolution in commerce started. On another front, the "Reformation" which is the term used to signify the desire for change within the church started in parallel with Renaissance. Reformed Protestant thinking that paved the way for the new ideas that culminated later in the "Enlightenment" thoughts emphasized the scientific discoveries and the general education throughout the society. At the same time, due to efforts made by theologians such as Luther, Calvin and other reformists the emphasis on the individual and its study of ancient texts increased. The Reformation ultimately led to freedom of dissent. Luther started his open attacks on doctrines and authority of the church on October 17, 1517 and his insistence on reading the Bible made the individual to assume greater responsibility for his own salvation. In 1536, Geneva was the centre for the teaching of John Calvin who was considered the greatest theologian of Protestantism. In England, Henry the VIII issued the act of Supremacy in 1534 which rejected papal control and created the National Church of England. In the meanwhile, Calvinistic thoughts were still strong in England and caused further reforms. In summary, Reformation, and its outcome, Protestantism, changed the outlook and created a dynamism that has continued to exert influence to the present day. This movement with its emphasis on personal responsibility and individual freedom; its refusal to take authority for granted; its effect on breaking the hold of the church upon life and the consequent secularization of life and attitudes changed the world tremendously.

Reformation and Renaissance intellectual outlooks and their associated cultural manifestations led to the emergence of a new movement called “Enlightenment.” By the 18<sup>th</sup> century people were witnessing the unending series of scientific discoveries and inventions and were benefiting from commodities manufactured from practical applications of these scientific advances. This created a positive view in the society that the scientific progress that had been achieved could indeed continue and accumulate over time. Also some thinkers came up with this idea that economic growth and rising living standards could cause public attitudes and political institutions to evolve in manners that improve the moral character of the society. Such an idea with a convincing explanation of how this process comes about was primarily the intellectual product of a group of 18<sup>th</sup> century thinkers who became known as members of Enlightened Movement. Friedman (2005) explains that Adam Smith and Anne Robert Jacques Turgot who were working independently arrived at a dynamic theory that shows how a society not only may, but with expanding knowledge necessarily will, advance from one mode of production to another (i.e. from shepherding to agriculture and then to an economy based on commerce). Their theory combined two essential parts: 1) Economic scarcity that exists and becomes more of a problem as populations expand, tends to cause the evolution of the societies through a series of stages in which the main economic activity is initially hunting and gathering, then shepherding, then agriculture, and finally “commerce.” 2) These different modes of production will need the adaptation of different legal and political institutions to meet the evolving requirements in the society.

Through their writings the leaders in the enlightenment movement showed that discipline, hard work, thrift, patience, division of labor, and specialization are conducive to greater productivity in a free-market economy. They also recognized that education and scientific research could also contribute to greater economic productivity. From the support that Calvin and his followers gave knowingly or unknowingly to the development of commerce and manufacturing activities, it can be argued that the Reformed Protestant denominations undoubtedly accepted, rather than resisting, the major institutions of the dynamic economic world such as division of labor, specialization, trade, wage labor, banks and credit. The vital role that Smith, Turgot, Mandeville, and other Enlightenment thinkers played in the development of commerce and industries has been summarized by Friedman (2005) who explains their ideas as: “Rather than worrying about how to suppress individuals’ insatiable appetites, as the Stoics of ancient Greece had done, or simply railing against them as countless religious sects had, Mandeville, Smith, and their followers believed that commerce would harness those appetites to serve the society as a whole. Just as insatiable curiosity drove the quest for scientific discovery, insatiable material wants drove the economic machine. The answer to the medieval religious injunction that all economic activity must be for the common good was that, under the arrangements imposed by commerce, economic activity driven by self-interest *was* for the common good. In the absence of individuals driven by “virtue” commerce offered an economic system that mimicked what a society of virtuous individuals would do. The result was, in cultural historian Christopher Lasch’s apt phrase, (“the moral rehabilitation of desire.”)”

Friedman (2005) also argues that the enlightenment thinkers recognized that commerce can reward some important personal traits such as honesty, order, reliability, punctuality, discipline, and enthusiasm to be helpful and friendly toward one’s fellow citizens and can innately create these traits in the citizens of a country. These are human characteristics that religions including Islam have not been able to completely promote in human societies. Even passing of laws in a society cannot guarantee that majority of citizens try to uphold these very important human traits. In modern economic jargon, these human traits have characteristics of public goods and possess significant “positive externalities” which can be internalized through public policy. In a commercial world and in a free society, individuals who adopt these and other similar personal characteristics could achieve greater success both financially and spiritually. The society as a whole will be also served in the form of greater output, less criminal acts, and greater spirit of cooperation when its citizens possess these traits.

Smith, Turgot and their followers also realized that the improvement in productivity and rising of incomes in commercialized societies could result in less human efforts to be necessary for feeding, clothing, and sheltering of a given population. The released time from subsistence activities, could be used by individuals to engage in other activities such as reading, writing, education, creating the artifacts, discussing the policy issues and participating in the society’s governing institutions. In reasoning this way, Smith and other Enlightenment thinkers foresaw much of the thinking about political democracy that emerged over the next century. Friedman (2005) explains that “Tocqueville’s observations on Americans’ astonishing proclivity to participate not just in

politics but in clubs and societies and associations of every kind (“not only commercial and industrial companies in which all take part, but associations of a thousand other kinds, religious, moral, serious, futile, general or restricted, enormous or diminutive”), and his emphasis on that participation as an ingredient important for the success of American democracy, sound like an empirical confirmation of Smith’s and Millar’s ideas on the importance of leisure pursuits—which, in a way, they were meant to be.”

It is important to emphasize that Smith, Turgot, and their contemporaries did not suggest that the development of economic growth and rising incomes necessarily lead to the development of the above traits in members of a society and its progress toward democracy. They saw these developments in individuals’ behaviour and outlooks, as well as the implications they drew for equality and democracy, as a consequence of “commerce” itself and its industrialization outcome. But considering the effects that rising incomes have on the further development of these traits reinforces the above original argument. Having discussed the process of industrialization and movement toward democracy and moral progress in the Western world we turn now to a discussion of the major factors that influenced the economic, political, and social changes in the greater Middle East in the aftermath of Islam.

## **Economic, Social, and Moral Progress in the Greater Middle East**

As it was mentioned before the role of trade in the economy was never downplayed in Islam. After all, the prophet himself is said to be an honest and successful merchant. Also Islam, being an egalitarian religion, has always emphasized a sense of cooperation, fellow-feeling and brotherhood among citizens. In the Middle East, however, there have not been any attempts to translate the Brotherhood of believers into economic progress and justice. Islam’s limited success in terms of preventing the creation of a castes system in the society and its promotion of social mobility, have been more than offset by its negative influence on economic growth and capital accumulation. Issawi (1982) divides the negative influence of Islam on the economy into two effects, 1) Islam being a conservative religion justified and supported the existing forms of governments and the status quo, and therefore it might have subdued the emergence of other creative intellectual, social, political, and economic forces. 2) Islam as an egalitarian religion has failed to create a more equal distribution of income and wealth throughout the Middle East. The severe inequalities of wealth and income observed even in the modern day Middle East provide a clear empirical support for the argument made by Issawi. In addition, the egalitarian precepts of Islam have certainly had some negative effects on economic incentives and growth as well as on socio-political development of Middle Eastern countries. These negative effects will be discussed later. It is important that we would first understand the long-term relationship between Islam and the totalitarian regimes that have reigned in the region.

The existence and continuation of autocratic regimes in the Middle East is explained by Issawi (1982) who argues that in the early Middle Ages the Sasanian and Byzantine Empires did not break down—in contrast to the Western Roman Empire—following the defeat of these two superpowers by Arabs. Arabs soon succeeded in establishing a strong and fairly centralized government similar to the collapsed regimes in Byzantine and Persia. Issawi (1982) further explains that “Whereas in Western Europe the ground was cleared for the growth of numerous and vigorous independent centers of power and activity—Church, city states, feudal principalities, universities, guilds, and other associations—in the Middle East the continued power of the state stifled such developments. The main economic consequence was that the state and its bureaucracy made it almost impossible for groups of producers to enjoy sufficient autonomy to set up institutions that could further their interests and expand their economic base, thereby enlarging the productive capacity of the economy.”

The centralized and heavy-handed governments that were either supported or dominated by clergies have reduced the incentives for market participants to work hard and grow the economy fast enough to improve the living standards. As it was mentioned before the improvement in standards of living and enjoying of greater leisure are necessary for public attitudes and political institutions to evolve in manners that improve the moral character of a society. Montesquieu and other thinkers of enlightenment movement concluded that *commerce* could induce industrialization, discipline, honesty, moderation, endurance, and thriftiness (Friedman 2005). In the view of these philosophers, commerce and free-market capitalism could also foster tolerance and democracy. The enlightenment thinkers based their propositions on the fact that in a free-market economy an individual has an economic incentive to buy from the cheapest supplier, or sell to the highest bidder, then, irrespective of

religion or political affiliation, commerce helps to break down group prejudice and to prevent ethnic cleansing. Also, since engaging in free-market transactions requires negotiation, bargaining and eventual compromise, engaging in these activities provides the conditions for the development of democracy. Then, the emergence and continuation of centralized governments that slowed down the process of commercialization and industrialization in the region partially explains the lackluster economic progress and socio-political advancement in the Middle East. The other barriers to such developments came from the conservative nature of Islam and its relatively greater interference in social, political, and economic affairs of the society. Let's look at these other barriers next.

In certain respects Islam, at least in the way it has evolved over the past 14 centuries, resembles the pre-reformation Christianity that did not suppose people to have personal responsibility and individual freedom. Muslims similar to pre-reformation Christians have been forced to take the authority for granted, and accept the hold of Muslim kings and clerics upon their lives. As we saw earlier in this paper the "Reformation" in Christianity emphasized personal responsibility and individual freedom. Its refusal to take authority for granted, and its effect on breaking the hold of the church upon life and the consequent secularization of life and attitudes changed the Western world tremendously. A similar reform movement in Islam is long-time overdue. People of the Middle East should be liberated from the hegemony of dictators of all kind including the Muslim clerics--especially the ones who believe in resurrection of an Islamic kind of government run by an Omayyad or Abbasid type of Caliph. A heavy-handed government supported or dominated by clerics will remove the inquiry from the society, reduces the incentives to innovate, work hard, and grow the economy fast enough to improve the living standards. The improvement in living standards as it was explained before is necessary for public attitudes and political institutions to evolve in manners that improve the moral character of the society. Smith and other thinkers of enlightenment movement concluded that free-market capitalism in a transparent society and characterized with division of labor and specialization could induce discipline, honesty, capital formation and industrialization. They also argued that commerce and free-market capitalism could foster tolerance and democracy. Their line of reasoning for this latter effect was that in a free-market economy people have economic incentives to buy from the cheapest supplier, or sell to the highest bidder, then, irrespective of religion or political affiliation, commerce helps to break down group prejudice and ethnic cleansing. Also, since engaging in free-market transactions requires bargaining and eventual compromise, engaging in these activities provides the conditions for the development of democracy. The autocratic and centralized regimes in the Middle East regardless of their background have not been receptive to the idea of improvement in commercial activities and industrialization of the region. Issawi (1982) indicates that, in the Middle East there have not been strong local governments; the municipal autonomies were always limited; and the entire state machinery have remained in the hands of kings, soldiers, bureaucrats, and clerics whose main objectives were to raise enough taxes and tariffs to finance wars and meet their salaries and other expenses such as security of their regime. The governments were not concerned with the effects of taxes and their expenditures on production. The centralized nature of governments in the region also explains the precariousness of property. Issawi (1982) explains that "from the early caliphate on, the history of the region is full of incidents where the property of merchants, officials, and others; similarly, with few exceptions, landed estates did not remain in the same family for many generations. No student of European history can doubt the importance of security of property in the rise of capitalism, and its absence goes a long way to explain the lack of a parallel development in the Middle East." Colonizing the region by Western powers and the discovery of oil in the region further enforced the continuation of centralized governments in the greater Middle East. Oil companies obtained concessions from the governments in the region. This has provided a substantial amount of petro-dollars for the corrupted governments in the oil producing countries especially since 1970s when OPEC became strong and active. Oil is a capital intensive and self-contained industry. It has absorbed a small portion of skilled labor force in the oil producing countries. Most of the revenue and foreign exchange obtained from oil have streamed back to the developed countries in terms of payments for armaments and investments in the money markets of Western Europe and the United States. The rest of the funds have been used for importing of all kind of commodities from the industrialized nations, paying of salaries to a large number of civil servants, bureaucrats, and the servicemen in the massive military forces. The abundance of oil money over the past four decades has made the governments of these countries to also engage in vast, insufficiently studied, and inappropriate development plans. In addition, the petro-dollars received by these governments has given them a strong bias toward highly capital-intensive technologies, despite the fact that these countries are more labor abundant than being capital abundant nations. The result of these government policies has been a highly distorted and unbalanced economic development in each of these countries. The oil industry has also made the Middle East subject to the highly

unsettling effects of constant interference and manipulation by the 19<sup>th</sup> century and present day superpowers. In summary, the foreign aggression and hegemony caused by strong and centralized domestic governments have made the economy of the Middle Eastern countries not to evolve properly and gradually to be suited to the character, needs, and resource endowment of the region. Also, the economic development and government led industrialization in these countries have not affected all segments of the society the same way. What these countries really need is less government involvement in economic activities, a much larger dosage of entrepreneurship and private sector activities, with a high degree of financial deepening. The first two remedies are clear enough; financial deepening requires some clarification that follows.

Due to abundance of petro-dollars in the region most Middle Eastern governments have been attracted to “shallow” finance. Shallow finance occurs when governments follow developmental strategies that distort financial prices including the interest rates and foreign exchange rates. As Shaw (1973) explains, shallow finance can be the result of a relatively strong government apparatus, a fairly weak level of indigenous entrepreneurship, or a relatively inefficient financial market. All three of these have been common in the Middle Eastern Countries. By distorting interest rates and foreign exchange rates, the governments of these countries have reduced the real rate of growth and the real size of financial relative to nonfinancial systems. In Muslim countries such as Malaysia and Indonesia where the strategy of “deepening” finance—a strategy of financial liberalization-- has been used the economic growth has accelerated. Financial repression (shallow finance) leads to a substantial increase in nominal rates earned on financial assets such as government securities and social trust funds. But these rates deflated by any broad index of prices for domestic goods and services will be rising less rapidly or falling. Then finance in the real sense is shallow, partly because it is being taxed by inflation. Where finance is shallow, the economy depends heavily on government fiscal budget and on its international capital accounts for savings and investment capital. Deepening eases the strain on taxation, reduces the loss of petro-dollars to foreign companies and countries, and moderates the demand for foreign savings. In addition to reversing capital flights, deepening also diverts savings from constantly going into real estate industry and will move the funds into economic activities with long-term positive effects on the economy. If the countries of the Middle East liberalize their financial policies and remove or reduce the distortions in their financial prices their liquidity reserves will increase. Then, the central banks in these countries easily build up their international currency reserves and find themselves much less in need of market intervention measures such as rations or licenses on the foreign exchange markets. Farmers and manufacturers substitute balances of financial assets for working capital that is normally in the form of wheat or rice or other commodity inventories that are costly to store or hold. Buyers and sellers give up barter exchanges when in all markets they can accumulate and use balances of liquid assets. Supply of financial assets expands relative to national income or in proportion to tangible wealth, and these assets will become available in different qualities. There will be a variety of financial assets with longer term maturities and more debtors gain access to financial markets. The pool of financial assets becomes diversified enabling the firms to optimize their capital structures. The expansion of the pool of financial assets provides the chance for lenders and investors to diversify their positions and reduce their risks. All of these can lead to greater capital formation and may accelerate the economy’s growth rate and its socio-political and moral progress. Shallow finance, on the other hand, hinders the real growth of the economy and causes universal poverty, political unrest, and oppression of dissent and continuation of government hegemony and control. Shallow finance will also cause economic injustice in the broader sense of the word than just the inequality in the distribution of income. Islam’s strictures against practices and policies that cause greater equality in the distribution of income have failed to create Muslim societies based on principles of economic justice. For example, Islam’s stricture against usury can lead to misallocation of funds among investment alternatives, less investments, much lower level of capital accumulation, and slower economic growth. This combined with the inability to transfer risk from the relatively less risk tolerant individuals to the ones who are willing and able to take more risk, can indeed reduce the economic growth and make the distribution of income less equal. Also, the inability to earn interest on small sums of money and being in need of Islamic bankers to invest one’s funds lead to less competition in the financial market, more severe case of agency problem, and much less transparency. All of these make the distribution of income even less equal. In addition, despite Islam’s strictures against usury, there has always been a substantial amount of money lending in the Middle East. Issawi (1982) notices that much of the money lending in the region has been undertaken by Christians, Jews, and Zoroastrians. He also acknowledges that Muslims have played a role in lending money at interest too. Since returns on risk-sharing were not regarded as usurious, a wide range of legal fictions and devices have been created and used from early Islamic times, to invest money in commercial and to a lesser extent industrial partnerships. All of this show the impracticality of the law against usury which, as we saw before, goes back to

classical Greek era and it is not even unique to Islamic law. Islam emphasizes the right to private property which is good. But one can find many examples from the past and present that show the confiscation of property from its owners has always been a normal practice in the region. It is also true that Islam assimilates many social relations, such as marriage, to property contracts. Yet, all kind of properties have in fact been precarious, and subject to confiscation. On another issue, Issawi (1982) notices that “Muslim laws of inheritance which excluded primogeniture strictly prescribed the shares of the various heirs, and allowed for very limited bequest, undoubtedly helped to break up large properties. By doing so, however, they made it more difficult to accumulate large blocks of capital and thus may have hindered investment. To circumvent inheritance laws, and ensure against confiscation, much property was converted into *Waqf* (mortmain), with an ostensibly charitable purpose. But here again the economic effect was usually adverse, since *waqf* were notoriously mismanaged. And, as noted earlier, divorce, polygamy, and inheritance laws, by weakening the family’s economic structure, may also have diminished the urge to accumulate.” It is obvious now that the slow rate of capital accumulation caused by certain strictures of Islam has been the source of sluggish economic growth and less social and moral progress in the region.

## CONCLUSION

This paper compared and contrasted the degree of economic justice achieved by the Muslim countries of the Middle East with the degree of it prevailed in the industrialized nations of the Western hemisphere. Economic justice in this paper has a broader meaning than merely achieving greater equality in the distribution of income. The author of this paper believes that openness of opportunities, tolerance, social and economic mobility, upholding of human rights and democratic values as well as greater equality in the distribution of income and wealth are all signs of achieving greater economic justice in a society. No one can deny that in regards to most of these qualities the Western countries are in a superior position than the Muslim nations of the Middle East. The recent political uprisings and the down fall of autocratic regimes in Tunisia, Egypt, Libya, and other countries have provided a golden opportunity for the citizens of each of these nations to establish a new system of government in their country. The different groups of political activists in these ancient nations are clashing and debating over what factors to consider when they attempt to establish their new political systems. Among them, are the traditional Islamic parties such as Muslim Brotherhood which is well organized and is trying to dominate the political process to incorporate, at least, some of the laws and teachings of Islam into the new constitutions that are being developed in these countries. One has to be opposed to these attempts if he/she accepts the ideas put forward by “Enlightenment” thinkers and presented in this paper from a book written by Friedman (2005). Enlightenment philosophers explained that accumulation of science and technology in the Western countries led to commerce, capital accumulation, and rapid economic growth and all of these together produced the relatively higher degree of moral progress and economic justice that we observe in these countries. Then the slow growth of the Middle Eastern countries caused by the policies of centralized and autocratic governments and conservative nature of Islam that encourages people to take the authority for granted, and accept, without any reservations, the hold of Muslim leaders and clerics upon their lives should be blamed for lack of adequate social development, democracy and moral progress in the region. Shallow finance practiced by the governments has also caused economic stagnation and injustice in the Middle East. People of the Middle Eastern countries do not really need a larger dosage of Islam in their political and economic systems. What they really need is less government involvement in their economic activities, a much larger dosage of entrepreneurship and private sector activities, and a high degree of financial deepening in their economies.

# **TEENAGE PREGNANCY: COPING WITH PREGNANCY AND SCHOOLING**

**Mokoena, S.K., Mji, A., Mukhola, M. S., Mokgobu, I., Marais, A.  
Tshwane University of Technology, South Africa  
Phiri, C., Venda University, South Africa**

## **ABSTRACT**

*The rate of teenage pregnancy in South Africa has reached proportions that are so scary that newspapers have come up with headlines such as "Pregnancy tsunami: Thousands of school girls in Gauteng alone are preparing to give birth." In fact, a member of the executive committee in one province intimated "... one school in Zululand in which 60 pupils fell pregnant in one year and that is not a development that you would want to associate with a school." As the teenage pregnancy problems are among school age children this suggests that this issue impacts directly on schooling. In fact some affected learners temporarily drop out of school while others leave schooling entirely. Those who return to school encounter the dual challenge and responsibility of being parents while being learners. As a result schoolwork gets affected and often results in poor scholastic performance. This paper is an integral part of a four phase study incorporating legal, social, health and educational aspects of teenage pregnancy. In particular, the aim here was to determine how the teenagers coped with pregnancy on the one end and performed at school on the other. In order to obtain a better perspective, we interviewed two sets of respondents from schools in two provinces bordering each other. The first were teenagers who had fallen pregnant. These teenagers were interviewed with the objective of gleaning insights from their experiences in respect of how they coped with the pregnancy and schooling. The second respondents were teachers. The interviews solicited the teachers' views about the impact and effects of teenage pregnancy in their schools. The study also established from the teachers how they assisted pregnant teenagers in keeping up with their schooling activities. The findings of this investigation should form a properly research account of how the pregnancy problem could be addressed in South Africa.*

## **INTRODUCTION**

Learner pregnancy is a global public problem in all aspects of life and has been a concern to health workers, community developers, industrialists, educationalists and parents. In South Africa, pregnancy rates among school going girls are escalating for various reasons. Learner pregnancy comes as inevitable interruption in education. In some instances, the affected learners drop out from school temporarily on the one hand, and on the other hand, the majority of these learners do not return to school. Those who return to school are always encountering the challenge of dual responsibility of parenting and being learners. As a result, the schoolwork is often resulting in poor scholastic performance which adds to the limited education and employment opportunities just to mention few examples of socio-economic challenges facing the country. The purpose of this paper is to investigate the perception on poor scholarly performance of learner pregnancy in the Mpumalanga and Limpopo Provinces of South Africa. The influence of other socio-cultural and economic environmental challenges will be mentioned; however the researchers will acknowledge their role on this crucial and sensitive discussion. Learner pregnancy has an impact on many areas of the pregnant girl's life. The life of the baby, family and the father of the baby are also affected (Marais et al, 2011). Chigona and Chetty (2007) argue that both pregnancy and parenting are the leading reasons girls give for dropping out of school.

## **HISTORICAL BACKGROUND**

The study conducted by the Human Science Research Council (HSRC) in 2009 on behalf of the Department of Basic Education in South Africa, report that there was “a perception in the country that there was an upsurge in teenage pregnancy, because the pregnancies were seen more often in schools, communities and amongst those collecting the Child Support Grant” (Department of Education, 2009). The study further found that learner pregnancy rates were higher in schools located in poor areas and in schools that were poorly resourced. In March 2011, “*News 24*” published an article arguing that in the KwaZulu-Natal Province, the Department of Education has recorded 17 260 pregnancies in schools on the 2010 academic year. In the Gauteng Province, in February 2011, the newspaper “*The Times*” published an article arguing that almost 5 000 schoolgirls in the province became pregnant in the 2009-2010 financial year and a shocking feature of the statistics is that 113 primary school girls became pregnant in the same period. The above statistics can be used to reflect how learner pregnancy has become a huge problem in schools.

## **RESEARCH METHODOLOGY**

The research methodology used in this paper was a combination of both qualitative and quantitative methods with large research strategy of exploratory and descriptive questionnaires. Burns and Grove (2003) indicate that exploratory studies are designed to increase the knowledge of the field of study. In addition, exploratory research allows the researchers to explore the dimensions of a phenomenon, the manner in which it is manifested and the other factors with which it is related. A descriptive study is defined as a collection of accurate data on the problem to be studied. According to Burns and Grove (2003:237), descriptive research is defined “as a way of discovering new meaning, describing what exists, determining the frequency with which something occurs and categorising information”. Interviews were also used for both teachers and learners to determine the impact of learner pregnancy on individuals affected by this phenomenon.

## **LEARNER PREGNANCY V/S POOR ACADEMIC PERFORMANCE**

Literatures on learner pregnancy provide many reasons for dropout by pregnant learners. Chigona and Chetty (2007) argue that mothering, peer pressure and school environment negatively affect “teen mothers” in coping with schooling. The HSRC report (2009:21) indicates that “the assumption that girls who drop out of school because of pregnancy would have continued their education may not be valid. Pregnancy may be the endpoint most directly associated with dropout but is not the cause”. In an interview with Ms Hlophe, an educator (not her real name), she echoed the same sentiments that learner pregnancy is an endpoint. This argument could be further supported by the KZN study incorporated to the HSRC report that for males, the inability to pay school fees and the need to work were the main reason for dropout, while for females, pregnancy and the inability to pay school fees were cited as reasons for dropout. Thus, the authors can argue that learner pregnancy and school dropout do share many common social and economic factors, of which the most significant are poverty and poor academic achievement. The authors have pursued further studies on learner pregnancy focusing on health and law; hence this paper is limited to education issues only.

The tables below provide a brief statistical picture on both Limpopo and Mpumalanga provinces. Table A provide the age and grades of the learners participated on this study. The total number of learners participated on this survey were 387 (that is, 196 Limpopo learners and 191 Mpumalanga learners). Table B and C provide for the sexual health information from school and home respectively according to the learners grades. These tables reflect that more than half of the participants are knowledgeable about sex health. It does appear, however, that the knowledge is related to sex and becoming pregnant rather than about pregnancy as a phenomenon.

The following are some of the learners’ response from the interviews conducted in both “*I know that a person falls pregnant after sexual contact. That’s the only thing I know, and that there is no menstruation during pregnancy.*” “*I had knowledge about pregnancy before. I got information from school. I was told that with pregnancy there is a possibility of dropping out of school and people will laugh at you*”. These responses have made the authors to reach a conclusion that learners get pregnant unplanned, but having knowledge about sex and its consequence to a certain extend. Table D provide data on learner pregnancy by province. The table portrays the Mpumalanga province to be much better compared to the Limpopo Province.

**Table A: Frequency distribution and percentages (%) of learners by age, grade and province**

Province	Age	Grade			Total
		10	11	12	
Limpopo	13	0 (0.0)	1 (0.5)	0 (0.0)	1 (0.5)
	14	2 (1.0)	0 (0.0)	0 (0.0)	2 (1.0)
	15	6 (3.1)	0 (0.0)	0 (0.0)	6 (3.1)
	16	8 (4.1)	0 (0.0)	0 (0.0)	8 (4.1)
	17	10 (5.1)	8 (4.1)	9 (4.6)	27 (13.8)
	18	1 (0.5)	13 (6.6)	37 (18.9)	51 (26.0)
	19	3 (1.5)	11 (5.6)	22 (11.2)	36 (18.4)
	20	1 (0.5)	2 (1.0)	22 (11.2)	25 (12.8)
	21	1 (0.5)	2 (1.0)	20 (10.2)	23 (11.7)
	22	0 (0.0)	0 (0.0)	9 (4.6)	9 (4.6)
	23	0 (0.0)	2 (1.0)	2 (1.0)	4 (2.0)
	24	0 (0.0)	0 (0.0)	3 (1.5)	3 (1.5)
	25	0 (0.0)	0 (0.0)	1 (0.5)	1 (0.5)
Total		32 (16.3)	39 (19.9)	125 (63.8)	196 (100)
Mpumalanga	12	0 (0.0)	0 (0.0)	1 (0.5)	1 (0.5)
	15	23 (12.0)	0 (0.0)	0 (0.0)	23 (12.0)
	16	50 (26.2)	4 (2.1)	0 (0.0)	54 (28.3)

Total	127 (32.8)	260 (67.2)	387 (100.0)

## CONCLUSION

The paper has demonstrated the fact that learner pregnancy is a problem in South Africa, despite the program run by both the Health and Education Departments on contraception and sexually transmittable diseases. Interrupted education or school drop out by girls are as a result of unplanned pregnancies. Regardless of their socio-economic background many have aspirations towards education. An unplanned pregnancy jeopardizes their chances of reaching such goals. Teenage mothers are not likely to achieve educationally or develop a significant career.

# INVESTIGATION OF HUMAN DEVELOPMENT IN KERMAN PROVINCE IN IRAN

**Mojtaba Mohammadnejadi Moodi**  
**Chabahar Maritime University, Iran**

## ABSTRACT

*Achieving all embracing development is one of the main goals of every government. Variables such as income per capita, saving and etc. have been used for comparison of countries achievements in last decades. But such variables only pay attention to the economic aspects of development, ignoring other effective factors of development. Human development index (HDI) was introduced as an indicator for all embracing development. Income, education and health are three main factors that play equal roles in this index. In the present paper first, human development index is calculated for every town and city of Kerman province in Iran and they are ranked on the basis of this index. Then, with regard to the point that giving equal weights to these three factors may be incorrect; with the use of Data Envelopment Analysis and output oriented model, the index was calculated again. The outputs of this model are three aforesaid variables and the input is a dummy variable with value of one. Ranking is done again. The finding of the study showed that except for the cities of Kerman, Rafsanjan and Sharehabak which stayed in the first, second and third ranks respectively, the ranking of other cities changed with Manoojan displaying the highest amount of change stepping from its former 12<sup>th</sup> position to 4<sup>th</sup> position in the new ranking scale.*

## INTRODUCTION

One of the most important aspects of human life is trying to improve his life standards, and to achieve greater welfare. Modern mechanisms of controlling societies which have mostly been developed in the last one hundred years, and are progressing rapidly, are all based on one basic and important principle, of which the development and progress of human societies stem. This principle originates from reconsidering the role and position of individual rights in societies, and thereby the role and position of governments in regulating the social, political, and economic relationships. If we arbitrarily accept that increasing the real income per capita is the best existing index for economic development, but without considering different secondary goals, and a deep understanding of value judgments of the income combination and distribution, we cannot call it economic welfare growth, let alone social welfare growth. We need a view of economic development which includes human development in it. For example, United Nations Development Programs focus on the concept and measurement of Human Development on the basis of Human Development Index. This index is not only based on true income, but also on such factors as life expectancy, adult literacy rate, and years of education. Therefore, ranking different regions and cities according to the Human Development Index can be substantially different from the ranking done based on the income per capita. Gross national product growth is not very important in itself, what is more important is the knowledge of using this money to improve human abilities. In most under-developed regions which mostly have a low human development level, the necessity of considering and revising efficiency is more pronounced due to the limitations of using the available resources. On the other hand, trying to get the most output out of the least amount of input is the main goal of all economic organizations in every society. Economic efficiency is the amount of useable product divided by the amount of needed resources for its production. Economic efficiency needs the solution of two problems. The first one is choosing the optimal combination of resources, and the other one is choosing a good method of production. In measuring the technical efficiency of different organizational units, different methods are used. Generally speaking, there are two basic methods for measuring the efficiency, Parametric and Non-parametric. In Parametric methods, a certain product

function is estimated according to different statistical and econometrical methods. Then, the efficiency is determined by using this function. But in Non-parametric methods, there is no need to estimate the product function. Data Envelopment Analysis is a Non-parametric method that compares the efficiency of different units in comparison to each other. In this technique, there is no need to understanding the product function, and no limitation in the number of the inputs and outputs. In this study, Data Envelopment Analysis, CCR Model, and Output-oriented BCC are used to assess the relative efficiency of different towns and cities of Kerman Province of Iran in relation to achieving the Human Development Goals.

## LITERATURE REVIEW

Nowadays, national reports on human development have become an important tool in discussing the status of this human index in different countries, and in investigating the challenges, and policies of human development. The first report of human development was published by Bangladesh in 1990, in which the conventional method of measuring the Human Development Index, that is giving equal weights to all its three factors, was employed.

Studying and measuring the Human Development Index by using Data Envelopment Analysis, or by other methods that give different weights to the three comprising factors, Mahlberg, M (2001) remeasured the Human Development Index with the help of Data Envelopment Analysis. In his study, he has used an output-oriented model including adult literacy rate, combined gross enrolment ratio, life expectancy at birth, GDP per capita, all of which are the comprising elements of Human Development Index. In this model, one dummy variable with the value of one is used. Using these results, he has reranked the countries with regard to Human Development Index according to the available resources.

Despotis (2004) has done a study about Human Development Index using Data Envelopment Analysis. He believes that conventional ranking of the countries according to the Human Development can be attributed to two reasons. First, some of the countries which have a better rate in all the three comprising factors of human development, that is adult literacy rate, life expectancy at birth, and GDP per capita, than other countries, will surely rank in higher positions. The second reason is that by allocating different weights to different variables, the ranking of countries which are not very different from each other will change. Considering these reasons, he used Data Envelopment Analysis. His study includes 27 countries of Asian and Australia. He came to the conclusion that Singapore, Hong Kong, and South Korea which ranked 1 to 3 in conventional ranking, got the score 1. In fact, they are on the border of efficiency in Data Envelopment Analysis and can form the reference group. In other words, the reference group for every country is a linear combination of the numbers related to these three countries. On the other hand, the results showed that these three countries got the best results among these 27 studied countries. Hong Kong was used 20 times, South Korea 17 times, and Singapore one time as the reference country.

Despotis (2004) in another article compared and remeasured the Human Development Index of 174 countries in the year 2000 using the Data Envelopment Analysis. The methodology of this research is exactly like the previous one. Then, according to the results obtained by Linear Planning Model, he reranks the countries with respect to efficiency in reaching the higher-levels human development standards. The findings reveal that 11 countries could reach the highest value set by DEA that is one. Ten of these countries were among the first eleven countries regarding Human Development Index ranking. The eleventh country with the score of 1 is Luxembourg whose previous rank was 17. This has been due to the fact that Luxembourg has had the highest GDP in the world in 2000, and the difference with the second country, United States, was 3900 \$. On the other hand, from among these 11 countries, Canada has been the first country in being used as the reference country, and has been used as the reference for 65% of the inefficient countries.

Karim Koshte and Zamanian (2004) have studied and analyzed the Human Development Indices in Sistan and Balouchestan Province of Iran from 1989 to 2000. They have also studied the development of these indices, development gap according to gender, and human poverty gap in the same period. They reached the conclusion that the overall Human Development Index of this province has improved, and increased from 0.336 in the year 1989 to over 0.569 in 2000, and this has been due to the increase in life expectancy, adult literacy rate, and the improvement of the number of enrolments in all the educational levels of this province. Furthermore, the human

development index based on gender has increased from 0.296 to 0.451, and this has been because of improvement of women education. And lastly, the human poverty index decreased from 49.63 to 32.66.

Feyz Zade (2003) conducted a study to compare the Human Development Index in Iran and its neighboring countries based on the 2003 report of Human Development. He expresses that although Iran's score of human development in this year was 0.719, which is less than its score in 2002, but a little more than its score in the previous years, Iran is the 106<sup>th</sup> country among these countries in 2003. And this is a big decline in comparison to its rank of 90<sup>th</sup> in 2001. The point is that among Iran's neighbors, excluding Afghanistan and Iraq, only Pakistan ranks below Iran in Human Development Index. Most countries such as Turkmenistan, Oman, and Azerbaijan have had a bigger improvement in their human development score. This is due to the fact that Iran's gross enrolment ratio decreased from 73% in 2001 to 64% in 2003.

## **DATA AND METHODOLOGY**

In this study, Human Development Index of different towns and cities of Kerman Province is measured by using the method introduced by United Nations, and then ranked according to these data. In the next stage, after considering this fact that giving equal weights to all the three elements of Human Development Index might not be fully correct, this index is measured again with the help of DEA, which is by giving different weights to different elements, provided that the sum of the scores for all the three elements equals 1 for each town. The towns are ranked again based on this new method, and the results are compared with the previous findings. All the data for this study were taken from Iran Statistics Center, and Governors Office of Kerman province. For analyzing the data, Win4Deap software, which is technical software for Data Envelopment Analysis, was employed.

### **Calculation of HDI**

Human Development Index is a componential index, comprising of three elements of income, health, and literacy rates of the society which are measured respectively according to income per capita, life expectancy at birth, and combined gross enrolment ratio.

The statistics relating to life expectancy at birth, gross town production, and combined gross enrolment ratios were not available in the data source. Thus, in order to reach the above-mentioned statistics, the following steps were taken. Life expectancy at birth is the number of years that a person is expected to live based on the normal conditions of the society, and the death and birth rate of that society. The data related to this variable were taken from the Organization of Management and Planning experts.

But the data for the gross national product were collected separately in economic, agricultural, fishing, and mining and other sections of the province. So, we had to calculate the gross province production based on these data. To this end, we considered a variable for each section to show the percentages (For calculating the weights, the variables must be relative). So that, considering these weights, every town's share of gross national product can be extracted. What is important is that these variables should be so chosen that they can be a good representative for that section, and on the other hand, their data must be available, or can be calculated.

The combined gross enrolment ratio is the number of all the students of the country divided by the number of people above 6 years old, and is always a number between 0 and 1.

### **Efficiency**

There are various definitions for efficiency, some of which are mentioned here:

Emerson, (1912): Efficiency is doing a work in the most optimal way possible, by the most qualified person in the best place and best time.

Summanth, D. (1985) believes that efficiency is the amount of real output divided by the standard or expected output.

Dimock (1931) defines efficiency as the result divided by the used input. In defining efficiency, we should determine the relative limits of the standard

## Data Envelopment Analysis

The Data Envelopment Analysis method refers to the PhD dissertation of Rhodes, supervised by Dr. Cooper. Data Envelopment Analysis is a mathematical planning technique which measures the relative efficiency of a team of deciding units, or in other words, Data Envelopment Analysis is a mathematical planning technique for measuring relative performances of organizational units which have different inputs and outputs, which it is difficult to measure and compare their efficiency.

For using the Data Envelopment Analysis technique, and evaluating each of the deciding units, we should design a linear planning model, and compare the relative efficiency of each of these DUMs. Thus, we should have as many linear planning models as the number of deciding units. And at the end, by solving these models, the relative efficiency of each unit is determined. The most important part of the Data Envelopment Analysis is finding the best virtual unit by combining all the real units. If the virtual unit is better than the studied unit, it means if the virtual unit gives a better output than the real one by using the same inputs, or having the same output with using less input, the studied unit is not effective.

## Data Envelopment Analysis Models

The linear planning model of Data Envelopment Analysis is as follows:

$$\begin{aligned}
 (1) \quad & \text{Max } Z_0 = \frac{\sum_{i=1}^s u_r y_{r0}}{\sum_{i=1}^m v_i x_{i0}} \\
 & st : \quad \quad \quad (j = 0, 1, \dots, n) \\
 & \frac{\sum_{i=1}^s u_r y_{r0}}{\sum_{i=1}^m v_i x_{i0}} \leq 1 \\
 & u_r, v_i \geq 0
 \end{aligned}$$

The deciding unit being studied is called the Zero unit. This means that we want to compare the efficiency of the Zero unit with those of other units. The main models of Data Envelopment Analysis are divided into two types: CCR models and BCC models. Both of these models can be studied from two different perspectives. They are typically called Input-oriented and Output-oriented approaches. Even these two approaches are studied from two perspectives: The primary model is through maximizing and is called Multiplier model and the dual model which is through minimizing and is called Envelopment model.

## CCR Model

This model was first introduced by Charnes, Cooper and Rhodes in 1978, and it was named after the initial letters of these people. The primary model of CCR for the Zero unit can be written as follows.

(2) output oriented multiplier CCR model :

$$Max Z_0 = \sum_{i=1}^m v_i x_{i0}$$

*S.t :*

$$\sum_{r=1}^s u_r y_{r0} = 1$$

$$\sum_{r=1}^s u_r y_{rj} - \sum_{i=1}^m v_i x_{ij} \leq 0$$

$$u_r, v_i \geq 0$$

## BCC Model

This model was proposed by Banker, Charnes and Cooper in (1984), and it was named after the first letters of these researchers. BCC model is just like CCR model, with variable W added to the model as the criterion variable. The Input-oriented Multiplier model of BCC is as follows.

(3) output oriented multiplier BCC model :

$$Max Z_0 = \sum_{i=1}^m v_i x_{i0} + w$$

*S.t :*

$$\sum_{r=1}^s u_r y_{r0} = 1$$

$$\sum_{r=1}^s u_r y_{rj} - \sum_{i=1}^m v_i x_{ij} + w \leq 0$$

$$u_r, v_i \geq 0 \quad w \text{ free in sign}$$

## A & P Model

This is a special version of DEA, in which the units are allowed to have efficiency values more than one. In fact, when the ranking of the studied units is the goal, for comparing the ranks of efficient units, which had efficiency value of 1, this model is used. The A & P Model in its variable efficiency version is as follows. If the fixed efficiency is the goal, it is necessary to delete the W variable from the model.

(3) A & P model :

$$Max Z_0 = \sum_{r=1}^s u_r y_{r0} + w$$

*S.t :*

$$\sum_{i=1}^m v_i x_{i0}$$

$$\sum_{r=1}^s u_r y_{rj} - \sum_{i=1}^m v_i x_{ij} + w \leq 0$$

$$u_r, v_i \geq 0 \quad w \text{ free in sign}$$

## RESULT AND DISCUSSION

According to what was mentioned, using the data of the aforesaid variables, we try to measure these indices. The obtained results are displayed in table 1.

Table 1. The components and indices of Human Development in Kerman Province

Town	HDI	Health index	Education index	Income index
Baft	0.633	0.733	0.694	0.472
Bardsir	0.645	0.770	0.692	0.472
Bam	0.614	0.750	0.735	0.357
Jiroft	0.609	0.701	0.736	0.390
Ravar	0.604	0.739	0.643	0.429
Rafsanjan	0.651	0.799	0.695	0.459
Zarand	0.585	0.750	0.605	0.399
Sirjan	0.631	0.737	0.703	0.451
Sharebabak	0.651	0.783	0.743	0.425
Anbar Abad	0.605	0.802	0.627	0.386
Kerman	0.663	0.708	0.775	0.507
Kahnootj	0.617	0.757	0.616	0.479
Manoojan	0.597	0.813	0.661	0.315
average	0.623	0.757	0.686	0.426
standard deviation	24.12	35.00	53.19	54.79

Source : Researcher calculations

Based on these results, it can be seen that Kerman has had the highest score in the income index, and Manoojan has had the lowest income index. Baft, Bardsir, Ravar, Rafsanjan, Sirjan, Kerman, and Kahnootj were above the average income index, but Bam, Jiroft, Zarand, Sharebabak, Anbar Abad, and Manoojan were below the average income index. With regard to educational standards, Manoojan was the best town, and Jiroft was the worst one. Baft, Bam, Jiroft, Sirjan, Rafsanjan, Sharebabak, and Kerman ranked in a higher position than the average. While Bardsir, Ravar, Zarand, Anbar Abad, Kahnootj, and Manoojan were below the average.

But regarding the health factor, the studied component is in its highest in Manoojan. While Jiroft had the lowest level in this factor. Bardsir, Rafsanjan, Sharebabak, Anbar Abad, and Manoojan were above the average, but all the other towns were below the average.

In Human Development Index, Kerman stood at the first rank, scoring 0.663 which was the highest score. Zarand scored 0.585 and stood at the lowest rank. Baft, Bardsir, Rafsanjan, Sirjan, Sharebabak, and Kerman could get a higher score than the average.

The last row of table 1 shows the standard deviation of the distribution of each index in different towns of Kerman province. According to this statistics, it can be said that the distribution of the health index is more homogeneous than the other two indices. And the distribution of the income index is not even.

In Table 2, according to Table 1, all the towns of Kerman province are ranked according to each index, and in the end according to the Human Development Index.

Table 2. Ranking of towns in Kerman province based on components and indices of Human Development Index

Town	Rank in HDI	Rank in health component	Rank in education component	Rank in income component
------	-------------	--------------------------	-----------------------------	--------------------------

Baft	5	11	7	4
Bardsir	4	5	8	3
Bam	8	8	4	12
Jiroft	9	11	3	10
Ravar	11	9	10	7
Rafsanjan	2	3	6	5
Zarand	13	7	13	7
Sirjan	6	10	5	6
Sharebabak	3	4	2	8
Anbar Abad	10	2	11	11
Kerman	1	12	1	1
Kahnooj	7	6	12	2
Manoojan	12	1	9	13

Source : Researcher calculations

In the next stage, the cities and towns of Kerman province are reranked according to the Data Envelopment Analysis. The used model is an Input-oriented model, in which the outputs are the main elements of Human Development Index, and its input is a virtual variable with the value of one. The results of this model are displayed in Table 3.

Table 3: Ranking of town and cities of Kerman province in HID using DEA

Town	Efficiency score	Efficiency score using A&P	Rank in HDI	Rank by DEA	Difference of DEA & HDI rank
Baft	0.945	-	5	11	-6
Bardsir	1	1	4	5	-1
Bam	0.979	-	8	7	1
Jiroft	0.949	-	9	8	2
Ravar	0.925	-	11	13	-2
Rafsanjan	1	1.026	2	2	0
Zarand	0.935	-	13	12	1
Sirjan	0.951	-	6	10	-4
Sharebabak	1	1.024	3	3	0
Anbar Abad	0.995	-	10	6	4
Kerman	1	1.099	1	1	0
Kahnooj	0.952	-	7	9	-2
Manoojan	1	1.014	12	4	8

Source : Researcher calculations

The results show that Kerman, Rafsanjan, and Shahrehabak are the first, second, and third towns regarding Human Development Index. And even changing the weights does not affect their ranks, but this is not true for other towns. Manoojan, Anbar Abad, Jiroft, Zarand, and Bam improved eight, four, two, one, and one ranks respectively. However, the other towns' ranks declined, and Baft declined 6 ranks.

# **ANALYSIS OF A CONVERGED WIRELESS SECURITY PLATFORM IN RURAL COMMUNITY: DWESA/CWEBE IN SOUTH AFRICA**

**Tonderai Muchenje and Progress Kariga  
Tshwane University of Technology, South Africa**

## **ABSTRACT**

*This paper provides an overview of security issues on a converged WiFi and WiMAX wireless networks. It also seeks to provide a comparative overview of other alternative wireless convergence scenarios which can be used depending on suitability applications requirement capabilities and availability of coverage. This research was conducted to investigate and evaluate the wireless technologies security and also to analyze how the convergence of WiFi and WiMAX address confidentiality, integrity and availability (CIA) in a rural setting, Dwesa/Cwebe was selected as our test bed for our project. Our findings reveal that inherent WiFi and WiMAX wireless networks protocols could not achieve a robust and seamless converged wireless networks.*

## **INTRODUCTION**

Wireless networks are some of the important technological development of this century. Companies, institutions and individuals have benefited from them, by increasing productivity and sharing information without undue concern about location and position, as long as they are within the wireless signal range. Though the wireless network has passed recognized benefits on its adopters, its security issues still remains an open question. Until the wireless network security has reached the equivalent security level provided by the wired networks, IT professional will find it difficult to adopt it as an alternative solution.

The 802.11 networks standards came to existence in 1999, with the 802.11b being the most deployed. The 802.11 wireless standards suffered some security flaws whereby their standard security method – the Wired Equivalent Protocol (WEP) mechanism – was cracked (Cam-Winget *et. al* 2003; Black Box 2005). Since concerns regarding security attacks on wireless networks are becoming costly, so there is a need for a high level of knowledge and skill to provide a robust network solution. The Institute of Electrical and Electronics Engineers (IEEE), Internet Engineers Task Force (IETF) and the Wireless Fidelity (WiFi) Alliance have come up with some interim and approved standard mechanisms to secure the 802.11 wireless networks, while 802.16 and the WiMAX Forum are looking to Worldwide Interoperability for Microwave Access (WiMAX) broadband wireless network specifications. These two institutes are in their development are trying to address the short coming experienced in the 802.11 wireless networks. The WiMAX has many capabilities ranging from backhauling WiFi, cellular connectivity, rural connectivity, residential and enterprise mobile support connections (Westech Communications Inc 2005).

This paper presents an overview of the security issues in converged of WiFi and WiMAX wireless networks. The paper also outline a comparison of possible convergences scenarios also evaluates them on their suitability in providing suitable and cost-effective solution to a rural setting. For our investigation and experimental purposes, we chose Dwesa/Cwebe as example of a rural setting. The aim of our investigation is to come up with the best practices in securing rurally deployed converged wireless networks for the fore-mentioned rural community.

# CHALLENGES IN WIRELESS NETWORKS

As much as the wireless networks have brought about major development in the way the information is shared security is one of the major concerns. We define security as protection of data being transmitted over a converged wireless networks. It is important to understand the full range of problems that security systems need to address. These needs are confidentiality, integrity and authentication (CIA) can be defined as follows:

## **Confidentiality**

Allowing only that the intended legitimate recipients to read encrypted messages (information).

## **Integrity**

Can be referred to as ensuring that another party has not altered messages after it has been sent.

## **Authentication**

This is making sure that parties sending messages or receiving messages, are who they say they are, and have the right to undertake such actions

On wired networks it has been exhaustively researched and there are many mechanisms available to provide confidentiality, integrity and authentication of information (CIA). Virtual Private Networks (VPNs), Internet Protocol Security (IPSec), Intrusion Detection Systems (IDS) and firewalls are just examples amongst various security mechanisms that has been proposed to address security issues in wired networks

The major problem when securing the wireless signal is in its mode of transmission (Griffith 2005). The wireless signal is transmitted through electromagnetic waves, which cannot be physically contained. Being communicated through the air makes them easy to intercept by anyone with the right transceiver equipment.

The IEEE had ratified the 802.11 wireless protocols with basic methods to secure such a network, namely disabling SSID, Media Access Control (MAC) address filtering and the WEP mechanism (King 2007). These were mechanisms thought to provide the CIA elements on the wireless networks. Advances in technology and software development later compromised these mechanisms leaving the network vulnerable to malicious attacks; even recent mechanisms still exhibit weak protection of management messages (Kismet 2006). WiMAX builds on the experience of security problems of 802.11 wireless networks. It was developed to solve most of the wireless LAN shortcomings especially security, and also quality of service, high-speed data rates and long distance connectivity coverage (Westech Communication Inc 2005). WiMAX, as a new technology on the market still undergoing experimentation, seems not to have fully solved the security flaws of wireless LAN. WiMAX still lacks mutual authentication, and is susceptible to replay attacks, spoofing of MAC address of the Subscriber Station (SS) and the PMK authorization vulnerabilities. Ever since the initial release of WiMAX in early 2004 (802.16d), the IEEE and the WiMAX Forum have been improving the standard incorporating some other capabilities to enhance security and mobility (Xu *et. al* 2006). Another major drawback in the deployment of WiMAX for connectivity is the large initial expense involved.

In addition to that, there is also a need to consider the security protocols and mechanisms within the context of the applications in a converged wireless network. Especially in a rural setting, where resources are at a premium, the impact of security protocols needs to be weighed against the requirements of the users. There are needs to consider end user needs in terms of lack of qualified network management, limited bandwidth, and specialized applications.

Confidentiality, in wireless networks is a fundamental concern for a secured transmission. The intended recipient should only receive the information transmitted. The message authentication provides integrity to both the message sender and receiver. The wireless link should always be available and not be susceptible to malicious attacks, which rob the end-user of availability (denial of service attacks) (Xu *et. al* 2006).

There are many attacks, which can be launched to compromise authentication mechanisms or protocols. Two common attacks that are especially effective against wireless networks are the message replay attack and the man in the middle attack. The message replay attack acts principally on the authentication and authentication key formation protocols, while the man in the middle (MiTM) attack usually occurs when the security

mechanism implemented does not provide mutual authentication. Other attacks known to occur include session hijacking, reflection attacks and other attacks due to misuse of cryptographic services. These security issues must be addressed for wireless network to reach equivalent security provided by wired networks.

## **DEFINITION OF WIRELESS CONVERGENCE**

The term convergence within the context of this paper refers to the combination of the two similar wireless networks, namely Wi-Fi (802.11) and WiMAX (802.16). The emergence of wireless networks is thought to be a crucial tool in “bridging the digital divide” (Best 2002). It enables many more people to become connected to online resources without the worry and cost of a wired connection. While wireless technologies had been broadly adopted by homes, organizations and research institutions in developed countries, the idea of extending existing wireless technologies to offer a cost effective solution to the rural communities arose. Wi-Fi was the first commonly accepted wireless protocol to add flexibility and mobility to the Ethernet network thereby opening a whole set of new use cases for Ethernet technology (Dymond 2003). Although Wi-Fi extended the capabilities of Ethernet; it did not solve networking issues concerning security, high-speed access and wide area coverage. In 2004 the IEEE 802.16 wireless

Standard was ratified to address the problems, which had been identified in Wi-Fi technology. Besides improved security and parallel communications, 802.16 should operate in a 50km line of site radius. The 802.16 standard is seen mainly as a wireless technology, which can support high-speed transmission of data, voice and video. To solve the rural connectivity in a cost effective manner, the University of Fort Hare conceptualized a convergence of the two wireless technologies at Dwesa/Cwebe rural setting. The IEEE 802.16 wireless standards provides for long distance rural connectivity while Wi-Fi is the end user access technology, owing to the widespread adoption of this technology in cheap end-user devices. To date there is no 802.16 wireless standard-enabled end user devices with broad adoption on the market. The converged wireless networks offered a number of benefits (Computer Science Corporation 2005), which are:

- Significantly reduced costs
- Effective communication
- Productivity Enhancements
- Simplicity
- Cost control
- Flexibility and scalability
- Increased Security

Some drawback of the convergence may be weak level of reliability of data, complexity of maintenance, low service and infrastructure upgradeability to suit rapid change in technology.

## **ALTERNATIVE WIRELESS CONVERGENCE**

This section provides a comparative discussion of other convergence scenarios and their unsuitability in achieving wireless convergence in providing services to mobile users and wireless Internet connectivity.

### **WiFi vs. Bluetooth**

Bluetooth and Wi-Fi uses the same 2.4GHz unlicensed radio spectrum. There are important communication technologies that provide different functionalities to different indoor wireless applications (Groupe Ingenico 2007). Bluetooth is a short range (~10metres) a wireless technology suitable for data file from one device to another in a close proximity. The Bluetooth exist in various devices such as phones, printers, personal digital assistance and modems and computers. Due to low bandwidth of Bluetooth, it is not effective to set up a network for remote applications. Therefore WiFi technology's is a better networking consideration for accessing files (TeleDynamics Communication 2007). The 16 bit Personal Identification Number (PIN) used for Bluetooth authentication and data encryption is not robust compared to the 802.11 security enhanced protocol used in Wi-Fi (Groupe Ingenico 2007; Crookston 2004).

## WiMAX vs. UTMS

Though the mobile technologies provide ability for users to use it as an access technology, its data rates speeds do not give competition to WiMAX. Theoretically the mobile technologies have data speeds from 115kbps for General Packet Radio Service (GPRS), 384 Kbps for Universal Mobile Telecommunications System (UTMS) and 14.4Mbps for High-Speed Downlink Packet Access (HSPDA) while WiMAX offer high data speeds of up to 70Mbps for coverage of 50km. As much as the HSPDA can provide a much faster theoretical maximum data rate of 14.4Mbps with a kilometer making it only suitable for short distance access technology (Vile 2006). Similarly to other mobile technologies WiMAX have the same capabilities to transmit data and voice. The choice of using mobile technologies in transmitting voice is more expensive compared to the VoIP/WiMAX as to WCDMA/HSDPA. The HSDPA uses a users' Subscriber Identification Module (SIM) card for authentication, while the WiMAX supports the strong modern cryptographic algorithms which is more robust to protect secret data transmissions [15]. The overall cost for the WiMAX equipment is much lower as compared to the UMTS. The main advantage of using the UTMS cellular system is that, its infrastructure for 3rd Generation mobile network (3G), HSPDA, GPRS and Evolutionarily Distinct and Globally Endangered (EDGE) is already there while the WiMAX requires a new infrastructure setup for it to operate. More people prefer UTMS for mobile communication compared to WiMAX since it can be easily available.

## WiFi vs. WiMAX

These two wireless technologies have common components in their operations with a major difference in the communication range. There is a need for many WiFi access point in order to cover the same distance covered by one WiMAX base station. Hence it is costly to deploy WiFi for greater distances. WiFi is a an access technology suitable for indoor use due to its short ranges as an extension to LAN technology while the WiMAX was designed for long distance , backhauling and optimized for Metropolitan Area Network (MAN). As much as the WiFi has an advantage of providing end user access capabilities, it an only support a limited number of users (not more than 12 per base station) whereas the WiMAX base station can support an average of about five hundred users. The WiMAX base station has a scheduling algorithm (First-In First-Out) which allocates a variable channel for each subscriber station to minimize the congestion and degrading throughput other than the random queue assignment based on MAC address in WiFi where as. The WiMAX uses a licensed and unlicensed spectrum where as the WiFi uses unlicensed spectrum with a limited channel bandwidth of 20 MHz. Due to the fact that WiMAX can support high bandwidth , low cost of ownership and provides backhaul capabilities it therefore can be considered as the future broadband access technology to bridge the 'digital divide'. The WiMAX is more reliable and have better QoS as it was designed with security as a major priority since the frailness of WiFi [16]. Despite the similarity in equipment cost, WiMAX technology requires a costly infrastructure while the WiFi can be easily install using low cost access points. In conclusion, WiFi has been adopted as an extension for Ethernet some years ago making it a mature technology as compared to the WiMAX which is currently license assignments and infrastructure deployment.

## 802.11 wireless lan (wlan)

The first 802.11 wireless network standards were developed in 1997 as an extension to the Local Area Network (LAN) (Black Box 2005). It was known as wireless Ethernet that only supported a maximum speed up to 2mbps. Frequency Hopping Spread Spectrum (FHSS) and Direct Sequence Spread Spectrum (DSSS) were the modulation techniques supported. There are three well known 802.11 wireless family standard widely used today.

### 802.11 wireless standard family

**802.11b** The 802.11b is a refined standard for the original 802.11 and was successful due to its high data rates. 802.11b is the most widely deployed wireless network within the 802.11 wireless family (Black Box 2005; Cam-Winget 2003). 802.11b supports data rates of up to 11Mbps and uses the DSSS modulation technique that is more reliable than the FHSS.

**802.11a** The IEEE 802.11a operates in the 5 GHz band with a maximum data rate of 54Mbps (IEEE 2003). This standard was ratified almost at the same time as was 802.11b, but its hardware was only made available in 2001 due to lack of availability of the frequency band components (Gast 2002; Morrow 2004; Wikipedia 2006). The major disadvantage in deploying 802.11a with the other 802.11 standards b and g is that they cannot co-exist, as they operate on different frequency bands. 802.11b/g operates on the 2.4 GHz spectrum (Gast 2002). There are some wireless card and access points which are compatible to all the three standards thereby supporting the 2.4GHz and 5GHz frequencies e.g. Orinoco 11a/b/g (Morrow 2004).

**802.11g** The IEEE 802.11g wireless standard also operates on the 2.4 GHz band and has similar range and characteristics as the 802.11b. It has a raw data rate of 54Mbps. The 802.11g has backward compatibility with 802.11b and differs only on the modulation technique; it uses Orthogonal Frequency Division Multiplexing (OFDM). This then makes the 802.11b devices not able to pick the signal from the 802.11g devices (Morrow 2004)

## Security issues on WLAN

Security is considered to be one of the biggest challenges when deploying a wireless network. Despite the introduction of the more effective 802.11i security standard, existing WLANs are not being secured properly (IEEE 2001). According to a survey undertaken in Johannesburg, South Africa, in July 2006 only two of two hundred and seventy two networks used 802.11i mechanism in securing their wireless networks (Rensburg 2006).

In accordance with the IEEE and the Wi-Fi Alliance there are a number of recommendations and best practices that were put forward to assure security of WLAN. WEP was the first protocol that was developed to provide confidentiality, integrity and authentication for data in transmission. The aims of WEP were not long lived due to a number of vulnerabilities (Wexler 2004) thereby letting unauthorized people to gain access to the wireless network.

The WEP mechanism has not been considered to be a solution for securing WLAN ever since it was compromised. Wi-Fi Protected Access (WPA) was then introduced in 2003 as an interim solution to WEP. WPA has two implementation flavors, WPA-PSK which is similar to the WEP with better authentication and encryption and WPA Enterprise mode, which uses the 802.1X protocol, RADIUS server as a back-end authentication protocol and Temporal Key Integrity Protocol (TKIP). A Message Integrity Check (MIC) is used to monitor information tampering by a hacker (Cam-Winget 2003). Table 1 illustrates a comparison of WPA technologies.

WPA was developed in 2003 as a short-term solution in fixing the security problem awaiting the ratification of the 802.11i in 2004. The 802.11i security standard for wireless local networks is similar to the WPA though it was designed with some improvements in terms of encryption mechanism. The 802.11i architecture contains the following components: 802.1X for authentication (Rensburg 2006) (entailing the use of EAP and an authentication server), Robust Security Network (RSN) for keeping track of associations, and AES-based Counter Mode with Cipher Block Chaining Message Authentication Code Protocol (CCMP) to provide confidentiality, integrity and origin authentication (Cam-Winget 2003). It also uses the same 802.1X port-access control protocol for better key management and a four way hand shake. This means that centralized security complements proven session key exchange technology in the latest standard.

*Table 1: Protocols of the WPA and WPA2 technologies*

<b>WPA Personal Mode</b>	<b>WPA2 Personal Mode</b>
Authentication: PSK	Authentication: PSK
Encryption: TKIP/MIC	Encryption: AES-CCM
<b>WPA Enterprise Mode</b>	<b>WPA2 Enterprise Mode</b>
Authentication: 802.1X/EAP	Authentication: 802.1X/EAP
Encryption: TKIP/MIC	Encryption: AES-CCM

Although there are specified mechanisms that have been postulated to be used in the securing of wireless LANs, organizations are still trusting virtual private networks (VPN) and firewalls to protect their highly sensitive data (Mujinga 2005). VPN may seem to be an attractive solution in securing wireless networks but there are a number of issues, which have to be considered before implementing the solution. When the organization has a VPN in place, it becomes easy and cost effective to extend it to wireless networks. There are two most common ways in which VPN can be implemented namely; IPSec and SSL

## THE 802.16 WIRELESS NETWORK STANDARD

WiMAX is the industry name for the 802.16 set of standards. It is an emerging technology that delivers carrier –class, high speed, wireless broadband at a much lower cost than the cellular services while covering large distances than Wi-Fi. It has been designed to be a cost-effective way to deliver broadband over a wide area. WiMAX has standardized broadband-wireless-access technology and is intended to handle high-quality voice, data and video services while offering a high quality of service (QoS). WiMAX is classified as in the Wireless Metropolitan Area Network (WMAN) that operates in between 10 and 66 GHz Line of Sight and 2-11GHz Non Line of Sight (Westech Communication 2005). Table 2 shows the frequency band where other 802.16 standards functions.

*Table 2: The evolution of IEEE 802.16 standard*

	<b>IEEE 802.16</b>	<b>IEEE 802.16 Rev'd</b>	<b>IEEE 802.16e</b>
Completed	Dec 2001	May 2004	Est. Mid-2005
Spectrum	10-66GHz	2-11GHz	2-6 GHz
Application	Backhaul	Wireless DSL and Backhaul	Mobile Internet
Channel Condition	Line of Sight only	Non-Line of Sight	Non-Line of Sight
Bit Rate	32-134 Mbps at 28 MHz Channelization	Up to 75Mbps at 20 MHz Channelization	Up to 16Mbps at 5-MHz Channelization
Modulation	QPSK, 16 QAM and 64 QAM	OFDM 256, OFDMA 2048 QPSK, 16 QAM , 64 QAM	Same as 802.16d, Scalable OFDMA
Channel Bandwidth	20, 25 and 28 MHz	Selectable Channel Bandwidth between 1.5 and 20 MHz	Same as 802.16d

[http://www.wimaxforum.org/technology/downloads/Can\\_WiMAX\\_Address\\_Your\\_Applications\\_final.pdf](http://www.wimaxforum.org/technology/downloads/Can_WiMAX_Address_Your_Applications_final.pdf),  
Westech Communication Inc, October 3, 2006.

IEEE 802.16 was developed after the security failures that weighted down the progress of IEEE 802.11 networks. The IEEE 802.16 Working Group in their design for a robust mechanism incorporated DOCSIS a pre-existing standard to solve last mile problems for cables. Recognizing the importance of security, the 802.16 working groups are busy designing several mechanisms and protocols to protect the service provider from theft of service, and to protect the customer from unauthorized information disclosure (Barbeau 2005).

## WIMAX SECURITY ISSUES

In this section an overview of the security issues in WiMAX is presented. The overview will provide how WiMAX tends to address confidentiality, integrity and authentication.

### Authentication

Authentication is a very important process which has been present to restrict network users from utilizing the services which they are only allowed. From the 802.16 MAC protocol stack, physical layer is below the security sub-layer where a secure transport communication process exists. This means then the physical layer

communication is sent on clear text which makes it vulnerable to attacks such as jamming of the radio spectrum water torture attack and scrambling (Johnson 2004; Ansari 2007). These attacks are made possible since there are no sufficient techniques available to protect physical layer. Ever since the development of WiMAX, mutual authentication has been a major problem. The Base Station (BS) is the only entity which authenticates the Subscriber station, leaving the Privacy and Key Management (PKM) vulnerable to forgery or replay attacks. The only way this problem can be managed is to include an authentication mechanism which provides mutual authentication. The IEEE 802.16 Working Group solved the problem with an amendment added to the current 802.16e to support Extensible Authentication Protocol to WiMAX networks for more details on EAP (Johnson 2004).

## **Confidentiality**

In WiMAX scenario the first management messages are not encrypted. This can provide vital security cipher suite information to a person intending to get confidential user information. An attacker can passively (eavesdropping user traffic) listen to the communication between the BS and the SS. The PKM protocol uses the Temporal Encryption Key (TEK) sequence space to encrypt messages. The use of the sequence number to differentiate messages is subject to replay attacks. Since the early version of 802.16 uses the DES in CBC for data encryption, it can only provide a robust security up to  $2^{32}$  of the 64 blocks (Johnson 2004; Ansari 2007), making the security diminish as the data rate goes over 6.36Mbps. The introduction of the 802.16e standard tried to solve the data encryption and key management failure in the WiMAX initial standards. The 802.16e data encryption incorporates the AES-CCM which could encrypt the payload of the MAC PDUs. The advantage of using the AES-CCM compared to DES-CBC is in its encryption of the authenticated data and protection of the Generic MAC header (GMH). The 802.16e designers thought of using the AES-CCM for a based on a wide consideration such as co-exists with the 802.11i security standard (Johnson 2004).

## **Integrity**

The initial 802.16 standard did not include the data traffic protection mechanism. This meant that forgery and data modification attacks were prevalent. Hence the 802.16 introduced a CBC-MAC as a component of the AES-CCM for protecting the integrity of the payload of the MAC PDUs (Ansari 2007).

## **DWESA/CWEBE COMMUNITY SETTING**

This research paper is providing a background information to the ongoing investigation of the Telecommunication platform set at Dwesa/Cwebe. Dwesa/ Cwebe are two rural districts located on the Eastern Coastline of the Transkei, within the Eastern Cape Province of South Africa. Dwesa is on the southern side of Mbashe River, while the Cwebe is on the northern side.

Figure 2 shows the whole network currently in place at the Dwesa/Cwebe site. The rural area is isolated from the rest of the world not only by its remote location, but also through the “digital divide”. The University of Fort Hare and Rhodes University, sponsored by the Telkom Centre of Excellence (CoE) are deploying a telecommunication platform at the site. This multi-purpose Information Communication Technology (ICT) infrastructure is intended to help people in the area to gain access to products and services, as well as gaining important information technology knowledge and skills. Numerous projects are underway to fulfill these goals and to place the total ownership of the projects in the hands of the community.

The IP converged wired and wireless network itself was designed and deployed as shown in Figure 1 (Whittington 2005). Our research on how security issues should be managed in such a converged network.

## **SECURITY CONSIDERATIONS**

The applications which are to be deployed at Dwesa/Cwebe telecommunication platform test will provide the following services:

- VoIP (as the area has poor coverage from cellular networks like Vodacom, MTN and few Telkom land lines)
- An e-commerce platform with shopping mall, e-government and billing services, e-learning
- Internet services: email, SMS, file sharing etc.

*Figure 6: IP Converged wired and wireless network in Dwesa /Cwebe*

Source: Wireless Security Corporation, VPN and IPSec: Imperfect Solution for Wireless Security

Our first step was thus securing each segment of the network using the inherent mechanisms considering the performance cost and effectiveness.

The major security consideration was on the interactions of the wireless networks devices taking the vulnerabilities and threat impact through impact analysis; e.g. shared resources between the wireless networks link and users such as RADIUS servers. We also considered network independent mechanisms such as IPSec or VPN.

Finally we need to optimize the security on the network according to the application requirements.

## INITIAL FINDINGS

The security mechanisms of each of the wireless technologies that comprise the network have already been discussed. As we have seen, the weakest link of the chain can be the WLAN segment. WLAN should be implemented using the 802.11i standard. This will probably not be possible right away in this project because of hardware incapacibilities of the Cisco Aironet 1100 AP to support 802.11i protocol standard. Another solution may have to be implemented which might be a WPA Enterprise mode using the TKIP for encryption.

We expect that IPSec and VPN should not be implemented, as they will impact on the cost of implementation and performance (Wireless Security Corporation; Wongthavarawat 2006). The only main advantage of using IPSec /VPN is that they can be implemented independently of a particular network, so they will be suitable for some applications like the e-commerce platform. However they are not suited to other applications like accessing the Internet.

According to WiMAX security findings, the initial 802.16d though a provided high-data speeds and a larger wireless coverage as compared to the WiFi technology, it had some security flaws which needed addressing. This initial 802.16d had a weaker data encryption mechanism, 3DES which later replaced by AES-CCM in the mobile WiMAX (802.16e). The authentication and PKM enhanced access control by introducing PKM-EAP.

As the security mechanisms of these two wireless networks still could not provide robust and seamless security a Point-to-Point Protocol tunneling with MPPE security infrastructure was recommended. Currently,

there are test underway in evaluating Point-to Point Protocol over Ethernet (PPPoE) running 128bit Microsoft Point-to-Point Encryption (MPPE) tunneling over this converged wireless network (Vaughan-Nichols 2004).

We expect that the security within the WAN will impose insignificant bandwidth penalties, so that we will be able to provide basic security for all applications on the network, even though this may not be required for the application.

Further we have found that the industry standards are moving very quickly so that, hardware supported converged WiMAX and WiFi networks will probably available for end user devices or at least relays in the near future. In this case, the security best practices we will highlight must be built-in (Cisco 2006).

## CONCLUSION

In conclusion, we believe that the converged wireless network is an ideal choice for building inexpensive IP based communication networks that carry data, voice and video. Furthermore, the convergence of Wi-Fi and WiMAX wireless technologies may offer a solution to high-speed rural Internet connectivity. It may even provide ICTs a cost effective way of bridging the digital divide in the near future, by mixing the cheapest components for Wide-Area and Local-Area connectivity. Although these wireless technologies offer tremendous benefits to individuals, businesses, educational institutions and rural communities Internet connectivity, security is still a major concern. Confidentiality, integrity and authentication must be achieved on the converged network. From the initial findings the inherent security mechanisms in WiFi and WiMAX still could not manage to offer a robust network solution in a converged infrastructure. Therefore, a testing of the PPPoE running a 128bit MPPE is under investigation to evaluate its effectiveness and effects on network performance. In future after the final implementation and testing of the proposed security mechanisms, a best practice for deploying a converged wireless network will be presented.

# STUDENTS' PERCEPTIONS OF FACEBOOK AND THEIR IMPLICATIONS AS AN INSTRUCTIONAL MEDIUM

**Althea Mvula and Richard Shambare**  
**Tshwane University of Technology, South Africa**

## ABSTRACT

*The Facebook phenomenon has revolutionised communication patterns especially among students and youths. Increasingly young adults integrate Facebook into their daily lives. The commonly used features include chatting, uploading personal profiles, exchanging notes and study material. Several factors (e.g., real-time interactive messaging, 3G mobile telephony, faster and cheaper Internet access) encourage social network sites (SNS) and Facebook adoption. While Facebook started primarily as a social website, connecting friends, in the recent past, many users increasingly use the platform for business, marketing, and study purposes. However, despite the many opportunities for facilitating teaching and learning in universities, in particular promoting students–instructor interaction, Facebook's usage in classrooms is still low. It is therefore opportune to investigate students' perceptions of the SNS. This study is to: (1) examine students' Facebook usage habits and (2) investigate the perceived usefulness of Facebook in education. Following the introduction of Facebook in a Business Management course, students' perceptions towards Facebook were subsequently ascertained using constructs of the Rogers' diffusion model. Data was collected from a sample of 195 undergraduate students using self-administered questionnaires. Findings confirm Facebook's popularity and utility in education. Results are discussed in the context of existing literature, and the paper concludes by proposing both theoretical and practical implications.*

## INTRODUCTION

As the popularity of social network sites (SNS) increases, usage of networks such as Facebook, YouTube, Twitter, and MySpace are growing rapidly. This exponential growth, according to Boyd and Ellison (2008) has “helped tip SNSs into mainstream culture.” Latest statistics indicate Facebook as the leading SNS – hosting more than 500 million subscribers (Facebook.com, 2011; WIUS, 2011). Even more interesting, is the fact that, Facebook's membership doubles every 6 months (Owyang, 2008). Therefore, by the end of 2011, Facebook is likely to have a staggering 2 billion users. Bicen and Cavus (2010) explain that social networking is most popular among young consumers, who are increasingly integrating SNS activities into their daily routines. Shambare, Rugimbana, and Sithole (2011), in a study on SNS usage patterns by South African students, reveal that 93 per cent of South African students log onto their Facebook accounts at least once a day. Daily, they spend an average of 3 ½ hours on Facebook. Thus, students are ‘Facebooking’ for almost a quarter of their daily productive time – 24 hours less eight hours of sleep.

For that reason, the Facebook phenomenon is more than a curiosity; it forms a pertinent topic for research. Despite the growing SNS literature (Bicen & Cavus, 2010; Carter *et al.*, 2008; Roblyer, McDaniel, Webb, Herman, & Witty, 2010), SNS usage, in particular, the Facebook experience in developing nations such as South Africa is hardly reported in the literature, at least in our literature searches. To address the paucity in the body of knowledge, this paper investigates the extent to which Facebook can be incorporated in university teaching and learning.

The remaining sections of the paper are structured as follows. First, the literature pertaining to SNSs is reviewed in the following section. Secondly, the methodology employed to answer the research questions is presented followed by results. The paper concludes by citing implications of these findings, as well as suggesting topics for future research.

## LITERATURE REVIEW

Modern SNSs were pioneered by SixDegrees.com in 1997 (Bicen & Cavus, 2010). Since then, the number of SNS subscribers has grown exponentially. Roblyer *et al.* (2010) point out that some 93 per cent of teenage Internet users between 12 and 17 years are active social network members. Of these SNSs, Facebook is the most popular and fastest growing (Boyd & Ellison, 2008). Current statistics show that globally there are 500 million Facebook subscribers (Facebook.com, 2011). SNS popularity, among the young consumers, is driven by the fact that social networks provide users with more flexibility and freedom to express themselves in ways that they could not possibly achieve in person (Shambare *et al.*, 2010). This presents an obvious opportunity, at least in theory, of extending Facebook into education. Students could be motivated to also communicate about their studies. For instance, Facebook may facilitate the sharing of school-related information and collaboration in assignments. Also, because of its 'freedom of expression' merits, discussion of "difficult topics" which could otherwise have been perceived as embarrassing to ask in a normal classroom setting, becomes possible to talk about on Facebook.

### The Role of SNSs in Education

Learning is a continuous and on-going process. Students acquire and assimilate new knowledge to develop new understanding. Therefore, effective teaching requires educators to guide, nurture, mould, and transmits knowledge to students on an on-going basis (Alger, 2009). In this context, Facebook's ability to promote the interchange of information among students on the one hand, and between students and lecturers on the other hand, potentially makes it a vital educational tool (Sabry & AlShawi, 2008). More specifically, Lavooy and Newlin (2003) demonstrate that effective use of computer mediated communication (CMC) can result in an increase, not a decrease, in learning interactions such as student-student and instructor-student interactivity. Therefore, technology tools such as Facebook can be used to communicate, scaffold and clarify course concepts and content while engaging students with information (Solvie and Kloek, 2007).

Sabry and AlShawi's (2008) Interactive Learning System (ILS) helps to understand the relevance of technology, and in particular SNSs such as Facebook, in teaching and learning. Effectively, an ILS is:

*an information and knowledge system for the purpose of learning and teaching, which incorporates certain design principles and qualities such as the ability to promote active thinking, allow for reflection and provide feedback, provide relevant interactions, different choices and variety of interaction patterns. It incorporates multimedia elements for supporting learning, which are generally preferred by many students compared with traditional learning methods. It incorporates latest technologies to enable both adaptability and adaptivity (Sabry and AlShawi's (2008:164).*

The components of an ILS (Figure 1) are (Baldiwn & Sabry, 2003; Sabry, 2005; Sabry & AlShawi, 2008):

- (1) *Content* – refers to tasks to be taught in relation to course objectives.
- (2) *Learners* – are the individuals that are supposed to acquire the knowledge. As such, individual differences (e.g., gender, culture, age, personality, and behavior) should be taken in account.
- (3) *Technology* – is the media through which information and knowledge contents can be delivered to learners. It includes multimedia representation to accommodate different types of interactions, teaching and learning styles. This component is a dynamic component that seeks up-to-date technologies (whether asynchronous or synchronous), and use of variety of innovative technologies to accomplish the system's goals and objectives
- (4) *Pedagogy* - contains pedagogical knowledge, methods and styles of teaching relevant to each subject matter, aims and objectives, and learners' differences. The wider the range of included strategies, the more effective and efficient the teaching and learning will be.

- (5) *Interaction* - is the component that coordinates and balances the other four components. It includes decisions about interactivity level, type of interactions and teaching styles to be used in accordance to different contents, different learners and technologies used.

**Figure 1: The ILS Components**

Source: Sabry and AlShawi's (2008:165)

According to Bonk (1999), an interactive learning system engages the learner with a variety of interactions with materials, peers, and educators. These interactions are incorporated through the “interaction” component of the ILS (see Figure 1). Alternatively, Figure 2 shows the three main types of learning interactions: student-information (S-I), student-lecturer (S-L) and student-student (S-S). In particular, Facebook enhances S-L and S-S interactions, which is the focus of this paper.

**Figure 2: The ILS Components**

Source: Sabry and AlShawi's (2008:166)

Facebook subscribers form closer links with other members, friends, contacts, or followers by extending or accepting invitations (Bicen & Cavus, 2010). These contacts can be consolidated into a “group,” which basically is a collection of friends, associates, or class mates. Through this link, messages including text, voice, and video files can be exchanged. This feature, therefore, is that which is proposed to accommodate the S-S and S-L interaction (Figure 2).

## Adoption of Facebook

Currently, SNSs are the fastest growing and most popular Internet-based technology (Roblyer *et al.*, 2010). As more users incorporate social networking, SNS adoption is likely to accelerate in the foreseeable future (Bicen & Cavus, 2010; Owyang, 2008; Roblyer *et al.*, 2010; WIUS, 2011).

Several factors have been cited as influencers of the widespread adoption of Facebook. This includes applicability in numerous settings – social, business, education (Boyd & Ellison, 2008) and allowing subscribers to access personalised and interactive services such as chatting, uploading and sharing pictures, videos and music (Owyang, 2008; Roblyer *et al.*, 2010). This is indicative of Rogers' (1995) factors (e.g., relative advantage,

compatibility, complexity, observability, trialability) that facilitate adoption of innovations (Rugimbana & Iversen, 1994; Taylor & Todd, 1995). Rogers (1995) explains:

*Innovations that are perceived by individuals as having greater relative advantage, compatibility, trialability, and less complexity will be adopted more rapidly than other innovations. Past research indicates that these five qualities are the most important characteristics of innovations in explaining the rate of adoption (Rogers, 1995:16).*

Consistent with Rogers' findings, research has shown that as teenagers move into social networking, their use of other Internet technologies such as email and Instant Messaging (IM) rapidly declines (Lenhart, Madden, Smith, and Macgill, 2007). For that reason, it is anticipated that their integrating Facebook in education would significantly improve teaching and learning.

## RESEARCH OBJECTIVES

The following research questions were formulated and form the basis for data collection, data analysis, and interpretation of results:

- RQ1:** *What are the Facebook usage habits of students?*  
**RQ2:** *Do Facebook usage habits vary according to experience or demography?*  
**RQ3:** *Which factors influence the adoption of Facebook?*

## METHODOLOGY

A survey was used to collect data (Calder, Philips, & Tybout, 1981). A sample of students was drawn from a South African university in Pretoria. The data were collected using a self-administered instrument in January and February 2011.

### *Participants*

Third-year National Diploma (undergraduate) students in engineering and management participated in the study. Researchers, after obtaining permission from their lecturers, solicited volunteer participants from in their respective classes. Some 270 questionnaires were distributed, 210 were returned. Of these 194 questionnaires were usable, thus representing a 72 per cent response rate.

**Table 1: Demographic profile**

Demographic Characteristics		Percentage (%)
<i>Gender</i>	Male	51
	Female	49
<i>Programme of study</i>	Industrial Design	16
	Human Resources Management	74
	Unspecified	10
<i>Study status</i>	Full-time	98
	Part-time	2
Facebook experience	< 1 year	35
	1 - < 3 years	46
	3 - < 5 years	14
	5+ years	4

The average age of participants was 21.9 years with a standard deviation of 1.9 years. The youngest participant in the sample was 19 years old and the oldest 27 years old, with 51 per cent being male and 49 per cent female. In terms of study status, 98 per cent were full-time students and the remaining 2 per cent part-time students. Almost half of the respondents (46 per cent) had Facebook experience of between 1 and less than 3 years. Some 35 per cent had less than 1 year's experience. Those with 3 to less than 5 years' experience were 14 percent and 4 per cent exceeded 5 years' Facebook experience (Table 1).

## Questionnaire

The instrument used was developed from the literature as well from questions used in previous Facebook studies (Bicen & Cavus, 2010; Roblyer *et al.*, 2010; Shambare *et al.*, 2011). The 2-paged questionnaire consisted of three sections: demographics, Facebook usage habits, and an adoption scale.

**Table 2: The questionnaire items – sources and rationale**

Section	Description	Source	Rationale
1	Demographics	Developed for this research	To collect demographic information of participants
2	Facebook experience & patterns	Bicen & Cavus (2010); Roblyer <i>et al.</i> (2010); Shambare <i>et al.</i> (2011)	To collect Facebook usage habits
3	Adoption Scale	Rugimbana & Iverson (1994)	To establish factors influencing Facebook adoption

The questionnaire was pre-tested on a group of 20 undergraduate students to ensure that questions would be correctly interpreted by the target sample. Refer to Appendix A for a copy of the questionnaire.

### Data analysis

The following statistical tests were utilised to answer research questions: descriptive statistics, non-parametric tests including Mann-Whitney U tests and Pearson's Chi-squares, factor Analysis, and reliability analysis. PASW (SPSS) v.18 was used for data analysis.

## FINDINGS AND DISCUSSION

The findings are discussed according to the order of the research questions.

**RQ1:** *What are the Facebook usage habits of students?*

Facebook is a web-based application. As such, Internet device and type of Internet connection affect how Facebook is accessed. These factors determine available features such as downloading/ uploading pictures or Instant Messaging accessible to subscribers. Hence, the need to identify Facebook usage patterns – Facebook experience, daily Facebook usage and the mode of connection used. Frequencies, percentages and non-parametric tests were employed to answer this research question.

### *Type of device used to access Facebook*

Ability to connect to the Internet is a prerequisite for Facebook usage. There are numerous connection devices which individuals can use to access Facebook. Ultimately, these determine not only the speed but also the nature of the content accessible on the site. Subscribers therefore select connection types most suited to their needs, lifestyle, and budget.

While desktop computers generally provide faster broadband connection, these tend to be more expensive in that it requires modems and Internet connection through an Internet Service Provider (ISP). On the other hand, subscribers are also able to access Facebook with WAP-enabled cellular phones. Figure 3 illustrates different connections used by the respondents. Mobile wireless devices including cell phones were most popular with 55 per cent. Some 15 per cent access their Facebook accounts using desktops at home, which represented the second preferred type of connection. University libraries also are popular access points, accounting for 12 per cent of respondents. Another 11 per cent showed preference for Internet cafés. Those that accessed Facebook at

work, public library, and other unspecified devices were 3 per cent, 2 per cent, and 2 per cent of respondents, respectively.

**Figure 3: Facebook connection device used**

#### *Daily Facebook usage*

In terms of daily Facebook usage, results indicate that on average respondents spend 2.2 hours with a standard deviation of 2.6 hours logged onto their Facebook accounts. Daily Internet usage of male and female respondents was compared using the Mann-Whitney U test. Results ( $z = 2.084$ ;  $p < .05$ ) show that there is significant difference in daily Facebook usage across gender. Female respondents spend more time 'Facebooking' than male respondents. Females on average spend 2.6 hours with a standard deviation of 3.6 hours compared to 1.9 hours, with a 1.9 hours standard deviation, for male respondents.

**RQ2:** *Do Facebook usage habits vary according to experience or demography?*

#### *Facebook experience*

In this context, Facebook experience refers to the total number of years participants have been using Facebook. Table 1 illustrates that some 81 per cent of the respondents have used Facebook for up to 3 years. Those exceeding 5 years' experience represented some 4 per cent of the sample. Facebook experience was subsequently broken down into three categories:

- (a) Low experience – less than 1 year experience ( $n = 64$ )
- (b) Moderate experience – between 1 and 3 years' experience ( $n = 83$ )
- (c) High experience – in excess of 3 years' experience ( $n = 34$ )

**Figure 4: Facebook experience by gender**

**Table 2: Facebook experience by gender**

Access device	Facebook experience			Total
	Low	Moderate	High	
Cell phone	17.5%	27.5%	10.8%	55.8%
Home	1.5%	7.1%	6.3%	14.9%
Work	0.4%	1.9%	1.1%	3.3%
Internet Cafe	2.2%	7.1%	1.5%	10.8%
University library	4.5%	6.3%	1.5%	12.3%
Public library	0.7%	0.7%	0%	1.5%
Other devices	0.4%	1.1%	0%	1.5%
Total	27.1%	51.7%	21.2%	100%

**Table 3: Comparison of Facebook experience and demographic profile using Chi-square tests**

Facebook experience vs.	$\chi^2$ (p-value)	Cramer's $V$ (p-value)
Programme of study	22.442 (.000)	.249 (.000)
Gender	10.599 (.005)	.242 (.005)
Study status (part-time or full-time)	1.031 (.597)*	.076 (.597)*

\*significant at 0.05 level

Table 3 presents results of Pearson's Chi-square test of Facebook experience and various demographic profiles. All but study status indicate insignificant result. However, given that the majority (98 percent of respondents) are full-time, the significant results considered with Cramer's test of strength of association ( $V = 0.076$ ;  $p = .597$ ) indicates a weak relationship. To get a more informed view of SNS usage across Facebook experience, a One Way ANOVA was utilised. The results ( $F = .551$ ;  $p > .05$ ) suggests that Facebook usage, operationalised by amount of time spent on Facebook, was the same across the different levels of experience.

**RQ3:** Which factors influence the adoption of Facebook?

This question sought to identify latent variable (or factors) influencing the adoption of Facebook by the respondents. Rogers' (1995) Adoption of Innovation scale, as adapted by Rugimbana & Iversen (1994) and numerous other adoption studies (Taylor & Todd, 1995) was used to answer this question. Subsequently, factor analysis was performed on the adapted adoption scale (see Table 2) to determine underlying variables. According to Rogers (1995), adoption of innovations is influenced by five factors: relative advantage, complexity, compatibility, trialability, and observability. These factors, as contained in the adoption scale, are supposed to load independently in five factors. The minimum requirements for factor analysis were satisfactory ( $KMO = 0.787$ ; Bartlett's Test of Sphericity  $X^2 = 460.072$ ;  $df = 36$ ;  $p < 0.000$ ) (Field, 2000). A three-factor solution was extracted. Compatibility items loaded in Factor 1. Observability items loaded in Factor 2. Convenience loaded on Factor 3.

**Table 4: Three-factor solution of factors influencing adoption of Facebook**

	Factor 1 Compatibility	Factor 2 Observability	Factor 3 Convenience	Communalities
My fellow students find FB suitable	.782			.739
My fellow students would use FB	.753			.700
I understand the effects of all options on FB		.897		.833
FB has always been easy		.630		.620
I feel confident using FB		.526		.638
FB is convenient to use in teaching/learning			.799	.697

I would save time using FB			.738	.637
FB is more convenient than email			.469	.382
Eigen values	3.691	1.127	1.028	(Total)
Percentage of variance	25.449	19.973	19.525	64.948
Cronbach's alpha	.745	.724	.558	

As illustrated in Table 4 above, three factors accounting for almost 65 per cent of the variance were extracted. Cronbach's alpha was used to test the consistency of these factors. The high reliability loadings of the sub-scales indicate that the three different responses are in themselves distinct constructs (Field, 2000). Overall, results indicate that compatibility, observability, and convenience are instrumental in the adoption of Facebook. These factors had Cronbach's alphas of .745, .724, and .558, respectively, exceeding the .5 minimum cut-off (Hooper & Zhou, 2007).

## CONCLUDING REMARKS

This paper examined (1) drivers influencing young consumers' adoption of SNSs and (2) the most preferred social networks. Results confirm the dominance of Facebook (Bicen & Cavus, 2010; Facebook.com, 2011). More importantly, the importance and significance of SNSs among young consumers is validated, in that social network sites have revolutionised (computer-mediated) communication in the 21<sup>st</sup> century.

Since students integrate SNSs into their daily lives as well as the fact that Internet and SNS usage increases with progression of studies, there is considerable evidence to suggest massive expansion for social networking in many aspects of young consumers' including education. With the advent of cheaper and faster Internet access driven by affordable Smartphones, adoption of social networking among young adults is poised to accelerate to an estimated 2 billion users by the end of 2011. The implication for education, in particular teaching and learning can only be good, as learners stand a better chance of interacting with (1) peers, (2) instructors, and (3) content.

Given the widespread adoption of SNSs by students, educators, in particular, need to discover strategies to tap into this trend. Thus, finding common ground between education and SNSs could go a long way to address meaningful interaction between learners and their teachers. Future research could consider investigating how mobile devices such as Smartphones are used to access social network sites. In particular, examining how teaching and learning could be enhanced by using social network sites mediated on mobile phones.

# **TRANSPORTATION INFRASTRUCTURE PROJECT MANAGEMENT IN THE UNITED ARAB EMIRATES: CURRENT PRACTICE AND IMPROVEMENT OPPORTUNITIES**

**Moza T. Al Nahyan, Amrik S. Sohal and Brian Fildes**  
**Monash University, Australia**  
**Yaser E. Hawas, UAE University, United Arab Emirates**

## **ABSTRACT**

*Over the past two to three decades, a number of large scale (mega) transportation infrastructure projects have been completed in the United Arab Emirates. Responding to a range of issues reported in the local media highlighting major project delays, our research set out to gain a better understanding of project management in the UAE (especially focusing on the softer aspects namely: communication, coordination, decision making and knowledge sharing). In this paper we report our findings from interviews conducted with twenty key stakeholders having extensive experience in the UAE transportation infrastructure construction industry. A range of issues are identified and based on these, we make three major recommendations namely: a higher level of engagement by the Sponsors/Clients in the planning and design stages of construction projects, improving the skills and competencies of professional staff and the use of global standards.*

## **INTRODUCTION**

Large scale infrastructure projects with increasing complexity are being constructed in many countries around the world and at an increasing rate in a number of developing countries. In this respect, project management is also becoming increasingly complex not only because the projects are becoming larger (referred to as Mega Projects when investments amount to \$1 Billion or more), but also because of the large number of stakeholders involved. Since mega projects can take many years to complete, responding to the changing interests and demands of stakeholders over the life of a project can make project management a challenging task (Friedman and Miles, 2002). In this paper we examine a number of transportation infrastructure project management issues in the context of a rapidly developing country, namely the United Arab Emirates (UAE).

The UAE is a federation of seven emirates (Abu Dhabi, Dubai, Sharjah, Ajman, Umm al-Quwain, Ras al-Khaimah and Fujairah) that has developed rapidly over the past three decades in terms of economic, business and social activities. Along with this, there has been massive activity in the construction industry, especially in developing the necessary transportation infrastructure (seaports, airports, highways and light rail). These projects have met with many challenges with some local media reporting on these issues. For example, Ahmed (2007), Ditcham (2005, 2006), Kazimi (2005) and Zaneldin (2005) have all reported on a variety of issues that have resulted in project delays. Causes of delay mentioned in the media include lack of coordination, slow decision-making, errors in design, utility relocation, and sudden changes in governmental requirements or modifications of quality standards of the work. Our initial interest and observations of the transportation infrastructure industry in the UAE highlighted that project management systems across the emirates lack coherence and compatibility. From this initial interest and observation grew our current project that is examining the management of transportation infrastructure projects in the UAE. Our overall research question is:

“What are the major project management issues causing delays in completion of mega transportation infrastructure projects (TIPs) in the UAE and how can effective project management practice result in the successful completion of these projects?”

The first phase of our project, completed in 2010, involved detailed interviews with a total of 20 key stakeholders engaged at various stages of large scale transportation infrastructure projects. These stakeholders were selected based on the stakeholder theory. The second phase that is currently being completed involves an in-depth case study around a mega project examining a wide range of issues. In this paper, we present results from Phase I of our project focusing on the following three set of questions:

- What are considered to be the critical stages of TIPs by the key stakeholders and how do they affect overall project success?
- How are unsuccessful projects defined and what are the reasons causing failures?
- What are the major project management concerns and what is the current management practice? How can project success indicators be improved?

The rest of the paper is structured as follows. The next section examines relevant literature followed by the methodology section that describes the approach undertaken to complete our project. The findings section presents the detailed analysis of the data collected. The paper ends with the conclusions section that presents a number of recommendations.

## LITERATURE REVIEW

Westney (2000) defines project management as the application of knowledge, skills, tools, and techniques to project activities in order to meet or exceed stockholders' need and expectations from the project. It has evolved from a management philosophy restricted to a few functional areas and regarded as something nice to have, to now an enterprise project management system affecting every functional unit (Kerzner, 2006). The Project Management Maturity Model which comprises of six major stages (namely planning, design, scoping, tendering, scheduling and ending with implementation which also includes benchmarking and continuous improvement) notes the degree of interaction between strategic management and planning and successful implementation of project (Gabor, 1990).

Because of the page limitation, it is not possible to present the relevant literature relating to each of the stages mentioned above. The key management aspects identified as of importance in project management are: Communication, Coordination, Knowledge Sharing, and Decision-Making. Effective communication practices ensures that all major players are kept fully informed of any problems or difficulties and have procedures for decision making and managing these immediately when they occur and not allow them to disrupt the project (Kerzner, 2001). Zwikael et al. (2005) examined project management practices and concluded that various types of management styles, scope and time management impact on improving technical performance of projects, while communication and cost management impact on improving overall success measures of projects. Other researchers have suggested the use of communication effectiveness models to predict satisfaction levels by contractors and clients at the earliest possible stage in the project life cycle (Soetanto and Proverbs, 2002). To minimize defective designs, and subsequent overrun of cost and schedules, Zou et al. (2007) reported that the design team needs to establish an efficient communication scheme among the designers. Stewart (2007) stressed that strategic implementation of innovative information and communication technologies are essential for the long-term survival of construction firms. The lack of communication among parties was reported among the ten most important causes of project delay by Sambasivan and Soon (2007).

Coordination is recognized as a key issue in transportation infrastructure projects. Timmermans & Beroggi (2000) stressed the importance of coordination between organizations with diverse objectives. The concept of international coordination for transportation infrastructure projects is addressed by Short & Kopp (2005). Chen and Partington (2006) emphasized the ability of project managers to coordinate activities on site. Lack of coordination among project participants was identified as a key risk factor in Australian projects (Zou et al., 2007).

Jackson & Klobas (2007) stressed the need to develop a knowledge sharing process model for project managers. Kovacs and Paganelli (2003) argued that data and knowledge interchange is urgently needed for improving efficiency and standardize operations of complex distributed organizations. The necessity of a feedback loop to gain insights on decision making in various projects is emphasized by Short & Kopp (2005); suggesting that in order to improve planning processes and decision making, it should be helpful to look back at the taken decisions and extract lessons from them. Decision-making is significantly tied to the communication media and effectiveness. Decentralized communication channels are known to facilitate better information flow and decision making when problems arise. Clients who have decentralized communication channels ease communication and facilitate faster decision-making (Soetanto & Proverbs, 2002). In assessing the project performance measures, project managers need to understand what causes or factors result in time overrun or cost overrun. Once these factors become clear, the managers can take proactive steps to avoid such situations. Sambasivan & Soon (2007) identified slow decision-making by clients as a primary factor for time and cost overrun. In the light of the above, our project specifically focuses on issues related to communication, coordination, knowledge sharing and decision-making in transportation projects in the UAE.

## METHODOLOGY

A qualitative research approach was considered appropriate and legitimate for our study. According to Manson (2005), “qualitative research is characteristically exploratory, fluid and flexible, data-driven and context-sensitive” and it aims at producing “rounded and contextual understandings on the basis of rich, nuanced and detailed data” (p.3). It has the advantage of being easily implemented, comprehended by decision makers and UAE culture, and is amenable to various project sizes and management forms. According to Woods (2006), methods of qualitative research involve observations, interviews, sampling, examining, written materials, questionnaires, focus group and case studies. Denzin and Lincoln (2000) argued that qualitative implies an emphasis on processes and meanings, which are not (and cannot be) rigorously examined or measured in terms of quantity, amount, intensity or frequency. Nevertheless, the approach is a useful technique for examining reasons for the success or otherwise of construction projects. Silverman (2001) states that there is no standard approach among qualitative researchers and claims that four primary methods are used namely, observations; analyzing texts and documents; interviews; and recording and transcribing.

Following the stakeholder topology concept by Mitchell et al. (1997), we identify Sponsors/Clients, Government Department, Management Firms, Consulting Firms and Contractors as the key stakeholders influencing transportation infrastructure projects in the UAE. In the context of the UAE, Sponsors are primarily the Council of Ministries or the Executive Council of Abu Dhabi that are responsible for the allocation of the federal funding, or for funding projects within the Emirate of Abu Dhabi. Clients on the other hand are those governmental agency initiating and responsible for the undertaking the project. Clients could be federal, state or private entities. An example of federal clients is the Ministry of Public Works (MPW). An example of a state client is the Municipality of Abu Dhabi.

Governmental Departments includes local Municipalities, the Police, the Utility companies, etc. They may be involved during various stages of the project, but mostly during the coordination activities made by the consultant during the design phase, and by the contractor during the construction phase. Management firms are third party entities responsible for coordinating and managing all project activities on behalf of the client or sponsors. Their responsibilities include reviewing all documents and design drawings prepared by consultants, approving payments, etc. Consulting firms have responsibilities that include design, scheduling, tendering and supervision of all construction activities by the contractors. Some consulting firms get involved in earlier stages of project planning and scoping on behalf of the clients, if the client organization has no internal planning departments. Contractors have responsibilities that include the scheduling of the activities of the construction phase and the execution of all civil work. Some contractors might get involved in the earlier design stages.

All the above groups are regarded as having a significant influence on transportation infrastructure projects as they possess significant roles during the execution of the various stages of the project. Project execution is affected by the quality of managerial decisions made by these stakeholders. Other stakeholders, such as the media; community groups; insurance firms; labor, legal and political entities; customer or road user, and

special interest groups (such as environmental protection agencies, traffic safety societies, and research institutes) are not included in our study.

Phase I field work involved undertaking interviews with 20 individuals representing the five key stakeholders mentioned above (see Table 1 below for profile of interviewees). A snowballing approach was adopted in this research to ensure the randomness in recruiting interview participants. Individuals who agreed to participate in our study were initially contacted by telephone and were briefed on the research project. Request for an interview was made and if granted, the interview date, time and place were arranged. The interview itself comprised ten sections with a total of 58 specific questions, intended to explore the interviewee's opinion on the key research questions. A typical interview lasted for approximately 90 minutes which was sufficient to achieve the targeted depth to each of the detailed research questions.

Table 1: Details of the 20 Interviewees

Organization	Positions	No. Interviewed	Years experience	Fields of Specialization
Sponsors/clients	Exec. Mgr to Technical Advisor	5	>80yrs	Mgmt, Planning and design
Government Agents	Exec. Director, Strategy & policy	3	15yrs	Business development & Construction
Management Firms	Senior and Project Mgrs	2	>40yrs	Road and engineering construction
Consultants	Vice President to Senior Consultant	5	>80yrs	Management and road construction
Contractors	Manager and Project Director	5	>100yrs	Management, construction and quality

To analyze the data collected, NVivo was used. This is a proprietary desktop software package for the organization and analysis of complex non-numerical unstructured qualitative data. It is primarily used by qualitative researchers working with very rich text-based and/or multimedia information, where deep levels of analysis on small or large volumes of data are required. The software allows users to classify, sort and arrange thousands of pieces of information; examine complex relationships in the data; and combine subtle analysis with linking, shaping, searching and modelling.

## FINDINGS

### Critical Stages of Projects and Key Stakeholders Affecting Overall Project Success

Almost all of the interviewees identified 'Planning' as the most critical stage of transportation infrastructure projects whilst close to one-half of the interviewees identified 'Design' as the most critical stage. It is interesting to note that only one interviewee (a Contractor) identified 'Tendering' as the most critical stage. 'Scoping', 'Construction' and 'Scheduling' were considered critical stages by only a few of the interviewees.

Around one-half of the interviewees identified Government Agencies and Clients as two of the key stakeholders affecting the success of transportation infrastructure projects. Six out of the 20 interviewees also identified State Government Departments and Financial Institutes as key stakeholders. Private Developers and Ministries/Cabinets were judged as the least important stakeholders affecting the project success.

There was little agreement amongst the 20 interviewees on how stakeholders influenced projects. The highest response overall (seven interviewees in total) was the "ability to affect project execution and flow of activities". The "ability to affect budget", the "ability to conduct and influence planning and design", the "level of involvement in a project" and the "role a stakeholder plays in a given project" was each mentioned by four interviewees out of the total 20 interviewees.

Overall, Clients and Local Government were identified as the most important stakeholders involved in the critical stages of transportation infrastructure projects, identified by half of the total interviewees. Followed in importance are Governmental Agencies, then Consulting Firms. Only one interviewee identified Contracting Firms and Management Firms as important.

## **Defining Unsuccessful Projects**

Unsuccessful projects were defined in a number of different ways. Overall, interviewees identified “Cost Overrun” (identified by eight interviewees), “Time Overrun” (seven interviewees) and “Poor Quality” (six interviewees) as the most common definitions used for unsuccessful projects. Only one interviewee identified “Not Achieving Stakeholders Expectations” and “Commuters Dissatisfaction” as definitions for unsuccessful projects.

Interviewees provided a variety of responses with regard to the factors that cause unsuccessful completion of projects. The most common responses relate to unqualified stakeholders. “Unqualified/Bad Contractors”, “Unqualified Consultants” and “Unqualified Engineers” were mentioned seven times as the major factors causing unsuccessful completion of projects. Another set of responses relate to lack of coordination mentioned six times and included responses such as “Lack of Coordination with local governments”, “Governmental Process” and “Poor Coordination with Utility Firms”. Other common responses relate to “Availability of Resources”/“Materials Procurements” - mentioned six times and “Bad Design” - mentioned four times and “Price Increments” - mentioned four times.

In examining more closely the reasons for project time overrun and cost overrun, interviewees gave a very wide range of responses. The responses given for time overrun cluster around five major reasons, namely: variation in or un-reviewed design and schedules (mentioned 10 times), improper planning, scoping or cost estimates (mentioned seven times), human resources issues (mentioned seven times) - responses included “Availability and reliability of human resources”, “Varieties of work labor skills” - employees having different cultural background, experience and skills, and “Insufficient resources - labor/ staff”, availability of materials (mentioned six times), and availability of qualified Contractors and Consultants (mentioned five times).

With respect to project cost overrun, the most common response, mentioned 16 times, relates to material cost increases/inflation. The next most common responses were project variations/rework (mentioned six times) and un-reviewed design/schedule (mentioned four times) and changes in stakeholder requirements (mentioned four times).

## **Management Practice in the UAE**

Two questions were asked with respect to management practice in the UAE. The first question asked interviewees to rank management practice as “Excellent”, “Very Good”, “Good”, or “Fair”. The second question asked for a reason for the response given to the first question. One-half of the interviewees regard management practice in the UAE as “Good” whilst one-quarter indicated this was “Excellent” (mentioned by three interviewees) or “Very Good” (mentioned by two interviewees). Three interviewees identified management practice as “Fair” and two of them did not provide a clear answer to this question.

A range of reasons was given for the above responses to the ranking of management practice. These cluster around the following three major reasons:

- Poor human resources – mentioned five times (responses included “Unqualified managers”, “Still learning”, “Engaging best qualifications” – hiring appropriately qualified staff, “Workforce variations” and “Availability of resources”),
- Lack of use of international design and quality standards – mentioned four times, and
- Lack of a continuous improvement culture – mentioned three times.

Two interviewees clarified that the double track mega projects that are currently taking place in the UAE is overloading all entities and hence affecting negatively on the ranking of management practice in the UAE. Poor

human resources were also identified above as a key management concern in the implementation of infrastructure projects in the UAE.

## **Communication in Project Management**

A series of questions focused on communication, namely how critical communication is to the success of projects, the common methods used for communication, effectiveness of communication within the organization and across the stakeholders, and how communication can be improved. The responses are summarized below.

Except for one interviewee providing no clear answer and another saying that it was “Critical to some extent”, all of the other interviewees indicated that communication is “Very critical” (five interviewees) or “Critical” (13 interviewees) to the success of the project. Interviewees indicated using multiple methods for communication within their organization/department. The most commonly used methods are “meetings with minutes” (mentioned 13 times) and “written documents” (also mentioned 13 times). Although “e-mail” was used reasonably frequently (mentioned 9 times), the use of “e-meetings” was only mentioned once.

Generally, there was agreement amongst the 20 interviewees that communication within their organization/department is “effective” (14 out of 20). Two of the interviewees indicated that it was “effective to some extent”, one saying that it was “not effective”, and three provided no clear answer. There was less agreement amongst the interviewees on the effectiveness of communication across the different stakeholders involved: seven indicating it was “effective”, six indicating it was “effective to some extent” and four saying that it was “not effective”. Interviewees made a number of suggestions as to how to improve communication methods. One set of responses relates to establishing communication committees (mentioned three times) that meet regularly (mentioned twice) and having a chair to avoid wasting time (mentioned once). “Making electronic communication official” and “Create a manual or system procedure for communication” were both mentioned twice as suggestions for improving communication.

## **Coordination amongst Stakeholders**

Overall, one-half of the interviewees indicated that coordination amongst the stakeholders was “effective” whilst another seven interviewees indicated that it was “effective to some extent”. The remaining three interviewees indicated that coordination amongst the stakeholders was “not effective”. Interviewees provided many suggestions with respects to improving coordination amongst stakeholders. The majority of responses fall into the following areas:

- Introduction of coordination regulations/model – mentioned six times,
- The introduction of new technology – mentioned four times (responses included “Develop a GIS-based master plan with federal and local governments involved”, “Introduce e-government in all aspects”, “Introduce electronic communication”, and “Merge the stakeholder network via software technology”),
- Early involvement of stakeholders –mentioned four times (responses included “Clarify project requirements from beginning”, “Encourage local authorities to share plans at early stages of project”, “Involve all stakeholders in early stages”, and “Briefing meetings with the right people”),
- Introduction and legalization of coordination committees/introduction of documented procedures – mentioned three times.

Other suggestions included “information exchange amongst agencies”, “increasing the level of trust and professional capabilities”, “enhancing problem understanding”, and “enhancing decision-making and giving authority”.

## **Improving Project Success Indicators**

Interviewees were asked to make suggestions as to how the various project success indicators (project quality, time overrun, cost overrun, and increasing stakeholders’ satisfaction levels) could be improved. These are discussed below.

*Improving Quality of Projects* - From the responses given, the following four ways of improving quality of projects are identified:

- Using competent staff/stakeholders – mentioned seven times (responses included “More qualified staff”, “Qualified Contractors”, “Better Consultants and Contractors”, and “Training staff”),
- Adoption of standards – mentioned four times (responses included “Adopt international standards” and “Adopt optimal standards to suit environment”,
- Improved coordination – mentioned three times (responses included “Better coordination amongst stakeholders” and “Good coordination in planning stage”), and
- Improved design – mentioned twice.

*Reducing Project Time Overrun* - Five major suggestions identified from the range of responses given by the interviewees are:

- Proper planning and monitoring, and proper design – mentioned eight times,
- Qualified staff/stakeholders – mentioned five times (“More qualified staff”, staff training’, and “Qualified contractors”),
- Increase coordination and cooperation – mentioned four times,
- Correct outsourcing/timely procurement – mentioned four times, and
- Increase financial and human resources - mentioned four times.

*Reducing Project Cost Overrun* – From the responses given, the following four ways of reducing project cost overrun are identified:

- Qualified staff/equipment – mentioned seven times (responses included “Proper equipment and staff”, “More qualified staff”, and “Staff training”),
- Improved project management – mentioned five times (responses included “Meeting time schedule”, Minimize interruptions”, and “Proper project management”),
- Control over materials – mentioned four times (“Control material cost”, “Looking for different material options and designs’, and “Secure materials ahead of time”),
- Enhance design – mentioned four times, and
- Coordination with and meeting stakeholder expectations – mentioned four times.

Interestingly, use of Value Engineering and New Construction Technologies was each mentioned only once. “Slowing down activities” was also mentioned once as a measure for reducing project cost overrun.

*Increasing Stakeholder Satisfaction* – A large number of suggestions were made by the interviewees. From these responses, three major ways for increasing stakeholder satisfaction are identified:

- Improved communication, coordination, support and involvement of stakeholders – mentioned six times (responses included “Having better communication & coordination”, “Better stakeholder involvement in planning and scoping”, “Getting Governments to talk more”, “More support from higher levels (the Cabinet) and “Better coordination between clients and municipality”),
- Meeting project objectives (budget, quality and time) – mentioned four times, and
- Good design – mentioned three times,

Interestingly, addressing safety and environmental issues, and minimizing claims was each mentioned only once by the interviewees.

## **DISCUSSION AND CONCLUSION**

The detailed findings detailed above highlights the complexity involved in managing transportation infrastructure projects in the UAE. With multiple stakeholders (Government Agencies, Clients and Consultants and Contractors themselves) influencing various stages of projects from planning to implementation suggests the need for effective communication, coordination, knowledge sharing and decision-making amongst the stakeholders, especially during the planning and design stages. With reference to the stakeholder typology (Mitchell et al., (1997), we identify the key stakeholders having high or medium levels of legitimacy, power and

urgency and hence the need for effective project management so that projects can be executed without major delays.

There was general agreement amongst the interviewees that majority of the projects were completed successfully and in cases where projects were considered unsuccessful, the common factors identified related to lack of resources, poor project design and planning and overall poor project management. The last factor mentioned results from availability of well qualified professional managers, engineers and other employees as well as having to deal with local government authorities. There was agreement amongst the interviewees that project management in the UAE is generally good but there is considerable room for improvement in terms of communication, coordination, knowledge sharing and decision-making amongst the key stakeholders.

Based on the research findings, there are a number of suggestions for making improvements. Firstly, federal government, through its various ministries/departments and agencies clearly have a major role to play in improving project management practice in the UAE. Communication and coordination amongst government departments need to be streamlined in a number of ways so that effective knowledge sharing and decision-making can take place, leading to successful project outcomes. This is particularly necessary during the planning and design stages which can subsequently reduce the number of changes (redesigns and variations) that are introduced in later stages of construction projects.

Secondly, there is an urgent need to improve the skills and competencies of professional staff at all levels and subsequently delegating authority to lower levels. Unqualified staff was given as a major reason by the interviewees a number of times for many of the issues being faced by the transportation construction industry. Appropriate human resource strategies that emphasize recruitment and development of personnel need to be developed and implemented effectively. Thirdly, organizations should adopt global standards to improve planning, design and construction activities. There is much to be gained at the individual, organizational and national levels from the adoption of such standards.

These three areas clearly need further examination and Phase II of our research is currently exploring these issues through an in-depth case study of a mega project underway in the UAE. Key stakeholders involved in this mega project have been identified and data collected through interviews, focus group discussion sessions, site visits and document analysis. Our aim is to develop a risk-based decision model to tackle the soft aspects (communication, coordination, decision making and knowledge sharing) of managing transportation infrastructure projects in the UAE. Results from Phase II of our study will be reported in subsequent papers.

# DETERMINATION OF EXTERNAL ORGANIZATIONAL SUSTAINABILITY

**Kęstutis Navickas, Antanas Makštutis, Renata Navickienę  
Mykolas Romeris University, The Republic of Lithuania**

## ABSTRACT

*The article analyses organizational internal and external environments, their possible correlations with 4 components of sustainability, and the principal determination models for sustainability of organizations. Based on the general principles of sustainable development organizations, a model for the determination of organizational sustainability has been developed. The use of self-organizing neural networks allows the identification of the external sustainability of each forest enterprise and the endeavour to explore vital, social, antropogenical and economical efficiency. The determination of the forest enterprise external sustainability is expected to help better manage the external sustainability of forest enterprises and explain the reasons for a respective level of external sustainability.*

## INTRODUCTION

The analysis of the scientific literature on sustainable leads to the observation that a substantial work has been done in this field however very little attention is given to the assessment of external organizational sustainability in scientific literature. The researches carried out in Lithuania have not examined the topic of external organizational sustainability assessment in detail.

In the real world, an organization functioning in a certain region generates many different types of data while performing functions assigned to it. When we examine the sustainability of such an organization or individual components of the organizational sustainability, we are dealing with the data describing each component of the organizational sustainability, the analysis of which presents a complex task, especially when the data of individual components of the organizational sustainability reflect a complex and integrated phenomenon, the sustainability of the entire organization. External organizational sustainability is generally characterized by a large amount of multicomponent indicators and indicator values. In the scientific literature, the data describing any component of organizational sustainability are commonly known as multidimensional data. It is very important for the persons in charge of organizational sustainability to retrieve the necessary information from the available multidimensional data which could help to understand the distribution of the forest enterprise external sustainability level, i.e. the distribution of external organizational sustainability across individual components of the forest enterprise sustainability as well as the reasons for a respective external sustainability level of the forest enterprise. Use of a visualization method for a self-organizing neural network makes this task easier.

The science of artificial intelligence provides perspective for modern computer systems development. Artificial intelligence techniques enable simplification of the complex sustainable development processes of organizations and their more effective management however the expert assessment of the sustainable development indicators remains the essential condition for the application of this type of technique (Dzemydienę, 2006).

As an alternative to contemporary models of the sustainable development of organizations, we hereby present the model for the determination of organizational sustainability to facilitate targeted interventions

inducing the sustainable development of an organization, performed by the sustainable development organizations' experts.

Forest enterprises play an enormous role in the competitive ability of a certain region. First of all, forest enterprises are large-scale forest managers acting in accordance with the Law on State and Municipal Enterprises and having the legal form of a state enterprise. Furthermore, forest enterprises own and exploit one of the basic natural assets of our country, a forest specifically, which shall serve the prosperity of the State and its citizens and preserve the landscape stability and the environment quality. Forest enterprises, at their own expense, restore cut down forests and plant new ones, develop and supervise them, protect them against fires, pests and diseases, and exercise environmental and recreational measures. The consensus of opinion is that the main purpose of the forest enterprise activities is sustainable forest management in order to meet the public needs for wood and other forest products and to perform the protective and recreational functions of forests. For this reason, it is appropriate to determine and examine the external sustainability of Lithuanian forest enterprises.

**Research subject:** External sustainability of Lithuanian forest enterprises.

**Research objective:** To determine the levels of vital, social, antropogenical and economical efficiency and external sustainability in forty Lithuanian forest enterprises on the basis of the developed model for the determination of organizational sustainability.

**Research techniques:** Analysis of Lithuanian and foreign scientific literature on sustainable development, statistical data analysis, questionnaire survey, expert assessment, simulation, ranking method for determining the indicator significance, visualization method for a self-organizing neural network – the unified distance matrix.

## DEVELOPING MODEL FOR DETERMINATION OF ORGANIZATIONAL SUSTAINABILITY

On the grounds of the organizational environment model developed by (Brownlie, 1987) whereby the breakdown of different organizational environment components in levels is explicitly presented, and the sustainable organizational environment model developed by us, the levels of internal and external sustainability can be distinguished.

Examination and assessment of organizational sustainability at two different levels allow us to determine the sustainability of internal and external organizational environment which is closely associated with the components functioning in internal and external environments. In addition, such analysis of organizational sustainability at different levels allows more accurate considerations on a respective level of organizational sustainability.

To illustrate the simplified determination and visualization process of the external sustainability of the forest enterprise, we have developed a model for the determination of the forest enterprise external sustainability.

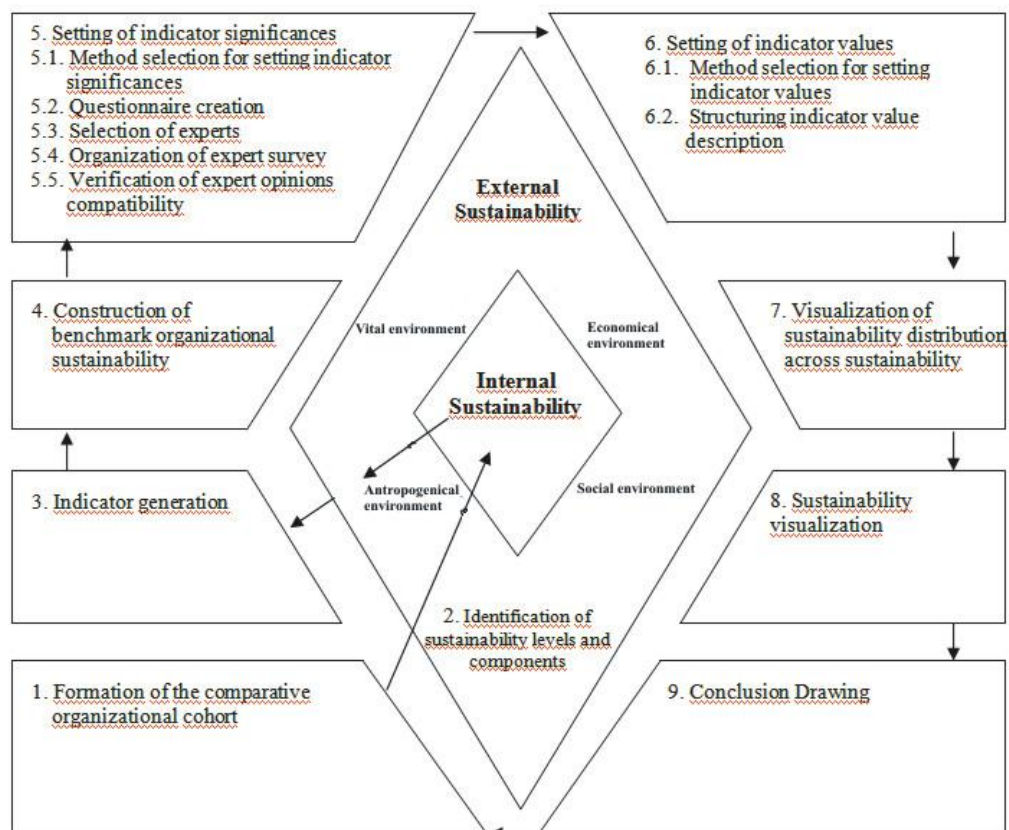

The representation of the model for determination of organizational sustainability in Fig. 1 shows that the simplified determination process of a certain organization's sustainability (a forest enterprise, in the given case) can be divided into 9 basic stages. In the central part of the model (the second stage of the model), an intervention in the internal and external organizational environment is visualized, wherein the identified vital, social, and antropogenical internal and external environments form the basis for the creation of sustainable organizational environment.

The formation of the comparative organizational cohort is the first stage of the determination process of the forest enterprise sustainability, in which the model input function is actualized. The formation of the comparative organizational cohort requires taking account of the legal form, the operational area, the main purpose of the activity, the number of employees, etc. of the organizations entering the same organizational cohort since it would be inappropriate to draw a comparison between the state budgetary institution and a private individual enterprise, or between a company with several thousand employees operating in a number of foreign markets and a joint stock company with a dozen of employees functioning in the local market. It should be noted that the accuracy of the formation of the comparative organizational cohort is closely related to the accuracy of

the determination of organizational sustainability accordingly a special attention should be given to the formation process of the comparative organizational cohort in order to minimize the distortions of organizational sustainability distribution across sustainability components and sustainability results.

The identification of sustainability levels and components is the second (intermediate) stage of the determination process of the forest enterprise sustainability which provides two sustainability levels and four sustainability components specifying the levels at which the determination process of the forest enterprise sustainability will be carried out, and the organizational sustainability components across which sustainability distribution will be identified. In the given case, we are going to examine only the external sustainability of the forest enterprise.

**Figure 1: Model for Determination of Organizational Sustainability**

Source: Compiled by the authors.

From the internal organizational environment in the second stage of the determination process of the forest enterprise sustainability, a gradual intervention in the firmly intrasynergically correlating vital, social, antropogenical and economical components of the internal sustainability is initiated. A transition from the economical component of sustainability to the firmly intrasynergically correlating vital, social, antropogenical and economical components of the internal sustainability is performed. A transition from the economical component of sustainability of external organizational environment to the second stage of the model takes place.

The generation of indicators is the third (intermediate) stage of the determination process of the forest enterprise sustainability. At this stage, the indicator-generating function of sustainable development researchers or professionals responsible for the sustainable development of the organization is actualized.

Absolute, relative, or other kinds of indicators, generally recognized and acceptable to many organizations, should be selected. In our case, the choice of a larger number of indicators would allow a more

accurate assessment of organizational sustainability but it would be more time-consuming and would result in various problems connected with data retrieval.

Sustainability visualization is the final stage of the determination of organizational sustainability. Conclusion drawing is the ninth stage of the determination process of the forest enterprise sustainability, in which the model output function is actualized. At this stage, the new knowledge derived during all the previous stages of the sustainability determination process is summarized. This knowledge helps to make appropriate decisions in the positive inducement of organizational sustainability.

## DISTRIBUTION VISUALIZATION AND DETERMINATION OF FOREST ENTERPRISE EXTERNAL SUSTAINABILITY

During the determination process of a particular forest enterprise's external sustainability, we can have a real time record of the values of a set of respective indicators of sustainability components which, if appropriately aggregated, can reflect the external sustainability of the organizational environment (see the seventh stage of the determination of organizational sustainability).

In order to determine the forest enterprise external sustainability and its distribution across sustainability components, it is appropriate to use the the visualization methods for self-organizing neural networks and to generate the unified distance matrix (or U-matrix for short). Moreover, the U-matrix values should be placed on the self-organizing map to identify the existing data clusters.

Based on the data of the self-organizing neural network, the U-matrix is generated which represents the distances between neighbouring neurons that are calculated using T. Kohonen's formula (Kohonen, 2001):

$$(1) \|M_p - M_{kl}\|$$

Where:

$M_p$  is the neuron neighbouring the  $M_{kl}$  neuron.

Self-organizing maps (SOM) have the essential advantage to perform high accuracy multidimensional data clustering and visualization operations. It is for this reason that the use of self-organizing maps in the visualization of multidimensional components of organizational sustainability is quite attractive (Kohonen, 2001).

In the case of the rectangular map,  $M = \{M_{kl}, k = 1, \dots, r, l = 1, \dots, s\}$ , where:  $r$  is the number of the network rows,  $s$  is the number of the network columns,  $M_{kl}$  is the vector, the number  $n$  of its dimensions equaling the number of training vectors (Dzemyda & Tiešis, 2001). At the beginning of training, the initial values of the components of the neurons/vectors  $M_{kl}$  are usually determined randomly. The neurons next to the neuron-winner are called first-order neighbours, the neurons next to the first-order neighbours are called second-order neighbours, and so on (Stefanovič & Kurasova, 2009).

In the scientific literature, one can come across a comparatively large number of visualization methods for self-organizing neural networks (component planes, histograms, etc.). The unified distance matrix (or U-matrix for short) is one of more popular visualization methods for self-organizing neural networks. The U-matrix is made up of distances between the neighboring neurons of the self-organizing neural network. E.g., with a dataset consisting of 4 columns and 150 rows, the U-matrix will be a vector of 150 rows and 4 columns. After generating the U-matrix from the initial data, its values must be placed on the self-organizing map which typically consists of rectangular or hexagonal neurons. The scientists Kraaijveld M.A, Mao, J., Jain, A.K. (1995) proposed a visualization method for self-organizing neural networks by means of which the average distances between neighbouring neurons are presented in gray or coloured scale tones (Kraaijveld & Mao & Jain, 1995).

If the average distances between neighbouring neurons are short, the map components matching these neurons are light-coloured; longer distances between neighbouring neurons are dark-coloured. Consequently, the data clusters existing on the self-organizing map are determined by light tones and the margins are determined by darker tones (Kohonen, 2002, Dzemyda & Kurasova, 2002).

The visualization method for self-organizing neural networks, the U-matrix, was tested using the multidimensional data model (Fisher, 1936) - the four-dimensional Fisher's iris dataset akin to the multidimensional data of organizational sustainability components.

It should be noted that the determined respective external level of organizational environmental sustainability has a strong influence on the external components functioning within organizational environments.

Distribution visualization and determination of the forest enterprise external sustainability are possible only if the vital, social, antropogenical and economical levels of external efficiency for each forest enterprise have been defined showing the distribution of the forest enterprise external sustainability across all the components of sustainability.

In addition, the set quantitative values for the vital, social, antropogenical and economical levels of each forest enterprise's external efficiency account for the derived overall level of the forest enterprise external sustainability.

## **EXPLICATION OF FOREST ENTERPRISE EXTERNAL EFFICIENCY LEVELS**

The vital levels of the forest enterprise external efficiency occasionally show the progress made by the forest enterprise within the external vital organizational environment.

We maintain that the unified distance matrix (or U-matrix for short) is one of more popular visualization methods for self-organizing neural networks. In our case, the U-matrix is made up of distances between the neighboring neurons of the self-organizing neural network, which are placed in the generated unified distance matrix of the forest enterprise vital external efficiency multidimensional dataset.

The vital efficiency levels of the benchmark sustainability of each forest enterprise and organization that are based on a certain distance existing between the benchmark sustainability of the forest enterprise and organization. The less the distance, the higher the level of efficiency which declares a more significant progress made by a relevant forest enterprise within the external vital organizational environment in respect of other forest enterprises concerned.

The analysis of the data provided in the U-matrix shows that the maximum distance of 7.45 exists between Valkininkai Forest Enterprise and the benchmark organizational sustainability. Consequently, Valkininkai Forest Enterprise is making the least progress within the external vital organizational environment in comparison with other forest enterprises. This is confirmed by the lowest vital external efficiency level recorded among all the forest enterprises. Meanwhile, the minimum distance of 2.61 exists between Ukmergė Forest Enterprise and the benchmark organizational sustainability. As a result, Ukmergė Forest Enterprise is making the most progress within the external vital organizational environment in comparison with other forest enterprises as confirmed by the highest vital external efficiency level recorded among all the forest enterprises. It can be maintained that Ignalina Forest Enterprise is making an average progress within the external vital organizational environment. This is confirmed by Ignalina Forest Enterprise vital external efficiency level of 5.03 positioning between the benchmark organizational sustainability and the maximum and minimum average distance of respective forest enterprises.

The social levels of the forest enterprise external efficiency occasionally show the progress made by the forest enterprise within the external social organizational environment. We maintain that the unified distance matrix (or U-matrix for short) is one of more popular visualization methods for self-organizing neural networks. In our case, the U-matrix is made up of distances between the neighbouring neurons of the self-organizing neural network, which are placed in the generated unified distance matrix of the forest enterprise social external efficiency multidimensional dataset.

The social efficiency levels of the benchmark sustainability of each forest enterprise and organization that are based on a certain distance existing between the benchmark sustainability of the forest enterprise and organization. The analysis of the data provided in the above table shows that the maximum distance of 8.92 exists between Ignalina Forest Enterprise and the benchmark organizational sustainability. Consequently, Ignalina Forest Enterprise is making the least progress within the external social organizational environment in comparison with other forest enterprises.

This is confirmed by the lowest social external efficiency level recorded among all the forest enterprises. Meanwhile, the minimum distance of 6.45 exists between Šiauliai Forest Enterprise and the benchmark organizational sustainability.

As a result, Šiauliai Forest Enterprise is making the most progress within the external social organizational environment in comparison with other forest enterprises as confirmed by the highest social external efficiency level recorded among all forest enterprises concerned.

It can be maintained that Trakai and Veisiejai Forest Enterprises are making an average progress within the external social organizational environment.

This is confirmed by Trakai and Veisiejai Forest Enterprises social external efficiency level of 7.70 positioning between the benchmark organizational sustainability and the maximum and minimum average distance of respective forest enterprises.

The antropogenical levels of the forest enterprise external efficiency occasionally show the progress made by the forest enterprise within the external antropogenical organizational environment.

Antropogenical efficiency levels of the benchmark sustainability of each forest enterprise and organization that are based on a certain distance existing between the benchmark sustainability of the forest enterprise and organization. The less the distance, the higher the level of efficiency which declares a more significant progress made by a relevant forest enterprise within the external antropogenical organizational environment in respect of other forest enterprises concerned.

The analysis of the data provided in the above table shows that the maximum distance of 8.75 exists between Jurbarkas Forest Enterprise and the benchmark organizational sustainability. Consequently, Jurbarkas Forest Enterprise is making the least progress within the external antropogenical organizational environment in comparison with other forest enterprises. This is confirmed by the lowest antropogenical external efficiency level recorded among all the forest enterprises. Meanwhile, the minimum distance of 4.24 exists between Veisiejai Forest Enterprise and the benchmark organizational sustainability. As a result, Veisiejai Forest Enterprise is making the most progress within the external antropogenical organizational environment in comparison with other forest enterprises as confirmed by the highest antropogenical external efficiency level recorded among all the forest enterprises.

The economical levels of the forest enterprise external efficiency occasionally show the progress made by the forest enterprise within the external economical organizational environment.

We maintain that the unified distance matrix (or U-matrix for short) is one of more popular visualization methods for self-organizing neural networks. In our case, the U-matrix is made up of distances between the neighboring neurons of the self-organizing neural network, which are placed in the generated unified distance matrix of the forest enterprise economical external efficiency multidimensional dataset.

Economical efficiency levels of the benchmark sustainability of each forest enterprise and organization that are based on a certain distance existing between the benchmark sustainability of the forest enterprise and organization. The less the distance, the higher the level of efficiency which declares a more significant progress made by a relevant forest enterprise within the external economical organizational environment in respect of other forest enterprises concerned.

It can be maintained that Trakai Forest Enterprise is making an average progress within the external economical organizational environment. This is confirmed by Trakai Forest Enterprise economical external efficiency level of 10.22 positioning between the benchmark organizational sustainability and the maximum and minimum average distance of respective forest enterprises.

## **DETERMINATION OF FOREST ENTERPRISE EXTERNAL SUSTAINABILITY**

The levels of the forest enterprise external sustainability occasionally show the progress made by the forest enterprise within the external organizational environment.

We maintain that the unified distance matrix (or U-matrix for short) is one of more popular visualization methods for self-organizing neural networks. In our case, the U-matrix is made up of distances between the neighboring neurons of the self-organizing neural network, which are placed in the generated unified distance matrix of the forest enterprise economical internal efficiency multidimensional dataset.

The table below shows a fragment of the U-matrix of the forest enterprise external sustainability multidimensional dataset, which represents the distances between neighboring neurons of the self-organizing neural network between forest enterprises and the benchmark organizational sustainability.

**Table 1: Fragment of U-matrix of Forest Enterprise Economical External  
Sustainability Multidimensional Dataset**

The external sustainability levels of the benchmark sustainability of each forest enterprise and organization that are based on a certain distance existing between the benchmark sustainability of the forest enterprise and organization. The analysis of the data provided in the above table shows that the maximum distance of 16.82 exists between Jurbarkas Forest Enterprise and the benchmark organizational sustainability. Consequently, Jurbarkas Forest Enterprise is making the least progress within the external organizational environment in comparison with other forest enterprises. This is confirmed by the lowest external sustainability level recorded among all the forest enterprises. Meanwhile, the minimum distance of 14.04 exists between Kėdainiai Forest Enterprise and the benchmark organizational sustainability. As a result, Kėdainiai Forest Enterprise is making the most progress within the external organizational environment in comparison with other forest enterprises as confirmed by the highest external sustainability level recorded among all forest enterprises concerned.

It can be maintained that Tytuvėnai Forest Enterprise is making an average progress within the external organizational environment. This is confirmed by Tytuvėnai Forest Enterprise external sustainability level of 15.43 positioning between the benchmark organizational sustainability and the maximum and minimum average distance of respective forest enterprises.

## CONCLUSIONS

Any Lithuanian State Forest Enterprise is a complex multidimensional structure which regularly hosts a variety of quantitative and qualitative changes. The sustainable development of forest enterprises can be induced by regulated, spontaneous or planned interventions which can be formed both, internally and externally, and which can be directed to the employees functioning within the internal environment of the organization or to the local/regional-scale customers, suppliers, partners and community members operating within the external environment of the organization.

The developed and described model for the determination of organizational sustainability explains the determination process of a certain organization's sustainability, which consists of 9 basic stages, however it does not reveal all the side factors governing the determination process of organizational sustainability (decision-making, grouping of responsible persons, task assignment, coordinating actions, primary data collection, etc.).

The self-organizing maps (SOM) have the essential advantage to perform high accuracy multidimensional data clustering and visualization operations. It is for this reason that the use of self-organizing

maps for the transformation of multidimensional components of organizational external sustainability into two-dimensional space is quite attractive.

The analysis of the data provided in a fragment of the U-matrix of the forest enterprise vital external efficiency multidimensional dataset showed that Valkininkai Forest Enterprise is distinguished for the minimum vital efficiency which is argued by the maximum distance of 7.45 existing between Valkininkai Forest Enterprise and the benchmark organizational sustainability. Meanwhile Ukmergė Forest Enterprise is distinguished for the maximum vital efficiency which is argued by the minimum distance of 2.61 existing between Ukmergė Forest Enterprise and the benchmark organizational sustainability.

The analysis of the data provided in a fragment of the U-matrix of the forest enterprise economical external efficiency multidimensional dataset showed that Ukmergė Forest Enterprise is distinguished for the minimum economical efficiency in comparison with other forest enterprises. This is confirmed by the maximum distance of 11.83 existing between Ukmergė Forest Enterprise and the benchmark organizational sustainability. It should be emphasized that the minimum distance of 8.66 exists between Kėdainiai Forest Enterprise and the benchmark organizational sustainability. As a result, Kėdainiai Forest Enterprise is making the most progress within the external economical organizational environment in comparison with other forest enterprises concerned.

The respective vital, social, antropogenical and economical levels of the forest enterprise efficiency indicate the distribution of each forest enterprise's external sustainability and account for the causes of levels of a certain external sustainability.

The analysis of the data provided in a fragment of the U-matrix of the forest enterprise external sustainability multidimensional dataset proved that Jurbarkas Forest Enterprise is distinguished for the lowest level of external sustainability which is confirmed by the maximum distance of 16.82 existing between Jurbarkas Forest Enterprise and the benchmark organizational sustainability. Meanwhile, the minimum distance of 14.04 existing between Kėdainiai Forest Enterprise and the benchmark organizational sustainability proves that Kėdainiai Forest Enterprise is distinguished for the highest external sustainability level.

# THE CONTRIBUTION OF INTERNAL AUDITING TO ENHANCE ORGANIZATIONAL PERFORMANCE IN THE RWANDA REVENUE AUTHORITY (RRA)

**Tshepiso I Ngwenya and Pascal Buregeya**  
**Tshwane University of Technology, South Africa**

## ABSTRACT

*The study determines how the internal auditing can contribute to improve organisational performance for Rwanda Revenue Authority (RRA). Internal auditing is perceived by others as a cost to organisation whereas on the other hand as a tool which enhance organisational performance. A survey of questionnaires and closed interviews using a coding method were conducted on three groups of RRA employees: namely; managers, internal auditors and middle managers. 86% respond was received which was strengthen by interviews to ensure the reliability and validity of data collection.*

*The investigation shows that the RRA's internal auditing function was not being objective and lack independence along reporting lines. Moreover, there were no audit committees to help in resolving this matter. Hence, the internal auditing assurances were seen as not adding value to the RRA in general.*

## INTRODUCTION

An organization cannot afford to operate ineffectively in a competitive environment. It is crucial for the Rwanda Revenue Authority (RRA) to be aware of all the factors that influence its business strategy. And one of the ways is to have an effective internal auditing which can play an important role in contributing to organizational performance.

It is now rare indeed to find an enterprise of any size, which does not have an internal auditing function. In many cases, internal auditing has now eclipsed other management services to become management's primary source of advice on efficiency, effectiveness, and economy. Accompanying its status within organisation, internal auditing is now much more strongly established professionally (Chambers and Rand, 1997).

However, in Rwandan enterprises it is seldom to find an internal auditing function. One of the causes of business failure in Rwanda organisations is the absence of an internal auditing function. Also not all internal auditing departments function at their full potential capacity because internal auditing is a relatively new profession in the Rwandan business environment. A number of internal auditing functions are in the process of either being established or of being upgraded.

Being part of the structure in many organisations, the internal auditing function is actually operational in few of them. Sometimes, organisations resort to external audit exercised by national as well as international private auditing agencies to carry out the audit function. This shows that the internal audit function is neglected and considered as useless in most of Rwandan organisations. It seems that this important function is neglected in most of the Rwandese organizations.

Based on the issues mentioned above, the research sought to answer this question: *Is internal audit contributing to the improvement of the organisational performance of the Rwanda Revenue Authority?*

To be in a position to respond to this question, the study is aimed at improving the internal auditing role and its organizational performance in the Rwanda Revenue Authority (RRA), and that internal auditors, as management consultants, should advice management on how to achieve organization's objectives and goals.

Throughout this research, the auditor's role in helping the audit committee and/or managers to improve organizational performance is emphasized. The purpose of this study is to focus on how auditors can contribute to the Rwanda Revenue Authority's performance. To do this, auditors must have a thorough knowledge of the business. If the auditor doesn't understand the business, he may focus on the wrong area or fail to provide meaningful recommendations for improvement to organizational performance. It aims also at diagnosing the service of internal auditing of the RRA. This research should allow decision-maker to understand the internal auditing role in the organisational performance and opportunity criteria for the establishment of internal auditing service in the organisation.

The literature is based on reviewing the effectiveness of internal auditing contribution to the enterprise's profitability. There is increasing management interest in the value which internal auditing can add to an organization's internal control framework. Internal auditors provide a mixture of benefits, from quality in the performance of internal auditing work and associated other services, to contributions to the achievement of organisation objectives; from experience, training and development gained by internal auditors, to future contribution to their organisation's management and specialist careers (Ridley and Chambers, 1998).

At a time when internal auditing is being challenged by outsourcing alternatives and by other methods of reviewing managerial effectiveness, it is particularly important to be able to measure its contribution to the enterprise's profitability. In this section we take a look at performance measures for internal auditing – measures of inputs (*economy*), process (*efficiency*) and especially outputs (*effectiveness*). Appropriate specific measures are recommended. In doing this we will be identifying the key aspects of internal auditing which need to be focused upon in order to improve internal auditing contribution to the enterprise's profitability. We consider the difficulties of reaching reliable measures of internal audit performance, and distinguish between qualitative and quantitative measures. We suggest a value for money approach to assessing internal audit performance.

It will be necessary to identify the categories of performance measures which may be used to evaluate internal audit performance and the strengths and weaknesses of each. Advice on their interpretation is given. The measurement of internal audit is placed in context with: (a) the general business environment, (b) professional standards for internal auditing, and (c) good management practice on planning and control (Chambers and Rand, 1997).

## **PLACING INTERNAL AUDIT IN CONTEXT**

Historically, the growth of internal auditing as a business service has been counter-cyclical, though not uniformly so. By this we mean that in the past, internal auditing has developed most strongly during times of economic constraint. Where directors, managements and regulators consider internal auditing as investment that reduces risk and cut costs in organizations. Al-Twaijry et al., (2003) and Spira and Page (2003), cited that internal audit could add value by helping organizations achieve economy, efficiency and effectiveness through consulting management and employees and assisting in the management of risk. However, internal audit effectiveness and organizational performance has not been empirically examined sufficiently so as to warrant conclusive facts. Moreover, although the existing literature (for example, Al-Twaijry et al., 2003; Cohen et al., 2004; Mat Zain et al., 2006; Mihret and Yismaw, 2007) recommend that Internal Auditing (IA) may not always be effective, the antecedents of IA effectiveness appear not fully explored as yet.

Even though internal auditing has its own setbacks as stated above, it has yield so much benefits to companies by providing qualitative assurance services( auditing services) and non assurance( for example, consultation), but still management are putting it under the microscope to determine whether it out ways the costs as this is a very expensive service. (Ridley and Chambers, 1998). To find out whether internal auditing is adding value or not and to determine its performance in the RRA, steps are carried in the methodology below to determine this.

## METHODOLOGY

A survey is used to address the knowledge of and the role played by internal audit regarding the organisational performance. Qualitative methods are used to describe internal audit's role in improving organisational performance, to identify performance of managers and auditors and to link them to the organisational performance. Furthermore, the mechanisms are used to find out factors leading to the improvement of organisational performance and internal audit's contribution in improving organisational performance.

A survey questionnaire is administered to three categories of employees in the targeted population. The first category of respondents ranged from first-level supervisors to departmental heads. The second category concerned the internal auditors and the third category concerned the division heads. The questionnaire was distributed, with the assistance of the internal audit division, to all senior managers, middle managers and internal auditors. The researcher collected the completed questionnaires from the respondents. These actions (the efforts of the researcher and internal audit division) increased the reliability and validity of the study. The feedback on the questionnaire represented 86% of the target population for this research.

The information was collected through various data collection instruments such as documentary sources, a survey questionnaire, and interview. The interview, aimed at compensating for the eventual shortcomings of the questionnaire.

The main source of data was annual reports of the Internal Audit Division. Data collected from reports were used to examine the realizations of internal audit function within the organization and the functions of the internal auditors. The first step of data analysis was about organizing raw qualitative data by using a coding technique.

## RESULTS

For the RRA, to achieve its mission, it is necessary to have an effective internal control. Establishing and maintaining an effective system of internal control calls for skills that can only be provided through a competent and professionally qualified internal audit function. Auditing is a key factor in the corporate governance. In addition to statutory auditor attestations on financial reports, internal auditing is an essential linkage in assuring an adequate system of internal control.

The RRA internal audit function is not totally independent and objective because of the reporting line. Internal auditors should be independent of the activities they audit. Audit reporting is at the heart of effective audit independence.

Many see a growing value from internal audit contributions in the assessment and reporting of control status. The RRA doesn't have an audit committee and this is a problem for internal audit to be objective and independent. Ridley and Chambers (1998) state the importance of audit committee. For internal audit units to be objective and independent, in all control and governance issues, their work should always be reviewed and supported by an audit committee or a similar group of senior no-executive management.

The Institute of Internal Auditors' policy is to recommend that businesses should have audit committees on the board. Where there are not present it is difficult to provide an adequate substitute in order to preserve audit independence. In the absence of either an audit committee of the board or an internal audit committee, greater reliance has to be placed on forging formally accepted direct lines of reporting to the board itself, the chief executive, the regulatory authorities and the external auditors. These reporting lines should be present even where there is an effective audit committee – with the exception that reporting to the board would, in that case, be via the audit committee (Chambers, 1992).

Even though the RRA internal audit function perform well according to the respondents, it is still not easy to rely on this because since the existence of this function there is no audit or evaluation made in order to measure its performance.

According to Ratliff et al. (1996), performance audits generally focus on efficiency and effectiveness, and they require that performance criteria be established. These audits depend on the availability of a set of accepted objectives and goals against which performance can be evaluated.

The internal auditor may use existing performance measures to assess performance. Effective Internal audit has then an important role to play in improving organizational performance but one can ask what makes effective internal audit. Vinten (1999) echoed that the critical condition for effective internal audit is adequate status and independence within the organization and the widest possible remit. The prerequisite is therefore visible and overt top level support and commitment of resources. The organization should be seen to listen to and act upon the advice of its internal auditors. It should invest the time, money, and energy in ensuring its internal auditors perform and that their advice is sound.

## CONCLUSION

The present research was an experimental assessment of the contribution of internal audit to organizational performance. The research investigated the performance of the internal audit function within the organization and its contribution in organizational performance. To achieve this, we emphasized on the performance in terms of activities done against the activities planned and some data were processed and analyzed.

While the results in this study are by no means conclusive, it is hoped that this study has contributed to the research done in the extent of the internal auditing practices. This study has also provided some evidence on the extent of the internal auditing practices and the influence it has on the internal control system.

# **MICROFINANCE ORGANIZATIONS IN SOUTH AFRICA: ARE THEY SUSTAINABLE AND SELF-SUFFICIENT IN RURAL SOUTH AFRICAN BUSINESS ENVIRONMENT?**

**Tshepiso I Ngwenya and Ntombi Skosana**  
**Tshwane University of Technology, South Africa**

## **ABSTRACT**

*This paper seeks to establish whether micro-lenders in South Africa (SA) directed at the rural poor aimed at poverty alleviation are self-sufficient and self-sustainable. The chances are that, the poorer you are, the more expensive or onerous informal financial arrangements there is (Sapovadia, n.d). As cited by Baumann (2004), donors, government and many analysts used sustainability as a benchmark of microfinance institutions' performance.*

*The concept of sustainability was used as a measurement to determine performance of microfinance organizations in South Africa. In addition to this, South Africa was compared to other developing countries to generate more concrete data; however the results indicated that it cannot be comparable due to its dual economic circumstances.*

*Data was collected from CEOs using structured questionnaires from all the micro-lenders registered under section 21 companies. South Africa reveals that South African micro-lenders are neither self-sufficient nor self-sustainable. Furthermore, findings indicate that South Africa situation doesn't allow comparison to micro-lenders in other developing countries because of its dual economic nature.*

## **INTRODUCTION**

A Millennium Summit was held in the United Nations Headquarters, in New York on the 6-8 of September 2000. This Summit consists of world leaders who adopted what is called the Millennium Declaration. The purpose of the Declaration was to outline goals that will be able to reduce poverty, hunger and other daunting issues for 2015, that will enhance a better socio-economic and political development of the world. These goals were called the Millennium Development Goals (MDGs) which were in turn craft into intense goals from so called, goal 1 to 8 outcomes (<http://www.un.org/millennium/background.htm>).

Based on these goals, South Africa (SA) took upon herself to ensure that these goals are its national priorities. Among them, SA sees it fit that it needs to introduce microfinance companies, which are organizations that will be within the SA Law under the umbrella of the UN, to combat poverty and provide funding to the needy (i.e. those who do not meet the banks' requirements to receive funding for various purposes) to better the living conditions for all South Africans. Also below are the targets set by Paris Declaration in 2000 which were scaled down and introduced in by the work that The Honorable, former President of SA, Thabo Mbeki and other African leaders, took upon themselves to drive the needs of the African continent by introducing what they call, NEPAD (New Partnership for Africa's Development).

## **BACKGROUND**

To ensure that the targets set in 2000 are in motion, the world leaders came together again in March 2<sup>nd</sup> 2005 in France, Paris. This occurs to form a commitment once more to which they called it the Paris Declaration. This Declaration was divided into sections and the commitments on its aid effectiveness include that:

- Developing countries will exercise effective leadership over their development policies, strategies, and to coordinate development actions;
- Donor countries will base their overall support on receiving countries' national development strategies, institutions, and procedures;
- Donor countries will work so that their actions are more harmonized, transparent, and collectively effective;
- All countries will manage resources and improve decision-making for results;
- Donor and developing countries pledge that they will be mutually accountable for development results(<http://www.aidharmonization.org/ah-overview/secondary-pages>)

To make these commitments more specific and suitable for the African continent, the Honorable former President Thabo Mbeki of South Africa (SA) and other African leaders came together to formulate NEPAD. NEPAD was developed to consolidate democracy, good governance and implement sustainable socio-economic development programmes on the African continent. SA has taken this even further by being involved in the India Brazil South Africa Dialogue Forum. The Forum strengthens the co-operation in removing distortions in the world that are skewed against developing countries and among others, rules of multilateral trade system and making the international financial architecture more responsive to development.

Based on the MDGs and the Paris Declarations concepts, more is directed to goal 8 which is more relevant to this study and explain fully the need of global partnership development by developed countries to developing countries in a form of donations for sustainability development. Goal 8 effectively underpins the efforts of developing countries to achieve all of the other MDGs (South Africa Millennium Development Goals Mid-Term Country Report, 2007). However, with regard to the financial system in SA, there are still no indicators that can be used to measure the present outcomes (South Africa MDGs Report, 2007).

That is why SA is still in a mess of sorting out issues of finance. However, SA is not alone in this financial crisis. At the time of writing this paper even developed countries like USA, EU and Asia are experiencing financial difficulties. When narrowing these financial issues to direct to the paper investigation, we try to find out whether micro lenders are sustainable and self sufficient in SA business environment or not?

## **South African Economy**

According to Encyclopedia of Nations (2009), South Africa has what it may be called a dual economy which is one comparable to industrialized nations and another which is comparable to developing countries. This type of an economy is double sided whereby the other portion is characterized by highly sophisticated way of doing things like developed countries and on the other hand, there is this tragic part of the economy, which is traditional and is mainly taking place in the rural areas. It is characterized by poverty, hunger and joblessness and other factors that are distorting for the betterment of live for all. The two economies have no contact to each other and there is a huge gap between the two in relation to matters of development in economic sustainability and self sufficiency. The two concepts, sustainability and self sufficiency are explained below to show what impact they have in relation to the dual SA economy.

The word sustainability came from the verb sustain meaning: to hold up; to bear; to support; to provide for; to maintain; to sanction; to keep going; to keep up; to prolong or to support the life of (Chambers Concise Dictionary). Sustainable growth, sustainable use and sustainable development do not have the same meaning; however, in some cases they are been used interchangeably. For the sake of this paper, only the term, sustainable development is defined since it one of the key terms in this study. The [www.ecifm.rdg.ac.uk/definitions](http://www.ecifm.rdg.ac.uk/definitions) refers sustainable development as a way to continue to improve the quality of human life whilst living within the carrying capacity of the ecosystems. This means that the system in which it operates must be in a position that it is capable of taking care on its own on an on-going process without receiving any support or help anyway or anyhow. Taking in to account these two definitions, the SA economic development explanation is circle around

these concepts. Due to its dual economy as outlined above, SA has nine provinces with each has its uniqueness. The Gauteng Province( meaning a place of gold), with is regarded as a power house of SA economic development, occupying 14% of the land area with 9,5 million people( South African National census, 2001), it is the most urbanized , affluent, sophisticated and modernized location followed by the Western cape. However, SA has this other side which is characterized by extreme poverty, lack of jobs and poor infrastructure. These include provinces like the Eastern Cape (e.g. Port Elizabeth) followed by Free State and Northern Province (Statistics South Africa Report). As elaborated above, about SA dual economy, now the question is whether SA economic sustainability and self sufficient is it comparable to other countries and or its region?

## **Comparability of South African economic development with other countries**

The Grameen Bank in Bangladesh is well known for its success in providing credit to the poor (Jain & Moore, 2003; Baumann, 2004; Van Ruit, 2001; Karlan, 2001).The main pillars of the lending model for the Grameen Bank is group lending rather than collateral and credit screening as a form of money lending .Because of it success outcomes, South Africa have attempted to replicate its model of lending however without any success. Factors like lack of self-sustainability and self-sufficiency have been identified as setbacks just like in most micro-lenders including group-lending organizations. (Seibel & Torres, 1999).

Another setback for South African it is its dual economy. The first economy is similar to that of Southern Europe which is categorized under those individuals who are well up economically and able to meet their basic needs whilst the second one related to South Asia where people are still living under impoverish sever and unbearable life style (Baumann, 2004). According to Gardner (2002), South Africa has been unable to generate the type of microfinance sector that has been successful in many African, Asian and Latin American countries.

As stated above, the Grameen Bank has being success in providing credit to the poor, however, its strategies has not been rewarding to other countries including South Africa. In a study of 27 explicators conducted by the Agricultural Credit Policy Council (ACPC) in the Philippines “The repayment performance was impressive, averaging a rate of 96.8 per cent, but the overall picture was dismal. The program was found to be donor – driven rather than self - sustainable. According to Small Enterprise Foundation, one of the best performing group-lending organizations in South Africa since 1992, they only managed to improve its self-sufficiency ratio from 51% to 83% in 2003.In a financial performance analysis done by the Micro Finance Regulatory Council in South Africa in 2004, it was found that the costs for micro lenders are twice the size of their income. As a result, they could not cover their normal operating costs like administration costs.

With these problems in hand ,the study’s main objective is to ensure that factors that are associated with good repayment of farmer groups in South Africa are identified which in turn will yield to self- sufficiency and sustainability of micro-lending institutions. Now, the big question is, “Are group lending microfinance organizations in South Africa self- sufficient and sustainable”? This question can be understood well when broken down in to sub questions as follows:

- Are the goals of the micro lenders aligned to the goals of government and or donors?( Link to Paris Declaration)
- Are group lenders that have a greater outreach self-sufficient and sustainable?

Taking into account the above questions in mind, the environment in which South African microfinance markets operate, are in a form of group associations, group co-operation and group responsibility that apply basic traditions of African societies in a traditional savings and credit schemes” (Harms, 2002). South Africa’s microfinance markets operates differently from others due to their differences in client characteristics, loan purposes, repayment mechanisms, motivations of the key institutions, and policies supporting service expansion. These differences make it difficult to directly transplant lessons learnt and or models from other developing countries to South Africa.

To make a good platform for the above to occur, the investigation operates under the following assumptions:

- A portion of the micro-lenders that fund rural communities finances them for agricultural purposes.
- Access to credit by the poor have the desired outcome by the non-profit micro-lenders such as poverty alleviation.
- Group lending is mainly for enterprises and not for consumption.
- All respondents have answered the questions honestly and truthfully.
- Rural communities are satisfied with the service offerings of the rural Micro-lenders.

With this in mind, the following key topics are discussed in details to get more light in what is happening with SA micro-lenders.

## **Microfinance & poverty alleviation in South Africa**

According to Porteous (2002), “Micro finance is the key to development in the Southern African Development Community (SADC) region and Africa in general”. The definition of microfinance depends on the purpose it performs. For example, micro-lenders aimed at poverty alleviation use definitions that enable them to exclude that portion of the population that do not fall within their scope or target group by using a threshold amounts for lending or a minimum or maximum lending amount.

The purpose of the micro-lending institutions is to:

- Provide service that can be targeted specifically at the poor and poorest of the poor.
- Make a significant contribution to the socio-economic status of the targeted community.
- Deliver services that can develop within a few years into sustainable organizations with steadily growing outreach.

## **Group lending**

Group lending according to Goeldner (2004) involves “the formation of a group with a fairly homogenous need for credit (in terms of loan size and term)” were group members individually usually act as the guarantor of the loan. In cases where a member of the group cannot make a payment, the other members of the group must repay on that person’s behalf. In a research done by Finmarktrust in 2006 for South African development micro-lenders, all micro-lenders that aimed at reaching the poor use one form of social intermediation methodology. Bay Research and Consultancy Service (2006) refers social intermediation methodologies as programmatic strategies that identify, develop, and employ community-level relational resources to extend micro-financial services to poor households.

## **Asia pacific countries**

In Indonesia, the BRI-Unit Desa(BUD) operates as a profitable organization that focus on increasing access to financial services and not on targeting poor people or resolving gender issues. In the case of BAAC (Bank for Agriculture & Agricultural Co-operatives) in Thailand, it uses a small group’s joint liability as a mechanism to generate costs savings and to harness peer pressure to enhance loan repayments. In terms of assessment of success or sustainability, one out of seven micro-lenders in the Philippines, was found to be viable as cited by the Asian and Pacific Development Centre (APDC).

# **METHODOLOGY**

The targeted population for the study was CEOs and CFOs of 17 organizations registered with the MFRC development micro-lenders or Section 21 or non-profit making companies in South Africa. Structured questions using face to face interview and faxing of documentations in case of failure to perform an interview, were methods of collecting data from the respondents. The questions were based on:

- Are group lenders sustainable?
- Are group lenders that have a greater outreach more likely to be sustainable?
- Are lenders that have been operating for longer periods more sustainable?
- Is there a relationship between sustainability and good repayments or bad repayment rates?

The respond rate was 100% since the population was not big. The numbers of the employees range from 1-10 depending on the activities and the number of the borrowers. At the time of writing this article, Capitec bank was a huge borrower which had 801 809 borrowers. Based on ethical issues, the names of the CEOs/CFOs contacted should not be disclosed however, their main activities is to provide manage loans to the participants.

## RELIABILITY & VALIDITY

Information was collected from CEOs or CFOs was reliable since they are in charge of exercising authority and delegating duties according to the micro-lenders requirements. Also the valuable, reasonable and relevant data that come from previous research and statistics to support the questionnaires to respondents add more force and strengthen the investigation.

## RESULTS & DISCUSSIONS

Underneath are the outcomes of this study as outlined by tables and figures:

**Table 1**

Outreach or number of provinces

<b>Targeting/Outreach</b>	
<b>Number of provinces</b>	<b>Percentage</b>
1-3	83%
4-6	17%
7-9	0%

As presented in Table 1, it was established that 83% of the respondents operate in a maximum of only three provinces. Seventeen percent (17%) operate in up to six provinces and none operate in more than six provinces or all provinces.

**Table 2**

Number of years in operation or existence

<b>Number of years in existence</b>	<b>Percentage</b>
Less than 3 years	0%
4-6 years	50%
7-10 years	33%
More than 10 years	17%

According to the results in Table 2, only 17% of the micro-lenders indicated to have been in operation for a period of more than ten (10) ten years. Half of the micro-lenders (50%) have operated for a period of between 4-6 years and the rest (33%) has been in operation for a period between 7-10 years. This question was meant to found out if given enough time, micro-lenders will be able to reach the numbers that might enable them to cover all their transaction costs.

**Table 3**

Lending or targeting method

<b>Lending method/targeting</b>	<b>Percentage</b>
Loans to individuals	17%
Loans to Groups	83%
Loans to Groups and individuals	0%

The findings in respect to the lending method used by the lenders are summarized and presented in Tables 3. An overwhelming majority of 83% of the micro-lenders grant loans only to groups while only 17%

lend to individuals. These findings are also supported the argument by Bay Research and Consultancy Services (2006) stating that the only South African institutions consistently reaching very poor households employ SIMs or group-lending to do so.

**Table 4**

Group targeting method: Organizations lending to groups only

Targeting method	Percentage
New groups are formed in line with the credit policy of the organization	80%
Existing groups are funded	20%

Eighty percent (80%) of the micro-lenders form groups in line with their credit policies while only 20% lend to groups that already exist. If the micro-lenders themselves are involved in the process, that might have an impact on their ability to reach big numbers hence the need to limit the number of province of operation.

**Table 5**

Loan Purpose

Purpose of loan	Percentage
Consumption spending	0%
Agricultural enterprises	0%
The purpose of the loan is not a criteria for funding	0%
Other	100%

Although all the micro-lenders indicated that they lend for **other** purposes, they all specified that they lend for micro enterprises but not specifically agricultural enterprises. None of the lenders grant loans for consumption spending and the purpose of the loan is a criterion for the granting of funds in the form of a loan for all lenders. These findings are very crucial to the research topic as they give a clear indication that loans for agricultural enterprises are catered for as just loans for other enterprises and not singled out. Baumann (2004) supports these findings by citing that “The South African pro-poor MFIs are mainly rural, but because South Africa has very few small-scale cash farmers, their clients are not agricultural microenterprises. They are mainly petty traders, dressmakers, traditional brewers, etc. in rural villages”.

**Table 6**

Trends in cost to income ratio

Trends in cost to income ratios	2003	2004	2005	2006
Less than 10%	50%	40%	40%	40%
10%-30%	0%	0%	0%	0%
30%-50%	25%	20%	20%	20%
Above 50%	25%	40%	40%	40%

Of the micro-lenders that completed and returned the questionnaires, 50% had a cost to income ratio of less than 10% in 2003, 25% had a cost to income ratio of between 30 and 50% and the remaining 25% had cost to income ratio of more than 50%. In 2004, 2005 and 2006, 40% of the respondents had a cost to income ratio of less than 10% while 20% had a cost to income ratio of 20%. The remaining 40% had a cost to income ratio of more than 50%. These findings show that costs remain high in most of the micro-lenders as compared to income, which can inevitably hamper operational and financial efficiency.

Figure 1 illustrates that most micro-lenders have an operational self-sufficiency of less than 40% and that the number is increasing although it remained the same in 2003, 2004, and 2005.

Figure 2 also indicates an increase in the inability to be financial self-sufficient by a majority of micro-lenders.

**Table 7**

Sources of funding

Government	17%
Donor funding	50%
Commercial Bank loans	0%
Government and donor funding	33%

Other loan funding	0%
100% self funding	0%

None of the respondents are 100% self-funding. The majority (50%) depends on donors while 17% rely on government funds. Thirty three percent (33%) of the respondent organizations rely on funding from both donors and government for their financial survival. Given the low levels of both operational and financial self-sufficiency in most micro-lenders, it should be expected that most of them would be relying on some kind of donor or grant assistance.

**Figure 1**  
Operational Self-sufficiency

**Figure 2**  
Financial Self-sufficiency

## CONCLUSIONS AND RECOMMENDATIONS

Credit lending was found not to be an appropriate method of alleviating poverty in SA. Micro-lenders should ensure that the requirements of lending money basically focus on poverty alleviation and not on other business transactions. There is also a need to revisit the definition of sustainability within the South African context especially given the nature of the country's economy, factors such as the regulatory framework relating to deposit taking as well as the definition as it relates to the ability to attract and retain donor funding.

Although according to Baumann (2004), donors are themselves starting to re-look their own expectations in respect of sustainability of micro-lenders, it is however incumbent upon the micro-lenders themselves to be proactive and ensure that donor grants do not come with requirements that will put pressure on them to be self-sustaining within a short period of time and shift their focus from their goal of poverty alleviation. Further to this, in reporting to donors, micro-lenders need to be transparent in terms of the challenges and the paradox relating reaching the poor and self-sufficiency and sustainability.

## PROPOSAL FOR FUTURE RESEARCH

A comparative study of the performance of all the different South African micro-lenders registered in the different categories by the MFRC might be beneficial to the industry. Although other types of micro-lenders such as banks may not have the same goals as development MFIs however there might be some lessons to be drawn from them given the fact that they operate in the same regulatory or legal environment and of course the same economy. There is also a need for further research to establish what models of poverty alleviation would be most appropriate to South Africa given its unique and dual economy.

Now that the National Credit Act has been promulgated, a study on the effects of the act on the sustainability of micro-lenders is also proposed. further to this, there will be a need to establish and understand the effects of the National Credit Act on access to finance by the poor that are targeted by development micro-lenders.

# **INTEGRATED FRAMEWORK FOR MEASURING CORPORATE SUSTAINABILITY, SOCIAL, ENVIRONMENTAL IMPACTS, CUSTOMER ATTRACTION AND BUSINESS SUCCESS**

**Emmanuel Obinali Obioha and Heinz Eckart Klingelhöfer**  
**Tshwane University of Technology, South Africa**

## **ABSTRACT**

*In recent times, the lack of a single widely accepted measurement tool for corporate sustainability and business success continues to be a matter of concern. Most sustainable development dimension measures have been developed in isolation of business activity and are not yet directly linked to business strategy. Conversely, many business executives have asked themselves, how would a greater focus on potential social, environmental impacts and customer attraction affect the performance of their company? This article presents a framework that can measure the impact of corporate sustainability on financial performance of firms by investigating the effect of potential social and environmental impacts on customer attraction and firm's financial performance. It will further explore and establish how the integrated forces of socio-economic development, human rights, environmental process focus (ecological footprint), and environmental product focus (eco-efficiency) drive customer attraction until the link to profit is clear.*

## **INTRODUCTION**

### **Background**

An increasing number of sustainability practitioners, managers, business executives and investors recognize the importance of developing a universal tool that can measure the relationship between dimensions of corporate sustainability performance and business success (Sustainability, 2001:05; Marc and Marie, 2001:587; Gerbens-Leenes, Moll and Uiterkamp, 2003:232; Francisco and Marianna, 2005:642; Schaltegger and Wagner, 2006:2:8:12). Although the majority of research revealed a strong positive link between sustainability and business success supporting the business case, most of it completely fails to address the key issues that could bring the bulk of mainstream investors and corporate managers to the table. Most sustainable development dimension measures such as cost-benefit analysis (CBA), environmental impact assessment (EIA), risk assessment (RA), life-cycle assessment (LCA), lagging indicators (LIs), leading indicators (LIs), benchmarking etc. have been developed in isolation of business activity and are not yet directly linked to business strategy (Sustainability, 2001:5; Marc and Marie, 2001:587; Francisco and Marianna, 2005:642; Gerbens-Leenes, Moll and Uiterkamp, 2003:232; Figge and Hahn, 2004; GEMI, 2009; GRI, 2010). Hence, many business executives have often demanded to know, if and how a greater focus on potential social, environmental impacts, and customer attraction would affect the performance of their company. Conversely, the lack of a single widely accepted measurement tool for corporate sustainability and business success continues to be a matter of concern.

Thus, by carefully identifying and articulating the drivers of financial performance and measuring and managing their broad effect on potential social and environmental impacts, managers can make a significant contribution both to the company and to the society. The framework provides a comprehensive approach for

examining the drivers of corporate sustainability and its use by managers can provide a clearer understanding of the impacts of the various past, pending and future corporate decisions on both the company and the society (Marc and Marie, 2001; Francisco and Marianna, 2005; Schaltegger and Wagner, 2006; GEMI, 2009; GRI, 2010)

## Linkages between corporate sustainable development dimensions and measures of business success

Tables 1 and 2 below illustrate ten dimensions of corporate sustainable development performance and also ten measures of business success. The aim of these tables is to classify the development performance dimension (i.e. socio-economic development, human rights, environmental process focus (ecological footprint) environmental product focus (eco-efficiency)) into a bigger scheme and then to cross-link them with the measures of business success. For the purpose of this article customer attraction ,as one of the drivers of financial performance is taken as a measure of business success in order to determine and communicate if and how sustainable development performance dimensions drives it until the link to profit is clear. Studies have found that customer attraction as a driver of financial performance is strongly influenced by potential social and environmental impacts including almost all the sustainable development factors (Sustainability 2001:5; Francisco and Marianna, 2005:642; Marc and Marie, 2001:587; Schaltegger and Wagner, 2006:2:8; GEMI, 2009; GRI, 2010). However, for a long time there has been the need for empirical research to test these relationships in South Africa (South African Foundation, 1998; Business and Marketing Intelligence, 1999; Centre for Development and Enterprise, 1999; JSE (SRI), 2008)

In this article, we chose sustainable development performance dimensions, according to company indicators as socio-economic development, human rights, environmental process focus (ecological footprint), environmental product focus (eco-efficiency) as in table 1 and customer attraction (financial driver) as the measure of business success as in table 2, because there is a positive relationship between customer attraction and sustainable development initiative as indicated above.

Table1. Ten Dimensions of Corporate Sustainable Development Performance

A.	Governance:	1.	Ethics, Values and Principles
		2.	Accountability and Transparency
B.	General	3.	Triple Bottom Line Commitment
C.	Environment	4.	<u>Environmental Process Focus</u>
		5.	<u>Environmental Product Focus</u>
D.	Socio- Economic	6.	<u>Socio Economic Development</u>
		7.	<u>Human Rights</u>
		8.	Work Place Conditions
E.	Stakeholder Engagement	9.	Engaging Business Partners
		10.	Engaging Non- Business Partners

Source: Sustainability, 2001: 05

Table2. Ten Measures of Business Success

A.	Financial Performance	1.	Shareholder Value
		2.	Revenue
		3.	Operational Efficiency
		4.	Access to Capital
B.	Financial Drivers	5.	<u>Customer Attraction</u>
		6.	Brand Value and Reputation
		7.	Human and Intellectual Capital
		8.	Risk Profile
		9.	Innovation
		10.	License to Operate

Source: Sustainability, 2001: 05

Thus, for sustainable development to become truly integrated into business decisions and strategy, a systematic sustainable development performance measurement is essential (Elkington, 1998; Gemi, 2002:2009; Sustainability, 2001; Marc and Marie, 2001; Francisco and Marianna, 2005; Schaltegger and Wagner, 2006)

## MEASURING THE BROAD EFFECTS OF POTENTIAL SOCIAL AND ENVIRONMENTAL IMPACTS ON CUSTOMER ATTRACTION AND FIRM'S FINANCIAL PERFORMANCE

### Theoretical Framework

The objective of this article is demonstrated in the figure 1 below, illustrating the theoretical framework of the links between corporate sustainability (socio-economic management and environmental impacts management) and economic success through the pathway of customer attraction and economic success/financial performance. The independent variables include, corporate socio-economic development, corporate human rights, corporate environmental process focus, and corporate environmental product focus while the dependent variables are, customer attraction and firm's economic performance/economic success. This paper will establish and develop the relationship between the independent variables on dependent variables by exploring the impacts/effects of the independent variables on dependent variables until profit is clear.

According to figure 1, successful management of corporate sustainability performance is achieved if the management of corporate socio-economic development, human rights, environmental process focus and environmental product focus are in line with increased customer attraction and economic performance.

Although many theoretical and empirical studies (mostly correlated-based) have been performed on the relationship between environmental and economic performance, only a few take a closer look at the above link (Lankoski, 2000; Margolis, Weber and Walsh 2003; Pearce, 2003; Porter, 1991; Reinhardt 1999a, 1999b; Schaltegger and Burritt 2005; Schaltegger and Synnestvedt 2002; Wagner and Schaltegger 2003:2004; Figge, Hahn, Schaltegger and Wagner, 2002; Schaltegger and Wagner, 2006; Margolis, Weber and Walsh, 2003)

Therefore, the following paragraphs of this section will measure the impact of corporate potential social and environmental impacts on financial performance of firms by investigating at first the effects of corporate

socio-economic development, corporate human rights, corporate environmental process focus (ecological footprint), and corporate environmental product focus (eco-efficiency) on customer attraction, and in the second step - the effects of customer attraction on financial performance.

## **Impacts on Customer Attraction**

### **Effects of Corporate Socio-Economic Development**

Corporate socio-economic development will help customers to differentiate between similar products and providers, price and performance being equal (Sustainability, 2001; Francisco and Marianna, 2005; Schaltegger and Burritt, 2003; Marc and Marie, 2001). Consumers are the most responsive to the sustainable development performance of the firms they buy products from. Ethics contribute value to the company by deepening the values connections with customers (Dalla, 1998; Avery, 2000)). Cause-related marketing is a powerful customer attractor, linking products to a charitable cause that can boost short-term sales (Sustainability, 2001; GRI, 2000; Nordisk, 1999; Rochlin and Christoffer, 2000). According to Sustainability, (2001) customer attraction is a company's ability to attract and retain customers through interesting products, attractive brands, a strong reputation, customer service or particular company activities. Thus, a company's ability to retain customers is clearly a driver of future revenues. The importance companies place on customer attraction is underscored by the typically vast amounts invested in marketing and advertising. However, high levels of community investment e.g. socio-economic development and partnerships, supporting local development by developing commercial or manufacturing activities in the area, hiring local staff, education etc, have been shown to increase brand differentiation, effectively acting as a tie-breaker in consumers' purchasing decision (Maser, 1996; Avery, 2000; Cowe and Williams, 2000; Walker and Grisaffe, 2000; GEMI, 2009). The socio-economic dimension is likely to have much impact on business to customer relationships, e.g. London-based Diageo plc reported that between 1994 and 1998, 22 cause-related marketing projects helped it raise \$600,000 for business-to customer causes while increasing sales of tracked brands by 37% (Sustainability, 2001:23). Thus, companies with good records in this dimension increase their brands/reputation in the market resulting in huge revenue, a factor of customer attraction, e.g. Coca-Cola, BP, Shell, Nike, Sasol have been well-documented in this dimension, which have brought issues such as human rights into corporate boardrooms (Sustainability, 2001:11; Marc and Marie, 2001:586; Ernst and Young, 2008:2009; JSE, 2008) A company's socio-economic development performance could be based on any of the following initiatives:

- Its policies on community investment
- The number, type and size of its donations
- The percentage of staff and suppliers that are based in the local community
- Community ratings of the company

Thus, a company that has high socio-economic development performance in the above areas, attracts more customers, increases its brands and records high level of financial performance.

### **Effects of Corporate Human Rights**

In this article, human rights is defined as the degree to which a company actively and constructively contributes to the protection of human rights for its employees, its neighbors' and indeed all host country residents, in the regions in which it does business and even, potentially, in regions it decides not to do business (Sustainability, 2001; WRI, 2001; WBCSD, 2000; GEMI, 2009). Sustainability, (2001) tells us that most consumers get their impressions of companies' sustainable development credentials from the press and civil society groups which monitor corporate behavior. As a consequence, corporate performance on human rights and the environment tends to weigh more heavily in their assessments than other sustainable development performance dimensions, hence poor performance in human rights may result in reduced consumer interest. Although little direct research exists, a number of incidents have shown that customers boycott products from companies with poor human rights performance e.g. BP's efforts to eradicate human rights abuses, and the direct involvement of the chief executive officer (CEO) Sir John Browne, have built public trust in the company and helped it strengthen its reputation. Shell realized when customers boycotted the company due to its perceived lack of opposition to a string of human rights abuses by the Nigerian government in 1995 (Shell, 2000; [www.bp.com/alive](http://www.bp.com/alive)). One would expect a positive and major increase in customer loyalty due to reputation for

superior ethical behavior. Conversely, the reputation-destroying effects of unethical behavior can drive customers away: e.g. The Coca-Cola Company paid out a record \$192.5 million in November 2000 to settle a racial discrimination lawsuit brought by black employees who claimed that Coca-Cola discriminated against them in pay, promotions and evaluations (Coca-Cola, 2000; Sustainability, 2001:19). Above all, some business customers are beginning to screen out suppliers with poor human rights performance but the net effect on contracts is marginal. 43% of socially responsible investment (SRI) funds use human rights performance as a screen, although definitions vary widely (Sustainability, 2001:21). Between 77% and 88% of consumers are more likely to buy from a good corporate citizen (Hillard, 1999). According to Sustainability, (2001:11), company's performance in this area could be based on the following criteria:

- The scope and depth of its human rights policies regarding, e.g. freedom of association or racial, ethnic and gender discrimination and the company's record of implementation
- Actual operating decisions, such as whether to go to or stay in the regions prone to human rights abuses and whether and how it uses its bargaining power with host governments to promote human rights
- Number of complaints against the company for human rights abuses, or alternatively, awards for proactive human rights performance.

Hence, human rights is a determinant of customer attraction and brand value or corporate reputation

## **Effects of Corporate Environmental Process Focus (Ecological footprint)**

According to Sustainability, (2001) the environment was the first sustainable development dimension to grab the attention of business, and environmental performance, to a greater or lesser degree, is now an integral part of most commercial operations. Environmental or ecological footprint refers to the extent to which a company minimizes any adverse environmental impacts associated with its production processes, through, for example, changes in materials, equipments or practices. Companies that operate in high environmental impact industries may exhibit relatively poor performance in terms of sustainability elements such as consumption of natural resources, emission and health risk of their products or services compared to companies operating in low environmental impacts industries. Thus, according to this article, a company's environmental performance records account for the relevant environmental impacts of the company's operation. Six indices are commonly used by most of the companies in their environmental reports (Elkington, 1998; Degan, 2003; Figge and Hahn, 2004; Marc and Marie, 2001; Francisco and Marianna, 2005; GEMI, 2002:2009; GRI, 2002:2010). The indices include energy consumption, resource consumption, water use, land use, waste generation and greenhouse gases emission (GEMI, 2009; GRI, 2010).

Despite a company's commitment to the above requirements, its environmental performance should aim at among other things delivering a competitively-priced goods and services that satisfy human needs and bring quality of life, while progressively reducing ecological impacts and resource intensity throughout the life cycle, at a level at least in line with the Earth's estimated carrying capacity – Eco-environmental Shear Zone (WBCSD, 2000; Francisco and Marianna, 2005; Marc and Marie, 2001; Schaltegger and Wagner, 2006). By far the most compelling business case can be made for the environmental process focus. Its impact on all business performance measures including customer attraction is positive. This is partly a reflection of its business enhancing potential, but also of the fact that the environment is becoming firmly entrenched in business practice and is getting a great deal of management attention, allowing its potential to be realized. All these initiatives, whether proactive or reactive, are aimed at improving corporate environmental and financial performance.

## **Effects of Corporate Environmental Product Focus (Eco-efficiency)**

The concept of eco-efficiency is defined as creating value for society and business by doing more with less over the full life cycle by, reducing the material intensity of its goods and services, reducing the energy intensity of its goods and services, enhancing the recyclability of its materials, maximizing the sustainable use of renewable resources, extending the durability of its products and increasing the service intensity of its goods and services (WBCSD, 2000; Velea and Ellenbecker, 2000; GRI, 2010; Schaltegger and Burritt, 2005; Sustainability, 2001; GEMI, 2009). On the other hand, environmental product focus is the extent to which a company has embedded environmental principles throughout a product's life cycle by for example, developing or re-designing its product and service portfolio to minimize adverse environmental impacts, e.g. product stewardship initiatives, design for the environment (Sustainability, 2001; Schaltegger and Burritt, 2005; IFAC,

1998:36; Howes, 2002; GRI, 2002:2010). Eco-efficiency is a concept and strategy enabling sufficient de-link of the use of nature from economic activity, needed to meet human needs, to keep it within carrying capacities; and to allow equitable access to, and use of the environment, by current and future generation (EEA, 1998). Two indices are identified to demonstrate a company's performance on eco-efficiency namely reuse rate and recycling rate.

Thus, in evaluating the company's sustainability performance and environmental quality, its environmental policy and product stewardship must set out its commitment towards achieving a cleaner environment, hence increase their bottom lines. A company will not only be sustainable through commitment to pollution prevention, reduction of environmental risks but to a greater extent on the principle of product stewardship (Sustainability, 2001; Francisco and Marianna, 2005; Schaltegger and Wagner, 2006; GEMI, 2002:2009; GRI, 2002:2010). Often the examination of product functionality and customer needs have led to radical new product and service strategies providing increased levels of customer satisfaction, e.g. Interface Inc, is using this strategy in its core business of floor carpeting. Rather than selling carpets to customers which are generally discarded after their useful life, Interface Inc leases carpets which it then takes back after use and recycle. Customer satisfaction is increased as customers receive high levels of service without concerns about post-customer waste and the company benefits through higher levels of customer retention and more efficient use of recycled materials. On the other hand, the society is improved through lower levels of waste in landfills. Studies have found out that customers will always patronize products of a company, provided price and quality are equal to alternative products (GEMI, 2002). Research confirms that a majority of retail customers will opt for the greener product (Sustainability, 2001; GRI, 2002:2010; GEMI, 2009).

## **Effects of Customer Attraction on Financial Performance of Firms**

Customer attraction is the golden road to shareholder value for most of the companies (Sustainability, 2001; Francisco and Marianna, 2005). Its link to brand value and reputation has been increasingly clear in recent years. Shareholder value represents Treasure Island for most organizations (GEMI, 2002:2009; GRI, 2010). Volkswagen notes that environmental performance links to competitive advantage via attractive conditions offered by banks and insurers, buoyant share prices and positive customer perception of the company (Volkswagen, 1999/2000). Customer attraction appears to have a positive relationship with innovation which is a driver of economic success (Walsh, Weber and Margolis, 2003; Keller, 2003). In an economic environment characterized by dramatic change, the ability to explore emerging opportunities by launching and learning from strategic experiments is more critical for survival than ever (Govindarajan and Trimble 2004). Organization which adapts to changes most effectively will be rewarded by consequential growth in sales, profits and possibly employment. In the high tech industries and industries with high brands and reputation, innovations are more frequent which show a high level of financial performance (Furman, Porter, and Stern, 2000; Govindarajan and Timble, 2004 Schaltegger and Wagner, 2006).

Companies like Shell International, stressed that a key driver of their sustainable development efforts is the desire to win customers, enhancing the brand by providing services and products built on sustainability thinking to create customer loyalty and market share (Shell, 2000). The Co-operative Bank also focuses on the ways in which its partnership approach to stakeholders is delivering value for each of the seven different categories of stakeholders, including customers (Co-operative Bank, 1999). The German chemical giant BASF (1999) is convinced that the markets of the future will shun companies who fail to take account of the environmental aspects of their products and processes. They therefore believe it is all the more important to have an effective yardstick for the company's environmental and economic performance. Eco-efficient products and processes will give them a decisive competitive edge. The company's latest environmental report introduces an eco-efficient tool designed to help customers to understand this area. Thus, customer attraction is the company's ability to attract and retain customers through interesting products, attractive brands, a strong reputation, customer service or particular company activities, which is clearly a driver of future revenue. The importance companies placed on customer attraction is underscored by the typically vast amounts invested in marketing and advertising. To compete successfully in today's global competitive environment companies are becoming customer-driven and making customer satisfaction an overriding priority (Drury, 2008). Customers are demanding ever-improving levels of service regarding cost, quality, reliability, delivery and the choice of

innovative new products. Thus, companies that are able to incorporate these business activities into their business strategy will gain competitive advantage and hence increase their bottom-lines.

## RESEARCH METHODOLOGY

The paper is cross-sectional, combining qualitative and quantitative approaches. The instruments will include face-to-face and telephonic interviews. A likerred-scaled items/questionnaire will also be used to collect data. The population is all 57 constituents listed companies within the Johannesburg Securities Exchange (JSE) subscribing to socially responsible investment (SRI) index classified by the reserve bank of South Africa, e.g. Resources, Commercials and Industrials). Data is analyzed in the following ways:

- Factor analysis was performed to reduce the data items
- Chronbach's alpha was used to validate the instrument
- Chi-square test was employed to test for association between the categorical variables and
- The analysis was performed at 95% confidence limit, Stata or SPSS served as statistical software packages.

## OUTLOOK

This paper is a work-in-progress since our aim is to produce a paper with international orientation we considered this audience appropriate for the kind of inputs that will help to furbish the paper. Thus, suggestions and contributions from this conference will be incorporated in the real study making it a balanced piece of study.

However, the theoretical as well as empirical evidence presented in this paper suggests that customer attraction will translate to corporate financial performance if managed and measured through the above linkages. Thus, Socio-economic development, human rights, environmental product focus and environmental products focus will positively drive customer attraction indicating that customer attraction is a good measure of corporate sustainability performance. A model characterized of the above linkages in consideration with the inputs from this conference, will be developed which completes this paper.

## CONCLUSION

By carefully identifying and articulating the drivers of financial performance and measuring and managing their broad effect on potential social and environmental impacts, managers can make a significant contribution both to their company and to the society. For sustainable development performance to become truly integrated into business decision and economic success, a systematic sustainable development performance measurement is essential. In our view, companies that not only identify and communicate key issues and value drivers but also clearly prioritize social and environmental impacts can gain a competitive edge by proactively managing sustainable development performance. Improved overall performance can be achieved by setting sustainable performance targets that are consistent with the company's operating principles that can measure, report and if necessary adapt performance to these targets over time. A company will successfully manage its corporate sustainability performance if the management of corporate socio-economic development, human rights, environmental process focus and environmental product focus are in line with increased customer attraction and economic performance.

On completion, this paper will develop and test a framework that can measure the impact of corporate social and environmental impacts (sustainability performance) on financial performance of a company through the path way of customer attraction and economic success. It will demonstrate how the integrated forces of potential social and environmental impacts drive customer attraction until the link to profit is clear. The framework developed will provide a comprehensive approach for examining the drivers of corporate sustainability and its use by managers can provide a clearer understanding of the impacts of the various past, pending and future corporate decisions on both the company and the society. Above all, it will assist organizations to better understand how to gain competitive advantage, increase firms' performance and provide an economic rationale for organizations involvement in sustainable development performance.

# **FIRMS PERCEIVE THE SAME HOST COUNTRY DIFFERENT, DEPENDING ON FIRM EXPERIENCE**

**Maud Oortwijn**  
**University of Warwick, United Kingdom**

## **ABSTRACT**

*During international expansion, firms face unknown foreign host country environments (Aharoni, 1966). The key problem for international business is the lack of knowledge and the related uncertainty about a host country (Johanson and Vahlne, 1977). Especially in transition economies, like China, it is impossible for foreign firms to make decisions with full knowledge of the host country conditions. Managerial interpretation of the local business context plays a critical role. The main aim of this paper is to discuss how firm experience relates to the perception of host country conditions (Oortwijn, 2010b). With increasing firm experience in international business, the perception of the same host country, China, becomes more optimistic.*

## **INTRODUCTION**

International business is inherently risky, because of the lack of knowledge of local politics, culture, market systems and language (Johanson and Vahlne, 1977). Knowledge is ascribed a pivotal role in the firm's internationalization process (Petersen, 2008). The level of commitment to international business often develops with increasing knowledge and experience that comes with experiential learning in international business in general and in the host market in particular. A firm's host country experience and its history of entry patterns in other countries shape entry preferences for entrance into a new host country (Pan and Tse, 2000; Chung and Enderwick, 2001; Yiu and Makino, 2002; Li and Meyer, 2008; Oortwijn, 2010a).

Many scholars define uncertainty about the host country as a characteristic of the host country, whereas part of the uncertainty is related to the firm's "not knowing". The present state of internationalization affects perceived opportunities and risk which in turn influences entry commitment decisions. Reduced uncertainty drives firm growth, because it makes perceptions of opportunities more accurate (Penrose, 1959). Experience in a host country or neighbouring countries helps understand foreign opportunities. It enables better judgements for entry and supports success of operations abroad (Barkema, Bell *et al.*, 1996). The perception of international business opportunities becomes more realistic, when based on experiential learning (Barkema, 1998; Delios and Beamish, 1999; Petersen, 2008). A lack of experience is related not only to the cost of developing proper operations, but it also limits the options considered by decision makers (Hutzschenreuter, Pedersen *et al.*, 2007). Perceived market uncertainty influences a firm's willingness to commit to markets. Firms have a tendency to avoid or reduce uncertainty (Cyert and March, 1963; Thompson, 1967).

## **Perceptions of foreign countries**

Entry choices are made by firms based on the perception of the external business contexts in which the business activities are due to take place. International Business scholars intensively studied the host country. Most research gathers secondary data on the host country variables from official sources. While these are important contributions, in practice decisions are made based on perceptions, not on objective macro-level measures of host country conditions. Primary data on managerial *perception* of host country opportunities, uncertainties and difficulties is studied less often (Collinson and Houlden, 2005). The host country perception has been largely neglected in International Business research. Recently, scholars become aware that the

managerial perception of host country conditions not necessarily mirrors the macro-level measures on host countries (Simon, 1991; Chapman, Gajewska-De Mattos *et al.*, 2008; Dong and Glaister, 2009; Dow, 2009; Jansson, Hilmerston *et al.*, 2009; Oortwijn, 2010b; Oortwijn, 2010c). While most research measures the macro-level variables of host country conditions, the perception is relevant for entry choices (Dow and Karunaratna, 2006; Oortwijn, 2011).

To develop an international business strategy, large amounts of complex data needs to be interpreted about a new and unknown business environment, while data is often only limited available. In new or unknown business environments organizations and decision makers need to interpret and make sense of large amounts of complex and often limited information (Daft and Weick, 1984). To assess new business problems or environments, managers follow implicit theories distilled from prior experience or knowledge (Hohenthal, Johanson *et al.*, 2003; Branzei, Ursacki-Bryant *et al.*, 2004). This activity is referred to as 'sense making' and is often defined as "*efforts to create order and make retrospective sense of what occurs*" (Weick and Roberts, 1993). This means that managers make sense of the new business environments by unconsciously applying relevant cognitive frameworks based on previous business experience, for instance experience in international business or experience within a specific host country. The firm's and manager's international experience influences the present perceptions, foreign entrance choices and global strategic posture (Carpenter and Fredrickson, 2001; Collinson and Houlden, 2005).

Another way, in which firm experience shapes perception, is through the organizational practices that develop over time. These are a reflection of past firm experience and present ongoing business activities. Organizational practices provide for instance conditions of decision procedures, share certain information, raise expectations with regard to punishment or reward and offer specific resources to a manager (Jarzabkowski, 2008). Managers thus interpret situations, within a certain social context and history that is attached to it, based on information provided by organizational information processes that reflect past needs. For small firms, decision making for international business is extra challenging (Knight and Kim, 2009; Oortwijn, 2010d). Given the limited financial and human resources available within most Small and Medium-sized Enterprises (SMEs), international business decisions are often based on know-how, skills and general business competences of the individual SME decision makers (Knight and Kim, 2009).

This paper reports on how host country conditions in China are evaluated in firms with different international business experience. It is not the intention to provide quantitative statistical proof for a relationship between firm experience and host country perception, but rather to reveal a mechanism which requires further investigation: The managerial assessment reflects the learning assumed in the Internationalization theory.

## METHOD

During 2006 and 2007, a number of 25 Dutch firms are studied while making decisions on 54 international business activities in or with China. Data is gathered on the entry strategy, the firm experience in international business and on the perception of the host country conditions. The entry strategy process is studied in time through interviews with the main decision maker. The managerial perception of host country conditions is measured in a Likert-scale survey with 15 statements about host country conditions in China. The physical and cultural distance between China and the Netherlands is significant, providing sufficient material to study how managers respond to perception of opportunities and uncertainties in unknown environments (Hofstede, 1980).

### Data gathered on firm experience

The firm's international business experience is measured semi-structured with factors that are known to influence foreign entry choices. The data is gathered through desk research and checklists in face-to-face interviews. Below the data on firm experience is defined.

#### Level to which the strategy is global

The level of internationalization is rated in two categories:

- Market within the EU and/or Supply chain within the EU
- Global supply chain and market seeking outside the EU

#### Number of years

The number of years in international business is a relevant measure for international business experience, though it is a dimension less often discussed (Erramilli, 1991):

- Number of years in international business < 25 years
- Number of years in international business > 25 years

#### Percentage of sales abroad

The percentage of sales that is realized outside the home country is a good measure for international business success (Sullivan, 1994; Rugman and Collinson, 2005). In the present study the cases are categorized:

- Sales abroad is < 75% of the total revenues
- Sales abroad is > 75% of the total revenues

#### Experience host country

The perception of international business opportunities in a foreign country becomes more realistic, when based on experiential learning (Barkema, 1998; Delios and Beamish, 1999; Petersen, 2008):

- No, no activities in China *or* only trade activities in China
- Yes, a presence in China

#### Experience host region

Experience in a host country or neighbouring countries helps understand the foreign opportunities and uncertainties (Barkema, Bell *et al.*, 1996). It is rated in two categories:

- No, no activities in Asia *or* only trade activities in Asia
- Yes, a presence in Asia

## **Data gathered on host country perception**

The data central to this paper is gathered in a structured written questionnaire. The 5 host country conditions are operationalized with three variables per construct. These variables are known determinants for entry choices (Agarwal and Ramaswami, 1992; Kim and Hwang, 1992; Davis, Desai *et al.*, 2000; Brouthers, 2003). Below an overview is provided of the statements per construct. The constructs concern political uncertainty, economic uncertainty, cultural distance, ease to conduct business and size of the opportunity.

#### Political uncertainty

Three statements together provide a balanced view on the perception of political uncertainty in the host country:

- *"I don't expect any major changes in the political system in China."*
- *"China will not undo her market reforms."*
- *"The Chinese government offers foreign firms a beneficial investment climate."*

#### Economic uncertainty

Economic uncertainty is measured in three different variables, through four different statements. First, the manager is asked directly his/her perception of economic stability. Then the manager is questioned on the long term revenue growth expectations, reflecting expected future growth of the Chinese market (expected revenue in 10 years time minus the expected revenue in 3 years time). In case the Chinese economy does evolve in a manner not beneficial, uncertainty on repatriating investments or profits increase the risk of economic uncertainty as it limits strategic flexibility. The survey statements on perception of 'economic stability' in China:

- *"China is economically stable."*
- *"Sales in China will be a large part of our worldwide revenue in 10 year time."*
- *"Sales in China will be a large part of our worldwide revenue in 3 year time."*
- *"I don't expect any difficulties repatriating profits or investments."*

#### Cultural distance

Cultural distance is measured by asking the respondent to what extent they perceive cultural differences between the Netherlands and China. Since geographical distance relates strongly to the level of knowledge of a different

culture, the geographical distance is the second statement. The third statement rated concerns quality standards. In interviews managers explain this to be the most important aspect of cultural distance for decision making.

- “*There are very significant cultural differences between the Netherlands and China.*”
- “*The geographical distance to home does not have a large impact on our decision to do business in China.*”
- “*We can maintain the same quality standards in China as at home.*”

#### Ease to conduct business

The survey statements on perception of ‘ease to conduct business’ in China:

- “*China’s infrastructure (telecom, road net, etc) is limiting business in China.*”
- “*The Chinese government’s general attitude towards foreign companies is positive.*”
- “*Product specifications in our industry are comparable to the Netherlands.*”

#### Size of the Opportunity

Survey statements on perception of ‘size of the opportunity’ in China:

- “*The Sales in China will be a large part of our worldwide revenue within 3 years.*”
- “*Doing business in China will improve our overall margins significantly.*”
- “*Transport cost will highly impact our decision to do business in China.*”

The questionnaire statements are rated by respondents on a five-option Likert-scale. The Likert-scale is coded quantitatively later on, in a rating of 1 to 5, with 5 being the most beneficial circumstances for the foreign company, e.g. for most statements “Strongly disagree”=1, “Disagree”=2, “I don’t know”=3, “Agree”=4 and “Strongly agree”=5. The statements in the questionnaire that are formulated negative, are coded with opposite rating values (“Strongly disagree”=5; “Disagree”=4, “I don’t know”=3, “Agree”=2 and “Strongly agree”=1).

## RESULTS

The analysis reveals how different firms perceive the host country conditions differently for the same host country. Firms with more international business experience worldwide and in China, on average have more optimistic perceptions of China as a host country.

### Worldwide international business experience

Table 1 shows firms grouped into two groups. The firms that already focus outside Europe for both sales and the supply chain, have a more optimistic perception of China as a host country (sum of perceptions is 49.75 versus 45.43 for firms that do not search for market opportunities outside the EU). A One-Way ANOVA test reveals that the difference between the groups is significant, with a p-value of  $p=0.03$ . Firms are more optimistic about China as a foreign business environment, when their international business focus already includes countries outside Europe. This optimism is reflected in all five host country conditions.

**Table 1: Host country perception and level of strategy international**

	Global SCM & Market (N=12)		Market or SCM in EU (N=14)	
	Average answer	Standard deviation	Average answer	Standard deviation
Political stability	11.58	1.51	10.57	1.70
Economic stability	7.42	1.56	6.93	1.33
Cultural closeness	10.00	1.21	9.29	1.98
Ease to do business	10.75	2.14	9.57	1.65
Size of the opportunity	10.00	2.37	9.07	1.69
	49.75		45.43	

Perception China: Average of the sum of three ratings on a Likert-scale from 1 to 5, with 5 most optimistic.

**Table 2: Host country perception and number of years international business experience**

	Number of years > 25 years (N=10)		Number of years < 25 years (N=16)	
	Average answer	Standard deviation	Average answer	Standard deviation
Political stability	11.70	1.57	10.63	1.63
Economic stability	7.60	1.58	6.88	1.31
Cultural closeness	9.30	1.25	9.81	1.91
Ease to do business	10.80	1.62	9.69	2.06
Size of the opportunity	10.20	2.44	9.06	1.69
	49.60		46.06	

**Table 3: Host country perception and the percentage of sales realized abroad**

	Sales abroad > 75% (N=9)		Sales abroad < 75% (N=17)	
	Average answer	Standard deviation	Average answer	Standard deviation
Political stability	11.44	1.13	10.82	1.88
Economic stability	7.78	1.64	6.82	1.24
Cultural closeness	10.11	0.60	9.35	2.00
Ease to do business	10.78	1.99	9.76	1.89
Size of the opportunity	9.67	2.60	9.41	1.77
	49.78		46.18	

Table 2 reveals how perceptions differ between firms depending on the number of years they are involved in international business. Again the more experienced firms are more optimistic about China as a host country (sum of perceptions is 49.60 versus 45.06 for firms that do not search for market opportunities outside the EU). A One-Way ANOVA test proves the difference between the groups is just significant, with  $p=0.09$ .

Table 3 shows how perceptions differ between firms depending the percentage of the sales they realize outside the Netherlands. Again, the more experienced firms are more optimistic in their perception of China as a host country (sum of perceptions is 49.78 versus 46.18 for firms that do not search for market opportunities outside the EU). A One-Way ANOVA test for the sum of perceptions per case company reveals that the difference between the groups is just significant, with a  $p$ -value of  $p=0.10$ .

From the above we learn how worldwide international business experience of the firm makes the perception of host country conditions in China more optimistic.

## Host region international business experience

International business experience in host country China shapes the perception of conditions in China even more (table 4). Firms that already have a presence in China are more optimistic about China as a host country. They are on average more optimistic about all five host country conditions. A One-Way ANOVA test is conducted on the sum of the host country perceptions between a group of firms with an existing presence and a group of firms that has no or only trade experience with China. The  $p$ -value of the test is  $p=0.002$ .

**Table 4: Host country perception and International business experience in China**

	Existing presence China (N=7)		Trade/No experience China (N=19)	
	Average answer	Standard deviation	Average answer	Standard deviation
Political stability	12.14	1.68	10.63	1.50
Economic stability	8.00	1.63	6.84	1.26
Cultural closeness	9.86	1.35	9.53	1.81
Ease to do business	11.57	1.27	9.58	1.89
Size of the opportunity	10.71	2.36	9.05	1.78
	52.29		45.63	

Perception China: Average of the sum of three ratings on a Likert-scale from 1 to 5, with 5 most optimistic.

**Table 5: Host country perception and International business experience in Asia**

	Existing presence Asia (N=16)		Trade/No experience Asia (N=10)	
	Average answer	Standard deviation	Average answer	Standard deviation
Political stability	11.30	2.00	10.88	1.45
Economic stability	7.70	1.70	6.81	1.17
Cultural closeness	9.80	1.14	9.50	1.97
Ease to do business	11.10	1.79	9.50	1.83
Size of the opportunity	10.00	2.45	9.19	1.76
	49.90		45.88	

A similar analysis is conducted dividing the firms into two groups depending on their experience in Asia (table 5). The first group with a presence in Asia and the second with no or only trade experience in Asia. The firms with a presence in Asia are more optimistic on all host country conditions. The difference is largest on the perceived 'ease to conduct business'. The p-value of the One-Way ANOVA test on the variances between groups for the sum of the five perceptions, results in  $p=0.06$ . On average, firms with a presence in Asia perceive host country China (49.90) significantly more optimistic compared to firms without a presence in Asia (45.88).

The analysis reveals how the perception of the conditions in host country China varies between firms, depending on firm experience in international business. Firms with more international business experience are more optimistic about conditions in the host country China. Confidence in foreign markets grows with firm experience. The optimism in perception is most notable for firms with a presence in China.

## FINDINGS

The role of the managerial cognitive processes is a factor mistakenly ignored in IB research. Managerial perceptions of host country business conditions differ from general macro-level measures of host country conditions (Chapman, Gajewska-De Mattos *et al.*, 2008; Dong and Glaister, 2009). The present work reveals a mechanism which at least partially explains why the macro-level measures and perceptions of the host country differ. The main contribution of this paper is that it links firm international business experience to managerial perceptions (Cho and Padmanabhan, 2005). The learning effect of international experience is reflected in the perception of the host country conditions. The intention of the paper is not to provide statistical significant support for this claim, but rather to reveal it as a mechanism which needs further investigation.

## Impact findings

The most common trend across the various sorts of firm experience across the five host country conditions is that perceptions become more optimistic with increasing firm experience. These findings are in line with the underlying assumption of the Uppsala model, that experiential knowledge reduces perceptions of host country uncertainty and risk (Hadley and Wilson, 2003). The results on firm experience and host country perception uncovers and makes explicit the learning process of international business within the firm. Another findings is how experience within the host country and host region shapes the perception more significantly compared to general international business experience.

These effects have hardly been studied before and are just limited taken into account in previous work in International Business. Knowing these effects exists, the biased sampling in previous work towards large MNEs certainly is an issue for the generalizability of research. More work can be done to apply these insights in the field of international business study and entry choices. A few studies reveal how individual experience impacts managerial choices on expansion (Buckley, 2007; Hutzschenreuter, Pedersen *et al.*, 2007). Individual managers are influenced by contextual factors and by personal and group cognitive processes (Yiu and Makino, 2002; Collinson and Houlden, 2005). It is the *perception* that in the end impact foreign entry choices, not so-called macro-level measures as reported by institutions.

Policy makers can benefit from the research findings, as it becomes clear how firms perceive the host country different depending on their history in international business in general and in the host region specifically. Firms with more optimistic perceptions more often decide to start conducting business with that market (Oortwijn, 2010a; Oortwijn, 2011). Moreover, firms with more optimistic perceptions more often choose a WOE, JV or partnership entry mode (Oortwijn, 2011). These entry modes support long term economic growth in a host country. Familiarity with the host country supports business activities of foreign firms in a host country. Policy makers thus do well to share knowledge of and insight in the general business conditions in the host country, to create a perception of “familiarity” and “understanding”. Moreover, previous work finds that perception of familiarity is best created through interaction with local firms (Eriksson, 2003; Schwens and Kabst, 2011). Policy makers could help facilitate networking activities of foreign firms. Another opportunity lies in de finding that firms with a presence in the host country, perceive China as a host country most optimistic. Extra attention of policy makers for firms with an existing presence, can lead to succesful expansion of their business activities.

## Research limitations

The paper does not aim to provide statistical proof of how the assumed learning within the internationalizing firm is reflected in the perception of host country conditions, but rather aims to reveal its existence and relevance. Despite the promising quantitative findings, further research is recommended with larger sample sizes, including varying home and host countries. The host and home country both influence the entry decisions and the perceptions of foreign business conditions, and the same is true for a combination of a host and home country (Chapman, Gajewska-De Mattos *et al.*, 2008; Dimitratosa, Petroub *et al.*, 2011).

The nature of the research, including comparative analysis of managerial assessments of the host country, requires the selection of cases based on one host country and one host country. Otherwise, comparison of managerial perceptions is not feasible. As a result, all findings are based on the perception of one host country, i.e. China. The mechanisms revealed are assumed similar for other home and host countries, while at least the size of the effects is likely different per country. The host country conditions in China themselves are different from other countries, which has an impact on the (variations in) perceptions of conditions (Eicher and Kang, 2005; Madhavan and Iriyama, 2009).

Though it was critical for the research design to limit the scope of the research to one home country and one host country, this is also a limitation. Firms with a home market in small open economies, like the Netherlands, tend to undertake rapid internationalization to either grow revenue, or achieve scale economies or cost advantages to compensate a limited scale typical for the home market (Bellak and Cantwell, M. Storper, Thomadakis, S., Tsipouri, L., 1998; Petersen, 2008). Dutch firms are more likely to pursue international business activities than firms from other countries. Also, the perceived pressure to expand operations abroad may overshadow the perceived uncertainties and risk of entering a foreign country. Moreover, the Dutch have a long

history in international business, which shapes their perception of and behavior towards other cultures. However, these characteristics for the Dutch home market do not interfere with the overall findings of the paper.

Another recommendation is to investigate how different experiences influence the perceptions of the various sorts of host country conditions. The present work suggests that experience in the host country shapes perceptions most. One recommendation is to study a broader set of firm and manager characteristics, to reveal how the different conditions of the host country are perceived differently within various working contexts. In-depth longitudinal study is recommended to learn about growth in firm experiential knowledge, influences the patterns of host country perception (Chetty, 2006). This will help understand what the mechanisms are that relate the experience to opinion forming on commitment to foreign countries.

## **ABSTRACT**

*Nowadays, a new solution for choosing a tourism destination is to use Internet. The purpose of this communication is to identify the characteristics of the website and personal variables of the E-client influencing the choice of a tourist destination via the net. The application concerned a sector of the health tourism in Tunisia. Through a questionnaire survey among a sample of 216 tourists, we were able to demonstrate that the criteria that are linked to the site, readability and design have a positive effect on the choice of a tourism destination as well as tourism personal variables: age, gender, civil status, number of children and life style. This has enabled us to draw a number of managerial implications.*

## **INTRODUCTION**

The service sector was considered as a source of wealth and benefits for most of the economies in the world, during the last two decades. Occupying a rather important place, the sector of tourism does not cease to evolve and achieve impressive booms. From here springs our research scheme, which is to provide an academic input that would enhance online tourism. Internet, today, takes the toll over all sectors, and the consumer is now able to satisfy his/her need with a simple click. Therefore, even the sector of tourism has come to take advantage of this technology and has lately been implementing electronic catalogues for the range of its products and services. Thanks to their variety, typology and objectives, websites are certainly inexhaustible sources of information and services. At such an advancing stage, hotels, travel agencies and airline companies present their e-services for international customers. We are, therefore, under the duty to examine the characteristics of the e-customer, who accepts, momentarily, these new access ways to intangible services, until the arrival at the touristic destination.

Additionally, we have come close to a new dimension, that has not been much exploited, yet modeled by internal services (Sociodemographic, life style, and profile variables), the internaut is as well guided by the variables discovered during the navigation and that are related to the website, with which he/she interacts and starts the selection process. We are, then, to study the input of readability, design and navigability of the site. Thus, our main query will be: « What are the characteristics, related to the website and to the E-customer, which affect the online selection of a touristic destination? »

It will be then interesting to examine the effect of the relationship between the personal variables and the website's characteristics on the choice of a health tourism destination. Such an orientation springs from the important emergence of the sector of health tourism in Tunisia and its development at an international level, demonstrated by a continuing rise in investment affecting this rapidly changing sector. We shall, first of all, define the relationship between tourism and Internet; we will then present the website as a strategic tool to promote a destination. Finally, we shall examine the personal variables that affect the online selection of a touristic destination.

## **The relationship between tourism and the Net.**

The World Tourism Office defines tourism with reference to its functional and organic features linking development, production, distribution and marketing of products and services designed to meet the travel needs and pleasures, an initiative that can come out of either private bodies, or public ones. According to Universalis encyclopedia, tourism is about spending leisure time outside one's principal residence place, having allocated an extra budget to cover expenses for that specific time. For Tissot (2007), the traveler uses the touristic fund to satisfy leisure needs and to take the maximum advantage of the touristic experience. The principal variables of tourism are transport, accommodation and attraction. Tourism is characterized by its limited duration, intangibility, the multiplicity of its components and by a well determined geographical area.. Internet has taken the toll on tourism as a business; and, according to Hudson (2002), many classic touristic companies make their own websites; whereas, others prefer referencing via other companies. Hence, the most active businesses of this sector, like airline companies, car rental agencies and international hotel chains, rapidly adhered to this strategy, cancelling all intermediaries and favorizing direct contact with the customer. In this context, statistics of online transactions have shown that most online purchasing is related to travel and transportation services, according to Hudson (2002). Internet and new information technologies were able to reflect their benefits on the sector of tourism by offering the ability to answer massive growing demands of the sector by maximizing the capacity, flexibility and connectivity. E-tourism is, thus, a sort of conquest to this new network. Internet provides benefits for all its users in the tourism business.

## **THE WEBSITE: A STRATEGIC TOOL TO PROMOTE A DESTINATION**

According to the electronic encyclopedia « WIKIPEDIA », a website is “a collection of related web pages that are addressed relative to a common URL address”. Galan notes that «the website has become a place of service and encounter». The website is then defined as the technical interface that maintains the encounter and service between a company and its customers... The online selection of a touristic destination is characterized as well by the absence of some variables that exist in traditional tourism: by this, we mean the absence of intermediaries. The photos, the images of the most admired places in addition to visitors' comments are factors that help a tourist make a final choice. In fact, using this technology, in the hope of making a successful destination choice, is credited to the fact that Internet has no constraints of distance, time and place, and that it allows easy exchange of information, according to Russel.W.(2007). The first motive behind a tourist's choice of a short holiday, according to Pike.s, (2007), is the need to relax, to re-energize, to take a step back from one's busy life, and to build new relations and live, for a while, by their standards.

The elements of a « service package», offered by a retail website, are multiple and linked to logistics and selected services... (as per the chart below). Thus, according to the specialists, the distinction between websites is done, essentially, on the basis of whether or not the website provides an online retail service.

### **Readability**

Readability is one of the main characteristics of a website. By this, we mean the ability of the internaut to understand the content of a website and satisfy his/her need with the minimum numbers of clicks possible. According to Gonzalez (2005), readability is the degree of ease with which the website guides the consumer and helps him eventually through his/her search. The same source cited above states that the perceived readability springs actually from the consumer's ability to explore the content of the website and to finally take decisions (know where he/she is, know where to go next, and know how to) (Lynch, 1974, O'Neill, 1991). But the perceived readability springs also from the customer's ease in making decisions (knowing how to look for the desired information, knowing how to go back to the starting point). This explanation will be demonstrated in our case in point, in which the tourist consults the website for the selection of his/her touristic destination. This leads us to our third point of study.

***H1: Readability affects positively/negatively the online selection of a touristic destination.***

Some surveys have demonstrated that airline companies can realize an increase in sales of at least 33% by refining their web ergonomics.

Let's examine the importance of this feature in the following paragraph.

## Website ergonomics

In a real outlet store, the general atmosphere plays an important part in promoting the goods and attracting customers. According to Lemoine (2005), the salesmen aim at increasing their sales significantly by animating the outlet store, by diversifying the music, the scents and the deco. Similarly, the website has its own unique atmosphere, namely, its Design. Here we approach one of the most important variables of our survey, the specificities of the website are fundamental in enhancing the acceptability of the navigation by a possible customer: the ergonomics. According to Ladwin (2001), «It is at this point that ergonomics of the selling website take a considerable importance». Therefore, the satisfaction of the internaut, his/her decision to purchase and even his/her loyalty are considered potential results. The comfort felt from using a selling website is the variable that explains the satisfaction of online buyers, according to Szymanski(2000). Before we state our research hypothesis, it is necessary to note that ergonomics can be divided in three parts related to design features. Our hypothesis is then constructed as follows:

***H2.1: the design that aims at facilitating the transaction affects positively/negatively the online selection of a touristic destination.***

The tourist tends to consult websites that he/she knows are simple and in which he/she can easily and rapidly find his/her quest. The work of researchers, who were interested in website ergonomics, has differently treated this concept. According to Ladwin views (2001), the main points were summarized as follows:

- Web pages ergonomics
- Their content, from a formal point of view
- Ergonomics of the sites' structures

According to MAT, the easy usage plays an important role in determining the perceived usefulness of the site.

Besides, According to Gorn(2004), who studies one of the most interesting components, which is the background color of the site and the role this plays in attracting and providing comfortable usage for the internaut. Additionally, research done by Henderson (2004), suggests that even the used script type can have an impact on the internaut and on his/her online connection in a given website. According to Katerattenakul(2002), the design of a website relies essentially on the fact that it should facilitate the transaction, the pleasure or the search for information. We can then understand that the characteristics of a website take many aspects and dimensions: cognitive, social, ludic and technical. Each dimension is sub-developed in order to further add characteristics to a website such as the informational feature, popularity, entertainment, vivacity, interactivity and of course easy navigation. We can now conceive our second sub-hypothesis:

***H2.2: The design that aims at entertainment affects positively/negatively the online selection of a touristic destination.***

In fact, the tourist that uses Internet to look for information about the place to be visited will equally look for a virtual online experience of the prospected holiday. Other views, like those of Danaher (2006), assert that variables such as intangibility, graphics and commercial content have a direct impact on the duration of the visit.

This explains the internauts' preference of one web site over others, the fact that will gain their confidence and loyalty at a later stage; therefore, according to Chouk(2004), «the confidence at this stage is an indicator of future behavior towards the site. ». In fact, the web site has the duty to revive the world of the advertised brand and therefore meet the characteristics of easy navigation, quality of the content and level of the service. In the case of tourism, the internaut who uses websites to have an idea about his/her next touristic destination is actually looking for a virtual experience and a first taste of the desired holiday. The characteristics of the website will be able to offer this thanks to audio visual features, photos and sufficient information. Our third sub-hypothesis is then taking shape as follows:

***H2.3: The design aiming at an easy search affects positively/negatively the online selection of a touristic destination.***

The requested information are not of the read-only type nor are they to fill a gap in the user's mind, the tourist is looking for more online assistance, an advice or even looking to terminate the decision making process

by booking. In this case, and according to Yakov (2005), the future tourist expects that the transaction be secure and perfectly discrete of his/her personal data. Generally, the internaut systematically admits online references according to the visible characteristics of the site (ergonomics and navigability). But, Ladwin (2001) also indicates that this choice is linked to internal variables of the internaut him/herself such as the expertise, capacity of storing information and the operational command of the website.

## THE PERSONAL VARIABLES

Are also called individual characteristics, they refer to a person's proper variables. According to Miltgen et Al (2005), in a digital context, these characteristics are made of socio-demographic data, life style, as well as of the internaut's profile. We shall examine hereafter these three concepts.

### Socio-demographic data

It is a very broad context that is largely used in marketing thanks to its ability to provide very important data about the target in a very easy way. This consists of sex, age, civil status, occupation, housing ...

The examination of this type of information during the processing of data about tourists helps us have a preliminary idea about the characteristics of this sample of consumers. In addition to that, the availability of these data about the e-tourist helps trace an idea, always in connection with this sample, but also closely related to these consumers' familiarity with Internet and its use in tourism. The e-tourist uses Internet only to have information about his/her destination and consequently make a decision. This point allows us to present our hypothesis.

**H3: socio-demographic data have an impact either positively/negatively on the online selection of a touristic destination.**

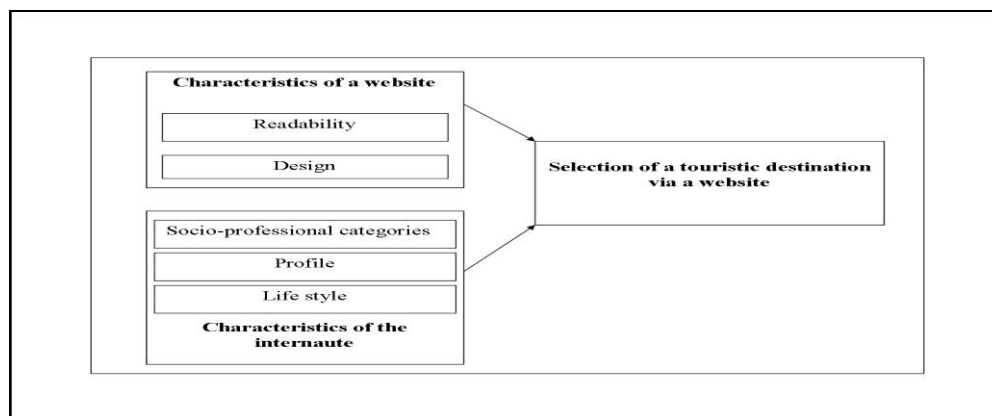

### Life styles

This concept was used in marketing after having been largely used in other social study fields. In psychology, Life style is a « tool of affirmation and differentiation of social statuses ». From a social perspective, to adopt a life style indicates « the belonging to a group and the will of a person to be differentiated from those who do not belong to his/her group ». The most comprehensive definition was provided by Wind and Green (1974) who attributed to the life style 3 distinctive characteristics: 1) Activities, interest and attitude; 2) Values and personal characteristics; 3) Consumer behaviour.

Therefore, in tourism, the life style plays a major part in the determination of the individuals who are interested in the sector's activities, and who have rather particular life style characteristics. Hence our next hypothesis:

**H4: Life style influences positively/negatively the online selection of a touristic destination.**

As a summary of this part, we can schematize our theoretical framework as follows (see scheme below)

## **METHODOLOGY OF THE RESEARCH**

The data that have served as a testing basis for our work hypothesis and as answers to the aim of the research have been collected through the means of a survey-questionnaire. This type of questionnaire was applied on an appropriate sample of 216 tourists, who came to Tunisia to benefit from health-tourism. Nevertheless, and in the hope of ensuring a better internal validity of the study, we have distributed our questionnaires to: 3 famous hotels in Tunisia (with seaside and thalasso-therapy resorts), and to 3 clinics (specialized in plastic surgery). The choice of the application sector to be health tourism was justified by its important rise in Tunisia. The last figures show that more than 40 000 Lybian and Algerian patients come to Tunisia every year for medical treatment; this was thanks to the implementation of a high-level medical infrastructure with renowned medical and paramedical competences. This sector attracts Western tourists as well, again thanks to our distinguished competences and « well-priced » services. We will first of all present our measurement scales for the characteristics examined by our study, and will also present an optimization of our built-in theories.

## **ANALYSIS OF DATA: SIMPLE CORRELATION**

For the data analysis, we used version 11.0 of the software SPSS (Statistical Package for the Social Sciences). With the help of this software, we managed to do a factor analysis of principal components using the appropriate scales to measure variables of our model. We also worked on an analysis of reliability by calculating the Cronbach alpha for each factor. We used the method of simple correlation in order to test the resulted hypotheses in relation to the choice of a touristic destination, readability and design of a website on one hand, and to socio-demographic characteristics, profile and the internaut's life style on the other. In order to be able to verify the relations between the different characteristics one by one, we used Pearson correlation test method. Our aim is to examine whether 2 variables, measured on the basis of the same observation pattern, do vary in an analogical way or not. Its sign will be the direction of the relation: the positive values corresponding to variations of the same direction, and the negative values to those of the reverse direction. It is important to note that the correlation index characterizes a linear constraint between two variables. If the index is near or equal to the unit, this indicates a total dependence between the two variables, if, on the contrary, its value is null, there will be interdependence between them. If its value is between 0 and 1, this shows a partial dependence between the two variables.

## **RESULTS OF THE STUDY**

### **Purification of measurement scales**

In this first step, we will test the reliability of internal coherence of the measurement scales of readability, design, profile and life style with the help of Cronbach Alpha. In fact, from a practical point of view, the works of Evrard et Al (1993) and Vernet (1991) have stated that, for an explorative study, the alpha is acceptable if it is between 0,6 and 0,8, and that for a confirmation study, a value that is superior to 0,8 is recommended. Thus, for each measurement scale, the items which are of low quality representation (<0,4) will be eliminated, as well as those which have a contribution superior to 0,3 on several factors at a time (even after rotation) in addition to all items having no contribution superior or equal to 0,5 over one of the principal components identified.

### **Purification of the readability scale**

The readability scale comprises 2 items. It was taken from research done by Yakov B. et Al (2005) in a context of electronic commerce. The observed value 0,87 of Cronbach  $\alpha$  lead us to consider that the reliability of this scale is satisfactory. The ACP applied on the 2 items measuring readability of the site shows only one principal component explaining 42 % of the total inertia. The analysis of KMO index (0,5) shows that the quality of the ACP is globally good.

## Purification of the design scale

The works of Katerattanakul .P (2002) have demonstrated that the design is a variable that measures navigability of an internet site and that could be sub-divided into 3 sub-variables which are :The design aiming at facilitating the transaction ,The design targeting pleasure, The design aiming at facilitating the search for information. The analysis of principal components has allowed us to keep 5 axes explaining 67.48% of the totality of information with a KMO equal to 0.674 very near of 0.7, and an index of Bartlett test = 0 < 0.05; it is therefore a pertinent and significant result of the ACP. The first ACP has shown that several items have important loadings on many factors, which explains that these latter were at risk of not being independent from each other. In this perspective, we have done diagonal rotations (using the PROMAX method of SPSS) that permit inter-correlations between the factors. Following these rotations, we could eliminate the ill-represented items (from a malformation probability). A second ACP was then built with three kept axes and the number of items reconsidered .Therefore, if we try to label our axes, we will call the first « AXIS OF THE DESIGN AIMING AT FACILITATING THE TRANSACTION » . The second axis will be considered as the axis relative to the «DESIGN AIMING AT FACILITATING THE SEARCH FOR INFORMATION». As for the third axis, the items that appeared could not point at the design that targets the pleasure of the internaut. The works of Yakov(2005) and Nantel (2005) have demonstrated a strong connection between navigability of the site and the sensation of pleasure that the internaut feels during a successful connection to a website. A reading of the items contained in the third axis allows us to characterize this latter as the axis of « navigability » rather than axis of pleasure. In fact, according to Novak and Hoffman (1997), the rapidity with which a task can be accomplished on a website is an efficient indicator of its navigability. In addition to that, Hoffman and Novak (1996) provide us with the classic definition of navigability as being the process of spatial orientation of the internaut.

## Purification of the profile scale

Literature written in this respect provides us with 3 profiles for the internauts: utilitarians, the web pros and the scepticals. Our scale was taken from works of Cases et Al (2003). In our case, the analysis of principal components resulted in 4 axes of 12 items, which explained 72.29% of the totality of initial information with a KMO equal to 0.683 near to 0.7, in addition to one index of significance equal to 0. Therefore, the matrix is pertinent. The post-rotation matrix results eliminated the misrepresented axes and gave a better coherence between the items. The descriptive analysis of each axis allowed us to specify and label all axes following the information that they contained. In fact, the items contained in the first axis indicate the characteristics of the first type of the internaut's profile, the web pros. The third axis characterized the profile of the internauts who are less familiar with Internet, the scepticals. The first axis will be that of the utilitarians. Regarding the second axis, we could detect the presence of items used both by utilitarians and scepticals. This is a mutant profile between these 2 major classes characterizing people recently « converted » to Internet but for utilitarian use only. They are known for their short connection time (specificity of the scepticals) and for their attachment to Internet for its rapidity and good bargains (characteristics of the utilitarians). We called this axis, the axis of the « sceptarists ».

## Purification of the lifestyle scale

This scale is taken from the works of Florence P.V (1999).The analysis of principal components has produced two axes of 7 items explaining 56.1 % of the totality of the initial information. If we try to describe the two axes, we can notice that the first axis is about the people who are most attracted to « package tours » when selecting their touristic destination, “they like to revisit places where they have already been but also dream to go somewhere new”. They give a lot of importance to cultural diversity, to their security and high quality accommodation. The second axis refers to tourists who « give a major importance to travelling with family and hope to escape from the work stress».

# PRESENTATION OF THE RESULTS

Our study has shown the correlation between the variables that are susceptible to shape the online selection of a touristic destination.

**Verification of the impact of readability and design on the selection of a touristic destination:**

The readability factor acts positively on the navigability of the website and consequently, on the online accomplishment of a task. As for the navigability factor, significativity/relative importance was equal to 0.27, a high number is consequently not a good factor to keep for the selection of a touristic destination. Let us move to study the factor of the search for information easy transactions, we could distinguish a significativity/relative importance equal to 0.00 they are then good factors through which the internaut judges an Internet site and makes his choice of the touristic destination (see appendices)

**Verification of the impact of socio-demographic data on the selection of a touristic destination:**

- **Age/choice of a touristic destination :** According to the results, the specific type of tourism studied (medical tourism) attracted principally an age-group between 35-45 years: the adult age-groups: the « mi-seniors ».
- **The gender/choice of a touristic destination :** The khi two test showed a significativity equal to 0.598 which undermines this hypothesis stating that the online selection of a touristic destination is not influenced by gender.
- **The Socio Professional Category/the choice of a touristic destination :** 60.4% of the respondents who were executive officers declared that they made their choice of touristic destination via the net.
- **The educational level/the choice of a touristic destination :** The selection of a touristic destination is negatively affected by the educational level.
- **The civil status/choice of a touristic destination :** 73.4% of the respondents who did their choice of touristic destination via the net were couples.
- **Number of children/choice of a touristic destination :** Pearson's khi two equal to 0.27 lead us to a confirmation of this hypothesis. The tourist, who chooses his /her touristic destination via the net, as explained previously, thinks about the number of persons to accompany him/her and consequently his/her children.

**Verification of the impact of the life style on the online selection of a touristic destination:**

Tourism remains for some linked to a life style of a specific group of consumers. We tried, throughout this research, to verify the impact that this variable had in the selection of a touristic destination via the net. It turned out that this was not a verified hypothesis and that this choice is not influenced by life styles.

The following chart summarizes all the results and validations of hypotheses:

HYPOTHESES	RESULTS
H1: Readability of a website would affect the online selection of a touristic destination.	Confirmed
H2: Design of a website would affect the online selection of a touristic destination.	Confirmed
H2.1: The design aiming at facilitating transaction would affect the online selection of a touristic destination.	Rejected
H2.2 : The design targeting pleasure would affect the online selection of a touristic destination.	Confirmed
H2.3: The design aiming at facilitating the search would affect the online selection of a touristic destination.	Confirmed
H3: Socio-demographic data affect the online selection of a touristic destination.	Confirmed
H3.1: Age influences the online selection of a touristic destination.	Confirmed
H3.2: Gender influences the online selection of a touristic destination.	Rejected
H3.3: socio-professional category influences the online selection of a touristic destination.	Rejected
H3.4: Educational level influences the online selection of a touristic destination.	Rejected
H3.5: Civil status influences the online selection of a touristic destination.	Confirmed
H3.6: Number of children influences the online selection of a touristic destination.	Confirmed
H4: Life style influences the online selection of a touristic destination.	Rejected

**Executive Implications**

At this stage, our survey's main objectives were to determine the effective causes behind the tourist's selection of a touristic destination via the net.

We picked two different variables and studied their impact on this choice:

- Variables linked to the website: readability and design.
- Variables linked to the internautes: socio-demographic variables, profiles and life styles.

This has led us to conclude, by confirming research hypotheses that the selection of a touristic destination via the net is principally linked to readability and design (targeting pleasure and facilitating the search) in addition to socio-demographic variables (age, sex, SPC, civil status). These results can be greatly used for other surveys, especially in the Tunisian market still expanding in this field. This segmentation/typology will enable the managers and decision makers either in health facilities or hotels to trace the line under this age-group, to try to further satisfy them and study the constraints of attracting other groups of tourists as well. This will also help them improve their services and better target their customers, and will also help webmasters and people in charge of designing web sites to better focus their work on the previously studied affecting the internaut.

## CONCLUSION

Throughout this research, we were interested in a specific type of tourism that has lately been exploited and that is in the way of expansion in Tunisia. Even though we focused only on individuals who made their selection of the touristic destination online, a sampling complement would have been equally interesting had we considered all tourist types whatever their way of collecting information or taking the decision. Besides, our study was focused on international customers, who use the net as a tool for their search for information, and from this point we noticed that the Tunisian tourist is still reluctant in using this service. We tried to prove that the websites of the Tunisian tourism facilities can create a busy business and attract interesting customers. The results are generally similar; there is only a difference at the level of the hypothesis regarding security of transaction via a web site, we found a difference between the application and the Tunisian and European context. Our aim was to distinguish the link between the online selection of a touristic destination, the variables affecting this choice and the input of the personal variables in the selection process. We managed to build a model profile for the health tourist in Tunisia, who chooses the country as a holiday resort via Internet where health tourism services are available. **The model profile outcome of our research is then as follows:** woman aged between 45 and 55 years old, of academic training, an executive officer, living in a couple and having 2 children, a utilitarian user of Internet in search of bargains and research material. What attracts her in a website is readability and navigability in addition to the easy process of finding information.

# USING ANALYTICAL NETWORK PROCESS TO QUANTIFY FACTORS AFFECTING FARMER DECISION MAKING

**Supachai Pathumnakul, Phalakorn Prakhamthong and Kullapapruk Piewthongngam, Khon Kaen University, Thailand**

## ABSTRACT

*Thailand, one of the top ranked world agricultural commodities exporters, is now facing land scarce and high competition among the alternative crops. To secure raw material supply, a processor needs to learn farmer's attitudes. In this study, Analytical Network Process (ANP) is utilized. Four crops were studied and compared. The results showed that top ranked five elements are crop revenue, other farmers' attitude toward the crops, Opinion leaders' attitude toward the crops, production cost, and complicity of field management. And mill's services are among the lowest ranked of the matrix. These results indicate direction of millers' strategy. The services currently offered by the mill might not be effective. The priority score of the farmers are low. Hence, millers should be more innovative in term of services giving to farmers.*

## INTRODUCTION

Thailand is among top ranked world agricultural commodities exporters. Recently, land abundant has become scarce. Farmer tends to switch from one crop to others. This switching in turn causing instability of raw material supplied to processors, hence, affects capacity planning and marketing plan of the processors. Fiercely competition forces processors to learn more about their suppliers. They need to learn farmer's attitudes in order to launch effective strategies to secure their raw material supply.

The past studied suggested factors affecting farmer behaviors; they are such as farm size (Henneberry et al., 1991), farmers' risk attitudes (BarShira et al., 1997), distance between fields (Bizimana et al., 2004), ownership of operations, labor, credit markets, and markets conditions (Rao, 1989), social-economic, environmental conditions of farm (Nkonya et al., 1997), support policy (Vavra and Colman, 2003). Or it may depend on farmers' objectives which are multi-objectives (Sangwan, 1983). The two common objectives are risk minimization and profit maximization. If farmers aim to maximize their profit, they will concern about price, yield, and cost of growing crop. On the other hand, if farmers aim to minimize risk, they will pay attentions to probability of disease outbreak; price and yield variations; and probability of rainfall during critical periods. The two methods; non-parametric method based on mathematical programming (i.e., Chavas and Cox, 1995) and econometric method (i.e., Bizimana et al., 2004) are often used to investigate farmers' behaviors. Both are not proper for this study because, firstly, the micro-level data are not available so that econometric model cannot be utilized. Secondly, optimization model is usually used to mimic decisions of a decision maker under certain behaviors, hence, millers will not learn farmers' preference. Therefore, in this study, we suggest the use of Analytical Network Process (ANP) as a tool to the task. It helps managers to structure the problem of integrating growers' attitude into selection decision and make more effective decisions by structuring and evaluating the relative attractiveness of competing options or alternatives.

## METHODOLOGY

As stated Lee et al. (2010) ANP, a multiple criteria decision making method, allows a modeler to form and quantify interdependency among decision attributes. The step of ANP forming comprises of model construction, pairwise comparisons and local priority vectors, supermatrix formation and transformation, and final priorities. First step, the problem is decomposed into a network of clusters (Lee et al., 2010). And in this

study, there are 7 clusters: crop choice, mill's services, government policy, personal factors, complicity of crop production, economic factors, personal factors, and physical factors). Clusters contain elements that share common attributes. For example the "Economic factors" cluster contains the features (i.e., production cost, crop price, crop revenue, time to market that are taken into account when farmer make a decision to grow crops. While connections represent the interdependency of two nodes, the arrow direction shows the influence flows. When two clusters are connected, at least one element in the first cluster influences or is influenced by one or more elements in the second cluster (Zammori, 2010). As for farmer's decision, the looped arc of economic factor cluster indicates inner dependency. for this study are shown in Fig.1 and Table 1.

#### (1) Crop choices

The four main competing crops, sugar cane, cassava, rainfed rice, and irrigated rice are elements in this cluster.

#### (2) Mill's services

Five common services offered by mills are elements in this cluster. The common services relating to crop production are loan, input factors, and technical services. And the last two services relating to marketing system of the crops are buying system and location of loading station.

#### (3) Government policy

Two common interventions of the Thai government are price support and input subsidy. While as, after decentralized policy, support from local government officers (i.e, technical training, some field services, seminar) are coming into play.

#### (4) Personal factors

Farmers are likely to follow others' opinion such as big crowd or opinion leader can influence crop choice. Also, they consider availability of labor, the range of land lease, and farm size to make the decision

#### (5) Complicity of crop production

Some crops require more intensive care than others. Experience of farmers can also influence on their perception toward the crop.

#### (6) Economic factors

The attribute relating to economic factors are production cost, crop price, crop revenue, and time to market. These factor affect revenue of the farmers.

#### (7) Physical factors

**Fig 1: The relationships among obtained factors**

Physical factors can affect the farmers' crop choice. The sugar cane needs more intensive care more than cassava. Cassava is more drought tolerance than cane. Only irrigated rice can be grown in irrigation area. Second step, the elements of each cluster are compared pairwise on a scale 1-9 basis. A score of 1 indicates equal importance between the two comparing elements and 9 represents the highest importance of one element compared with the other one. A reciprocal value is assigned to the inverse comparison (Lee et al., 2010). For example, if element j score 6 compared with i, inversely, element i would score 1/6 compare to j. After pairwise comparison, the eigenvector method is used to retrieve the local priority vectors for each pairwise comparison matrix (Lee et al., 2010).

Third step, a supermatrix is formed from pairwise comparison matrices. Each pairwise comparison is entered into appropriate columns and rows or a segment of the super matrix such that each segment represents a relationship between two clusters. A zero matrix segment indicates no relationship between the two clusters. Then, the supermatrix is transformed to weighted matrix, and then, the limit supermatrix to capture the limit priorities of the direct and indirect influences of each element for all elements (Lee et al., 2010). The supermatrix for this study are shown in Table 2.

The last step, the limit supermatrix is converted to final priorities. In this study, priorities from limiting priorities and priorities normalized by cluster is shown in Table 3 and 4.

## RESULTS

Table 3 can be interpreted form managerial application as follows. According to priorities from limiting supermatrix, the top five ranked important elements are rainfed rice, crop revenue, sugar cane, other farmers' attitude toward the crops, and cassava. That is because rice ties closely with the Thai culture. Expressing sugar as number one priority is along with expectation. And if cluster one is not considered, the top ranked five elements are crop revenue, other farmers' attitude toward the crops, Opinion leaders' attitude toward the crops, production cost, and complicity of field management. And mill's services are among the lowest ranked of the matrix. These results indicate direction of millers' strategy. The services currently offered by the mill might not be effective. The priority score of the farmers are low. Hence, millers should be more innovative in term of services giving to farmers. Cheap loan and input factors might not be as important as in the part. This does not suggest that miller should give up present services but to either use marketing campaign to emphasize on the value of their services or to be more innovative and responsive to farmers' needs. And because farmers prioritize crop revenue as their most top ranked, millers should focus on technical advices that raise farmers' revenue. Miller might send a message regarding crop's revenue to farmers in order to persuade farmer to allocate their land to grow a crop. Words of mouth seem to pay very important role in crop choice. Hence, miller can make a success story as one of the marketing campaign.

Table 4 indicates that according to farmers' attitudes market share for the five crops should be 45%, 25%, 16% and 11% for rainfed, sugarcane, cassava, irrigated rice. For mill's services, farmers prioritized loan and technical services. For government policy, farmers consider price support and support from local government. For personal factors, opinion of other farmers and leaders are quite influential. Then, millers may try to locate opinion leaders in each area and work with the opinion leader closely to make him successful in adopting the crop. Also, miller might try to work with a group of farmers instead of an individual. And if those groups are successful, they will spread the news about the benefit of the crops. For the complicity of crop production, except for maturity age, other attributes are quite equally important. For the crops have complicate production process, millers might try to reduce some processes that obstruct farmers in adopting the crop. And millers may try to change perception regarding the complicity of the crop. For economic factors, farmers pay attention to revenue the most. While price and cost is equally important, time to market is quite low in priority. Lastly, for physical factors, farmers consider distance when decide for crop to grow. Hence, millers might try to establish closer buying facilities to farmers' fields. These results imply strategic direction for company that farmers are no longer need only extension program. They are more like suppliers to the mill. If the mill can work on supplier development programs and coordinates closely with farmers, it will lead mill to secure more of the raw material supply. In this light, mill and farmers need to communicate closely and learn each other constraints so that both parties gain mutual benefit from the partnership.

## CONCLUSION

This research aims to learn farmer's attitudes in crop selection using Analytical Network Process (ANP) is utilized. Four crops were studied and compared. The results showed that top ranked five elements are crop revenue, other farmers' attitude toward the crops, Opinion leaders' attitude toward the crops, production cost, and complicity of field management. Though the mill tries to use service strategy to attract farmers, it seems

that the mill services currently offered are not effective strategy. Hence, more of innovative programs and new marketing strategies should be conducted in order for mill to gain more trust by farmers.

## **ABSTRACT**

*Thai sugar mills now are facing fiercely competition among another. Due to recent competition, some mills raise their cane price above regulated level, locate their loading facility closer to the growers, purchase cane supply without contractual agreement, and use proprietary handlers as their market channel. In this paper, we tested the growers' response to tentative mill programs. Growers were divided into three zones: inner, middle, and outer zones. The conjoint analysis and logit model is utilized to determine behavior of the grower in the three zones. The results showed that the growers of the three zones react similarly to the price changes. And reducing distance from fields and waiting times at the loading stations are likely gain higher probability of being chosen by growers. Likewise, mill should be creative in giving services to inner zone and focus on increasing the number of growers having access to services for middle and outer zone. Last, new creative social programs should be created to strengthening relationship between mill and growers' community.*

## **INTRODUCTION**

Thai sugar mills now are facing fiercely competition among another. Due to the government policy to encourage competitive environment, more mills are granted operation permits. In the past, mills used loan and input (i.e., herbicide, fertilizer) service strategies to attract cane growers. And cane growers supply cane to mill through contractual arrangement under regulated price. However, the recent competition ticked some mills switch to price strategy. They raise their cane price above regulated level and locate their loading facility closer to the growers and purchase cane supply without contractual agreement. Though, it is not morally right to conduct this strategy, some mills utilize proprietary handlers as their market channel. Growers, though, may benefit from higher price, they are risking their guarantee market. Moreover, miller feels that growers that locate further away from mill behave differently than the ones that locate closer to the mill. And because distance from field to mill plays crucial role in growers having access to mill's services, millers are also eager to know if they need to use different strategies for different group of growers located in different location. In this paper, we identify factors that may influence northeastern Thai cane grower to choose their millers. Growers were divided into three zones: inner, middle, and outer zones. The conjoint analysis and logit model is utilized to determine impact of these factors on cane farmer's choices for cane selling channels for each zone.

Conjoint choice techniques have been introduced to the marketing field since the early 1970s (Kjaer, 2005). Later, economists utilized this technique explain random utility theory (Ben-Akiva and Lerman, 1985). The conjoint choice techniques are an analytical tool to elicit consumer's preference from hypothetical data. It explains and predicts changes of consumer's preferences due to changes of products or situation beyond the current set of experiences. Respondents are asked to compare two or more choices, which vary along several characteristics of interest, and they are asked to choose one of them. This allows the researcher to break down the preferences of respondents by each attribute instead of just entire products or situations (Habb and McConnell, 2002).

## METHODOLOGY

Due to the nature of study that bases on assumption of combination of several factors maximizing a farmer's utility, a qualitative choice model is applied. The model in this study is based on a random utility model (RUM) developed by McFadden (1974), and details of the model are represented below.

Each cane grower faces a set of  $K$  discrete alternatives. Each alternative provides utility,  $U_k$ , to each grower. A cane grower will choose an alternative  $k$  that maximizes his/her utility among the  $K$  alternatives.

$$(1) \quad U_k = u(\mathbf{X}), k = 1, \dots, K$$

where  $U_k$  is the maximum utility received from choosing alternative  $k$ ; and  $\mathbf{X}$  is the vector of the attributes associated with alternative  $k$ .

In the decision-making process, when asked to choose among alternative, the sugar cane grower will compare and choose an alternative that gives his/her the highest utility comparing to other alternatives (a measure of welfare or happiness). This condition is represented by

$$(2) \quad U_j > U_k$$

A grower will choose alternative  $j$  over  $k$  only if (2) holds for all  $j \neq k$ , (i.e., the chosen option always gives him or her the highest satisfaction). However, the real utility of the respondent is unobservable; we can only observe choices made by growers. So, let  $Y$  be the observed variable that is ordinal in nature. In this study, there are only two choices of marketing channels, which are the traditional mill and proprietary handler. Thus, the values of  $Y$  are

$Y=1$  if the sugar cane farmer was to sell his/her sugar cane to the traditional mill and

$Y=0$  if the sugar cane farmer was to sell his/her sugar cane to proprietary handlers

Since we do not know the real utility of the respondent, we can observe the indirect utility function of the respondents denoted as  $V$  through their choices

$$(3) \quad U = V + \varepsilon$$

where  $\varepsilon$  is unobservable part of the utility that is unknown. The indirect utility function can be observed by using the answers to the conjoint choice questions in which the attributes are arguments, and since the dependent variable is discrete in nature with two values, the logit model is applied. Therefore,  $V$  can be expressed as a function of the attributes accompanying each alternative, and the utility can be expressed as

$$U_j = V_j + \varepsilon_j = \mathbf{X}_j \beta_j + \varepsilon_j$$

$$U_k = V_k + \varepsilon_k = \mathbf{X}_k \beta_k + \varepsilon_k$$

$$(4) \quad \text{Prob}(Y = 1 \mid \mathbf{X}) = \text{Prob}(U_j > U_k) = \text{Prob}((\beta_j - \beta_k) \mathbf{X} + \varepsilon_j - \varepsilon_k > 0)$$

where  $\beta$  is a vector of unknown coefficients. For simplicity,  $V$  is assumed to be linear in  $\mathbf{X}$ , so

$$(5) \quad V = \beta_1 (Ph) + \beta_2 (Pl) + \beta_3 (Dl) + \beta_4 (Wl) + \beta_5 (Wh) + \beta_6 (Sh) + \beta_7 (Sl) + \beta_8 (Rh) + \beta_9 (Rl)$$

where  $Ph$  and  $Pl$  are the price of the mill (preliminary cane price) higher than price offered by proprietary handlers 200 baht/ ton and lower than of proprietary handlers 200 baht/ ton.  $Dl$  is the distance from sugarcane field to loading facility no more than 7 kilometers. If fields are located less than or equal to 7 km from the mill then  $Dl = 1$ ; 0 otherwise.  $Wl$  and  $Wh$  are the waiting time at the loading facility no more than 8 hours and more than 12 hours. If waiting time for loading sugar cane at the mill longer than 12 hours then  $Wh = 1$ ; 0 otherwise. If waiting time for loading sugar cane at the mill less than 8 hours then  $Wl = 1$ ; 0 otherwise.  $Sh$  and  $Sl$  are the high and low support levels from the mill. And  $Rh$  and  $Rl$  represent high and low social relationship between the mill and communities. To avoid singularity, we dropped dummy  $Wm$  which represented waiting time for loading sugar cane at the mill between 8-12 hours;  $Dh$  that represented loading facility that located further than 7 km from the field;  $Ps$  which represented preliminary price that equal to that of proprietary handlers;  $Rm$  is the support level of the mill at medium level;  $Rm$  which represented the social relationship at medium level.  $\beta$ 's are parameter estimates.

## EMPIRICAL RESULTS

The estimation results are shown in Table 1, 2, and 3. The percent correctly classified, which measures goodness-of-fit based on the estimated probability compared to the real choices of respondents suggested that the three models correctly predict growers' decision around 73.7-76.40 percent. The coefficient and significant columns presents the magnitude of coefficient estimates and significant level of its correspond variable. The coefficient estimates of the logit model do not explain the changes of probability due to the changes of independent variables. Instead, the marginal effects or probability derivatives, the probability changes of growers' decision due to change of a particular independent variable while holding all other variables at their sample means, are used to explain the probability change due to changes of independent variable. For the test of different among parameters, Wald test is applied and the results of the test are shown in Table 4.

In case of relative price, growers tend to sell cane to proprietary handlers although the price of mill is higher than that of proprietary handlers. However, when the preliminary cane price is higher than proprietary handlers 200 baht/ton, the growers probability of selling cane to mill increase. The coefficients of the three models are all significant with the same direction. The Wald test also indicated that the three parameter estimates from the three models are not significantly different. Distance from field to the loading station is significant in inner and outer zone but not for middle zone. Though marginal effects show that the three groups would sell their cane to mills of loading station is closer to growers' field. And the outer zone tends to be more responsive to the distance of the loading station. The distance from field of the outer seems to be the only parameter that statistically different from other zones. In this cane, parameter estimates for distance from field of outer zone is

statistically different from that of the middle zone. For waiting time, the inner zone seems to be more tolerable for longer waiting time than the other. Shortening waiting time seems to work with inner and outer zone. However, middle zone seems to be unresponsive to waiting time both longer and shorter. As for services level, inner zone seems to value services level more than middle and outer zone, though not so statistically strong. For the social relationship, again, inner zone seems not to want more social relationship with mill while the probability of selling cane to mill would be higher if mill increase social relationship in middle and outer zone

## PRACTITIONER'S SUMMARY

Price is evidently the most influencing factors as indicate the regression coefficient and their level of significance as it directly reflects the incomes perceived by cane growers. It indicates that mills are now in a highly competitive environment. Because mills, unlike proprietary handlers, are constrained by the regulated price. Mill seems to have disadvantages when growers in the three zones stated their interests in price. Also, the three groups react similarly to the price changes. Hence, there is not particular target group to defense growers from competitor's pricing strategy. For waiting time and distance from field, the combination of these two strategies can effectively attract the growers from those three zones. The mill should facilitate growers more by locating loading station closer to the field and to improve the queuing system to shortening waiting time. Actually, waiting relate directly to growers' income. That is because cane will lose weight if cut-to-crush delay time prolong. Also, growers are losing opportunities cost when they spend long waiting time at the loading station. For services, mills need to be more innovative in giving services to grower especially for inner zone. It seems that the current services do not gain mill any growers' satisfaction from inner zone. However, the middle and outer zone still response well with the current services strategy. Hence, mill may focus on increase number of grower having access to current services and expedite time of serving growers. For the social relationship, with the current program to create social relationship between mills and growers, it seems to be an ineffective strategy for all zones. This is not to suggest that mill should give up all social relation programs but the program should induce more grower engagement in order to increase strategy effectiveness.

## CONCLUSIONS

Thai cane growers now have more than one choice of their cane buyer; sugar mill and proprietary handlers. In this study, a conjoint choice survey of cane growers was conducted to elicit the grower's decision mechanism for selecting their market channel. Five major factors, related to income maximization, satisfaction maximization, and risk minimization, influenced the farmer's decision were studied. These factors are distance from sugarcane fields to loading station, waiting time at loading facility, the relative prices of sugar cane

between mill price and those offered by proprietary handlers, the services levels of the mill, and the social relationship between the mill and the grower's communities. A logit model was applied to determine the degree to which a set of attributes influenced the grower's decision to sell their sugar cane for inner, middle, and out zone located around the mill.

The results showed that the growers of the three zones react similarly to the price changes. And reducing distance from fields and waiting times at the loading stations are likely to be most effective strategy. Likewise, mill should be creative in giving services to inner zone and focus on increasing the number of growers having access to services for middle and outer zone. Last, new creative projects to increase bond between mill and growers' community should be created.

# CONTRIBUTORY COMPETENCIES TO THE SUCCESSFUL GLOBAL EXECUTIVE

**David Pitcher**  
**Indiana Institute of Technology, USA**

## ABSTRACT

*The global leader must first possess superior baseline credentials. Excellence in the appropriate discipline is seminal; an introduction which may precede further exploration. Drivers behind interdependent partnerships which produce successful outcomes include communication, collaboration, connectivity, and empowerment. To address these factors, and beyond educational and professional experience and credentials, the contemporary leader should demonstrate competency in emotional intelligence and social intelligence. Mayer and Salovey described emotional intelligence (EI) as “a type of social intelligence that involves the ability to monitor one’s own and others’ emotions, to discriminate among them, and to use this information to guide one’s thinking and actions” (p. 433). A working knowledge of oneself is foundational to this process. Limitations should be subverted, targeted, and improvement sought at every dimension (Bar-On, Maree, & Elias, 2007). According to Goleman (2006), social intelligence (SI) connotes “...being intelligent not just about our relationships but also in them” (p. 11). It is, in effect, the ability to act wisely in human relationships (Goleman, 2006). Separately and together, the aspiring global leader should view competency in EI and SI as crucial to his/her success*

## THE STRATEGIC DEVELOPMENT OF THE GLOBAL LEADER

The requirements for today’s global leaders have risen dramatically as international connectivity has facilitated the emergence of a new prototype of executives. Perhaps paradoxically, today’s leader has already morphed into the global leader of tomorrow. Individual markets have already become fused into a global arena. Globalization is embedded at all levels of the economy and society in general, and successful global leadership requires leaders to no longer think as individuals, but rather to think of leadership as a team process (Hess & Bandyopadhyay, 2010). Few entities operate outside of some international activities, and this activity is becoming increasingly vociferous. Hannay (2009) discussed the cross-cultural applications of servant leadership within Hofstede’s (1993) five national cultural dimensions in the context of multicultural workforce and economic globalization, with a focus on theoretical review. Hence, a global leader may work in an international context, or may be employed for a domestic firm which has global stakeholders which could include employees, suppliers, customers, or markets.

Throughout the coming decade, leaders will emerge who adopt a cross-cultural mentality, seek out blue ocean opportunities and exploit them, and learn and apply techniques, concepts, and principles from others without regard cultural origin. These strategic elements will assist leaders as globalization continues to accentuate commonalities and diminish differences.

The recruitment criteria, retention, and performance of leaders of the second decade of the twentieth century will be judged in new ways that have evolved in recent years. The emotional intelligence (EI) of today’s global leader is crucial to his/her success, particularly in the arena of the individual’s self-awareness. The adage of knowing oneself has never been more appropriate.

While emotional intelligence focuses on the introspective, social intelligence (SI) examines the expansion into what transpires when individuals connect (Goleman, 2006). It impacts relationships and influences conflict, rapport, and synchronization between individuals (Goleman, 2006). SI is the ubiquitous determinant of authenticity. Likewise, the global leader who possesses cultural intelligence has the capability to function effectively in situations characterized by cultural diversity (Ang & Van Dyne, 2008).

## **EMOTIONAL INTELLIGENCE – THE ESSENTIAL FOUNDATION**

Emotional intelligence (EI) connotes the capacity to understand, motivate, and develop ourselves and others resulting in improved work performance and enhanced organizational effectiveness (Goleman, 1998; Goleman, Boyatzis & McKee, 2002). Personal competence in EI is demonstrated in self-awareness, self-regulation (or self-management), and motivation. Emotionally intelligent social competence can be seen in empathy or one's social awareness, and in social skills which involve managing relationships (Goleman, 1998). Boyatzis and McKee (2005) observed that "EI accounts for 85% to 90% of the difference between outstanding leaders and their more average peers" (p. 28).

Mayer and Salovey defined emotional intelligence (EI) as "a type of social intelligence that involves the ability to monitor one's own and others' emotions, to discriminate among them, and to use this information to guide one's thinking and actions" (p. 433). The emotionally intelligent individual knows her/himself and manages or regulates personal soft skills in a quality-enhancing fashion (Dubrin, 2010; Goleman, 1998). Some have found Emotional Intelligence (EI) to be critical to the performance of organizational leaders and it is determined by various metrics aimed at the evaluation of effectiveness (Dubrin, 2010; Goleman, 1998; Goleman, Boyatzis & McKee, 2002; Nadler, 2007). The organizational leader should demonstrate a high level of EI in order to achieve a high quality of influence and to produce extraordinary outcomes in an organization; outcomes for which substitutes for leadership are not possible and are dependent upon superior leadership (Bar-On, 2007).

Baseline hard-skill credentials and social-political affiliations have provided the traditional paths to organizational leadership (Manning, 2003). But if that is the key that unlocks the door to leadership positions, what provides further entry into the rooms only occupied by the upper echelon of leaders? Goleman (1998) argued that a triangulated impact hinges upon the attainment and practice of these skills, because "a leader's strengths or weaknesses in emotional competence can be measured in the gain or loss to the organization of the fullest talents of those they manage" (p. 32). Potential effects can be experienced by the leader, the organization, and the individual followers. Further tertiary results may also be influenced, positively or negatively.

The ultimate wages remunerated to leaders who do not value individual contributions and who encourage a Tayloristic approach exclusive of EI considerations are meager when juxtaposed beside the self-aware, self-regulating, motivational leader (Adler, 2008). Feedback is an important component of continuous improvement (Caluwe & Vermaak, 2003). In a description of this concept, Blanchard (1999) explained that "none of us is as smart as all of us" (p. 14). A "bottom up" or collegial style is preferable for the encouragement of meaningful input which can positively affect change (Bennis & Nanus, 1988).

The reflexivity principle involves an examination of what is known and how it is known (Guillemin & Gillam, 2004). EI begins with introspection:

Leaders high in emotional self-awareness are attuned to their inner signals, recognizing how their feelings affect them and their job performance. They are attuned to their guiding values and can often intuit the best course of action, seeing the big picture in a complex situation. (Goleman, 2002, p. 253).

These are not exclusively innate traits possessed by a select few who are highly recognizable as successful leaders and upon whom were bestowed emotional gifts (Northouse, 2007). Contrarily, EI self-awareness competencies are developed over time by individuals committed to mastery of soft skills with a view toward superlative performance (Caldwell & Gravett, 2009).

The emotionally intelligent leader recognizes personal strengths and limits (Goleman, 1998). The self-examination or self-awareness phase is the initial and foundational element of EI. No psychological examination or diagnosis is necessitated (Slater, 2001). This step yields the fruit of identification of that which can be built upon, and that which must be corrected. Strengths remain qualities upon which the leader recognizes as assets and grows with all humility (Dubrin, 2010).

Employing a quantitative study, Wang and Huang (2009) explored relationships between group cohesiveness, transformational leadership, and emotional intelligence (EI). The purpose of the research was to examine the triangulating relationship between transformational leadership, group cohesiveness, and the antecedent effect of EI on transformational leadership. As teamwork has increased in popularity in industrial settings, group cohesiveness has been identified as central to team performance, which positively impacts numerous functions (Wang & Huang, 2009). The leadership of the group has been identified as positively correlating with group cohesiveness. The premise is that cohesiveness or commitment and motivation of the group members to remain collectively together and achieve for the good of the whole is foundational to team success.

EI was measured by an instrument of self-report developed by Wong and Law (2002). Transformational Leadership was measured by the 20-question Multifactor Leadership Questionnaire (MLQ) developed by Bass and Avolio (1997). Group cohesiveness was measured by 8 items developed by Dobbins and Zaccaro (1986).

In the study of emotional intelligence (EI), it is foundational to know that there exists a difference between EI and standard personality traits. Caruso, Mayer, & Salovey (2002) set out to determine the value of EI and its functional usefulness through a quantitative study which compared and contrasted EI and its relation to personality trait variables to "...determine where constructs overlap" (p. 309).

The Multifactor Emotional Intelligence Scale (MEIS) was developed and became the instrument for this study. Caruso et al (2002) reported that "in this study, EI was separable from several standard personality traits...and the MEIS is not measuring constructs that are assessed by standard personality tests" (p. 318). It was positively correlated that EI may make a contribution toward career choice.

Data supported a positive correlation between transformational leadership and group cohesiveness. Secondly, the results also supported a positive correlation between EI and transformational leadership. Finally, Wang and Huang's (2009) data supported "...that the impact of emotional intelligence on group cohesiveness was mediated by transformational leadership" (p. 388).

Landy (2005) expressed a disbelief in the contribution EI as a factor in workplace effectiveness. He described doubt in the scientific validity of EI studies, and a disdain for the proprietary secrecy of the databases which hide key elements of foundational studies and hinder a more thorough examination of the predictability of occupational success relative to EI.

Landy (2005) credited E. L. Thorndike's reference to social intelligence in 1920 as the first mention of a precursor of EI. It was Landy's opinion that Thorndike merely coined phrases rather than initiated development of a construct. Landy (2005) asserted claims that EI research is flawed relative to scientific parsimony, design, and conceptual, definitional, and psychometric stability. Landy's (2005) arguments were based upon an unscientific and undocumentable approach, historical misperceptions and inaccuracies, and the desire of the masses to seek attribution and potential improvement in areas which he feels are unable to be gained through such effects. His ultimate concluding appeal to an unscientific explanation for the persistence of EI summarizes the failure of his discourse. In the end, he was unable to convince by anything scientific, so he resorted to the very method of appeal which he has criticized. The access to data notwithstanding, his arguments simply did not succeed by invalidating the existing body of research in support of the EI construct and its usefulness in occupational effectiveness.

Even if EI were not a new concept, or not a separate construct, its worth remains imperative Bolman & Deal, 2008). Bar-On (1985) initially identified the emotional quotient (EQ). Salovey and Mayer (1990) have been credited with naming the construct, and Goleman (1995) popularized the concept. Nadler (2011) posited that "EI can be defined in terms of understanding yourself, managing yourself, understanding others, and

managing others. People who possess high EI are the ones who truly succeed ... “(p. 9). The method of discerning how important emotional and social skills are juxtaposed against raw intelligence presents a meaningful and necessary evaluation.

Summarily, Wang and Huang (2009) found that “leaders’ emotional intelligence was related to group cohesiveness through transformational leadership behavior” (p. 389). Wang and Huang (2009) offered a well-documented account whose triangulated effort made a strong statement for EI. They argued that team effectiveness is impacted by the group’s cohesiveness. They further documented a positive relationship between group cohesiveness and transformational leadership. Finally, emotional intelligence was positively correlated with transformational leadership. This pointed to a relationship in this study between emotional intelligence and team performance or effectiveness via transformational leadership and group cohesiveness.

## **SOCIAL INTELLIGENCE – ACTION AND INTERACTION PRODUCED BY CONNECTIVITY**

The emergence of the digital age has brought with it challenges to communication as it has delivered technological means of connectivity. As people email, text, conference call, participate in chat rooms, and interact through means of social media such as Face book and Twitter, a decline in social capital and an increase in social corruption has occurred (Goleman, 2006). Whereas EI focuses on the individual within, social intelligence (SI) expands to what transpires when individuals connect (Goleman, 2006).

Thorndike (1920) is credited as the originator of the term social intelligence. According to Goleman (2006), SI connotes “...being intelligent not just *about* our relationships but also *in* them” (p. 11). It is, in effect, the ability to act wisely in human relationships (Goleman, 2006). Exceeding the selfishness of manipulation, social intelligence enables communication of emotion and the transmission of honesty and trustworthiness. Is the individual genuine in the expression of love, power, and empathy?

Social intelligence is the ubiquitous determinant of that authenticity. SI impacts relationships and influences conflict, rapport, and synchronization between individuals (Goleman, 2006). One’s degree of SI has bearing on the effectiveness and ability to cope, adapt, and contribute. It is closely related to EI through the social competency component. Whereas EI looks internally, SI delivers that internal comprehension to the occupants of the environment in which the individual has influence. Furthermore, while it may be difficult to demonstrate complete competency in EI without being competent in SI, the same may be true of SI’s relationship to cultural intelligence (CQ). (Pitcher, 2010).

The interplay between EI and SI, which can be illustrated in a two-dimensional model (see Figure 1). The individual low in emotional intelligence and social intelligence is typified in quadrant one of Figure 1. This individual may be high in baseline credentials, providing a more traditional candidate for leadership. However, deficiencies in self-awareness, self-regulation, and social intelligence would diminish the opportunity for outstanding leadership in a global context. Quadrant two is exemplary of the individual high in EI, but low in SI. An introverted individual who possessed intuitive self-awareness and practiced self-management, but lacked in social intelligence would be assessed to be in this domain. The meta-argument against this individual would be that sufficient knowledge and self-control could not supersede interpersonal relationship inadequacies.

The result of high EI and high SI is depicted in Figure 1. This model assumes that baseline credentials are met or exceeded. Therefore, this individual has demonstrated competency in self-awareness, self-regulation, social awareness, and relationship management. This provides strong implications for the global leader. International and global activities conducted with the leader exhibiting high EI and SI portends an orientation toward interdependence and the reduction of miscommunication. A presentation of the rare combination of high social intelligence competencies but low EI can be viewed in quadrant four of Figure 1.

Rapport is a crucial element for the global executive. According to Goleman (2006), “Rapport exists only between people; we recognize it whenever a connection feels pleasant, engaged, and smooth. But rapport matters far beyond those fleeting pleasant moments. When people are in rapport, they can be more creative together and more efficient in making decisions...” (p. 29). Tickle-Degnan and Rosenthal (1990) found that the

three elements of mutual attention, shared positive feeling, and a well-coordinated nonverbal duet, when arising in tandem, catalyze rapport.

Newcombe and Ashkanasy (2002) conducted research on negative feedback with positive expression. They studied unflattering feedback that was given by managers while at the same time displaying warm feelings toward the subordinates by their voices and expressions. The recipients felt positively about the overall interaction, although they received criticism specific to their performance. The wide array of stakeholders must be considered in every situation (Bennis, 2009). Social intelligence is vital in affirming individuals while sometimes delivering a differing opinion.

## **THE THOROUGHLY PREPARED GLOBAL EXECUTIVE**

The successful global leader of the second decade of the twenty-first century will understand the importance of people. Whether studying the cultural nuances of those with whom the leader will interact, locating and implementing strategies that look beyond the struggle with competitors to identify new niches and procure noncustomers, in addition to embracing ideas which originated from a distant land. A key to this success will be to seek out and exploit commonalities rather than differences.

Current leaders must foundationally know who they are and not only be receptive to change, but welcome and embrace it. The organization they lead must be reflexive and responsive to change, rather than operating in a Tayloristic, machine-like, bureaucratic fashion (Morgan, 2006). Such an atmosphere can only be envisioned, inspired, and driven by the leader who exemplifies a persistent sense of urgency (Kotter, 1996). Transformational leadership will be requisite to instill exponential change in the leadership and followers of the organizations. Succession plans will require recruitment, training, and retention of mentees in order to sustain such efforts (Pitcher, 2010)

Contemporary success will be driven by collaboration, communication, and connectivity. Relationships built upon interdependency and partnerships will be the hallmarks of successful countries, organizations, and individual leaders. The synergy that elucidates from that connectivity is dynamic and cannot be achieved by anyone with a selfish agenda.

The global leader must possess superior baseline credentials. Excellence in the appropriate discipline is a given, and serves as an introductory criteria for further exploration. The leader should demonstrate competency in emotional intelligence. A working knowledge of oneself should be foundational to this process. Limitations should be subverted, targeted, and improvement sought at every dimension (Bar-On, Maree, & Elias, 2007). Self-regulation must be achieved, and social awareness and relationship management mastered. Beyond that, social intelligence is requisite. To demonstrate EI in an internal fashion, replete from the social interaction success so necessary in cross-cultural situations, would be a travesty (Pitcher, 2010). The composite of these “non-cognitive” attributes can enable the individual to be positioned for leadership – globally – now and in the future.

In addition to superior baseline credentials, emotional intelligence and social intelligence are required of the global executive. The lifelong learning process in each of these arenas should continually be present and reflected in these growing and emerging competencies (See Figure 1) (Pitcher, 2010).

# **AN EXPLORATORY STUDY ON PERCEIVED SERVICE QUALITY IN INFORMAL CONVENIENCE STORES IN SOUTH AFRICA**

**Thérèse du Plooy and Johan de Jager**  
**Tshwane University of Technology, South Africa**  
**and**  
**Dion van Zyl, University of South Africa, South Africa**

## **ABSTRACT**

*A review of the literature reveals that the measuring of service quality in businesses operating in the formal sector has attracted far more attention than businesses operating in the informal sector. To focus on the factors that influence service quality in informal businesses is just as important. For this study, survey data were obtained from 371 shoppers at informal shopping outlets located in South Africa. The findings revealed that 'empathy', 'tangibility', 'reliability' and 'assurance' were considered to be the main drivers of perceived levels of service quality amongst shoppers at informal retail outlets in South Africa. Practical implications for informal retailers, limitations and suggestions for future studies were articulated.*

## **INTRODUCTION**

Various studies have indicated that the vast majority of consumers in developing nations, including South Africa, are poor. Although most of these people could be classified as poor, their aggregate buying power or contribution to a country's GDP cannot be underestimated. Therefore, investigating the role that businesses are playing in the upliftment of this sector of the community is valuable. One of the many challenges for these countries is to determine how to upgrade these communities in terms of a variety of service-delivery efforts (Rogerson, Bendixen & Abratt, 2007). However, a considerable volume of academic study has been devoted to customers' assessment of the service delivery by formal retail stores (Gremmler & Gwinner, 2008; Ha, 2009; Maxham, Netemeyer & Lichtenstein, 2008; Wong & Sohal, 2003). Most studies have examined retail service quality in developed countries, but the focus has only recently expanded to include encounters in the diverse retail environment in developing countries, such as India (Darshan, 2005) and the Philippines (Munoz, Raven & Welsh, 2005). Clearly, less attention has been paid to the informal sector and to satisfying their needs, and to uplifting communities in developing markets; and there seems to be very little published recently on the customer service in the informal food retail environment in South Africa. The following section will consider retail service quality from a developing perspective.

## **RETAIL SERVICE QUALITY FROM A DEVELOPING PERSPECTIVE**

Several recent studies have explored the cultural differences between service orientations in different countries. Some follow a customer perspective, while others explore it from the view of service suppliers. Seock and Lin (2011) examined the cultural influences on consumers' loyalty and evaluations of the relative importance of apparel retail store attributes in Taiwan and the USA. The findings showed that culture has a significant influence on the relative importance of retail stores' attributed dimensions. Brady and Robertson (2001)

surveyed fast food customers in the US and Ecuador; and they found that the effect of service quality on behavioural intentions (repurchase intentions, loyalty, and word-of-mouth) is mediated by the consumers' level of satisfaction. However, they found that this relationship is consistent across cultures. Carraher, Parnell and Spillan (2009) interviewed almost 1342 small business owners from Austria, the Czech Republic, Hungary, Latvia, Slovakia, and Slovenia – to determine the importance of personality attributes to explain service-oriented performance, such as helpfulness, thoughtfulness, consideration, and co-operation.

Wong and Sohal (2003:292) undertook a study in Melbourne, Australia to determine the influence of store staff on customers' loyalty towards retail stores. They compared the retail service quality provided by stores in a country retail district with those provided by stores in a city's retail district. Klemz, Boshoff, and Mazibuko, (2006:590) compared the service delivery of staff in urban retail stores with that in non-urban areas in South Africa. Although the drivers of service quality found in these studies were different, both imply significant differences – when comparing service quality in stores in county or rural areas with that in urban areas. Some of these studies seem to suggest that the influence of national and regional cultural differences on customer perceptions of service encounters in the retail environment gives the best explanation for these differences (Darshan, 2005; Munoz, *et al*, 2005).

Malhotra, Ulgado, Agarwal and Baalbaki (1994) investigated the differences in perceived service quality between customers in developed and that in developing countries. They suggested that this is mainly due to environmental, economic, and socio-cultural factors that impact on their perceptions and expectations with regard to service quality. The findings of these studies are clearly supported by Malhotra, Ulgado, Agarwal, Shainesh and Wu (2005:256) who strongly oppose the application of Western approaches and measures of service quality employed by service companies that operate in a developing environment, and in diverse cultures. They warn that this would result in unsatisfactory and inappropriate marketing strategies. It is clear that there is still a need for research on service-quality perceptions in developing countries, because the research focus has primarily been on developed countries. The empirical section of this study will now be described.

## **RESEARCH OBJECTIVES**

The study set out to measure, from a selection of customers, the level of satisfaction with the overall service quality provided by small informal retail stores in South Africa. Two of the most prevalent types of informal retail operation has investigated in this study: Spaza shops and small general dealers in townships. In addition, the study aims to identify the service quality dimensions that best explain the perceived level of service quality, as well as customers' future intentions of shopping at the retail store.

More particularly, the study was guided by the following specific research objectives, which are:

- To confirm the dimensionality and internal reliability of service-quality dimensions developed on an a-priori basis from the existing literature;
- To measure the level of satisfaction with the overall service quality provided by small informal retail stores in South Africa;
- To obtain a ranking of the service-quality dimensions based on the average composite ratings of respondents;
- To identify the significant predictors of overall service quality and intention to shop in the future; and to identify statistically significant differences in the average ratings of demographic groups.

## **RESEARCH DESIGN AND METHODOLOGY**

### **Data collection and sampling**

The survey was conducted at five selected areas, with informal grocery stores, in the largest province of South Africa. A total of 400 questionnaires were administered by trained interviewers fluent in English, as well as the prominent African languages spoken in the selected areas. Every third respondent who passed the data-collection point was screened and invited to participate in the study. This resulted in a convenience sample of 390 shoppers at ten informal shopping outlets in the selected areas.

In developing the survey instrument, an extensive literature review was conducted, including a review of several empirical studies on measuring service quality in a particular shopping environment. From this, forty-seven statements (or items) measuring six different service quality dimensions were selected. Statements for this quantitative study were structured so that each could be rated using a 5-point rating scale, where 1 = strongly disagree; to 5 = strongly agree. In order to obtain a measurement for a dimension, a composite was calculated based on the ratings of the subscales.

In addition to the inclusion of service-quality items, the questionnaire also included questions for recording the demographic characteristics of the respondents, such as gender, age, highest educational qualification, household income and population group. Lastly, the questionnaire sought additional information relating to the shop, including location, type of structure and the type of services offered.

To address the dimensionality and the convergent and discriminant validity issues, a number of inter-item correlation matrices were constructed – using the individual items, as well as the composite service quality dimensions. Inspection of the matrices revealed that correlations among items measuring the same construct were uniformly high, compared with the correlations between composite dimensions (table 1).

**Table 1: Inter-item correlation matrix**

		Tangibility	Service scape	Reliability	Responsiveness	Assurance	Empathy
Tangibility	Pearson Correlation	1					
	n	371					
Service scape	Pearson Correlation	0.76	1				
	Sig. (2-tailed)	0.000					
	n	371	371				
Reliability	Pearson Correlation	0.51	0.49	1			
	Sig. (2-tailed)	0.000	0.000				
	n	371	371	371			
Responsiveness	Pearson Correlation	0.42	0.44	0.65	1		
	Sig. (2-tailed)	0.000	0.000	0.000			
	n	371	371	371	371		
Assurance	Pearson Correlation	0.56	0.60	0.57	0.61	1	
	Sig. (2-tailed)	0.000	0.000	0.000	0.000		
	n	371	371	371	371	371	
Empathy	Pearson Correlation	0.45	0.44	0.57	0.66	0.60	1
	Sig. (2-tailed)	0.000	0.000	0.000	0.000	0.000	
	n	371	371	371	371	371	371

□ In addition, the internal reliability of composite dimensions was confirmed by means of Cronbach's alpha. The main findings regarding the internal reliability of composite dimensions may be summarised as follows:

- *Tangibility*: This was initially measured by 14 items, of which 12 were retained for further analysis. The coefficient alpha value for this subscale was 0.874.
- *Servicescapes*: This was measured by 10 items, of which all were retained for further analysis. The coefficient alpha value for this subscale was 0.826.
- *Reliability*: This was measured by five items, all of which were retained for further analysis. The coefficient alpha value for this subscale was 0.726.
- *Responsiveness*: This was measured by seven items, of which four were retained for further analysis. The coefficient alpha value for this subscale was 0.803.
- *Assurance*: This was measured by six items, all of which were retained for further analysis. The coefficient alpha value for this subscale was 0.692.
- *Empathy*: This was measured by five items, of which three were retained for further analysis. The coefficient alpha value for this subscale was 0.785.
- *Overall satisfaction with service quality and future intention to shop*: The statements read: 'I am satisfied with the overall service quality'; and 'I intend to shop at this store/shop in the future'.

□

□ The service quality dimensions and the items within each are listed in the appendix. The standardised item alpha for the scale was calculated as 0.935, exceeding the suggested level of 0.7, as recommended by Nunnally (1978).

## DATA ANALYSIS AND RESULTS

### Sample characteristics

The demographic profile of the respondents interviewed will now be reviewed. The majority of the shoppers interviewed (93%) were black Africans, since it is mostly this population group buying from small informal food stores. Females made up 54% of the sample, while 78% of the respondents were younger than 35 years. About two-thirds reported an average household income of less than R5 000 per month. Respondents also reside predominantly in informal settlements (63%). With regard to the way respondents were served, half of the sample were served over the counter, 35% through a window, and 15% through self-help.

### Overall rating of service quality and intention to shop

As many as 45% of the respondents agreed or strongly agreed with the statement: 'I am satisfied with the overall service quality'. In contrast, 28% disagreed or strongly disagreed. The remaining 27% neither agreed nor disagreed (See figure 1). With regard to the statement: 'I intend to shop at this store/shop in future', the majority of the respondents (59%) agreed or strongly agreed.

**Figure 1: Rating of statement - 'I am satisfied with the overall service quality'**

**Figure 2: Rating of statement - 'I intend to shop at this store/shop in future'**

In contrast, 16% disagreed or strongly disagreed. The remaining 25% neither agreed nor disagreed. A significant positive correlation of 0.66 ( $p = 0.000$ ) was found between the two statements, confirming a positive relationship between the level of service quality and the future intention to shop (See figure 2).

### Average ratings of service quality dimensions

Table 2 shows the average ratings for the six service dimensions. Results showed that 'reliability' obtained the highest average rating (3.35) of the six dimensions, followed by 'responsiveness' (3.32) and 'empathy' (3.31). 'Servicescape' (3.25) obtained the lowest average rating. A Friedman test confirmed significant differences between average ratings ( $p = 0.036$ ), in particular the top- and bottom-rated dimensions.

**Table 2: Average ratings of the service quality dimensions**

Dimensions	Mean	SD	Rank
Reliability	3.35	0.72	1
Responsiveness	3.32	0.83	2
Empathy	3.32	0.82	3
Tangibility	3.27	0.76	4
Assurance	3.26	0.65	5
Service scape	3.25	0.72	6
<i>Friedman test (sig=0.036*)</i>			

## Identifying the drivers of service quality and intention to shop

In order to identify those dimensions that best predict overall service quality and the intention to shop in future, a stepwise multiple regression analysis was performed, as shown in Table 3. The stepwise regression model ( $F = 1355.51$ ;  $p < 0.000$ ; adjusted R square = 0.936) identified ‘empathy’, ‘tangibility’, ‘reliability’ and ‘assurance’ as the best predictors of overall service quality. These dimensions explained around 94% of the overall variation in the ratings of overall service quality. Inspection of the standardised Beta coefficients reveals that ‘empathy’ contributes most in predicting overall service quality, relative to the other service quality dimensions.

With regard to the intention to shop, the stepwise regression model ( $F = 1786.06$ ;  $p < 0.000$ ; adjusted R square = 0.935) identified the following variables as the best predictors: ‘assurance’, ‘reliability’ and ‘empathy’. Of interest to the researchers was the exclusion of ‘tangibility’ from the model. In addition, where ‘empathy’ contributed most in explaining the variation in overall service quality relative to the other predictors, ‘assurance’ contributed most in explaining the variation in intention to buy at the shop in future.

## Differences in the ratings of demographic groups

Various statistical tests (independent t-tests and ANOVA) were performed to identify significant differences in the average ratings of demographic groups. The following main results are of relevance.

- Older respondents were significantly more satisfied with service quality aspects, such as the ‘service-scape’, ‘reliability’, ‘responsiveness’ and ‘overall service quality’, than were the younger respondents.
- Respondents with a higher educational profile were significantly more satisfied with service quality aspects such as ‘tangibles’, ‘servicescape’ and ‘assurance’ than were other educational groups.
- Higher income groups showed more satisfaction with service quality aspects, such as ‘assurance’, ‘overall service quality’ and ‘intention to shop in future’ than did lower income groups.
- There were no significant differences in the average ratings of gender and race groups.

Similar statistical tests were performed to identify whether a variation in the study variables could further be explained by aspects, such as shop location, structure and type of service provided. The following results were obtained.

- Respondents interviewed at shops located in formal settlements showed higher levels of satisfaction with aspects relating to ‘tangibles’.
- Respondents interviewed at shops that were located in a brick building or inside a main house showed higher levels of satisfaction than did those respondents who were interviewed at shops that were located in a shack or room/garage attached to a house. Differences in mean ratings were evident across all the study variables.
- Lastly, respondents that were able to serve themselves when shopping showed consistently higher levels of satisfaction when compared with other means of service. Respondents being served through a window were the least satisfied.

**Table 3: Regression analysis**

Factors	Unstandardised Coefficients		Standardised Coefficients	T	Sig

## RECOMMENDATIONS AND IMPLICATIONS

A review of the literature revealed that service quality in businesses operating in the formal sector had received more attention than businesses operating in the informal sector. Yet, when considering the latter's customers, the aggregated buying power or contribution they make to South Africa's GDP should not be underestimated. In fact, Ligthelm (2003) highlighted the rapid growth of the informal economy in South Africa. In a very competitive and demanding economic climate, the focus on the factors that influence service quality in informal businesses is thus considered valuable to all shop owners. In addition, the findings could also be of interest to government and other groups that provide support and guidance to informal retailers.

The results showed that in general customers are satisfied with the overall service quality provided by informal retail shops. However, the results also showed that about one in four respondents interviewed was not satisfied. For some shops, the level of service quality should be a matter of concern. Small informal retail outlets cannot compete with larger and more formal outlets on aspects such as available resources, marketing research and economies of scale. In order to survive and grow, these informal retailers need to ensure that a quality service is delivered.

This study also found a significant positive correlation between perceived service quality and the intention to shop in future at the store. This is in line with the findings from studies by Brown, Brown, and Ostrom (2002) and Dabholkar, Thorpe and Rentz (1996). These researchers identified a strong positive relationship between service quality and the intention to repurchase. They also found a strong relationship between service quality and the probability of recommendation. With services that are mostly intangible, and are usually produced after purchasing (Reimer & Kuehn, 2005), prospective customers face a high degree of uncertainty and need to be persuaded or encouraged to shop at a particular outlet, because of positive word-of-mouth communication with other shoppers.

The delivery of service quality should therefore form an integral part of any retailer's strategy. In addition, retailers benefit from customers satisfaction, since satisfied customers can be retained more successfully, and the market share can be expanded further – ultimately improving their overall financial performance (Kim & Jin, 2002:224). What can also work in the favour of the smaller retail outlets is the fact that they can deliver a customised service delivery, as they are more flexible and responsive to their customers' unique requirements (Gottfridsson, 2010). These strategies are more readily attainable by small businesses, as they are in closer contact with their customers.

Areas that were identified as best predictors of satisfaction with service quality included 'empathy', 'tangibility', 'reliability' and 'assurance'. In fact, of the four predictors, 'empathy' was found to be the most dominant. With regard to intention to shop, the best predictors were identified as 'assurance', 'reliability' and 'empathy'. Where 'empathy' was most dominant in predicting overall service quality, 'assurance' was identified as being the most dominant in predicting future shopping intention. These underlying aspects should be focal points when developing service quality strategies for informal retail shops. With limited resources, retailers need to consider carefully a balanced service mix that meets the expectations of their customers, as well as being consistent with the attributes most highly valued by those most likely to buy at their stores.

Other challenge areas that emerged from the study were the differences in service quality perceptions measured between the various demographic and geographical groups. The results revealed that demographics, such as age, educational level and income, explained some variation in the respondents' satisfaction ratings. With regard to location, differences in perceived satisfaction levels were evident amongst groups that shopped in formal settlements versus those who shopped in informal settlements. The structure of the shop and the means of service delivery also played some part in explaining these variations.

## **LIMITATIONS AND DIRECTIONS FOR FURTHER RESEARCH**

As with any empirical study, this study also has some limitations. These shortcomings could provide other promising avenues for further research. The study's focus on informal grocery stores in one province may limit the extent to which the findings can be generalized to the rest of South Africa – or to other informal sectors. The current study could therefore be extended to other provinces in South Africa, and to other developing countries. Another question that has emerged from this study is: How different is the overall level of perceived service quality measured amongst informal retail shoppers when compared with those that shop at formal outlets? A comparative study could therefore be of value to gain understanding of the service quality challenges faced by informal retail stores when competing against the formal outlets.

# **EXPLORING THE EFFECTIVENESS OF MINIBUS TAXIS AS AN ADVERTISING MEDIUM IN AN EMERGING MARKET**

**Thérèse du Plooy, Tshwane University of Technology, South Africa**  
**Giselle du Plessis, University of Pretoria, South Africa**

## **ABSTRACT**

*This study explored the effectiveness of minibus taxi advertising in South Africa by interviewing regular minibus taxi commuters about their attitudes, perceptions and attention of minibus taxi advertising. Data was collected from 360 commuters in Tshwane, one of the largest metropolitan areas in South Africa. A stratified sample was applied by intercepting minibus taxi commuters at the eighteen formal and semi-formal taxi facilities. A structured questionnaire, with 5-point Likert scales, was used in order to measure the different constructs. The results showed that the captive audience had strong positive feelings towards advertising in general and enjoyed looking at advertisements and found it entertaining. A strong positive attitude towards taxi advertising is evident. Perceptions towards taxi advertising are overall positive and taxi advertising attracted attention. An integrated approach should be followed utilising traditional advertising mediums combined with out of home media and specifically taxi advertising to reach the emerging market.*

## **INTRODUCTION**

Until recently OHM (Out-of-home media) has been one of the last options to be considered for advertising campaigns, but it has become more attractive to advertisers lately. The expenditure on traditional media such as television, radio and newspapers has experienced dramatic decline during the recent economic recession. The fragmentation of mass media worldwide resulted in a decrease in the popularity of traditional media such as newspapers and television, with increasingly more being spent on new media such as the internet and mobile phones. Lately there has also been a positive shift toward OHM which is evident from the growth experienced in several international market. Fortenberry and McGoldrick (2010) reported that a total of approximately \$6.99 billion was spend on outdoor advertising in the USA in 2007 with billboard advertising accounting for 66% of this expenditure. The growth is significant, with expenditures doubling over the previous decade, yielding an average growth rate of 6.1%. Globally outdoor advertising has also increased significantly, comprising around 14% of the advertising spend in China and Japan and more than 10% in France and Greece. The drastic increase of the popularity of OHM in Russia after their inclusion in the free market system is also remarkable. In particular large billboards, are encouraged because there as it is regarded as an indication of prosperity in Russia. It can be expected that the international growth trend of OHM should also be the case in South Africa, however the contrary seems to be the case. Specifically transit advertising is currently an under-utilised OHM, despite that it might the one medium that can offer the solution to the increasingly cluttered outdoor advertising space (Du Preez, 2007). Despite the international growth and increasing attractiveness of OHM it also received relatively little attention in the marketing literature (Wilson & Till, 2008; Veloutsou & O'Donnell, 2005). There still seems to be a lack of published research on the South African commuter market and how to use transit advertising effectively. This is clearly an area that needs to be explored more in depth and is therefore the focus of this study.

## **MINIBUS TAXI ADVERTING AS TRANSIT MEDIA**

According to Du Plessis (2010) outdoor advertising falls under support media. Outdoor advertising which includes billboards, posters and in-transit advertising forms part of support media. Transit advertising is aimed at commuters making use of transportation services on a daily basis, including buses, taxis, commuter trains and aeroplanes. Three types of transit advertising can be identified: Posters found inside buses, taxis and trains, outside posters that are placed on the sides, backs and/or roofs of buses, taxis and trains and floor displays, island showcases and electronic signs that can also be found in airports, train stations and taxi ranks. Veloutsou & O'Donnell (2005) explains that transit advertising is mostly used as a secondary advertising medium that works best in conjunction with other mediums. It is believed to be very effective in reinforcing existing brand or brand messages and less so to create awareness for new brands.

Transit advertising can also be considered one of the most cost effective means of reaching a bigger audience according to Mudeliar (2008). Gray (2008) also suggests that transit advertising allows for extended coverage and detailed, repetitive messaging. Vehicle branding is specifically designed to engage commuters while queuing in large volumes at taxi ranks and bus depots. In addition to reaching thousands commuters every day transit advertising provides detailed information about specific products. Transit media has the potential to bring the advertisers message straight to the consumer in new, creative and attention-grabbing formats that differ tremendously from the tedious, worn-out traditional outdoor mediums. Transit advertisements cannot be ignored as easily as other mediums, because it cannot be switched off as one would with a television or radio, and it grabs attention whether standing still or in motion (Mudeliar, 2008). Advertisers increasingly also integrate OHM types with other media in their advertising campaigns to increase the effectiveness significantly. Transit advertising can be combined with radio advertising (Gray, 2008) or mobile phones can be used to generate feedback that allows advertisers to examine who is viewing and interacting with the messages (Wayne, 2010).

It should be noted that public transit and taxis in emerging markets such as South Africa are rather different when compared to developed countries. The emerging market in South Africa makes use of a combination of transport i.e. bus, minibus taxi's, metered taxi's, trains and motor vehicles. More than one mode of transport would often be used to reach work or home on a daily basis. The South African taxi industry has minibus taxi's transporting up to 16 passengers as well as smaller taxi's transporting fewer passengers. The emerging market mostly makes use of the sixteen-seater minibus taxis. The minibus taxi industry is carrying 65% of South Africa's public transport passengers which consist mainly of the emerging market. The role of taxis will be mainly to provide feeder services to larger carriers of people such as the Bus Rapid Transit and Gautrain (Van Zyl, 2009). Commuters are seen as a captive audience in a controlled environment, considering that minibus taxi commuters in South Africa spend on average about 29 minutes on a taxi trip being exposed to media (OHMSA<sup>2</sup>, 2010).

Two recent studies on transit media include taxi advertising (Veloutsou & O'Donnell, 2005) and airport advertising (Till, 2008). Veloutsou and O'Donnell (2005) conducted exploratory research in three areas in Scotland, on the overall attitudes and feelings towards advertising, outdoor advertising and taxi advertising from the perspective of the targeted audience. This study confirmed the high reach of outdoor advertising and found that effectiveness of taxi advertising was dependant on the level of exposure, area of habit (work, live and travel) and the amount of information that outdoor advertising conveyed. It was suggested that taxi advertising should be used as a secondary medium in an IMC campaign to reinforce a message, to support an already established brand or to inform on developments related to the advertised brand. Wilson and Till (2008) look at the effectiveness of airport advertising by observing how air travelers interact with this type of transit media and surveys to measure the recall and recognition. The location, format and size of the advertisements in the airport terminals were assessed based on their level of exposure to passersby. This findings revealed how the size and shapes of the advertising format, as well the number of words in the copy influence recall and recognition. The major findings confirmed the importance of influences such as location or placement of the advertisements as well repetition on brand recognition. These findings of this study are evidently also applicable to other transit media such as taxi, bus and train advertising. However, very little has been published on transit media, more specifically mini-taxi bus advertising in South Africa.

## **RESEARCH OBJECTIVES**

The following objectives guided the study:

- To explore the general view of regular minibus taxi commuters towards advertising in general.
- To explore the view of regular minibus taxi commuters towards taxi advertising.
- To investigate the perception towards taxi advertising by regular minibus taxi commuters.
- To investigate the attention paid towards taxi advertising by regular minibus taxi commuters.

## **RESEARCH DESIGN AND METHODOLOGY**

### **Data collection and sampling**

Data for this study was collected by 360 personal interviews with regular minibus taxi commuters in Tshwane, one of the largest metropolitan areas in South Africa. These commuters form part of the large emerging market in South Africa. Trained interviewers under close supervision conducted the fieldwork. A stratified sample was applied by intercepting minibus taxi commuters at eighteen formal and semi-formal minibus taxi facilities in the selected area. Respondents who passed the data collection point at or close to the selected taxi ranks were screened to ensure they were regular minibus taxi commuters and invited to participate in the study.

### **Measuring instrument**

Veloutsou and O'Donnell's (2005) structured questionnaire was used as basis for this study, but had to be adapted for the South African market. The adaptation was done based on the input of media experts at one of the largest Transit media companies in South Africa. The questionnaire was then pre-tested with a convenience sample of 30 students who make use of minibus taxis as their major form of transport. The students' demographic profile matched the target profile and could therefore be used to pre-test the questionnaire. A 5-point Likert scale was used to measure respondent's attitudes, perceptions and attention towards minibus taxi advertising. The following major aspects were included in the questionnaire: Commuting profile, general attitudes towards advertising and taxi advertising, perceptions of taxi advertising, attention towards taxi advertising as well as preferred advertising media. The main findings of the study will now be described.

## **DATA ANALYSIS AND RESULTS**

### **Profile of the Sample**

The profile of the sample is shown in table 1. The demographic profile of the sample is as follows: 46.7% males and 53.3% females made use of minibus taxi transportation. The majority (71%) of respondents were between 19 and 40 years old. It is also clear that majority of the minibus taxi commuters are employed, earning a disposable income or were students. The household income of the majority of respondents (54%) are below R7 999 per month, while almost 20% has an household income between of R9000 and R16 999 per month. Ninety-three per cent (93%) of commuters interviewed were black Africans.

It can be seen that the type of transport usually used by a large majority of the respondents was minibus taxi's (90%), followed by bus transport (28%) and trains (16%). Many commuters make use of a combination of modes of transport. The results reflect the considerable amount of time commuters spend on public transportation either waiting for minibus taxis or commuting. The most common aspects commuters thought about in the taxi were their money, their budget, getting a job. After that they thought about family/children/friends. Their work/task for the day was also on their mind. The activities commuters kept themselves busy with most while in the taxi mostly were looking out of the window followed by listening to the radio, talking to other passengers and chatting on their cell phone. This was followed by reading a magazine and the newspaper. This indicates the important role the integrated marketing communication mix plays in reaching commuters in different ways.

**Table 1 Profile of the regular commuters**

<b>Gender</b>	Male	168	46.7%

## Regular minibus taxi commuters' view on advertising and taxi advertising

The view of the respondents on advertising and taxi advertising will be describe in the following section. When considering their general feeling towards advertising, it is interesting to note that the commuters felt strongly about advertising being a valuable source of information and that advertising keeps them up to date with new product feature developments. The commuters had a strong positive feeling towards advertising and enjoyed looking at advertisements. Only a small percentage (16%) of commuters felt advertisements were

irritating but nearly a third of the commuters felt that advertising is misleading. Just more than half felt that advertisements were entertaining.

**Table 2: General feeling of regular commuters towards advertising**

	Mean	SD	Frequencies %		
			Strongly Disagree/ Disagree	Neutral	Strongly agree/ Agree
Overall I feel positive towards advertising	3.93	0.91	7%	18%	75%
Advertising is a valuable source of information	4.39	0.75	3%	5%	92%
Advertisements are irritating	2.51	1.09	51%	33%	16%
I like to look at advertisements	3.74	0.92	10%	20%	70%
Advertisements are entertaining	3.59	0.96	11%	32%	57%
Advertising keeps me up to date with new product feature developments	4.11	0.94	6%	11%	83%
To me advertising is often misleading	2.87	1.14	36%	37%	27%
To me there are too many advertising	3.56	1.20	21%	20%	59%

The strong positive attitude towards taxi advertising is evident when looking at commuters attitudes specially towards taxi advertising (table 3). Two thirds of commuters' perceptions towards taxi advertising were very positive. The findings of the study are far more positive than one would anticipate. It is unexpected to find contemporary consumers expressing positive views towards the use of any advertising medium, as it is well established that the people often makes every effort to avoid the increasing number of advertising messages attempting to catch their attention. More than two thirds of the respondents indicated that they are familiar with the brand names advertised on taxis, supporting the view that taxi advertising is very effective to reinforce an existing message or to maintain high levels of awareness for leading brands.

**Table 3: General attitudes of regular commuters towards taxi advertising**

	Mean	SD	Frequencies %		
			Strongly Disagree/ Disagree	Neutral	Strongly agree/ Agree
Overall I feel positive towards taxi advertising	3.6	0.93	12%	28%	60%
I like to look at taxis covered in advertisements.	3.47	1.01	17%	28%	55%
I like to look at advertisements inside the taxi	3.38	1.09	21%	26%	54%
I like to listen to radio advertisements inside the taxi	3.67	0.97	13%	21%	66%
The concept of taxi advertising is a 'creative' one.	3.72	1.01	11%	26%	63%
I have spoken to other people about the branded taxis/taxi advertisements I have seen.	2.74	1.18	51%	17%	32%
I am familiar with the brand names advertised on taxis.	3.64	1.07	19%	14%	67%
Taxis with advertisement are usually cleaner	2.9	1.08	35%	35%	30%
Taxis with advertisement are usually safer	2.61	1.07	47%	34%	19%
Taxis with advertisement are usually more comfortable	2.72	1.1	42%	35%	23%

Two thirds of the commuters perceive taxi advertising to be creative and novel, implying that it can also be used to attract the attention of this target market to launch new brands. Listening to radio advertisements is highly associated with commuting in a taxi, clearly supporting the integration of radio advertising with transit media to increase the effectiveness of a campaign aimed at this market. Only one third of commuters discuss advertisements on taxis with other consumers. There was not a strong positive feeling that taxis with advertisement are usually cleaner, safer or more comfortable.

Perceptions towards taxi advertising are overall positive (table 4). Most of the respondents interviewed enjoyed taxi advertising and almost 60% perceive it as an important source of information when making purchase decisions. Interesting to note is that the majority of commuters do not perceive taxi advertising to be

clutter (52%) or as visual pollution (58%). Thirty two percent of respondents agreed that reckless driving might influence their attitudes towards the advertised brand.

**Table 4: Perception towards taxi advertising by regular commuters**

	Mean	SD	Frequencies %		
			Strongly Disagree/ Disagree	Neutral	Strongly agree/ Agree
I like advertisements on taxis.	3.4	0.99	19%	28%	53%
Taxi advertising is a valuable source of information to me.	3.53	0.96	15%	26%	58%
Taxi advertising makes the environment look unattractive	2.40	1.01	58%	27%	15%
There are too many taxi advertising.	2.59	1.02	52%	29%	19%
Reckless driving by taxis drivers influence my perception towards the advertised brand negatively.	2.8	1.28	45%	24%	32%

When considering commuters' attention paid towards taxi advertising (table 5) it can be seen that 71% of the commuters reported that they have noticed advertisements on passing taxis. Advertisers should therefore capitalise on the fact that taxi advertising has the ability to attract attention,. A total of 69% of respondents indicated that they read advertisements on passing taxis, and 64% inside taxis.

**Table 5: Attention paid towards taxi advertising by regular commuters**

	Mean	SD	Frequencies %		
			Strongly Disagree/ Disagree	Neutral	Strongly agree/ Agree
I often notice brands/advertisements on passing taxis.	3.67	0.98	15%	14%	71%
I often read brands/advertisements on taxis.	3.64	1.03	19%	12%	69%
I often read brands/advertisements inside taxis.	3.54	0.99	18%	19%	64%
I pay attention to the new branded taxis/taxi advertisements.	3.35	1.04	23%	29%	48%
I remember branded taxis/taxi advertisements more than advertisements in other media	2.61	1.09	52%	25%	23%

Table 6 reflects the reliability of the data in the different dimensions of the research instrument. Dimensions 1, 2, and 4 of the research instrument tested reliable. Dimension 3 did not test reliable with a score of 0.49. Reliability scores should be  $\geq 0.70$  to show that the items are a good measure of the construct.

**Table 6: Reliability**

	<i>Cronbach's Alpha</i>
Dimension 1: General feeling of regular commuters towards advertising	0.75
Dimension 2: General attitudes of regular commuters towards taxi advertising	0.78
Dimension 3: Perception towards taxi advertising by regular commuters	0.49
Dimension 4: Attention paid towards taxi advertising by regular commuters	0.75

## RECOMMENDATIONS AND IMPLICATIONS

The following conclusions and recommendations can be drawn from the main findings. Taxi advertising has a lot of potential and is still seen as novel and it has not yet been overused. Products and services targeting the emerging markets can successfully reach them through taxi advertising. This captive audience can be reached through extensive exposure and increased frequency to transit media due to commuter's daily routines. As finance is important to this group it is an ideal opportunity for banking services advertisements and job opportunities to be advertised in the taxi.

Advertisers who target this market should capitalise on the positive feelings towards advertising and supply the target market with the information they enjoy about new products and new product development. Product applications and usage will also attract this market's attention. Transit media has the potential to bring the advertisers message straight to the consumer in new, creative and attention-seeking formats that differ tremendously from the tedious, worn-out traditional outdoor mediums. Transit advertisements cannot be ignored as easily as other mediums, because it cannot be switched off as one would with a television or radio, and it grabs attention.

A concern for advertisers might be the potential negative effect of dangerous driving by taxi drivers on perceptions towards the advertise brand. This needs to be kept in mind by advertisers and it is advisable to only use reputable suppliers of transit media.

The items in the dimensions of perceptions of taxi advertising of the research instrument should be reviewed to ensure future reliability of this dimension. Each variable in the dimension can be considered individually or exploratory factor analysis can be applied to all variables to discover the dimensionality.

The challenge is to increase recall of advertisements placed in and on taxis. The fact that traditional media still is the most successful in communicating advertising messages in the emerging market, transit advertising and promotions/samples/demonstrations should be integrated with the traditional television advertising, radio advertising, billboard advertisements and print advertising in newspapers or magazines. There is a big opportunity for advertisers to grow the importance of digital and social media through integration with the traditional media as well as with transit media and especially promotions, samples and demonstrations.

An integrated approach should be followed to use traditional advertising mediums and combine it with OHM and specifically taxi advertising. The taxi advertising should be used to remind commuters of products advertised in other media and to reinforce those messages. Radio advertisements can be supported by outdoor advertising, transit advertising and advertising in magazines and newspapers. Taxi advertising will not be as effective if used on its own. Advantages for advertisers using taxi media include flexibility and mobility by accessing areas where other types advertising is not possible, restricted or just too expensive. This media can target minibus taxi commuters by placing a message inside taxis or at the taxi ranks. Driver in cars can also be targeted by branding the outside of taxis.

International and national companies who aim to target the emerging market should use an integrated communication approach by using traditional mediums and combining it with taxi advertising.

Limitations of the study are that although the attitudes, perceptions and attention of taxi commuters were measured it is not clear how the advertising affects buying behaviour. The respondents may have positive attitudes, perceptions and attention about the advertisements, but do they actually buy the products? Future research is necessary to examine this. The fact that the research was undertaken only in Tshwane, Gauteng could be a limiting factor. Future research should be extended to other areas in South Africa. The high incidence of respondents using minibus taxis as transport medium is due to the fact that the respondents were intercepted for questioning at taxi ranks. It would be interesting to test commuters at bus and train stations and compare the results with this study.

# DECISION TO GROW SUGAR CANES VERSUS COMPETITIVE CROPS: A CASE STUDY OF THAILAND

**Kawpong Polyorat, Khonkaen University, Thailand**  
**Upsorn Pliansinchai, Mitr Phol Sugar Cane Research Center Co., Ltd.,**  
**Thailand**

## ABSTRACT

*Thailand, one of the leading sugar producers, has tried to increase its level of sugar production by persuading farmers of competitive crops to grow sugar canes. Therefore, this research seeks to examine sugar cane farmer's decision to grow sugar canes vs. competitive crops (cassava, rubber, and eucalyptus) by examining four independent factors: cane price, competitive crop price, sugar mill support, and community support. Conjoint analysis with data from Thai farmers indicates that the first three factors significantly influence the farmer's choice of crops to grow (sugar canes vs. competitive crop).*

## INTRODUCTION

Thailand's economy relies heavily on agriculture and agro-industries. At a global level, Thailand is one of the major exporters of agricultural products (Falvey 2001). Rice, rubber, tapioca, sugar, black tiger prawn, and chicken are among the foremost income generators for the country. A high percentage of its population is connected in one way or another with the production of these agricultural commodities.

Sugar has been recognized as one of the world's most traded commodities. In addition, the sugar exports accounts for more than one quarter of the world's production (Mahadevan 2009). For this internationally important economic sector, Thailand is one of the leading sugar producers and exporters (Piewthongngam, Suksawat, and Tenglolai 2007). It has attempted to catch up with more advanced sugar producing countries such as Brazil, South Africa and Australia (Higgins 2006) by trying to increase its level of production.

One approach to increase sugar output is to increase the productivity or the yield of the sugar cane farm without expanding the land for cane growing. A number of innovative techniques (e.g., dual-row cane farming, Polyorat and Tenglolai 2009) have been implemented for this purpose. An option to increase yield per hectare is to expand the land of growing sugar cane. As most of the arable land in Thailand is already used for crop growing, trying to increase the cane-growing land inevitably means persuading growers of other crops (eg., rubber, cassava, and eucalyptus) to switch to growing canes. For example, rice field may be used for growing canes, instead (Polyorat and Pangrit 2010).

Sugar and sugar cane industries in Thailand are composed of several related members in the value chain including the growing, harvesting and transport, milling, and marketing sectors (Everingham et al. 2002). In order to enhance the quantity of sugar production through the increase of cane farmland, sugar mills have to collaborate with their major suppliers or cane farmers (Suksawat, Piewthongngam and Tenglolai 2008) because, in Thailand, sugar canes are the primary raw material in sugar refinery industry (Piewthongngam, Suksawat, and Tenglolai 2007). Moreover, most of sugar canes in Thailand are grown by independent farmers, not by the sugar mills as in some other countries. Therefore, sugar mills cannot any longer limit their effort to their mill

boundaries but, instead, must rely on their cane farmers' contribution (Suksawat, Piewthongngam and Tenglolai 2008).

However, the mills' attempt is challenged by the limited amount of sugar canes supplied to sugar mills from farmers. One reason for this is that many farmers choose to grow other competitive crops. An interview with industry experts indicates that cassava, rubber, and eucalyptus are major competitive crops that have received attentions from farmers in the region.

Therefore, to remedy the situation of insufficient cane supply, this research seeks to examine sugar cane farmer's decision to grow sugar canes vs. other competitive crops. Although there could be numerous factors influencing the farmer's decision, a preliminary discussion with a major sugar mill in Thailand suggests four primary influencing factors: cane price, competitive crop price, sugar mill support, and community support.

## **Cane price and competitive crop price**

Crop price reflects a farmer's income. From the perspective of this study, cane price, therefore, represents the income a farmer will earn from growing canes while competitive crop price implies the income forgone or opportunity lost from growing canes. Income is an important factor for cane farmers ((Mahasuweerachai, Polyorat, and Piewthongngam 2010). In fact, income maximization is said to be a primary motivation for cane farmers (Mahedevan 2009).

## **Sugar mill support**

A cane farmer who is a sugar mill's member is provided with guaranteed market, loan services, productivity improvement program, market information and long-term planning. The offer of important production inputs (e.g., low-interest loan, chemical fertilizer, herbicide, purchasing agreement, and long term planning) is expected to minimize the farmer's risk in growing canes (Mahasuweerachai, Polyorat, and Piewthongngam 2010). Although the farmers are likely to prefer the high (vs. low) support from the mill, it remains unclear how important this factor is in comparison with the crop prices. Therefore, the present study attempts to examine the relative importance of mill support versus crop prices so that a sugar mill can decide the extent to which they should allocate their resources for this support.

## **Community support**

An individual's behavior could be subject to interpersonal influence (Bearden, Netemeyer and Teel 1989). For example, a cane farmer is found to ask for opinions from other farmers in their neighborhood when making a decision to adopt the dual-row farming method (Polyorat and Tenglolai 2009). As the majority could influence the behavior of an individual (Ladwein 2003), the present study attempts to examine if the decision to grow cane versus competitive crops is affected by whether the majority of farmers in their community grow or do not grow canes. Furthermore, in order to better understand the role of opinion leader (Solomon 2007) or a person whose belief, attitudes, and behaviors could influence what other people think, feel, and do, this study also examines if a community leader's growing canes would impact on a farmer's decision to grow canes.

Based on the roles of crop prices, mill supports, and interpersonal influences as discussed thus far, the present research endeavors to examine the following four hypotheses which are visually displayed in figure 1. The results from this study will yield insight regarding how a sugar mill can implement a marketing plan to more effectively persuade farmers to grow canes (cf. Polyorat 2009).

**H1:** Cane prices influence the decision to grow canes vs. competitive crop.

**H2:** Competitive crop prices influence the decision to grow canes vs. competitive crop.

**H3:** Mill supports influence the decision to grow canes vs. competitive crop.

**H4:** Community supports influences the decision to grow canes vs. competitive crop.

**Figure 1: Research Framework and Hypotheses**

## METHODOLOGY

A conjoint analysis, widely used in the marketing literature, is a form of an analysis of variance which allows the measurement of consumers' preferences for different attributes of a product or service (Carricano and Poujol 2008). The objective is to identify, for instance, the most importance attribute consumers (i.e., "farmers" in the present study) use for decision making when consumers have to tradeoff the more preferred attributes with the less preferred ones in various levels of each attribute. In the present study, the four independent variables (cane price, competitive crop price, mill support, and community support) represent the four product attributes. Cane price, competitive crop price, and mill support have three levels (low, medium, and high). The fourth independent variable- community support- also has three levels but is categorized as "most people in the community do not grow canes," "most people in the community grow canes," and "the community leader grows canes." In the current study, a conjoint analysis with fractional factorial design was used to avoid the respondents' fatigue.

Face-to-face interviews were conducted with 47 farmers. The sample size was comparable to what identified in the agricultural marketing literature (cf., Polyorat et al. 2009). The sample based on purposive sampling was drawn from Kalasin and its neighboring provinces because this is one of the major areas for sugar cane production in Thailand. Research participants were first greeted and provided with a basic description of the study. Next, they were asked a series of questions regarding their decision to grow sugar canes vs. competitive crops given different combinations of cane price, competitive crop price, mill support, and community support. Finally, participants were thanked and debriefed. They received a small gift as a compensation for their participation.

## RESULTS

To test the four hypotheses, a logistic regression model was run where cane price (low, medium, high), competitive crop price (low, medium, high), mill support (low, medium, high), and community (most people in the community do not grow canes, most people in the community grow canes, the community leader grows canes) are independent variables. The last category of each independent variable is used as the reference point. Crop decision (canes vs. competitive crops) is the dependent variable. The results are displayed in Table 1.

**Table 1: Logistic regression results**

DV: Decision to grow canes vs. competitive crops

Model Chi-Square = 287.66, df=60,  $p < .001$ , -2LL = 226.32, Nagelkerke's  $R^2 = .28$

The overall model is significant ( $\chi^2 = 287.66$ ,  $p < .001$ ). The results for the decision to grow canes versus competitive crops are provided as follows.

## Cane versus cassava

Regarding the decision to grow sugar cane versus cassava, cane prices are found to influence the decision to grow canes (vs. cassava), as hypothesized in H1. Specifically, farmers tend to choose to grow cassava (vs. cane) when cane prices are either low ( $b_{\text{low cane price}} = 1.89$ ,  $p < .001$ ) or medium ( $b_{\text{medium cane price}} = 0.57$ ,  $p < .01$ ) in comparison with high cane prices.

As hypothesized in H2, cassava prices are found to influence the decision to grow canes (vs. cassava). Specifically, farmers tend to choose to grow canes (vs. cassava) when cassava prices are either low ( $b_{\text{low cassava price}} = -1.54$ ,  $p < .001$ ) or medium ( $b_{\text{medium cassava price}} = -1.01$ ,  $p < .001$ ) in comparison with high cassava prices.

As hypothesized in H3, mill supports are found to influence the decision to grow canes (vs. cassava). Specifically, farmers tend to choose to grow cassava (vs. cane) when mill supports are low ( $b_{\text{low mill support}} = 0.83$ ,  $p < .001$ ) in comparison with high mill support. There is, however, no difference between medium and high mill supports ( $b_{\text{medium mill support}} = 0.33$ ,  $p > .1$ ).

Contrary to H4, community support is not found to influence the decision to grow canes (vs. cassava). There is no difference between “most people in the community do not grow canes” ( $b_{\text{most people in the community do not}}$

$\text{grow canes} = 0.41, p > .05$ ) in comparison with “the community leader grows canes. Similarly, There is no difference between “most people in the community grow canes” ( $b_{\text{most people in the community grow canes}} = 0.00, p > .1$ ) in comparison with “the community leader grows canes.”

## Cane versus rubber

Regarding the decision to grow sugar cane versus rubber, cane prices are found to influence the decision to grow canes (vs. rubber), as hypothesized in H1. Specifically, farmers tend to choose to grow rubber (vs. cane) when cane prices are either low ( $b_{\text{low cane price}} = 1.87, p < .001$ ) or medium ( $b_{\text{medium cane price}} = 0.63, p < .001$ ) in comparison with high cane prices.

As hypothesized in H2, rubber prices are found to influence the decision to grow canes (vs. rubber). Specifically, farmers tend to choose to grow canes (vs. rubber) when rubber prices are either low ( $b_{\text{low rubber price}} = -1.24, p < .001$ ) or medium ( $b_{\text{medium rubber price}} = -0.86, p < .001$ ) in comparison with high rubber prices.

As hypothesized in H3, mill supports are found to influence the decision to grow canes (vs. rubber). Specifically, farmers tend to choose to grow rubber (vs. cane) when mill supports are low ( $b_{\text{low mill support}} = 0.63, p < .01$ ) in comparison with high mill support. There is, however, no difference between medium and high mill supports ( $b_{\text{medium mill support}} = 0.27, p > .1$ ).

Contrary to H4, community support is not found to influence the decision to grow canes (vs. rubber). There is no difference between “most people in the community do not grow canes” ( $b_{\text{most people in the community do not grow canes}} = 0.43, p > .05$ ) in comparison with “the community leader grows canes. Similarly, There is no difference between “most people in the community grow canes” ( $b_{\text{most people in the community grow canes}} = -0.03, p > .1$ ) in comparison with “the community leader grows canes.”

## Cane versus eucalyptus

Regarding the decision to grow sugar cane versus eucalyptus, cane prices are found to influence the decision to grow canes (vs. eucalyptus), as hypothesized in H1. Specifically, farmers tend to choose to grow eucalyptus (vs. cane) when cane prices are either low ( $b_{\text{low cane price}} = 1.94, p < .001$ ) or medium ( $b_{\text{medium cane price}} = 0.77, p < .05$ ) in comparison with high cane prices.

As hypothesized in H2, eucalyptus prices are found to influence the decision to grow canes (vs. eucalyptus). Specifically, farmers tend to choose to grow canes (vs. eucalyptus) when eucalyptus prices are either low ( $b_{\text{low eucalyptus price}} = -2.46, p < .001$ ) or medium ( $b_{\text{medium eucalyptus price}} = -0.97, p < .001$ ) in comparison with high eucalyptus prices.

As hypothesized in H3, mill supports are found to influence the decision to grow canes (vs. eucalyptus). Specifically, farmers tend to choose to grow eucalyptus (vs. cane) when mill supports are low ( $b_{\text{low mill support}} = 0.74, p < .05$ ) in comparison with high mill support. There is, however, no difference between medium and high mill supports ( $b_{\text{medium mill support}} = 0.02, p > .1$ ).

Contrary to H4, community support is not found to influence the decision to grow canes (vs. eucalyptus). There is no difference between “most people in the community do not grow canes” ( $b_{\text{most people in the community do not grow canes}} = -0.22, p > .1$ ) in comparison with “the community leader grows canes. Similarly, There is no difference between “most people in the community grow canes” ( $b_{\text{most people in the community grow canes}} = -0.34, p > .1$ ) in comparison with “the community leader grows canes.”

## Additional analysis

As there are some farmers who appear to stick to either canes or a particular competitive crop no matter what levels of cane price, competitive crop price, mill support, or community support are, the logistic regression model is rerun, but this time with these farmers removed from the analysis. The results closely mirror those in the first model where all data are included both in terms of direction and significance of influence, suggesting the robustness of the findings. The amount of variance explained or  $R^2$ , however, is higher in the second model

which appears reasonable. The first model is kept for generalizability sake as it includes higher number of farmers.

## DISCUSSIONS

### Summary

The study results reveal that cane price, rice price, and mill supports significantly influence the decision to grow canes (vs. competitive crops) while community supports do not. The higher cane price and the lower competitive crop price attract farmers to grow canes (as opposed to competitive crops). Similarly, the higher level of mill supports also encourages farmers to grow canes (as opposed to competitive crops). Contrary to expectation, however, community does not have a significant influence on this decision.

### Research Implications

Based on the beta coefficients, both cane prices and competitive crop prices have stronger impact than mill supports. Therefore, the crop prices are undoubtedly the most critical factors farmers take into consideration in their selection of crop choices. However, the crop prices are often not the factor under the control of sugar mills. In fact, sugar and sugar cane are closely influenced government regulation and intervention (Mahadevan 2009).

As a result, mills may need to turn to ‘support and service’ as strategic tools to encourage farmers to grow canes instead of other competitive crops. In fact, the results from the conjoint analysis implies the compensatory model of decision making (Carricano and Poujol 2008) where a drawback of one attribute can be compensated or offset by the good point of another attribute of the given product. If this is the case, as sugar mills lack control over market prices of sugar canes and competitive crops, sugar mills, therefore should resort to relationship marketing with farmers. That is, mills may focus on providing several services or supports to each farmer, interacting with each farmer on a regular basis, soliciting farmer’s participation, and working on long-term objectives (Michon 2006). However, as the study results indicate no significant impact between the medium vs. high level of relationships, a mill, therefore, may not have to devote all of their resources for this support, but rather make sure that at least some level of service is achieved.

### Limitations and Avenues for Future Research

The current study has a number of limitations which suggest directions for future research. The present study collects data from only one region of Thailand. Future research may replicate the present study in other parts of the country where major sugar cane production is conducted such as the central provinces including Supanburi and Kanjanaburi. This revalidation will enhance the understanding of farmer’s crop switching behaviors in more diverse geographical locations. In addition, as the results of this study were drawn from survey data alone, future research should employ additional research methods such as in-depth interviews and focused-group interviews in order to gain a better understanding of the relative influences of each independent variables (cf., Polyorat 2011).

# THE RESIDENT CHINESE TOURISM MARKET IN SOUTH AFRICA CAN BE A SUSTAINABLE MARKET

**Marius Potgieter and Fei Yang**  
**Tshwane University of Technology, South Africa**

## ABSTRACT

*South Africa's tourism entrepreneurs should cogitate on the uniqueness and opportunities of the resident Chinese market. Empirical research was conducted to obtain a description and to determine which tourism related activities this market already experienced, and also to determine their likeliness of partaking in selected activities. A sample of 100 Chinese in Pretoria was invited to participate. Almost 50% of the respondents have been in South Africa for 6 years or longer and most already experienced sightseeing (91.8%) whilst visiting coastal destinations is their most likely future tourism activity (96.9%). Further research is needed so that entrepreneurs can customize their offerings for this emerging market.*

## INTRODUCTION

The Chinese nation is a supra-ethnic concept and Chinese, for the purpose of this paper, are regarded as those speaking the Chinese language. When reference is made to Chinese it is inclusive of all Chinese staying in South Africa for an extended period of time. The number of Chinese residing in South Africa is increasing after the establishment of diplomatic ties between South Africa and China. Chinese maintain their lifestyle and still practice many of their traditional customs. The Chinese market is unique; because they have their own traditions, customs, language, and beliefs.

Chinese in South Africa offers opportunities for tourism entrepreneurs and this market is an emerging market which can be sustainable – but: entering this market is conditional. Entrepreneurs ought to ensure that they are knowledgeable about this market because “The Chinese tourism industry will change the West’s traditional models for handling tourists” (Roy Graff quoted by Handle Chinese tourists with care, 2008). Added to this, Wang *et al.* (2010) stated that an “in-depth understanding of its culture and people” is needed. This call for a significant reconsideration of the business practices and tourism offerings presented to this market. Published material and electronic databases failed to yield research information on the resident Chinese tourism market in South Africa and it is undetermined whether South African entrepreneurs are cognizant about what this market entails. Research is needed to determine if it is necessary to develop the market, or maybe products should be development, or even business diversification should be considered, as well as being able to contrast associated costs and risks against the growth potential and attractiveness of this market.

Dealing with an emerging market calls not only for information but for knowledge. The Chinese market in South Africa is vast and cannot be covered with one single research study or paper and this paper sets out to obtain insight on the following:

- A description of the Chinese market in Pretoria (their gender, age, and duration of stay in South Africa).
- The tourism-related activities already experienced by the resident Chinese people in Pretoria.
- The likeliness that Chinese tourists will participate in various activities in future.

This paper consists of four sections. *Firstly*, a review of literature relevant to Chinese people and tourism; *secondly*, a presentation of the research methodology followed and the data analysis techniques used for the purpose of this paper. *Thirdly*, the findings are presented and the paper is brought to closure with *lastly*, a

conclusion which includes a discussion of the main inferences, the theoretical and managerial implications, and recommendations emanating from this study.

## LITERATURE REVIEW

The political changes in South Africa sparked international interest and the vision of the 1996 White Paper on the Development and Promotion of Tourism in South Africa was "...to develop the tourism sector as a national priority in a sustainable and acceptable manner" (DEAT, 2002:3). The South African Government realized the importance of developing tourism in a sustainable and responsible way and published the National Responsible Tourism Guidelines for South Africa in 2002. Tourism is an important contributor to the economy of South Africa and the National Department of Tourism "drafted a national tourism sector strategy to accelerate the responsible growth of the tourism industry from 2010 to 2015" (National tourism sector strategy announced, 2010:32).

The Republic of China was also subjected to major reformatations. An open-door policy and economic reform was adopted by the Chinese government in 1987 and they obtained accession to the United Nations World Tourism Organization (UNWTO) in 2001 (Zhang *et al.*, 2002). South Africa obtained Authorized Destination Status (ADS) from the China National Tourism Administration (CNTA) in 2004 enabling South Africa to host Chinese tourists in groups on specified itineraries (Rogers, 2008). The arrival figures of Chinese in South Africa to increase by 12.4% from 2008 to 2009 (SAT, 2010a:10). The value of the Chinese tourism market in South Africa was ZAR763.5 million in 2008 and it is expected to grow substantially.

China incorporated tourism into their national plan for social and economic development in 1986 (Zang *et al.*, 2000). A total of 45.8 million Chinese travelled internationally during 2008 (Annual Report of China Outbound..., 2010) and the UNWTO predicts that 100 million outbound Chinese tourists will be achieved by 2020 (UNWTO, 2001:12). China became the world's second largest economy in 2008 and services (incorporating tourism) contributed 40.1% to their GDP (SAT, 2010b:8). China is South Africa's biggest export destination (R27,6 billion in 2008) and imports partner (R35,24 billion in 2008) (Pass the chopsticks: a look..., 2010:65) with a total trade worth R119,7 billion in 2009 (Pres Zuma talks trade in..., 2010). Tourism should "be seen and protected as perhaps one of the world's premier export products" because if tourism is properly cared for, then "it is a sustainable and renewable recourse" (Tourism is an export, 2010).

Chinese tourists are selective about their destinations and gender, occupation, education, age, and family structure influence their behavior patterns and attraction preferences (Huang *et al.*, 2000). Symbolic images are also extremely important to these tourists (Wang *et al.*, 2010). Furthermore, their customer satisfaction and loyalty are influenced by their cultural values (Hoare *et al.*, 2008). Added to this is an understanding of their travel motivation and quest for memorable experiences (Huang *et al.*, 2009).

Chinese tourists indicated that visiting friends and relatives, and dining as the most important activities whilst outdoor sport were perceived as the least important activities (Law *et al.*, (2004). The results of the Brand Tracking Survey of November 2006 conducted by South Africa Tourism (SAT) indicates that the number one reason why Chinese tourists chose South Africa was to experience a different culture (67%) and this is followed by to relax (61%). Another survey conducted confirmed that sightseeing remained the biggest purpose (Research and Markets: New report..., 2007). The results of the Departure Survey statistics of SAT (SAT, 2010b:57) indicates that scenic beauty is ranked as the number one reason for satisfaction among Chinese visiting South Africa for the period 2004 – 2008.

Entrepreneurs are encouraged by Law *et al.* (2004) to fully understand their target market's tourism behavior because this will lead to effective resource management and marketing plans. However, sustainability is only possible if there is commitment from public and private sector organizations (Henderson, 2010). Therefore, sustainability can only be realized if it is a collective effort.

## RESEARCH METHODOLOGY

Empirical descriptive research was undertaken and a quantitative survey was conducted. The research population was Chinese residing in Pretoria, South Africa for an extended period of time and non-probability convenience sampling method was followed. A Chinese fieldworker residing in Pretoria had access to the sample members and the sample size decided upon was 100 Chinese people and the realized sample size was 97%. The survey instrument used was a self-completing structured questionnaire. The data collection process was administered by the fieldworker and completed questionnaires were coded into numerical representations.

The numerical representations were captured onto a datasheet and the information was validated and no data-capturing errors were detected. Descriptive statistics was obtained for every variable in order to understand the data and to be able to achieve the stated objectives. A cross analysis was also performed on linked and test variables to determine whether they compare. A uni-variate descriptive analysis was performed on all the original variables to obtain frequencies, percentages, cumulative frequencies, and also cumulative percentages. The following inferential statistics were used: Cross-tabulations and Chi-Square based measures of association (if in some cases there were expected values of less than 5 in the cell Exact p-values were then calculated).

Following is a presentation of the findings that emanated from the data-analysis.

## FINDINGS

The findings of this study will now be dealt with in the following order: a description of the respondents and this is followed by a presentation of the tourism-related activities the resident Chinese people have already participated in and also the likeliness of them partaking in various activities in future.

### Participant description

Three descriptors were used to obtain an impression of the Chinese people residing in Pretoria and these descriptors are: gender; age; and lastly, how long the respondents have been staying in South Africa at the time of the survey and the results obtained are illustrated in Figure 1. This information was also used for cross-comparison purposes.

**Figure 1: Participant description (in %)**

Figure 1A illustrates that more males ( $n=56$ ) than females ( $n=41$ ) participated in this survey and this does not imply that there are more Chinese males residing in Pretoria than females. Almost two thirds (63.9%) of the Chinese people residing in Pretoria are between 21 and 30 years of age (Figure 1B) and this is followed by

those who are between the ages of 41 to 50 (16.5%). Almost half of the resident Chinese people (48.5%) have been in South Africa for 6 years or longer (Figure 1C) and this is followed by those who have been in South Africa for 3 to 6 years (40.2%). A significant finding is that Chinese people tend to reside in South Africa for an extended period of time seeing that 88.7% (48.5+40.2) have been residing in South Africa for three years and longer. This study was conducted in Pretoria and the findings regarding the duration as presented does not imply that these Chinese people have been residing in Pretoria for the entire time of the durations as indicated. It could be that some of them located in or at other places in South Africa and relocated to Pretoria, but they were residents in Pretoria at the time of the survey.

Cross-comparisons between gender, age, and duration in South Africa revealed the following:

- *Gender*: most of the respondents in both cases (males – 71.4% and females – 53.7%) are between the ages of 21 and 30 years old. A large number of females have been in South Africa for 6 years and longer (65.9%) whilst males have been in South Africa for between 3 and 6 years (51.8%). Only 35.7% of the males indicated that they have been in South Africa for 6 years and longer.
- *Age*: the gender comparison has been dealt with and it is the 21 to 30 years age group who is dominating the duration of stay in South Africa (less than one year: 3.2%; 1–3 years: 9.7%; 3–6 years: 53.2%; more than 6 years: 33.9%).
- *Duration in South Africa*: the results obtained are the same as discussed under Gender and Age and this confirms that there were no data capturing errors. An assumption is made that the respondents up to 20 years old and those who are 41 years and older are permanent resident permit holders or South Africa citizens and that those who are between 21 and 30 years of age is students with a study permit residing in South Africa.

## Activities experienced

A list of nine tourism-related activities was provided and respondents were requested to indicate the activities they have already participated in. There was no restriction and respondents could mark as many as applicable. A total of 401 responses were received from the 97 respondents and these activities are listed in sequence from most to least participated in: Sightseeing (by 92.8% of the respondents); Ecotourism-related activities (88.7%); Heritage & Culture (86.6%); Visiting Friends and Relatives (83.5%); Wine Tourism (21.6%); Adventure Tourism (19.6%); Golfing and Gambling (8.2% in both cases); and the lowest scored activity was Other (by 4.1%).

## Likelihood of activity participation

Respondents were provided with six tourism-related activities and a Likert scale was used to establish their likelihood of partaking in these activities. The results obtained are indicated in Table 1.

**Table 1: Likelihood of participation (in %)**

Activity	Definitely	Likely	Unsure	Probably Not	Definitely Not
National Parks	<b>52.6%</b>	37.1%	7.2%	3.1%	
Botanical Gardens	8.2%	39.2%	<b>43.3%</b>	9.3%	
Coastal Regions	<b>90.7%</b>	6.2%	3.1%		
Museums	7.2%	25.8%	<b>37.1%</b>	27.8%	2.1%
City Activities	29.9%	<b>33.0%</b>	23.7%	7.2%	6.2%
Socializing	34.0%	<b>43.3%</b>	13.4%	9.3%	

The priority order of tourism-related activities that would appeal to resident Chinese tourists, as indicated in Table 1, are as following: firstly is Coastal Regions (Definitely: 90.7%); secondly is National Parks (52.6%); and this is followed by Socializing (Likely: 43.3%) and City Activities (33.0%) whilst the biggest uncertainty is visiting Museums (37.1%) and lastly Botanical Gardens (43.3%). What is interesting to note is that the priority order changes when the results of Definitely and Likely are combined, the order then is: Coastal

Regions (96.9%); National Parks (89.7%); Socializing (77.3%); City Activities (62.9%); Botanical Gardens (47.4%); and lastly is Museums (33.0%) – Museums and Botanical Gardens change places.

Cross-comparisons between gender, age, and duration in South Africa was performed and Chi-Square based measures of association (if in some cases there were expected values of less than 5 in the cell Exact p-values were then calculated). All p-values are >0.05 and will not be presented unless otherwise indicated. The results are presented in the following order: gender, age, and lastly duration of residence in South Africa in terms of the six tourism-related activities indicated in Table 1.

- *Gender:* the results obtained indicate that for –
  - National Parks – both males (58.8%) and females (41.2%) indicated that they would Definitely (52.6% of the total) visit these parks and this is followed by Likely.
  - Botanical Gardens – more males (59.5%) are Unsure than females (40.5%) that they would visit these gardens whilst 43.9% of the females will Likely visit these gardens.
  - Coastal Areas – both males (56.8%) and females (43.2%) indicated that they would Definitely (90.7% of the total) visit the coastal areas.
  - Museums – both males (52.8%) and females (47.2%) are Unsure (37.1% of the total) as to whether they would visit museums.
  - City Activities – males are Likely (68.8%) to partake in these activities whilst females will Definitely (69.0%). The Chi-Square p-value is 0.005 and this is supported by the Fisher's Exact Test and this means that there is a statistically significant difference between males and females.
  - Socialising – both males (57.1%) and females (42.9%) are Likely (43.3% of the total) to partake in this activity.
- *Age:* the results obtained indicate that for –
  - National Parks – the age group of 21 to 30 indicated that they will Definitely (50.0%) and are also Likely (37.1%) to visit these parks whilst in South Africa. The results further indicate that older people are more inclined to visit the National Parks.
  - Botanical Gardens – the age group of 21 to 30 achieved the highest score for Unsure (69.0%) as to whether they will visit botanical gardens although those in the 41 to 60 age group are more likely to visit these gardens. The Chi Square p-value is 0.015 and this indicates that there is a statistically significant difference.
  - Coastal Areas – the age group 21 to 30 once again recorded the highest scores and will Definitely (93.5%) visit the coastal regions of South Africa. The Chi Square p-value is 0.00 and this is supported by the Fisher's Exact Test p-value=0.004 and this indicates that there is a statistically significant difference.
  - Museums – Unsure (37.1% of the total) and Probably Not (27.8% of the total) achieved the highest scores and in both cases it was within the age group of 21 to 30 (63.9% and 70.4% respectively).
  - City Activities – Likely (33.0% of the total) and Definitely (29.9% of the total) achieved the highest scores and in both cases it was within the 21 to 30 age group (71.9% and 82.8% respectively) and this is followed by Unsure (23.7% of the total).
  - Socializing – Likely (43.3% of the total) and Definitely (34.0% of the total) achieved the highest scores and in both cases it was within the 21 to 30 years age group (47.6% and 84.8% respectively) and this is followed by only 13.4% of the total who indicated Unsure.
- *Duration of residence:* the results obtained indicate that for –
  - National Parks – those who will Definitely (52.6% of the total) visit these parks are resident Chinese who have been in South Africa for 6 years and longer (52.9%) whilst those who have resided in South Africa for 3 to 6 years are Likely (46.2%) to visit these parks.
  - Botanical Gardens – Unsure (43.3% of the total) and Likely (39.2% of the total) achieved the highest scores and in both cases it was within the 6 years and longer duration group (54.8% and 44.7% respectively) and this group is in both cases followed by those in the 3 to 6 years duration group (Unsure: 40.5% and Likely: 34.2%)..
  - Coastal Areas – all four groups of duration indicated that they will Definitely (90.7% of the total) visit the coastal regions and the highest Definitely score was obtained amongst those who have been in South Africa for 6 years and longer (46.6%) and this is closely followed by those in the 3 to 6 years (40.9%).

- Museums – the sample total who indicated Unsure is 37.1% and of these 47.2% are in the 6 years and longer group and the same applies to those who indicated Probably Not (55.6%). Those in the 3 to 6 years group scored Unsure at 41.0%.
- City Activities – those who would partake in this type of activity are those who have been in South Africa for 6 years and longer seeing that 34.0% indicated Definitely and 31.9% Likely and they are closely followed by the 3 to 6 years duration group (30.8% in both cases). Likely (33.0% of the total) is closely followed by Definitely (29.9% of the total) as likeliness that the respondents will partake in this activity.
- Socializing – the highest scoring occurred in the 6 years and longer group and 44.7% was equally indicated for Definitely (34.0% of the total) and Likely (43.3% of the total) and they are once again closely followed by those in the 3 to 6 years group. The Chi Square p-value=0.057, which is close to a statistically significant difference.

## CONCLUSION

The results obtained indicate that Chinese people residing in Pretoria are mostly young (between the ages of 21 to 30) and have been in South Africa for 6 years and longer. This could be ascribed to the large number of tertiary institutions in Pretoria. These residents prefer sightseeing, ecotourism, and heritage and cultural activities and this are in concurrence with the findings of previous research (Chinese tourism targets at sustainable..., 2001; Wang *et al.*, 2004; Research and Markets: New report..., 2007; Hoare *et al.*, 2008; McCartney, 2008). Furthermore, they are not keen on golfing, gambling and adventure activities and this is in concurrence with the findings of Law *et al.* (2004) and that of Sheng *et al.* (2008) and the inference is made that there was no change in Chinese people's tourism activity preferences between 2004 and 2010. The results obtained indicate that resident Chinese people would prefer tourism activities that include coastal areas, national parks, and socializing but that they are not likely to consider tourism offerings that include visits to museums and botanical gardens. These findings are in concurrence with the results of previous studies and this indicates that there has not been a change in Chinese people's preferences. Socializing and city activities also feature as potential preferences, especially amongst females, and this could concur with meeting people from other cultures, shopping, and also dining out to experience local cuisine. These findings are in concurrence with previous studies (Law *et al.*, 2004; Hoare *et al.*, 2008; Liu *et al.*, 2008; Huang *et al.*, 2009) and preferences have not changed since 2004. It is also evident from the results that the likeliness of visiting national parks decline as the duration of residence increases and this could be ascribed to the fact that newly arrived residents tend to visit these parks within the first three years of being in South Africa whilst those who have been residents for 6 years and longer tend to revisit national parks. The inference is also made that those who have been in South Africa for 6 years and longer are more inclined to visit the coastal areas of South Africa and it could be ascribed to the fact that they already visited attractions located closer to their point of residence and that they have overcome some of their impediments and fears of travelling in a foreign country.

The resident Chinese tourism market in South Africa is emerging and could be developed into a lucrative market for South African entrepreneurs if they are knowledgeable about this unique market. The research conducted for the purpose of this study was pioneering and should be supplemented with extended research that includes other economic centra as well as being expanded so that a complete impression of the resident Chinese market can be developed for the benefit of entrepreneurs in the tourism industry instead of betting on a trial-and-error experiment. For example, should botanical gardens and museums want to attract more resident Chinese people then these attractions should develop their offerings in accordance with the preferences of the market segment, such interactivity, branding, and image. The same applies to developing tourism offerings for this market – packages and offerings should include activities that coincide with the activities resident Chinese people indicated they likely would partake in.

The importance of knowledge, not just information, about the Chinese market cannot be accentuated enough and this supported by Wang *et al.* (2010) who stated: An in-depth understanding of its culture and people is imperative for Western companies to do business in China or aim at Chinese as its target market.”

# A LEGAL APPROACH TO HUMAN TRAFFICKING IN SOUTH AFRICA

**Louise du Preez and Antoinette Marais**  
**Tshwane University of Technology, South Africa**

## ABSTRACT

*Human Trafficking is an international phenomenon, with more people currently enslaved than in any other time in the history of mankind. All countries should implement legislation preventing and eradicating the trade in humans. The aim of this paper is to give a background on human trafficking with reference to the different forms of trafficking and the factors giving rise to this phenomenon. The different Trafficking Protocols, addressing human trafficking at international level, are also discussed. The paper also investigates the present position in South Africa. A critical discussion concerning current trafficking legislation and the proposed trafficking-specific legislation follows, with reference to the effectiveness of existing and proposed legislation, the prevention of human trafficking, prosecution of traffickers, protection of trafficking victims and their re-integration into society. In conclusion the authors will make recommendations with reference to the effective implementation of the proposed legislation.*

## INTRODUCTION

Human trafficking is a modern form of human slavery, where supply meets demand. Although human trafficking is not a new concept, in the context of globalization it has reached shockingly high levels. Experts agree that human trafficking amounts to nothing more than organized crime with an estimated 600 000 to 800 000 humans being trafficked on an annual basis, with a total market value of approximately \$32 million. Profits for the human trafficking business are estimated to be \$7-10 billion annually. Of the number of trafficked individuals, 80% are presumed to be female. A shocking statistic is that 50% of all trafficked individuals are minors. The International Labour Organization estimates that worldwide there are approximately 12.3 million victims (adults and children) of human trafficking at any given time.

Although human trafficking is considered to be an international crime, there was no internationally accepted definition of human trafficking until 2000, when the Palermo Protocol (to be discussed in detail later) was adopted. This Protocol defines human trafficking as follows:

*'... the recruitment, transportation, transfer, harboring, or receipt of persons, by means of threat or force or other forms of coercion, of abduction, of fraud, of deception, of abuse of power or a position of vulnerability or of giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation. Exploitation shall include, at a minimum, the exploitation of the prostitution of others or other forms of exploitation, forced labor or services or practices similar to slavery, servitude or the removal of organs'.*

From this definition it becomes clear that the common denominator present in all human trafficking incidents is the use of force, fraud, or coercion to exploit a person for profit. The definition indicates that trafficking usually takes place in three different stages, namely means (partial deception, full deception, or abduction), mobilization (transport, or transfer of the victim from one place to another whether inside an area or cross-border) and exploitation (where the trafficker transports and sells the victim for personal gain). All three elements must be present and connected to each other before the conduct constitutes to human trafficking.

The Trafficking in Persons Report (TIP-Report) of 2010, brought out by the Department of State of the United States of America, states that human trafficking is likely to extend to every country in the world. For this reason, it is imperative that the international community combine efforts to combat human trafficking. To achieve the total eradication of trafficking in persons all international role players must implement legislation and policies that will make it impossible for traffickers to continue with this practice.

## **FORMS OF HUMAN TRAFFICKING**

It is very difficult to clearly define the different forms of human trafficking, as the different forms more often than not, tend to overlap to a large extent. According to the United Nations, the most common forms of human trafficking are sexual exploitation of women and girls, and to a lesser degree, even young boys. Forced labour in the agricultural-, manufacturing- and construction industries is also rife. Other forms of human trafficking include begging, domestic servitude, acting as a drug mule, organ harvesting and debt bondage.

People often tend to think that the main purpose of human trafficking, on the part of the trafficker, is money and sex. In many instances this is not the case. The main purpose of the trafficker in the abuse of trafficking victims is power and control and the need to humiliate, punish and exploit the victims.

## **FACTORS INFLUENCING HUMAN TRAFFICKING**

Human trafficking only exists because of the fact that a supply and a demand exists. If no demand for trade in humans exists, there will be no purpose in supplying humans. Factors contributing to human trafficking exist on both the supply and demand side of the equation. 'Push'-factors are those factors that influence the supply side of trade in persons, whilst factors contributing to the demand in human beings are called 'pull'-factors.

### **'Push'-Factors**

Various factors influence the supply of humans in human trafficking, such as poverty, gender inequality, poor education and political instability. People living in extreme circumstances of poverty run a far greater risk of becoming a victim of human trafficking, as they are often desperate to improve their living conditions and will therefore believe the false promises that the traffickers make to them. Many people living in poverty in rural areas hear about the so-called riches in urban areas. When a trafficker approaches such a person, with the promise of work in an urban area, they believe this person, in an effort to improve their living standard and often the living standard of their families as well. Traffickers also abuse the person's desire to be transported to an urban area, by offering them transport, often at a price and then abduct the victim to supply a specific demand. In some cases, parents sell their children to traffickers in order to make money.

In many countries men still regard women and female children as inferior members of society, without a voice equal to those of their male counterparts. Young girls are forced into arranged marriages with much older men. Men often have a sense of entitlement concerning sex and sexual activity, whereby the men do not think that exploiting a woman or young girl for sex is wrong. They think that it is what women are there for and in their specific culture such exploitation is acceptable.

A lack of quality education also plays a major role in the supply of humans in the human trade industry. People living in an area or country where quality education is not available, are misled by human traffickers into believing that they are sending their child to a place where the child will receive an education that will improve the child's life. In these cases the parents allow their child to go with the trafficker, because they were deceived. A lack of education on human trafficking also makes it difficult for the victims of trafficking to identify the risks involved in trusting a person. The victims then allow this person a certain amount of control over their lives. The fact that many recruiters acting on behalf of traffickers are acquaintances of the victims makes it easier for the victims to be misled.

Political instability in a country (such as the current situation in countries like Zimbabwe, Iraq and Afghanistan) leads to migration of the citizens of that country to safer countries, often neighbouring countries, where better opportunities exist. The people who flee from the political instability in their country in many cases do not have the necessary travel documents to legally enter the country they are traveling to. This puts these people at a higher risk of falling victim to human trafficking, as they rely on smugglers to illegally smuggle them over the border into the new country. The smugglers can then easily abduct them and sell them as victims of human trade. It is important to note that not all instances of smuggling amount to human trafficking. Only where the smuggled person is exploited at some stage, does the smuggling amount to trafficking.

## **‘Pull’-factors**

One of the consequences of the economic recession is a demand for cheap labour. Traffickers provide these low-skilled and cheap labourers to the industries that require them, most notably brick kiln workers, charcoal- and gold miners and domestic servants. These labourers work in appalling conditions for very long hours, with very little or no pay. Many of these labourers are bound to their employers through debt bondage, where they have to work off a debt which in reality never gets paid in full because of the low wages they earn.

Sex tourism is also a major ‘pull’-factor, where victims of human trafficking are sold to work as prostitutes in brothels, with very little or no pay. Often the only compensation these victims receive is food and lodging, and sometimes drugs, which binds them to their abusers. Young children become the victims of sexual exploitation, because of the perception that young children are HIV-free. It is therefore safer for a person to have sexual intercourse with a young child, as the risk of being infected with a sexually transmitted disease is much slimmer.

Many couples who cannot conceive naturally and who are not in a position to adopt a baby through legal means are willing to buy babies on the ‘black market’. This makes the trafficking of babies a lucrative business for human traffickers to supply babies to the adoption trade.

A demand for organs and body parts for transplants and cultural medicinal purposes leads to the trafficking of persons to harvest their organs and body parts. These organs are then sold to people who require an organ transplant, where organs are not available through legal channels.

Countries in the midst of armed conflict make use of child soldiers to participate in the conflict. As Ali, a former child soldier who fought with the rebels in Chad, was quoted in the TIP report stated: *‘If you see a young person wearing military clothes, carrying a gun, these are children who have lost their lives. Fighting is the last thing that a child should be doing’*.

## **INTERNATIONAL POSITION ON HUMAN TRAFFICKING**

In an effort to prevent the international phenomenon of human trafficking, the United Nations adopted two protocols in Palermo, Italy in 2000, dealing with the trade in human beings. The first protocol (which will be focused on in this paper) is the Protocol to Prevent, Suppress and Punish Trafficking in Persons, especially Women and Children, referred to as the Palermo- or Trafficking Protocol. This Protocol came into force on 25 December 2003. By the end of 2009, the Trafficking Protocol had 117 signatories and 133 countries adopted this Protocol. The other protocol adopted was the Protocol against the Smuggling of Migrants by Land, Sea and Air.

The Palermo Protocol obliges ratifying states to prevent and combat human trafficking, and to protect and assist the victims of trafficking.

The Palermo Protocol was the first document that formally defined human trafficking (as indicated above). The Palermo Protocol further described the rights of victims of human trafficking. These rights include appropriate housing, medical-, psychological and material assistance, employment- educational and training opportunities. In addition to these rights there are also counseling and information concerning their legal rights in a language that they understand as well as due compensation for any damages that they suffered as a result of the

trafficking. If the victim of human trafficking is a child, that child is entitled to even more rights, insofar as the child's best interests need to be considered at all times in providing assistance and protection.

In the United Nations Recommended Principles and Guidelines on Human Rights and Human Trafficking, the United Nations lays out certain principles for countries dealing with victims of human trafficking, pertaining to their rights. The country where the victims are found must not arrest or detain the victims of trafficking for illegal entry into the country nor for any other illegal conduct the victims may have made themselves guilty of as a direct result of being a victim of human trafficking. The victims need to be protected against further exploitation after being rescued, irrespective of their willingness to assist in legal proceedings against their traffickers. If the victim is willing to participate in legal proceedings against the traffickers, then the victim must be treated with dignity during these proceedings.

The Palermo Protocol requires of all ratifying states to criminalize human trafficking, investigate and prosecute human traffickers and to undertake border control measures. The Protocol further obliges ratifying countries to introduce trafficking-specific legislation to deal with human trafficking cases in that specific country.

## **SOUTH AFRICAN POSITION**

Due to South Africa's position in Africa, both geographically and as Africa's economic powerhouse, the country plays a major role in human trafficking. South Africa serves as a source-, transit- and destination country. Human trafficking does not only apply to cross-border trafficking, but to internal human trafficking as well.

A large portion of the South African population lives in poverty and suffers from a high rate of unemployment which leads to labour migration. This means one or more of the members of a family leave the home in search of employment. Labour migration creates the opportunity for traffickers to coerce people into believing that they are taken away from their home to be gainfully employed elsewhere. Instead they end up as forced labourers in various industries, sex workers or drug mules within the South African borders, or in other countries. The family allowed the person to leave the family home because of their belief that they will benefit in some way from the transaction, therefore giving consent to the act of taking the person from the family home. The persons lured away with the promise of employment elsewhere are often young children.

A lack of border control on land, air and at sea makes South Africa the ideal country in Africa to act as a transit country. South Africa is a transit hub for countries in Central Africa as well as Asia and even Europe. Direct flights exist between South Africa and many European and Asian countries, making it easier not to be caught by the authorities. From the Western Cape, it is also possible to leave the country by sea, without being detected.

As a destination country South Africa is the end of the road for many victims of human trafficking from neighbouring countries, such as Lesotho, Mozambique and Swaziland. These people, mostly women and young children, are brought to South Africa to work in the sex industry or as low cost workers in various other industries, for example the textile industry. South Africa is also a destination country for people trafficked from the rest of Africa, Asia, the Middle East and some European countries, such as Russia.

From 2005 to 2008 South Africa was placed on the TIP Report Tier 2 Watch List. This in essence meant that the United States Department of State recognised that the South African government was making significant efforts to eliminate human trafficking in the country, but did not fully comply with the minimum standards required to do so. In the 2007 TIP Report the US Department of State reported that the South African government did not provide information on the measures they took to protect the victims of human trafficking. Instead the state continued to deport and/or prosecute foreign victims without providing the appropriate protective services. South Africa was removed from the Watch List in 2009 in recognition of the government's efforts to bring itself in line with the minimum standards required to fight the battle against trade in persons, and the commitments the state made to take additional steps in 2010.

Reliable statistics on human trafficking in South Africa are sketchy and no official statistics on trade in persons for South Africa exist.

## **Existing Coordinated Institutional Responses to Trafficking**

The South African government established the Human Trafficking Desk within the Organised Crime Unit of the South African Police Service (SAPS) in 2003. This Desk was established to co-ordinate all trafficking-in-persons related issues in the country, advise the Organised Crime Unit on human trafficking matters and provide training on human trafficking to members of the Organised Crime Unit.

As part of the fight against human trafficking in South Africa, the government launched the Tsireledzani Programme in March 2009. This is the state's counter-trafficking programme driven by the National Prosecuting Authority (NPA). Tsireledzani comprises of provincial task teams that need to investigate and implement measures to combat human trafficking on a provincial level, in conjunction with NGO's and faith-based organisations. Provincial task teams have already been established in Kwa-Zulu Natal, Limpopo and Mpumalanga, with several more planned in the near future. Tsireledzani also works closely together with key international role players in human trafficking, such as the International Labour Organisation (ILO), the United Nations Office on Drugs and Crime, UN Children's Fund and the Human Science Research Council.

## **Current South African Legislation dealing with Human Trafficking**

All ratifying countries to the Palermo Protocol are expected to introduce trafficking-specific legislation. South Africa ratified the protocol and is therefore obliged to implement such legislation. At present, the country has not yet promulgated the necessary legislation specifically dealing with human trafficking. Currently, a person accused of a trafficking-related crime, may be prosecuted for various other charges. In terms of the common law, a suspected perpetrator of human trafficking can be charged with abduction, kidnapping, rape or sexual assault.

Another option is to charge the suspected perpetrator in terms of various pieces of legislation, such as the Children's Act (38 of 2005) and the Criminal Law (Sexual Offences and Related Matters) Amendment Act (32 of 2007) (hereafter called the Sexual Offences Amendment Act).

Chapter 18 of the Children's Act (sections 281-291) criminalizes trafficking of children, under the age of 18 years. Section 284 specifically prohibits the trafficking of children. The trafficker cannot rely on a defence of consent by the minor child. The Children's Act states that no child can give consent to adoption, removal from the child's home or any exploitation. By including adoption of a child in the Children's Act as one of the forms of trafficking, the Act expanded on the existing definition of human trafficking as described in the Palermo Protocol. The definition was further expanded to include the removal of the child's body parts or organs. The Children's Act, in section 289, provides for the protection of children who are victims of human trafficking, whether they are South African citizens, or foreigners. Section 291 provides for the extra-territorial jurisdiction of the court to include cases of trafficking of South African children outside the borders of South Africa. The convicted trafficker will face imprisonment of up to 20 years, a fine or both. The trafficker can also face a fine or imprisonment of a maximum of 10 years, or both, for related crimes, in addition to the sentence for trafficking.

Sections 70 and 71 of the Sexual Offences Amendment Act were introduced to act as an interim measure until the legislation on the Prevention and Combating of Trafficking in Persons is implemented. Section 71 defines human trafficking for sexual purposes as an offence for which a convicted trafficker can face life imprisonment. Section 71(5) states that a victim of trafficking is not liable to stand trial for any crimes committed as a direct result of the trafficking. The perpetrator upon conviction faces imprisonment of a maximum of 2 years, when making use of the "services" of the victim of trafficking. This Act also applies extra-territorially.

These pieces of legislation have intrinsic limitations, as both only deal with certain aspects of human trafficking. The Children's Act can only be utilised in instances of trafficking involving minors, under the age of 18 years. The Sexual Offences Amendment Act, on the other hand, only deals with cases where the victim of

human trafficking was sexually exploited, raped or sexually assaulted. The Children's Act does not make provision for the payment of compensation by the trafficker to the child victim. The Children's Act falls short in that it does not provide for prevention strategies, or community education on awareness of human trafficking. The Sexual Offences Amendment Act does not describe any form of protection of the victims of human trafficking or preventative measures to curb human trafficking. The Act also does not make provision for compensation to be paid to the victim of trafficking. The shortcomings in both the Children's Act and the Sexual Offences Amendment Act make it essential for the South African government to implement trafficking-specific legislation as a matter of urgency.

## **PREVENTION AND COMBATING OF TRAFFICKING IN PERSONS BILL**

In 2003 the South African government began work on new anti-trafficking legislation to meet the requirements as set out in the Palermo Protocol, due to the fact that the present legislation used to combat trafficking is spread between different acts and no clear statutory offence for human trafficking exists. In March 2010, the government introduced draft anti-trafficking legislation (Prevention and Combating of Trafficking in Person Bill 7 of 2010). This Bill was presented to Parliament on 16 March 2010, and is still awaiting Parliament's approval.

The object of the Bill is to tighten the current laws relating to human trafficking, as well as to criminalise different aspects of trafficking in persons, and to prescribe appropriate penalties in the event of a trafficking conviction. The Bill also seeks to provide for the prevention of trafficking in persons and the protection of victims of trafficking, whilst assisting these victims by rendering various services to them.

Currently South Africa does not have a legal definition describing human trafficking as a criminal offence. The Bill aims to rectify this situation by including a definition for the trafficking of persons in Clause 1. This definition expands on the definition of human trafficking decided on in the Palermo Protocol, as it includes forms of trafficking such as adoption and debt bondage. The definition includes conduct that will be regarded as human trafficking offences, such as trafficking in persons, the possession, destruction, confiscation, concealment of, and tampering with travelling documents of victims of human trafficking, and conduct that results in the trafficking of persons. This proposed legislation will also include extra-territorial jurisdiction of the courts.

Preventative measures in the Bill are described in Chapter 2. By informing and educating the public, through awareness programmes of the risks and dangers of human trafficking, especially those who are vulnerable to human trafficking, the government can sensitise the community against recruitment by traffickers. Victims of human trafficking need to be informed of the various rights and services they are entitled to. As part of prevention, government must discourage the demand, and supply, of victims. The penalties imposed by the Bill serve as a form of discouragement for would-be traffickers. Convicted traffickers face heavy penalties in that they can be sentenced to life imprisonment with/without the option of a fine. The prescribed sentence for causing another person to enter into debt bondage is imprisonment of up to 15 years. The prescribed sentence for tampering with travel documents is imprisonment of a maximum of 10 years. Clause 7 of the Bill provides for imprisonment not exceeding 15 years for a person who intentionally benefited from human trafficking. The court can also order the convicted trafficker to pay compensation to the victim for loss of income, loss of property, mental suffering and contracting a life-threatening disease.

Chapter 4 of the Bill deals with the protection of human trafficking victims. Protection offered to child- and adult victims of human trafficking differ according to the Bill. Where an immigration officer, labour inspector, social worker, social service professional, medical professional, nurse, teacher, traditional health practitioner, -healer or -leader, suspects that a child is a victim of human trafficking, this person must immediately report this suspicion to a police official. If a person, mentioned above, suspects an adult is the victim of human trafficking, they can only report this suspicion if the adult gives his/her written consent. The police must refer the victim of suspected trafficking to a designated child protection organisation, or the provincial department of social development (DSD), in the event of a child, or to an accredited organisation or DSD in the event of an adult, within 24 hours.

Victims of trafficking are also protected against conviction of illegal activities carried out as a direct result of the fact that they are victims of human trafficking.

## RECOMMENDATIONS AND CONCLUSION

From a South African point of view the most important consequence of the Palermo Protocol is to promulgate and implement the Prevention and Combating of Trafficking in Persons Bill. Awareness must be raised amongst government officials, such as judges, magistrates, prosecutors, social workers, police officials as well as the general public. Proper data collection is imperative. The data must be collected on a regular basis and must be reliable and accurate. Without proper data, it will be impossible to ascertain the real impact of human trafficking in South Africa. Finally, South Africa needs to address the root causes of human trafficking and provide social, political and economic stability to name but a few.

The Palermo Protocol and other related international policies emphasize human trafficking all over the world. It is essential that all countries endorsing the Palermo Protocol meet the requirements in order to effectively eradicate human trafficking globally. Human trafficking is a major challenge. Some of the legislation currently enforced globally is still in its infancy and to a large extent untested. Ultimately, human trafficking is an enormous global problem and the response to the problem to date is clearly still inadequate. The preventative, protective and prosecuting responses must be integrated to effectively combat human trafficking. Human trafficking is everyone's problem.

# **THE CONTRIBUTION OF INTRAPRENEURIAL TRAINING TOWARDS THE IMPROVEMENT OF SERVICE DELIVERY BY PUBLIC INSTITUTIONS IN SOUTH AFRICA**

**M A W Prinsloo**  
**Tshwane University of Technology, South Africa**

## **ABSTRACT**

*During the launch of the ANC manifesto for the upcoming Municipal elections in South Africa the President of South Africa, Mr Jacob Zuma has emphasised the fact that service delivery in South Africa is not up to the standard that is expected from the citizens of this country. The South African public sector focuses on the improvement of the general welfare of the society. This implies that services and products should be delivered in a more effective and efficient way. To achieve these training programmes for official in the public sector there should be a paradigm shift from the traditional approach to training of officials in the public sector to training in intrapreneurial skills. Intrapreneurial skills require that the planning of service delivery programmes should be organised and structured and this should take the form of a business plan. Public intrapreneurs differ from private sector entrepreneurs in that it operates in an environment that holds a particular value system that include responsibility accountability, social equity and efficiency. Public intrapreneurs function within an environment where they should be responsible to the community needs. A public intrapreneur should be trained to become an official who can initiate new circumstances through innovative action and this person should through the training processes be able to capitalize on opportunities in his striving to improve service delivery to the community. The South African public sector is characterised by constant changes. The public intrapreneur should be trained to have the ability to meet these changes. An intrapreneur should be able to identify opportunities and utilised these opportunities to improve service delivery to the communities. In this paper the focus will be on the traditional training programmes for public officials in South Africa. This will be compared to intrapreneurial training with the focus on the advantages of intrapreneurial thinking for the improvement of service delivery programmes in South Africa. If public officials are well trained and the public sector environment can accept the new approach, resources can be used more effectively and efficiently with the result that communities would benefit. An intrapreneurial government will also be able to satisfy needs more quickly as the decision making process would be faster.*

## **INTRODUCTION**

To promote service delivery in South Africa, intrapreneurial management in government departments needs to be encouraged. The current ANC government in South Africa has realised that service delivery to the communities needs to improve and to achieve this, with the limited resources available a new approach needs to be developed.

Public Officials should have the opportunity to address needs from the community on their own initiative instead of, as is currently the excepted norm; wait for someone in a higher position to take decisions that should merely be implemented by the officials.

This is one of the major challenges in South Africa. Power to decide on important issues is in the hands of elected elite and the implementations of decision are therefore time-consuming. Flatter organizational structures are needed where managers can take the responsibility to take decisions and to implement these decisions.

In order to understand public intrapreneurship it is important to differentiate between entrepreneurship and intrapreneurship.

## **ENTRAPRENEURSHIP VS. INTRAPRENEURSHIP**

According to Shukla entrepreneurship is the practice of embarking on a new business or reviving an existing business or reviving an existing business by pooling together a bunch of resources in order to exploit new found opportunities (<http://www.pagu.com> visited on 21 April 2011)

Fox and Maas (1997:9) argues that there can be different definitions of entrepreneurship because they are based on several valid but different premises, but they define intrapreneurship as the ability of a person to identify opportunities and to utilise these opportunities to their benefit. Hisrich and Peters (1992:10) defines entrepreneurship as a process of creating something different with value by devoting the necessary time and effort assuming that these inputs will lead to resulting awards.

Entrapreneurship on the other hand involve the practice of entrepreneurship by employees within the public domain (Shukla 2009). Intrapreneurship refers to employees that are willing, able and allowed to use innovation, creativity and self-determination to identify and convert opportunities into better service delivery programmes.

The difference between the entrepreneurial (private) and intrapreneurial environment (public) is that in the public sector, external forces impinge on the public manager in a far greater and more complex way than on his private sector counterpart. Private Management is characterised much more by directions and orders to subordinates (Cameron and Stone 1995:116)

The public Manager on the other hand is regarded as the guardian of the tax payer's money and is restricted in terms of decision making by the legislature, the media, courts and trade unions. To ensure that public service delivery programmes in South improve it is of the utmost importance that managers be trained to develop intrapreneurial skills in order for them to cut on the beaurocratic principles and address problems and opportunities as they develop. Intrapreneurship is a style of management that is concerned with obtaining and managing resources to exploit opportunities. Intrapreneurs create opportunities by disturbing the status quo, but the labour environment should provide the necessary support that will allow intrapreneurs to challenge the status quo.

The main difference between the public sector and the private sector lies in that the public sector aims to improve the general welfare of society and that the private sector focus on profit making (du Toit and van der Walt 1999:45) within a public intrapreneurial organisation, "profit" would be obtained when products and services are provided in the most efficient and effective way.

## **INTRAPRENEURIAL PUBLIC MANAGEMENT**

Characteristics of intrapreneurial governance should include a vision, a mission, innovation and self motivation. Planning in the public sector requires the delivery of goods and services to society optimally. In order for this to happen the public institutions needs to be changed and public officials needs to be trained in the process of intrapreneurialism (Fox and Maas 1997:108)

The argument can be made that planning should take the form of a business plan and that public officials should be socialised so that this business plan can be implemented successfully. Public institutions should be innovative and creative in order to accommodate the constantly changes in the demands and needs from the public.

If government acts as an intrapreneur and use resources effectively and efficiently, society could benefit from it because it could result in better services and less tax.

An intrapreneurial government will also be able to satisfy the needs from the community more quickly as the decision making process would be faster, especially if employees are informed and share the same vision and mission (Fox and Maas 1997:98)

## **CHARACTERISTICS OF A PUBLIC INTRAPRENEUR**

Kroon and Moolman (1992:20) list the following characteristics of an intrapreneur:

## **Motivation**

Motivated public officials can be described as officials who want to succeed. Instead of focusing on the obstacles the intrapreneur will focus his energy on positive ways of changing these obstacles into tasks and challenges that he will achieve.

## **Drive, perseverance and energy**

These characteristics refer to the internal source of motivation and includes expectations, needs, drives and objectives.

## **Role orientation and purposiveness**

This includes the ability to formulate challenging attainable objectives that will motivate the intrapreneur to be selective in evaluating opportunities and to know when not to take up a challenge.

## **Time perspective**

An intrapreneur regards time as extremely valuable. They see time as a scarce resource. They are future orientated and tend to finalise tasks without procrastination or self-doubt

## **Internal focus of control**

Intrapreneurs believe in their own ability to direct their activities towards success, despite obstacles. They realise the fact that they might make mistakes but these mistakes are regarded as learning opportunities and they are unlikely to repeat these mistakes.

## **Handling uncertainty**

Because intrapreneurs possess an inner drive towards success they will sometimes have to make decisions in times of uncertainty, but they have the ability to endure uncertainty without compromising effectiveness and efficiency.

## **Risk taking**

Intrapreneurs are prepared to take calculated risks. They are aware of their own limitations and abilities and will take on challenges within these boundaries.

## **Ethics and integrity**

Integrity and reliability are probably the most important factors contributing to the long-term success of an intrapreneur. Timmons (1990:291) argue that success without the highest measure of integrity is regarded as failure.

# **COMPETENCE REQUIREMENTS FOR INTRAPRENEURIAL MANAGERS**

Competence can be defined as skills, knowledge, attitudes, attributes and values required to perform a task as well as the ability to apply them in the work environment (Lindsay and Stuart, 1997) for the purpose of

this paper, attitudes attributes and values are referred to as personal competencies. Personal competencies can be described as:

## **Identification of opportunities**

Intrapreneurial managers need to learn to utilise information effectively to determine the priority need of the community. The one factor that distinguishes an intrapreneurial official from one that does not have intrapreneurial orientation is the ability to identify opportunities and most important, to be pro-active. Being pro-active will ensure timeously and improved services to the community.

## **Networking**

Intrapreneurial managers should be able to capitalize on existing internal and external networks and how to use existing networks to expand their total network. Knowing with whom you partner with can be the competitive edge to capitalising on opportunities.

## **Self acceptance**

Intrapreneurial managers should know their personal abilities and limitations. Their focus areas should be within their special talents and abilities. If there are any areas where they can develop, they should embark on initiatives that can ensure competence.

## **Drive and determination**

According to Timmons (1999) drive and determination are the most important personal competencies that an intrapreneurial manager should have. Drive and determination is the fuel that accelerates the intrapreneurial vehicle.

## **Opportunity obsessed**

Successful intrapreneurs are obsessed with opportunity. This obsession manifests itself in a sound knowledge of the needs from the communities and identifying ways and means to address these needs effectively and efficiently.

## **Creative problem solvers**

Intrapreneurs have the ability to think laterally or to stimulate teams to do that. Intrapreneurs don't have to be creative people, but they have the ability to find creative solutions to traditional problems.

## **Adaptable**

Intrapreneurs have the ability to learn quickly and to adapt to change in a short time. Because of this, they don't fear failure, but regard mistakes as an opportunity to learn.

## **THE INTRAPRENEURIAL ORGANISATION**

The public sector differs from the private sector because of different value systems. Values in the public sector include efficiency, accountability, responsiveness and the upholding of individual rights. In order to develop an intrapreneurial organisation, public institutions need to change.

Intrapreneurship cannot come into practice if the organisations culture is not intrapreneurial, but the culture of the organisation cannot be changed overnight. Intrapreneurs must be innovative in creating an organisation that

is entrepreneurial (Holtzhauzen 199). Fox and Maas (1997:19) has identified the following guidelines that promote the establishment of an intrapreneurial organisation.

## **Vision**

The vision of the organisation must be understood and supported by employees at all levels in the organisation. The vision will be the energy that sends the organisation in the correct direction. This vision should include intrapreneurship and create the opportunity for intrapreneurial thinking in the organisation.

## **Training**

The intrapreneurial organisation functions within a dynamic and constantly changing environment. Training of intrapreneurs should therefore be continuous to keep up with the latest developments.

## **Recognition**

A system of recognition should be implemented to stimulate intrapreneurial thinking. Intrapreneurs should be allowed to exploit opportunities without the fear of punishment.

## **New ideas**

In order to identify new opportunities, new ideas must be created. Communication plays an important role in the stimulation of new ideas and newly implemented ideas should be made visible to the employees of the organisation so that they can be inspired and motivated to contribute to the continuous search for new and better ideas to improve service delivery.

## **Flexible structures**

The implementation of new ideas should be done as soon as the ideas have been generated. This calls for structures that should be flexible in order to adapt to the changing environment and circumstances. Robbins (1999:405) adds that entrepreneurial organisations tend to have similar cultures. They encourage experimentation reward both successes and failures; and celebrate mistakes.

According to Robbins (1999:405) these organisations are likely to have the following characteristics:

- Acceptance of ambiguity: Too much emphasis on objectivity and specificity constrains creativity.
- Tolerance of impractical: Individuals who offer impractical answers to what-if questions are not stifled. What might seem to be impractical might lead to creative and innovative solutions.
- Low external controls: Rules regulations and policies are kept to a minimum. Intrapreneurs should be encouraged to challenge the status quo and should not be bound by rules and regulations.
- Tolerance of risk: Intrapreneurs are encouraged to experiment without fear of consequences should they fail.
- Tolerance of conflict: Diversity of opinions is encouraged. Different ideas will generate more options or possible solutions to problems.
- Focus on ends rather than means. Goals should be made clear and intrapreneurs should be encouraged to consider alternative routes towards meeting the goals. Focusing on the final result suggest that there might be several right answers to any given problem.
- Open-systems focus: Institutions closely monitor the environment and respond rapidly to changes as they occur.

# **DEVELOPMENTS IN THE TRAINING PROGRAMS OF PUBLIC OFFICIALS IN SOUTH AFRICA SINCE 1994**

After the election of the South African government in 1994 a number of significant changes in the training and development of public official has been introduced.

The South African government has promulgated a number of legislation with the specific aim on improving training of public officials. Some of this legislation is:

### - **The White Paper on Public Service Training and Education, 1998**

The aim of the White Paper is the development of a dedicated productive and people-centred public service staffed by public servants whose performance is maximised and whose potential is fully developed via the comprehensive provision of appropriate and adequate training and education at all levels of the organisation (White Paper on Public Service Training and education, 1998:14)

According to the White Paper (1997:38) the formulation and evaluation programmes of public service training and education will be carried out in accordance with the following broad principles:

- Access and entitlement: All public servants will be entitled to ongoing and meaningful opportunities for training and education.
- Needs analysis: Programmes of training and education will be based on a detailed assessment of the needs of individual organisations and employees and will be designed in particular to secure on optimal fit between these two set of needs.
- A competency-based approach to learning outcomes:  
The new approach to public service training and education will focus on outcomes rather than inputs, with particular reference to the competencies required at different levels to build individual and organisational capacity.
- Flexibility and decentralisations:  
To ensure that programmes of training and education are designed flexibly to meet the individual and changing needs of particular departments. Responsibilities will be decentralised as far as possible, with agreed upon national norms and standards.
- Learning Organisations: Training education and development will be promoted in ways which will enable public service institutions to become learning organisations, capable of continuous development and adaptations through the creative integration of learning at all levels.
- Adequate resourcing: This is vital for the success of training and educational programmes and will be ensured in particular by integrating plans and priorities for training and education as a central element in the budget planning process, at national, departmental and provincial levels.
- Quality and cost-effectiveness: This will be promoted through the effective utilisation of available resources; avoidance of duplication; establishment of effective structures and mechanisms for co-ordination of training and education at national and provincial levels; introduction of improved forms of standard setting and accreditation; and the forgetting of training and education activities that add value by developing skills, knowledge and attitude that can be transferred to the job.
- The skills Development Act 97 of 1998:  
The purpose of this Act is firstly to develop the skills of the South African work force by improving the quality of life of workers, productivity in the workplace and the competitiveness of employers, and to promote self-employment and the delivery of social services.  
Secondly to encourage employers to employ people who find it difficult to find employment and to use the workplace as an active learning environment to provide employees with opportunities to acquire new skills.  
Thirdly the Act encourage workers to participate in learner-ships and other training programmes and to ensure the quality of training and education for the work place (Skills Development Act< 1998:8)

## **TRADITIONAL TRAINING PROGRAMMES FOR PUBLIC OFFICIALS IN SOUTH AFRICA**

Traditional training programmes for public officials in South Africa can be categorised into two sections, firstly in the job-training and of the job-training. On the job-training according to Carrell et al. (1998:318) involves job instruction given by an employee's supervisor. This type of training may involve learning how to complete routine tasks such as report writing, conductivity of interviews or selling of a product. Some of the on-the-job training methods used are coaching or job rotation.

Off-the-job training methods include classroom lectures, films and simulation exercises. These types of training are well suited for conveying specific information but it does not encourage intrapreneurial thinking.

From the intention and purpose of this legislation it is evident that the South African Government has committed themselves to the improvement of training and education of public officials to ensure better service delivery to the communities in South Africa.

It is however important that intrapreneurship be encouraged through different training programmes.

## **INTRAPRENEURIAL TRAINING PROGRAMMES**

Training programmes should be developed that will encourage public officials to challenge the status quo. Programmes should be challenging and should focus on:

- Creative problem solving:  
Intrapreneurs should have the opportunity to be creative in problem solving according to Robbins (1999:404) creativity refers to the ability to combine ideas in a unique way or to make unusual associations between ideas. An institution that stimulates creativity will develop a novel approach to doing the work on unique solutions to problems.  
To encourage intrapreneurial training and creative thinking, public institutions should be ambiguous with low levels of external control, and public official opinions (Robbins 1999:404) These different opinions might lead to new innovative approaches to solving a problem.
- Brainstorming:  
Brainstorming is an idea-generating process that encourages alternatives while withholding criticism (Robbins 1999:463).  
Intrapreneurs should have the opportunity to discuss different methods of solving a particular problem without the fear of criticism. All alternatives should be recorded for discussion and analysis.
- Leadership Development:  
Training programmes should also focus on the importance of visionary leadership. Visionary leadership can be defined as the ability to create and articulate a realistic, credible, attractive vision of the future for an organisation that grows out of and improves upon the present (Robbins 1999:530)

## **CONCLUSION**

According to Harye MacKay (<http://michael.goldman.com/intrapreneurship.htm>) many people fail to achieve their goals because they have grown so comfortable in their job that they are afraid to meet the challenges of a new one.

For public service delivery programmes, to be effective and efficient it is important that intrapreneurial thinking be encouraged. To be a successful intrapreneur will take more than just creativity or an idea. The successful intrapreneur has to be willing to take real risks at sharing and pushing a unique idea.

Intrapreneurs may have to be patient and wait for their senior management's final approval to create new services and they must be willing to push-wait-push-work but never quit.

Intrapreneur don't have it better, they simply have it different because they are fighting against well established systems.

To be successful with the implementation of service delivery programmes, intrapreneurs should put the public institution and not themselves first. Ethical conduct is of the utmost importance.

Public intrapreneurs should be involved in training programmes that will develop their creative thinking and visionary leadership skills.

In an environment that is constantly changing intrapreneurs should take the leading role in developing new, better and more efficient programmes to improve service delivery.

It is important that the public institutions create an environment where anyone can come forward with ideas on how to improve service delivery. It should not matter where a person fits in the organisation chart. If the idea is good, and the benefits and risks are clearly stated, that idea should get the green light.

# HOW CONCERNED IS THE SOCIAL NETWORKING GENERATION REGARDING INTERNET SECURITY AND SAFETY PROTECTION?

George Priovolos, Vincent Maher, and Joseph Ford  
Iona College, ISA

## ABSTRACT

*Industry experts report that cyber-threats are approaching pandemic levels as Internet-based attacks have significantly increased in number and become more sophisticated and targeted. Users find it more and more difficult to adequately protect, at an affordable cost, the various kinds of information they generate and use on an ever-larger number of Internet-enabled devices. Today's college-age young adults, who grew up with the Internet, have moved most of their daily life online communicating and networking with others through multiple digital touch points. This paper will examine their awareness of Internet security risks and attitudes towards online protection.*

## INTRODUCTION

Online security has developed into a major concern for businesses, governments, Web experts, and the public at large in the past several years. However, online security issues associated with individual usage of the Internet have only recently attracted scholarly attention. Still, academic research in the area has focused mostly on safety issues, especially as they relate to children, and privacy concerns.

The recent escalation of attacks against unsuspected Internet users can be attributed, at least in part, to the increased level of sophistication of cyber-criminals; at the same time, individuals surfing the Internet during their leisure time—as opposed to doing so in the course of their employment or education—may be less aware of security threats for a number of reasons: lack of information on online illegal activities aiming specifically at individual users; inability to grasp the vulnerability of the medium to the extent that much of it involves technical detail and esoteric terminology, and a false sense of security that may be amplified by the use of standard computer protection software, often pre-installed in new hardware.

Moreover, at least some of these users may be in a state of denial hoping that somehow their (perhaps, limited) online activity would not attract the attention of cyber-criminals. On the other hand, even when leisure Internet users are quite aware of the dangers, many of them may be slow to take appropriate action to protect their online information and activities due to the high perceived cost in time and money that most comprehensive protection solutions seem to require and a reluctance to modify their online behavior in order to minimize exposure to the danger. Either way, selecting an online defense is not easy; a multitude of so-called “security shields” appear to promote mostly technological solutions (i.e., software programs), which are designed to protect against already known threats. As cyber-criminals continuously evolve their schemes and update their technologies, vendors of such programs seem to always try to play catch-up—a thing that may further erode consumer confidence in them.

One of the main reasons why many experts at this point warn that threats to cyber-security are approaching pandemic levels is the fast growth of new Internet-enabled hardware like smartphones, game consoles, tablet PCs, etc. These devices connect to the Internet when the user's attention is more likely to be focused on online content—not Web security per se. Furthermore, the latest popular Internet platforms supporting e-commerce, social networking, communication and entertainment are designed with built-in capabilities to collect and pass on user information making them (and their owners) more vulnerable to online intrusions and attacks.

Young adults, aged 18-25, tend to be heavy users of the Internet; they typically surf the Web using an assortment of wired and wireless devices, therefore, representing a very important segment of the total online market. Due to their heavy use of the Internet “anytime, anywhere” and their level of comfort at conducting a wide variety of online activities, individually or in groups, they are also highly likely to become targets of cyber-attacks and other abuses. Although, this demographic is undoubtedly more intimate with technology than other age cohorts, their Internet savvy might not necessarily help them become more sensitized to online dangers. In fact, it is conceivable that their relatively high level of familiarity with the Web could actually make them underestimate the threat.

This paper represents an exploratory attempt at examining the awareness of online security threats among college-age young adults, who access the Web via multiple Internet-enabled devices, in their leisure time (i.e., outside of work and/or school). The research reported here actually constitutes a preliminary step towards a larger project seeking to establish the security profile of this important cohort.

## NATURE OF INTERNET THREATS

According to Gray and Christiansen (2009), online risk can be classified as either “safety risk” or “information risk.” The former may involve physical harm and is usually considered in connection with online abuse of underage children. On the other hand, “information risk” relates to the hazards associated with disclosing online one’s pertinent personal information (e.g., name, age, address, etc.).

In fact, in popular Social Networking Sites (SNSs) like Facebook, LinkedIn or Twitter, young adult Internet users are these days accustomed to revealing additional information about their activities, interests, and opinions on current—and often controversial—social and/or political issues. This information—once posted—may be collected, stored, mined and sold for marketing or other (even unethical/illegal) purposes (Zeidner 2007). Moreover, various popular applications (“apps”), run within social networking and other sites, interact with users and their data posing additional performance and security risks (Makridakis et al. 2010). Smartphones and other recently introduced Internet-enabled digital equipment, using relatively new operating systems, are even more vulnerable to security threats.

Sun (2007) identified four types of malicious software programs: (a) system monitors that unobtrusively record and communicate sensitive and personal information; (b) “Trojans” that steal information, install malicious programs, or hijack a computer; (c) “Adware,” which monitor the online activities of individuals in order to deliver targeted advertising, and (d) tracking cookies that store user preferences regarding websites and other online content. Malicious software (“malware”)—an all-inclusive term used nowadays to describe various types of abusive software launched through a user’s Internet connection—can be installed with or without the user’s knowledge or consent; in the former case, user agreement is usually obtained by means of a misleading or incomplete disclosure. Certain types of users e.g., children and seniors may be particularly vulnerable to the extent that they do not fully appreciate the implications of providing their consent for the installation of such software in their computers. Young adults, who are heavy users of so-called “Peer-to-Peer” (P2P) applications allowing easy transfers of large video and audio files across networks, constitute another high-risk group.

The effects of security breaches may be severe: users whose digital equipment has been infected by malicious programs are exposed to surveillance and/or information collection without their awareness or consent. In addition, malware often causes a computer crash, freeze or slow-down negatively affecting an Internet user’s online experience. Ironically, a user’s effort to limit exposure to potentially infected websites in order to reduce online risks e.g., by blocking all dynamic content (including Javascript, Flash, etc.) would likely diminish his/her Internet enjoyment. Moreover, repeated, ominous warnings about the Web’s vulnerability are making today’s Internet surfers more hesitant to search for and connect to untried websites/links—a condition aptly termed in a recent paper as “clickphobia” (Lucky 2011).

Despite widespread concerns about online dangers among users, Internet experts, as well as policy makers, and the rapid proliferation of various “security solutions,” scholarly research in the area is generally lagging behind (Sriramachandramurthy et al. 2009; Dinev and Hu 2007). More specifically, past literature in the field of Internet security—as viewed from an end user’s perspective—has been dominated by conceptual studies seeking to describe the wide array of online threats; on the other hand, empirical research on Web user perceptions of online vulnerabilities has often considered only one type of threats (i.e., “spyware”) focusing specifically on the adoption of technological solutions to the problem (Sipior and Ward 2008; Lee and Kozar 2008). In fact, to-date, much of the information regarding Web user online security perceptions has been generated by commercial organizations providing security products and services; for instance, the most recent

RSA Global Online Consumer Security Survey involved 4,500 adult active Internet users from 22 countries, who were asked to share their opinions and attitudes on the security risks they face, their level of awareness concerning the latest threats, and what online service providers should do to protect them (RSA 2010).

Recent studies have suggested that online users concerned with Internet security may need to employ both “technical” (e.g., installing anti-malware software; pop-up blockers; firewalls, etc.), as well as non-technical, i.e., “tactical” measures (e.g., avoiding high-risk online activities) to adequately protect themselves (Sriramachandramurthy et al. 2009; Buchanan et al. 2007). Related research indicates that Internet users who adopt “tactical” defensive measures may neglect to also use protective technologies perhaps due to the mistaken belief that they do not need it (Lee and Kozar 2008). On the other hand, it has also been reported that users with high self-efficacy are less likely to employ preventative i.e., “tactical” measures (LaRose, Rifon and Enbody 2008); this may be due to the fact that these individuals tend to be more familiar with and trust the various existing security arrangements at popular websites (Acquisti and Gross 2006). Thus, one would expect that young adults, who are typically quite accomplished—albeit risk-prone—users of the Web, would be likely to rely, mostly, on “technical” means in order to protect themselves online.

## METHODOLOGY

Four “in-depth” group interviews were used in this study to establish familiarity with the topic i.e., Internet behavior and security, as it is understood by the target population, namely school-age young adults. Using qualitative research for exploratory purposes is quite common in the social sciences and marketing research (Desvouses and Frey 1989).

The four group interviews for which results are reported in this paper were conducted, over a two-week period, using an approach comparable to that used in marketing focus groups. They were moderated by two of the authors, who structured them in a way that would facilitate the disclosure of related information from the participants’ personal experience. Group moderators adopted a flexible, objective and empathetic approach throughout the interviews; moreover, every effort was made to encourage the entire group to participate in order to ensure the fullest coverage of the topic under investigation and preclude a few respondents from dominating the discussion (Merton et al. 1956; Stewart and Shamdasani 1990). In addition, throughout the group discussions, the interviewers tried to alleviate any feelings of asymmetrical power that might have been present as a result of their position (Fontana and Frey 2005; Silverman 1997), in effect, inviting group participants to “educate” them on the issues on hand. The setting i.e., classroom gatherings following the completion of case studies dealing with the current state and future outlook of Social Networking Sites was considered highly conducive for this kind of inquiry. As a result, all group interviews were characterized by a high level of respondent participation and a fair amount of group interaction. Warren (2002) has described a similar interviewing approach as part of a qualitative research design that is rooted in grounded theory (Strauss and Corbin 1990; Glaser and Strauss 1967).

Furthermore, according to Charmez (2002), researchers employing qualitative methods must outline specific and focused questions that seek to uncover the root issues to be investigated; they should use open ended questions and remain flexible in order to “pick up and pursue themes.” To this end, a Discussion Guide was developed by one of the authors that included the topics to be covered during the interviews, the most important questions related to them, as well as instructions for probing participants to facilitate the interviewing process. A partial list of the questions included in this Guide is included below (the specific order and phrasing of the questions asked of each group differed depending on the flow of the discussion):

- How extensive is your use of the Internet in your leisure time i.e., outside of work and school?
- What are some of the things that you do online during your leisure time?
- Overall, how concerned are you about Internet security and safety? What are some of the issues that you are most concerned about in this regard?
- Have you (or someone close to you) ever been the victim of an Internet attack? If so, what kind? How did you (or the person close to you) resolve it?
- Who do you believe should be responsible for protecting personal information posted online? Why?
- What are some of the things you do in order to protect yourself and your personal information online? Do you think you’re doing enough in this regard? If not, what else could you have done to avoid online hazards?
- What is your overall opinion regarding Web marketing and the way it is practiced nowadays? Is online marketing a threat or an opportunity from a consumer perspective? Why?

At the end of each group session, interviewers compiled a synopsis of the main points brought up during the group discussion based on their contemporaneous notes. Creswell (1998) has suggested that qualitative study data analysis consists of reducing the raw data derived from in-depth interviews to a small set of “themes” from which “the story” behind the collected information can emerge. To that end, an initial search for themes within the data was followed up by a second phase of systematically organizing all the information collected during the interviews on the basis of these themes. Further reviews of the materials produced additional insights that helped better conceptualize the original themes and their interrelations and pointed to important exceptions or inconsistencies. Finally, by looking into the list of themes developed from the data, several generalizations or propositions were constructed (Taylor and Bogdan 1984), which are described in the Findings section below.

## FINDINGS

The findings of this study reinforce the popular belief that today’s young adults have made the Internet a major part of their lives; in fact, some respondents talked about their online experiences as if their whole lives were designed around the Internet. For instance, a group participant responding to a question about frequency of Internet use stated: “How many hours I spend online? How about ‘how many hours I’m NOT online on any given day?’”

Moreover, several respondents described their Internet use in terms that may lead one to believe it has become an addiction of sorts i.e., an end-in-itself. Indeed, some of the themes that emerged from the interview data reflected a single-minded commitment to Internet-related activities, which persists over time: “lack of control” over Internet use, developing Web surfing “rituals,” and lack of concern about the “consequences” of Internet use were the most prominent among them. Yet, the vast majority of participants appeared to thoroughly enjoy their online activities during their leisure time and used generally positive terms to describe it—many of the latter related to themes like “staying in touch” with friends, “sharing” and, to a lesser extent, “keeping up with the news/staying informed.”

Nearly all respondents in this study identified Facebook, the currently most popular Social Networking Site, as the website they visit on a daily basis and the one where they spend most of their time online; a distant second was Twitter, which—however—they mostly accessed while “on-the-go” using their smartphones. Moreover, unlike Facebook that was apparently a universal choice to conduct a wide variety of online activities, Twitter appeared to have both dedicated fans as well as strong critics—the latter referred to it as a “fad” and “a waste of time” with a few even questioning its networking abilities/character. Interestingly, virtually no respondent indicated that they ever visited Myspace these days, the leading networking site of years past; a couple of participants dismissively stated “it’s only good for young(er) kids.” These findings seem to confirm the present status of Facebook as “the site of choice” for college-age young adult Internet users, as well as its “stickiness.” At the same time, they serve as a reminder of how ephemeral can an Internet service’s success be, especially when it caters to a “fickle” demographic like today’s teens and young adults.

Although no exact count was obtained during the interviews, it appeared that significant gender differences might exist with regard to preferred online activities among young adult Web surfers. For example, many female respondents indicated that they spend considerable amounts of time searching for and communicating with online friends, whereas males claimed most of their online activities involved searches for video and audio downloads, file sharing, and streaming sports events. Both male and female respondents reported that they spend significant amounts of time playing online games. Assuming such gender differences hold in future empirical studies, it appears that male Internet users are likely to engage in riskier Internet behaviors and thus be more vulnerable to online threats.

Furthermore, the findings of this exploratory study do not confirm those of previous research that generally showed a lack of awareness and understanding of security issues by Internet users (e.g. Sipior, Ward and Roselli 2005; Lee and Kozar 2008 etc.). An overwhelming majority of participants in this study thought they were quite knowledgeable regarding online dangers and—when probed—listed several different types of malware and other online threats, including newer forms like “spear phishing” (i.e., targeted phishing) and “smishing” (i.e., phishing by means of SMS messages). In fact, about half of them claimed that they had experienced some form of online abuse, including malware infection of their hardware, scams, identity theft, or harassment (e.g., cyber-stalking). Factors that may explain the substantially higher levels of Internet vulnerability awareness found in this study include participant age and heavy use of the Internet—both of them point to a higher than average familiarity with Internet-related issues. Also, efforts to educate the public about

online threats, including malware and how it is spread on the Web and between different Internet-enabled devices, have recently intensified, contributing to higher overall levels of awareness.

In addition, when group participants were asked to discuss the consequences of online security vulnerabilities, the majority of them indicated that, in most circumstances, some forms of “spyware,” like “adware,” could in fact be beneficial to Web users to the extent that the information collected is used by marketers for designing better programs (e.g., special offers) targeting them. Moreover, “cookies,” tracking the websites an Internet user visits and “beacons” monitoring his/her behavior on these sites were considered by many respondents as “a fact of (online) life.” Consequently, study participants were likely to view intrusions into their personal information and their online habits by or on behalf of marketing firms as mostly a trade-off between “privacy” concerns, on the one hand, and potential market benefits, on the other.

By contrast, the appropriation of a Web user’s sensitive information (e.g., credit card numbers and other financial information) by cyber-criminals was clearly identified as a “security threat.” Moreover, corroborating previous research, respondents seemed to also differentiate the latter from issues relating to online “safety,” a term applied, by most, exclusively to problems encountered by young children surfing the Web on their own e.g., attacks by cyber-predators, online stalking, etc. Lastly, a separate category of cyber-threats were identified as those causing social embarrassment such as the use of personal information posted by the user him/herself for purposes other than those originally intended. The most frequently-cited example to illustrate this case—as perhaps it should have been expected of college students concerned with their future careers—involved prospective employers searching for and finding potentially compromising online information about a user’s past and present personal habits, private activities, etc.

As far as online protection is concerned, virtually every interview participant confirmed the use of commercially available anti-virus software programs although several of them reported problems with and/or reservations about their activation; in addition, most respondents claimed that this type of online defense was quite effective but could not guarantee 100% protection against newer forms of cyber-attacks. Again, reaffirming past reports, many study participants, stated that cyber-criminals and spies will “always be ahead of (protection) software developers,” thus, rendering purely technological solutions to online security problems only partially effective. On the other hand, modification of online behavior, like avoidance of “nasty” sites, was cited by only a handful of interview participants as the most effective form of cyber-defense. In addition to doubting the effectiveness of such measures, most respondents appeared reluctant to alter their established surfing habits arguing that doing so would deprive them of “much of the joy of (Internet) surfing.” Characteristically, when probed, none of the respondents indicated that they had ever stopped or reduced their online activities, including e-shopping, in response to talk about online security threats.

Finally, a number of particularly interesting findings relate to the question of who—in the opinion of the study’s participants—should be responsible for online security and safety. As expected, given their perceived high familiarity with the Internet and online hazards, the vast majority of respondents adopted a “user beware” approach stating that such responsibility should—first and foremost—be exercised by users themselves. Additionally, many seemed to believe that commercial entities providing online access (ISPs), as well as those mostly interested in collecting, storing and/or using Web user data i.e., e-tailers, Web portals, and Social Networking Sites should be held liable for online security breaches. Also, it was apparent from reviewing participant responses on this issue that there was a strong preference for strict user control over personal data by means of optional security settings—a feature that should be available on most commercial and social websites.

## CONCLUSION

The expansion of the Internet and the proliferation of associated technologies have resulted in both increased efficiency and the emergence of new methods of communication, entertainment, and personal expression. More than anyone else, the Web has affected today’s young adults, who were raised with it and for whom its use has become second nature. However, Internet use may also give rise to a number of security threats, which are increasingly targeting individual “leisure” users of the medium whose online activities are not related to work and/or study.

It has been suggested that a thorough understanding of current online activities by specific groups of users and their attitudes toward protective measures (technologies as well as behaviors) is necessary for the design and implementation of effective defenses against such Internet threats (Dinev and Hu 2007). This exploratory study contributes in this direction by offering insights into how college-age young adults may behave while surfing the Internet during their leisure time; the study’s findings regarding young adult Web

users' awareness of the risks involved and the various measures they take to mitigate such risks could provide a useful foundation for further empirical research.

However, to put the findings of this study in the proper perspective, one has to keep in mind that all focus group discussions are context- and time- dependent; they represent opinions and attitudes of the particular group of individuals involved, at that specific moment in time (Charmez 2002). In order to generalize the results obtained from one such group discussion, additional sessions with different groups of participants drawn from the same population segment (i.e., young adults) should be convened. The present study reported on findings from four such groups; however, the composition of these groups was not sufficiently varied to warrant the extraction of robust behavioral patterns and/or attitudinal trends.

Another obvious extension of this study could examine how leisure Internet users' attitudes towards online threats and protection are affected by their exposure to related information in the course of their employment and/or education. As the process of boundary blurring between work/school and leisure activities continues unabated, one may assume that behaviors and information learned in one of these domains will be readily utilized in the other. However, the findings of this study suggest that this might not be the case to the extent that young adults, in particular, may be willing to accept relatively high levels of risk in their private lives to be able to participate in their favorite online activities.

Furthermore, as "cloud" computing gradually expands into the individual Internet user market, online threats should also be expected to increase. Protecting sensitive online information, from intrusion or abuse by unscrupulous marketers and other cyber-criminals will undoubtedly become more challenging. In fact, a migration to the "cloud" could alter the way individual leisure users perceive online dangers: for instance, any additional safeguards (e.g., strong encryption) offered by "cloud" providers could instill in them a false sense of security ("Alice-in-Wonderland" phenomenon); alternatively, their fears regarding online dangers may be exaggerated by their apparent lack of control over their data in the "cloud" and what may happen to it.

Thus, additional research is also warranted on the marketing implications of online behavior modification in response to ongoing security concerns. While automatic online collection of personal information has the potential to radically change marketing practices delivering substantial benefits to businesses and consumers alike, concerns about ownership and control of user private data are likely to intensify.

Lastly, from a public policy perspective, future research efforts should focus on determining better ways to educate the public about the diverse nature of online security risks and their diffusion mechanisms, as well as the technical and tactical defense measures that could provide effective protection against them.

# INDUSTRIAL POLICY REVIVAL?

**Michal Putna**  
**Masaryk University, Czech Republic**

## ABSTRACT

*The debate on industrial policy can be characterized by a number of contradictions and different opinions on this topic. Many economists reject the idea of industrial policy as such arguing that only free market can guarantee effective allocation. On the other hand, many economists support the idea of a new industrial policy and its positive effects on national economy. The purpose of this paper is to review the debate on industrial policy and outline the concepts and instruments of a new industrial policy. This paper also discusses the current tension between the theory and practice of industrial policy.*

## INTRODUCTION

Industrial policy (IP) raises heated debates among economists all over the world. Those who are against it, reject the idea that the state and its agencies should be better at allocating scarce resources than a free competition. They do not believe that state interventions as part of industrial policy could ex ante detect viable companies eligible to receive support. Such a “*selection of winners*” is seen as problematic and unfair by the IP antagonists mainly because of asymmetric information and the danger of rent-seeking and bribery. Those who advocate industrial policy, on the other hand, see IP as an opportunity to boost the economy of a country increasing its competitiveness in a global economy. Bringing in evidence examples of IP having contributed to growth of productivity and economy in the past, they believe that industrial policy is a suitable tool for economic growth stimulation and support. This clearly shows that the clash of opinions between the opponents and advocates of industrial policy is rather fierce. This paper aims to shed some light on the theoretical background of industrial policy and clarify the reasons for its modern revival.

Its first part is concerned with a concise definition of industrial policy. Next the main obstacles are listed impeding the implementation of industrial policy: asymmetric information and rent-seeking. Finally, the impacts of globalisation on the effectiveness of IP are outlined.

## Definition of industrial policy

Although no generally accepted definition of industrial policy is known, we should accept one for a start. For the purposes of this paper we will use a definition by Pack and Saggi (2006: 2) where industrial policy is described as: “*Any type of selective government intervention or policy that attempts to alter the structure of production in favour of sectors that are expected to offer better prospects for economic growth that would not occur in the absence of such intervention*”. Also another, very similar, definition of IP can be used that defines industrial policy as activities that: “*Stimulate specific economic activities and promote structural change*,” Rodrik (2008: 3). Initially, it is also good to introduce the basic tools with which industrial policy works. These include: tax breaks, import tariffs and/or quotas, public guarantees, incentives for foreign direct investment, R&D subsidies, establishment of research centres, preferential access to finance and many others. The selection and implementation of a particular tool of industrial policy always depends on the objective to be achieved. A detailed list of industrial policy tools along with their fields of use was made by Naudé (2010: 8). At the end of his paper, Naudé (2010) also lists the basic bibliography on industrial policy, which is a good starting point for those interested in these issues.

## Revival of industrial policy

*"Neomercantilism is perhaps a better name for an interventionist industrial policy," DiLorenzo (1984: 605).*

*"Now more than ever, Europe needs industry and industry needs Europe," EC (2010: 3).*

The above citations clearly demonstrate the gap between the authors' opinions. However, despite this contradiction, one thing is clear. Today, particularly after the 2008 economic recession, the industrial policy experiences its revival. The financial crisis having inflicted serious damage on whole industries, the subsidies granted to businesses and whole sectors of national economies had never been so high before. The reason is that, in most of the advanced countries, the industry brings a major contribution to the GDP thus determining the standard of living of the population of such countries. Table 1 lists the contribution to GDP of each sector of economy.

**Table 1: GDP composition (2010)**

GDP composition by sector (%)			
Country	Agriculture	Industry	Services
Saudi Arabia	2.7	61.9	35.4
United Arab Emirates	0.9	51.5	47.6
China	9.6	46.8	43.6
Indonesia	16.5	46.4	37.1
Thailand	10.4	45.6	44
Norway	2.1	40.1	57.8
South Korea	3	39.4	57.6
Russia	4.2	33.8	62
Mexico	4.2	33.3	62.5
Argentina	8.5	31.6	59.8
South Africa	3	31.2	65.8
World	5.7	30.7	63.6
Austria	1.5	29.4	69.
India	16.1	28.6	55.3
Germany	0.8	27.9	71.3
Turkey	8.8	25.7	65.5
Spain	2.9	25.5	71.6
European Union	1.8	25	73.2
Italy	1.8	24.9	73.3
Netherlands	2.6	24.9	72.4
Australia	4	24.8	71.2
Japan	1.1	23	75.9
United States	1.2	22.2	76.7
United Kingdom	0.9	22.1	77.1
Canada	2	20	78
France	1.8	19.2	79

Table 1 also testifies to the importance for national economy of the industry in each country. This is also the reason why industrial policy becomes the key interest of the governments. Aiginger and Sieber (2006) show that industrial policy has again been gaining ground for the following three reasons: (i) globalization and rapid advances of technology encourage efforts to find new industrial policy tools suitable for the third millennium, (ii) the re-united Europe is afraid that it could lose some of its key industries due to outsourcing, which would lead to de-industrialization (iii) the new states (not just the new EU member states) are rather active

and aggressive in attracting investors. It is especially industrial policy that can face all these global challenges, which may be the reason for its present revival.

Another reason for the idea and tools of industrial policy being revived is that (economic) development is closely related to structural changes that make it possible to produce new goods and services using better technology and thus efficiently allocate scarce resources. By the neo-classic growth theory (the Solow model) the output is determined by the capital accumulated and the work force and, therefore, the accumulation of capital is thought to be a basic condition of economic growth. By the New Growth Theory (Romer), however, a long-term economic growth no longer depends on the accumulation of capital only, but mainly, on investment in research and development as well as on innovation. This may also be seen as another reason for the renewed interest in industrial policy in today's post-recession world. Thus, by supporting R&D investment, industrial policy may make a major contribution to economic growth. Other authors, too, see innovation (Cimoli et al., 2006) and accumulation of capital (Lucas, 2008) as the basic components determining the development of industries. With the correct institutional setting, industrial policy may stimulate structural changes in economy leading to higher growth and productivity rates to achieve a higher standard of living.

Today this industrial policy potential is often pointed out, particularly in EU, as one of the tools of Europe's post-recession upturn. In "*An Integrated Industrial Policy for the Globalisation Era*" a document adopted by the European Commission in late October 2010, one can read that: "*Now more than ever, Europe needs industry and industry needs Europe*," EC (2010: 3). This document is one the key initiatives of *Europe 2020*, a new ten-year growth policy to accelerate growth and generate employment by preserving and strengthening the European industrial basis. Neither was industrial policy forgotten in the USA. On the contrary, as stated by Naudé (2010: 5) „*Faced with the recent financial crisis, the USA has continued to resort heavily to what can be described as industrial policy to support recovery.*“ Thus, today industrial policy experiences a real revival.

## **Theoretical background of Industrial policy**

Having touched some of the reasons for the renewed interest in industrial policy, let us now take a look at the theoretical background of IP and two key problems faced when industrial policy is implemented in practice. Economic theory justifies regulatory interventions through industrial policy by efforts to put right market failures. The main market failures related (not only) to industrial policy include: asymmetric information and rent seeking with corruption, Naudé (2010) and Rodrik (2008). Opponents of IP believe that these problems cannot be resolved and, therefore, it is better to reject industrial policy as such. IP advocates, on the other hand, maintain that these problems are not insurmountable and, therefore, industrial policy should not be rejected. We might now want to look at the two main (theoretical) obstacles that the industrial policy opponents say cannot be resolved.

### **Asymmetric information**

The IP opponents' major objections include the argument that governments do not possess sufficient and relevant information to know beforehand which sector is potentially viable to be supported by industrial policy tools. This asymmetry of information is allegedly an insurmountable obstacle to implementing IP. However, if one takes a closer look at this argument in the light of other economic policies commonly carried out by governments all over the world, its relevance quickly disappears. Rodrik (2007, 2008), for instance, says that governments implement a great deal of regulatory policies that could be rejected exactly on the same grounds of inherent asymmetric information. Despite that, we do have fiscal and monetary policies, healthcare and social policies, pension policy, education policy, trade policy, competition policy, and many others. Thus, industrial policy is just one of many economic and political measures adopted by governments and rejection of IP on account of information asymmetry would logically imply rejection of all other policies facing this problem, too. As Rodrik says (2008: 2-3) „*. . . most governments do carry out various forms of industrial policy already, even if they call it by other names ("export facilitation", "promotion of foreign investment", "free-trade zones", etc)*“.

### **Rent-seeking and corruption**

The second most frequently referenced obstacle to successful IP implementation is the danger of rent-seeking and the related corruption. Even this argument can be refuted by looking at the issue in a broader context. The thing is that rent-seeking and corruption are inherent to every, not just capitalistic, society and in no case does it apply only to industrial policy. Although to different extents, corruption is present both in developing and advanced countries, both in countries implementing industrial policy and those that do not. For this reason, the argument that IP cannot be successful due to the danger of corruption and rent-seeking is little convincing. Moreover, as Robinson says (2009), rent-seeking problems are strongly sensitive to the political context in which industrial policy is implemented.

We have just outlined two major objections to industrial policy implementation along with the relevant counter-arguments. Despite this difference of opinions, today most countries have adopted and implemented some form of IP such as running agencies that tout for not only foreign investment, Rodrik (2004). Now that we have mentioned the main (theoretical) obstacles to IP we know that most advanced countries do carry out some sort of industrial policy. The question is now whether industrial policy really does help enhance productivity and competitiveness of a country and thus accelerate its economic development. It may not come as a surprise that the opponents and advocates of IP provide different answers.

Rodrik (2008) says that IP opponents rely on cross-industry econometric studies, which do not suggest a clear positive relationship between the way industrial policy is implemented and the economic strength of a country. Lee (1996), Lawrence and Weinstein (2001) are among such authors. Economists are of different opinions as to whether industrial policy measured by economic tools really works, that is, whether it tends to the fulfilment of its goals. Based on their own research and study of literature, Pack and Saggi (2006) and Rodrik (2004) have come to the conclusion that the empirical data on the implementation of different industrial policies are still insufficient to see clearly whether industrial policy is fruitful or not.

Those advocating industrial policy use mainly case studies from particular countries to illustrate the efficiency of industrial policies such as Rodrik (2004, 2008). They say that the tools of economic analysis used, multiple-regression models in particular, are prone to such problems as ignored variables and/or unclear causal relationships and, therefore, case studies from particular countries are the only reliable method. Rodrik (2004) then lists countries where IP was implemented successfully.

## **Industrial policy and globalization**

In the third millennium, global economy faces new challenges and so does industrial policy. Some authors such as Lall (2004) maintain that globalisation has degraded the potential of industrial policy making its benefits unclear. Also the UN (2007) Report mentions that business policy, as one of the key parts of industrial policy, is no longer as efficient as it used to be. The ongoing globalization, the liberalization of world trade, and the fewer market barriers generally lead to the importance of business politics being diminished and thus the efficiency of industrial policy being smaller. Moreover, IP has always been implemented along with other state policies such as fiscal, monetary, and social policies. This may bring about conflicts between the objectives and tools of industrial policy and other policies. This is a problem pointed out by Valila (2006), who warns that some IP tools are also fiscal tools, which may prevent industrial policy from bringing the desired results.

## **CONCLUSION**

Industrial policy is one of the many business and political measures realized by the state. Same as with fiscal, monetary, social, healthcare and other policies, there is nothing extraordinary about industrial policy and, therefore, arguments trying to prove that IP cannot be implemented successfully because of asymmetry of information and problems of rent-seeking are mostly unjustified. In broader aspect, industrial policy is an integral part of structural policy and most advanced countries do implement some form of IP. This process has been much accelerated by the financial crisis of 2008. Today industrial policy partially coincides with innovation policy and the need to adequately respond to the global economic challenges. Therefore, the new industrial policy assumes that, in a globalized world, industries have no chance if they do not extend their sphere of interest

beyond domestic markets. The future research should be mainly concerned with the impacts of the financial crisis on IP generally, and with the industrial policy tools used in the post-crisis upturn period in particular.

# SOCIO-ECONOMIC INNOVATIONS - A CHALLENGE FOR MANAGEMENT

Anna Putnová  
Brno University of Technology, Czech Republic

## ABSTRACT

*An innovation is defined as launching new or substantially improved products or services. Innovation Union is a flagship initiative of the Europe 2020 Strategy. At first innovations were only based on new technologies later including also organizational changes. Now it is social innovations that seem to play a major role. In June 2009, the Czech government approved a National Research, Development, and Innovation Policy for 2009 to 2015. This is a systematic approach to innovation management. Today, advanced countries are taking what is called a third generation approach – integrated strategy of socio-economic development. This paper tries to show the contribution of socio-economic innovation for management of companies.*

## INTRODUCTION

The innovation concept was centred about changes in technology. It was only later that also organisational changes came to be seen as innovation. In recent years, social innovation has been growing in importance. Socio-economic innovation strategy is an important attribute in the time of economic slowdown since increasing sales, improving quality, and extending markets can no longer be based on financial support, but rather, internal development incentives have to be searched for. Any form of innovation is related to change, progress, and increased competitiveness. Innovation means launching new or substantially improved products, methods, and/or services. In the European Union, innovation has become an important factor of economic development.

(US is steadily performing nearly 50% better than EU.  
China is still 55% below EU but is catching up).

## Innovation in EU

The Innovation Union plan contains over thirty actions points, with the aim to do three things:

- make Europe into a world-class science performer
- remove obstacles to innovation – like expensive patenting, market fragmentation, slow standard-setting and skills shortages – which currently prevent ideas getting quickly to market
- revolutionize the way public and private sectors work together, notably through Innovation Partnerships between the European institutions, national and regional authorities and business.

European Innovation Partnerships will bring together the public and private partners – in Europe, in a country, in a region – to achieve clearly defined objectives in areas where, addressing social problems, Europe may become number one. These partnerships will mean better research, coordinated investment, fast legislation and higher demand. The primary funding provided by the Commission will encourage further investment from the partners. The Commission will take measures for better access to funding. In cooperation with the European Investment Bank, it will facilitate cross-border operations in risk financial exchanges, strengthening the risk-sharing financial instrument.

Through Innovation Union, companies may commercialise ideas to receive new power. Innovation Union means:

- better access to funding,
- innovation-friendly rules and regulations,
- fast regulative legislation,
- cheaper patenting,
- innovations supported by the public sector,
- innovation partnerships making companies in EU more competitive,
- simpler access to the EU research and innovation programmes.

Sources: Innovation Priorities for Europe (2004).

The Scoreboard places member states into the following four groups (see figure 2 below):

**Innovation leaders:** Denmark, Finland, Germany, Sweden all show a performance well above that of the EU27 average.

**Innovation followers:** Austria, Belgium, Cyprus, Estonia, France, Ireland, Luxembourg, Netherlands, Slovenia and the UK all show a performance close to that of the EU27 average.

**Moderate innovators:** The performance of Czech Republic, Greece, Hungary, Italy, Malta, Poland, Portugal, Slovakia and Spain is below that of the EU27 average.

**Modest innovators:** The performance of Bulgaria, Latvia, Lithuania and Romania, *Innovation Priorities for Europe* (2004).

## Socio-economic development

This type of development combines such concepts as education and development of personality which also means development of society. Any form of innovation results in positive changes, progress, and competitiveness. Social innovation should bring more employment, better services offered to the public and, most of all, deployment and development of human potential. Support for social innovations on a European scale gives a chance to new forms of education:

- lifelong learning of all the generations,
- equal opportunities for women,
- closer cooperation between the public and commercial sectors,
- and many others.

In June 2009, the Czech government approved a National Research, Development, and Innovation Policy for 2009 to 2015. This is a systematic approach to innovation management. Advanced countries are taking what is called a third generation approach – integrated strategy of socio-economic development. [*Innovation Union*, 2011].

**Figure 2 : EU Member States' innovation performance**

Note: Average performance is measured using a composite indicator building on data for 24 indicators going from a lowest possible performance of 0 to a maximum possible performance of 1. Average performance in 2010 reflects performance in 2008/2009 due to a lag in data availability.

The performance of Innovation leaders is 20% or more above that of the EU27; of Innovation followers it is less than 20% above but more than 10% below that of the EU27; of Moderate innovators it is less than 10% below but more than 50% below that of the EU27; and for Modest innovators it is below 50% that of the EU27.

**Figure 3: Innovation index**

### Research and innovation performance index: best performing EU countries compared to Japan and US

Sources: Presentation of J.M. Barroso to the European Council, 4 February 2011

There are many definitions of socioeconomic development. “According to Inglehart and Welzel, three closely intertwined components characterise human development or societal progress: socioeconomic development, emancipative cultural value change and democratisation”, [Deutsche Bank Research, p.10 (2008)].

**Figure 4: The process of human development**

Social innovation may be seen as a form of employment, public service and, mostly, fulfilment and development of human potential.

The green light for social innovation on a European scale improves the chance of support for new, innovative forms of education:

- all generations taking part in lifelong education,
- equal chances created for women in society,
- closer relationship between the public and private sectors in implementing innovations, etc.

*“Every firm should look at decisions and opportunities through the lens of shared values. This will lead to new approaches that generate greater innovation and growth for companies and also greater benefits for society. Companies can create economic values by creating societal values.”* [Porter, M. and Kramer, M., p. 65, (2011)].

## Socio-economic innovation – case study from the Faculty of Business and Management

Faculty of Business and Management is one of 20 business-and-management-oriented public universities. In 2010 it ranked as 17<sup>th</sup>. According to the demographic trends, the student numbers will drop by a whole one third over the next three years. It is clear that the faculty had to look for a new strategy, other than increasing the number of students, to improve its position in the education marketplace [Etický kodex 2011]. Due to a university restructuring policy, the funding received in 2010 dropped by 15 percent as compared with 2009. Thus the strategy chosen was socio-economic innovation. The objective to be achieved was to balance the budget and not increase the costs of the new methods. We concentrated on:

### 1. Quality of research

- innovation meant changing the rewarding of academics. While previously it was older staff members having worked with the faculty for a long time who received the best pay, since 2009 we have adopted a discriminating approach giving preferential treatment to younger teachers. Being based on an age limit, the system was transparent providing funding for their professional development.
- the best research workers were given a symbolic financial reward along with a public appreciation by the Dean

## 2. Quality of teaching

- we focused on new forms of education, placing more emphasis on lifelong learning and reducing fulltime study in some courses. We enhanced e-learning and self-teaching forms. This meets the requirements of the new ways of study based on new technologies.
- students were given more say in appraising the courses through anonymous enquiries or via the Student Chamber of the Academic Senate
- a student club was established which is also used for hosting social events

## 3. Shared values

An ethical code was created within 15 months by a group of faculty stakeholders. The point was to monitor the ethical aspect of each activity. This interactive approach has proved to be efficient and the subsequent discussion brought many suggestions for its improvement [Etický kodex 2011].

- assessing processes – next to ethical criteria we also used the criterion of efficiency in judging the activities of faculty departments.
- CSR – we prepared a concept involving both social and environmental activities. For the second time, the faculty organized an alumni get-together to strengthen the feeling of identity with the faculty. We are creating a tradition for cultivating the academic environment by teachers and students together organizing a charity collection under a Christmas tree. The money is given to a children's home.

## 4. Diversity

- Diversity – also students and doctoral students from Eastern Europe and Asia are admitted. We make it a point to search for talents from the former states of the Soviet Union and Eastern Europe. Their activities help internationalize the faculty. It is diversity that we see as chance to have more socio-economic innovations.
- cooperation with practice – we have a systematic approach to establishing cooperation with commercial companies. This is an open group of firms cooperating with us mostly on educational projects.

# CONCLUSION

This approach has yielded good results within very short period. In the rating, the Faculty of Business and Management advanced eight positions finishing among the first ten best business-and-management faculties in the Czech Republic. In terms of funding required, these changes were little demanding. What they did require was a value concept to help implement the innovative changes to their full extent. Using the full potential of human and academic resources can be seen as a return to the role the universities have played since the middle ages. Universities have always been free institutions promoting progress and creativity. They were open to students from different countries guaranteeing education and dissemination of moral values. We should not forget about this aspect if we do not want to end up as mere educational agencies. Progress and responsibility are two sides of the same coin. Therefore, a firm value basis and socio-economic innovations are necessary for the development and growth of society. The case study from the Faculty of Business and Management is an example and perhaps also inspiration for the commercial sphere, which, in the current period of economic upturn, is looking for efficient ways of strengthening its prosperity.

# **CREATING SUSTAIBABLE EMPLOYMENT: WORKPLACE ACCOMMODATION DECISIONS FOR EMPLOYEES WITH HEARING DISABILITIES**

**S. Janse van Rensburg and R. van der Walt**  
**University of Pretoria, South Africa**

## **ABSTRACT**

*Workplaces are often inaccessible and work practices create barriers for people with disabilities to perform to their full potential and advance upon the career ladder. Workplace accommodation actions can be seen as a way to remove these barriers to advance performance and progression. The purpose of this study is to identify the factors managers consider when they receive a request for workplace accommodation, and how these different factors influence the outcome of the request. A qualitative strategy of inquiry was used to elicit the underlying constructs managers formed in the consideration of requests. Six (6) different scenarios in which a hearing impaired employee has asked for workplace accommodation were presented to respondents and their reactions were elicited using the Repertory Grid Technique. The main factors managers considered were (i) current performance, (ii) size of the request, (iii) the attitude and commitment of the employees towards their work, (iv) their reaction to their disability and (v) using the request as a possible incentive or reward. Being familiar with the factors used to consider requests may allow organisations to develop decision making models that attempt to remove the personal bias involved in these decisions. Reasonably accommodating employees can ensure a more equitable working environment in which both people with and without disabilities may actively participate and benefit. Factors that are considered in the awarding of requests are not always relevant to the promotion of a barrier free workplace. This study provides a basis from which further studies can develop a model that can be applied in the consideration of workplace accommodation requests.*

## **INTRODUCTION**

Employment plays a vital role in modern life; it ensures social and economical inclusion. Unfortunately, people with disabilities experience several barriers in entering, keeping and advancing in gainful employment (Mansour, 2009; Ngweni, 2007; Kleynhans & Kotze, 2010). People with disabilities have benefited from the provision of workplace accommodation, but there is little consensus on what constitutes workplace accommodation and what factors should be considered in the provisions of such accommodation (Butterfield & Ramseur, 2004).

The purpose of this paper is to examine the factors that influence managements' decisions when considering workplace accommodation requests. Factors that possibly affect decisions on workplace accommodation can tentatively be defined as a) onset controllability - the level of control the person with the hearing disability had in the onset of the impairment; b) the size of the request - the magnitude of the financial and non-financial implications of the request and c) current performance - both the successful performance of job functions as well as the integration of the person with the team and culture of the organisation.

### **Exclusion of People With Disabilities**

Exclusion of people with disabilities from the mainstream of society prevents them from accessing fundamental social, political and economic rights. People with disabilities (PWD) are excluded not only from society, but also from employment. According to Jones (2008) the ratio of the employment rate of PWD to non-disabled in most OECD countries is 50%. Cook & Burke (2002) stated that while only 18% of non-disabled

people are excluded from employment, an estimated 70% of PWD are excluded. In the recent Annual Report of the Commission for Employment Equity (CEE) (2009), PWD are the most under-represented group in the South African work place, at only 0.9% of reported employment.

This exclusion can be the result of a range of factors, for example social attitudes which have perpetuated stereotypes of disabled people as dependent and in need of care; and a discriminatory and weak legislative framework which has sanctioned and reinforced exclusionary barriers (Mansour, 2009, Kleynhans & Kotze, 2010).

## **Employing People with Disabilities**

Employment is seen as a fundamental human right and allows an individual to become a valuable and contributing member of society. However, this remains a fundamental problem affecting the majority of people with disabilities and their families. Ward & Baker (2005:143) states that “individuals with a disability ...while able to work, were limited in the kind or amount of work they could do.” PWD are not just limited by the kind of work they can do, but also face barriers in entering and retaining employment (Ward and Baker, 2005; Schur, Kruse & Blanck, 2005; Solovieva; Walls; Hendricks & Dowler, 2009).

According to Schur, Kruse & Blanck, (2005) the employment experiences of PWD are strongly impacted by supervisor and co-worker attitudes. These attitudes are influenced by several factors including stereotypes; discomfort in being around people with disabilities, strain caused by communication difficulties, personality factors and prior contact with PWD's. These attitudes can resultantly affect the employee with a disability by influencing supervisors' and co-workers expectation of their performance. Evidence has been found of a negative bias on the performance potential of PWD (Colella, De Nisi & Varma, 1998); lower performance evaluations, the desire of the PWD to work and the hiring and career progression of PWD (Schur, Kruse & Blanck, 2005).

The International Labour Organisation (ILO) (2002) prescribes that employers should adopt a strategy for managing disability as an integral part of their overall employment policy and specifically as part of the human resources development strategy. The disability management strategy should include provision for: (a) recruiting jobseekers with disabilities, including those who have not worked before and those who wish to re-enter the labour market after a period of non-employment; (b) equal opportunity for employees with disabilities; and (c) job retention by employees who acquire a disability.

Workplace accommodation is defined by the ILO (2002) as:

”Adaptation of the job, including adjustment and modification of machinery and equipment and/or modification of the job content, working time and work organisation, and the adaptation of the work environment to provide access to the place of work, to facilitate the employment of individuals with disabilities.”

Solovieva, *et al* (2009) confirms that workplace accommodations are essential for reducing unemployment amongst PWD. When opportunities and workplace accommodations are provided, people with disabilities can add value to the workplace by contributing valuable skills and abilities to every workplace. The obligation can arise when an applicant or employee voluntarily discloses a need or the need become self evident to the employer (TAG, 2003).

Workplace accommodations can take several forms, including structural modifications to a work station or work site to make facilities more accessible: assistive technology and devices; adopting a flexible work schedule; changing training and assessment materials and systems; adapting existing equipment or acquiring new equipment: including computer hardware and software; restructuring jobs so that non-essential functions are re-assigned; providing specialised supervisions; training and support in the workplace as examples (TAG, 2003; Hartnet, Thurman & Cordingly; 2010).

There are several factors that influence the awarding of workplace accommodation requests. These include, but is not limited to fears of high costs related to accommodations, the reaction of co-workers and the retention of PWD after workplace accommodation have been made (Schartz; Hendricks & Black, 2006; Hernandes, McDonald, Lepera, Shahna, Wang & Levy 2009; Paetzold, Garcia, Colella, Ren, Triana, & Ziebro, 2008).

Several studies have shown that workplace accommodation is more likely to be given for easily observable disabilities than hidden disabilities (MacDonald-Wilson, Rogers, Massaro, Lyass & Crean, 2002). Physical, auditory and visual disabilities are more easily recognised, while mental disabilities are most often

hidden and not so easily observable, thus it can be expected that workplace accommodations will rather be given to people with physical or auditory and visual disabilities.

However, the extreme levels of inequality and on-going discrimination experienced by disabled people in the workplace suggest that the provisions of legislation and policy statement are not, on their own, sufficient to remove discriminatory practices, nor to support the creation of equal employment opportunities for people with disabilities. It is necessary to understand the problem from various perspectives including the individual with a disability, the complexity of the disability itself; as well as the attitudes and perceptions of managers and co-workers.

Florey and Harrison published a study on reactions to reasonable accommodation requests in 1997, describing an information-processing model of responses to requests for workplace accommodation from disabled employees. The primary focus of their study was to provide a framework of the cognitive and affective mechanisms underlying the support or resistance of managers towards accommodation requests. A sequence of information processing mechanisms is proposed culminating in the willingness or unwillingness to comply with accommodation requests.

The model can be applied to identify the perceptions, cognitions, judgments and intentions of employers when an employee with a disability requests an accommodation. It describes three general sets of variables and mechanisms which influence a decision based on a request. The three variables identified in this model are based on the stimulus characteristics and pertain to the person lodging the request (source), the request itself (message) and the receiver of the request (receiver). The characteristics of the source include the type and severity of the disability, onset controllability, current job performance and request history (Florey & Harrison, 1997). None of these factors should be considered according to the Code of Good Practice on the Employment of People with Disabilities used in South Africa.

The message (request) includes the magnitude of the accommodation requested, the justification for the request, and the formality with which an accommodation request is lodged also influence the reaction to the request (Florey & Harrison: 1997). Legally, the magnitude of the request is one of the only factors allowed to influence willingness to make an accommodation.

The characteristics of the receiver pertain to previous contact with people with disabilities, experience in accommodation requests, stereotypes of disabled and knowledge of the disability (Florey & Harrison 1997). If the receiver has had previous contact or experience in this regard, their decisions might be influenced by that experience.

A persons' willingness to help is reduced if the person receiving assistance can be made personally responsible for the situation they find themselves in (Florey & Harrison, 1997). Thus if the fault for the onset of a disability can be attributed to the person him or herself, other people will be less inclined to offer assistance.

It is commonly perceived that all accommodations are costly. This is, however, a misperception. When considering a request for accommodation, this subjective determination often plays a role. It is generally accepted that requests that imposes a smaller imposition should be complied with, while bigger requests can legitimately be refused (Florey & Harrison, 1997).

Intermediate judgements are influenced by affect, cognition and behaviour. Affect can be seen as the respondent's feelings towards, and evaluation of a person, issue or event, cognition refers to his/her knowledge, opinions, beliefs or thoughts about the object, while conation describes the behavioural intentions and actions regarding the event (Fishbein & Ajzen, 1975).

Weiner in (Florey & Harrison, 1997) states that cognitions, precedes affect. These intermediate judgments will then influence willingness to help. Furthermore, the norm of social responsibility, the possible job performance consequences as well as perceptions that all requests for accommodation will be costly, will influence the long and short term intentions to comply with accommodation requests (Florey & Harrison, 1997).

By modifying various factors in the source of the request, like onset controllability or magnitude of the request, it is possible to determine how perceptions and cognitions influence judgments and intentions to comply with the request. An important finding in the study was that the history of the disabled employee (the source of the request) caused a strong positive affect in the attribution of responsibility which plays an important role in the favourable consideration of a request. The magnitude and perceived cost of the request also contributed significantly to the intention to comply with the request.

Ajzen and Fishbein (1975) propose that beliefs, representing individuals information about an object, person or event is the basis of their attitude and subjective norms toward that object, person or events. This informational base ultimately determines an individual's attitudes, intentions and behaviour. They further state that a human being is essentially a rational organism who uses the information at his/her disposal to make judgments, for evaluations and ultimately make decisions. According to this model, decisions regarding the

awarding of requested workplace accommodation are influenced by several subjective factors based on beliefs and perceptions.

## OBJECTIVE

Taking the discussion in the previous section into consideration, it becomes clear that PWD face several barriers in society and the workplace. Workplace accommodation is a strategy that is available to remove or limit the effect of those barriers. This study endeavoured to understand some of the factors that influence a manager's decision to comply to a request for workplace accommodation.

The objective of this study is to identify which factors managers consider when they receive a request for workplace accommodation from a hearing impaired employee. It further investigates the influence of these factors influence on the outcome of workplace accommodation requests. These questions are listed in table 1.

**Table 3: Research Questions**

### Specific Research Questions

To what extent do the characteristics of the source of the request influence the initial perceptions and cognitions of the receiver?

To what extent will contribution of personal responsibility influence affect towards the accommodation request?

To what extent will perceived imposition/cost influence affect towards the request?

To what extent will perceived imposition/cost influence obligation to comply?

To what extent will the perceived performance consequences influence obligation to comply?

## DESIGN

Studying the factors underlying responses toward requests for workplace accommodation requires investigation of the subjective meaning applied to the analysis of these requests (Florey and Harrison, 2000). A qualitative study was conducted using a survey design. The survey was implemented by conducting interviews with respondents.

This study required analysis of the deep substructure of beliefs, pre-conceptions, norms and attitudes and their influence on intentions and decision (Fishbein & Ajzen; 1975). Eliciting these deep lying constructs, required a qualitative strategy of inquiry. This choice is supported by Florey & Harrison's original 1997 study that used a qualitative approach to identify factors that influence decisions on workplace accommodation.

Florey & Harrison's original study has been followed up by several studies on the topic of workplace accommodation using qualitative approaches (Combs & Omvig, 1986, Florey & Harrison, 2000 and Baldridge & Veiga, 2003). As these studies were all conducted in the USA, the qualitative survey design was used to attempt to replicate the findings of the 1997 Florey and Harrison study in the, Gauteng Province of South Africa, the economic heartland of the country. Even though Gauteng Province only comprises 1.4% of South Africa's land surface, it accommodates 22.4% of the nation's population, contributes 33% of the national economy and a phenomenal 10% of the GDP of the entire African Continent (SouthAfrica.info: 2011).

## METHOD

The research strategy is based on personal construct theory. This strategy encompasses eliciting personal construction of meaning from participants, based on the premise of "man as scientist" (Stewart and Stewart, 1990). The key points of Personal Construct Theory (PCT) are firstly that perceptions influence expectations, and expectations are influence by perceptions; secondly the medium of this influence is the construct system and finally, these construct systems are unique and develop throughout life (Stewart & Stewart, 1990). Kelley (as cited in Fransella; Bell and Bannister, 2004: 3) defines a construct as being:

*... "A basic dimension of appraisal, often un verbalised, frequently unsymbolised, and occasionally unsignified in any manner except by the elemental process it governs. .... the system of constructs provides each man with his own personal network of action pathways, serving both to limit his movements and to open up to him passages of freedom to which otherwise would be psychologically non-existent."*

In PCT the focus is on the process of construing, which consist of the application of personal constructs created during life and which then forms the personal construct system. A central assumption of the theory holds that a person's reality is built up of contrasts rather than absolutes, thus it can be surmised that a person's construct system is composed of a finite number of dichotomous constructs (Jankowich, 2004). The argument is that nothing can be affirmed without simultaneously denying something else. For example, if we say person A is friendly, we are also saying he/she is not unfriendly. The theory continues to state that constructs have a range of convenience, which holds that constructs operate within a context and that it can only be applied to a finite number of elements (Fransella; Bell and Bannister, 2004).

Repertory grids is a technique developed by Kelley used to elicit personal constructs. According to Jankowich (2004: 14) it is a "form of structured interviewing which arrives at a precise description uncontaminated by the interviewer's own viewpoint." This technique was used to elicit personal constructions of meaning and judgements. In the construction of grids, it is important to use the bipolarity of constructs in the rating of elements as well as the context in which the elements must be within the range of each respondent's range of convenience.

## **Instruments**

As all respondents would not necessarily have had experience in workplace accommodation requests, six different scenarios of an employee with a disability requesting a workplace accommodation was described. Each scenario addressed all the factors as stated in the research questions. The different factors that were manipulated in each scenario included onset controllability; job performance and size of the request. To control for the wide range of disabilities and workplace accommodations only one type of disability, i.e. hearing impairment, was described. As people with hearing disabilities are relatively well represented in the workforce, it is feasible the respondents might have encountered this type of disability in the workplace. There is also a wide range of accommodations available to people with hearing disabilities, ranging from assistive devices, changes in work arrangements and support from team members (Baldridge and Swift, 2003).

Six scenarios of employees with hearing disabilities were written. The description of the employment situation and job role was kept neutral and respondents were told the employee was a member of their team. Participants received and read all six scenarios. They were then given an opportunity to record their initial emotional and cognitive reactions to the scenarios, the factors they would bear in mind in considering the request and their intention to comply with the request. The repertory grid was then used to elicit the participants' constructs regarding the scenarios.

## **Data collection**

Data was gathered as to the initial perceptions of the respondents as they read the scenarios. They were allowed to record their thoughts, feeling, factors that was important for them as well as their intentions to respond to each request, on an initial response sheet. After this process, the repertory grid was used to elicit further responses. Respondents were then asked to identify in rank order of who they thought they would be more likely to accommodate as well as to rank the factors they considered in this decision.

Data was collected using the repertory grid technique. The following steps were followed in collecting the data. A scenario with a description of six employees with a hearing disability, background regarding the onset controllability, job performance and request for accommodation was handed to each participant. This construct elicitation was used to determine effect of the initial perceptions and cognitions on the intermediate judgements.

Three of the respondents were not willing to use the repertory grid as they felt the process was too time consuming. They were then allowed to discuss each individual scenario separately, and then rate their intentions to allow the accommodation and the factors they felt would influence their decision.

This unwillingness to use the repertory grid development limited the type of repertory grid analysis that could be used. The data gathered in the initial response sheet and obtained during the rest of the interviews was still useful in examining the factors managers reported.

## **RESULTS**

A convenience sample of 10 managers in the Gauteng Province of South Africa was drawn. The sample consisted of 20% black and 80% white managers, while 40% were male and 60% were female; this distribution reflects the current racial workforce demographics for senior and executive managers as published by the Commission for Employment Equity (2009-2010). The organisations represented were 30% international organisations (from the mining, ICT and pharmaceutical sectors), 50% national companies (from engineering, manufacturing, professional consulting and financial sectors), 20% were from the public service sector on local as well as national sphere of government. The organisational positions of the respondents were distributed as 40% on executive management level, 30% on senior management level and 30% from human resource management. Of the ten respondents interviewed, only one indicated that she had been involved in a workplace accommodation request before.

Before the factors that managers considered regarding workplace accommodation request was examined, their understanding of workplace accommodation was clarified. In general the respondents had an adequate understanding of the objectives of workplace accommodation. One respondent reported not being sure of what it was. The general consensus was that workplace accommodation aims to assist PWD to be able to be gainfully employed and be able to cope with the demands of employment. Two additional aims identified are to ensure effective performance as well as equality. One respondent stated *“Allow a person a fair platform to perform their best....it creates and equal departure point for reaching potential.”*

When asked about the types of workplace accommodations that can be made the majority of respondents placed more emphasis on structural and environmental adaptations. This indicates a tendency to see disability a bit one dimensional – physical and more “obvious” disabilities taking centre stage. One response that can be quoted in this context is: *“It is not fair to change the essential elements of the job – can’t create discrimination towards rest of team”*. Three of the respondents however, identified a wider range of workplace accommodations, including work reassignment; creating awareness amongst other employees and team members, assistive devices and employee assistance programmes for PWD.

As the constructs elicited can differ between the respondents, it becomes difficult to compare individual grids. In this study, generic content analysis procedures were used to cluster the different constructs in grids (Jankowicz, 2004). Table 3 depicts the 7 different categories of constructs identified in combining the seven grids.

**Table 4: Seven Categories of Constructs Based on Generic Content Analysis**

Category	Definition	Sum %
<b>Cause of disability</b>	Not to blame for the disability vs. own negligence caused the disability; Control over onset of the disability;	3 7
<b>Team contribution</b>	Good relationships with colleagues; Good relationships with colleagues vs. does not try to communicate or fit in; positive impact on the team	7 16
<b>Attitude and commitment</b>	Tries hard vs. disruptive to the environment. Positive attitude and commitment vs. tries his best vs. does just the minimum expected of him	11 24
<b>Performance</b>	Delivers very good work vs. poor work; earned their stripes vs. not very deserving	4 9
<b>Size of the request</b>	Small (reasonable) request vs. Request is too big – way out, Less strings attached to request; Cost-benefit ratio.	8 18
<b>Dealing with disability</b>	Deal with their disability in the best possible way vs. hiding behind disability. Disability does not become the employer’s problem vs. has not overcome disability – becomes “others’ problems,	7 16
<b>Miscellaneous</b>	Kind of precedent being established; see the request as a possible incentive/reward; perceived openness for negotiation	5 10
<b>Total</b>		45 100

As can be seen in table 3 the constructs appearing more than any other is attitude and commitment, which comprised 24% of all the constructs; second the size of the request, comprised 18% and finally the contribution made to the team and the way the individual deals with their disability each represented 15%. This result can be seen to indicate that the characteristics of the sources of the request have an influence on the initial perceptions and cognitions of management to a very large extent. The perceived cost/imposition of the request also seems to play a big role in the initial perceptions and cognitions. The cause/onset of the disability seems to have a smaller influence on the initial reactions of the respondents.

## Intentions to comply with the request

Respondents were also asked to rate the different scenarios on the likelihood that they will comply with the request. These ratings are presented in table 4:

**Table 5: Ratings of intention to comply with request**

Respondent	Scenario					
	1 Low onset controllability High job performance Medium request	2 Low onset controllability Low job performance Large request	3 Low onset controllability Low job performance Small request	4 High onset controllability Low job performance Large request.	5 High onset controllability High job performance Large request.	6 High onset controllability High job performance Small request
1	3	5	2	6	4	1
2	1	4	5	6	3	2
3	1	4	5	6	3	2
4	2	3	4	5	6	1
5	6	3	1	5	4	2
6	2	4	3	6	5	1
7	2	4	3	6	5	1
8	3	4	2	6	5	1
9	2	4	3	6	5	1
10	2	4	3	6	5	1
Mean	2.4	3.9	3.1	5.8	4.5	1.3
SD	1.4	0.6	1.3	0.4	1.0	0.5

As illustrated in table 4, the highest rating in terms of intention to comply with the request was given to scenario 6 with a person who even though he could be assigned blame for causing his own disability, was seen to have a positive attitude towards his work as well as coping with his disability. His request was also small and seen to be more reasonable. Some of the comments made regarding this scenario on the initial reaction response sheet were as follows:

**Table 6 Initial reactions for Scenario 6**

Scenario 6: high onset controllability, high job performance and a small request	
Initial thoughts and feelings	Factors considered
<ul style="list-style-type: none"> <li>Valued employee</li> <li>Brilliant attitude</li> <li>Passion toward life</li> <li>Takes responsibility</li> <li>Makes it easier for himself and others</li> <li>Appreciate human willingness to perform</li> <li>Tries hard/committed</li> <li>Would like to help him</li> <li>He is stubborn but resilient</li> </ul>	<ul style="list-style-type: none"> <li>Team player</li> <li>Management potential</li> <li>Performance</li> <li>Initiative</li> <li>Request well thought out</li> <li>Takes parameters of the organisation into consideration</li> <li>Not a very big ask</li> <li>Good worker</li> <li>Positive and wants to live a full life</li> </ul>

The person second most likely to receive the accommodation was depicted in scenario 1, who was also described as a high performer and asked for a small accommodation. This person however, had little or no control over the onset of his disability. Some of the comments made regarding this scenario on the initial reaction response sheet were as follows:

**Table 7: Initial Reactions to Scenario 1**

Scenario 1: low onset controllability, high job performance and a medium request	
Initial thoughts and feelings	Factors considered
<ul style="list-style-type: none"> <li>He doesn't let his disability influence his job performance</li> <li>Team player</li> <li>More positive attitude</li> <li>Performance of good quality, ideas,</li> </ul>	<ul style="list-style-type: none"> <li>Would consider rewarding his performance to help keep him motivated</li> <li>High performance</li> <li>Request is reasonable</li> <li>Team person</li> </ul>

<ul style="list-style-type: none"> <li>• initiative, socially active</li> <li>• Good – nothing puts him off</li> <li>• Doing excellent work – don't want to lose him</li> <li>• Reasonable</li> <li>• Fair</li> <li>• Tries hard/committed</li> <li>• Likeable person</li> </ul>	<ul style="list-style-type: none"> <li>• Already good performance – why spend more money</li> <li>• Small cost to provide possible large benefits</li> </ul>
--	--

The person third most likely to receive the accommodation was depicted in scenario 3, who was described as a poor performer and asked for a small accommodation. This person also had little or no control over the onset of his disability. Some of the comments made regarding this scenario on the initial reaction response sheet were as follows:

**Table 8: Initial reactions for Scenario 3**

Scenario 3: low onset controllability, low job performance and a small request	
Initial thoughts and feelings	Factors considered
<ul style="list-style-type: none"> <li>• He may lack confidence in his own abilities</li> <li>• Solid citizen</li> <li>• Performs well under well defined structures</li> <li>• Can be up skilled</li> <li>• Non-fitting in might be due to others not understanding him</li> <li>• Frustration caused by the situation</li> <li>• Sympathy</li> <li>• Worth spending money on him</li> <li>• Seems to want an improvement</li> <li>• Assistance - make things easier in environment</li> <li>• Big difference is his potential</li> <li>• Seems not to always hear what he should do</li> <li>• Seems hesitant to take action when he doesn't know exactly what is expected of him</li> <li>• Fear of failure</li> </ul>	<ul style="list-style-type: none"> <li>• He obviously tries hard</li> <li>• Performance</li> <li>• Attitude/passion/motivation</li> <li>• Delivery good and bad</li> <li>• Request within reason</li> <li>• Create awareness on both sides</li> <li>• Can perform well if communication is received correctly</li> <li>• Small request</li> <li>• Time frame – what will be the benefits – personally, team and environment</li> <li>• Cost implication</li> <li>• Demands on team</li> <li>• He is coming with suggestions (willingness)</li> </ul>

The person fourth most likely to receive the accommodation was depicted in scenario 2, who was described as a poor performer and asked for a large accommodation. This person also had little or no control over the onset of his disability. Some of the comments made regarding this scenario on the initial reaction response sheet were as follows:

**Table 9: Initial reactions for Scenario 2**

Scenario 2: low onset controllability, low performance and a large request	
Initial thoughts and feelings	Factors considered
<ul style="list-style-type: none"> <li>• Should he be working?</li> <li>• His hearing is affecting his job performance.</li> <li>• He should have communicated his problems to me earlier</li> <li>• Don't always realize the impact of disability on job performance</li> <li>• Wants to improve, wants to be part of the team. Probably feeling anxious to participate</li> <li>• Is he lazy? Or is his hearing impairment impacting on his performance/confidence</li> <li>• Would still like to help him, but expect him to change his attitude</li> </ul>	<ul style="list-style-type: none"> <li>• Should not be in a teamwork environment.</li> <li>• Could he not perform other duties?</li> <li>• Poor performance - time/quality</li> <li>• Team dynamics</li> <li>• Accommodation will add to performance</li> <li>• Climate/team dynamics</li> <li>• Budget and availability of finances and other resources</li> <li>• Opportunity for him and others</li> <li>• Link between request and results</li> <li>• Demands on the organisation/team</li> </ul>

The person second least likely to receive the accommodation was depicted in scenario 5, who was described as a good performer and asked for a large accommodation. This person also had control over the onset of his disability, which was caused by negligence and not following OHS regulations. Some of the comments made regarding this scenario on the initial reaction response sheet were as follows:

**Table 10: Initial reactions for Scenario 5**

<b>Scenario 5: high onset controllability, low job performance and a large request</b>	
<b>Initial thoughts and feelings</b>	<b>Factors considered</b>
<ul style="list-style-type: none"> <li>• Did not obey previous company's rules</li> <li>• Reason for disability own fault</li> <li>• Good performer</li> <li>• Takes initiative</li> <li>• Beyond organisation –impact of disability on other – clients</li> <li>• Asking a lot</li> <li>• He might do some other things wrong</li> <li>• Want to assist – improve performance, assist environment</li> <li>• Positive attitude</li> <li>• Would like to help him but he has to be reasonable</li> <li>• Neglect - own fault for hearing loss</li> </ul>	<ul style="list-style-type: none"> <li>• He lost his hearing through neglect of looking after his own health</li> <li>• Cost benefit analysis – will financial analysis benefit the organisation?</li> <li>• Retention issues – if we change the system – he might leave</li> <li>• Cause of disability – did not comply to policies/procedures for OHS</li> <li>• Average worker</li> <li>• Careless/negligent</li> <li>• Will it improve the situation for him or the company?</li> <li>• Size of request</li> <li>• Being reasonable and job relevance</li> </ul>

The person least likely to receive the accommodation was depicted in scenario 4, who was described as a poor performer and asked for a large accommodation. This person also had control over the onset of his disability. Some of the comments made regarding this scenario on the initial reaction response sheet were as follows:

**Table 11: Initial reactions for Scenario 4**

<b>Scenario 4: high onset controllability, high job performance and a small request</b>	
<b>Initial thoughts and feelings</b>	<b>Factors considered</b>
<ul style="list-style-type: none"> <li>• Not coping</li> <li>• Uses disability as excuse</li> <li>• Stinking attitude</li> <li>• Does not co-operate</li> <li>• Does not take ownership</li> <li>• Deserved to be dismissed</li> <li>• Employee angry and dissatisfied</li> <li>• General poor performer</li> <li>• Trying to manipulate the situation with disability</li> <li>• Below par effort</li> <li>• Resistance to allow request</li> <li>• Last change before performance management</li> <li>• He irritates me</li> <li>• Unreasonable and demanding</li> </ul>	<ul style="list-style-type: none"> <li>• Can't work with people – maybe not his fault.</li> <li>• Not liked by staff.</li> <li>• Difficult to deal with</li> <li>• Performance is bad</li> <li>• Habitual offender</li> <li>• Reckless by nature</li> <li>• Attitude and performance</li> <li>• Request vs. attitude</li> <li>• Does not work as part of team</li> <li>• Behaviours – aggression</li> <li>• Cost implications</li> <li>• Inability to become part of the team</li> </ul>

From the rankings described above it seems as if the size of the request played the biggest role in the intention to complete. The three of the top rated scenarios which represented a small request like asking team members to speak louder and writing instructions down, while the bottom three scenarios had large requests like appointing sign language interpreters as personal service assistance, forcing all team members to attend sign language classes and purchasing expensive assistive devices.

The perceived performance variable seemed to play a secondary role to the top two rated scenarios both depicting a high performer requesting a small accommodation. The scenario where a poor performer requested a small accommodation was rated third. The other scenario of a high performer requesting a large accommodation was rated fifth, indicating the possibility that the size of the request will override the performance variable in factors the managers take into consideration when considering workplace accommodation requests. Onset controllability only seemed to be considered where a scenario described an employee who deliberately disobeyed occupational health and safety requirements resulting in significant hearing loss.

## Rating of Reported Factors taken into Considerations

Respondents were finally given the opportunity to identify the factors they did take into consideration when reading the workplace accommodation requests in each scenario. They were then asked to rate this with one being the most important factor. The different factors identified coincide quite closely with the categories of constructs identified using the generic content analysis reported in table 3. Where a factor is blocked out, the respondent did not report that as a consideration.

**Table 12: identified Factors and Their Ratings**

Factor Considered	Respondent Ratings										M	S
	1	2	3	4	5	6	7	8	9	10		
Size of the request	5	5	1	1	2	4	5	1	1	1	2.6	1.9
Current Performance	3	4	2	4	1	1	4	2	5	3	2.9	1.3
Positive attitude (willingness to try/effort put in)	1	1	4	3		3	1	3	3	2	2.3	1.1
Potential to perform	2	3	5		4	6	2			5	3.8	1.6
Control over onset of disability		6		2					6	6	5	2
Impact of accommodation on future performance			6		3			5	4	7	5	1.5
Personal reaction to disability	4		3			2				4	3.3	0.9
Contribution to the team		2					3	4	2		2.8	0.9

As illustrated in table 11 the attitude of the person asking for workplace accommodation is the factor reported as playing the most important role in the decision to reward the accommodation. The other factors considered in order of the combined rankings were size of the request, the contribution the requester is making to the team and the individual's current performance, requester's reaction and skill in coping with his own disability and the perceived potential of the employee to perform in the future of the accommodation is granted. Factors that play a lesser role in the outcome of the request were identified as the control the individual had over the onset of their disability and the impact the accommodation will have on future performance of the organisation.

## CONCLUSIONS

At the start of this paper the objectives were stated as the identification of the factors managers consider when they receive a request for workplace accommodation from a hearing impaired employee. The eight factors identified were (1) the size of the request, (2) current performance, (3) positive attitude (willingness to try/effort put in), (4) potential to perform, (5) control over onset of disability, (6) impact of accommodation on future performance, (7) personal reaction to disability and (8) contribution to the team.

The research questions stated at the start of this paper can be answered as follows:

### **To what extent do the characteristics of the source of the request influence the initial perceptions and cognitions of the receiver?**

The characteristics of the source of the request has a major influence on the initial cognitions and perceptions of the receiver in the sense that a perceived positive attitude toward the organisation, job and team seemed to have a positive reaction from the management respondents. If the respondents perceived that the requester had a positive outlook on life and also seemed able to deal positively with his/her impairment, it also

appeared to lead to a greater positive perception of this person and the willingness to want to help him/her. However, a negative attitude toward not only work, but also toward his/her disability seemed to lead to negative perceptions and decreased the intention of a manager to grant the requested accommodation.

**To what extent will contribution of personal responsibility influence affect towards the accommodation request?**

If personal responsibility could be attributed to someone with a positive outlook on life and his/her disability, the respondents were much more forgiving of the role the individual played in the cause of his/her disability. However, a negative outlook on life and the organisation, job or team, led to a more unforgiving perspective and a smaller drive to comply with the request.

**To what extent will perceived imposition/cost influence affect towards the request?**

The affective responses to a request perceived to be less of an imposition was generally more positive than if the request was perceived to be an excessive imposition. The negative affective response was reported in situations where the other factors of the request was perceived more positive, example the performance of the requester was good, or their attitude was perceived to be positive. If the other factors of the request were perceived to be more negative, the perceived imposition of the request seemed to have a stronger negative affective response.

**To what extent will perceived imposition/cost influence obligation to comply?**

The perceived imposition or cost of the accommodation played the most important role in the intention and obligation to comply with the request. If the request was deemed too big or unreasonable, even if this was seen as being requested by a valuable employee, the intention and obligation to comply was minimised.

**To what extent will the perceived performance consequences influence obligation to comply?**

If there was a perceived positive influence on future performance, the respondents were more likely to comply with the request. This however, also had a more negative effect in that where an already performing employee requested an accommodation, some of the respondents felt that as the person is already performing, he will not need the accommodation. The other side of this argument was that if someone requested an accommodation; they must first show the ability to perform before the request could be considered.

As this study was conducted in a small sample of ten, the results cannot be seen as representative. . However it opens several areas for deeper and more rigorous research to understand how requests for workplace accommodation will be considered and complied to. Future research can focus on how the characteristics of PWD and the perceptions of their attitude influence managers' accommodation requests. A further area of interest can be how managers and colleagues perceive the influence and justifiability of workplace accommodation on organisational and individual performance. Another focus for future research can be to examine the factors a PWD will consider when disclosing his/her need for a workplace accommodation.

## **Managerial implication**

This study serves to assists management in being aware of the factors taken into consideration when considering requests for accommodation. The underlying pre-cognitions and assumptions underpinning these decisions can lead a manager to make an unfair decision. PWD can also benefit from these results by understanding the factors managers take into considerations. From an organisational perspective the findings indicate the need to create awareness of the factors that could unfairly prejudice PWD in the conceding of workplace accommodation requests. This implies that awareness and education programmes should focus on the eliminating biases in the information processing of managers. Specifically training should highlight the need to remove barriers to performance in the workplace for example using written communication rather than verbal communication. .

Organisational and managerial practices aim to maximise the contribution of all employees' talent and abilities. PWD can be as talented and able as people without disabilities, but may experience several barriers in the workplace. Thus it is important to realise that workplace accommodation is essential to performance and not be seen as an incentive or reward for already good performance. The expectation of future benefits and value added by the employee to the organisation should be highlighted. Providing appropriate decision making models and policies for awarding of workplace accommodations can improve workplace retention and quality of life of PWD (this could even have a positive impact on employees without disabilities).

# **INFLUENCE OF CRM ON CUSTOMER LOYALTY – AN APPLICATION TO THE LIFE INSURANCE INDUSTRY IN SOUTH AFRICA**

**Mornay Roberts-Lombard and Leon du Plessis**  
**University of Johannesburg, South Africa**

## **ABSTRACT**

*The primary objective of this study is to investigate the influence of CRM on customer retention at a South African long-term insurance organisation. Primary data was gathered using a questionnaire, with items referring to CRM and customer loyalty. The sample consisted of 254 customers in four major centres in South Africa. Data was factor-analysed. The findings of the study stipulate that CRM positively influences customer loyalty. The relationship between CRM and customer loyalty is significant at a p value equal to 0.000. This relationship implies that if the long-term insurance organisation successfully maintained relationships with its customers, intentional customer loyalty at the long-term insurance organisation will increase. Furthermore, CRM in the multiple regression analysis explained 80.2% of the variance ( $R^2$ ) in customer loyalty. In other words, it can be said that 80.2% of a possible change in the level of customer loyalty in the long-term insurance organisation investigated, is caused by CRM. Therefore, one unit increase in CRM will increase customer loyalty with 89.5% when considering Beta.*

## **INTRODUCTION**

An organisation that wants to succeed in today's global competitive market where customers are empowered and brand loyalty erosion is increasing, will have to move to Customer Relationship Management (CRM). Customer Relationship Management enables organisations to provide excellent real-time customer service through the effective use of individual account information (Kotler and Keller, 2006). This requires a more complex approach, organisations need to investigate customer needs, they have to build relationships with both existing and potential customers, and they will have to satisfy their customers' needs (Rootman, 2006). Organisations realise the importance of satisfying and retaining customers. Acquiring new customers can cost five times more than the cost involved in satisfying and retaining current customers. Organisations on average can lose up to 10% of their customers. When customer defections are decreased by 5%, this can lead to an increase in profits of between 25% - 85%, depending on the industry. The profit rate of a customer tends to increase over the life of the retained customer (Berndt, Du Plessis, Klopper, Lubbe & Roberts-Lombard, 2009; Kotler and Keller, 2006; Ndubisi & Wah, 2005). Long-term insurance organisations such as Liberty Life require a loyal customer base to survive. Loyal customers can be generated through CRM. In 2008 Liberty Life lost R940 million as customers lapsed or surrendered their contracts, thereby ending their relationship with Liberty Life (Liberty Holdings Limited, 2009). CRM can assist Liberty Life in building long-term beneficial relationships with customers, which has a direct influence on the value proposition to customers, and the competitive position of Liberty Life in the market. This will lead to customer loyalty and increased profits to Liberty Life.

## **LITERATURE REVIEW**

### **The long-term insurance industry in South Africa**

The South African insurance market generated total gross written premiums of \$24.2 billion in 2007, representing a compound annual growth rate (CAGR) of 8.9% for the period spanning 2003-2007. The long-term insurance segment was the market's most lucrative in 2007, generating gross written premiums of \$14.7 billion, equivalent to 60.6% of the market's overall value. The performance of the market is forecast to accelerate, with an anticipated CAGR of 9.7% for the five-year period 2007-2012, which is expected to drive the market to a value of \$38.5 billion by the end of 2012. Liberty Life was the largest long-term insurance organisation in South Africa, accounting for 20.3% of the country's value (Datamonitor, 2008).

## **Customer Relationship Management**

Today, many organisations such as banks and long-term insurance organisations realise the importance of CRM and its potential to help them acquire new customers, retain existing ones and maximise their lifetime value. A close relationship with customers will require a strong coordination between Information Technology (IT) and marketing departments to provide a long-term retention of selected customers (Read, 2009). The broad application of CRM has led to a multitude of definitions. Krasnikov, Jayachandran and Kumar (2009) describes CRM as an enterprise-wide commitment to identify the individual customers of an organisation, and to create a relationship between the organisation and these customers as long as the relationship is mutually beneficial. CRM evolved from organisation processes such as RM and the increased emphasis on improved customer retention through the effective management of customer relationships.

CRM is important for service organisations. If organisations desire a good relationship with customers, they must ensure that their management and staff are trustworthy and show a strong commitment to service (Tynan and McKechnie, 2009). Trust and commitment are key elements for retaining customers (Ndubisi, 2007). CRM provides a transition from a transaction-based to a relationship-based model that concentrates on the acquisition, development and retention of profitable customer relationships (Baran, Galka & Strunk, 2008). Unless there is a minimum level of trust between the parties in the relationship, it is unlikely that a relationship will be maintained. When trust breaks down in a relationship, the relationship is likely to dissolve. Trust can only be established after numerous interactions took place between the parties. Trust between the parties must be developed and it must be seen as an investment in the relationship building that has a long-term benefit for both parties. Trust emerges as parties share experiences and interpret and assess each other's motives. As the parties learn more about one another, risk and doubt are reduced (Kim, Kim, Kim, Kim & Kang, 2008). Two-way communication with customers is enabled by advances in information and telecommunications systems. All the communication with customers, when it is integrated into the organisation, recorded and managed, allows the relationships with customers to develop and to be maintained (Alhabeeb, 2007). A goal of CRM is to create an opportunity for re-purchase by a customer through an improvement in the communication process to the customer, providing the right offer, relating to product and price, through the right channel, at the right time. This will lead the customer to perceive that the organisation is concerned with the customer's needs, and this in turn may lead to greater satisfaction towards the organisation. When the customer has had additional experiences with the organisation in which the customer's needs were satisfied, the customer may develop a sense of loyalty to the organisation (Kim, Kim, Kim, Kim & Kang, 2008). Similar to trust, commitment appears to be one of the most important variables in understanding relationships, and it is a useful construct for measuring the likelihood of customer loyalty, as well as for predicting future purchase frequency (van Doorn & Verhoef, 2008). How conflict is handled between the organisation and the customer will either ensure loyalty, or the customer will leave the organisation and go to a competitor (Ndubisi & Wah, 2005). Long-term relationships with customers can successfully be created, reinforced and retained by building the customers' trust in an organisation over time, demonstrating a commitment by the organisation to service, communicating with the customers in a timely, reliable and pro-active fashion, and handling conflicts between the organisation and the customers effectively (Tsai, Tsai & Chang, 2010).

## **Customer loyalty**

The aim of relationship marketing is the establishment and maintenance of long-term relationships with customers (Helkkula & Kelleher, 2010). Organisations understand that it is considerably more profitable to keep and satisfy existing customers, than to constantly renew a strongly-churning customer base. To make relationship marketing work, marketers have adopted a customer management orientation, which emphasises the

importance of customer lifetime value, retention and the dynamic nature of a person's customer-organisation relationship over time (Botha and van Rensburg, 2010). The rationale behind CRM is that it improves organisation performance by enhancing customer satisfaction and driving up customer loyalty. A model has been designed to explain this logic, and it is called the satisfaction-profit chain (Lehmuskallio, 2009). Customer satisfaction increases because the insight into customers allows organisations to understand them better, and through this, organisations create improved customer value propositions. As customer satisfaction rises, so does customer repurchase intention. This then influences the actual purchasing behaviour, which significantly impacts organisation performance (Alhabeeb, 2007).

There are two major approaches when defining and measuring loyalty; one is based on behaviour and the other on attitude. The behavioural loyalty refers to a customer's behaviour on repeat purchase, indicating a preference for a brand or a service over time. There are two behavioural dimensions to loyalty. Firstly, the question must be asked if the customer is still active. Secondly, the organisation must determine if they maintained their share of the customer's spending. Attitudinal loyalty refers to a customer's intention to repurchase and recommend, which are good indicators of a loyal customer. A customer who has the intention to repurchase and recommend, is very likely to remain with the organisation (Tynan and McKeachie, 2009). Attitudinal (intentional) loyalty is measured by reference to components of attitude such as beliefs, feelings and purchasing intention. Customers who have a strong preference for involvement or commitment to a supplier are the more loyal in attitudinal terms (Lehmuskallio, 2009). This study will focus on the attitudinal (intentional) loyalty of the customers of long-term insurance organisations. Organisations must track customer loyalty as the truer measure of how they compare to competitors and this will shift the focus from customer acquisition to customer retention (Baran et al., 2008).

## **PROBLEM INVESTIGATED**

Statistics released by the Life Offices Association (2007), indicated that in the second half of 2006 surrenders of policies increased, lapsed premiums also increased by 18% as compared to the previous half-year, and 31% compared to the corresponding period in 2005. A policy is surrendered when the policyholder stops paying the premiums and withdraws the reduced fund value of the policy before maturity. A lapse occurs when the policyholder stops paying premiums before the fund value exceeds the unrecovered costs, meaning that the paid-up or surrender value is zero. In both cases, customers are lost as they terminate their relationship with the long-term insurance organisation. The purpose of CRM is to increase customer satisfaction, improve customer perception of service quality, and increase customer loyalty (Baran et al., 2008). CRM applied correctly leads to customer loyalty, and loyal customers are usually more profitable (Helkkula and Kelleher, 2010). To retain existing customers in the current economic climate where customers are lapsing their long-term insurance policies because of the unsure economic future, long-term insurance organisations will have to understand how trust, commitment, two-way communication and conflict handling through the application of CRM can contribute to customer loyalty. Larger portions of long-term customers than short-term customers exhibit high profitability, therefore the theory of an overall positive connection between customer loyalty and profitability cannot be rejected (Leverin & Liljander, 2006). Long-term insurance organisations will not be able to survive for much longer in the competitive long-term insurance industry, battling the global recession, if they do not understand the importance of these variables influencing their CRM, and how they can improve customer loyalty. This paper will focus on the importance for long-term insurance organisations to better understand the need for CRM, and how that will lead to customer loyalty. The problem statement therefore refers to an investigation into the influence of CRM on customer loyalty at a long-term insurance organisation in South Africa.

Service organisations can benefit from CRM, as customers focus on the service aspect and interaction with the service provider when evaluating a service organisation, as no physical product is involved (Rootman, 2006). Long-term insurance organisations need to be aware of the importance of CRM in ensuring customer loyalty. This would assist long-term insurance organisations in applying a CRM process that will strengthen customer loyalty and increase market share in South Africa.

## **RESEARCH OBJECTIVE AND HYPOTHESES**

The objective of this paper is to investigate the influence of CRM on customer loyalty at a long-term insurance organisation in South Africa.

To give effect to the problem statement, the following null hypothesis was formulated, stating that no relationships exist. An alternative hypothesis was also formulated stating that the relationships exist.

HO<sup>1</sup>: There is no relationship between CRM and intentional customer loyalty at a long-term insurance organisation in South Africa.

HA<sup>1</sup>: There is a relationship between CRM and intentional customer loyalty at a long-term insurance organisation in South Africa.

## RESEARCH METHODOLOGY

This study was conducted in two phases, the first phase focused on qualitative research, and the second phase focused on a quantitative research approach. A focus group interview was held with a manager of the Customer Walk-in-Centre in Johannesburg, and two other senior managers responsible for customer relationships at a long-term insurance organisation. The focus group interview assisted the researcher in developing the questionnaire and provided the desired information on CRM and customer loyalty from a long-term insurer's viewpoint (Rootman, 2006). The questionnaire was used during the quantitative phase of the research. The reason for quantitative data is that it is easy to interpret the results in simple conclusions (Zikmund & Babin, 2007: 83). Taking into consideration the nature of the research, the problem statement and all other related matters regarding the research, the research was descriptive. A structured questionnaire survey was used to collect data for this research, and this process was administered by conducting personal interviews. The questionnaire included self-developed items, as well as items from questionnaires used in previous research. The population of the research consists of the long-term insurer's entire individual, natural person, customers who visited Customer Walk-in-Centres in the Gauteng (Johannesburg and Pretoria), Kwazulu-Natal (Durban) and Western Cape (Cape Town) provinces of South Africa. For the purpose of this study a probability sampling method was used. Stratified sampling, followed by simple random sampling was used in this study. The reason for selecting this sampling technique was that the sampling frame of the study was divided into subgroups, strata, and the sampling process was performed separately on each stratum. Stratified samples are the most statistically efficient, and they allow the investigation of the characteristics of the interest for particular subgroups within the population (Churchill & Iacobucci, 2005). The sample size selection of this study was twofold. Firstly, the sample was based on the percentage of customers visiting Customer Walk-in-Centres presented as a portion of the total number of customers visiting these centres. Secondly, the percentage was applied to 254 customers of the long-term insurer entering the Customer Walk-in-Centres in Johannesburg, Pretoria, Cape Town and Durban in South Africa.

The research instrument, a questionnaire, was pre-tested in a pilot study involving five customers in the Customer Walk-in-Centre in Johannesburg. Reliability and validity are the hallmarks of good measurement and the keys to assessing the trustworthiness of any research conducted. The reliability measurement for this study was the internal consistency reliability test. Reliability tests whether the questionnaire will measure the same thing more than once and result in the same outcome every time (Cant, Gerber-Nel, Nel & Kotze, 2005; Ndubisi & Wah, 2005). The extent to which a particular measure is free from both systematic and random error indicates the validity of the measure. In this study exploratory factor analysis, utilising the Varimax with Kaiser Normalisation was performed to assess the discriminant validity of the questionnaire. Validity was also confirmed by conducting the Kaiser-Meyer-Olkin (KMO) and Bartlett's test of sphericity (Madiba, 2009). The statistical analysis that was used in the study included a multiple regression analysis to test the hypotheses formulated for the study, and an analysis of variance test (ANOVA). The rotation of the factor matrix was also performed to assess the discriminant validity of the measuring instrument.

## FINDINGS

The findings of the empirical investigation are presented in the following section. Firstly, this paper will look at reliability, then validity, and lastly the findings of the multiple regression analyses will be discussed.

## Reliability

The internal consistency reliability test compares different samples of the items being used to measure a phenomenon, during the same time period. This can be done by means of a split-half reliability test, also known as the coefficient alpha or Cronbach's alpha, and results exceeding 0.60 will reflect the lower level of acceptability (Ndubisi & Wah, 2005). The reliability statistics for the questionnaire are presented in Table 1.

**Table 1 Reliability statistics**

Constructs	Cronbach's Alpha
CRM	0.941
Loyalty	0.970
CRM and its influences on Loyalty	0.918

It is evident in Table 1 that Cronbach's alpha for all three constructs are above the lower limit of acceptability, 0.60. This confirms that the measurement set used in the study was reliable.

## Relationship between CRM and customer loyalty

Organisations adopt CRM for a number of reasons, but most noticeably it is employed to increase customer satisfaction and customer retention or loyalty. The relationship with the customer can be exploited by the organisation through cross-selling, extension selling, or by some other transaction offering additional income to the organisation (Biedenbach and Marell, 2010). The study revealed that the majority of customers (45.01%) strongly agree that there is a relationship between CRM and intentional customer loyalty at a long-term insurance organisation in South Africa. All the dimensions of the study had a high structural correlation. The empirical results indicate a positive relationship between CRM and intentional customer loyalty at a long-term insurance organisation in South Africa. The study is consistent with Botha and van Rensburg (2010) and Du Plessis et al. (2005), who state that CRM is based on an organisation's effort to develop long-term, mutually beneficial links with customers. Thus, if a long-term life insurance organisation has high quality relationships with customers, it will end up with more loyal customers. Kotler and Keller (2006) agree by stating that maximising customer value means cultivating long-term customer relationships. Therefore, if a life insurance provider is committed, trustworthy, communicates timely and accurately and is skilled in conflict handling, greater loyalty will be created among customers. These findings corroborate the findings of the study of Ndubisi (Ndubisi, 2007).

A multiple regression analysis was performed to assess the relationship between CRM and customer loyalty. The results are reflected in Table 2.

**Table 2 Influence of CRM on customer loyalty**

Dependent variable Customer Loyalty					
Model	Sum of Squares	DF	Mean Square	F	Sig.
Regression	503.073	1	503.073	1019.925	0.000
Residual	124.298	252	0.493		
Total	627.371	253			
	R <sup>2</sup>				
	0.802				
Model	Standardised coefficients, Beta	T	Sig.		
(Constant)		1.691	0.092		
CRM	0.895	31.936	0.000		

Table 2 indicates that CRM positively influenced the dependent variable customer loyalty. The relationship between CRM and customer loyalty is significant at  $p = 0.000$ .

This relationship implied that if the long-term insurance organisation successfully maintained relationships with its customers, intentional customer loyalty at the long-term insurance organisation will increase. Table 2 further indicates that CRM in the multiple regression analysis explained 80.2% of the variance ( $R^2$ ) in the dependent variable. In other words, it can be said that 80.2% of a possible change in the level of customer loyalty in the long-term insurance organisation is caused by CRM. Finally, Table 2 illustrates that one unit increase in CRM will increase customer loyalty with 89.5% when considering Beta.

The hypothesis  $H_0^1$  which states that there is no relationship between CRM and intentional customer loyalty at the long-term insurance organisation in South Africa is rejected. The hypothesis  $H_A^1$  which states that there is a relationship between CRM and intentional customer loyalty at the long-term insurance organisation in South Africa is accepted.

## MANAGEMENT IMPLICATIONS

The empirical results imply that a long-term insurance organisation can improve and maintain its relationships between the organisation and customers if the long-term insurance organisation exhibits trustworthy behaviour and shows genuine commitment to service. A long-term insurance organisation should develop training session to inform employees that the core CRM processes are customer acquisition, customer retention and customer development. Just as a customer acquisition strategy aims to increase the customer base, the focus of customer retention is to keep a high proportion of current customers by reducing customer defections. The long-term insurance organisation should launch a customer development strategy which aims to increase the value of retained customers. A long-term insurance organisation should retain and develop loyal customers by being trustworthy and committed to service delivery. In order to maintain relationships with customers and to retain loyal customers, a long-term insurance organisation can give special benefits to loyal customers, for example lowering policy charges when new policy agreements are entered into, and charging less administrative fees for managing investments. It is clear from the empirical studies that only one unit increase in CRM at the long-term insurance organisation can increase customer loyalty with 89.5%. A long-term insurance organisation should ensure that CRM, and therefore customer loyalty, increases by delivering high quality and high value products and services. The policies and other services should deliver on promises.

A long-term insurance organisation should train employees to understand that every single contact with a customer must count. Customers' first impressions are the ones they remember, therefore frontline employees should be equipped to ensure a positive first experience. This is the best way to acquire loyal customers. A long-term insurance organisation must know its customers. Loyalty schemes equivalent to Discovery's Vitality Programme can be introduced by a long-term insurance organisation. This loyalty programme will not only contribute to obtaining a bigger share of the wallet of the customer, but can also be used to obtain more information about customers. A long-term insurance organisation must build a system linked to its policy master that will inform management when customers defect. These customers should be contacted immediately and asked why they intend leaving the long-term insurance organisation, and determine if anything can be done to rectify the reason why the customer is not happy. A long-term insurance organisation must deliver excellent customer services and the particular experience a customer has with customer service will influence how the customer feels about a long-term insurance organisation. A long-term insurance organisation should always do the unexpected, and that is to treat customers well. Unfortunately, most customers today expect to be ignored or mistreated. A long-term insurance organisation can request senior managers to phone clients personally to thank them for their support or give reasons for a mistake made, and indicate what the long-term insurance organisation is doing to rectify the mistake. A long-term insurance organisation should use its customer database to maximise the personalisation of offers to customers. Should a long-term insurance organisation be able to implement the recommendations, customer loyalty will increase, which will lead to higher profits and will give a long-term insurance organisation a sustainable competitive advantage.

## CONCLUSIONS

It is important to note that, although the research was conducted in four major centres in South Africa at one long-term insurance organisation, the findings and recommendations may be applicable to other long-term insurance organisation in South Africa due to the uniformity of services on offer. This research succeeded in

highlighting the importance of CRM when predicting customer loyalty at a long-term insurance organisation in South Africa. Organisations adopt CRM for a number of reasons, but most noticeably it is employed to increase customer satisfaction and customer retention/ or loyalty. The relationship with the customer can be exploited by the organisation through cross-selling, extension selling, or by some other transaction offering additional income to the organisation. The study revealed that the majority of customers (45.01%) strongly agree that there is a relationship between CRM and intentional customer loyalty at a long-term insurance organisation in South Africa. Finally, the study concluded that there is a high structural correlation between CRM and customer loyalty.

# ON-LINE DESIGN AND EMOTIONAL BRANDING: ARGUING A CASE FOR SPIRITUAL TRAVEL AGENTS

**Mornay Roberts-Lombard , University of Johannesburg, South Africa**  
**Ray Holland and Anar Mensikotora, Brunel University, United Kingdom**

## ABSTRACT

*In recent years, branding strategists have been talking more about emotions, human factor and two-way customer communication that can enhance the way brands communicate and express themselves and their values and create lasting relationships with customers. There are certain types of brands that epitomise evidence of the existence of more than just emotional connection between the brand and a consumer. These brands are respected, loved and understood. These brands are more than tangibles. In recent decades social consciousness in western countries has evolved much, scandals around cheap labour exploitation by mega brands such as Nike and Gap showed that people expect more from brands, and that customers genuinely care about the truth and strong and genuine philosophy behind the brand. Research methods such as a literature review, qualitative interviews, customer journeys and focus groups were applied in order to find main customer preferences and expectations and indicate whether the brands within the spiritual travel industry do compliment these needs and expectations. Today's brands are seeking to become more personally and emotionally engaged with a customer, they aim to take a place in the mind and heart of its audience and so win their loyalty. Therefore, for a spiritual travel agent it is very important to have a personal approach and encourage trust as it deals with a very personal subject – the spiritual development of an individual. The majority of spiritual travel agents are based on-line, however most of these do not realise the importance of on-line-branding and design in creating an impressive and memorable customer experience and differentiating themselves from competitors. The main issues discussed in this paper are the possibility of forming a deeper connection between a brand with a strong set of spiritual values and a customer, how this message can be sent, and in what ways it can be communicated.*

## INTRODUCTION

Experiential marketing, emotional branding and deeper connection are new keywords for a successful brand in the modern world. The greater need for differentiation and social trends has pushed the limits of what the brands represented approximately 20-30 years ago (Holt, 2002). Function is no longer the differentiator, what customers are looking for, is meaning. Ever since the 1990s there has been a general interest in New Age practices, various books were published and spiritual techniques were brought from the East into Western countries, including America, where 'spiritual hunger' made people look for the deeper meaning of their existence (Wind, 2009). With increased wealth people also seek outward signs of social respectability, which is expressed by participating in rituals such as worship and religious practices. Tourism is a major area that can contribute to satisfying deeper human needs, many people use trips to faraway countries to explore the world and find their 'true self'. Spiritual tourism is a niche market that attracts more and more customers, especially from the Western world. Tibet and India have been spiritual tourism destinations for centuries, however, in recent years spiritual tourism destinations can be found almost everywhere (Wind, 2009 & De Mooij, 2004).

Previous research argued that spirituality in branding is mainly expressed through humanistic messages, Corporate Social Responsibility (CSR) and ethical business practices. The so-called 'conscious consumerism' trend in the Western world can clearly be linked to the need for intangible values in society. It would, however, be wrong to say that every brand that is ethical and humanistic is somehow spiritual (Czellar & Laurent, 2005; BCG, 2004 & Shenkar & Yuchtman, 1997). Therefore, brands in spiritual tourism that 'sell spiritual

experiences' and that have spiritual values that are much more than Corporate Social Responsibility (CSR) brands were investigated in this paper. From the research in this paper it became apparent that spiritual branding is broader than ethical or CSR branding. Although conscious consumerism might imply a higher development in societal value systems and global responsibility, spiritual in the original meaning of the word is much more than that. More people are looking for spiritual experiences and development. Many find it through such popular practices as Yoga and Meditation, some engage in 'self-seeking' travelling mostly to developing countries, such as India, Thailand, Peru, Tibet and other popular destinations to live simpler lives and find simpler happiness. This research paper aims to help build a successful on-line-based spiritual travel agent brand by enhancing trust, and encouraging more differentiation to improve customer experience and seek to create a framework for building trust and differentiation into such a brand. This paper would be of great help for start-up and existing businesses specialising in spiritual travel and spirituality, and to brand consultants and assist students researching this topic.

## **LITERATURE REVIEW**

### **Exploring emotional branding**

Emotional branding is the organisational-wide pursuit of a sustainable connection that makes customers feel so valued and cared for that they will go out of their way to be loyal. It elevates emotion to the strategic level, recognising its importance in creating a relevant brand identity and managing the consumer's experience. Emotional branding experience is reflected in every stage of the customer life cycle – from acquisition to activation, retention to reactivation (Robinette, Brand & Lenz, 2001). The strongest brand identities both functional and emotional benefits (Aaker, 2002). Emotional branding has almost become a buzz-word in branding in recent years. Emotional branding, unlike 'rational' Unique Selling Points (USPs), provides more emotional than functional benefits. Many fashion, perfume and cosmetics brands use emotional branding to tap into the mind of a person, stimulate emotion and create certain feelings that are associated with a brand (Powel 2007 and Robinette et al., 2001). Brands such as Nike have successfully used emotional branding in its advertisements. Neumeier (2006) states that When Nike folks say, 'Just do it,' they're peering into my soul. I begin to feel that, if they understand me that well, their shoes are probably pretty good. I'm then willing to join the tribe of Nike'. Many product/service choices we make in our daily life are based on personal attraction to a product or service of a specific brand. A successful brand communicates its values effectively, and so manages to take a 'mind space' in consumers' minds thus being able to recall certain emotions that the brand wants to be associated with. Kotler and Armstrong (2010) argue that people are more responsive to emotional messages than to rational ones, as human beings are led by emotion. According to Roberts (2004), emotions are a serious opportunity to get in touch with consumers. And best of all, emotion is an unlimited resource. It's always there - waiting to be tapped with new ideas, new inspirations and new experiences.

### **Five senses**

Roberts (2005) stipulates that the senses are the fast track to human emotions. Brands have realised the importance of sensorial communication in creating certain brand associations and personal experiences for their customers in retail, cyberspace and other brand touchpoints that would consistently send the brand messages. Some examples are Intel's famous sound by which people recognise that a computer has the 'Intel Inside', without even seeing it, or smelling aromatic candles in Spa salons that create a certain mood and recall emotions, such as calmness and relaxation - all of these factors help people to differentiate brands and make them memorable (Lindstrom, 2005). Lindstrom (2005) argues that the five senses identified above are important in any form of communication and life experience which links to memory and can tap into emotion. However, sounds, smell, images and colours can all contribute to reflecting a brand's identity in a unique and engaging manner to a customer. Earlier research found that fast music influences customers in the shop by making them buy more and slow or classic music can make customers spend less. Music can also reflect the personality of a brand, for example, high-end luxury brands might use classical music in their shops more than brands that target teenagers (Aburdene, 2005).

### **Trust**

Honesty is expected. Trust is engaging and intimate. It needs to be earned. Trust is very important in branding, especially when it deals with such an intimate and personal subject as spirituality. A lack of trust can destroy the brand, but its presence can encourage greater customer loyalty (Best, 2006 & Gobe, 2001). Ind (2003) states that with regard to interactions between people and organisations, there has to be a congruency between what is offered and what is delivered. This is the basis of trust. However many brands, especially in the service sector, need to encourage trust by the way they communicate to a consumer before the purchase. Building trust within cyberspace is not an easy virtue. The following guidelines can help an organisation to build trust into an on-line-based brand, namely, make the website simple, but informative, use endorsements and testimonials, anticipate every question, confirm and add real people (Lindstrom, 2005).

## **Social Trends**

A social trend is one of openness and exploration. It seems that people are seeking direct experience as opposed to dogma and the freedom to take meaning where they find it, from a mixture of traditions. Generation X & Y (individuals estimated to be between the ages of 12 and 50 years) are now showing a decided predilection for Eastern mysticism (El-Amir, 2010 & Gobe, 2001). According to Megatrends 2010, Colorado's Shambhala Mountain Center, had 1,342 visitors in 1998, compared to 15,000 in 2003. The stress of the materialistic world and isolation caused by a lack of free time and changing dynamics of lifestyle caused the need for alternative holidays. Eastern philosophy started expanding throughout developed countries and adapted in a more simple way for the general public's understanding and to fit their lifestyle (Aburdene, 2005). Gobe (2002) states that there is a trend in 'Soul Seeking through Sensation', 'This trend is about the impassioned need people today have to actively seek sensations to feel their "aliveness" and gain a deeper sense of themselves, whether through the wild adventure of extreme sports or relatively tame activities that involve indulging in experiences that wake up the senses – and everything in between.

## **Nature of spirituality**

The meaning of spirituality has become broader in recent years. If the traditional meaning of spirituality was associated with religion, it has now shifted to a more broad concept of 'spiritual individualism', when a person follows his/her instincts, inner thoughts, experiences, needs and understanding of life and the world. Spirituality is personal and individual. A person can be spiritual without belonging to any specific traditional religion. Spirituality is defined as "life and consciousness away from the body" (Olins, 2007 & Ries & Trout, 2000). Eastern spirituality was brought to Europe in 1970 and has since become a part of the popular culture. Practices such as yoga and meditation are very popular among people of different ages and backgrounds (Ries, 2003)

## **Spirituality in branding**

Most importantly, the biggest misconception in branding strategies is the belief that branding is about market share, when it is really always about mind and emotions shared (Gobe, 2001). Many brands are aiming to reflect spiritual benefits in its products such as Aveda that offers 'Chakra 5' calming perfume, Origins that sells a 'mind relaxing' chewing gum, or Evolution that specialises in homeware, lucky charms and ethical jewellery inspired by the Buddhist culture Oprah Winfrey has built her phenomenal success by smartly tapping into this customer's need to be viewed and addressed in a holistic manner. Her new multifaceted lifestyle magazine O, which is rich in material for 'body, mind, and soul' and seeks to help readers to become more of 'who they are,' is a testament to this philosophy' (Crosbie & Knight, 1995). A dissertation written by Tasuku Iwano, a former MA Design and Branding Strategies course student at Brunel University, explored the topic of brand spirituality. In the study the areas of conscious consumerism, ethical brands with high values and brand culture were researched. The researcher concluded that brand spirituality can be expressed through strong humanistic values expressed by a certain brand and how these values are embedded into a brand culture. The research has also found that the manner in which society in modern days expresses its need for spirituality can be seen in a rising trend for ethical brands and cause-related marketing.

## **Spiritual tourism**

Spiritual tourism has now evolved from being associated with religion into a more holistic way of maintaining good physical and spiritual well-being that can suit anyone. A person does not have to be religious in order to visit a spiritual site or go on yoga holidays. Eastern philosophy is highly popular due to its 'open-minded' approach to such a personal subject, and many Eastern practices have a significantly good influence on a person's physical and mental well-being. Hundreds of different therapies that have taken their roots from religious and ancient forms of therapies are now evolving and being transformed to suit the busy lifestyle of people. Yoga and meditation have become mainstream and are being practiced not only in Buddhist ashrams (temples), but also in regular gyms and spas. Across the cultural landscape, there is plenty of evidence of this growing trend (Kapferer, 2008). There are now more than 10 000 New Age bookstores throughout the United Kingdom (UK) and South Africa (RSA) respectively, but one can also flip through such mainstream magazines such as Time, Woman's Day, Spirituality in Essence and De Kat to witness it. Spiritual retreats have become a vacation alternative. Spirituality is becoming more acceptable than ever before. Spiritual, also known as holistic holidays, are aimed at both religious and non-religious people. These holidays can have exploratory, philosophical, religious and community character to them. (De Mooij, 2004).

The need for a deeper meaning in one's life is a natural way of evolution of human consciousness. Ind (2003) states that a simple trilogy that Straker and Rawlinson derive from Maslow and evolutionary needs, and which is very relevant to questions of brand, is the need for a sense of control, the need for a sense of identity and the need for novelty. 'The inclusive tour, typical of mass tourism of the past 30 years, is becoming outmoded (Kunde, 2002). The Key Note Market Report (2007a) stipulates that there is growing evidence that more tourists desire individual expression, more possibilities to learn something new, and greater activity. Most of niche tourist agencies that specialise in holistic/spiritual tours operate on-line due to convenience and the low cost which this type of retail offers. There is therefore a big trend globally in on-line holiday purchases and the growing number of people purchasing holidays on the Web shows that it is also convenient to customers. In addition, there is also growing evidence that more tourists desire individual expression, more possibilities to learn something new, and greater activity (Lindstrom, 2005). Most of niche tourist agencies that specialise in holistic/spiritual tours operate on-line due to convenience and the low cost that this type of retail offers. Spiritual (holistic holidays) travel agents, are easier to find on the Web, however there is an evident need for such travel agents to use a strategy which could be applied to make their business model more successful, and enhance trust and deliver more differentiation, as there is an evident lack of such (Key Note Market Report, 2007b). The branding of spiritual travel agents therefore needs to be more focused on what their brand stands for, what their brand values are, and what associations they would like to create in the consumer's mind (Neumeier, 2006).

## **AIM AND OBJECTIVES OF THE RESEARCH**

Creating a strategic model for differentiation and building trust for on-line based spiritual (holistic) holiday travel agencies.

- The first objective which aims to investigate current strategies that spiritual brands and travel agents employ to differentiate themselves from competitors and build trust, was achieved through the conduction off both primary and secondary research, such as a literature review, case studies, observation and qualitative interviews with professionals from the spiritual travel industry.
- The process of reaching the second objective, namely to conduct industry, brand consultancy and user research to find out the existing and suggested branding strategies for a spiritual travel agent was reached through the conduction of qualitative interviews with four customers, three spiritual travel agents, four brand consultants, one experiential marketing consultant, two-stage customer surveys and focus groups, and the outcomes were later compared with the current strategies implemented in industry to see the advantages, disadvantages and opportunities for spiritual brands.
- The third objective was reached when the 5-D Spiritual Brand and On-line Trust Building models were developed and evolved into a further framework for building a spiritual travel agency brand.

## METHODOLOGY

Having read previous works of well-known brand strategists, former MA Design & Branding Strategy students, journals, newspapers and on-line resources enabled the researcher to understand the popularity of the topic being researched and find the views of experts on the issues of Emotional and Spiritual Branding, Corporate Social Responsibility, Tourism Industry Dynamics and Spirituality as a whole. Several tools and frameworks from the branding theory have been used to analyse and evaluate brands in case studies, and later to further develop some of the models according to the findings made. Some of the sources included 4-D Branding by T. Gad, Emotional Branding by M. Gobe, Strategic Brand Management by J. N. Kapferer, Unique Now or Never by J. Kunde, Megatrends 2010, Soul and Spirit magazine and Design Management journals. A focus group was used in order to understand the meaning of spirituality and brand spirituality as defined by a group of people. It enabled the researcher to understand customer expectations, opinions, assumptions, design preferences and certain associations with the topic. Different visuals were also used in a focus group to evaluate the preferences of certain websites and reasons behind these perceptions. Participants were also asked to create mood boards of their own depicting what they perceive as spiritual. Focus groups are undoubtedly valuable when in-depth information is needed about how people think about an issue – their reasoning about why things are as they are and why they hold the views they do (Coldwell & Herbst, 2004). Interviews are a great opportunity for direct involvement with a customer or an expert, whose opinions are important in gaining the insight into an individuals' knowledge and attitudes towards a chosen topic. Qualitative interviews enabled the researcher to research these opinions in more depth by guiding the interviewee through adapted questions. Qualitative interviews can assist with the finding of answers to 'Why?' questions that have arisen from previous pilot surveys. One major advantage of the interview technique is its adaptability. A skilful interviewer can follow up on ideas, probe responses and investigate motives and feelings, which the questionnaire can never do (Bell, 2005). Qualitative interviews were conducted with four customers, three spiritual travel agencies, namely Unique Travel, Neal's Yard Agency and Yoga Ashram Rishikesh in London, four design consultancies in London and Oxford, including Etal Design, Bloom Design, FHD London, and the BlazinStar experiential marketing consultancy. Semi-structured interviews were suitable for the study because they give an opportunity to find out more information about certain areas that the interviewee might have more expertise in. It also allows the researcher to ask the right questions from the respondents depending on their experience and knowledge. Semi-structured customer interviews assisted to adapt questions to each interviewees' perceptions and experiences in spiritual tourism. It was also selected/regarded the most suitable type of interview, because the motivations of the respondents were different when going on a spiritual holiday, for some it was religion, for others spiritual growth and a getaway from the everyday routine.

## STRATEGIC DESIGN AND BRANDING INTEGRATION

The research revealed that a spiritual brand has to start with brand philosophy that is deep and reaches for human consciousness. A brand philosophy makes you think and feel at the same time. Emotional Branding is the key to communicating with a customer on a deeper personal level. Through an emotional approach and sensory elements, the creation of a spiritual experience becomes possible and builds a memorable customer experience. Spirit and emotion are inseparable. They go hand in hand. Destinations and settings are very important for a customer, it also reflects the type of spirituality the brand wants to communicate. Customers prefer visually appealing places to spend their holidays. The majority of customers are also interested in visiting destinations with a rich historical and cultural focus. Cultural-spiritual tours are among the most preferred by these customers. In terms of website design, the aspect of 'spiritual' has to be reflected in nature, earthy, fresh and natural colours, white, blue, green and brown. The overall style of the website has to be pure and simple, with many visuals and pictures of real people. The first page of the website (Home page) has to be more visual than informative, and the rest of the website should be easy to navigate, as navigation is highly important. It also has to be both visual and informative. Interactive website features are also preferred, programmes of tours should also be provided by a travel agent. Helping tips, such as blogs, currency exchange rates, detailed tour programmes and virtual tours are needed for the convenience of customers. Sensory branding is what makes a brand experience unique. Music plays an important role in evoking and heightening positive emotions. Sound branding should be used more often to trigger emotions and bring more differentiation to the website. Only one website from all visited used music as one of the ways to represent the brand, namely the website of the Shymala

Ayurveda Spa. This is therefore evidence of sensory design being undervalued among on-line spiritual brands. Many customers would prefer to engage with the local community at the destination to experience their lifestyle. These people mostly want to discover the place themselves without being led. Travel agents should provide guidance for a holiday and allow customers to have control. This implies that spiritual tourists prefer to be in charge for packaging their own holiday on-line, whether using the same travel agent website or different ones. Therefore spiritual travel agents should focus on offering not only packaged tours such as the packages that they currently offer, but flight and hotel booking facilities on the websites as well. Independent travellers also want to be directed by the travel agent, so that they could have more confidence and freedom at the destination, pre-holiday talks and local maps should be provided to those travellers. Consistent and quality Design, Word-Of-Mouth and Reviews must reflect brand essence and build trust on-line. Travel agents need to differentiate to attract customers. Differentiation can be reached through vision, positioning and emotional design. The message sent to an audience has to be consistent throughout all touch points. A spiritual brand is most importantly a personal brand, mass-media advertising is not suitable, but Word-of-mouth, thematic media, magazines and events such as the Mind Body Spirit Festival in London are more suitable. Spirituality is not mass-market orientated, therefore the service has to be exclusive, even elitist. Social networking websites better not be used, however, the travel agency can create its own networking website or a special section for networking for like-minded people. Storytelling and visuals evoke trust and interest. More blogs, reviews and on-line diaries for sharing personal experiences are needed. More spiritual travel agent brands should take an example set by Amazon regarding the customisation of the brand. This is a highly convenient feature that allows a customer to spend less time searching, and makes him/her feel more 'cared for'. A spiritual brand has to be ethical. It is a natural way to follow for such a brand. Whether it is encouraging recycling, practicing eco-tourism, helping local communities or supporting charities, these actions have to be coherent with a brand's core values, philosophy and vision. Brand extensions suitable for a spiritual travel agency are meditation and yoga workshops, talks on spirituality, charity projects, spa salons and certain products such as aromatherapy candles and Buddha statues.

## **A strategic design and branding model for a spiritual travel agent**

The proposed on-line based travel agent brand model illustrated by figure 1 will enable travel agents specialising in spiritual holidays to build trust into their web space, create a holistic brand basis, including brand values, associations and features, and create a holistic brand mind space in the minds of customers. The model suggests that a brand system has to be at the basis of a spiritual brand, as it will provide guidelines for the building and communication of a brand. Website-based spiritual travel agents will need to create trust around its brand through a strategic use of design, reviews and generating word-of-mouth around the brand and its core values and philosophy in the brand system. All of these combined with five dimensions, which are spiritual, mental, social, ethical and functional will create a spiritual brand mind space in the mind of the customer. The model in Figure 1 was evaluated by Phil Cleaver from Etal Design.

## **CONCLUSIONS**

The research revealed that a spiritual brand has to start with a brand philosophy that is deep and reaches for human consciousness. It makes an individual think and feel simultaneously. Emotional branding is the key to communicating with a customer on a deeper personal level. Through an emotional approach and sensory elements, creating a spiritual experience becomes possible and builds a memorable customer experience. Spirit and emotion are inseparable. Destinations and settings are very important for a customer, they also reflect the type of spirituality the brand wants to communicate. Customers prefer visually appealing destinations to spend their holidays. People are furthermore also interested in visiting destinations with a rich history and culture. Many customers would prefer to engage with the local community at a destination, to experience their lifestyle. These individuals want to discover the place themselves without being guided by tour operators. Storytelling and visuals evoke trust and interest. More blogs, reviews and on-line diaries for sharing personal experiences are needed. A spiritual brand has to be ethical. Whether it is encouraging recycling, practicing eco-tourism, helping local communities or supporting charities, these actions have to be coherent with the brand's core values, philosophy and vision. Brand extensions suitable for a spiritual travel agent are meditation and yoga workshops, talks on spirituality, charity projects, spa salons, and certain products such as aromatherapy candles.

# DEVELOPING A QUESTIONNAIRE TO PROFILE A HOSPITALITY SUPERVISOR

**Antoinette Roeloffze and Ilse Swarts**  
**Tshwane University of Technology, South Africa**

## ABSTRACT

*A competent supervisor enhances the success of an operation by meeting the needs of employees and guests. Successfully profiling the supervisor and identifying specific competencies is critical for the industry, as there is strong competition for financial and human resources capital. A major South African hotel group's 'performance standards' document was used to develop a relevant supervisor profile questionnaire. This document is based on the concept of 'leadership pipeline'- how to build the leadership-powered company. The category 'Manage other'-Operational/Specialist, of which the core purpose is to deliver frontline management, was used to develop the questionnaire. The population of this study will be supervisors from the same hotel group.*

## INTRODUCTION

As the hospitality industry is perceived as a people business, friendly and congenial reception of guests by hospitality employees is viewed as the heart of the industry. Employees need the ability to provide the quality of service and value guests expects. A further challenge is to find and retain employees. An aspiring candidate wishing to pursue a career in the tourism and hospitality industry, should take cognizance of the reality in an industry that is known for its long, demanding working hours. According to Emenheiser, Clay and Palakurhti (1998:1), successful managers need to possess a variety of talents, abilities and skills. Bowen and Ford (2004:394) confirm that those managerial skills needed for hospitality organisations and the managerial skills needed for organisations that produce tangible products, will be different.

Hospitality organisations are in competition with one another to provide high-quality, value-added service and products to their guests (Burke, 2001:28). The ability to deal with uncertainty and ambiguity in the workplace is only one of the many aspects that will require particular competencies of hospitality managers.

The work of a hospitality supervisor involves understanding customers' expectations and meeting those expectations in personalised and creative ways. Therefore successful supervisors need above-average interpersonal, problem-solving and self-management skills. The aims of this study are to compile the profile of a hospitality supervisor and to set-up a conceptual model of criteria for a selection process when appointing and training potential hospitality supervisors. It is imperative to ensure that those candidates who wish to pursue a career in the hospitality industry have a profile to match the requirements laid down by of the industry. Birdir (2002:4) states that hospitality organisations should develop and promote programmes which can be used to identify those employees who have an acceptable level of knowledge and skills regarding the principles and practices of the profession and related disciplines.

According to Greer (2001:14), careful selection is one tried method to retain front-line employees. Valid tests and improved interviewing procedures as part of the selection process, will go a long way towards better job matches, increased job satisfaction among employees and will minimize staff turnover. Charan, Drotter and Noel (2001:1) indicate that the demand for leadership exceeds the supply therefore organisations are attempting to hire 'stars' from sources outside their own pool of workers. Recruiting outsiders for certain positions can imply that the leadership pipeline in the organisation is dysfunctional, further indicating that internal training, mentoring and other developmental programmes are not keeping the pipeline supplied with

potential employees. A need for more leaders at the various levels of management requires that an organisation's management needs to build leaders by developing the average employee's potential. The supposition is that human beings have the ability to grow and that the average person's potential is not fixed. A society would not be able to achieve economic, as well as cultural progress, if this ability were not there. Charan, Drotter and Noel (2001:5) assert that work potential is based on accumulated skills and experience, as evidenced by past achievement, the ability to learn a new skill and the willingness of an employee to take on new challenges. For an organisation to capitalise on an employee's potential, there needs to be an appreciation of the true requirements at key leadership levels. Management needs to have an understanding of the necessary requirements/skills to ensure successful transition from one level to the next level.

## **BACKGROUND AND MOTIVATION**

### **Employment opportunities in the hospitality industry in South Africa**

South Africa, having recently emerged from international isolation, is a country boasting beautiful and unique natural attractions. According to the Tourism, Hospitality, and Sport Education and Training Authority (THETA, 2003:2), the South African Government has identified the tourism, hospitality and sports sectors as the fastest growing industries in South Africa with enormous potential for economic growth, which could lead to unprecedented employment opportunities in the hospitality industry (THETA, 2003:2).

The South African Government expects tourism to increase its contribution to the gross domestic product (GDP) from 8 % in 2005 to 12 % in 2010 (SSA, 2007:12). In terms of these targets, 500 000 new will be created in the next five years (South African Government Information, 2008). The major stakeholders in the South African economy (Industry, Labour and Government) are unanimous on the issues that the skills level of the workforce in South Africa needs to be upgraded. By upgrading the skills of the workforce, the economy could develop to such an extent that more work opportunities and increased life benefits for all South Africans would result (SSA, 2007:7).

Government views the tourism, hospitality and sports industries as a means to create employment opportunities at many levels thereby helping to redress the situation of previously disadvantaged individuals. It aims to develop the tourism, hospitality and sports sectors nationally to open up job opportunities. The stakeholders in these industries are encouraged to establish enterprises that will provide more employment. Creating more jobs in the South African tourism sector could lead to improved service delivery, increased capacity and skills development and upgrading of skills through training (SSA, 2007:7).

The *South African Qualifications Authority (SAQA) Act, no. 58 of 1995* and the *Skills Development Act, no. 97 of 1998*, provided establishments in the tourism, hospitality and sports sectors with opportunities to upgrade the skills level of employees, and to provide education and training for employees in the industry. In addition, Employment Equity legislation has created opportunities for previously disadvantaged sections of the workforce to advance to supervisory and management-levels (THETA, 2003:2). This trend is set to continue due to political pressure and social pressure in the country (THETA, 2003:2). In 2005, when Thabo Mbeki was president (SSA, 2007:12), the South African Government launched the Accelerated and Shared Growth Initiative for South Africa (AsgiSA), that had two main objectives:

- To reduce poverty and unemployment by 50, 0% by the year 2014; and
- To enable South Africa to achieve and sustain average economic growth rates of 4. 5% between 2005 and 2009, and 6. 0% between 2010 and 2014

### **Current skills status of employees in the hospitality industry**

According to a survey done by THETA (2003:38), employees who have jobs, no matter how menial, are not classified as disadvantaged. Nevertheless, there is consensus that such employees are disadvantaged in terms of realistic opportunities for career advancement. Reasons given are a low level of education, restricted skills, and a lack of access to training.

When compared to international standards, the proportion of managerial/supervisory positions to operational positions is not particularly high, with an average ratio of 1:6. Given the extensive overstaffing at operational levels in the hospitality industry, one has to conclude that the industry is generally over-managed and over-supervised. An industry that is over-supervised maintains a low level of skills at both operational and lower supervisory levels. It can however also reflect social transition in South Africa, where employees with almost no supervisory experience are expected to perform lower supervisory roles (SSA, 2007:12).

## **Skills development programmes in the hospitality industry**

A country such as South Africa that has high unemployment and dire poverty levels needs to be competitive and productive, nationally as well as internationally. For the country to be competitive, it needs to have a culture of training a highly skilled workforce. The tourism, hospitality and sports sectors are viewed as key sectors where issues such as training, development of skills, and job creation need to be addressed (THETA, 2003:2).

A key organisation involved in the training and development of personnel for new responsible tourism in South Africa is the Tourism Human Resources Development Department. This department affirmed the introduction of the subject Travel, Tourism and Hospitality in schools in 2000 (South African Government Information, 2008). A second initiative in skills development for the tourism industry is the Levy and Grant system. To follow this approach, the hospitality industry has to become involved in training employees and uniform qualifications based on industry-endorsed unit standards will be established. A third initiative in training and development is spelt out in the *Skills Development Act, no. 97 of 1998*, that makes provision for Learnership programmes. Learnership programmes can take many forms and can be delivered in many modes as long as they satisfy the SAQA requirement of 120 credits at each level. The programmes include a blend of on-the-job and off-the-job learning (THETA, 2003:122-123). Other learning avenues that can be followed are offered at tertiary institutions, such as universities and hotel schools.

## **The profile of the hospitality employee and supervisor**

A candidate wishing to pursue a career in the tourism, hospitality and sports industries, should consider the reality of an industry that is known for long working hours, shift work and working over weekends and on public holidays. Only a specific profile will be able to meet such demands. Staff in hospitality industry deal with people and deliver a service to satisfy the specific needs of customers/guests. Industry expects an employee to be a 'people person', with good communication skills, who is dedicated to quality and good service, is a team player, and has the ability to work under pressure (THETA, 2003:122-123). People can be viewed as a challenge, as the workforce in the hospitality industry has become progressively more diverse in terms of race, gender, ethnicity and generation (Chen & Choi, 2008:295). Worsfold (1989:51) states that during the moment of service the hospitality employee can no longer be influenced by the organisation. It is solely the skills of the employee and the behaviour of the guest, which interact to produce the delivery of the service. The hospitality supervisor has an important role when it comes to fostering a culture of service delivery. It is expected of the supervisor to have an extensive knowledge of customer behaviour traits and expectations. It is critical for the supervisor to enhance the quality of both staff and staff performance. This is generally done through formal and informal training as well as staff development (Burke, 2001:28).

## **Importance of the selection process for employees in the hospitality industry**

Organisations in the hospitality industry, in particular, are faced with high staff turnover (Birdir, 2002:43). According to McFillen, Riegel and Enz (1986:37), a high staff turnover of restaurant managers can be more damaging to hospitality organisations' operations than a high turnover of rank-and-file workers. The primary reasons for high staff turnover are the absence of company training, managerial skills of superiors and non-existent organisational structure and policies, as well as odd working hours, low salaries, excessive public contact and excessive demands of guests and management (Birdir, 2002:43). According to Greer (2001:14),

hiring employees that are a good match with an organisation's job and co-employees will ensure staff retention. Research indicates that careful selection of employees is a tried and tested method to retain front-line employees. Worsfold (1989: 51) states that the sustainability of a profitable hospitality organisation will depend on the selection of efficient managers. According to Walker (2004:5), hospitality employees that are committed to the organisation, are seen as a critical business asset. This powerful tool enables an organisation to function optimally and constantly measure the organisation's ability to retain their intangible assets. The aim of a selection process is to glean such information from the applicant that will predict the success of the candidate in the job (Griffen, 1993:342). A favourable end-result could be that candidates accept jobs that will fulfil their expectations (Greer, 2001:15).

## RESEARCH DESIGN AND METHODOLOGY

The proposed research will be 'exploratory research' (Collis & Hussey, 2003:10-15), as it will be conducted into a research problem about which there are no known earlier studies to refer to for information. The research will provide significant 'value in use' (Remenyi, Williams, Money & Swartz, 2002:39) to the entire hospitality industry. The 'social world' (Remenyi *et al.* 2000:30-31) will serve as the platform for the research primarily because social science deals with how things are and why they are (Neuman, 2003:39). While the proposed research will be primarily empirical in nature using a quantitative (positivistic) research paradigm, it will also be underpinned by theoretical research, using a qualitative (phenomenological) research paradigm (Leedy & Ormrod, 2005:101). As 'case study' research provides the researcher with a wider research application in which to conduct research (Yin, 1994:1), and 'action research' serves as a method of doing case study research (Collis & Hussey, 2003:66-67; Struwig & Stead, 2004:15), 'case study' will serve as the primary research method.

## DEVELOPING THE QUESTIONNAIRE

*"Research should always be driven by curiosity" (White, 2009:5).*

Having been involved in the training and placement of Hospitality Management students for more than twenty-one years, the researcher's curiosity has been aroused to find the link between expectations of the hospitality supervisor and employee. Which skills are required to perform in the workplace and what is the level of education needed for the position? To answer these questions a profile of a hospitality supervisor needs to be drawn up. The hospitality industry has a tendency to rate experienced employees higher than those employees with a qualification. This is in contrast to the general trend that graduates have an advantage in chosen area of work. Furthermore the general opinion seems to be that a qualified employee is not necessarily the best recruit. Data on profiles of senior management indicates that age, work experience as well as gender of the hospitality employee, do influence career prospects (Harkison, 2010:2).

The population chosen for this study is the team of hospitality supervisors in one of the main hotel groups in the Republic of South Africa. This hotel group is rated among the top 50 hotel chains in the world and is regarded as the leading hotel group in South Africa (Southern Sun, 2008). The reason for choosing this specific hotel group is that currently there are more than 76 hotels in South Africa and with a total of around 500 supervisors. The researcher was provided with a 'performance standards' document which is used by the above-mentioned hotel group for the training, development and skills building of staff. This 'performance standards' document is based on the concept of "*leadership pipeline*" – how to build the leadership-powered company. Major organisations constantly headhunt 'stars' from organisations outside their own companies. Recruiting employees for management positions could suggest that the leadership pipeline in a specific organisation is dysfunctional, because internal training, mentoring and other developmental programmes are not keeping the pipeline full (Charan, Drotter & Noel, 2001:1).

According to Charan, Drotter and Noel (2001:5), the need for more leaders at various levels requires an organisation's management to build employee's skills, rather than to buy them. A question that could be raised: Could today's average employee become tomorrow's "right-for-the-job" leader? Charan, Drotter and Noel (2001:5-6), maintain that it is possible, due to the fact that a person's potential is not fixed. It is the belief that a human being has the ability to grow. If this were not true a society would be unable to achieve economic as well as cultural progress. The Leadership Pipeline is a model that was developed to assist employees in an

organisation to re-invent themselves, as well as to match their potential with a series of requirements. Rapid changes in the nature of work, global opportunities and on-line learning have an effect on people's potential which leads to changes several times in the course of a their career. From a managerial point of view it means that one should keep an open mind on and optimistic attitude towards who the right person for a leadership position might be. The Leadership Pipeline model is not a straight cylinder. It bends in six places each of which in return represents a change in organisational position. For the purpose of profiling the hospitality supervisor a questionnaire was developed focusing specifically on the passage/bending to "manage others" (operational/specialists).

An employee who produces good results and demonstrates the ability to interact with other employees usually receives additional responsibilities. When management feels that these employees buy into the organisation's values, they are often promoted to lower management positions (supervisors). This step appears to be an easy, natural process, but unfortunately this is also the point which a large percentage of the potential supervisors resist change, due to the fact that they want to continue with their duties in the same way as before. These employees become supervisors without accepting the new requirements demanded by the job - the shift from "doing" the work yourself to getting the actual work done through the efforts of others (Charan, Drotter & Noel, 2001:17).

The researcher was provided with a 'performance standard' document which was used to compile the questionnaire. The category (Manage Others – Operational/Specialist) of which the core purpose is to deliver frontline team results through enabling others, was used to develop the questionnaire. Supervisors in this specific hotel group are measured according to the following performance dimensions: Leadership and people performance; Guest and relationship performance; Financial and business performance; Management and operational performance; and Innovation and improvement performance (Southern Sun, 2010). In developing the questionnaire the above-mentioned performance dimensions were observed. The questionnaire consists of four sections, namely biographical information (Section A); perceived supervisory experience; knowledge and skills with regard to the achievement of organisation's goals (Section B); perceived expectations of personal performance as a supervisor (Section C); and required supervisory skills (Section D). Precise wording of questions or statements plays a vital role in interpreting the answers given by the respondents (Bradburn, Sudman and Wansink, 2004:3). The researcher made use of all five performance dimensions, provided in the 'performance standard' document, each with its own sub-headings and changed these terms into comprehensible statements, which were then distributed between Section B and C of the questionnaire.

Section A of the questionnaire covers the biographical detail of the respondent. The reason for this section was to glean information which could assist the researcher in determining the age group, gender and level of education that is currently working in the hospitality industry. Studies indicate that there are three generations of employees in the hospitality industry, namely the Baby Boomers (born between 1946 and 1964), Generation Xers (born between 1965 and 1977) and Millennials (born after 1977). The Millennial generation group is slowly entering the hospitality industry as entry-level managerial workforce employees (Chen and Choi, 2008:596). As misunderstanding and resentment between older and the younger employees grow, problems arise. Older employees tend to be more cautious, are less likely to take risks and are probably more resistant to change, whereas younger employees are be more sceptical about the value of relationships in an organisation (Chen and Choi, 2008:596). According to Miller, Walker and Drummond (2002:60), younger employees will also present a challenge in the field of communication and management training. From a managerial point of view it is imperative to understand differences in attitude towards work as well as similarities in a diverse workforce. By understanding these differences management will be able to formulate more effective strategies with regard to recruitment and employee retention. Section B consists of statements. The respondent needs to indicate the importance of his/her experience, knowledge and skills with regard to achieving organisational goals. The supervisor is the person who is responsible for managing people, who in turn are responsible for making products and delivering a service (Miller, Walker & Drummond, 2002:3). To achieve the required results through and with others, influencing skills become critical. Supervisors who are skilled influencers are clear and firm about the outcomes they need to achieve (Yemm, 2008:21). An even scale of 1 – 6 was used. The reason for presenting the respondent with an even number of response categories was to compel the respondent to 'lean' towards one end or the other (Bradburn, Sudman & Wansink, 2004:162). It is important to determine whether the respondents lean towards the same competencies, as this will provide the researcher with information, regarding knowledge, skills and behaviour, that are required as a

supervisor. A combination of these competencies could create a competitive advantage for any hospitality organisation (Jauhari, 2006:123) If a link between specific competencies is found, organisations will be able to develop and use selection techniques that have greater validity and reliability (Worsfold, 1989: 51, Jauhari, 2006:123).

In Section C statements are formulated in such a manner that the researcher would be able to familiarise herself with what the hospitality supervisor's perceived expectations with regard to his/her own performance are in the work place. For an employee to be in a job that does not suit his/her personality requires more energy, than that required from an employee whose job is more in line of how he/she naturally behaves (Baron, 2007:2). An uneven number of response categories were given on a scale of 1 – 5. The respondent had the choice ranging from strongly agree to strongly disagree. The last section of the questionnaire (Section D) consists of two open-ended questions. According to Bradburn, Sudman & Wansink (2004) an invaluable part of any questionnaire consists of open-ended questions. Both advantages and disadvantages exist with open-ended questions. Open-ended questions allow and encourage respondents to express their opinions fully. These could furthermore provide the researcher with additional and quotable material that could lead to future research reports. One disadvantage of using open-ended questions could be that the researcher needs to summarise the data, which is very time-consuming. Another disadvantage could be that the respondents provide different amounts of detail in their answers (Neuman, 2003:241). Caution must be exercised by the researcher not to dismiss any comments that conflict with her own analysis of the research. However open-ended questions could provide the researcher with an opportunity to uncover novel, uncommon but intelligent opinions. As the workforce in the hospitality industry has become more diverse due to factors such as generation differences (Generation, X, Generation Y and Millennials), open-ended questions could provide the researcher with valuable insight into these differences. An appreciation of differences between these generations could result in more effective human resource management strategies. In return the researcher could be provided with valuable information when a conceptual model of criteria for a selection process needs to developed, for appointing and training potential hospitality supervisors. Birdir (2002:4) opines that hospitality organisations should develop and promote programmes which could be used to identify those employees with acceptable levels of knowledge and skills regarding the principles and practices of the profession and related disciplines.

No person is able to draft a perfect questionnaire the first time around. Questions can be misunderstood or not provide the required answers. Therefore it was important for the researcher to conduct a pilot-test before distributing the final questionnaire (Bradburn, Sudman, & Wansink, 2004:317). After the completion of the questionnaire a pilot-test was conducted to ensure reliability and validity of information extracted from the questionnaire. The participants in the pilot-test were ten supervisors from two boutique hotels. As the pilot-test procedure is not identical to the main study and respondents are given more flexibility it was very helpful for the researcher to have a focus group after the completion of the questionnaire to discuss any problems experienced. No difficulties in completing the questionnaire were experienced and all ten respondents confirmed that the questions were clear, logical and relevant to their positions as hospitality supervisors. During the focus group discussion respondents did, however, mention that supervising employees has changed in recent years. The diversity of current employees is forcing the supervisor to change his/her leadership skills. Statistical data obtained from these respondents were checked by a statistician for the purposes of correctness and good order.

In this research, ethical issues are involved. During the research process, various individuals from a major hotel chain in South Africa were contacted and requested to complete the questionnaire in order to collect valuable information from them. A document was drawn up to inform the participants about the nature of the study to be conducted. A statement guaranteed that all responses would remain confidential. The questionnaire was then sent via e-mail to a key staff member in the hotel chain who was responsible for the distribution of the questionnaire. Each respondent had a choice between e-mailing or posting the questionnaire directly to the researcher or it could be sent back via the office of the key staff member who was responsible for distributing the questionnaire.

## **CONCLUSIONS AND RECOMMENDATIONS**

The atmosphere of a hotel, guesthouse or restaurant is what draws guests back (Du Toit, 2001:30). An employee in the hospitality industry needs the ability to affect the human experience, by creating powerful impressions, such as to provide the service quality and value guests expects, which may have a lasting effect on the guest (Walker, 2004:5). The industry depends on the physical labour of many hourly or non-managerial workers to provide the required service. However the level of service with regards to quality depends largely on how well it is managed (Miller, Walker & Drummond, 2002:2). Managing hospitality service delivery systems requires unique skills/competencies. Which competencies are required to perform in the workplace and what is the level of education needed for the position? To answer these questions a profile of a hospitality supervisor needs to be developed and is really essential to create a successful hospitality environment. The workforce in the hospitality industry has become more diverse in terms of race, gender, ethnicity and generation (Chen & Choi, 2008:295). A 'performance standards' document of one of the main hotel groups in South Africa provided the researcher with five performance dimensions with regard to formulating the concept for developing the questionnaire. As this hotel group represents a large population of supervisors in South Africa, the researcher hopes to establish a functional profile. After profiling the supervisor, the researcher would like to develop a set of selection criteria that could assist hospitality organisations to employ the most suitable candidates for supervisory level.

The analysis of the results of the questionnaire will be conducted as soon all questionnaires are received. This paper has some limitations as it focuses only on questionnaire development, therefore the global policy implication cannot be discussed. This issue leaves ample opportunity for further research.

# **PREPARING SOUTH AFRICA'S FUTURE PUBLIC SECTOR LEADERS: INNOVATION IN TEACHING AND LEARNING AT UNIVERSITIES OF TECHNOLOGY**

**E. J. van Rooyen**  
**Tshwane University of Technology, South Africa**

## **ABSTRACT**

*Universities of technology distinguish themselves from “traditional universities” on the basis of their unique product offering, which includes the incorporation of subject-relevant state of the art technology into its curriculum as well as an emphasis on vocational education and work-integrated learning. At universities of technology, schools of Public Management or Public Policy are preparing students for service in the public sector. This would imply a product and curriculum that is innovative, relevant to the employment market demand, which enjoys industry-recognition thereof, and reflects a career-focused design. Within this context in South Africa, academic schools at universities of technology serve as facilitators for administrative leadership development against the backdrop of the notion of a developmental state. It is thus essential that such academic schools include into their teaching curriculum aspects of leadership and to attempt to expose the students thereto in accordance with a university of technology's ethos. In this paper the challenges ahead for the academic departments and schools of Public Management concerning teaching and learning for leadership development are advanced and some postulates are presented.*

## **INTRODUCTION**

South Africa is one of the largest and most stable economies in the African continent and boasts a well-developed basic infrastructure. The Country is categorised as a lower middle-income economy country by the World Bank. The country exhibits several characteristics of a developing economy, such as well grown primary, secondary and tertiary sectors and a non-dependency on agriculture as primary industrial activity; the manufacturing, mining and service sectors are the largest contributors to the country's GDP. It sets the platform and acts as springboard for many African countries' development and growth. The country is a lead role player in SADC as well as the African Union.

A significant recent development is South Africa's ascension to the BRIC group of major emerging economies. BRICS is an acronym for Brazil, Russia, India, China and South Africa. BRICS is a forum that provides its members with opportunities to network and to initiate economic arrangements with a view to increasing economic growth and achieving greater global economic impact.

However, within this context it is imperative that South African organisations and institutions ensure that they acquire and develop appropriate capacity in terms of leadership and management technologies to support and guide the above-mentioned developments and challenges. For instance, according to some future watchers and economists the BRICS countries are part of a fraternity referred to as the “new economic eagles” and South Africa counts among the so-called “eagles nests” from which metaphorically a new generation of global leaders and managers will be incubated. Charlton (1993) mentions that the axiom behind all successful human endeavours be it family, business, political, sporting, spiritual or national or international level, can be summed up in one word – Leadership. The supply of leaders does not exceed the demand and if projections are

accurate, the future demand is even greater than the current. Yet, the uniqueness of the South African socio-political as well as economic conditions, both past, current and future, dictate that the moment is imminent where quick-fix leadership development solutions should be substituted in favour of well-considered leadership development models befitting the Country. In other words, it is time to develop a bespoke leadership and management model appropriate for South Africa in particular: South Africa's leadership demand differs from the rest of the world in terms of time, intensity and space.

Within this context, the schools of Public Management at universities of technology serve as facilitators for administrative leadership development in the public sector against the backdrop of South Africa as a developmental state. In this paper the challenges ahead for Public Management schools at South African universities of technology, concerning teaching and learning for leadership development are advanced and some postulates are presented

## UNIVERSITIES OF TECHNOLOGY

A university of technology seeks to remain in touch with and responsive to the needs of its environment and community, be it the labour market, its students, its stakeholders or civil society in general. South African universities of technology are appreciative of the fact that they are located within a state constituted on the principles of developmentalism. Therefore, community engagement is encouraged in both a formal manner, such as interactions that are linked to the curriculum (work-integrated learning or service projects), and a non-formal manner, such as partnering with the community in outreach activities. What especially sets a university of technology apart from a traditional university is its focus on innovation and entrepreneurship, through to commercialisation. In this respect, a university of technology advances its entrepreneurial flair and informs its curricula by promoting cutting-edge research and innovation – activities that are governed by a need for application or problem-solving and which, ideally, lend themselves to commercialisation. Research and innovation are seen as dynamic trans- and multidisciplinary processes that rely on partnerships and networks that collaborate to come to fruition. A university of technology emphasises teaching and learning through means of cutting-edge technology. Technology in this regard, is defined in its broadest sense as the efficient and effective application of expertise. The processes of technological innovation, technological transfer and the commercialisation of technology form the basis of all educational activities.

Therefore, when an academic school such as Public Management at a university of technology embarks on programme design and curriculum formulation it naturally adheres to the principles of the prevailing regulatory regime, but it should also be sensitive to and cognisant of the demands and needs of its particular sector or industry. Not only should these programmes result in the acquisition of skills and the transfer of knowledge through means of an integrated system that is discipline-specific and learner appropriate, but it should also adequately transfer or infuse the competencies that the employer requires from employees as products of the higher education system. In other words, the product of a higher education institution, especially a university of technology should bear knowledge of and be conversant with cutting edge technologies associated with the vocation concerned. In addition, universities of technology in conducting teaching and learning, also profess to be on the forefront of developing cutting edge technology methodologies. Therefore, when Public Administration is taught, not only should the discipline-specific knowledge and theory be conveyed, but also the sector- or industry-specific public administration technologies to ensure that the learners are equipped to perform the necessary administrative and managerial functions as far as possible. The contents of programmes should focus on knowledge and practical skills directly relevant to leadership, as opposed to much of the (theoretic) content in academic disciplines. The programmes must take cognisance of the way in which students learn and acquire knowledge. The contents of development and training programmes must take into consideration the interests of all who have a stake in effective leaders, and not solely what specialists in specific academic fields consider relevant.

Naturally, it would be difficult to teach technical skills for job-specific functionality on a generic Public Administration programme. The intention is not to do this though, but rather to lay the foundation for quick integration into the practical work environment with its particular modalities. In this context consideration should therefore be afforded to appropriate leadership development for the public sector. Yet, before leadership development interventions could be decided upon and introduced into education and training programmes, the

nature of leadership and aspects relating to leadership development theory should receive thorough consideration.

## THE CONTEXT OF LEADERSHIP DEVELOPMENT

In a classical work entitled *Leadership in Administration*, a revered Public Administration scholar, Philip Selznick writes that “*Leadership...is a slippery phenomenon.*” (Selznick, 1957: 25). Selznick continues to indicate that it is futile to understand leadership apart from the broader organizational context of which it forms part: “*a theory of leadership will necessarily reflect the level of sophistication we have reached in the study of the organization. We are dealing with an activity, with a function, with work done: we can make no more sense of it than is allowed by our understanding of the field within which that activity takes place.*” Essentially, the type of organization, for instance whether it is a public sector organization or private (to mention only one qualification) is important when the concept leadership is explored

When leadership development programmes are designed, it may be appropriate to consider what is broadly meant with the concept before decisions are taken as to the exacting content of the programmes. Adapting the *Center for Creative Leadership's* definition (1998), leadership development may be described as: The expansion of a person's capacity to be effective in leadership roles and processes, these roles and processes being those that enable groups of people to work together in productive and meaningful ways to achieve common goals.

This definition may imply that:

- *leadership development* is the development of *capacities* within the individual;
- *leadership effectiveness* should be derived from studying what makes people effective in a variety of leadership roles and processes; and
- people must take on *leadership roles* and participate in *leadership processes* in order to carry out their obligations to larger social entities (community of leaders), that is, leadership roles may be formal positions infused by authority to take action and make decisions, or they may be informal roles with little or no formal authority.

In addition, Charlton (1993: 195) mentions that leadership development has a strategic imperative, which underwrites the ideas that:

- it should occur at all levels of the organisation;
- the organisational culture must adapt to allow people to fully utilise their skills and initiative; and
- strategic human resource systems must reinforce attempts to select, develop and maintain leadership *competencies*.

In the above context the old adage applies where an organisation ensures that a strategic (planned) programme is in place where “*the right people are in the right place at the right time*”.

## THE DEVELOPMENT PROCESS

Any well-structured organisational strategy and concomitant business plan provides direction for the modalities associated with a human resources strategy for such an organisation. A human resources plan in the conventional sense includes processes associated with selection, appraisal, development and rewards for performance. The implication however, is that the appropriate people need to be selected, and such people should be appraised and subsequently their development needs should be aligned to particular *competencies* and behaviour (Charlton, 1993: 173). In turn, these strategies should inform all human capital development stakeholders internal as well as external to the organisation, to the nature of the development interventions.

These processes are however dependent on the organisation's ability to identify specific *competencies*, which form the basis of a particular organisation's success. What constitutes a good leader in a particular organisation? Which skills, craft or knowledge in particular do we need to achieve the organisation's goals and objectives? What type of attitude and behaviour are appropriate? Which values are appropriate and expected from the leaders? Such identified *competencies* will then in turn inform on which (developmental) interventions should be made to ensure or enhance organisational success. In a public sector context, the same considerations

would apply but with due cognisance of the service delivery ethic as well as the political backdrop against which such entities operate.

A developmental or learning experience can be conceptualised as consisting of *three elements* (adapted from: Center for Creative Leadership, 1998):

- Feedback
- Challenge
- Support

Following is a description of the aforementioned elements:

### ***Feedback***

The best development experiences provide information that can be used for assessment. Feeding back such assessment information to people on a variety of dimensions will help them to understand where they are now, their current strengths, their current levels of performance or effectiveness as leaders, and what their important developmental needs are. While a developmental experience may provide data, learning only takes place if there is feedback in the form of meaningful information to the learner. Such information also provides a benchmark against which people can assess the effects of their developmental efforts.

### ***Challenge***

Challenging experiences provide people with information that conflict with their perceptions of themselves. When people find that their habitual ways of dealing with situations are not effective, dissonance is created forcing them to question the adequacy of their skills, frameworks, attitudes and approaches. The experiences that stretch, confuse and confront people are characterised by:

- novelty
- difficult goals
- situations characterised by conflict
- dealing with losses, failures, and disappointments

### ***Support***

Developmental experiences are challenging. To change is not easy, it requires new ways of thinking, the development of new skills and abilities that require persistence in the face of initial failures and incompetence before mastery is achieved. To persist, people need support in the form of confirmation by others and encouragement to change. Experiencing that other people value their efforts to change and grow help them cope with the temporary experience of incompetence. Other people, organisational norms and procedures provide support for change.

It is important to bear in mind that people differ in the degree to which they learn from the same kinds of experiences, and that is why a variety of developmental experiences are required. These differences are due to *two factors*:

- Firstly, people differ in the level of challenge they perceive in an experience. What is challenging to one person, may be experienced as normal and well within his or her capacity by another.
- Secondly, people differ in the ability to learn from an experience. The ability to learn is a combination of motivational factors, personality factors, and learning strategies.

Against the preceeding background, research aimed at establishing best practices in leadership development, it was found that the most effective leadership development programmes were characterised by the following (Conger and Benjamin: 1999):

- Such programmes were built around a single well-formulated leadership model.
- It was clear who the target population would be.
- Pre-course preparation was used.
- Learning was reinforced through personalised feedback and support.
- Multiple learning processes and approaches were used.
- It consisted of extended learning periods and multiple sessions to accommodate individual aptitude.
- Specialised support systems were provided.

## COMMON SHORTCOMINGS OF DEVELOPMENT PROGRAMMES

In their study of leadership development programmes Conger and Benjamin (1999) found the following common shortcomings:

*Lack of a critical mass (environment-specific focus).* A serious drawback of leadership development programmes is that they often are not geared to people from the same workplace or collective environment. Leadership is a collaborative experience. Learners apply and construct their understandings not only from formal educational experiences but also from the collectives of which they are members and from their relationships with other members of the collective. What gives new learning the potential to take hold is that one's group also endorses, promotes and reinforce them.

*The ineffective use of competency models.* Competency models have become very popular in leadership training, with most training programmes employing these models. They also appear increasingly in performance appraisals. The general conceptualisation of what constitutes a leadership competency has evolved considerably over the past two decades. Boyatzis (1982) defines a *competency* as an underlying characteristic of a person – a motive, trait, skill, aspect of one's self-image or social role, or body of knowledge that he or she uses. As Conger and Benjamin (1999: 56) point out, today's concept of leadership as consisting of far more behavioural dimensions than twenty years ago when leadership models often considered of two roles – a task and a people orientated role, or a set of decision-making steps ranging from autocratic to participative styles. Leadership models have also moved towards reframing the leader's principle role to that of change agent. Competency models have definitive advantages:

- They are normally constructed around tangible dimensions- behaviours, outcomes, or activities – that can be measured;
- They send a clear message about the specific attributes considered valuable. If linked to rewards and performance measures, they can establish clear expectations; and
- They provide a framework for both individuals and the collective to benchmark themselves.

Problems associated with competencies may be due to the fact that they are often derived from academic models that tend to lean towards very general competencies. They are the by-products of research typically conducted across many different organisations and sectors and geographies and cultures and as such they rarely produce customised dimensions. In effective programmes, competencies are customised for the particular environment concerned, and focus not only on the present, but also on the future requirements.

*Insufficient time spent on developing skills.* Programmes often attempt to cover too many dimensions of leadership and end up doing justice to too few. They often focus on conceptual learning and make little or no effort to help participants develop any skills at a pace that would accommodate different learning styles and aptitudes.

*Limited or no programme follow-up and support.* One of the most common dilemmas facing leadership development programmes is the lack of follow-up. When the programme ends there are no additional experiences to reinforce learning nor are there ongoing programmes of feedback to allow participants to gauge their development efforts around specific leadership competencies (Conger and Benjamin 1999: 56).

Providing learners with opportunities to apply what they have learned strengthens learning. This could take the form of project work or specific assignments or work-integrated learning, for which outcomes must be specified, and on which participants must report outcomes. This allows a measure with which to gauge the extent to which leadership development has come about.

## PROPOSED PUBLIC ADMINISTRATION PROGRAMME DESIGN APPROACH

If leadership, therefore forms such an important aspect insofar as preparing South Africa's future public service decision-makers are concerned, should the typical public Administration curriculum not emphasise (even lend extensive attention to) aspects of leadership, its nature, competencies, leadership behaviour and associated

values? Should leadership development not form the core of the curriculum, and its importance be pronounced in this manner? Will such an emphasis detract from the teaching the essence of the science of Public Administration in any real way?

From the preceding discourse, the following suggestions may be of value for a school of Public Management at a university of technology:

**Firstly**, the programme design process should seek to remain true to the ethos of a university of technology. In other words, the following aspects should be considered:

- A continuous alignment with the environment and community in which its products need to serve. The implication is that the economic, social, and psychological needs of individual and organisational role-players in the public sector should be considered. This can only be achieved if the programme designers, both subject-specific experts and practitioners are truly conversant with this environment. A lecturer should be more than only a distant observer of the industry, but rather an actor therein. This would consequently yield especially three important benefits to the University, namely an improved research and publication output, improved knowledge-feedback processes during lecture sessions and quality teaching and learning outcomes.
- A university of technology emphasises innovation and entrepreneurship (which in a public sector organisational context may also be translated to intra-preneurship). This may be achieved by improving creative thinking skills and innovative thought competencies. In other words, a “problem solving mentality” should be developed among learners. Leaders distinguish themselves in their ability to apply visionary acumen and to be solution-generators and technological innovators.
- Any successful programme at a university of technology should also allow for inter-disciplinarianism and trans-disciplinarianism. A fully-rounded Public Administration grandaunt should carry not only knowledge associated with subject-specific matter, but should also be conversant with basics associated with related disciplines such as business management, accountancy, marketing, communication management, information and communications technology and even be exposed to the basics of philosophy, law and language. Such knowledge may improve on the solution-seeking competency of an employee. It would allow a person to see the proverbial “bigger picture”.

**Secondly**, a strategy should be implemented to move away from a predominantly teaching focus to a learning focus as far as classroom activities are concerned. Although firm motivation exists for both of the aforementioned *foci* in the class room, the learning focus orientation should receive emphasis. Although this does form part of the official University policy, it does not practically translate into classroom conduct by many lecturing staff members. This may be achieved through retraining and redirecting lecturing staff towards, output orientation, problem-solution centeredness and contextually defined knowledge sharing methodologies. It is imperative that lecturers should attempt to improve learners’ conceptual thinking skills, improve on their ability to think in terms of the relativism and their ability to prioritise amongst conflicting objectives and criteria in a management environment.

**Thirdly**, lecturing staff should include into their teaching and learning elements of constant feedback on progress and performance. They should ensure that the classroom activities and subject matter on offer are challenging and where necessary, the system should be geared to actively support learners who are either at risk, or who’s aptitude and even attitude in relation to the programme and its content, is below standard.

**Fourthly**, it may be postulated that if the feedback, challenge and support-factors, mentioned previously are in place, conditions for the creation of an enthusiastic learner and subsequently a lifelong learning mentality may be facilitated. Learners should be enticed to develop a love for reading and knowledge exploration. An emphasis should be placed on exploring new technologies to support administrative and managerial functioning in public sector organisations. Life-long learners have an inclination to engage in self-directed learning. The ideal is to establish a behavioural context that promotes self-directed learning. According to Goleman (2002), the crux of leadership development is to convince the learner that they should intentionally and continuously develop and strengthen the aspects of their own knowledge and skills armoury.

Furthermore, excellence in programme design and content as well as in teaching and learning may be achieved by:

- Designing and integrating into all modules and programme content a single well-formulated leadership development model. A model that adheres to the notion of the developmental state. A model that takes account of the past, present and future South African reality.
- Design all modules and programme content according to who the target population or learner profile is. Be cognisant of the fact that learner profiles should be flexible and be able to accommodate differences and extra-ordinary demands or learner needs.

- Include obligatory and level-appropriate but challenging pre-course and pre-lecture preparation by learners, self-directed reading assignments and on-location investigative assignments. Learning should be reinforced through proper guidance, feedback and support.
- Multiple learning processes and approaches should be used. It should include activities that would strengthen conceptual thinking ability, creativity and innovation and include vocation-orientated competency development; the emphasis should thus be on developing critical thinking skills, a problem-solving mentality and practical or technical task execution.
- Apply well-researched competency models as far as public sector leadership needs is concerned. Competency models should be reflective of the current demand and anticipate future demand for particular leadership competencies in the public sector. Such models should actively refrain from being too generic and too abstract. The emphasis should be on developing a leader that will be able to demonstrate not only an ability to lead on different levels (strategically, tactically and functionally) but one who is also competent enough to apply knowledge and technical administrative and managerial skills.
- Integrate into all programmes and modules the essential need for value based-decision making, transparency and accountability to the greater community in the pursuance of public administrative conduct, as enshrined into the Constitution and South Africa's Human Rights philosophy.

## CONCLUSION

In conclusion, it may be stated that a school of Public Management is charged with an immeasurable responsibility to contribute towards South Africa's leadership development demand. Yet, to honour our responsibility in this regard, our lecturing staff should re-assess their own teaching and learning practice and ensure that it is aligned to the leadership development objective associated with Public Administration. Our grandaunts should able to provide not only theoretical solutions to real administrative and managerial quagmires in the public sector, but they should be able to innovate in the arena of administrative and managerial technology development through thought leadership, which culminates in realising the socio-economic development quest of the Country.

# PROMOTING URBAN FOOD SECURITY IN SOUTH AFRICAN LOCAL GOVERNMENT

E. J. van Rooyen & M.A.W. Prinsloo  
Tshwane University of Technology, South Africa

## ABSTRACT

*The global economic crisis impacts widely on the poor and destitute, especially in developing countries, where it is significantly pronounced in informal urban settlements. Consequently, from a governance point of view the issue of food security is a matter of concern. As a result, some municipal policy makers assert that urban farming activities may be an effective way in which to alleviate the effect of hunger and malnutrition among destitute households - thus providing immediate relief to the needy.*

*From a Public Administration point of view, it is argued that it may be more efficient to expend limited resources on programmes and projects to assist urbanites to become self-sufficient urban farmers, as opposed to spending such resources on merely acquiring and distributing food with the effect that dependency on government is maintained or even increased.*

*In this paper the following aspects are addressed: **Firstly**, the case of the City of Johannesburg is cited where provision is made in the day-to-day virtual needs of indigent peoples. **Secondly**, a model through which community and stakeholder consultation may be conducted is presented. **Lastly**, it is postulated that municipal decision makers should decisively apply an issue-driven approach as well as pro-poor growth strategies in their integrated development planning, for such programmes and projects.*

## INTRODUCTION

Across the world the current economic disposition renders many poor households, especially those among developing nations, vulnerable in terms of food security. The impact of the financial crisis is experienced by developing countries on macro-level, which in practice translates to an approximate 923 million people across the developing world being “seriously undernourished” (2007 statistics) and more recently, an additional 119 million receding into this category because of food inflation and related aspects. Thus, according to the former United Nations Secretary-General, the world now has the obligation of fulfilling the Millennium Development Goals (MDGs) by caring for approximately 1 billion poverty stricken people ([www.fao.org](http://www.fao.org)) who suffer from day-to-day food insecurity ([www.financialexpress.com](http://www.financialexpress.com)).

Part of the challenge facing policy makers is the limited comprehension of all the clinical reasons for continuous worldwide increases of food prices. Some of the reasons cited could include the impact of the increased demand for bio-fuels, declining water supply, and population demographics (especially in India and China) (Fresh Link, July 2008, p. 3). According to the Food and Agriculture Organisation, increased investments in agriculture and in particular increased attention to improving international and domestic policies set to fight poverty, are needed immediately. Assessments conducted by the Food and Agriculture Organisation ([www.fao.org](http://www.fao.org)) had identified particular short- and medium-term approaches to be taken rapidly to deal with this crisis, viz.:

- Protective safety measures should be implemented through policy and action to ensure day-to-day household food security to limit vulnerability among the poor.
- Improve the access to quality seeds and fertilizers to boost farmers’ productivity (including small farmers).

- Strengthening capacity building initiatives in the areas of particularly production, processing and marketing of agricultural products.
- Strengthening institutional capacity to improve on policy development and policy implementation.
- Better functioning markets at all levels as well as improved market infrastructure and information services, especially for small farmers.
- Improve sustainable management of natural resources.
- Increased participation of women in the agro-food sector.

For example, during 2008 increased production of cereals in African countries registered less than 1 percent since many were not able to apply the above-mentioned approaches and measures. In Low-Income Food Deficit (LIFD) countries that depend on imports to support their food requirements, the situation is even worse because of price pressures on even locally produced food ([www.fao.org](http://www.fao.org)).

This paper highlights both some theory as well as practical knowledge gained in development practice in relation to the administration of programmes and projects associated with urban farming and food security issues in general. Since a developmental local government is only possible with the established institutions that embrace the principles of democracy and participatory governance which involves all stakeholders and most importantly local communities in the process of decision-making and service delivery to build a sustainable society, existing systems that seeks to achieve participation of relevant stakeholders should be maximised. The intention with this paper is to lay the foundation for more extensive debate surrounding these issues, but in essence attempts to pose the following points:

**Firstly**, the South African local government system of ward committees is posed as an appropriate vehicle with which urban farming programmes and projects may be launched in a municipal setting such as the City of Johannesburg. **Furthermore**, it is postulated that municipal decision makers should decisively apply an issue-driven approach as well as pro-poor growth strategies in their integrated development planning, for such programmes and projects. **Lastly**, it makes the point that urban farming activities are not by default tantamount to Local Economic Development as such, but may be a catalyst to achieve this goal in due course.

## URBAN AGRICULTURE AND FOOD SECURITY

Urban agriculture presents in many forms throughout the world. In some cases urban agriculture forms part of an extensive agri-business (economic) endeavour whereas in some cases the purposes are merely recreational. Yet, in some cases, urban agriculture is seen as an activity purposefully designed to address issues relating to food security and sustenance or survival among poor and indigent peoples in urban environments. Urban agriculture contributes to food security in two ways:

**First**, it increases the *amount* of food available to people living in cities; and **Second**, it allows for an offering of a *variety* of fresh vegetables and fruits and meat products to be made available to urban consumers (City of Johannesburg. Draft Policy Framework – Urban Agriculture Policy, p. 6). In a rapidly urbanising world, innovative interventions such as urban agriculture activities are needed to deal with the challenges in this regard. General statistics on the world's urban population is:

- 50% of the world's population lives in cities.
- 800 million people are involved in urban agriculture worldwide and contribute to feeding fellow urban residents.
- Low-income urban dwellers spend between 40% and 60% of their income on food each year.
- By 2015 approximately 26 cities in the world are expected to have a population of 10 million or more. To feed a city of such a size – an estimated 6000 tonnes of food must be availed each day.

One significant aspect of the above-quoted statistics is that most of the growth in urbanisation will occur within the developing world. Sub-Saharan Africa is the most rapidly urbanising region in the world. Much of Africa's urban population already lives in densely populated cities such as Johannesburg (City of Johannesburg. Draft Policy Framework – Urban Agriculture Policy, p. 6).

By way of an example, the City of Johannesburg's food security and urban agriculture programme resides within the Johannesburg Fresh Produce Market. Until recently, the City of Johannesburg has been actively involved in

alleviating food insecurity within its area through a Food Bank-programme. The Food Bank is a non-profit organisation that distributes approximately 9000 food hampers per month to registered welfare organisations that care for HIV/AIDS orphans, the elderly and to crèches. However, for the purposes of sustainability it is envisaged that this programme should be extended through means of a comprehensive urban agriculture intervention.

## PROPOSING A WAY FORWARD

An intervention is proposed, which is two-pronged in that it will establish food gardens for poor urban dwellers within the confines of a city and simultaneously, it should advance the economic aspirations of those who, through the latter achieve surpluses in their food production endeavours. This initiative should be aligned to the short- and medium-term approaches suggested by the Food and Agriculture Organisation mentioned above.

A sustainable approach to, and purpose with urban agriculture should be to:

- Improve domestic food security – reduction in vulnerability of food economy to external shocks (e.g. fuel price increases, food inflation, shortages of crops, etc.);
- Improve economic opportunities (e.g. job opportunities, enterprise development);
- Address social concerns relating to poverty and unemployment; and
- Improve environmental conservation, preservation and mitigation.

**Firstly**, a municipality should subscribe to a pro-poor growth development strategy, which strives towards achieving sustainability in its design and implementation. Such a strategy has the potential to provide food, environmental enhancement, education, beautification, inspiration and hope. Urban agriculture may contribute to youth education, employment creation, whilst it provides utility and respect to elders, builds communities, recycles kitchen and other urban “wastes”, and produces fresh nutritious food. Because many of the benefits of urban agriculture can be attained through other activities or means, producing food is perhaps the single most important benefit.

**Secondly**, the practices of SHREQ should be introduced into urban agriculture activities and thereby promote sustainable development practice in adherence to the notion of the developmental state. SHREQ refers to amongst others the following:

- **Safety & Health** – Safe agriculture practice, instruments and implements. Use and usage of chemicals, pesticides and pharmaceutical products with due consideration for human and animal health and wellbeing.
- **Risk** – Proper assessment and analysis with regards to investment, effectiveness and efficiency, and economy.
- **Environment** – Sound environmental practices according to the principles of sustainability and Local Agenda 21.
- **Quality** – Adherence to relevant standards set as far as processes and products are concerned.

**Thirdly**, an issue-driven approach (as opposed to a sector-driven approach) in the planning and implementation of urban agriculture initiatives may be considered where the issues of food security and poverty alleviation retain focus, and where sectoral interests are integrated in the design of such a strategies.

Among indigent urban communities, food security is the bottom line why urban agriculture is important. However, urban agriculture is only one way to solve food security issues and thus should be viewed in this larger context. Organising around urban agriculture may not always be the best way to address food security issues, but organising around food security issues is one of the best ways to promote urban agriculture.

## INTEGRATED DEVELOPMENT PLANNING (IDP)

As far as urban farming is concerned, the Resource Centers on Urban Agriculture and Food Security (RUAF Foundation) (PAPUSSA Policy Briefs, p.1) recommendations are made with regards to how policy makers should reflect such activities in a sustainable way. The predominant recommendation is that all such activities should form an integral part of urban planning and development strategies. In South Africa, a form of planning methodology termed Integrated Development Planning (IDP) is followed by local government to provide for sustainable development and service delivery.

Integrated development planning may be defined as both a **process** through which municipalities prepare a strategic development plan, for a five-year period and a **product** of the integrated development planning process (Integrated Development Planning and Integrated Development Plan). The IDP process comprises a single, inclusive planning process within which all other municipal processes must be located. As an extension, all local economic development in a municipality must be fully integrated as a local economic development plan (LED) within the IDP. The IDP is a strategic planning process in itself. Therefore, if a municipality is being developmental and responds to local development problems, it needs to establish a clear vision and objectives to address these issues. For example, poverty and unemployment remain the key challenges facing municipalities in South Africa, and IDP objectives therefore need to include targets for meeting these challenges.

The IDP is a comprehensive plan for the development of the local area. Since the IDP is the key strategic planning instrument that guides and informs all planning, budgeting, management and decision making in a municipality, the IDP draws together all the development goals and objectives, including those for local economic development and food security. It includes a long-term vision, an assessment of the existing level of social and economic development, development priorities, development objectives, a spatial framework, land development objectives, operational strategies, municipal budgeting and all related resource allocation realities. The IDP ensures co-ordination between the different initiatives of government by drawing together the development goals, objectives, priorities, strategies and budgets (Integrated Development Planning and Local Economic Development. Emerging Leadership Municipal Development Programme. 2009. Programme Manual. Module 3).

## **THE ISSUE DRIVEN APPROACH IN INTEGRATED DEVELOPMENT PLANNING**

An Integrated Development Planning-model, as applied in South Africa for instance, is focused towards integrating social, economic and natural environmental concerns across sector and disciplinary interests. Specifically, the integratedness aspect relates to (Local Pathway to Sustainable Development in South Africa, n.a.:12):

- The special integration of place of employment and place of residence;
- The integration of multiple land uses;
- The integration between adjacent geographic areas;
- The eradication of spatial segregation and separation;
- The integration of urban and rural areas;
- The integration of ethnic groups;
- The social and economic integration of different communities;
- The integration and coordination of institutional activities;
- The integration of various developmental processes such as planning, management and implementation; and
- The integration of development information.

To ensure that integration occurs (such as in the above exposition) is practically speaking, a daunting task. It implies that the various issues, sectors and dimensions of development need to be considered comprehensively when development planning is conducted. Contrary to conventional planning practice, integrated development planning requires a focus on issues, rather than merely development sectors. The notion of integration therefore, central to integrated development planning, implies that sectors (stakeholders) are

approached in the context of their contribution to addressing priorities for development. In other words, key priority *issues* are identified and thus forms the focus of the planning process.

In terms of the issue-driven approach, social, economic and natural environmental considerations are taken into account. This forms a cross-cutting “golden thread” throughout the planning process. Cross-sectoral intervention areas may include:

- Poverty Eradication;
- Combating HIV and AIDS pandemic;
- Gender Equality and Development;
- Science and Technology;
- Information and Communications Technology;
- Environment and Sustainable Development; and
- Private Sector Development.

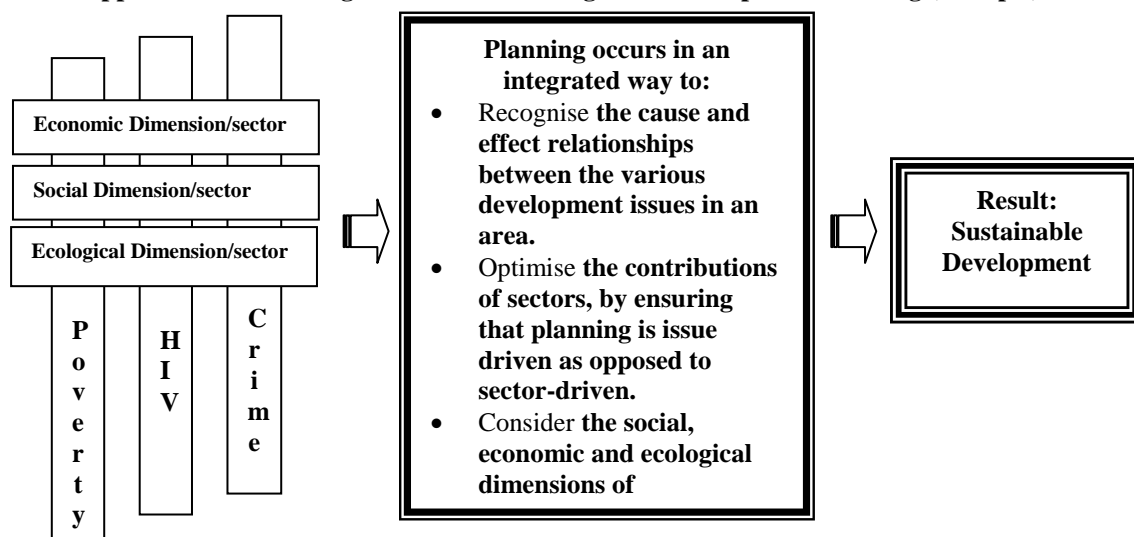

In addition, some integration intervention areas have been identified, being:

- Trade/Economic Liberalisation and Development;
- Infrastructure Support for Regional Integration and Poverty Eradication; and
- Sustainable Food Security; and Human and Social Development.

In the context of scarce human, financial and other resources, elements of institutional and structural capacity should form part of the planning and implementation processes for sustainable development. In figure 1 an example is presented which serves to illustrate the issue-driven approach and integrated nature of integrated development planning and how taking account of the cross-cutting aspect may result in sustainability in development planning.

In conjunction with the above, a particular reference to pro-poor strategies are appropriate: According to a research report emanating from the University of Reading (Pro-Poor Livestock Policy Initiative – A Living from Livestock, June 2004) it should be noted that when development policies and strategies are considered, both the poor livestock producers as well as more established production entities should be targeted. However, the food security and sustenance aspects associated with urban agriculture seem to indicate that some policies and strategies should emphatically be directed to serving the poor as such whilst it could be employed in conjunction with pro-growth policies and strategies as well.

#### Issue-driven Approach and the Integrated Nature of Integrated Development Planning (example)

Source: (Adapted from Local Pathway to Sustainable Development in South Africa, n.a.: 16)

Such a notion is supported by notable scholars ([www.businessstimes.co.tz](http://www.businessstimes.co.tz)) and institutions such as the World Bank (Chief Economist Africa Region, World Bank, November 2005). The essence is that development strategies must be pro-poor, yet it should be broad based and set across sectoral divides. The world bank emphasises that shared growth as an approach seem to be beneficial in recent East Asian countries where a focus is placed on growth across different sectors to equip the poor to participate in, and benefit from growth. Along these lines, recognition is given to the pursuit of growth without bypassing the poor, but equally, devoid of a myopic focus on pro-poor policies, which may divert attention from the growth principle (Chief Economist Africa Region, World Bank, November 2005).

In view of the above exposition, it could be deducted that local communities, who are the beneficiaries (stakeholders) of urban agriculture initiatives by the relevant authorities, should actively have input in the design and execution of such programmes and projects. Naturally, the established system of ward committees may be effectively utilised to further this objective. The following section depicts the ward committee system's functioning, as it presents within the South African policy and regulatory regime.

## **PUBLIC PARTICIPATION AND WARD COMMITTEES**

At all spheres of government, public participation has been identified as an important factor in engaging the broader community. Several government policy documents, such as the Reconstruction Development Programme (RDP) and The White Paper on Local Government, 1998 serve as the policy frameworks advocating and promoting the need for public participation or involvement.

Public participation in local government and development is also influenced by historical and current dynamics of the social, political and economic context in which local government seeks to operate. These dynamics should be acknowledged by local authorities in their formulation and implementation of development policies and their intentions to foster public participation (Atkinson and Reitzes, 1998: 128). The phenomenon of public participation in the South African system of government has become one of the major (and also dynamic) challenges for public managers at all levels and in all spheres of government. In the public domain, many services are provided. The public may be regarded as consumers who are entitled to good service, but they are also citizens (Du Toit, Van der Walldt, Bayat and Cheminals, 1998: 124) of a particular municipality residing in numerous wards. Public participation within a municipality is performed by ward committees. This is also advocated and promoted by government policies and legislation, which should be utilised to capacitate communities as far as the municipal governance process and procedures are concerned.

Participation embraces many different levels of involvement apart from the provision of basic information which is an essential base for all levels of participation. There are four general, separate arrangements embodied in the terms of reference: consultation, where the Council identifies an issue and seeks public response; direct involvement or power sharing, where community representatives are full members of the decision-making body; community action, where groups put forward their own demands; and community self-management, where groups have control of facilities and resources (Stewart, 1983: 132).

Public participation is more often than not restricted to public response to identified issues. The local authority has its own pattern of working, represented by its procedures, settings and roles, and giving expression to the values, assumptions and beliefs of the established organisational interests. Those interests should be respected and not disturbed by uncontrolled public involvement.

Furthermore, the public, as customers and citizens, can share needs and wants, but can also differ in their purposes. Citizens, as customers of government, are naturally more responsive to public needs than are government officials and the poorest of moral performances and accountability by government are generally associated with conditions in which few citizens have any influence (Du Toit *et al.*, 1998: 124).

People have the right to participate in government programmes and in civil society. Public participation includes standing for elections, voting in elections, becoming informed, holding and attending community meetings, joining civil and/or political organisations, paying taxes, protesting and petitioning. Craythorne (1997: 74) argues "...that public participation must also be understood in the context that cannot mean the submission

of all decisions on public affairs to a decibel auction by some vague entity known as the public, as it is likely that decisions will not be taken or that the wrong decisions will be taken, and such a step would amount to the abdication by the elected representative (Ward Councillor) of his/her responsibility to govern”.

## CONCLUSION

In the above discourse an attempt was made to refer to the essential theory concerning food security issues as it arises within the context of development, the South African local government system and sustainable development in general. Practical experience within a particular country and in particular a municipal environment does provide noteworthy suggestions on how sustainable food security measures may be administered. Currently public administrators are faced with the challenge of how to effectively administer programmes and projects associated with LED and food security and it may be opportune to consider how the ward committee system could be utilised to ensure sustainable public participation in this regard.

In summary, it may be noted that food security is currently an immediate response to an immediate problem in the developing world. Yet, as the foundation is cast for urban farming practice to occur, it may simultaneously transpire as the precursor toward local economic development, which may improve the prospects for increased entrepreneurship, job creation and poverty alleviation. Either way, when policies are weighed, local government should lend consideration to urban agriculture interventions, which honour issue-drivenness, pro-poor growth emphasis and the principles of SHREQ, all within the context of a strategic and integrated development planning model.

# THE HYPOTHESIS OF A NEW APPROACH TO LEAN PRODUCTION INTO THE CONTEXT OF LEAN THINKING

**Ksenia O. Safronova, Higher School of Economics National Research University, Russia**

## ABSTRACT

*The enterprise management entirely depends on the literacy of strategic management and intellectual potential of employees. Presented in the article are orthoepic content terms of Lean. Also the article includes the detailed analysis of the main operating functions of the production in the concept of lean enterprise, the tools of «Lean Production» as evolutionary development philosophy of «Lean» and the updated hypothesis of a new approach to Lean Production, based on the Noosphere Thinking. In that case, there are born a new term of «Lean Learning Manufacturing».*

## «TOPICALITY OF RESEARCH»

During the last decade, the leadership of many Russian companies began to understand that the deciding factor on the path to business success is a clear statement of the company's strategy and its effective realization. Control of the operating system business is a key in this respect. Performance of the main operating functions of the enterprise is based on the strategic vision of the enterprise core competencies and capabilities to enhance its competitiveness in the market.

Every company strives to meet customer needs, and so maximizes production applying the most efficient use of production facilities and talent. That is why increasing international competition and rapid technological development require the heads of organizations to consider in a new way the full range of management issues for its operating units responsible for the production of goods and services.

During the last decade, management of many Russian enterprises has begun to understand the prospects of using the principles of Lean Production. However, in the pursuit of «winning» as a loyal customer, the company should not forget about the rationality of the use of intellectual, natural and financial resources. In this context, the process of rational using of available recourses becomes important in society, in the company. Therefore, solving the problems of today, we can build a future through the lean technology.

The concept of Lean Production is the philosophy of management, where we don't speak only about changing the prevailing style of production organization, but about a modern culture too; about creating new operating systems, which will be riddled with lean thinking, both among the highest, and among the lower strata enterprise.

Enterprises of this type focus on management approach, the use of existing reserves on the basis of conjecture «Noosphere Thinking». Before proceeding to the analysis of Noosphere Thinking is needed to define the genesis of the concepts of Lean Manufacturing. The hypothesis of a new approach is in the concept of Lean Production in the context of Noosphere Thinking for expanded and detailed proof of the existence. Now the challenges are facing business partly arise because of resistance to change, lack of professionalism, and lack of motivation. Change of ideas and methodologies are cyclically. In the thirties of the twentieth century philosophy of business management system was the most advanced to the «Toyota Production System» (TPS). Today this concept is known as «Lean Production».

The concept of «Lean Production», based on specific principles, where the paramount value is the consumer, and is transformed into a «Lean Thinking», dictated by the value from the standpoint of the manufacturer and the substructures of the operating system business in general. Value - the starting point of Lean Thinking. Value is created by the manufacturer, as defined by the user. Both external and domestic consumers are advocates in the role of consumer. Anybody in any stage of the production process is also considered as a consumer, which should provide all necessary and at the right time. Therefore, it is important to understand values through the integration and coordination of staff through educational programs, which are not only learning the technological aspects, but also brought up the morale, values of the organization.

The process of producing goods and services has been being allowed to talk long about operation management. Breakthrough in the development of the concept of scientific management and production methods has been marked by Just-in-time development approach. The aim of JIT is a smooth and rapid flow of materials, information, and finance through the entire operating system. JIT – strategy driven demand – is nothing made up for as long as there is no need of it. The demand for parts or finished products «pulls» the product of the system. The phrase «sell daily – make daily» embodies the essence of JIT-standard.

Order formations became possible by the emergence of MRP-system as appropriate and in the right quantities. In many ways, the successful implementation of MRP-system depends on the support and active participation in the project implementation of top management. Ignoring this condition is fraught with consequences that can meet resistance from the rank and file employees in the flesh to the loss of communication with business objectives and strategic goals. Reactive process of order execution is carried out through a Kanban system. The Kanban heart is theorizing of the scientific organization of labor theory of F. Taylor and streaming production of H. Ford.

The main purpose of implementing the principles of Kanban and «pull flow» is rapid response to customer needs at the right product at the right time in the specified amounts. To implement this principle the introduction of quick changeovers of equipment – SMED system (Single minute exchange of die) is required. This system implements the approach of Total Productive Maintenance. TPM-task approach focuses on the systematic involvement of all staff in continuous improvement of operational (production) process.

Just-in-time development approach was followed by the development of Total Quality Management. Development of TQM was contributed significant results, both in operational management and in the practice of business management in general. As the process of production management is being developed, a new level of automation of business processes has got a brand new quality. This trend began to popularize the need for training of a new quality (level) – Integrated managers whose duty is to ensure the consistency of individual areas of management.

## **LEAN MANUFACTURING IN THE CONTEXT OF LEAN PRODUCTION**

«Lean Manufacturing» means a systematic influence on the process of creating value for each product - from concept to production, from order to delivery, from raw materials extraction to the moment when the product gets into the hands of end users with a minimum time, cost and losses. Production – this is not the domain of the enterprise. By producing a «Lean Production» is meant that a more general form is the main operating function.

According to, the classification of the business processes of the operating system of the organization, the production is the processing subsystem of the operating system, as the contents of the business process – is the creation of products. Organization's business processes is the primary operating function, which converts the resources received by the company's entry in the final product that represents value to the customer on the exit. The realization of the main operational function determines opportunity, procedures and methods of achieving competent expression and organization competitiveness. It is necessary to build the work with the subsystems of the operating system. In that case, need to talk about working «Lean Production» as «Lean Manufacturing». Management philosophy on the principles of «Lean» is built on the philosophy of morality based on respect for the employee as an individual, involvement in the process of solving the current problems of all employees, creating psychological atmosphere, eliminate fear and providing the ground for the creative potential of man.

There is the development of all three subsystems of the operating system along with the development of production as the main operating function. This means that the activities of all three subsystems – the management, processing, providing – must adhere to the principles of «Lean Manufacturing».

## LEAN PRODUCTION AS TEACH MANUFACTURING

The concept of «Lean Production» – is not just a set of tools and techniques. In order to «Lean» principles work need to create a system that would encourage staff to think, learn and improve. Lean encourages technology to become a learning organization through relentless self-analysis – Hansen. Hansen is part of company culture and an integral part of the Learning Organization. According to the head of Toyota Technical Center, without self-examination is not possible to create a learning organization: «Without Hansen is not possible to do kaizen. Japanese Hansen means that when you do something bad, you should first feel the deepest regret. Then you should develop a plan for solving problems in the future, believing that you will never repeat his mistake. Hansen – a way of thinking, mentality, attitude. Hansen and Kaizen are inextricably linked».

Constant change, innovation and flexibility are integral components of successful business and the mandatory conditions of survival of the XXI century. And the new approach relies on the ability to learn. Lean Manufacturing intelligently uses the stabilization and standardization in order to bring innovation emanating from the project team. These innovations should be standardized and will be used until such time until you find a new approach. Standardization, innovation is intermittent, which is enshrined in the new standards are the foundation of a new approach to learning and creating Learning Manufacturing (Organizations).

Moreover, if the acquired knowledge and skills consistent with the natural inclinations and aspirations of man, it will benefit both the person and company. In this case, preparation of training programs through corporate universities within the enterprises (manufacturing) are transformed into a new type of education of people, because they promote not only professional but also the mental, moral and spiritual development of personality. Continuous improvement and learning in a Learning Manufacturing (Organization) applies to suppliers. Lean enterprise expands its borders and begins a difficult work to integrate third-party vendors into a single network. This structure is called «Lean Learning Manufacturing». Joint training is carried out through workshops on improving production, which is responsible for the results of training provider. At these seminars are being tested different approaches to the organization of the suppliers. Subsequently, some suppliers created an association BAMA (Bluegrass Automotive Manufacturing Association). As part of BAMA's leading providers share their experiences and discuss their concerns, organize joint projects. These meetings contribute to the company-manufacturer convey key information to suppliers.

The success of «Lean Learning Manufacturing» equires a skilled top management of the manufacturer, partnerships with suppliers, a culture of continuous improvement and collaborative learning. Conceptually, approaches MRP, TPM, SMED, means of visual control and part of the standard of quality management – JIT, TQM formed the core of the new philosophy of management of modern business Lean Production.

## ORTHOEPIC CONTENT TERMS OF LEAN

In the process of learning concepts (terms), actively used in the concept of «Lean Production» the problem is identified the correct perception and use of terms that constitute the backbone of the «Lean». Incorrect translation of certain terms has provoked confusion in the content of concepts. In order to solve the problem of tracing terms in other languages has been created table (orthoepic content) «Lean» terms with definitions of their values. However, before you begin building orthoepic content terms, it became necessary to clearly define the values of terms used to create a logical connection between the terms of the concept of «Lean Production».

Illustration of the meaning of the terms of inclusion on a «doll» can illustrate their logical linkage (Fig. 1).

**Fig. 1. Logic connection between the values of key terms used in the concepts of «Lean Production».**

In this regard, we are entering on the new level not just process control and management of the operating system. There is a new hypothesis for development. Development of «Lean» may be represented as orthoepic communication terms, is actively used in the concept of Lean Production.

Identified contexts of ideas Lean Production suggest the development of the theory of «Lean» to output to a new level of culture of enterprise management, the scheme of interaction between its levels and departments, as well as a system of values and attitudes to work of employees.

The table «orthoepic content terms» based on the deriving research (Table 1).

**Table 1. Orthoepic content of the terms**

Term	Definition
Lean Production	The concept of management, focused on the struggle against the losses of all kinds in all subsystems of the operating organization.
	A set of techniques developed through the creation of sustainable value for customers, employees and owners with a minimum time, cost and errors.
	Style of management organization, where the main emphasis is on education of gifted people, cross-training, strategic thinking as a higher and the lower layers of the organization.
Lean Manufacturing	Transformed the concept of lean production, which covers all the subsystems of the operating system business (management, marketing, information technology, etc.)
Lean Thinking	The philosophy of lean production, aimed at combating all types of losses in all spheres and at all levels of the company.

The most important aspect of the production process of «Thinking System» is to create a company man.

## NOOSPHER THINKING AS IDEALOGIYA TRANSFORMING KNOWLEDGE SOCIETY

As in the evolution of philosophy «Lean», and all changes in nature has always been associated with the role of moderator – Man. Evolution of human relationships: people – society, the employee – company, organization – suppliers, the company – the customer – is largely dependent on modern technologies, concepts and ideologies. Century ideology of today should seek a harmonious combination of Man – Nature – Society – Space. This harmonious union describes the Noosphere thinking. This idea of the noosphere belongs to Russian scientists. Great contribution to the development of the noosphere thinking was made by V.I . Vernadsky in his works «Biosphere and noosphere», «Philosophical thoughts naturalist». Noosphere thinking idea is a mechanism of the humanity survival by creating a balance between the capacity of the biosphere and the needs of the population to meet the good things of life, gradually increasing the technology of maintaining the balance.

Human activities could lead to the degradation of Earth's biosphere and death, but can also lead to the noosphere – the next evolutionary stage of the existence of a new biosphere. Noosphere – a sensible creative

power of thought and action of the majority of people in the biosphere, harmonious union of man and nature. Man of the noosphere – a man of the future. In his teachings Vernadsky said about scientific knowledge as a special area, «where the process of continually organizing and processing information on various events and objects of reality». Biosphere is modified in a new state – the noosphere. Noosphere thinking permits politics and economics, morality and art, philosophical thought and religious life. Academic life generates a new technique, technology, improves manufacturing processes that directly and powerfully alter the nature, «enriches humanity, making it more knowledgeable and skilful». The idea of sustainable consumption involves the creation of future society – Noosphere society. In this regard, there is the reorientation of the society to a creative understanding of the evolution of knowledge, using the methods of energy-self-regulation.

In perspective, the concept of energy-paradigm «sphere of the mind» is a kind of energy-shell of the Earth, «which records are stored all the results of cognitive, emotional, verbal, verbal, material and economic activities of man and mankind». You can submit new model of «being» where the man of the noosphere, and to be more precise human intelligence – is the core, the essence, and the tools of development and transformation of the world, societies, organizations – is the stratosphere thrift. The idea of Noosphere Thinking is not affected by accident, because one must look at the root and see the basic relationship. Realizing the essence of «Lean Production» in conjunction with the specific areas of activity can create an efficient operating system. All parts of the logistics chain will be «linked» the ideology of Noosphere ratio (relationship). Noosphere evolution in the inner world of man can lead to changes in society and nature. And these changes must be backed by concrete action. Role of the applied part or biosphere-saving aspect is given to the principles of «Lean Ratio». If we change the Noosphere Thinking officer, taught him to work, to improve themselves, to devote him to the philosophy of «Lean», then we will create a strong corporate culture and as a consequence, the effective (efficient) operating system.

Let's investigate this theory of Noosphere Thinking if this idea is submitted only in one organization, not in the global sense. Each organization is a small company with its population and territory, wealth and hierarchy, communication and technology, corporate culture and management style. In order to control and manage effectively this system, the organization must actively coordinate all its departments. There are four levels of integration of the organization: operational, functional, cross-functional and inter-institutional. Sharpen their focus on the last two levels. Cross-functional level determines the internal integration of the organization. The essence of it is reduced to the integration of all departments and services of the enterprise for a given outcome. However, cross-functional integration is not enough to achieve competitive advantage in today's business environment. Therefore, under current conditions the company can be effective only when the external integration of its activities on inter-organizational level, where the stability of the open system is formed by the development of interaction with the environment. Thus, we can talk about environmentalism. Therefore environmentalism lean perception can be regarded as a focus of psycho-emotional and cultural education of the individual to interact with the environment (contact with people, the microclimate in a particular situation and environment). This idea can lead Hawthorne experiments of Elton Mayo, which examined the effects of certain environmental changes on the productivity of workers as a confirmation. Despite the fact that the idea of «Lean» is born with business needs, its principles are well reflect the essence of the Noosphere Thinking.

The concept of «Lean Production» in the context of Noosphere Thinking generates a new philosophy of Lean Thinking. Reason for lean thinking is «Learning Lean Manufacturing». In this case, lean thinking has permeated all the subsystem of the operating system business.

## **ABSTRACT**

*The social complexity perspective of Organizational Learning is a conceptual approach that integrates cognitive and social perspective conceptions by drawing on two sets of principles of Complexity Theory, particularly those associated to the dynamics of Social Complex Adaptive Systems. Through the social complexity perspective lens, learning emerges as a space where different possibilities can be contained and it is also a process and product of the multiplicity of connections. This approach is particularly relevant for analyzing the process of international standardization on social responsibility, where double level of consensus – amongst stakeholders and across countries – was successfully achieved. The purpose of this paper is to present a new theoretical approach for investigating ISO 26000 standard development as a social, complex learning process. It was assumed that the social complexity perspective of Organizational Learning can improve the understanding of the role of learning as a source of institutional sustainability in the light of the strategic challenges faced by ISO within the global governance arena.*

## **INTRODUCTION**

The expansion of the scope of the International Organization for Standardization (ISO) regarding the societal aspects which ISO standards increasingly address – such as impact on the environment and energy consumption, consumer and worker protection, health, food safety and ethics – requires that the representatives of the corresponding interested stakeholders be properly involved. By way of illustration, the scope and membership of the ISO committee on consumer policy (ISO/COPOLCO), have been systematically reviewed to consider broader participation of the interests associated to the impact of consumer products and services on these societal aspects and the potential contribution of international standards to clarify the corresponding claims (ISO, 2009).

The need for ISO to work on a social responsibility (SR) global standard was first assessed in 2001 by COPOLCO. In 2003, the multi-stakeholder ISO Ad Hoc Group on SR, which had been set up by ISO's Technical Management Board (TMB), completed an extensive overview of SR initiatives and issues worldwide. In 2004, ISO held an international, multi-stakeholder conference to further help to determine whether or not it should launch a SR standard. The positive recommendation of this conference led to the establishment in late 2004 of the ISO Working Group on Social Responsibility (ISO/TMB/WG SR) to develop an international standard on Social Responsibility, which was published in late 2010 as ISO 26000 - Guidance on social Responsibility (ISO, 2010).

The international standard ISO 26000 aims at implementing and accelerating the development, realization, and improvement of influential factors for social responsibility in organizations. ISO 26000 was developed for all kinds of organizations in any country of the world, including countries with emerging markets and developing countries. As the ISO standard was designed as a guidance document, providing meaningful guidance to all kinds of organizations on social responsibility issues, the standard is neither intended for third-party certification nor describes a management system.

Regarding the membership of the ISO/TMB/WG SR, it was the largest and the most broadly based in terms of stakeholder representation of any other single group formed to develop an ISO standard. Six main stakeholder groups were represented: industry; government; labour; consumers; non-governmental organizations (NGO); 'service, support, research and others' (SSRO), as well as a geographical and gender-based balance of participants (ISO, 2011).

Under the joint leadership of the ISO members for Brazil (ABNT) and Sweden (SIS), it was made up of experts nominated by ISO members (national standards bodies – NSBs) and from international or broadly-based regional organizations. ISO/TMB/WG SR concluded its work in late 2010 with 450 participating experts and 210 observers from 99 ISO member countries and 42 D-liaison organizations. ISO 26000's learning process will be treated in the present work as a process that involves individual cognition and collective activities of multi-stakeholders that are bounded by common goals and commitment to organizational actions of the ISO/TMB/WG SR.

This paper presents partial results of an ongoing MSc. research project which aims to: (i) show, through the social complexity perspective, empirical evidences on the learning dynamics and the specific learning mechanisms experimented by the several groups during the development process of ISO 26000 standard; and (ii) identify the facilitating and constraining factors for organizational learning in two social complex evolving systems - the ISO/TMB/WG SR and one of its national mirror committees - the Brazilian ISO/TMB/WG SR Mirror Committee.

The research methodology of this ongoing MSc. project comprises: (i) bibliographical and documental review on international standardization; social complex adaptive systems; organizational, with special attention to integrative approaches; (ii) review of the development process of ISO 26000 standard; (iii) design of a conceptual model that integrates the international standardization and organizational learning, through the lens of the social complexity perspective; (iv) development and application of a survey questionnaire in two levels - ISO/TMB/WG SR and its Brazilian Mirror Committee; and (v) description of ISO26000 study case, bringing empirical evidences of organization learning in an international, multi-stakeholder environment.

The main contribution of this research project is to introduce a new theoretical approach, as presented here, for investigating ISO 26000 standard development as a social, complex learning process. This can be especially useful as it can improve the understanding of the role of learning in a double level of consensus – amongst stakeholders and across countries – in the light of the strategic challenges faced by ISO within the global governance arena. From the ISO 26000's case study, it can be revealed the best mechanisms that facilitated the process of learning and also the main barriers observed in such an international, multi-stakeholders' environment. For future international standards developments, the case study can also bring some recommendations that ISO could adopt in near future to meet needs and expectations of all stakeholders' categories, particularly different groups other than those that classically took part in ISO standardization processes.

## **THE ISO 26000 STANDARD DEVELOPMENT: A COMPLEX LEARNING PROCESS**

For reviewing the development process of ISO 26000 standard and reinforcing its organizational complexity, a reference source of information provided by ISO was accessed via the online ISO Livelink area (ISO, 2011). This database comprises an extensive empirical material on its development process, including circa of 1,700 documents as a whole. By way of illustration, different drafts of ISO 26000, minutes of the

working group meetings, working documents, resolutions, comments or results of ballots could be accessed and reviewed.

The ISO 26000 development process introduced innovative and flexible organizational procedures, which can be summarized as follows: (i) adoption of a multi-stakeholder approach; (ii) implementation of twinning principle to a greater extent than had yet been carried out in any ISO standards development group; (iii) configuration of a basic organizational framework including subgroups devoted to: adopting new flexible procedures, in addition to the usual ISO rules; looking for funding under-funded groups; and enhancing communication within and outside ISO/TMB/WG SR; and (iv) implementation of an inclusive decision-making process, which encompassed national mirror committees from 99 countries, having in their composition experts from the above mentioned stakeholders' categories.

One of the most prominent characteristics of this process was the adoption of a multi-stakeholder approach. The experts of ISO/TMB/WG SR were nominated by the ISO members and included experts representing six main stakeholders' categories. In addition, interested international and broadly based regional organizations were also able to appoint a maximum of two experts each. The six stakeholders' categories were: (i) industry; (ii) government; (iii) consumer; (iv) labour; (v) non-governmental organizations (NGO); and (vi) 'service, support, research and others' (SSRO). The stakeholders' categories were first defined by ISO/TMB in a document titled "*New work item proposal - Social responsibility*" (ISO, 2004). Later on, the ISO/TMB/WG SR agreed that the 'Other' category should be re-named "Service, support, research and others (ISO, 2005).

ISO member bodies (MBs), i.e. those national bodies that represent their country within the ISO organization, were allowed to nominate up to six persons, one for each of the six stakeholders' categories. These nominees hold an "*expert status*", which includes the right to participate actively at the different drafting stages. Their individual views had to be considered during the development process (ISO, 2004; ISO, 2009). International or broadly based regional organizations could additionally acquire a so-called "D-liaison status", which offered the right to nominate up to two experts with the same status as other nominated experts (ISO, 2004).

In May 2010, the ISO/TMB/WG SR consisted of 450 experts from 99 countries and 42 D-liaison organizations. (ISO 2010). Experts representing "Industry" accounted for approx. 22% of the WG experts, followed by the categories "Government" (approx. 21%), "SSRO" (approx. 19%), and "NGO" (approx. 19%). The two smallest groups were "Consumers" (approx. 11%) and "Labour" (approx. 8%), as showed in Figure 1.

**Figure 1: Balance of stakeholder representativeness**

The development process of ISO 26000 was special in a number of respects, particularly with regard to the efforts made to ensure the participation of developing countries. Within this perspective, ISO implemented the principle of twinning (twin leadership between a developed and developing country) in the ISO/TMB/WG SR largely than had yet been carried out in an any ISO standards development group. The ISO/TMB/WG SR was jointly led by two National Standards Bodies: one from a developing country and the other from a developed country, respectively the Brazilian Association of Technical Standards (ABNT), and the Swedish

Standards Institute (SIS). Besides this twin leadership between Brazil and Sweden, there were efforts in the sense that any subgroup that was established should have in their leadership representatives from developing and developed countries on an equitable basis.

Figure 2 shows the organizational structure of the ISO/TMB/WG SR, which was created in 2005 by the group at the very beginning of its operations (ISO, 2005). A Chairs' Advisory Group was established to provide strategic advice to the Chair and to the Vice Chair. A Task Group (TG1) was created to find ways of ensuring balanced participation across regions and stakeholder groups, in particular through fundraising efforts. TG2 was created and charged with developing external communication and dissemination tools, and a third Task Group (TG3) was established to devise internal guidance on special procedures for the WG SR to complement those existing ISO procedures (ISO, 2008). And three additional Task Groups (TG4 to TG6) were initially established to take forward drafting of different parts of the standard.

As reported by ISO (2007), the WG SR organizational structure evolved along the course of the ISO 26000 development. The three additional task groups (TG4 to TG6) were disbanded and their leaders took part of a new subgroup titled 'Integrated Drafting Task Force' (IDTF) established in November 2007 at the Vienna WG SR Meeting. The IDTF was specifically charged with the duty to review and revise the ISO 26000 drafts as a whole. As showed in Figure 2, an Editing Committee was also established. Besides, Language Task Forces (which were not formally part of the WG SR) worked to translate key documents into languages other than English in order to ease participation from non-English speaking countries.

**Figure 2: Organizational structure of the ISO/TMB/WG SR**

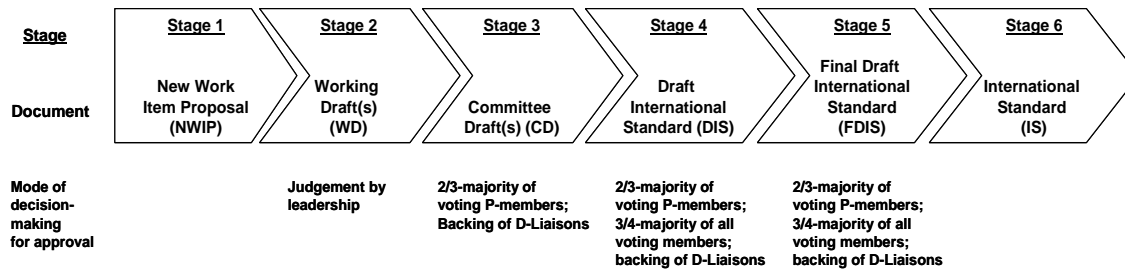

As far as the implementation of an inclusive decision-making process is concerned, National Mirror Committees from the member countries were established, having in their composition experts from the six stakeholder categories. This organizational mechanism was designed to provide national perspectives as input to the experts acting in the ISO/TMB/WG SR, in addition to those from 42 international and broadly based regional organizations (D-liaison organizations).

In accordance with the ISO/IEC Directives, Part 1 (ISO, 2008), the development process of ISO 26000 was performed in several successive stages. Figure 3 shows the stages and modalities of decision-making in the ISO 26000 standard development.

For new ISO projects (Stage 1), the proposer of the initiative shall indicate the range of organizations/stakeholder groups supporting the initiative, as well as those that, according to their interests and identified needs should as a minimum be involved in its development in order to facilitate the arrangements of national consensus building (ISO, 2010). Liaison organizations should be committed to informing and seeking

input from a broad range of their relevant stakeholders on any new ISO projects once the ISO member bodies approve them (ISO, 2010).

**Figure 3: Project Stages and Decision-Making in the ISO 26000 Standard Development**

In order to complete one stage and enter the next, a continuously improved draft version of the guidance standard has to be approved. These different drafts could be considered as milestones of the development project. The main draft versions, representing the pre-stages of the official ISO 26000 document, are namely the Working Draft(s) (WD), followed by the Committee Draft(s) (CD), a Draft International Standard (DIS) and a Final Draft International Standard (FDIS) (ISO, 2008). The aim of such a development project is to build consistent draft documents for each stage for subsequent approval through a consensus-based process among all experts, and consequently the publication of a new standard as an official ISO document (Figure 3).

The overall proceeding principle within the ISO 26000 development was founded in the idea of finding a consensus among the participants (ISO, 2005). ISO defines consensus as a "*general agreement, characterized by the absence of sustained opposition to substantial issues by any important part of the concerned interests and by a process that involves seeking to take into account the views of all parties concerned and to reconcile any conflicting arguments*" (ISO, 2008).

The role of learning in a double level of consensus – amongst stakeholders and across countries – will be the object of the MSc. Research, by applying the new conceptual approach presented in next section. The motivation for this exploratory, conceptual paper was that the organizational learning approaches used so far are mainly focused on how local learning and best practices are shared and transferred across individuals and network of institutions without addressing the dynamics and learning mechanisms employed (Gherardi, 2001; Easterby-Smith et al, 1999; Elkjaer, 2005; Antonacopoulou and Chiva, 2005; 2007).

## THE SOCIAL COMPLEXITY PERSPECTIVE OF ORGANIZATIONAL LEARNING

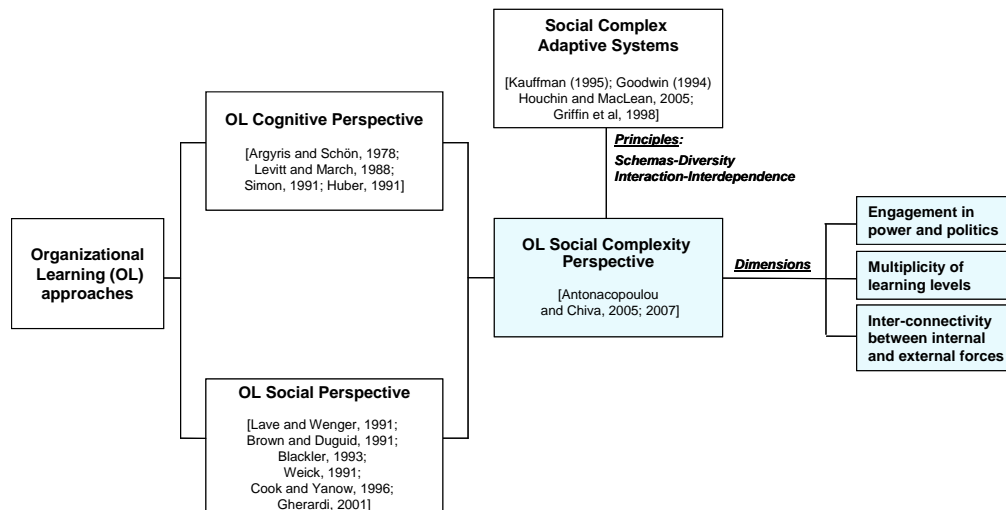

The social complexity perspective of Organizational Learning (OL) is a conceptual approach proposed by Antonacopoulou and Chiva (2005; 2007) that integrates cognitive and social perspective conceptions by drawing on principles of Complexity Theory, particularly those associated to the dynamics of Social Complex Adaptive Systems (Kauffman, 1995; Goodwin, 1994; Houchin and MacLean, 2005; Griffin et al, 1998). Figure 4 represents schematically the theoretical background concerning the social complexity perspective of OL.

Antonacopoulou and Chiva (2005; 2007) focused on the radical perspective of Complex Adaptive Systems (CAS) approach (Kauffman, 1995; Goodwin, 1994; Houchin and Mac Lean, 2005; Griffin et al, 1998), but also considered concepts like schemas or rules, as they refer to micro-dynamics in relation to knowing and doing that are central to organizing.

The complexity principles they focused on are *schemas–diversity* and *interaction–interdependence*. These two sets of principles were chosen both because they reflect the most significant dimensions that explain the nature of CAS, and also because they correspond to the two main streams in OL research: (i) cognitive perspective (Argyris and Schön, 1978; Levitt and March, 1988; and Huber, 1991); and (ii) social perspective

(Lave and Wenger, 1991; Brown and Duguid, 1991; Blackler, 1993; Weick, 1991; Cook and Yanow, 1996; and Gherardi, 2001). A key element of the cognitive perspective is Schema Theory (Gnyawali and Stewart, 2003), which considers learning as the process of transforming, creating, refining or validating schemas. On the other hand, the social perspective considers learning as the product of social interactions (Gherardi, 2001).

**Figure 4: Theoretical Background Schema concerning the Social Complexity Perspective of Organizational Learning**

Based on *schemas-diversity* and *interaction-interdependence* principles, Antonacopoulou and Chiva proposed an integrated conceptual view of OL that explores the interactions between learning actors at different levels and the wider environment and identifies the conditions that support the interdependencies between them. For capturing the dynamics of learning and organizing structures, they identified three dimensions as key for explaining the social complexity of OL. They are: (i) engagement in power and politics; (ii) multiplicity of learning levels; and (iii) inter-connectivity between internal and external forces. These dimensions will be discussed in the next section, focusing on the ISO 26000 standard development process.

## AN ATTEMPT TO UNDERSTAND LEARNING DYNAMICS OF ISO 26000 STANDARD DEVELOPMENT

The choice of the social complexity approach for analyzing the learning process of ISO 26000 development was mainly due to its strength in treating organizations as social evolving complex systems, reinforcing the role of learning as a source of institutional sustainability. One of the basic assumptions of this research is that both internal (endogenous) and external (exogenous) interactions are essential to learning within an international and multi-stakeholders' organizational environment – such as ISO 26000 standard development. As different social actors were involved, they can be identified as learning entities that interacted and negotiated through various boundary objects.

As mentioned before, the three dimensions concerning the social complexity approach are discussed here with an attempt to design, in the second phase of this research, a conceptual model that integrates international standardization and organizational learning processes, through the lens of the social complexity perspective, as conceived by Antonacopoulou and Chiva (2005; 2007).

The first dimension– *engagement in power and politics by individual agents* – can help to explain how the members of the ISO/TMB/WG SR and one of its Mirror Committees - the Brazilian Mirror Committee- contributed through their actions to either the stability or renewal of the whole social complex system, by following or breaking the rules as they had learned. In both groups, engagement by individual agents can be considered as an active and intense process of collaboration. For the research purposes, it was assumed that the

relationships between individual actors within the ISO/TMB/WG SR's and the Brazilian Mirror Committee's internal environments contributed to shape the forces that influenced the complex learning process that took place. Another assumption was that the interactions between the members of these two groups and their respective external environments also influenced the whole learning process.

Concerning the second dimension – *multiplicity of learning levels* – the analysis of multiple connections and interdependencies between the diverse stakeholders involved in the ISO 26000 development (and their social structures) should consider forces such as identity, language, power and politics as key conditions shaping how double level of consensus in relation to the emerging SR schemas was successfully achieved. In fact, understanding which conditions made connections across levels of analysis possible and how they were formed are key points to be taken into account during the development of ISO 26000's case study.

Finally, in relation to the *interconnectivity between internal and external forces* it should be explored the mutually adaptive relationship between the ISO/TMB/WG SR's and the Brazilian Mirror Committee's organizations and their environments. Since the internal and external environments are dynamic and permeable, the social complexity of OL emphasizes interconnectivity by drawing attention to inter-relationships as key to understanding the fluid, emergent and self-organizing nature of learning in organizations.

This new conceptual approach can provide a basis for better capturing the conditions that make organizational learning possible in the ISO 26000's development process. It offers a robust and consistent framework for a deep organizational analysis focusing on the following issues:

- a critical view concerning the political forces that influenced the experts acting in the ISO/TMB/WG SR, and the mechanisms that allowed knowledge to be created and shared and collective learning to emerge;
- an analysis of the negotiations that governed the interaction between the members within the ISO/TMB/WG SR and also within the National Mirror Committees, so that the respective power of individuals could better explain their actions when they sought to protect their perspectives;
- an identification of the conditions that corroborated the interconnections between the ISO/TMB/WG SR and its multiple external environments (countries and stakeholders categories) and also an analysis of the interdependencies between endogenous and exogenous forces defining what was learned and how learning was played by individual agents and groups;
- a better understanding of the facilitating and constraining factors for inter-organizational learning and self-organizing concerning two social complex evolving systems (the ISO/TMB/WG SR and the Brazilian Mirror Committee of WGSR);
- an analysis of the governing assumptions that defined what was learned within ISO/TMB/WG SR's and the Brazilian Mirror Committee's contexts, revealing the tensions and ex-tensions from which learning emerged.

## CONCLUSIONS

From the perspective of an international standardization context, the social complexity approach of Organizational Learning suggested that the actions and interactions of diverse stakeholders can generate learning as a possibility and determine the approaches by which they seek to learn. These features indicate that the learning in such context is a non-linear process that creates the possibility for learning and maximizes the possibilities from learning. In this sense, organizational learning can be considered as the emergent product of multiple connections and this aspect is particularly relevant for analyzing the ISO 26000's process, where double level of consensus – amongst stakeholders and across countries – was successfully achieved.

From the authors' perspective, we strongly believe that the ISO 26000's case study – illustrating the application of the social complexity perspective of OL – can reinforce the role of organizational learning as a source of institutional sustainability in the light of the strategic challenges faced by ISO within the global governance arena. For future international standards developments, this case study can also bring some recommendations that ISO could adopt in near future to meet needs and expectations of all stakeholders' categories, particularly different groups other than those that classically took part in ISO standardization processes.

# **WEB-BASED CUSTOMER REVIEWS FOR A CARIBBEAN FOUR STAR ALL-INCLUSIVE RESORT - IDENTIFY DRIVERS FOR EXCELLENT RATING**

**Martin Schmits, Consultant, Switzerland**  
**Shaukat Ali, University of Wolverhampton, UK**

## **ABSTRACT**

*The four star Punte Verde is an all-inclusive Caribbean Sea resort in the Punta Cana region in the north east of the Dominican Republic. Resorts such as the Punte Verde need to utilize marketing research processes to optimise their performance and identify the objectives and measures to compete with other resorts and to gain competitive advantage. Main data sources were qualitative and quantitative hotel reviews available on Tripadvisor.com as well as the company's homepage and further online available resources. Based on these customer reviews TripAdvisor.com creates popularity lists for all reviewed hotels within a certain vacation area or region. For the area Punta Cana, tripadvisor.com listed 92 different four to five star hotels, whereas the Punte Verde comes 51st place with overall more than 1,300 reviews and a TripAdvisor®-rating of 3.5 out of 5. This research evaluates in which categories the management need to invest resources in order to improve feedback and avoid negative appraisals and finally to move from the middle places up to higher ranks within the popularity rank.*

## **BACKGROUND**

The Punte Verde is one of around 90 hotel resorts in the municipal district Punta Cana in the most eastern province La Altagracia in the Dominican Republic. Punta Cana is the most popular and fastest growing tourist area of the Dominican Republic and well known for its all-inclusive style vacation resorts (Ministry of Tourism; 2009; www.tripadvisor.com 2009). Hotel operators in the Caribbean Sea are dealing on the one hand with excellent climatic and geographic conditions and on the other hand with strong and growing competition and the outcomes of the economic crises. (www.weather.com, n.d.; Brockmanns, 2009; Froese, 2007; wikipedia.com, 2009). Resorts such as the Punte Verde need to utilize marketing research processes to find out how to optimise their performance. They need to identify the objectives and measures to be able to compete with other resorts and in order to gain competitive advantage. For the hotel and restaurant industry there are many adequate methods for successful marketing research. This research makes use of online secondary sources that are available on the internet. Main source were qualitative and quantitative hotel reviews available on Tripadvisor.com as well as the company's homepage and further online available resources. The hotel offers nearly 800 bedrooms that are separated in standard garden view, standard sea view, deluxe sea view and presidential suits in different sections for families and couples. The entire resorts lies directly in front of the beach front with many coconut palm groves and offers a pool area with two large pools and a separated pool for kids. Within the resort there are four international dress-code required a la carte restaurants, one casual restaurant and several open buffet restaurant for breakfast, lunch and casual dinner. The hotel features a spa area and offers several spa-opportunities, different therapies, sauna and beauty saloon services. Additional services and entertainment offers are corresponding to many other comparable hotels within the region (www.tripadvisor.com, 2009); Fleischmann, 2005). The Punte Verde is facing competition from many hotels and resorts all over the Caribbean Sea, the Dominican Republic and particularly within the region Punta Cana. Occupancy rates are very volatile, for instance 2006 was a record year with a growth of 3%, but there was negative growth. Such numbers show indirectly the influence of economic crises (Brockmanns, 2009; www.domrepworld.com, 2008).

## RESEARCH QUESTIONS

There has been an increasing number of internet-based service providers who allow people to write reviews based on their own experiences about hotels all over the world and containing qualitative as well as quantitative contents. Based on these customer reviews these service provider creates popularity lists for all reviewed hotels within a certain vacation area or region. For the area Punta Cana, tripadvisor.com listed 92 different four to five star hotels, with the Punte Verde ranking 51st place based on more than 1,300 reviews (more than 500 over a two year period) and a TripAdvisor®-rating of 3.5 out of 5. On holidaycheck.com, the Punte Verde comes 33rd place out of 77 reviewed hotels with 85 reviews within the last two years and a popularity index of 4.4 out of 5. Finally, on the German-based platform vivaltis.de, the Punte Verde comes 44th place out of 61 reviewed hotels and holds a popularity index of 3.75 out of 5 with 39 reviews within the last two years (2009) (Table 1). While placing the hotel in the middle part of their ranks, all networks draw more or less the same picture of the resort.

**Table 1 Overview popularity-index and number of reviews (Effective on April 2009)**

Punte Verde	Place	Popularity-Index	Number of Reviews
Tripadvisor.com	51 of 92	3.5 of 5	1376 (2007 – 2009: 520)
Holidaycheck	33 of 77	4.4 of 5	85 (2007 – 2009)
Vivaltis	44 of 61	3.75 of 5	39 (2007 – 2009)

In times of growing competition, hotels must find opportunities to stay competitive or even to create competitive advantages against their rivals. Given the economic slowdown in most countries, many people think twice if and where they spend money when planning their vacation. Meanwhile platforms such as those mentioned earlier have become important vacation decision tools for people all over the world. Consequently they could be a strong part of the marketing mix of every hotel if the reviews are appropriate. The challenge for Punte Verde management is to figure out how to move from the middle places up to higher ranks within the popularity ranks. They need to identify in which categories (services, activities, amenities etc.) they have to invest resources in order to improve feedback and avoid negative appraisals. This research analyses the available qualitative and quantitative secondary data that have been provided for the Punte Verde as well as for its strongest competitors. It compares the outcomes of the reviews with the specifications of the hotel's own website and figure out where are the differences between the promised and the current situation and what are the main reasons for negative feedback. The research questions can be summarised as: What are the main differences between the Punta Verde and much better rated resorts; Which are the main categories that hold room for improvement; What measures have to be taken in order to improve feedback and avoid negative reviews.

## METHODOLOGY

### Data Sources

The qualitative and quantitative data for this research utilises online available secondary data of hotel reviews. We view this secondary data as “quasi-primary” data, whereby the survey already having been conducted by TripAdvisor®. TripAdvisor® Media Network, operated by TripAdvisor®, LLC is the worldwide biggest internet travel community and attracts worldwide more than 32 million monthly visitors across its 14 travel brands. The TripAdvisor® branded sites alone show more than 25 million visitors each month and have 10 million registered members. It provides detailed information and more than 20 million independent customer reviews about more than 400,000 hotels and 550,000 restaurants worldwide. Because of these data's clearly objective and consistent structured design, it is possible to deal with them in the same way like it would be done with primary data, even if they are deemed secondary data in pure research terminology. Whilst there may be concerns about the reliability of individual data, the sample is deemed to be big enough to make outlier visible. This research takes advantage of qualitative and quantitative data in form of discretionary customer feedback posted on the same site. The data have already been “collected” by the company, the design of the questionnaire is pre-defined and the results can be easily taken from the mentioned source for further analyses. Focussing on the reviews of hotels, TripAdvisor® provides a comprehensive questionnaire with a five point scale rating part (cleanliness, location, rooms, service and value), a qualitative and individual review part and descriptive part

with a broad selection of attributes in the categories ‘describe your trip’ and ‘tell other travellers more about this hotel’ (TripAdvisor.com, 2011). The second part starts with the date of the stay, followed by a closed-end question with two possible answers – regarding the purpose of the trip -, two open-ended questions and ends with a ‘purchase-intent’, closed-end question. The first asks for a brief one-sentence statement about the hotel, the second question offers free space to write as much feedback as desired. The last question asks for a recommendation of the hotel with the two possibilities ‘yes’ and ‘no’. The third part covers descriptive information. The first question ‘How would you describe its style?’ provides multiple choice answers such as ‘quiet’, ‘roomy’, ‘charming’, ‘comfortable’, ‘elgant’, ‘romantic’ etc. The second question asks for the perception of amenities such as ‘business centre’, ‘fitness centre’, ‘high speed internet’ etc and can be answered with ‘yes’, ‘no’ or ‘not sure’. (TripAdvisor.com, 2011). Based on its structured approach, the TripAdvisor.com-questionnaire shows a valuable, high degree on comparability and sufficient room for useful additional information. The TripAdvisor.com questionnaire provides many attributes as help in order to describe the perception of the hotel and the type of vacation the respondent has taken. Combined with the type of closed-ended questions, these attributes can be easily compared and used to categorise different customer groups. However, there is still a risk of getting biased feedback because the respondent may not think beyond the supportive provided information. This research uses feedback from all ages and types of travelling group to be able to get an insight about differences between the expectations and perceptions of the different groups. The direct focus thereby lies on people who were not satisfied with their stay in the resort and who would not recommend the hotel to a friend. 80 negative and 20 positive reviews from TripAdvisor® over a sixteen month period were used. Negative means that the respondent gave the resort two or less points and does not recommend the hotel, positive means the respondent gives more than two points and usually recommend it.

## FINDINGS

The goal of this research is to identify those aspects that need to be considered in order to be able to achieve a higher rank on the TripAdvisor.com popularity index. When comparing the achieved overall ratings of the Punta Verde with some of the Top 15 resorts (Table 2), the difference is quite obvious. On the one hand the hotel has between 30 and 45 percent less top ratings of five points and on the other end of the scale, it has between four and six times more bad ratings of one point. The objective seems to be clear – improve the product to avoid poor rates as well as increase the percentage of excellent rates.

Table 2 – Comparing Ranks (Tripadvisor Popularity Index, April 2009)

Overall Rating	Iberostar Bavaro (Rank 3)	Excellence Punta Cana (Rank 9)	Punta Cana Princess (Rank 11)	Punta Verde (Rank 53)
5	62%	65%	50%	21%
4	24%	20%	29%	36%
3	6%	6%	9%	14%
2	6%	6%	9%	15%
1	2%	4%	3%	13%

The following analyses gives an overview over those aspects that have to be considered in order to improve the rank position within a reasonable time. The following analyses are based on two different samples. The first sample includes the last 200 reviews covering the period from August 2008 to April 2009. More than 99 percent of the respondents are either from Canada, USA or UK. This sample provides only the overall rate and the country of the respondent. The second sample contains more detailed information from about 100 reviews over the following 16 months, based on the quantitative part of the questionnaire of TripAdvisor.com. Descriptive information were standardized and coded. The months were designated the number 1 – 12. Regions were distinguished between North America (1) and Europe (2). Status were distinguished by family (1), couple (2) and group (3). Age was separated into four categories 18-24 (1), 25-34 (2), 35-49 (3) and those between 50-64 old (4). The recommendation factor had 1 for ‘no’ or a ‘0’ for yes. An additional information is the average price level which has been taken from the hotel’s web site and turned into an ordinal scale of five categories between (5) for the high season and (1) for the low season.

The data sources as well as the analyses underlie certain limitations in relation to selection, validity and reliability and feasibility. Only the most significant are highlighted as follows. There are frequently some concerns and discussions about the reliability and credibility of the reviews and the independency of the authors. The problem is that all these portals can be manipulated and they can be abused to either write above average reviews or poor reviews about competitors (Bonk, 2009). There have been some cases, where feedbacks contained advertising texts from the certain hotel itself. In some cases there are even cases of blackmailing where hotel guests threaten to write negative feedbacks if the price would not be massively reduced (Puscher 2008). The portals reacted to this development and installed various protection systems such as editorial control of the feedback, no anonymous feedback or to give outliers a lower weight. Overall it can be said that manipulation cannot be avoided completely. Mitigation is also provided by the detailed form of the questionnaires and the often high number of reviews which make it easier to determine extreme outliers.

Assuming an average occupation rate of 70 percent and an average length of stay of about seven days, the entire population within 16 months equates to about 76,000 people. The design of the questionnaire and the extract of the used information resulted in different limitations or simplifications, respectively that had to be considered. The sample used was 100 persons, which is approximately 0.13 percent of the entire population. The sample was non-random and considers only the part of the population which is participating in online-reviewing on TripAdvisor.com. Services were taken as umbrella term without further distinction. There was no separate classification for the food and the restaurants. Individual discounts or last minute prices were not considered; there was rather an average price factor used – based on the certain travel season.

Table 3 User TripAdvisor.com by origin of country

	Canada	USA	UK	Other
Country (%)	65.5	22.5	11.5	0.5

Table 3 shows the distribution of the origin countries of the last 200 respondents. It is obvious that TripAdvisor.com is being used mainly by people in Canada, USA and UK with the Canadian tourists being the biggest group with 67 percent, followed by USA with 23 percent and UK with 12 percent. Based on the sample and the defined problem, several questions can be asked and relationships between variables can be analysed. These are: The relationship between country and overall rating; the relationship between the overall rating and the ratings for cleanliness, location, rooms and service; the relationship between price and value.

## Association between country and degree of satisfaction

The following stacked pillar diagram shows the degree of satisfaction as percentage on base of the origin country of the respondents. A chi-square is useful to figure out if there is any association between these two aspects and this is shown in Tables 4 & 5.

Based on the context the null hypothesis and the alternative hypothesis can be stated:

*Null hypothesis  $H_0$ : There is no relationship between country and grade of satisfaction.*

*Alternative Hypothesis  $H_a$ : There is significant relationship between country and grade of satisfaction.*

The critical value of  $X^2$  on a significance level of five percent and eight degrees of freedom  $[(5-1) \times (3-1)]$  is 15.05. Because the calculated  $X^2$  is 4.7 and thus less than the tabular value, the null hypothesis cannot be rejected and the alternative hypothesis cannot be approved. That means that there is no significant relationship between the country of a respondent and the grade of satisfaction.

Diagram 1 – Degree of satisfaction based on country

Table 4 – Cross tabulation Country and Rating (Sample size = 200)

			Country			Total
			Canada	USA	UK	
Rating	Completely dissatisfied	Count	21	8	5	34
		% within Country	16.0%	17.4%	21.7%	17.0%
	Somewhat dissatisfied	Count	29	8	5	42
		% within Country	22.1%	17.4%	21.7%	21.0%
	Neither satisfied nor dissatisfied	Count	18	5	1	24
		% within Country	13.7%	10.9%	4.3%	12.0%
	Somewhat satisfied	Count	37	18	9	64
		% within Country	28.2%	39.1%	39.1%	32.0%
Total	Completely satisfied	Count	26	7	3	36
		% within Country	19.8%	15.2%	13.0%	18.0%
	Total	Count	131	46	23	200
		% within Country	100.0%	100.0%	100.0%	100.0%

Table 5 – Results Chi-Square Test ( $X^2$ )

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	4.688(a)	8	.790
Likelihood Ratio	5.022	8	.755
Linear-by-Linear Association	.085	1	.770
N of Valid Cases	200		

a 4 cells (26.7%) have expected count less than 5. The minimum expected count is 2.76.

## The relationship between the overall rating and the aspects cleanliness, location, rooms and service

Diagram 2 shows the percentages of the degree of satisfaction from all respondents of the sample who have given an overall rate equal or less than three . It is obvious that the service, the quality of the rooms and the degree of cleanliness are the most significant aspects whereas the location seems to be a minor issue and to have widely met the expectations.

Diagram 2 – Degree of satisfaction in different aspects of the product

The relationship between the overall rating and the ratings for cleanliness, location, rooms and service was

analysed using multiple regression analysis. It was important to know, which of the components needed the most focus to improve the overall impression of a guest. Multiple regression analysis of relationship between the overall rating and the aspects cleanliness, location, rooms and service are shown in Tables 6-8 .

The coefficient of determination  $R^2$  shows that 76 percent of the variation of the overall rate is explained by the variation in the independent variables. All independent variables are positively associated with the dependent variable (positive regression coefficients). Any improvement in one of the independent variables results an improvement in the overall rating. The regression coefficients show the estimated effect of a one-unit increase. For instance, an increase of one point (on a five point scale) is associated with a 0.35 point increase in the overall rate. The standardized coefficient BETA shows that service is the most important aspect, followed by cleanliness and rooms. It is interesting to see if there is any association between the price level and the perceived value of the customer. The resort has five different price levels over the year. A correlation analysis to measure the degree to which the changes in the price level is associated to a change in the perceived value was undertaken and the results are shown in table 9 . The coefficient of correlation R shows a value of 0.55. This value usually ranges from  $-1$  to  $+1$ . The closer R is to one of these extremes, the stronger is the degree of association between the two variables. In this case one can state that the association between the average price and the perceived value is rather unimportant.

Table 6 Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.769(a)	.591	.575	.585

a Predictors: (Constant), Service, Location, Rooms, Cleanliness

	Sig. (2-tailed)		.588
	N	103	99
Value	Pearson Correlation	.055	1
	Sig. (2-tailed)	.588	
	N	99	99

## CONCLUSIONS AND RECOMMENDATIONS

The data analysis shows that more than 99 percent of the respondents who use Tripadvisor.com to review the Punte Verde are from Canada, the US and the UK. However, the results show that the origin country of the guest has no or a very small influence on the overall satisfaction rate. Furthermore, even the average price level seems to have no significant influence on the value perception of the customer. The most significant aspects in order to improve the overall satisfaction rate is the service perception followed by cleanliness and room configuration. The location widely meets the expectations and has no influence on poor overall rates. Based on the fact that more than 50 percent of all rates are neutral or positive and the results from the analysis, it can be said that the resort has a large potential to improve its overall rating. The management need to focus on establishing a constant high level in areas of service and cleanliness. Furthermore it needs to further invest into renewing room quality. A further analysis of the qualitative part of the reviews in order to exactly distinguish the priorities of the service improvement could be promising. The qualitative parts also could provide valuable information about additional aspect such as entertainment and activity programs.

# STRATEGIC LEADERSHIP COMPETENCE: A NEW SERVICE DELIVERY PARADIGM

**Nico Schutte, University of Limpopo, South Africa**  
**Titos Khalo, Tshwane University of Technology, South Africa**

## ABSTRACT

*It is contended that with rare exceptions, in the 21st century an organisation's, and in this case the public service productivity, will lie more in its collective intellect – that is, in its collective capacity to gain and utilize competency – rather than in its hard assets such as land, plant and equipment. Thus the most effective public service strategic leadership practices will be the ones through which strategic leaders find ways to become more and more knowledgeable, proficient and communal (competent). Similarly, it is interesting to note that, as long ago as 1530, Niccoli Machiavelli asked these basic questions: How can a complex, modern pluralist society in an era of rapid change, be effectively governed? How can it evolve a unity of action out of a diversity of interests, values and institutions? And how can it derive strength and cohesion from being surrounded by a multitude of competing powers? Similarly, Marquardt (1996:211) puts it very succinctly; “Most successful change efforts (public service to becoming a learning organisation) begin when individuals or groups (such as the public service strategic leaders) within the organisation look seriously at the organisation's ..... performance and realise that a great crisis or opportunity looms”. There is growing evidence that there is a need for a significant departure from conventional approaches and that a leap into a new strategic leadership competence (knowledge, skills and attitude) model for quality service delivery paradigm is necessary. Increasingly this new paradigm highlights the need to further develop the government's strategic leadership competence with a view to achieving improved public service delivery capacity. This article reports on the study of a highly complex and turbulent sector, namely the public service environment, in order to identify the strategic leadership competency (knowledge, skills and attitude) mix variables used, and to assess current strategic leaders perceptions on the importance of such strategic leadership competency variables for success in public service delivery. The South African Public Service, since the advent of democracy in 1994, is an especially complex and turbulent environment. Therefore, the purpose of this study was, amongst other things, to identify and outline the profile for public service strategic leaders in terms of competency domains, which will make a unique contribution to new knowledge. The competency domains and or taxonomy that will be evaluated and tested is outlined in Bloom's work (Bloom, et al. 1956:19). Bloom and his colleagues deliberately choose the term "taxonomy" for their classification system to emphasise the hierarchical nature of learning. From their research, they concluded that, "there is an unmistakable trend pointing toward a hierarchy of classes of behaviour which, didactic is in accordance with our present tentative classification of these behaviours" The paper focusses on the changing strategic leadership paradigm – from a “former” traditional model through the transition to a “contemporary” strategic leadership competence model “paradigm”. This paradigm is shaped by Bandura's social cognitive theory, Senge's organisational learning theory, international and national leadership trends and events in government. The contribution and advantages of strategic leadership competence for effective and efficient governance are highlighted and the paper concludes with an explanation of strategic leadership competence organisational arrangements necessary to support the new paradigm; Strategic Leadership Competence: a new service delivery paradigm*

## INTRODUCTION

In most organisations worldwide, the magnitude of change is ever increasing. In the midst of these uncertainties, there is an increasing need for public service strategic leaders who can provide structure, meaning and self-assurance within their teams. Competent public service strategic leaders become a sought after thrust in the newly formed public service.

According to the Accelerated and Shared Growth Initiative for South Africa (ASGISA, 2006), for South Africa to realize the objective of building a developmental state, the public service has a critical role to play in delivering the goods and services required to accelerate economic growth, reduce poverty and inequality and improve the lives of all South Africans. An effective state is the most important catalysts which can enable South Africa to reverse the negative legacy of the past reduce inequality and create a truly non-racial and non-sexist democracy in South Africa.

Moreover and in line with international trends, the Government became increasingly aware of the fact that a significant expansion in the capacity and quality of service provision was not possible with traditional leadership delivery approaches. There is growing evidence that there is a need for a significant departure from conventional approaches and that a quantum leap into a new strategic leadership competency paradigm is necessary. Strategic leaders need to develop new ways of thinking or a shift of mind (paradigm shift), which according to Senge (1990) originates from the Greek "meta-noia" meaning a shift of mind). He further postulated that for the Greeks, it meant a fundamental shift or change, or more literally transcendence ("*meta*"— above or beyond, as in "metaphysics") of mind ("noia," from the root "*nous*," of mind). In the early (Gnostic) Christian tradition, it took on a special meaning of awakening shared intuition and direct knowing of the highest, of God. "Metanoia" was probably the key term of such early Christians as John the Baptist. In the Catholic corpus the word Metanoia was eventually translated as "repent." Increasingly this new paradigm highlights the need to further develop the Government's strategic leader's competence with a view to achieving improved delivery capacity.

## **STRATEGIC LEADERSHIP: PRESSURE ON THE “OLD PARADIGM”**

Bourgeois, Duhaime & Stimpert (1999) also highlight the fact that organisations i.e. public service might be challenged by the strategic leadership thinking contained in their leaders mental models that can influences their strategic decision-making and the actions the different institutions and or departments take. As a result, for strategic leaders within the public service to grasp the meaning of "metanoia" is to grasp the deeper meaning of "learning," and or “ability” (organisational and personal), because learning also involves a fundamental shift or movement of mind and or way of thinking. To move from an old to a new paradigm *as the white paper on transformation suggest will requires a transformation process resulting in rapid and radical change in all the facets of the public service as organisation. These changes may be so significant that it bring about a new organisational culture* (Drucker, 1995).

These new relationships may in turn transform both the organisation and its environment, this necessitate the newly appointed strategic leaders to be aware of and have an understanding of the public service as an open system where organisations such as the *public service are influenced by the local transformation situation, and a broader globalization* (Senge, 1990).

## **THE CONCEPT PARADIGM/MENTAL MODEL AND OR INTERPRETIVE SCHEME**

Bourgeois, Duhaime & Stimpert (1999) Senge (1995) define mental models as the deeply inherent assumptions, understandings or representations (interpretive schemes) of the phenomena that influence how we understand the world and how we respond to it. This is supported by Kuhn (1996) who contend that the phrase refers to a set of habits that define a scientific discipline during a particular period of time. Mental models tell us what is and is not important to us, what we like and do not like what we should and should not notice. Mental models include our understanding of how things work and what we expect to happen next. When we encounter something new our minds quickly construct new mental models to help us understand this new phenomenon (Duhaime & Stimpert, 1999).

Thus strategic leaders within the public service [a social group] draw on these shared interpretive schemes to act and thereby help to produce and reproduce a social reality that would reflect their shared assumptions, cultural norms and social rules. Such reality forms the sub-culture of the particular group. Interpretive schemes implicitly

influence individuals' Sense making and actions in organisations by shaping their interpretations of organisational phenomena. The concept of interpretive schemes therefore closely relates to the concepts such as 'mental models' Giddens (1984), 'technological frames' Giddens (1984) and 'paradigms' (Giddens, 1984).

Therefore public service strategic leader's mental models and or interpretive schemes of the situations they encounter determine whether a particular strategic issue or situation will be noticed and or observed, how it will be interpreted and understood, and how they as managers should respond to the situation.

A mental model and or paradigm thus could create a groupthink or mindset challenge, which could lead to so called - cognitive dissonance This is the feeling of uncomfortable tension which comes from holding two conflicting thoughts in the mind at the same time, which cannot be explained by the universally accepted paradigm a shift in thinking usually occurs. In support Kuhn (1996) argues that a paradigm is thrown into a state of crisis, during which time new ideas are tried and tested. Eventually a new paradigm is formed, which gains its own new followers. An intellectual "battle" takes place between the followers of the new paradigm and the old paradigm. With this context as back-ground, it is the contention of this article that the existing paradigm and or mental model of strategic leadership as a position are in a state of crisis and that a new delivery paradigm is emerging – a paradigm in which strategic leadership competencies as delivery mechanism would feature prominently.

## **SERVICE DELIVERY: PRESSURES FOR CHANGE**

Also in South Africa there are major pressures for a renewed focus on the issue of "service delivery". These pressures are directly the result of the far-reaching process of socio-political and economic transformation taking place in South Africa as well as, more indirectly, major rethinking about the nature and role of public sector institutions in many developing and developed countries. Central to this rethinking has been a major re-definition and realignment of the traditional ways in which service provision is managed in the public service. As a result, the public service in South Africa is undergoing radical change. Whatever the case may be, a distinctive feature of public service institutions is that they are expected to be highly professional, thus unify public service values with the values and standards of the profession itself

In Accordance does article 195 explicitly allude to the word principle, which according to the Oxford complete word finder (1993) means "statements or descriptions of what should or should not be done, that describes the rules, parameters or guidelines for performing the task". Consequently would it be important for the public service to become sensitive of the fact that embedded within the stated principles are specific expectations. Expectation on the side of the government in that the appointed public managers (strategic leaders), are able (competent) and willing (motivated) to deliver (perform) said responsibilities as cited by article 195, and expectation on the side of the community that they will receive the promised services as a result of the appointed public managers leadership ability.

With the policy framework in place, the critical issue increasingly be-came the question of service delivery itself. In assessing the current service paradigm, one should keep in mind that the challenges con-fronting the public service in South Africa does not by any means lie only with institutional and managerial issues. The challenges of ser-vice delivery are indeed much more complex and are deep-rooted in the historical, socio-economic, geo-political and other contexts of South Africa.

## **PERSPECTIVES ON PUBLIC SERVICE TRANSFORMATION**

Osborne and Gaebler (1992) argue that a revolutionary restructuring of the public sector is under way — an "American Perestroika." Like the Soviet version, they believe this one is being driven largely by politicians and bureaucrats who, under great fiscal pressure, are introducing market forces into monopolistic government enterprises. They further suggest that governments should: 1) steer, not row (or as Mario Cuomo put it, "it is not government's obligation to provide services, but to see that they're provided"); 2) empower communities to solve their own problems rather than simply deliver services; 3) encourage competition rather

than monopolies; 4) be driven by missions, rather than rules; 5) be results-oriented by funding outcomes rather than inputs; 6) meet the needs of the customer, not the bureaucracy; 7) concentrate on earning money rather than spending it; 8) invest in preventing problems rather than curing crises; 9) decentralize authority; and 10) solve problems by influencing market forces rather than creating public programs.

The “*Perestroika*” which Osborne and Gaebler (1992) refer to was and is also currently evident in the intensity of international and domestic public service reform in relation to the effectiveness and efficiency of public sector services. The effect of this reform was that all well known public management theories were and still is scrutinized especially the Weberian bureaucracy approach were assessed and scrutinized and as result criticized as being slow, ineffective, inefficient, not cost-effective and unresponsive to the public needs. During the mid 1980s and 1990s the neo-liberal ideology dominated the development arena. Capitalism was the dominant economic system, and the democratic form of governance had no significant rival (Hulme & Turner, 1997). This is supported by Hughes (1998) who are of the opinion that there is a need for a new model of public sector management and or leadership, especially in many developed and developing countries as a suitable model for public sector reform and management. This is also supported by the World Bank and other donor agencies that all encouraged New Public Management, and as a result do they all link their donor aid to good governance (accountability), the development of strong central capacity for policy co-ordination, and the development of highly skilled staff to increase efficiency levels (Hughes, 1998).

As earlier stated should the public service’s transformation strategy be part of the overall business strategy this, notion is supported by Mintzberg (1994) who characterized organisational strategy as the pattern of decisions in an organisation that determines and reveals its objectives, purposes, or goals, and produces the principal policies and plans for achieving those goals, and defines the range of business the organisation is to pursue. It becomes evident through Mintzberg’s contention that strategic leadership is of vital importance for any organisation (public service) in order to give strategic guidance towards the implementation of the promised renewed (change) initiatives. Hence, if the senior and or strategic leaders within the organisation are not committed to the intended change efforts, and if they do not possess the necessary competencies to lead it effectively, and if they don’t play their role as change agents, the public service renewal (change) will not be effective.

On the other hand does the learning-organisation paradigm stresses mobilizing different kinds of information to enhance performance. The learning organisation seeks mastery in creating, acquiring, organising, and sharing knowledge and at applying this knowledge to reach solutions and alter behavior (Senge 1990). He further stress the fact that organisational learning depends on the leader’s ability to manage information—the capacity to harness the organisation’s information resources and capabilities to yield organisational effectiveness. The significant for the public service from the above discussions is that it reveals the magnitude of changes within the organisational and or strategic environment, which strategic leaders need to take note of and be prepared for. The relevance for the public service will be to learn from the private sector concerning strategic leadership-related principles in reaction to the said changes, which might assist in increasing the efficiency and effectiveness of the public service. This is supported by Caiden & Sudaram (2004) who maintain that less developed countries such as South Africa have lacked the resources and managerial/leadership capacity to implement complex New Public Management reforms.

## **CHALLENGES AND CONSTRAINTS ASSOCIATED WITH THE OLD PARADIGM**

Rost (1993) notes the importance of studying (strategic) leadership as a relationship rather than simply a list of personal or situational characteristics, and laments the misplaced focus on “the peripheral elements surrounding leadership and its content instead of on the nature of leadership as a process, on leadership viewed as a dynamic relationship”. In accordance does Bandura (1999) similarly consider the interaction of persons (strategic leaders) and situations as unidirectional, partially bi-directional, or triadically reciprocal. While unidirectional frameworks emphasize the unique impact of both person and environment, partially bi-directional models add the impact of persons on environments, and vice versa. The triadic model, on the other hand, represents the relationships among the variables to be reciprocal, ongoing, and dependent on circumstances. However Bandura (1999) indicate that the latter of their respective types is the best description of true interactionist thinking.

Sergiovanni (2005) supported this concept stating that “leadership inevitably involves change, and change inevitably involves learning”. Retallick and Fink (2002) further reinforce this concept when concluding that “leading is defined as the framing of meaning and the mobilization of support for a meaningful course of action”. Specific to public service, the strategic leader comprehends that public service reforms need to be pursued under conditions which maximize intensive organisational learning, involving logics of action through external ideas as well as internal ideas (Fullan, 2003).

Therefore, public service strategic leaders who want to lead in a culture of change need to understand that it is an involved activity that resulted in direct impact and interaction with others participating in the change while attending to the creation of and sustaining of a culture of renewal (Fullan, 2003). According to Sergiovanni (2005) do such leaders have the cognitive ability to know and focus on what was critical as well as the who (social competence) i.e. the people who they also cared deeply about, they also take accountability for their work and have the ability to learn from their successes and failures, take calculated risks, and are trustworthy people. He further states that if public strategic leaders are such leaders, they will also advance reciprocal learning that would enables others to contribute to the creation and negotiation of personal and organisational meaning, maximize the potential of the individual and organisation, and this will consequently lead to a shared purpose and or vision. He further pointed out that such strategic leaders create conditions for change by stress capacity building.

The above factors lead to a new, all-encompassing definition by the researcher which serves as the main premise of the study: Leadership is an interactive process involving the leader`s, Cognitive: mental skills (Knowledge) Affective: growth in feelings or emotional areas (Attitude) Psychomotor: manual or physical skills (Skills) to influence and align people through effective communication towards a common vision. The definitions discussed above differ in many ways, illustrating the multitude of factors that affect leadership and the different perspectives from which to view it. Some definitions confine leadership to downward influences only; others emphasise the controlling aspects of leadership and disregard the emotional aspect of leadership. Together, the various definitions discussed above provide a more holistic view of a very complex concept.

This paradigm of finding radical new ways of strategic leadership, how-ever, confronts political and managerial mental models, existing organisational values and cultures, behaviour habits established over years, and bureaucratic inertia. To overcome these and other challenges and constraints in effective strategic leadership in order to deliver effective and efficient service, it will be necessary to address a number of important constraints. As an important agent of organisational culture, logics of action implies that organisational cultures of the parties involved in an organisational relationship are aligned, recognising mutual dependency, and ensuring possibility of exchange relationships. Such alignment of logics of action carries implications for inter- and intra-governmental relationships, since public service departments have a single *raison d’être*, namely optimal service to the public against the background of limited resources. Unaligned logics of action may bring about conflicts in inter- and intra-governmental relations, which will invariably impact on optimal service delivery.

The logics of action construct holds important implications for the roles of the strategic leaders of the Public Service in the establishment of a new competent service delivery culture paradigm vis-à-vis other public service departments; viewed as subcultures of the latter competent holding culture. It needs to be emphasised that every department, while forming a distinct sub-culture, also forms a competent holding culture in its own right in relation to the sub-cultures that form or become established in that particular department. The task of the strategic leadership cadre is, therefore, always to pursue alignment of logics of action among all relationships that may exist or form in the process of the organisation performing its various functions.

## **STABILITY AND TRANSFORMATION: THE PARADIGMATIC PARADOX**

Most organisations today have been influenced by this seventeen century Newtonian perspective of the world, one in which:

organisations are designed to have many machine-like characteristics and functions;  
most events and interactions are predictable and measurable;  
many of our expectations of regularity are met;  
there exist well-defined variables, boundaries, and cause-effect relationships; and  
there are principles, policies, and rules to guide behaviour because most organisations are acquainted with the effective and efficient ways to do things, if not the most excellent ways.

Just as Newton's laws broke down as physics explored ever-smaller elements of matter and ever-wider expanses of the universe, rigid, control-oriented organisations don't work well in a world of instant information, constant change, and global competition.

On the other hand does April, Macdonald and Vriesendorp (2000), Bohm (2002:1-25), Wheatley (1999) present an argument that from quantum mechanics and chaos theory emerge new understandings (schema) of order, disorder, and change, which might be important for leaders (public service) of today to take into account. Individual actions, whether by atoms or people, cannot be easily predicted and controlled. The reasons why are stated as follows:

Nothing exists except in relationship to everything else. It is not things, but the relationships among them that are the key determinants of a well-ordered system we perceive. Order emerges through a web of relationships that make up the whole, not as a result of controls on individual parts.

The empty space between things is filled with fields, invisible material that connects elements together. In organizations, the fields that bind people include vision, shared values, culture, and information. Organisations, like all open systems, grow and change in reaction to disequilibrium, and disorder can be a source of new order.

Thus a paradox is likely to be a key element of a new paradigm for service delivery. In a paradox “everything is its opposite” (Hock, 1994). A central paradox in government transformation is that political and managerial leaders strive to maintain stability or equilibrium, but that transformation requires instability since energy for creative change comes from being off-balance – or, as Peters (1992) states: “you’re only in control when things are out of control”. A state of near-chaos provides special impetus for transformation (see Quinn & Cameron, 1988).

## **TOWARDS A NEW SERVICE DELIVERY PARADIGM: TRANSITIONAL ARRANGEMENTS**

Jantsch cited in Wheatley (1999) pointed out that any living system is "a never resting structure that constantly seeks its own self-renewal". She further stated that description of a system defines a paradox that would be important to note when organisations (public service) think about creating a new paradigm. A living system produces itself; it will change in order to preserve that self. Change is prompted only when an organism decides that changing is the only way to maintain itself. Life is about creation. This ability of life to create itself is captured in a strange-sounding new word, Autopoiesis (from Greek, meaning self-production or self-making). Autopoiesis is life's fundamental process for creating and renewing itself, for growth and change.

However there is another important paradox in living systems. Each organism maintains a clear sense of its individual identity within a larger network of relationships that helps shape its identity. Each being is noticeable as a separate entity, yet it is simultaneously part of a whole system. Bohm (2002) and Wheatley (1999) are of the opinion that humans observe and count separate selves, and pay a great deal of attention to the differences that seem to divide them, in fact the human race survive only as they learn how to participate in a web of relationships. Autopoiesis describes a very different universe, one in which all organisms are capable of creating a "self" through their intimate engagement with all others in their system. This is not a fragile, fragmented world that needs us to hold it together. This is a world rich in processes that support growth and coherence through paradoxes that (public service) leaders need to contemplate.

Thus is it important for public service strategic leaders to take note of what Senge (1990) suggest, the use of ‘systems maps’ – diagrams that show the key elements of systems and how they connect. However,

strategic leaders might often have a problem 'seeing' systems, and it takes work to acquire the basic building blocks of systems theory, and to apply them to an organisation such as the public service. On the other hand, failure to understand system dynamics can lead public service's strategic leaders into sequences of blaming and self-defence point the finger at the enemy who is always out there, and problems are always caused by someone else' (Bolam and Deal, 1997).

April, Macdonald and Vriesendorp (2000) are also of the opinion that leaders (public service) need a different set of skills, which Arnold and Mindell cited in April et al (2000) coined: metaskills. They argue that Meta-cognition can be defined as "an individual's awareness of his or her own cognitive processes, and his or her ability to control these processes by organising, monitoring, and modifying them as a function of environmental factors". They define the metaskills of a leader as the "*skills needed to step back and look at themselves in their broader contexts (family, work, community, the world, the universe) in order to raise their awareness, consciousness and understanding of who they are, why we are here, how we operate and how that affects others and our environment*".

## **SERVICE DELIVERY AND THE CREATION OF "MEANING"**

An important aspect, which the strategic leaders need to understand is that they need to believe in the new government, because the most vivid example of the future-directedness inherent in our experience of meaning, according to Frankl (1970), is that of faith, which he defines as 'an unconditional trust in ultimate meaning'. The experience of faith includes the belief that what they do not understand now, they will understand later. Faith is the belief that everything will make sense in the end, the consolation that 'it will be all right or work out all right' or 'will be worth it all' in the long run.

Hence, public service strategic leaders need to be cognizant of the fact that if they want the public service to induce meaning, meaning cannot be encompassed by a purely rational act, but can be comprehended only by an act of intuitive knowing. This implies an orientation of openness—a readiness or willingness to experience meaning. More than intellectual curiosity is required. There must be an involvement of their total being in the experience of meaning i.e. they believe in the organisation and the greater cause of serving their fellow man. The best example of intuitive knowing (which is also, according to Frankl, the most encompassing framework for an experience of meaning) is that of faith. Frankl (1967) speaks of an 'Uruertrauen zum Dasein', the basic trust in being. 'I believe...' is an act of declared openness to receive evidence of the existence of that which is believed in. The eye of faith sees "transparently, namely, in the light of transcendence". It is the man or woman of faith who alone can in spite of all say yes to life under all conditions and circumstances.

Thus meaning is experienced every day by ordinary men and women and in this case public sector strategic leaders in three principal ways: the first is what they give to the world in terms of their tasks, duties or creations; the second is what they receive or take from the world in terms of their encounters and experiences; and the third is in the stand they take towards their predicaments and sufferings (Frankl 1970).

## **MEANING AND THE SOCIAL LEARNING THEORY**

"Learning would be exceedingly laborious, not to mention hazardous, if people had to rely solely on the effects of their own actions to inform them what to do. Fortunately, most human behaviour is learned observationally through modelling: from observing others one forms an idea of how new behaviours are performed, and on later occasions this coded information serves as a guide for action." (Albert Bandura, Social Learning Theory, 1977).

Social cognitive theory is a recent theory of human behaviour that may have significant potential for influencing strategic leadership activity in today's organisations. It provides a framework that helps to facilitate strategic leadership competence (knowledge, attitude and skills) within established organisations. The theory recognises the impact of the environment on human development while also placing responsibility on the individual to grow from within. It incorporates the primary critical categories of variables influencing

organisational behaviour; that is, cognitive, behavioural, and environmental determinants (Davis & Luthans, 1980).

In short, social cognitive theory posits that the environment, the focal behaviour, and the person (including internal cognitions) reciprocally interact to explain individual actions. The Social Cognitive Theory framework depicts any human phenomenon as being the result of a dynamic process consisting of reciprocal relationships among three categories of factors: the individual's social cognitions, the individual's behaviour, and the social context (Bandura, 1977).

Accordingly the cognitive approach emphasises understanding. A leader has to understand himself, his needs, and his behaviour and also has to understand the environment that includes followers, their needs and behaviours. It is mostly expected from leadership to coming up with plans and ideas that are acceptable to followers and help to achieve the objectives of the group. This is also known as social competence or as Knight and Hughes (1995) argues "The ability to initiate and maintain satisfying relationships especially with peers".

***The steps in this approach can be described as:***

The leader identifies the environmental variables that control his/her behaviour.

The leader spends some time to work with the subordinate to discover the personalized set of environmental contingencies that regulate the subordinate's behaviour.

The leader and subordinate jointly attempt to discover ways in which they can manage their individual behaviour to produce more mutually reinforcing and organisationally productive outcomes.

The leader enhances the efficacy of the self and that of subordinates through setting up successful experiences (coaching, mentoring), and give exemplar, positive feedback, persuasion, and encouragement. The increased efficacy will mostly lead to performance improvement. The success of the subordinates can in turn lead to leadership efficacy through the increased confidence in the leader.

Figure 1 (adapted from Bandura, 1977) depicts this relationship. Indeed, some theorists have argued that other explanations of human behaviour are too limiting and, at best, provide only a partial explanation of the complexities of organisational behaviour (Davis & Luthans, 1980).

## **THE VALUE OF A LEARNING ORGANISATION PARADIGM IN THE PUBLIC SERVICE**

Senge (1990) argues that learning organisations and in this case the public service require a new view of leadership. He sees the traditional view of leaders (as special people who set the direction, make key decisions and energize the troops as deriving from a deeply individualistic and non-systemic worldview. At its centre the traditional view of leadership, 'is based on assumptions of people's powerlessness, their lack of personal vision and inability to master the forces of change, deficits which can be remedied only by a few great leaders' (op. cit.). Against this traditional view he sets a 'new' view of leadership that centres on 'subtler and more important tasks'.

**Figure [1]**

Senge (1990) proposes: At the heart of a learning organisation is a shift of mind (metanoia) – strategic leaders from seeing themselves as separate from the world to connected to the world, from seeing problems as caused by someone or something "out there" to seeing how their actions create the problems they experience. A learning organisation is a place where strategic leaders and members are continually discovering how they create their reality, and how they can change it. As Archimedes has said, "Give me a lever long enough ... and single-handed I can move the world". The implications of this position, if taken to its logical conclusion, are that our

whole understanding of what “strategic leadership” means and entails must change. If the public service consider, once again, Senge’s work, it would follow that recruitment, training and development might take the form of ‘learningful conversations’, of ‘group dialogues’. The work of the public service strategic leader or manager might become more centrally concerned with aiming to eradicate the boundaries to ‘group learning’ (in as far as this might be possible); to ‘marry up’ organisational and individual aspirations; to reveal and to resolve ‘deeply’ held conflicts, perhaps those residing in individuals ‘mental models’. Hence, the work of the public service’s strategic leaders would be continuously to develop, to organise and to balance the relationships between employees so as to best facilitate generative learning. Furthermore, the learning organisation is pointing towards the need for strategic leaders to discover their own organisational systems and to make these actively clear to members of the organisation in such a way that people are able to see the consequences of their actions. It is thus pointing towards the need for strategic leaders to expand ‘learning horizons’: perhaps even to make people more accountable for their actions.

In this context, an activity such as performance appraisal would involve elucidating the ‘total system’ that any particular employee was involved within. That is to say, identifying where an individual is located within the organisation’s structure, how this position has changed over time, and how it is likely to change in the future. In keeping with Senge’s idea that, while we learn best from experience, the consequences of our actions within organisations are often not visible to us, it might involve explicitly spelling out the consequences (both intended and unintended) of a person’s actions, over time and throughout the organisation – that is to say, *as a part of the total system*. Performance appraisal, to take just one example, would thus be understood to be more of a means to facilitate adaptive learning by enabling people to ‘see the bigger picture’, than a means of controlling the workforce (in any simple sense). The ideas relating to the learning organisation therefore have quite radical implications for the practitioner.

As stated, a fundamental idea involved in the concept of the learning organisation is that of *organisational or team learning*. Academics have been argued that these terms are highly problematic as they might lead people to conceive of the public service as an organisation as having a *real* existence all of its own: of an organisation *itself* having the equivalent of a human ‘mind’ which is capable of ‘learning’. This, in turn, leads us to conceive of ‘organisational learning’ and ‘individual learning’ as two *ontologically* distinct things (that is to say, two things which are, ‘in reality’ distinct, not just ‘conceptually’ distinct). Following on from this conceptualisation, public service strategic leaders are left asking questions such as ‘what is the *relationship between* organisational learning and their individual learning’, a question which is flawed from the outset.

Thus, in short, the terms ‘individual learning’ and ‘organisational learning’ actually refer to ‘two sides of the same coin’; they simply refer to different levels of an ongoing process involving knowledge sharing, knowledge building, knowledge adaptation, and knowledge development as part of a group. It is in this relationship and or connection that the concept of the learning organisation is most similar to that of ‘human capital and or knowledge management’. However, a comparison of these two sets of ideas is somewhat outside of the scope of this research. While the observations developed above cannot be considered to signify a ‘guide to strategy’ as such for public service strategic leaders aiming to make use of the ideas relating to the learning organisation, they are offered here to promote a critical awareness of both the key problems and the potentially valuable contributions of this increasingly popular concept. However Nonaka and Takeuchi (1995) criticised organisational learning theories for failing to recognise *knowledge development* as learning. The metaphor of individual learning is still widely used and what constitutes organisational learning inadequately defined (Weick, 1991). The concept of knowledge creation is underdeveloped in organisational learning models which assume that some artificial intervention is required to implement double-loop learning.

Accordingly for strategic leaders within the public service to grasp the meaning of organisational learning and move towards “metanoia” is to grasp the deeper meaning of “learning,” and or “ability” (organisational and personal), because learning also involves a fundamental shift or movement of mind and or way of thinking. According to Kroon (1995) it will be the tasks of the public service strategic leaders as a team to lead the members effectively in order to provide certain products or services and as such fulfilling particular needs and achieving the stated goals of the organisation. Therefore it is “no more business as usual”.

Building a new world of work and in the process regrouping and rearranging organisations and what they are doing to get on the right track, creating new enthusiasm, energy and believe amongst the people, with a sense of direction and purpose is now at the order of the day (Senge, 1999). This concludes the brief overview of the changing service delivery paradigm, both nationally and internationally.

# THE NEW PARADIGM: STRATEGIC LEADERSHIP COMPETENCE

McCormick and Martinko (2004) draw attention to the fact that *for* anyone to be successful in a leadership role, they must “first know something about being a good leader, and also have the skills to carry out the role (core competencies)”. They are also of the opinion that with the exception of cognitive resource theory (Fiedler & Garcia, 1987), none of the contemporary leadership models incorporate leader schema (being previously in such a position), scripts and knowledge structures as an explanatory variable.

Eisenstat & Beer (1994) maintain that if an organisation (public service) wants to achieve its strategic tasks it dependent on three organisational capabilities namely:

Coordination amongst all parts that must work together to accomplish the strategic task. The question that needs to be asked is whether the different business units have the appropriate levels of coordination or teamwork among functions and customers that are needed to accomplish the strategic task? Commitment of individuals and groups to accomplishing the strategic task. Do the key functionaries at all levels have the level of commitment that is necessary to accomplish the strategic task? Do the office bearers of the public service have the necessary technical and managerial competence to accomplish the task? Do they also have the necessary technical and managerial competence to solve problems and coordinate solutions?

They further argue, that more highly competent office bearers, is not enough, because for the functionaries to integrate their efforts effectively, strategic managerial and interpersonal competencies are needed at the top and lower levels. They also have to develop competencies and methods for prioritizing programmes and allocating resources across projects. Lower-level members might need to develop skills in programme management and group decision-making in order to implement certain projects.

## SUPPORTING THE NEW PARADIGM: THE NEED FOR STRATEGIC LEADERSHIP COMPETENCE ADJUSTMENTS IN GOVERNMENT

As discussed earlier transformation from an “old” to “new” delivery paradigm is an incremental process. Public institutions cannot expect officials to change the way they have done things for years, over night. Proper management of the transition of people through the process of change is critical to the success of a new system. There are typically three aspects to the transition of people through transformation, namely the discontinuation of the old way of doing business, migration, and starting the new way of doing business (see Dey, 1999:148).

Given the previous discussion, it is suggested that a public service strategic leadership competencies are linked with his/her individual’s knowledge, attitude and skills that facilitate effective leadership performance. Additionally, the job itself and the environment in which managers are expected to perform also seem to influence the level of leadership performance or effectiveness. Thus, successful alignment between a strategic leader’s competencies, the job as a strategic leader, and the work environment is seen to contribute towards the strategic leadership competencies required to perform effectively. It is suggested that strategic leaders also require social competencies to ensure effective strategic leadership performance. This seems to concur with the performance model proposed by Boyatzis (1982, in Spangenberg, 1990:2) in that strategic leaders are required to consider the social nature of their work environment and their duty of ensuring employee and customer satisfaction to perform effectively. Additionally, public service strategic leaders will need to utilize their individual competencies to ensure that their strategic leadership tasks are effectively accomplished. Public service strategic leaders therefore require social competencies.

It is argued that managerial leaders in their capacity as strategic leaders are responsible for the effective functioning of the organisation and that their unique significance of competence in their role as strategic leaders, shows in fact that by far the most important factor in the successful functioning of any organisation is the match between the level of capability of the organisational strategic leader (and, secondarily, of the CEO's subordinates) and the level of work called for in the strategic leadership role (Jaques and Clement, 1994). Consequently does the key to service delivery improvement for the public service lie in the capacity within the organisation for developing and maintaining public service strategic leader's competence. The significance of the competence approach is that it recognises the complex interaction of people, skills and technologies that drives the public service performance and addresses the importance of learning and interdependence in its progression (Scarborough, 1998).

**Figure [2]** (Adapted from Boyatzis, 1982, in Spangenberg, 1990)

## CONCLUSION

Globally there are clear indications that public institutions are going to be lead differently. Developments such as the reinventing government movement and new public management signal the emergence of a new service delivery paradigm. In this new paradigm public institutions will increasingly utilise alternative service delivery approaches and mechanisms to provide services. These approaches and mechanisms will require integrated, functional systems and procedures that are dynamic, flexible, and accountable.

The utilisation of strategic leadership competence in government results in a new implementation “taxonomy” for public service strategic leaders. From this article it should, however, be clear that competency development adjustments need to be made to inculcate a new paradigm and to incorporate competency development to support strategic leaders. The resulting strategic leadership competence paradigm will add significant benefits to both public service and community.

# MOBILE PHONES: THE 21<sup>ST</sup> CENTURY ADDICTION?

**Richard Shambare, Robert Rugimbana, and Takesure Zhoua**  
**Tshwane University of Technology, South Africa**

## ABSTRACT

*The mobile phone has become the 21<sup>st</sup> Century icon. It is ubiquitous in the modern world, as an on-the-go talking device, an Internet portal, a social networking platform, a personal organizer, and even a mobile bank. In the information age, the cell phone has become an important social accessory. Since it is relatively easy to use, portable, and affordable, its diffusion continues to surpass that of other ICT technologies. Research increasingly suggests cell phone usage to be addictive, compulsive, and habitual. Students are among the heavy users of mobile technologies, accordingly, a 33-item questionnaire measuring addictive and habitual behaviour was administered to a sample of students. Results indicate that indeed cell phone usage is not only habit-forming, it is also addictive; possibly the biggest non-drug addiction of the 21<sup>st</sup> Century.*

## INTRODUCTION

As the popularity of ICT-driven communication increases, mobile phone usage has been tipped into mainstream culture. This is particularly true for young adults, who increasingly consider mobile phones as part of their being and identity (Hooper & Zhou, 2007; Madrid, 2003). Past studies demonstrate that young adults and students use cell phones for various purposes including Facebook, where students spend at least 3 hours every day on their Facebook accounts using mobile phones (Mvula & Shambare, 2011).

Given the widespread adoption of mobile telephones, many researchers have posited that the use of cellular phones is addictive, compulsive, dependant, and habit-forming (Aoki & Downes, 2003; Hooper & Zhou, 2007; Madrid, 2003). Madrid (2003) particularly asserts that “mobile phone usage is a compulsive and addictive disorder which looks set to become one of the biggest non-drug addictions in the 21<sup>st</sup> Century.” Despite this, very little research attention has focussed on this phenomenon, and even less has empirically tested these claims. It is against this background that this research investigates these claims by testing whether mobile phone usage is indeed addictive, compulsive, and habitual. To achieve this, a mobile phone usage questionnaire developed by Hooper and Zhou (2007) to measure addictive, compulsive, and habitual behaviour was tested on a sample of South African students. Since students usually take the lead in adopting technological innovations including mobile phone usage (Rugimbana, 2007), a student population was considered ideal.

Hooper and Zhou (2007) considers mobile phone usage as having a mobile (cellular) phone and using it to communicate by means of calling or sending text messages commonly known as SMSs. For practical purposes, this definition will be adopted for the purposes of this research. Mobile phone usage is a distinct consumer behaviour, whose implications are potentially valuable to a multiplicity of disciplines including marketing and education. For educators, understanding how and why students use cell phones can provide them with knowledge not only to facilitate learning, but to discover means of embracing the technology into the classroom (Bicen & Cavus, 2010; Carter *et al.*, 2008; Mvula & Shambare, 2011). On the other hand, marketers may gain valuable insight of using mobile phones as a medium for advertising as well as the marketing of mobile phones.

Past research identified numerous types of behaviour associated with mobile phone usage. Therefore, this study concerns itself with the identification of these types of behaviour and the respective underlying motivations of that behaviour. In other words, the objectives of the research are to:

- determine whether the types of behaviour according to Hooper and Zhou (2007) are identifiable in a developed nation's context such as South Africa
- categorise mobile phone usage according to the typologies identified in the latter study, based on the underlying motivations

The remaining sections of the paper are structured as follows. First, the literature pertaining to mobile phone usage is reviewed in the following section. Secondly, the methodology employed to answer the research questions is presented. Results are then presented next. Finally, the paper concludes by citing implications of these findings, as well as suggesting topics for future research.

## LITERATURE REVIEW

To appreciate mobile usage, the study considers a multi-disciplinary review of the literature. Following on from Maslow's motivation model, Hooper & Zhou (2007) posit that human behaviour can be viewed as the actual performance of behavioural intentions driven by certain underlying motives. This view appears to be consistent with adoption theories such as Ajzen's (1991) Theory of Planned Behaviour, Davis' (1989) Technology Acceptance Model. Basically these models propose that product attributes (e.g. relative advantage, perceived ease of use, or perceived usefulness) influence behavioural intention, which in turn initiate behaviour (Taylor & Todd, 1995).

### Motivation of mobile phone usage

Although mobile phones were initially used as communication devices, today they are a 21<sup>st</sup> Century icon that performs multiple roles (Garcia-Montes *et al.*, 2006). Mobile phones can represent a bank if used in mobile banking (Jayamaha, 2008), a camera, personal organiser, a calculator, and a social networking device (Bicen & Cavus, 2010). Aoki and Downes (2003) further argue that a mobile phone is no longer a phone linked to a space but rather a phone linked exclusively to an individual (Boyd & Ellison, 2008; Mvula & Shambare, 2011). In the following sections, some of the more common motivations for mobile phone usage are discussed.

**Social interaction:** Mobile phones are used for social interaction. Adopters use them to stay in touch with friends and family (Aoki & Downes, 2003).

**Dependency:** Following adoption, users become more comfortable using cell phones. Rogers (1995) identifies this as 'commitment' to using an innovation. In other words, as adopters begin using mobile phones regularly they become part of the users' lives to such an extent that they feel lost without them (Hooper & Zhou, 2007). Mobile phones become such a necessity that they feel disconnected and lost if they do not have their mobile phone in their possession (Aoki & Downes, 2003).

**Image and identity:** Mobile phones may also be considered as status symbols (Taylor & Harper, 2003). Mvula and Shambare (2011) confirm this latter position; they indicate that South African students adopt mobile phones to use on Facebook, simply because their friends use cell phones for Facebook. Hence, Wilska's (2003) findings propose mobile phone usage as being addictive, trendy, and impulsive.

### Behaviour associated with mobile phone usage

From these motives, the literature posits six types of behaviour associated with mobile phone usage. These are habitual, addictive, mandatory, voluntary, dependent, and compulsive behaviour (Hanley & Wilhelm, 1992; Hooper & Zhou, 2007; Madrid, 2003; O'Guinn & Faber, 1989), and are discussed in detail in the following sections.

### Addictive behaviour

Hanley and Wilhelm (1992) define addictive behaviour as any activity, substance, object, or behaviour that has become the major focus of a person's life to the exclusion of other activities, or that has begun to harm

the individual or others physically, mentally, or socially. Addictive behaviours in is usually considered a means of improving feelings of low self-esteem and powerlessness (O'Guinn & Faber, 1989).

## **Compulsive behaviour**

O'Guinn and Faber (1989) affirm that compulsive behaviour is repetitive behaviour; it is typically very difficult to stop and often results in harmful economic or societal consequences.

## **Dependent behaviour**

Dependent behaviour is different from addiction, in that it is often motivated by the attached importance of a social norm (Hooper & Zhou, 2007). In this context, it is not addiction of mobile phone usage, but the attached importance of communication.

## **Habitual behaviour**

Many behaviours that people perform regularly can be characterized as habits, since they are performed with little mental awareness (Biel *et al.*, 2005). These are initiated by environmental cues in a given situation which call for individuals to act. The cues send signals to an established habit which corresponds to behaviour in a given situation.

## **Voluntary behaviour**

Unlike habitual and addictive behaviour, voluntary behaviour is reasoned behaviour which is driven by specific motivations.

## **Mandatory behaviour**

Mandatory behaviour is defined as behaviour needing to be done, followed, or complied with, usually because of being officially required (Aoki & Downes, 2003) or being parentally mandated. In terms of motivation, mandatory behaviour is usually driven or prompted by environmental consequences (Aoki & Downes, 2003).

## **Research Objectives**

To address research objective, the following research question was formulated:

**RQ:** *What types of behaviour are associated with mobile phone usage?*

## **RESEARCH DESIGN**

A survey method was used to collect data from students in Pretoria, using non-probabilistic sampling methods (Kerlinger & Lee, 2000). Four undergraduate students, trained as research assistants administered the instrument to participants.

## **Sampling and sample size**

Non-probabilistic sampling technique was utilised, and to ensure a more representative sample consisting of students at all study levels, both high school and university students were utilised (Calder *et al.*, 1981). While these two groups may appear to represent two separate populations, past studies (e.g., Livingstone, 2008) focusing on young consumers tend to combine consumers under 35 years old as one population group. Therefore, the choice for including the entire spectrum of students stems from the latter views. Research

assistants were positioned at strategic locations, near schools and libraries, where they approached students to participate in the study. Table 1 illustrates the participants' demographic characteristics.

**Table 1: Demographic Profile**

Demographic Characteristics		Per cent (%)
<i>Gender</i>	Male	29
	Female	71
<i>Education level</i>	High School	42
	University Diploma/ Degree	26
	Postgraduate	32
<i>Cell phones owned</i>	One	64
	Two	28
	Three or more	8
<i>Cell phone experience</i>	< 1 year	7
	1 – 3 years	15
	3 – 5 years	10
	5+ years	68

Respondents' ages ranged from 14 to 38 years, yielding a mean age of 20.67 years with a standard deviation of 2.94 years. The K-S Normality test was not significant ( $D = 1.279$ ,  $p = 0.076$ ), suggesting that the sample followed a normal distribution.

## Data Collection

In total, 180 self-completion questionnaires were distributed to willing participants. Of these, 104 questionnaires were returned but only 93 were usable, representing a response rate of about 52 per cent. The remaining 11 instruments had too many missing values to be useful.

## Questionnaire

To measure mobile phone usage patterns, Hooper & Zhou's (2007) mobile phone usage scale (MPUS) was adapted and used to collect primary data. In keeping with the research objective of establishing whether cell phone usage was indeed addictive (Aoki & Downes, 2003; Madrid, 2003), the questionnaire used by Hooper and Zhou (2007) was considered most appropriate, as the previous study also considered a sample of students. A pilot test was conducted with 10 undergraduate students to ensure that content of questionnaire would be comprehensible to the target respondents (Dwivedi, Choudrie, & Brinkman, 2006).

## RESULTS

This research question and research objectives sought to identify the types of behaviour associated with mobile phone usage. It was also important to determine whether students exhibited one type of behaviour over another or perhaps a set of behaviour types over others. The mobile phone usage scale (MPUS) was used to answer this question. Factor analysis was performed on the MPUS. According to Hooper and Zhou (2007), the MPUS contains 6 behaviour typologies, each represented by the 6 subscales: habitual, mandatory, dependant, addictive, compulsive, and voluntary. These items are supposed to load independently in 6 factors or behaviour typologies.

Tests to determine the suitability of factor analysis were all satisfactory ( $KMO = 0.831$ ; Bartlett's Test of Sphericity  $X^2 = 845.195$ ;  $df = 153$ ;  $p < 0.000$ ). Subsequently factor analysis, with a principal component

analysis (PCA) as an extraction method was performed. A three-factor solution was extracted. Dependency behaviour items loaded in Factor 1, habitual behaviour items loaded in Factor 2, and addictive behaviour items loaded in Factor 3 (Table 2).

**Table 2: Three-factor solution of mobile usage responses**

	<b>Factor 1</b> Dependant	<b>Factor 2</b> Habitual	<b>Factor 3</b> Addictive	<b>Communalities</b>
D5	0.840			0.721
M1	0.803			0.777
D1	0.783			0.687
D2	0.781			0.715
D3	0.765			0.712
D4	0.754			0.657
H3		0.828		0.727
H2		0.762		0.657
H1		0.722		0.584
H5		0.712		0.548
H4		0.695		0.629
A3			0.751	0.620
A2			0.737	0.629
C1			0.726	0.640
A1			0.633	0.454
A4			0.598	0.482
Eigenvalues	6.954	2.214	1.713	(Total)
percentage of variance	26.065	18.209	16.181	60.455
Cronbach's alpha ( $\alpha$ )	0.915	0.832	0.788	

Table 4 illustrates that the three-factor solution accounts for about 60 per cent of the variance. Subsequent tests for internal consistency of items in all three factors yielded satisfactory results, as all factors had Cronbach's alphas in excess of the 0.7 cut-off (Field, 2009; Ozer & Gunluk, 2010).

## DISCUSSION AND CONCLUSIONS

This research sought to establish the types of behaviour according identifiable in mobile phone usage. A secondary objective was to assess how students in a resource-poor context compare to those in a resource-rich country. Following in, researchers attempted to categorise mobile phone usage according to the typologies commonly identified in the literature. While earlier studies posit six typologies, this study found support for only three: dependency, habitual, and addictive behaviour. These results suggest that mobile phone usage is dependency-forming, habitual, and addictive. For instance, such dependant behaviour is exemplified with the overwhelming response to questions like: "I often feel upset to think that they might be missing calls or messages." The reliability of each the factors: dependency, habitual, and addictive behaviour was 0.915, 0.832, and 0.788, respectively. These are comparable to those found by Hooper and Zhou (2007), which were 0.842, 0.793, and 0.880, respectively. The high reliability loadings of these factors indicate that the three different types of behaviour are in themselves distinct constructs. Future research could consider looking at this constructs utilising a different sample of mobile users.

# **TALENT MANAGEMENT AND EMPLOYEE ENGAGEMENT IN THE INFORMATION INFUSED WORLD: A THEORETICAL ORIENTATION**

**Harshika Sharma, Holborn College, UK  
Ann Ozuem, Roehampton University, UK**

## **ABSTRACT**

*Contemporary organisations are increasingly placing emphasis on talent management and employee engagement. Extant conceptual issues related to talent management and employee engagement are polarised by divergent views, creating a number of implications for academics and practitioners alike. The primary goals of this paper are to synthesise the underlying theories of talent management and to refocus academics and practitioners on the implicit and explicit benefits of management of talent and employee engagement in the global workforce.*

## **INTRODUCTION**

The term 'talent management' carries different meanings to different people (Cheloha and Swain, 2005; Jackson and Schuler, 1990; Kesler, 2002). To some, it means the management of "high-worth individuals or the talented." Whilst to others it is generally about how talent is managed on the assumption that all people have talent which should be identified, developed and liberated. This view is associated with competency-based human resource management practices. Talent management decisions are often driven by a set of organisational core competencies as well as position-specific competencies. There exists a wide range of extant theories related to talent management, both amongst academics and practitioners. However, there is dearth of theoretical orientation linking talent management and employee engagement. The current study aims to conceptually bridge the gap between talent management and employee engagement in an information infused world.

## **UNDERSTANDING TALENT MANAGEMENT**

So many different definitions of talent management exist that it is difficult to confer and compare across organisations. Lewis and Heckman (2006) conducted a review of the literature and concluded that there were several distinct streams of definitions and various degrees to which organisations have utilized each of them. One definition simply replaces the term 'human resources' with 'talent management' (Cohn et al, 2005; Conger and Fulmer, 2003; Garger, 1999). Talent management is a collection of human resource functions and practices like recruitment, selection, development and succession planning (Byham, 2001; Heinen and O'Neill, 2004; Olsen, 2000). The term can also include any area related to organisational development as well as employee relations. However, talent management is seen as an improved version of the former 'personnel' moniker which positively invests and manages employees as assets of organisations.

Talent management considers the internal pool of resources as it focuses on human resource and succession planning (Cheloha and Swain, 2005). Jackson and Schuler (1990) define it as an architecture where a set of processes are designed to ensure there is an adequate supply of employees for jobs within an organisation. It is all about having the right resources available at the right time for the right job (Kesler, 2002). Many organisations consider talent management as an over-arching recruitment tool that utilizes technology to assist in identifying the correct resources.

A third definition focuses on managing talent according to performance and views it as an “undifferentiated good” that emerges from humanistic and demographic perceptions (Buckingham and Vosburgh, 2001). This generic perspective of talent management does not focus on specific positions or boundaries. Critical to this stream of thought is the ability to manage people to their highest potential towards high performance organisation. It includes the development of people and managing the process of human resources. This requires cooperation and communication amongst managers at all levels (McCauley and Wakefield, 2006; Redford, 2005). Whilst all of these individual definitions have some credibility, the term ‘talent management’ in the 21st century needs to encompass these diverse concepts together into a more powerful concept.

Many organisations are making conscious efforts to manage talent. “The future of talent management may be about embracing and leveraging connectedness” (Frank and Taylor, 2004). It appears that organisations are increasingly embracing this concept. In fact, it has become a tactical necessity for many organisations. Talent management is in fact a part of the overall strategy of organisations. Many organisations are adopting models that help them compete with the best available resources for maximum organisational effectiveness (Ashton and Morton, 2005). Based on an analysis of these various interpretations, it is proposed that the concept of talent management may need to take on a more holistic approach. Talent management is defined by combining many of the above attributes into a “whole” model viewed in terms of a strategy.

According to Ashton and Morton (2005), talent management is imperative and has become an integral part of organisational planning. It is simply more than putting people in the right job at the right time. This view purports that since there is no single definition, talent management must be fluid and flexible and must adapt according to changes in business strategy. It is a driver within the organisation’s strategy that provides a connection to the performance of the human resources. Talent management in the 21<sup>st</sup> century must be more strategic and broad based in order to drive performance and manage human talent (McCauley and Wakefield, 2006). Organisations will only survive if talent management is aligned within the business strategy.

A 21<sup>st</sup> century concept of talent management must be a holistic concept. The various attributes combined within the model suggest that talent management must:

- 1) involve the integration of human resources across all departments and levels
- 2) be supported by cooperation from management
- 3) be facilitative in nature
- 4) be aligned with the overall business strategy
- 5) be upbeat in terms of future prospect
- 6) be an improved process that develops and manages talent and,
- 7) depend on a culture that fosters connectedness among employees and managers.

Talent management is a holistic concept where all the tenets are an outgrowth from the basic premise of talented human resources at the core of organisational effectiveness. When talent management becomes a core competence, it significantly improves strategy execution and operational excellence. This approach improves the performance and the potential of people who in turn impact on organisations.

Based on a review of these various interpretations, it is proposed that the concept of talent management may need to take on more of a holistic approach. Talent management is defined by combining many of the above attributes into a “whole” model viewed in terms of a strategy.

## **HOLISTIC APPROACH**

Talent management is not a human resource or organisational developmental initiative. It is something that is integrated within organisational strategy. It provides the framework for driving strategy throughout the company and at all levels. An organisation cannot simply implement one facet of talent management but must combine these in order to build a complete concept and strategy. By combining all talent management contexts together, talent management enables an organisation to “grow” from a holistic perspective. In order to develop a successful talent management strategy, employees need to feel “connected” or engaged with their jobs and

organisations. Effective talent management policies and practices that demonstrate commitment to human capital result in more engaged employees and lower turnover (McCauley and Wakefield, 2006).

<b>HR Talent Management</b>	-It is a set of typical HR practices -Replaces the term HR with Talent Management	(Byham,2001; Heinen and O'Neill, 2004; Olsen, 2000)
<b>Concept of Talent Pool</b>	-Set of processes designed to ensure the supply meets the demands of employees -Related to human resource planning - Right people at the right time in the right job	(Cheloha and Swain, 2005; Jackson and Schuler, 1990; Kesler, 2002)
<b>Generic talent management</b>	-Manages talent according to performance -Manages talent from both humanistic and demographic perception	(Buckingham and Vosburg.,2001; McCauley and Wakefield, 2006; Redford, 2005; Rothwell and Poduch, 2004)
<b>Holistic Approach</b>	-Integrates human resources and systems - Aligns talent with business strategy -Facilitative in nature like organisation development	

Table 1: Talent Management Definitions

## EMPLOYEE ENGAGEMENT: A STRATEGIC PRIORITY

“The challenge today is not just retaining talented people, but fully engaging them, capturing their minds and hearts at each stage of their work lives.” The concept of ‘employee engagement’ (EE) is rapidly gaining popularity, use and importance in the workplace. Research and consultancy firms, led by the high-profile Gallup Organisation are increasingly focusing their efforts on surveys of employee engagement that aim to improve levels of engagement. This is because corporate results have reportedly demonstrated a strong link between some conceptualisations of engagement, worker performance and business outcomes (The Gallup Organisation, 2004; ISR, 2005). Engagement is also increasingly examined in the business and psychological literature, as researchers struggle to catch up with its wave of popularity in the corporate world. While there is great interest and importance placed on the concept of engagement, there is also great confusion in the literature as to what exactly engagement is as a concept, and how it is to be defined and measured. Indeed, engagement has been defined, operationalised and measured in many diverse ways.

Engagement may in fact be a global concept, as it seems to be based on a combination of job satisfaction, job involvement, organisational commitment and intention to stay. It is important to continually understand and foster EE in the workplace’ (Lanphear, 2004).

The term ‘employee engagement’ has become a focus for many organisations. Employee engagement definitions (like talent management definitions) stems more from practice than from empirical findings. A review of the literature, particularly Melcrum’s (2005) study in Britain, proposes differing definitions of employee engagement (Dalal et al, 2008; Robinson et al, 2004; Saks, 2006). Research reflects that there has been heightened interest in the study of employee engagement in the recent past. Smythe (2007) deems that employee engagement is an incoherent concept with inadequate empirical support to generate interest for study. Successful talent management depends upon the engagement of the human resources. If employees feel “connected” to their job and organisation, the performance and effectiveness of organisation will increase (Lockwood, 2006).

The possibility of increasing effectiveness through a talent management strategy that is integrated with engagement could be the key to sustainable and appropriate talent for an organisation. In general, practitioners define engagement as employee commitment and a connection to the job and organisation (Gallup Study, 2006). Employees who are motivated help to drive the organisational strategy. Such employees have a “willingness” to

go an extra mile and perform beyond the call of duty to contribute to the success of the company. Kahn (1990) looks at engagement from a cognitive, emotional and physical connection of an employee to their work role. Engagement according to the author is measured through attentiveness, connection, integration and focus. Rothbard (2001) and Salanova et al (2005) add motivation and absorption to the concept which brings a more holistic view. It is important to point out that Saks (2006) views engagement differently from organisational commitment. He suggests that it is not an attitude but it is evaluated in terms of how well the individual is attentive and absorbed in the performance of their role. May et al (2004) conclude that engagement is concerned with how the individual performs during the job. It entails the active use of emotions and behaviours. Maslach et al (2001) characterise engagement as involvement, efficacy and rigour which is the opposite of burnout.

The antithesis of being engaged is to be disengaged which also has a connection to the term "burnout." Burnout is a syndrome of emotional exhaustion, depersonalisation and a reduced sense of accomplishment (Leiter and Maslach, 1988). It is the feeling of being emotionally overextended and drained by one's contact with other people. Kahn (1990) notes that when individuals are disengaged, they withdraw physically, cognitively or emotionally. The Gallup study (2006) classifies disengaged employees as "not-engaged" and "actively disengaged." Un-engaged employees have essentially "checked out." and their approach to work lacks passion. Actively disengaged employees are not just unhappy at work; they are acting out their unhappiness. Thus, burnout can be viewed as the opposite of engagement.

The role of defining engagement is the ability to identify when people are disengaged (Maslach and Leiter, 1997). It helps to determine the factors that are important to identify areas to improve engagement. Overall, in the academic literature, employee engagement has been consistently defined as a distinct and unique construct that consists of cognitive, emotional, and behavioural components that are associated with individual role performance. Practitioner definitions tend to overlap into other constructs such as job involvement and commitment. The academic definition is more precise, but in general, they both attempt to measure the alignment and motivation of an employee's effort towards the job and the goals of an organisation.

Engagement is then defined when the job is challenging and meaningful and when adequate resources are provided to individuals. Engagement occurs when managers provide a supportive environment. These cognitive, physical and emotional attributes all contribute to engagement. Talent management practices and policies that are focused on human capital result in more engaged employees and lower turnover (Driving Performance and Retention Through Employee Engagement, 2004). Subsequently, talent management has a large impact on employee productivity and employee retention. According to a Corporate Leadership Council study, employees who are committed perform 20% better and are 87% less likely to resign (*ibid.*). Lockwood (2006) suggests effective engagement fosters an environment of stimulation, development, support, contribution and recognition. This aligns directly with talent management. Those organisations that include talent management in their overall strategy will fare better than those that do not. This involves translating corporate goals into workforce needs, linking people to profit and effectively managing talent (Farley, 2005). Talent management needs to be a regular and consistent consideration of any organisation.

<b>Practitioner</b>	<ul style="list-style-type: none"> <li>Engaged with passion, connection, commitment towards the job and organisation</li> <li>Job satisfaction</li> <li>Sense of contribution</li> </ul>	Employee Engagement Report: Gallup study 2009, Global workforce study, 2009
<b>Academic</b>	<ul style="list-style-type: none"> <li>Engaged employees express themselves physically, cognitively and emotionally</li> <li>Attention and absorptions</li> <li>Involvement</li> <li>A fulfilling state of mind characterised by vigour and dedication</li> </ul>	Kahn, 1990; Maslach, et al., 2001; D.R. May, et al., 2004; Rothbard, 2001; Salanova, et al., 2005

<b>Combined Approach</b>	<ul style="list-style-type: none"> <li>• Challenging and meaningful job</li> <li>• Resourceful</li> <li>• Perceived support from organisation and supervisor</li> <li>• Rewarded and recognized</li> <li>• Committed to organisation</li> </ul>	
--------------------------	---	--

Table 2: Employee Engagement: Different Perspectives

## CAREER ANCHORS

Talent management has taken different forms over the years and is not only concerned with finding ‘the best’ talent but also with developing the individual. Schein (1978) examined the development of the individual throughout the career cycle and developed the concept of career anchors. These are defined as the area of self concept that a person would not give up if forced to make a choice (Schein, 1978). They organise and constrain career decisions.

A career anchor has three components as follows:

1. Self-perceived talents and capabilities,
2. Self-perceived motivation,
3. Self-perceived outlook and values.

The concept emphasises the interaction between capabilities, motivation and outlook and values into "self concept".

Five career anchors for competence originally identified by Schein (1978) are:

1. Functional competence,
2. Administrative competence,
3. Sovereignty,
4. Security,
5. Entrepreneurial skill.

Three additional anchors were identified by Schein (1996)

1. Service,
2. Challenge,
3. Lifestyle.
- 4.

In the 1970s, it was evident where individuals stood with respect to their career anchors. However, in the 1980s, Schein (1996) found that the changing environment that existed within organisations pushed people to adjust and this resulted in the emergence of three additional anchors. With rapid technological and economical change people had to become more self-reliant. In addition, these factors played a role in the development of individuals within the organisation. As firms provide development and opportunities, individuals must assess their own career anchors to determine how to best increase productivity and engagement. Schein (1996) questions the extent to which, "individual career occupants have to plan and budget for their own learning, or will organisations take on some of this burden because it will ultimately be to their advantage." Schein (1996) not only advocates for greater employee participation, (especially with his research on career anchors) but also imposes on organisations a need to do better design work and to develop roles through open-systems planning. He envisaged that organisational culture and climate are key factors to changing this direction and human resource strategy will become decentralised into organisations in order to become integrated with the overall corporate activity. He acknowledged that talent can be developed in the individual but that the culture or climate must also be appropriate for this to occur.

## TALENT MANAGEMENT AND EMPLOYEE ENGAGEMENT

“The policies and practices of talent management that exhibit commitment to human capital result in an engaged workforce and lower turnover” (Gallup Report, 2004). “Talent management along with employee engagement can make or break the bottom line” (Lockwood, 2006). Engaged employees perform 20% better and are 87% more likely to be engaged. An important construct for employee engagement is linked to retention of the talent pool as an outcome of the talent management process (Bhatnagar, 2007). Engagement has been found

to be beneficial for the organisation as well as for the employees. So having an engaged workforce is a win-win situation. The manager plays a vital role as he/she facilitates employee engagement to both the job and the organisation. The value and accuracy of communication by senior management helps to create a more engaged workforce. Building employee engagement is an ongoing process. Effectual employee engagement promotes an environment of motivation, development, contribution and recognition (Lockwood, 2006). He concludes that the key factor that count when building engaged talent is ultimately the culture within the organisation.

Organisations need to reinvent their approaches to talent management in order to sustain increased business results in an increasingly competitive business landscape. Due to the shift in paradigm, increased participation from the executive level is viewed important. Rothwell and Poduch (2004) are of the opinion that most executives think of talent planning as "executive placement planning for senior-level backups". Furthermore, talent planning is proactive and attempts to ensure that internal talent and leadership development should be considered simultaneously while making business decisions. Culture and communications within an organisation must also be integrated. The holistic concept of talent management encompasses transforming corporate objectives into the needs of the workforce, linking employees to yield effective business performance (Farley, 2005). The executive level management have to refine how human resources are built-in wider organisational strategies. Only those organisations that learn to master talent management function will outgrow others with superior outcomes.

## **TALENT MANAGEMENT STRATEGY**

In the evolving global economy, for sustained business results, organisations will have to redefine their approach to talent management that effectively influences employee engagement. Many managers understand and even categorize that capable and enthused employees are assets to any organisation (Barlett and Ghoshal, 2002). Organisations advance when there is a "flexible, dedicated and greatly enthused pool of talent with a powerful sense of motivation concerning their service" (Smythe, 2007). Yet, following a decade of reengineering and decentralising, employees are more worn out than empowered and more pessimistic than optimistic. Little attention has been given to issues like employee capability and motivation. "Somewhere between theory and practice, precious human capital is being misused, wasted or lost" (Bartlett and Ghoshal, 2002),

In this state of rapid change, organisations should continuously change in order to sustain. Talent management strategy is an integral constituent of driving incessant changeover in the organisation. As intricacy and transformation drive organisations, managing talent will require a shift from an art to a decision science. Gone are the days of the "gut instinct" management style. Today's business leaders are closely gauging decision-making techniques to run their organisations successfully with an engaged workforce. According to Davis and Stephenson (2006), scientific management will develop into an indispensable tool to not only gain a competitive edge but also to simply stay in the game. It should come as no covert that employees are the ultimate source of continued competitive lead since conventional basis associated to financial capital and economies of scale have been destabilised by globalisation.

Pfeffer (1995) suggests that if organisations are going to vie in today's economy, it is important to develop employees with the right skills and potential. When organisational leaders possess the wealth of data of its talent pool, the finest talent management decisions can be easily made (Farley, 2005). The talent management outlook must be altered. Often management focus on financial capital as the decisive strategic resource to be managed. However, they fail to realise that it is human capital that needs to be viewed as the strategic resource. Schaufeli and Bakker (2004) found that engaged employees are more strongly attached to their organisations and therefore are less likely to leave the organisation. Engaging employee is imperative to the successful retention of talented employees (Bhatnagar, 2007).

Talent management is a strategy and not a HR initiative. It supports all strategic and cultural objectives and represents management commitment that is revealed in their activities and resolutions. This enables organisations to develop and engage key employees to meet the evolving business landscape. However, without commitment from the top management, talent management will fail. The passion for commitment must come from the top and must seep into the culture. According to Ready and Conger (2007) the dynamism of a company's talent management process comes from the three defining characteristics of commitment,

engagement, and accountability. Fostering commitment begins with the new hire and continues throughout the career. Engagement reflects the degree to which company leaders show their commitment to talent management

Figure 1 below proposes a holistic concept of talent management. A talent management strategy includes performance development, open climate, communication, continuous workplace improvement and rewards and recognitions. This holistic concept should be supported by the top management and embraced by all managers. Through this strategy, employee engagement can be secured in order to positively affect overall organisation strategy. Employee engagement is only attained when there is management support, interesting work, coaching supervisors, and personal development opportunities, a sense of contribution and reward and recognition. If talent management is not part of the organisation-strategy then it is doomed for failure. Talent management is both a combination Of organisational goals and effort.

The talent management model is supported by the holistic dimensions and definitions of both talent management and engagement. From both the theoretical and practitioner's viewpoint this model is significant. Though the holistic model is inherently complex it is promising from a conceptual construct.

According to Barney (1991), it is vital to find and develop the resources in an organisation which helps in generating implicit organisational knowledge. Based upon the data, human resources must be cautiously selected (Boudreau and Ramstad, 1997). The organisation must also provide an appropriate culture and environment for learning and development in order to sustain and move the firm forward (Lado and Wilson, 1994). It is the human capital that will implement the HR/OD strategy that integrates with the overall organizational strategy.

**Fig 1. Talent Management Model**

By managing human capital and aligning it with employees' values and what the company can offer, the organisation can successfully accomplish its goals (Lawler and Worley, 2006).

If the above talent management model architecture is identified and confirmed as a core mechanism of a talent management strategy, organisations can successfully move ahead. Organisations must value human capital as their strategic resource and manage human resources effectively. When organisations positively invest in their valuable assets, they become the decisive source of differentiation providing growth and success to the organisation. Organisational change will occur but strategic talent management has to be developed to enhance employee engagement that results in improved performance for both the employee and the organisation.

With a proper talent management strategy, human capital can be affirmed as the number one strategic resource in an organisation. This strategy improves employee engagement that in turn increases organisational success. The review of literature has provided contemporary definitions of talent management and employee engagement. A talent management model has been outlined that provides the framework for defining a more definitive building block that bridges talent management and employee engagement.

## CONCLUSION AND IMPLICATIONS

Often, 'developed' theory is not adequately explored. The above talent management model is based upon extant literature and earlier theories that embrace both talent management and engagement strategies. Viewed from a practitioner's perspective, the affect on practice weighs sanguinely. The time constraint on the part of practitioner makes talent management theory a luxury. This limitation necessitates practitioners to apply a strategy and aim for quick positive results. The talent management model demonstrates that it can be positively applied in an organisation. For practitioners, the holistic model may seem complex but when implemented, it is worth the effort to find an increase in employee engagement and the results align to the general organisational goals. The talent management model applies to employees, professionals in human resource management and leaders of an organisation.

From an employee perspective, a talent management strategy that promotes an open climate, clear communication and an environment of learning and improvement will engage employees on a higher level to support the company's mission and goals. Employees will feel fulfilled and also receive personal as well as career development that will enhance their skills and knowledge. In other words Talent Management focuses on enhancing the potential of employees by developing their capacities. Capacities are the basic DNA of an organisation and also of individual potential. Employee development encourages employee engagement which is essential to an efficient workplace. Strategic talent management improves the skills and talents of employees and increases the performance of the organisation. Employees enjoy the feeling of personal growth and satisfaction that comes from the opportunity to develop their skills. Employee development can have a dramatic effect on the level of employee retention. Simply put, engaged employees, given the opportunity for personal and professional growth, are more likely to stay with the organisation. Commitment to the organisation improves with engagement and the employee will find more opportunities within the company.

Human resource professionals now have a model that has been explored with "real case" data. Exploring what actually works through a field study approach provides confirmation of theories and strategies that have successfully been applied. It offers a framework to build a company-specific talent management strategy that helps in managing talent to find out how to hire the right people, how to keep promises, how to maintain a healthy work environment, how to recognise merits, how to provide learning opportunities and how to shield employees from high work pressures, among others. Highly demanding business environments make it imperative for organisations to build competence in the form of superior intellectual capital. Through strategic talent management HR professionals can gain competitiveness in the long run. Therefore it is the duty and responsibility of the HR professionals, also known as Human Capital Stewards to manage the human capital as well as the knowledge capital and become not only HR professional but also knowledge facilitators.

In essence strategic talent management helps the HR professional to nurture a talented workforce, which can win the war in the business field. Talent has to be spotted, carefully nurtured and, most importantly, preserved. The new mantra is the right person for the right job. It is not necessary for HR professionals to try to guess what might work for an organisation. In addition, confirmation of the theory provides HR professionals the opportunity to successfully contribute to the overall company strategy.

Finally, the leadership of any organisation will benefit from this holistic talent management model as it explains the various dimensions that contribute to both the success of a manager and organisational strategy. The senior leadership routinely discusses human capital as a top source of competitive advantage. But moving business leaders from talking the talk to walking the walk remains a challenge. It is a critical as talent management programs need to be driven from the top to ensure lasting success. Business leaders have the opportunity to define core elements of any strategic human capital initiative. From defining high level business objectives and cascading them down through the ranks to identifying critical roles and competencies that will

end up defining the very nature of the talent culture, senior leadership plays a fundamental role. But the business leader needs operational processes and technologies to transform vision to reality. This forms an integrated talent management platform that is vital in delivering a unified view into talent data and processes.

It identifies the attributes important for an employee to be engaged. Through these constructs, leaders can identify ways to build trust, promote positive supervisory skills, and provide challenging work that includes development aspects for all employees. These are the areas where senior level management need to ensure that they have programs in place to educate supervisors and provide support towards overall goals. Practitioners can view this model through a new paradigm. Talent management is not just about recruiting, retaining and deploying employees. It is a strategy to contribute to the overall organisational goals with positive outcomes by utilising the most valuable resources. It may mean that changes have to occur through this paradigm shift, but with a talent management strategy, change can be accelerated with positive outcomes.

## **FUTURE RESEARCH DIRECTION**

This study provides the foundation for further testing and exploration of holistic concept of talent management with other organisations as well. This research draws together theoretical and practical implications and attempts to bridge the gap between theory and practice. For scholars, the research confirms that talent management positively impacts employee engagement and for practitioners, the research provides a model with which to create a talent management strategy. This research can be used as a base to be applied to other organisations and explored in other types of industries as well as in larger groups. This research could also stimulate further theory. The model could be tested in a service unit to review and test the impact on engagement on organisational effectiveness. Further research could be conducted to find if there is increase in productivity after the implementation of a talent management strategy. Further research could explore how rewards and recognition relate to talent management and engagement. Further research could be conducted to gauge the level of employee engagement and the different variables that influence the degree of engagement. Each of these dimensions could be studied individually in terms of their effect on talent management strategies and employee engagement.

# **A CROSS-CULTURAL INVESTIGATION OF CONSUMER FRUGALITY: THE CASE OF THE UNITED STATES AND CHINA**

**Elaine Sherman, Hofstra University, USA**  
**Leon G. Schiffman, St. John's University, USA**  
**Yong Zhang, Hofstra University, USA**

## **ABSTRACT**

*This study investigates an important consumer trait: frugality, in a cross-cultural setting. Data were collected in the United States and China to examine possible differences in this important consumer predisposition. Results indicate that contrary to popular belief, consumers in China exhibited a lower tendency to withhold spending than consumers in the United States. Results also suggest that the more frugal American consumers were happier than their Chinese counterparts. Both theoretical and practical explanations are offered, and implications are discussed.*

## **INTRODUCTION**

Since 2008, many of the developed countries have experienced downturns in the form of a global recession. But, by the end of 2010, the recession was showing signs of easing-up. In gravitating to the current research, we wondered whether there was a possible shift in values toward spending among young adult Americans. We were also interested in contrasting young adult American consumers spending outlook or orientation with those of their Chinese counterparts. More specifically, we were interest in examining whether young adult Chinese consumers were still holding on to their country's historical tendency to be conservative or frugal when it comes to consumer spending, or alternatively whether they have shifted to a more consumption-oriented perspective, one historically associated with Western culture, particularly that of the United States. Finally, we did not rule out the possibility that because of the economic conditions in the United States compared to China, that there was the possibility of a shift in spending outlooks; that is, that the young adult American consumers were adapting a more frugal spending orientation, whereas the young adult Chinese consumers were transitioning to a consumption or spending-orientation.

In the United States, as well as many other economically developed countries, there has been in recent years an economic upheaval, with countries suffering the effects of a severe financial downturn that has affected many consumers. This unsettling economic climate has also affected consumption behavior and values. In coping with these events, many consumers have adjusted by adopting a more frugal perspective toward their consumption activities. Nevertheless, more recently there are some indications that these economies are experiencing some economic recovery. For example, in the United States, the Commerce Department in January 2011 released figures indicating that the Gross Domestic Product i.e., GDP) grew at an annual rate of 3.2 percent in the fourth quarter, up from 2.6 percent in the previous period (Rampell, 2011). In addition, in the beginning of 2011, consumer confidence continued to rise, the American stock market experienced sharp increases, and retail sales were better than in the previous two years. However, one of the paramount questions at this time is what if anything has been the lingering impact of consecutive years of declining spending on a post recessionary environment (Berk, Cheddar Christina, 2010). A particularly important issue is whether there has been even a more "permanent" impact on many American consumers by their experience with cutbacks in consumer spending, and whether such cutbacks in spending have made them more cautious and selective consumers.

Furthermore, we wondered whether these recent consumer experiences have impacted their core values and made them more appreciative of “thriftiness” as an “ongoing-way-of-life.” Also, a concern for the business community is that while spending may have increased, many consumers in the United States and in other parts of the world may have changed their buying patterns and become more focused on continuing to get better value and other expressions of “thriftiness,” that are associated with a kind of recessionary-related behavior. The changes suggest a more “frugal” consumer may be emerging. These changes also have implications for marketers interested in world markets. Given the rise of globalism and the importance of foreign markets for expanding business, the pressure to understand the consumption behaviors of specific international target markets is likely to be quite important with respect to the challenges associated with future market growth.

During the same period, China has been experiencing a different dynamic challenge, one associated with its rapid growth. Many of China’s 1.3 billion consumers are embracing new economic consumption habits or consuming orientations. China is still a country of extremes. Many in urban areas have seen incomes growing about 10% annually, while those in rural areas have only seen a 1% increase in annual income. This discrepancy is making for a sharp divide between these two segments of China’s population. In addition, within the cities, there are large differences in income. There is a small affluent class (8 million households) and a rising middle class (25 to 30 million households). These two groups are drivers of a growth for consumption of many consumer product categories (Boston Consulting Group and Wharton, 2009). These groups are also often acquiring products not only for consumption but status. Thus, popular products like designer clothing, mobile phones and other visible products are often being sought out as expressions of “conspicuous consumption.” With this growing market, it is important for marketers and researchers to understand the changing attitudes of Chinese consumers.

In an effort to explore the nature and extent of recent changes in attitudes towards spending of both American and Chinese consumers, our research examines possible shifts in values toward spending among young adult Americans, and contrasting their outlooks to young adult Chinese. Thus, a primary purpose of our research is to examine whether young adult Chinese consumers are holding on to their country’s historical tendency to be conservative or frugal when it comes to consumer spending, or alternatively whether they have shifted to a more consumption-oriented perspective, historically associated with Western culture, particularly that of the United States. Finally, we did not rule out the possibility that because of the economic conditions in the United States compared to China, there is a possibility of a shift in spending outlook among young adult American consumers. Specifically, we wondered whether young adult Americans consumers have adapted a more frugal spending outlook, in contrast to young adult Chinese consumers who appear to be transitioning to a spending orientation.

Another important interest of our research is to explore whether the values of frugality and be consumption-oriented affect the direction and extent of happiness of the young adult Chinese and American consumers. More specifically, we wished to examine the relationship between being frugality (spending less) and the extent of happiness (more or less happiness); as well as the relationship of not being frugal (spending more) and happiness. Again, it was the purpose of our research to investigate these two questions.

## **RESEARCH DESIGN AND METHODOLOGY**

This section is divided into a discussion of three elements of our research: (1) the two countries to be studied, (2) the two samples of respondents, and (3) the variables to be examined.

### **Two Countries to Be Studied**

For this research, data were collected in the United States and China, in a period between mid-2009 and near the end of 2010. Our goal was to examine possible differences and similarities between young adult American and Chinese consumers; that is, those between 18 and 29 years of age, in terms of their current outlook

toward spending or more precisely their extent of frugality and how this may be associated with subjective happiness.

These two countries were selected to assess the likely cross-cultural differences between young adult Chinese and Americans with respect to the dynamic changing attitudes and behavior in China, and the United States. Moreover, we anticipated that these two countries differed in terms their political and economic outlooks with regard to materialism, conspicuous consumption and frugality. Therefore, it was our intent to explore the dynamics of consumption, frugality, and consumer happiness, within the context of these two very important countries.

## Cultures of Individualism and Collectivism

It is well established that countries and their cultures have been found to differ in terms of their positions on a continuum of “individualism” to “collectivism” (Hofstede 1980). For instance, in the case of the United States, individuals has been characterized as seeking independent relationships to one another (i.e., individualism), and individual goals take precedence over group goals (Hofstede 1980). In contrast, in China, the population is more likely to have an interdependent relationship with each other (i.e., collectivism).

More specifically, in our research we decided to contrast the United States and China. Specifically, China has often been characterized as a country with a *collectivistic culture*; whereas, the United States has been characterized as a country with a particularly strong *individualistic culture*. As such, Chinese society has historically focused on social interests and collective actions, and de-emphasized personal goals and accomplishments (Oh 1976; Li 1978). In contrast, in Chinese society, harmony and conformity not only tend to govern interpersonal relations, but these qualities also enjoy social and cultural approval (Hsu 1981). In comparison, the United States is ostensibly a country known for its “rugged individualism.” The concept of individualism is the belief that each person is an entity separate from the group; and, as such, the individual is endowed with “natural rights” (Spence 1985). In sharp contrast to cultures that are characterized by harmony, conformity and interdependency, the Americans view rugged individualism as a desirable trait worth striving for. They embrace the belief that an individual is not only self-sufficient as a matter of fact, but that he or she must strive toward it as an “ideal.” Still further, American values such as individual achievement orientation and encouragement for the attainment of material gains and prosperity are rooted in individualism. Evidence suggests that differences along this dimension of culture account for major differences in consumption values and behavior. For instance, in the case of Chinese school children, Chan (2006) found that early on in their life, children were taught the importance of saving. Indeed, lessons in elementary school textbooks put a strong emphasis on being “thrift” and “frugality.” Chinese students were taught that there were “private goods” and that there were “public goods;” and further that all material goods were the results of human labor. Attention was also given to the notion that goods should be used properly. Wasting goods was portrayed as a “sin.”

When it comes to spending or saving, one might speculate that the Chinese outlook reflects the traditional Chinese value of a long-term orientation or preference for savings, and delayed gratification. This value orientation is historically important values. It has been supported by researchers and scholars who suggest that “the Confucian Consumers” of China does not seek to spend and are predisposed to saving a much great proportion of their earnings, than those in other societies, such as the United States (Roubini 2010). As the Chinese have experienced an emerging rise of materialism and conspicuous consumption during the past decade (Podoshen, Li, and Zhang 2010), it has to some extent begun to shatter the traditional image of the “Confucian Consumers.” Over the last decade, there has been an increase in the new-higher income classes in China, a thirst for branded status material goods, and the attraction of conspicuous products that are influencing Chinese citizens who seek higher incomes and money to acquire a variety of new possessions. Previous research has also indicated that young urban adolescents in China are prone to being more materialistic as they are exposed to advertising and success models that stress materialism (Chan 2006).

In contrast, recently, Booz, Allen & Hamilton (2110) reported results of a study of how young adult Americans have adapted to the changing economic conditions of the 2008 recession. In this research, we have sought to explore these shifts and see if they are reflected in terms of an established measure of “consumer frugality.” Frugal behavior is now considered to be “trendy” by many American shoppers, and accordingly(Booz

Allen & Hamilton (2010): “In this changed environment, marketers need to develop deeper insights into shopper attitudes and behaviors in order to better align their product, pricing, and marketing communications strategies.

Their recent study indicates the consumers are changing their behavior. For instance, approximately two-thirds of the consumers that they interviewed, reported that they now consider saving to be more important than spending, and that they frequently used shopper’s coupons. In addition, more than half of the consumers indicated that they would rather get the best price than the best brand. Still further, more than half of consumers suggested that have reduced their discretionary spending (e.g., 53 percent reduced their expenditure on consumer electronics, apparel, and media and entertainment, some 51 percent). When the survey asked how they expected these attitudinal changes to be reflected in future plans, some 64 percent of consumers indicate that will continue such behavior (e.g., shop at a different store with lower prices). So as far as they can see, a frugal shopping orientation is in their future.

## The Sample

Our overall sample consisted of 596 male and female university students. There were 342 student-respondents drawn from universities in northern China and 251 American student-respondents drawn from two universities in northeastern United States. The respondents ranged in age between 18 and 29. As already noted, one of the reasons for selecting this age sample was that in China there are differences in consumption patterns between age groups in the Chinese market. Young urban Chinese have been influenced by changing economic decrees by the government that supports various economic reforms and a new emphasis on globalization. Young adults were raised with these new views as many of their parents changed and strived towards success and materialism (Podoshen, Li and Zhang, 2010). For this reason, the age grouping from 18 to 29 appears to be right on the mark for our current study.

## The Questionnaire and Variables Examined

The same questionnaire (except for languages) was administered in China in mid-2009 and in the United States in mid-2010.

Our research focuses on the following research questions:

1. Whether the increased sense of wealth and the desire for consumption are leading young adult Chinese consumers to be less frugal than the corresponding sample of young adult American consumers?
2. Whether the increased sense of wealth and the desire for consumption are leading young adult Chinese consumers to be happier than the corresponding sample of young adult American consumers?
3. Whether the reduced sense of wealth and historical desire for consumption are leading young adult American consumers to be more frugal than the corresponding sample of young Chinese consumers?
4. Whether the reduced sense of wealth and historical desire for consumption are leading young adult American consumers to feel less happy than the corresponding sample of young adult Chinese consumers.

For the research consider in this paper, we need to describe two variables that we have examined, namely: (1) consumer frugality and (2) subjective happiness.

## Measuring Consumer Frugality

The concept of consumer frugality has not been widely studied by researchers in the field of marketing. The term “frugality” frequently brings to mind images of a cheap or miserly individual, one who spends little and saves just for the sake of saving. However, as a general consumption propensity, it is not “pure” deprivation of consumption, but also reflects certain immediate sacrifices in the consumption of goods and services in order to afford future consumption. Therefore, frugality is defined as a “consumer lifestyle trait characterized by the

degree to which consumers are both restrained in acquiring and in resourcefully using economic goods and services to achieve longer-term goals” (Lastovicka, et al. 1999).

To gauge consumer frugality we selected a measure of frugality consisting of eight items designed to secure respondents’ consumption beliefs and lifestyle (see Lastovicka et al. 1999). These items were measured on a six-point Likert-type scale.

## **Measuring Subjective Happiness Scale**

The study of happiness has attracted many researchers in the past several decades (e.g., Lyubomirsky and Lepper 1999). Happiness has been a focus of human life since ancient times. Perhaps, the pursuit of happiness has been one of the most salient and enduring human predispositions of any culture. The study of happiness has attracted many researchers in the past decades (see Lyubomirsky and Lepper 1999, for a review). Recently, Blanchflower and Oswald (2011) have reviewed the findings of international surveys of self-reported happiness which focused on the United States and Europe. One of the conclusions of the research review is that happiness is related in many of the studies to education and income, yet national income increases has not resulted in higher national happiness. In China, the subject of happiness and its links with a growing economy have recently been examined. It seems that the legislature; that is, the National Peoples/Congress, has decreed that increasing happiness is as important as increasing GDP. Thus the idea of promoting happiness has become an important goal. (“Don’t Worry, Be Happy...,” March 17, 2011).

To measure happiness, we selected the Subjective Happiness Scale (SHS) by Lyubomirsky and Lepper (1999). The original measure, when introduced was characterized by “a high internal consistency, a unitary structure with stability over time and across 14 different samples.” In addition, “when examining its construct validity it was to correlate highly with other happiness measures and moderately with constructs theoretically and empirically related to happiness and well-being.” Evidence of discriminate validity was further obtained “from very low correlations with theoretically unrelated constructs, such as academic success and stressful events” (Lyubomirsky and Lepper, 1999). The measure was employed to gauge the degree of happiness felt by the respondents. In our research the measure served as the dependent variable. A composite score was calculated by taking the average of the items in each of the two scales. Certain items in the subjective happiness scale were reverse-coded. Such composite scores were used in the testing of research questions. Scale reliability was also assessed, and both scales demonstrated highly satisfactory internal consistency with the subjective happiness Scale's Cronbach's alpha of 0.81 and the frugality scale's Cronbach's alpha of 0.82. The independent variables, the independent variables used in the analysis are the two countries (i.e., United States and. China).

## **THE RESULTS**

The findings of our research are presented in terms of the two independent variables: frugality and subjective happiness.

### **Frugality**

Analysis of variance procedures were employed to analyze the data on frugality. The dependent variable was the Frugality Scale, and the Country was the independent variable. The results reveal that there is a significant country main effect ( $F_{(1, 589)} = 16.2, p < .000$ , means: 4.32 (United States) vs. 4.06 (China). The United States sample is shown to be more frugal than their Chinese counterpart.

### **Subjective Happiness**

Similarly, analysis of variance was used to analyze the data on subjective happiness measures. The dependent variable was the Subjective Happiness Scale and the independent variable was Country (U.S. and China). There is a highly significant Country main effect ( $F_{(1, 592)} = 49.68, p < .000$ , means: 5.07 (for the United States) vs. 4.48 (China)), and U.S. sample is happier than the Chinese samples.

The results suggest, contrary to prior history and what might be expected, that the young adult consumers in China were less likely to be frugal and to be less likely to withhold spending than the young adult consumers in the American sample. Exploring the issue of subjective happiness, the more frugal American consumers were happier than their Chinese counterparts.

## DISCUSSION

These results suggest that unlike some of the previous generations of Chinese consumers, who would be likely to be characterized as “frugal,” current young adult college-educated Chinese consumers are different. Their attitudes toward spending seem to be similar to what we would expect of young people in the United States in pre-2008 recessionary times, as well as possibly in other post-industrial countries. Marketers, targeting young adult Chinese consumers need to be aware of these changing attitudes and predispositions towards buying goods and services and spending money. However, a caveat of the current study is that the ability and desire for more goods and services does not necessarily mean that these consumers are happier. A deeper analysis of these findings can have many implications for future directions of marketing in China. In addition, the findings suggest that young adult Americans who are frugal are also happier than their Chinese counterparts, who appear to be significantly less frugal and less happy. It is difficult to speculate “why” the young American’s are happier with their new found frugality. One possibility is that maybe some young Americans have found that a period of frugality has surprised them, and that they indeed have experienced greater happiness with a less possession-full lifestyle.

## CONCLUSION AND FUTURE RESEARCH

If sustained over time, for American consumers, this shift in outlook and related behavior may lead to a shift in other related core values. For instance, we may see a corresponding long range increase in their embracing of a greater commitment to “thriftiness,” as a popular lifestyle orientation. This could mean a dramatic shift in orientation for American businesses; as they try to adjust to consumers’ changing values. Accordingly, Booz Allen & Hamilton (2010) recently released a study that indicates that American consumers are continuing to economize and have cut spending on both discretionary and essentials.

Again, if this outcome is sustained, there are implications for world markets. Given the rise of globalism and the concurrent importance of foreign markets to the overall business environment, the pressure to understand the consumption behavior of target markets is even more important than ever. Not only do marketers need to understand how consumers wish to spend their money, but they also need to understand how consumers are likely to hold back on their spending (i.e., their tendency to act “frugally”). This undoubtedly has significant implications for the need to develop effective strategies that lead to the creation of products, services, and promotion strategies that are more sensitive to satisfying consumers’ shifting consumption-related preferences.

For China and Chinese consumers, the research suggests that marketers of goods and services are likely to target the young adult Chinese consumer with products and service that match their increased taste for high quality and status brands of consumer goods and services. While the Chinese are currently turning more to consumption to respond to their changing culture and its emphasis on become a market leader in many diverse industries, it is still possible that the current “love affair” with consuming will eventually cool down and a more rewarding balance between the past and the current environment will be achieved.

Finally, our findings provide a fertile ground for additional research to more fully examine the dimensions and relationship between frugality and happiness. For instance, it would be interesting to further explore in future cross-cultural research a comparison of adult Chinese consumers with consumers drawn from other rapidly developing countries, such as India, Brazil, and selected other Asian and European countries.

# **COMPARING THE COMPETITIVENESS BETWEEN BRAZILIAN AND EUROPEAN FOOTBALL (SOCCER) (G-5) –INTERPRETATIONS AND SUGGESTIONS**

**Cláudio Vicente di Gioia F. Silva, Walter Gassenferth,  
Luiz Alberto Nascimento Filho and Maria Augusta Soares Machado,  
Faculdades IBMEC/RJ, Brasil**

## **ABSTRACT**

*World sport has been seen as a growing industry, generating revenues of roughly US\$ 1 trillion a year. Playing a major role in this industry, football (soccer) is accountable for an annual turnover of approximately US\$ 250 billion – Brazil's share being approximately 1% of that amount. The growing marketing and globalization of football has brought up new topics such as: the risks associated with competitiveness; the need for professional management; creating corporate teams; sports strategies and marketing; accounting; accountability.. This paper aims at: i) understanding the risks associated with the competitiveness of football leagues; ii) comparing the competitive balance in the five largest European football markets (Germany, Spain, France, England and Italy) in relation with Brazilian football and; iii) interpreting these results in view of the literature concerning sports administration.*

## **INTRODUCTION**

The concern of this paper is turned to the balance among the teams competing for the Brazilian national football championship. In that context, the more balanced the teams are, the greater the uncertainty about the results of a match (and consequently of the championship as a whole) will be. Lack of balance means not to maximize the amount of fans going to the stadiums or watching the matches on TV due to the predictability of the result. Thus, the teams and sport leagues would start incurring the risk of long-term loss of spectators, with a risk of dominance by some teams while others would go bankrupt.

Considering this broad discussion on the competitiveness in football industry, this paper gives a priority to the study of the risks of some teams concentrating wins and titles, in contrast to their opponents, which characterizes a dominance of the former over the latter and impairing the success of the championships in the long run. This paper also addresses the change in championship model as was adopted by Brazilian teams in 2003 in an attempt to “copy” the European national championships, which use the point system. The conclusions hereby, despite the short time for comparison, are also related to the selection of that system.

The main objective of this paper is comparing and interpreting the levels of competitiveness between Brazilian and European football, more specifically among the five biggest football centers in the world (England, Spain, Germany, France and Italy). The interpretation of the results will be related to the risk of dominance by some teams, bankruptcy by others, and reduced number of fans in the long term. The characteristics of the structure and management of the Brazilian football, which might influence the results achieved as well as the current point-system championship model that follows the patterns of European national championships, are also analyzed.

Table 1 illustrates the object and subject of this research, as based on Tachizawa (2002), carrying the type of organization and defined topic.

**Table 1 – Type of organization and defined topic**

Subject: Sport Administration		
Object: Football Industry		
Title: Comparing the Competitiveness between Brazilian and European Football (Soccer) (G-5) – Interpretations and Suggestions		
Subject and Object	Type of organization	Defined topic
Quantitative Research on Sport Administration	Brazilian football teams competing in the major league	Comparing the competitiveness (balance) of the five biggest European championships with the Brazilian championship and interpreting the results

This paper makes use of secondary data and championship results disclosed by the football associations of the studied countries. It is limited to a comparison of the levels of competitiveness and sports balance in Brazil and in the five biggest football centers in Europe, namely: Italy, Germany, Spain, England and France.

## THE FOOTBALL INDUSTRY

World sport has been seen as a growing industry, generating revenues of roughly US\$ 1 trillion a year. Playing a major role in this industry, football (soccer) is accountable for an annual turnover of approximately US\$ 250 billion – Brazil's share being approximately 1% of that amount.

One way to understand the football industry lies in the typology proposed in Figure 1, which is based on Westerbeek and Smith (2003, p.89). It suggests that the sport industry is divided into three main segments, as described by Ducrey et al. (2003):

- Sporting Goods – Manufacturers of equipment, sports materials, licensed products. Examples include: Nike, Adidas and Reebok.
- Consulting – Firms providing services such as consulting, management, sport medicine, amongst others. Examples include: IMG and Octagon.
- Sports Services – Organizations offering the sport as their end product. This segment can be divided into three categories, as follows:
  - The Event – Organizations that generate revenue, either directly or indirectly, from the spectators. In this category, the athletes are professional and examples of participating entities include the teams and Leagues.
  - Participants – Entities providing opportunities for people to engage in sporting activities, at a non-professional level, such as amateur teams, gymnasiums and sports communities.
  - Hybrid – Organizations provide a mix of the above-mentioned categories: the event and the participants. Examples include those government agencies developing mass participation and promoting athletes who could stand out at an elite level.

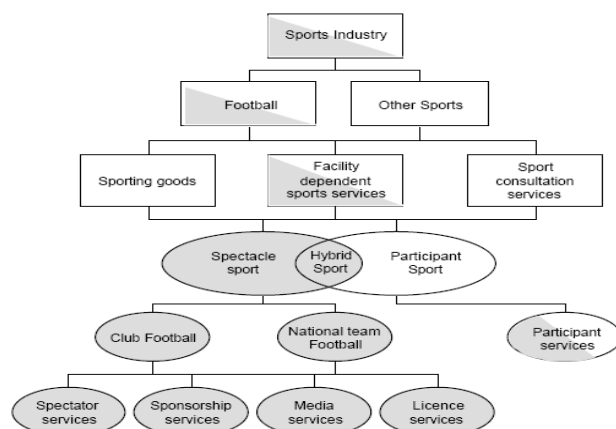

Another view of the football industry is found in Leoncini (2001) and is based on Aidar et al. (2000), which divides the structure of football as follows: i) Producer Market; ii) Consumer Market; iii) Intermediate Market (Resale and Industrial). That perspective is demonstrated in Figure 2, below.

According to this viewpoint of Aidar et al (2000), the football fans are the consumer market, who have a direct commercial relation via box office or merchandising with the Producer Market represented by the football associations. This consumer market also consumes from the Intermediate Resale Market (TV and licensed companies) and from the Intermediate Industrial Market (sports marketing companies). Lastly, the Intermediate Resale Market and the Intermediate Industrial Market interact with the Producer Market by selling broadcast rights and marketing operations, respectively.

The organization of the producer market follows a world hierarchy, whereby FIFA (International Federation of Association Football) is the maximum authority in football and below it come the confederations,

which accountable for football in their respective continents, as is the case of CONMEBOL (South-American Football Confederation) and UEFA (Union of European Football Associations).

**Figure 1 – The Structure of the Football Industry (Westerbeek and Smith, 2003). Adapted by the author.**

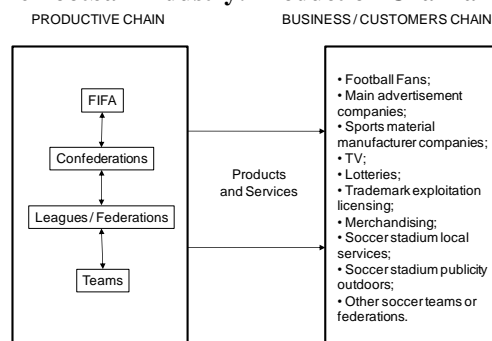

**Figure 2: The structure of Football**

Following that hierarchy, there are the national federations or confederations such as CBF (Brazilian Football Confederation), the sports leagues and the state federations, such as FERJ (Rio de Janeiro State federation), and then come the teams.

**Figure 3: The Football Industry: Production Chain and Customers**

In England, there is also an attempt to classify the consumer market, the football fan, into: i) virtual fans (who do not go to the stadium); ii) local fans, who attend the matches at the stadiums in their region; iii) followers, who follow the team to other regions; iv) Family Supporters, who go to the stadium with another

family member; and v) Corporate Supporters, those who go to the stadium and require special treatment in the cabins and VIP areas. (Leoncini, 2001).

One of the peculiarities of this end consumer in football is that, differently from ordinary merchandise, his/her relationship with the team is lasting, despite the service it provides not being one of the best, like for example: no titles, discomfort and insecurity in the stadiums. As studied by Taylor (1998), this is an emotional relationship converted into a commercial relationship, the description of which is described in one of the best known cases in football, the team Manchester United. Since the team had a higher reputation than the other English teams, it was a leader in terms of the average public attending its matches even when it failed to win titles (Szymansky 1995). In Brazil, the football teams manage to narrow the relationship with the fans even being relegated to the second division in the league, as is the case of Botafogo, in Rio de Janeiro, or even down to the third division, like Fluminense, also in Rio.

That customer-team relationship suggests that football demand is inflexible in relation to price (Szymansky; Kuypers, 1999). Nonetheless, in Brazil, such inflexibility appears to be discussable as the teams fail to achieve better revenues at the box offices due to price increase. One factor that might contribute to such inflexibility is that football is competitor in the entertainment industry, which provides the society with other alternatives (such as the cinema, theater, music shows, and other sports), and the Brazilian society has demonstrated some dissatisfaction with the level of the service provided in the sports events. That fact demonstrates as a strategic error in running the business, as described by Porter (1998, p.26), that: "Many managers concentrate exclusively on their direct antagonists in the fight for market share and go unnoticed that they too are competing against their customers and suppliers for bargain power. Meanwhile, they also neglect the attention to the newcomers or fail to recognize the subtle threat of substituting products." Still regarding end customers, according to Ducrey et al. (2003), the most important factors for the fans are as follows:

- The quality of the match – This has to do with aspects of the show, entertainment, the pleasure to watch the matches and the quality of the visiting teams.
- Uncertainty, or unpredictability of the result (of the match or championship) – Regarding the uncertainty of a match, generally, the tighter the result expected for a match, the more that match is attracting to the fans. As to the result of a championship, understanding goes that the average attendance is influenced by the dispute and that the higher the competitive balance, more teams have a chance to win the title. Consequently, the fans consume more as a response to such fierce competition, thus increasing the commercial activities related to the championship and the teams.
- The success of that fan's team – There is a level of satisfaction in those fans which is achieved by the team's good performance. Teams that constantly lose are less attractive to the public.

Michael Porter (1986) asserts that, in order to reach a defendable position in the market, the companies can use three types of generic strategies to always lead some sort of market. One such strategy proposes leadership of one market niche, if it is not possible to lead the market as a whole, by total cost or by product differentiation. Therefore, the incentive to leadership and the possibility to it ensure greater competitiveness in the industry. According to the championship models of the major European centers, there is an option to lead niches – one example refers to the intermediate leaders that qualify for a the UEFA Cup or for the Champions Cup – or to lead the championship as a whole or the lower block in the standing, which ensures the team to remain in the first division championship for another year. That model, which encourages neache leaderships, makes the tournament more attracting even for the fans of those teams that cannot lead the championship as a whole. Another perspective on the structure of football shows that the performance of a team can be understood by the characteristics of the industry (structure and behavior) and by that team's strategy (Leoncini, 2001). This analysis was performed by Szymansky & Kuypers (1999), who identified critical factors that could explain the logic of the football business, namely: i) Sport Performance – the team's performance in the championship; ii) Operating Profit – The difference between the revenues generated by the team and its overall expenses before Income Tax; iii) Salary Expenditures – The expenditures on salaries, especially those of the technical department (players, coaches, trainers, etc.); iv) The Result from Player Transfer – the financial income from the operations in the players market.

Despite a proven relation between performance in the field and financial performance does not exist, such factors would indeed making up the basis for two relationships studied in the definition of a football team's

strategic management scope, namely: i) salary expenditures x performance in the field; ii) performance in the field x generated revenues (Leoncini, 2001).

According to Dell’Osso and Symanski (1991), salary expenditures might have a direct relationship with the performance in the field. However, the expenditures on high wages also represent a threat to the financial balance of the teams, thus making that equation more difficult to be solved. An aggravating factor is that one team may invest in great players for a short-term performance, win titles and yet have losses in the end of the fiscal period. In Europe, specifically in the English football, the concern with that threat of the high wages is visible in the administration reports of the teams, as is the case of the 2003 annual report of Liverpool : “As we see it, the team continues to exercise careful control over the costs related to the wages paid to the players”. (Authors’ Translation)

Lastly, it is possible to analyze the football industry through its sources of revenue, as per Leoncini (2001), whereby the most common commercial relationships for Italian/English leagues and teams can be classified on the basis of the following types of revenue: i) the relationship with TV (transmission rights); ii) the relationship with the main sponsor; iii) the relationship with the Lotteries; iv) the relationship with the fan (box office/merchandising); v) the relationship with the technical sponsor; vi) the relationship with merchandise producing companies (operating the brand via licensing / advertising signs); vii) the relationship with other teams / federations (trade of players).

This paper makes use of the classification of the revenue sources described in the reports of the richest teams in the world in terms of revenue by DELOITTE & TOUCHE, namely: i) Commercial, which is divided into a) Merchandising and Licensing; b) Sponsorship and Supply of sport material; ii) Box office; iii) The Media. The comparative analysis between the sources of revenue of European teams and the Brazilian teams is included in section 3.2.4 on Brazilian football.

## METHODOLOGY

The research on competitive balance was firstly conducted on the basis of what the literature on industrial economics and the economic regulation presents as industrial concentration measures. These are measures demonstrate, ex-post, what can be regarded as a dominating position or even, in terms of regulation, as a market power a company holds in view of its competitors. Such industrial concentration measures include the concentration ratios and especially the Herfindahl-Hirschmann Index (HHI) as an indicator that is also used in the analyses of the concentration actions by economic regulation agencies such as the US Federal Trade Commission.

Concerning the specific research on competitive balance, the work of Oughton & Michie (2004) summarizes the main techniques used in sports leagues. Such measures are listed in Table 2 of the Appendix to this paper. In the specific case of the competitive balance in football, item “b” of Table 2 shows the different papers addressing this sport which are classified in accordance with the objectives of the research, such as: i) long-term dominance, ii) seasonal; iii) match.

In the analyses of the papers on the balance in football and sport leagues, the HHI is observed to be used both for long-term dominance concerns and seasonally, which is in accordance with the delimitation of the proposed study. Thus, in view of the acceptance of this indicator as a measure of concentration as well as in the publications about sports leagues and football, this paper is intended for calculating the results of the five largest European football markets (Germany, Spain, France, England and Italy), having the HHI as a measure of analysis.

The time period to be studied is ten years, considering the difficulties to obtain the figures for the Brazilian Championship before that period of time due to the different formats the teams used. In this setting, two problems become relevant for the research and are presented below and solved in section presenting the two calculations to be used.

- i) The changes in the championship model for the Major League (‘A’ Series) of the Brazilian Championship

ii)

Before 2003, the model adopted in the Brazilian Championship was known as qualifying phase model. After (and including) 2003, the point system model was selected. Thus, like in 2002, for example, the first eight teams of the first phase of the tournament would qualify for the second phase. This means that a given team could have more points, or better performance, throughout the championship and not be the champion, since the advantages achieved in the first phase could be lost in the second phase. Moreover, some teams (those classifying for the next phase) ended up playing more matches than others (which would not classify), thus impairing the calculations.

ii) The amount of teams competing in the championships

Both in Europe and in Brazil there are cases whereby the amount of competing teams varies from year to year within the historical sequence to be studied. Also, the number of teams that vie in the tournament varies from country to country.

These problems are solved below in the demonstration of the two types of calculations.

• **Calculation 1: HHI – Oughton & Michie (2004) Model – Seasonal**

This calculation is used in papers such as that of Oughton & Michie (2004), and also used by Depkin (1999), by calculating the HHI on the classification table and the performance in percentage for each team. For demonstration purposes, the table below describes the HHI, for the example of the maximum unbalance possible, for 20 teams.

The calculation is done on the performance of each team in the championship and by the sums of the squares of that performance, as per the formula below, whereby  $S_i$  is the performance of each team in relation to the potential maximum points total:

$$HHI = \sum_{i=1}^n s_i^2$$

**Table 2: Teams Performances and Maximum HHI**

TEAMS	MATCHES	WINS	PPG	TOTAL	MAXIMUM	PERFORMANCE (%)	(PERFORMANCE) <sup>2</sup>
1	38	38	3	114	114	100%	1.000
2	38	36	3	108	114	95%	0.898
3	38	34	3	102	114	89%	0.801
4	38	32	3	96	114	84%	0.709
5	38	30	3	90	114	79%	0.623
6	38	28	3	84	114	74%	0.543
7	38	26	3	78	114	68%	0.468
8	38	24	3	72	114	63%	0.399
9	38	22	3	66	114	58%	0.335
10	38	20	3	60	114	53%	0.277
11	38	18	3	54	114	47%	0.224
12	38	16	3	48	114	42%	0.177
13	38	14	3	42	114	37%	0.136
14	38	12	3	36	114	32%	0.100
15	38	10	3	30	114	26%	0.069
16	38	8	3	24	114	21%	0.044
17	38	6	3	18	114	16%	0.025
18	38	4	3	12	114	11%	0.011
19	38	2	3	6	114	5%	0.003
20	38	0	3	0	114	0%	0.000
BASIS							6.842
HHI (MAXIMUM)							0.068

PPG – Points per game

The table below shows that maximum and minimum HHI in accordance with the number of teams competing in the championship. Thus, in the case of a 20-team championship, if the HHI calculation reaches, for instance, “0.4789” in a given year, it means that for that particular year the HHI is 70% from the maximum HHI, that is, from the maximum unbalance, which in that case would be “0.0684”. Thus, problem “ii” above, with relation to the number of teams competing in the championship, would be solved since using a percentage of the maximum HHI would act as a standard setter is independent from the number of teams.

This way, it will be possible to calculate, for the five largest European championships and for the Brazilian championship, a history for those ten years in relation to the maximum HHI and a trend curve, thus allowing for comparing the Brazilian competitive balance in relation to the other championships.

Moreover, in order to avoid problems regarding the amount of matches to be played, in the case of Brazil, for the years in which the championship did not follow the points system (before 2003), data corresponding only to the first phase (the qualifying phase) will be used.

**Table 3: Maximum and Minimum HHI.**

TEAMS	MATCHES *	MAX HHI	MIN HHI
18	17 or 34	0.0684	0.0222
20	19 or 38	0.0684	0.0222
22	21 or 42	0.0751	0.0244
24	23 or 46	0.0817	0.0267
25	24 or 48	0.0851	0.0278
26	25 or 50	0.0884	0.0289
28	27 or 54	0.0951	0.0311

\* For calculating the HHI Max, it does not matter whether the format is for one shift (one leg) or double shift (two legs).

Yet, despite being one of the best indicators for comparison, using such data means assuming problem “1” presented above, whereby the champion may not have the best performance of all teams in the tournament, in the case of the Brazilian championship before 2003. This problem shall be offset in calculation “2” herein.

- Calculation 2: Model of Dell’Osso. F & Symanski, S (1991)

This paper also uses the measure proposed by Dell’Osso. F & Symanski, S (1991), included in the paper ‘Who Are the Champions?’, as a simple calculation to supplement the previous analysis by granting 1, 2 and 3 points for first, second and third places in the championship, respectively, and by verifying the concentration of the same teams in the first positions in the championship, thus representing a long-term dominance.

This methodology shall be complemented by using the HHI in order for us to demonstrate the concentration of such teams in the first positions of the tournaments over a period of time, in this case, ten years. This methodology is based on Gerrad (2004) and Eckard (2001) for long-term dominance.

Also, for this calculation, the figures achieved with the maximum HHI are compared. In that case, the “Maximum HHI” represents the maximum concentration of times in the first three positions, representing the most unbalance possible, as shown next.

The comparison of this “maximum HHI” (example 1) will be made against another more balanced situation (example 2). In example 2, the historical HHI for the ten-year period studied accounts for only 32% of the Maximum HHI, which would represent the maximum unbalance.

**Example 1:**

COUNTRY	2005	2004	2003	2002	2001	2000	1999	1998	1997	1996	TOTAL	%	HHI MAX
Team A	3	3	3	3	3	3	3	3	3	3	30	50%	2500
Team B	2	2	2	2	2	2	2	2	2	2	20	33%	1111
Team C	1	1	1	1	1	1	1	1	1	1	10	17%	278
TOTAL											60	100%	3889

Champion: 3 points; Vice Champion: 2 points; Third place: 1 point.

**Example 2:**

COUNTRY	2005	2004	2003	2002	2001	2000	1999	1998	1997	1996	TOTAL	%	HHI
Team A	3	3	3	2	2	2	1	1	1	1	19	32%	1003
Team B	2	2	2	1	1	1	0	0	0	0	9	15%	225
Team C	1	1	1	0	0	0	0	0	0	0	3	5%	25
Team D	0	0	0	3	3	3	2	2	2	2	17	28%	803
Team E	0	0	0	0	0	0	3	3	3	3	12	20%	400
TOTAL											60	52%	1253

HHI MAX	% HHI MAX
3389	32.21%

Champion: 3 points; Vice Champion: 2 points; Third place: 1 point.

This way, it will be possible to calculate this figure for the five largest European championships and for the Brazilian championship around a figure that analyzes the concentration difference of the same teams in the

first divisions. This becomes an effective measure of long-term dominance. Moreover, complementing calculation “1” proposed above, this becomes a way to solve problem “i”, in such a way that the first places in the final classification are those acting as the basis for comparison..

## RESULTS

The results for the studies are demonstrated as per the two calculations described in the methodology. The first of them is based on the model of Oughton & Michie (2004) and on other works such as that of Depkin (1999) for determining the seasonal competitive balance. The second is based on authors such as Dell’Osso, F & Symanski, S (1991), Gerrad (2004) and Eckard (2001) for long-term dominance. The interpretations on the results and the comments about other sports and about future researches are presented next.

### a. SEASONAL CALCULATION

The seasonal calculation considered the annual classification for each championship for the 10-year period. Firstly, the data for each country are presented – such data being calculated on a yearly basis and compared with the maximum unbalance possible for the number of teams competing in the tournament. These data are presented as a table in section a.1.

Next, the graphs with the curves are presented. Firstly, the graphs are related to that maximum unbalance and, secondly, they are related to the trend curve in logarithms of the previous graph. These data are presented in section a.2.

## b. DOMINANCE CALCULATION

The dominance calculation considered the final positions of the yearly classifications. From them, the concentration of the same teams in leading positions (first, second and third place) was calculated by using the HHI concentration indicator for the 10-year period and through a comparison amongst the various national championships.

The tables below show the calculations by National Championship and, next, a table is presented in order of unbalance, which summarizes the data presented.

### b.1 Tables.

## b.2 Grouped Table

The table below groups the results shown above in maximum unbalance order, from the long-term dominance viewpoint. Thus, the English Championship, over the past ten years, has the highest unbalance index, represented by the concentration of the same teams in the first three positions in the final standing.

COUNTRY	% HHI MAX
England	71%
Germany	63%
Italy	59%
Spain	53%
France	44%
Brazil	26%

# CONCLUSIONS AND RECOMMENDATIONS

In order to avoid dominance by some teams, and the consequent bankruptcy of others, thus bringing about serious losses to a very profitable business such as the football industry, the balance of forces among the teams competing in the Brazilian championship should be pursued, in spite of the data favoring Brazil, as presented in the table grouped in the results of this paper. By comparing the levels of competitiveness between the Brazilian championship and the championships of the five biggest world football centers (England, Spain, Germany, France and Italy), and by interpreting the results, it can be inferred that:

1. The change in championship model as adopted by the teams in Brazil in 2003, which involves the point system format with options for classification to other football cups, has been leveraging the balance amongst the competing teams;
2. Repatriating high-renowned veteran players, on moderate-cost wages, represents an attempt in Brazil to improve the quality of each match. This factor (the quality of the match) is one of the three most important factors, along with result uncertainty and unpredictability and team success, in order to keep the end customers, the followers, in the stadiums.

These arrangements are making the matches in Brazilian football less predictable and more attracting, thus bringing more fans to the stadiums and increasing the number of viewers of the matches broadcasted on TV, consequently increasing the revenue of the football industry, which comprises the sales of merchandise; consulting, especially sports medicine consulting; and the sports services, like the matches and sports activities provided for the population as a whole.

On the other hand, a recommendation based upon this study should be made in order to enhance the financial balance and the balance of forces amongst the teams vying in the Brazilian championship: Selling tickets for the championship matches in advance, by means of payment booklets that allow for an easier way for the stadium-goers to pay for their tickets, also represents an example provided by the main European

championships of converting emotional relationship into commercial relationship, which should be followed in Brazil since the Brazilian demand does not seem to be as inflexible regarding ticket prices as verified by Szymansky and Kuypers (1999) in European football.

# **INTERORGANIZATIONAL CO-OPERATION IN COMPANY MANAGEMENT**

**Alla N. Sterligova, Nina M. Vladimirova**  
**Higher School of Economics State University, Russia**

## **ABSTRACT**

*Differentiation and integration are typical processes for the modern management. The article describes the system of modern management. It defines the place of processes in the structure of the management object. The author characterizes processes as the object of management and presents the integration trends of management. The study of management integration mechanisms has allowed to draw conclusions about the presence of four levels of performance integration (interorganizational, interfunctional, functional, operational). As was proved in conducted surveys every integration levels yields consistent results. To implement the interorganizational co-operation, it is required to perform dedicated preparatory work, since an organisation controlled at the interfunctional level cannot naturally evolve to the interorganizational level.*

## **PERFORMANCE AND PROCESS IN MANAGEMENT**

At present management undergoes a rapid growth. Performance management is one of its modern areas. In a broad sense performance is any employment or job which includes expedient change and transformation of the surrounding world. Performance includes a purpose, means, result and the process itself. In the sphere of management definitions of performance and its management are vague. We can refer to R. Williams (2003), who generalizes materials of numerous foreign researches in his publications. He does not provide a definition of the concept "performance" and states that «it is rather difficult to give its definition» and that «there is no general definition of performance management for all professionals in this sphere». The definition of performance is presented by various models of its perception as control systems of performance and as the system integrating firm's management areas.

Process is a close concept to performance. Modern specialists understand this term as the above mentioned components of performance. Recorded in ISO 9000:2000 the definition states: «Process is a stable, purposeful set of interconnected types of performance which transforms inputs into outputs that are valuable for consumers by a certain technology». Here processes include performance, rather than the reverse, as it follows from a classical definition of performance.

As the problem of management integration in a firm constitutes a subject of performance management, it is expedient to use the concept "performance" in the context of integration processes. A concept "process" as a more general one is used in discussing all questions connected with management, including its separate directions.

## **OBJECTIVE MANAGEMENT DIFFERENTIATION**

Management is quite diverse nowadays. There have been constant attempts to systemize its types. Using the cybernetic model of management system, there has been an attempt to reveal logic of development of modern management, identification of its types and their interrelation. The subject and management object and also contents of job's firms (purpose, technology, style and national and cultural features of management) served as criteria for the research.

The conducted analysis has shown that the variety of management types (284 types in this research) is connected first of all with a variety of areas of application and features of realisation of managerial processes and also the fact that differentiation of management has an objective character. It has been revealed that differentiation of management goes in several interconnected directions. The direction «Management Object» has the most developed and stable structure.

Historically the first management object was process. Another group of management objects is various "subjects" which as well as processes require detailed elaboration as management objects. First of all management subjects should be divided into material and non-material ones. In the framework of material subjects the most important is the distinction between animate and inanimate objects. Animate subjects of management represent human resources (separate persons and groups of persons).

There is a spectrum of modern management types for separate persons: personified management, self-management, clients management, etc. Groups of persons are objects of management in general management, social management, personnel administration, team management and so forth. Inanimate objects are presented in modern management practice by objects of labour, implements, other property, supporting resources (financial and informative). Especially it is necessary to note rapid differentiation of objects of this level in the framework of information resources: they control databases, data, site contents, address lists, computers' desktops, information life cycles, memory, networks and so forth. It is obvious that soon this list would extend and that the same would happen with all resources that apply innovative technology of the future.

The spectrum of types of management directed on non-material subjects is quite broad. The types of management connected with human resources develops most dynamically, e.g. conflict management, health management, management of stress, anger, ideas, talents. A general tendency is to approach to individuals, positive influence on potential executors and supervisors. Other non-material objects of management are purposes, safety, etc.

Thus, the management object has a structured hierarchy where the process and the subject as well as objects of management are the factors of a two-dimensional space. The third dimension of the management object introduces the scale of management objects. Management can be directed on separate objects (self-management, etc.) or on groups of objects (corporate management, firm management), and also on interconnected objects (industries, territories, systems of various character and nature).

Processes as objects of management in turn have quite a complicated structure. We can single out deterministic and stochastic processes by their character. Management focused on controlling stochastic processes operates probabilistic approach to analysis, forecasting and activity planning. It is typical for instance for investment management, management of credits/deadlines of projects unlike for instance scientific management, operational management, firmal management, management of taxes and duties, time management, etc.

In the late 60s – early 70s the attention was drawn to processes connected with interactions at various levels that led to development of new types of management such as interfunctional, interfirml, interbranch management, management of partner relationships, interaction of projects, customer relations, interactions with public authorities, etc.

From the beginning of the last century management of processes had a division by industries in many respects justified by technological features of separate processes. At present this tradition has remained in many respects: specialists speak about business management as a whole or about management of its development (strategic management), change management, management of researches, developmental works, purchase, production, distribution, management of marketing, sales, electronic trade or (in the framework of a providing subsystem of an operating system) about management of documents circulation, warehousing, insurance, logistics, training, acquisition of licenses, etc.

The third subgroup of management objects are objects in which it's difficult to separate a subject and a process from each other. Herein a subject as an management object in its state is connected with development of

a process; therefore, management of a process connected with a subject becomes an integral part of a type of management. For example, such types of management are management of staff, labor force, labour, human resources, focus groups. While working with so called inanimate objects there is the same rigid interrelation. For example, it affects work with material resources: integrated management (quality), logistics, material management, management of inventory, waste, resources, etc. The similar situation is with financial resources: trust management, management of accounts receivable, cash assets, salaries, expenses, investment portfolio, circulating capital, costs, project cost, etc. We can talk about the link of processes and information resources and also with implements.

Non-material subjects as objects of management are also often inseparable from processes that are connected with them. Management of detection and correction of errors, time management, management of knowledge etc., deal with such questions.

A broad spectrum of objects of management consists of inseparable processes, material and non-material subjects. These are all social and economic systems, and consequently, firms, enterprises, associations, public bodies. Such objects are considered in administrative management, public administration, innovative management, corporate management, firm management, management.

## **TOPICALITY OF MANAGEMENT INTEGRATION**

Practice of detailed elaboration of management object and influence on management of a differentiation of labour, purposes, styles and national and cultural features of management highlights issues of management integration in various directions.

The concept "integration" is used in several areas of knowledge and each of them specifies its unique significance. Integration is an extremely used term in modern science and management. The theme of integration of management is one of the most popular. The overwhelming majority of specialised scientific literature at least once addressed this theme in the last five years. As a whole it is told that management integration is considered from different approaches. Integration is described as consolidation of activity's types, complex realisation of functions and administrative interactions, interaction of participants of distribution process (including sellers and buyers), availability of general information and communication systems, construction of organizational relations (including rationalization of system's organization) and also a process of inclusion and involvement of new elements, field of activities or separate functions into an activity.

Diversity of understanding of integration involves various types of integration in economics and management. Main types of integration are: economic, horizontal and vertical (ascending) integrations, combined integration, progressive (direct) integration, progressive and regressive integrations, conventional integration, circular integration, through, short-term and long-term integration, conglomeratic integration. The description of evolution of management integration is offered in foreign literature (Stevens (1889); Christopher (2006) et. al.)

As the conducted research has shown, management integration is led both in the direction of uniting its various components and in the direction of analysis and synthesis of management objects. The interrelation of the following directions of differentiation was found during the research: object – object, object – subject, object – management technology, object – management objective, subject – national and cultural features of management, management style – national and cultural features of management.

The interrelation of management types on the following directions is noted in the process of management: management subject influences the choice and realisation of technology, style and management objective; management technology tests the influence of separate components, and also the style and national and cultural management features; national and cultural features of management affect the choice of management's objective.

Formation of management types includes groups that are consolidating various levels of objects of management, namely: a process and a particular type of activity; a process as the management object and an

animate object as the management object (Self Management, etc.); a mixed management object (a subject and a process) and industry (municipal management, etc.); a mixed management object (subject-process) and group of objects of the criterion of a scale (Corporate Management, Firm Management, etc.); a mixed management object (subject-process) and territory of scale's criterion (management of a regional economy, etc.).

Integration of management caused by a deepening professional management differentiation requires the research of management integration's mechanisms.

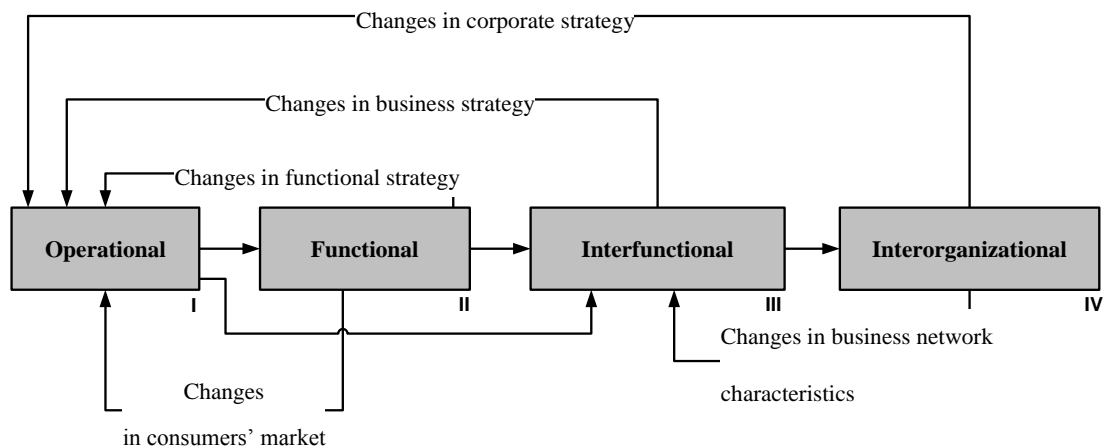

## WORKING HYPOTHESIS OF RESEARCH

Ignoring the geographical aspect of integration and generalizing the results of research performed by other authors, it should be concluded that performance integration displays four levels. The first three levels (operational, functional and interfunctional) can be defined as internal integration of activity within the framework of a separate enterprises. The last interenterprise level represents external integration (Figure 1).

Successful interfunctional interaction within the framework of individual enterprises lays the basis for successful interorganizational integration. Effectiveness of interfunctional interactions has to do with maturity of functional operation. Efficient control of individual functional areas is based on a clearly spelled-out operational level of activity integration (Johnson (1999); Craighead (2007)). Depending on the considered performance level, one can speak about control of operations, functional areas, interfunctional and interorganizational interactions. Process approach to control allows functional network of business-processes of an enterprise to be ensured without distinguishing between the functional and interfunctional levels of activity. The conducted research was based on availability of the above-mentioned activity integration levels in the control experience of each enterprise.

The research hypothesis is that implementing different performance integration levels yields consistent results.

**Figure 1. Interaction of levels of activity integration.**

The research hypothesis is that implementing different performance integration levels yields consistent results.

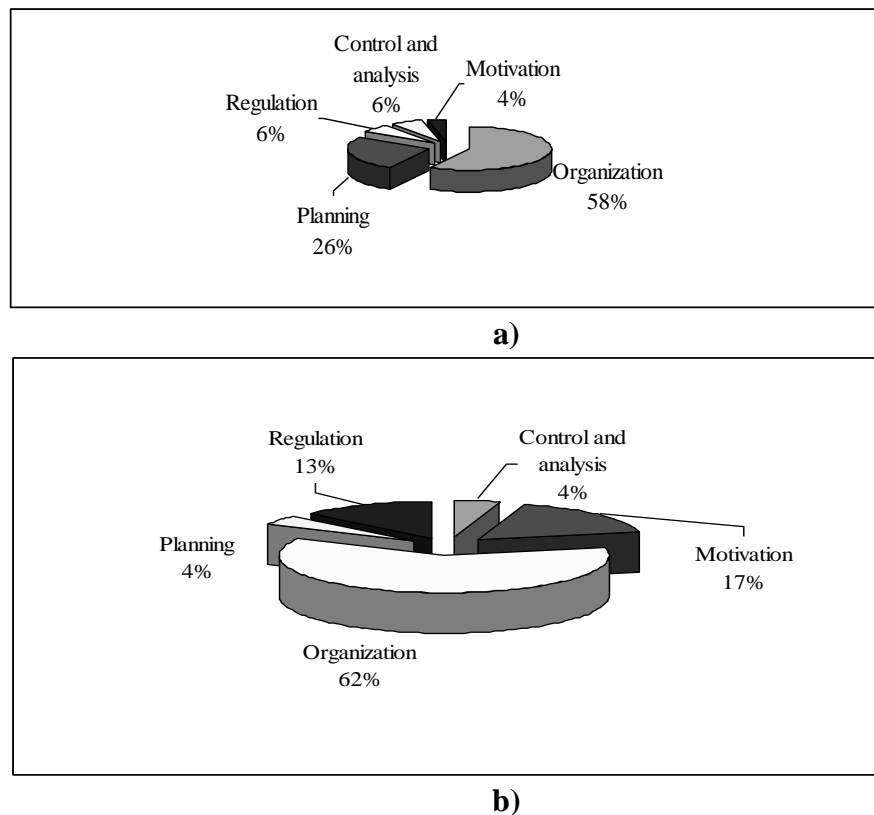

We conducted a poll of organisations' employees working in Russia to check the working hypothesis of our research based on the Higher School of Economics (HSE) and the International Logistics Centre of HSE. About 500 people took part in the polling. The volume of the research was estimated by the accumulation of consistent results of the performance level integration.

# INTERORGANIZATIONAL CO-OPERATION AS A LEVEL OF PERFORMANCE INTEGRATION

On the interorganizational level experts mentioned most often integration security with suppliers and customers, and savings of costs and expenses. These are main positive results of considering operation of organisations in business networks. The second place is «Strategically directed management» which reveals the main difference of interorganizational co-operation from other levels of performance directed primarily to the internal business environment. Consequently, they do not realize strategic opportunities of organisations to the full in business environment including network competition. The third place – «Client oriented approach». The structure of other positive results of interorganizational co-operation is rather diverse and describes both external and internal management environment.

In functional-administrative sphere the function "Organisation" has the greatest percentages both in positive results and negative results of interorganizational co-operation (58% and 62% accordingly (Figure 2). Organisation of managerial processes and realizing business in time and space, forecasting and planning of these processes in business networks are obviously strategically directed.

**Figure 2. Influence of Positive (a) and Negative Results (b) of Interorganizational Co-operation on Management Quality**

In professional sphere management has most positive results judging by their percentages (57%). Special attention to management in interorganizational level is logically connected with the leading function "Organisation". Operational performance has the greatest percentages of negative results (40%). This is recurrence of operational integration and it focuses attention on the process approach to organisation's management in network competition.

In the process sphere the prevailing attention in positive results' assessment of interorganizational co-operation is in the realization stage (45%), defects assessment (unlike other previously considered levels of integration) - the preparation stage (61%).

Only 29% of negative results of interfunctional integration influence the selected positive results of interorganizational co-operation. It fundamentally distinguishes interorganizational co-operation from other levels where the majority of negative results of lower levels is influenced completely or partly by positive results of higher levels. Thus, network competitiveness requires the organisation's management to have radically new knowledge, experience and skills. Yet interorganizational co-operation is insufficiently spread in Russian business' practice. Therefore, it is little developed and that, possibly, can explain such a small number of the mentioned negative results. Possibly in the future this level's feature of interaction will be studied in greater detail.

One of the negative results of interorganizational interaction most often pointed by experts is the fact that this level needs a detailed study of operational, functional and interfunctional levels of integration. In fact, this statement does not have any negative connotation. The fact that operational, functional and interfunctional levels of integration were not studied in detail resulted in inability of managers to notice positive results of interorganizational co-operation (primarily of strategic character in network competition). As the overwhelming majority of Russian organisations are in such situation, they are viewed as a drawback. To implement the interorganizational co-operation, it is required to perform dedicated preparatory work, since an organisation controlled at the interfunctional level cannot naturally evolve to the interorganizational level, that requires further investigation.

# ENDURING SUCCESS: WHAT EFFECT DOES BUSINESS FIRM SIZE, INDUSTRY OR TYPE OF OWNERSHIP HAVE ON LONGEVITY?

Vicki R. TenHaken, Katelyn Rumsey and Alison Meshkin Sale  
Hope College, USA

## ABSTRACT

*ABSTRACT: Some companies have managed to overcome economic challenges, massive changes in technology, globalization and other socio-cultural transformations to not only survive, but thrive over an extended period of time. Are there certain industries to which these companies belong that are more conducive to long-term survival? Does private ownership or firm size make a difference in a business's ability to survive over the long term? The authors have built a data base of U.S. companies over 100 years old and compare these company profiles to U.S. businesses overall in an attempt to answer these questions.*

## INTRODUCTION

A fundamental objective of the firm, though often unstated, is survival. Returning investment to shareholders and meeting customer needs are both means to this end. Companies focus on profitability, but the underlying reason for making a profit is to continue to operate the business. However, most firms do not “live” as long as they could. A study by Royal Dutch Shell described in *The Living Company* (de Gues, 1997) calculated the average life expectancy of a large multinational corporation at forty to fifty years. A study by Hewitt Associates indicates the average life span of companies today is twelve to fifteen years (Hewitt, 2004). de Gues suggests that the natural life span of a corporation could be as long as two hundred to three hundred years. When evaluating company performance in terms of years of existence versus potential longevity, the implication is that most firms are failures.

Why be concerned about corporate longevity? Besides the fact that there is something unnatural in the high corporate mortality rate (no living species endures such a large gap between its maximum life expectancy and its average realization), few other institutions - such as churches or universities - seem to have the abysmal demographics of the corporate life form. As de Gues says in *The Living Company* (1997), the damage that results from the early demise of otherwise successful companies is not merely a matter of shifts in the *FORTUNE 500* list: “Work lives, communities, and economies are all affected, even devastated, by premature corporate deaths.” It is not just the owners or investors in a company that profit from an organization’s survival, but employees, customers, suppliers, and communities all benefit as well.

What enables some companies to defy the odds to continue operating for a century or more while others succumb to an early death? Are there certain industries where it is easier to overcome economic challenges and adapt to changes in socio-cultural and technology trends? Is size or form of business ownership a factor in whether a company survives over a long period of time?

Previous research on long-lived companies (Collins and Porras, 1994; de Gues, 1997; Grossman and Jennings, 2002; Stadler, 2011) has focused on large, publicly-traded firms. Collins and Porras’ *Built to Last* studied American companies (though many were not yet 100 years old); de Gues’ study at Shell profiled international companies of a size similar to Shell that were over 200 years old; Grossman and Jennings focused on 15 large, publicly-traded industrial firms with 100 years (or more) of consecutive dividends; Stadler looked

exclusively at large European companies over 100 years old. The work of Japanese professors Iwasaki and Kanda on *shinise*, or very old Japanese companies, included small-to-medium size organizations, but all the companies were privately-held (Iwasaki, Kanda: 1996).

Though these studies of long-lived companies came to slightly different conclusions, there were some common factors identified by all or several of them. Following are the shared results found in these studies that cross geography, size and ownership differences:

1. The presence of a strong core ideology, corporate culture and values (Collins and Porras, de Gues, Grossman and Jennings, Iwasaki and Kanda, and Stadler)
2. The ability to drive for change while protecting these core values (Collins and Porras, Iwasaki and Kanda, de Gues, Grossman and Jennings, Stadler)
3. Conservative business practices (de Gues, Grossman and Jennings, Stadler)

## OBJECTIVE

Since the only previous research on old companies in the United States (Collins and Porras; Grossman and Jennings) was based on a few large, publicly-traded firms many of which were not yet 100 years old, the authors of this paper decided to build a data base of U.S. firms over one hundred years old: small and large, public and private. The intent is to see if old companies tend to be larger or smaller than the average U.S. firm or if they cluster into certain industries. The Japanese research (Iwasaki and Kanda) and case studies of several 100-year-old Midwestern U.S. companies (TenHaken and Cohen, 2007) seem to indicate that business strategies of staying small and private are keys to longevity. Many of the companies in these studies also appear to cluster into retail and service industries. Since most of the old U.S. companies interviewed by TenHaken and Cohen were privately-held firms (in fact, family-owned), perhaps one way companies survive over such a long time period is by staying private. Often this limits access to capital and thus growth, which could lead to the old companies being smaller, on average, than other firms. Also, it is possible that certain industries lend themselves to longevity because of the particular industry dynamics and external influence factors: many of the case study firms were in the retail or service industries where personal customer relationships were very important in business success.

Hypothesis #1: Maintaining private ownership is one way companies survive over a long period of time; therefore, the percentage of privately-owned companies over 100 years old will be higher than in the overall U.S. business population.

Hypothesis #2: If old companies are, in fact, more likely to be privately-owned, this could limit access to capital and thus growth, so a greater percentage of companies over 100 years old are small to medium size enterprises than in the overall U.S. business population.

Hypothesis #3: Companies over 100 years old will cluster in certain industries because some industries are more affected by factors such economic fluctuation, technology change and globalization.

Hypothesis #4: Because building close relationships with customers and employees is a key factor in a business's sustainability, the industries into which old companies cluster will be retail and service-oriented industry categories.

## METHODOLOGY

The authors of this paper chose one hundred years as a defining point for long-lived companies because by then the firm has survived changes in ownership (several generations if a family-owned company), as well as the many significant economic and environmental challenges of depression, world war, advances in technology, globalization, etc. The focus of this study is surviving *control* firms. Companies were not included if they were bought out by other organizations, even if a local facility continued to operate as a branch business or subsidiary. When a company becomes just one part of another organization, it was considered too changed to qualify for this study. Both private and publicly-owned companies are included. No restrictions were placed on size. Not-for-

profit organizations, such as hospitals or educational institutions, and family farms were not included in this research.

Some states compile lists of companies by founding date or have “century clubs,” easing the process of data collection. For most states, however, the process of collecting the information for this data base was an arduous task. Using several different sources, the authors were able to develop a data base consisting of over 400 U.S. companies more than 100 years old. This data base was then analyzed on a number of different factors and compared with United States Census data for all U.S. companies.

## COMPANY PROFILES

Our data base of 100-year-old U.S. companies is sorted by industry, size and type of ownership. We identify the percentage of companies in this data base that meet the general criteria of a Small to Medium Size Enterprise, or SME. For the purposes of this study, we are working with a definition of an SME as any business establishment with less than 500 employees. However, because we expected a number of the old companies to be very small, we also break down the SMEs into “very small,” with less than 20 employees; “small” with 20 to 99 employees; and “medium,” with 100 to 499 employees.

The data base of old companies is also sorted by type of ownership – those that are privately held and those that are publicly-traded.

To see whether certain industries lend themselves to longevity, either because of internal industry dynamics or external influence factors (such as being less affected by changes in socio-cultural or technological trends, or more dependent on relationships making them less vulnerable to global competition) we compare the industry break-down of the old companies data base to the data in the U.S. Bureau of Labor Statistics North American Industry Classification System (NAICS).

## FINDINGS

The following table shows the percentage of companies in this data base that could be classified as small to medium size enterprises (SME) compared to that of the U.S. business population at large:

**Table 1.**

COMPANY BREAK-DOWN BY SIZE		
Number of Employees	% of U.S. Businesses	% of Old Companies
Under 20	85.95	14.15
20-99 employees	11.66	16.10
100-499 employees	02.14	13.66
All SMEs	99.75	43.90
500 + employees	00.25	56.10

In Table 2 the percentage of companies in this data base that are public or privately-owned is compared to that of all U.S. business.

**Table 2.**

COMPANY BREAK-DOWN BY OWNERSHIP		
Type of Ownership	% of U.S. Businesses	% of Old Companies
Publicly-owned	0.21	37.56
Privately-owned	99.79	62.44

The information in Table 3 breaks down the century-old companies by industry classification and compares this with the overall percentage of U.S. companies in these industries:

**Table 3.**

<b>COMPANY BREAK-DOWN BY INDUSTRY</b>		
<b>Industry</b>	<b>% of U.S. Businesses</b>	<b>% of Old Companies</b>
Mining	00.29	03.17
Utilities	00.24	03.17
Construction	10.05	01.46
Manufacturing	04.08	41.95
Wholesale	05.99	04.63
Retail	15.57	12.44
Transportation	03.02	01.22
Information	01.95	05.85
Finance & insurance	06.97	17.80
Real estate	05.23	00.49
Professional services	11.81	03.41
Management services	*	00.49
Administration services	05.30	00.00
Educational services	00.85	00.00
Health care	10.80	00.24
Arts & entertainment	01.72	00.49
Accommodation & food services	08.69	01.71
Other services	07.46	01.46

## DISCUSSION OF FINDINGS

The percent of long-lived companies that are privately-owned compared to the percentage of privately-owned U.S. businesses overall is difficult to accurately assess. Out of the total entities registered as “companies” in the United States, approximately 15,000 are public (Wall-Street.com, 2010). Using the 2007 Economic Census Summary data from the U.S. Census Bureau, the total number of U.S. companies is 7.214 million meaning that 00.21 percent of companies are publicly-held and 99.79 percent are privately-owned. The difficulty in using these numbers as an accurate comparison with the numbers from the old companies’ data base is that the Census Bureau statistics likely include a large number of individuals reporting business income from activities that we would not consider a “company” in this research. Studies focused on old privately-held firms (Iwasaki and Kanda; *Family Business*) show that these companies, regardless of geography, believe strongly that staying private is key to their success.

We see this same data reliability issue in the U.S. data of SMEs where over 85 percent of businesses “employ” less than 20 people: it is difficult to know how many of these are single-persons operating side-line businesses of some sort that could not be considered a true company for this analysis. Add to this the fact that we know our list of companies over 100 years old is missing many very small, local businesses (those with less than 20 employees), and we are left with certain categories where it would be erroneous to draw any conclusions from comparison data. If we remove the “Under 20” group from both the Census data and our old companies data base, we perhaps will have a more accurate comparison of company size.

**Table 4.**

<b>COMPANY BREAK-DOWN BY SIZE LESS COMPANIES &lt;20</b>
---

Number of Employees	% of U.S. Businesses	% of Old Companies
20-99 employees	83.00	18.75
100-499 employees	15.25	15.91
SMEs (20-500)	98.20	34.66
500 + employees	01.80	63.34

Though the “medium-size” category of companies with 100-499 employees now has a very similar percentage in each group (15.25 percent for all companies and 15.91 percent for old companies), overall we still see that a far greater percentage of 100-year-old companies are large (63.34 percent of old companies have over 500 employees, compared with only 1.8 percent of all companies.)

The areas where comparisons are believed to be quite accurate are in the breakdown by industry. There are industries in which old companies show a higher representation than in the general U.S. business population. Out of the 18 industry categories, old companies show a higher representation in six. These are: Mining, Utilities, Manufacturing, Information, Finance & Insurance, and Management Services. Of these industry categories, the most significant difference shows up in Mining, Utilities, and Manufacturing where the percentage of old companies is ten times greater.

The industry categories where the percentage of old companies and the percentage of U.S. companies overall is closest are Wholesale (5.99 percent for U.S. businesses and 4.63 percent for old companies) and Retail (15.57 percent for U.S. businesses and 12.44 percent for old companies).

Looking back at our hypotheses at the beginning of this research (that old companies tend to be smaller than the average U.S. firm, that they cluster into certain industries and that they survive by staying private), we find that only one of these are supported with the information compiled for this data base: U.S. companies over 100 years old do tend to cluster in certain industries – Manufacturing, in particular. The authors admit that they expected (because of capital requirements, technology changes and global competition) to find that manufacturing businesses would have a more difficult time surviving over a long period of time. Because of government regulation, including a history of protection from competition, it is understandable that Utilities would be an industry noted for firm longevity. It was thought that old businesses would cluster in the retail and service industries, but this was not the case. In a recent study of nearly 500 Japanese *shinise* by Makoto Kanda, the industry breakdown was 37 percent Wholesale, 34 percent Manufacturing, 12 percent Retail, 12 percent Construction and 5 percent Services. The Retail category shows the closest match between the two countries, both at 12 percent and Construction the largest difference (12 percent in Japan compared with 1.47 percent in the U.S.).

Regarding the public vs. private and company size hypotheses, though the data is somewhat more difficult to draw accurate conclusions from, it is fairly safe to say that the hypotheses cannot be supported: In fact, the percentage of old companies that are public is far larger than the percentage of overall U.S. companies, and companies that have survived over 100 years skew large (over 500 employees) rather than small or medium-size.

**Hypothesis #1:** Maintaining private ownership is one way companies survive over a long period of time; therefore, the percentage of companies over 100 years old will be higher than in the overall U.S. business population. *Not proven. In fact, even allowing for some inaccuracies in the data base regarding small businesses, the percentage of old companies that are publicly owned is far higher than in the general U.S. business population.*

**Hypothesis #2:** Because continued survival is more important to long-lived companies than growth, a greater percentage of companies over 100 years old are small to medium size enterprises than in the overall U.S. business population. *Not proven. Except for the medium-size category (100-499 employees) in which percentages for both old companies and the general business population were similar, a greater percentage of old companies appear to be large.*

Hypothesis #3: Companies over 100 years old will cluster in certain industries because some industries are more affected by factors such economic fluctuation, technology change and globalization. *True. Old companies do have a much higher representation in six out of the 18 industry classifications, with the percentage of old companies in three of them significantly higher than in the general business population.*

Hypothesis #4: Because building close relationships with customers is a key factor in a business's sustainability, the industries into which old companies cluster will be retail and service-oriented industry categories. *Not proven. Though the percentage of old companies in the retail industry was close to that in the general population, it was not higher. This could be because a number of very small, local retail businesses have not been identified in this data base, but even so, it does not appear that old companies have a greater retail focus. There was a clear concentration of old companies in the Finance & Insurance industry, which is service-oriented, but the concentration in Manufacturing, Mining and Utilities was far greater.*

Managerial implications from this study that could have value for businesses throughout the world that desire to sustain operations long into the future include the following: If you are currently a privately-owned firm and need to raise capital to grow, going public is *not* a “death sentence.” It is possible to live a long corporate life whether public or private, large or small. (Having a strong corporate culture/core value set seems to be more important than size or type of ownership.) Also, if you are in the Mining, Utilities, Manufacturing, Information, Finance & Insurance, Management Services, Wholesale or Retail industries, there do not appear to be factors at play that might make long term survival more difficult.

## FURTHER STUDY

As noted in the introduction, most previous research on the topic of corporate longevity strategies and practices has focused on a few very large, publicly-owned companies. Now that this data base consisting of companies of all sizes has been compiled, a survey of a sample of companies from this data base could uncover whether there are any common strategies or corporate behaviors that enable a business's longevity regardless of size.

# MAKING SENSE OF RISK AND RISK PREVENTION IN ONLINE ENVIRONMENTS: A THEORETICAL PERSPECTIVE

**David Tenjo, London School of Commerce, United Kingdom**  
**Wilson Ozuem, University of Gloucestershire, United Kingdom**

## ABSTRACT

*Generally speaking, electronic markets facilitate the exchange of information, goods, services, and payments associated with market transactions (Bakos 1998). The advent of Internet technology challenges the ways in which we seek to manage openness and visibility in the market space. Such a paradigm shift has consequences as a new modality of commercial transaction. Theoretical grounded understanding is needed to expand our insights into risk and risk prevention to inform effective marketing practices in the evolving marketplace. The underlying goals of this paper are to review extant conceptual issues related to online risk, and develop an agenda needed for future research.*

## INTRODUCTION

It is not an exaggeration to assert that risk is one of most heavily research issues in computer-mediated marketing environments (CMMEs) and the concept of online risk has gained considerable attention (Risk is one of the main drivers of e-commerce). This concept can be broadly defined as "the chance of a vulnerability being exploited" (Universal Postal Union, 2009). When speaking of risk in e-commerce, some scholars refer to the uncertainty that something will go wrong on the system which will cause it not to deliver the expected performance. Risk may refer to aspects such as the likelihood that the system may crash, the likelihood that the business will not succeed, or the chance that users will experience breaches to their private information. For example, Qin (2009) states that the security and reliability problems can be divided into several categories, which are the categories of risk: They are data loss, virus attacks, error operations, hardware failure, system breakage, insufficient security configuration, security problems of the communication protocols, and other problems, such as application software, and imperfect service programs (p. 135). Smith (2004: 35) identifies many kinds of sources of risk involved in e-commerce transactions, they are: network penetration, poor authentication procedures, unauthorized access by an authorized individual, malware, software failure, and hardware failure. Risk in e-commerce can also be classified as different types of uncertainty that the software will work as it is expected (Gosh and Swaminatha, 2001). According to those views, risks are seen as the threats that create uncertainty in e-commerce systems.

The study of risk as a scientific concept was initiated during the third decade of the 20<sup>th</sup> century in studies of financial analysis and economics; however, it was in the 1960s where the concept started being applied to shopping and the use of technology (Mariani and Zappalà, 2006: 208). With the introduction of the internet as a very important channel for commercial transactions, the study of risk took a higher importance.

Risk can also be identified as any uncertainty that consumers face regarding the outcomes of their online transactions. Katos (2010) identifies two different kinds of risk in e-commerce, which are: product risk and transaction risk. Product risk refers to the uncertainty that the goods or services that are purchased will meet their expected properties. On the other hand, transaction risk refers to the likelihood that some adverse event will

take place as a result of the transaction process (Chang, Cheung and Lai, 2005). Authentication risk, seen as the insecurity that the parties involved in the transaction are actually who they say they are; privacy risk, understood as the likelihood that private information will be stolen; security risk, which refers to the uncertainty that the transmitted data will be safe when it is passed over, and non-repudiation, which means that there is an uncertainty that the communication existent is indeed between the two parties involved only (Katos, 2010). This research focused on risk seen as all the uncertainties faced by online customers existent as a result of their online transactions, or their intention to perform online transactions. It can be the likelihood that breaches to their private information will occur, the probability or financial losses due to contracts not complied with, or the likelihood that the products or services purchased does not satisfy the promised characteristics.

Customer risk perception plays a very important role in the importance of risk in online environments. Forsythe and Shi (2003: 869) identify risk perception in online environments as “the subjectively determined expectation of loss by an internet shopper in contemplating a particular online purchase”. Mariani and Zappalà (2006), identified the evolution of the study of risk perception as starting with with Bauer (1960) who revealed that consumers appraise shopping behaviour as risky one when consumption choices have uncertain consequences as to potential gains or losses. Subsequently, Cox and Rich (1964) pointed out that risk perception has an effect on the decision to purchase or not at a distance and which product to purchase. Concurrently to that, Cunningham (1967) asserted that risk derives from the probability and consequences of negative events. The four most prevalent types of perceived risk in online commerce are product performance risk, psychological risk, financial risk, and the risk of loss of time/convenience (Mariani and Zappalà, 2006: 210). These types of risk shape the way in which risk itself influences customers’ decisions when performing online transactions.

## **CONCEPTUALIZATION OF RISK IN ONLINE ENVIRONMENTS**

E-commerce security as a science and a discipline involves the study of issues that affect the integrity and reliability of systems, and issues that represent risks to the safety, security, and privacy of individuals who use the system. Many scholars have tried to determine exactly what it is that e-commerce security is concerned with. Schmidt et al. (Schmidt et al., 2009: 47), state that e-commerce security is concerned with building the trust necessary between the parts involved in an online transaction in order to make it a successful one. Such trust can be built by creating safeguards that prevent computer attacks. As such, Marchany and Tront (2002) state that e-commerce security strategies handle two main issues, they are: protecting the security of the business network and all of its components, and ensuring transaction security between customers and businesses. According to Gosh (Gosh, 1998: 9), studying security in e-commerce means dealing with one main concern for users, which is the potential loss of assets and privacy due to breaches to the security of the system whether they are physical trespasses, or gaining access through software means. This belief is supported by Qin (2009), who contended that “e-commerce security is closely concerned about the protection of citizen’s privacy, and the survival and development of enterprises”. Furthermore, Qin (2009: 135) also states that “the reliability of e-commerce system is the foundation of e-commerce security”. In summation, studying ways to protect user’s privacy and security is the number one issue for researchers on e-commerce security. Such is the view that this research took; the notion that e-commerce security is concerned with protecting people’s privacy and minimizing risks of financial losses to both business and individuals due to online attacks.

The evolution of the study of online security has conceded that security is as much a technical problem as it is a social problem. When concerns for online security began being an issue of major interest for scholars, most of the attention was centered on creating software and hardware tools to secure the system. Gosh (Gosh and Swaminatha, 2001: 33) argued that “the greatest risk to electronic commerce is failing software”. However, this belief has evolved and in the same year, Anderson (2001) redirected the assumption that e-commerce security was mainly a technical problem. He stated that information security is about taking technical measures such as giving access control, cryptographic protocols, firewalls, and better tools for detecting intrusions and malicious code; however, “information security is due at least as much due to perverse incentives” (Anderson, 2001). Feigenbaum et al. (2009: 73) agree with Anderson, and suggest that “most aspects of security and privacy research have been suffused with economic considerations”. In addition, Compañó and Lusoli (2009) claim that one of the main reasons for the struggle with issues concerning online privacy is the “apparently irrational and unpredictable behaviour of users when engaging in online interactions involving identity”. In conclusion, in

order to preserve security in e-commerce, it is necessary to look at the people aspect of the uncertainty as well as the technical aspect of it.

To that extent, Hassler (2001: 387) insists that in order to preserve e-commerce as a secure medium, awareness and education is essential. “[people] should become familiar with the basic security concepts and their limits as a matter of common sense... children should be taught respect for the privacy and security needs of others”. Moreover, with new technologies introduced to perform marketing activities, simply researching technological procedures and processes might be leaving the work half-done. As Ozuem et al. (2008) state, academics should move to providing practitioners with concepts and methodological pathways based on the changing behaviour of consumers. In summation, whether it is due to economic reasons, social reasons, psychologically irrational behaviour, or plain ignorance, online security is as much due to technical issues, as it is due to the behavioral aspect of people who use it and research efforts should focus on the behavioral aspect as well as the technical aspect of security.

## WHITHER TRUST AND PRIVACY

Trust plays an important role in e-commerce. The trust that users have upon the system helps determine its evolution and how widespread it becomes as it is a significant determinant for adoption. “The main reasons people do not want to buy are related to trust, concern over electronic instruments of payment, and price” (Sartori, 2006: 185). If there is a lack of trust in e-commerce, users as well as businesses and operators will stop using the internet, and revert back to the traditional ways of doing business (Marchany and Tront, 2002). Further to this, if there is an absence of trust, e-business systems are found to lead to resentment within the user community, tensions and conflicts will arise, and ultimately users will withdraw from the system (Bunduchi, 2007). In addition, Kao (2009) concludes that transaction trust significantly affects consumers’ intentions to adopt the internet to perform their business transactions. However, just how much an excess of trust would lead to unsafe consumer behaviour has not been studied with much attention.

The traditional meaning of trust as a concept is applied to e-commerce as well. Lin et al. (2005: 262) define trust as a relationship between two entities in which one party has certain beliefs regarding the attributes of the other one. The properties of a trust relationship are identification, which refers to whether the subject entity is what it claims to be; qualification, which refers to the belief that the other entity is capable of doing what it says it does; and consistency, which refers to the credence that the subject entity is able to deliver the result, with certain level of acceptable certainty (Lin et al., 2005: 262). According to Bunduchi (2007: 161), there are two types of trust. One is the goodwill trust, which is defined as confidence in another party’s intentions to act according to the agreements made between the two parties; on the other hand, risk-based trust is more impersonal, and relies on reputation information and economic reasoning. Furthermore, risk-based trust is the main kind of trust present in B2C transactions, as familiarity and constant interaction, which are two main sources of goodwill trust, are not present on online transaction (Ba and Pavlou, 2002). The way trust with its traditional significance and types is applied to e-commerce as well.

Trust in e-commerce is very sensitive because of the many issues that surround this new technology, and all the important aspects that are at stake for both consumers and businesses. There is a natural lack of trust on the e-commerce process due to the constant stories of consumer data privacy breaches, and hacker attacks (Marchany and Tront, 2002). On e-commerce, trust reveals a higher level of importance than in traditional commerce as there still is a lack of clear rules, and because online products and services are not immediately verifiable (Gefen and Straub, 2004). The nature of e-commerce provides for a need of trust, but it is that nature which leads to a natural lack of trust among those involved.

As trust is very important for e-businesses, merchants spend a great deal of effort in generating trust on customers. Creating familiarity to their websites is a main way to generate trust, so businesses publicist and create a lot of exposure to their businesses partially in an attempt to create trust (Gefen and Straub, 2004). Research has led to many elements of website trust assessments. Some of these include “usability of the website interface, the presence of third party seals of approval, the amount of information about the products, privacy policy, company address, and contact persons, ease of purchase, and ease of navigation” (Hussin et al., 2005). Those trust attributes allow businesses to send a message to their customers that their business is legitimate and

that they can transact with them. Nevertheless, one big setback of this approach is that consumers may not be able to fully judge the reliability of attributes and their importance; they may misinterpret the cues or be misleading (Hussin et al., 2005). As a result, trust generation becomes a very complex issue.

Privacy is one of the riskiest aspects for consumers on e-commerce. Privacy concerns are a very important reason why people are prevented to go online, or why people provide false information online. Privacy is a problem for e-commerce due to a combination of irregular business practices, consumers insecurities, and media pressure (Ackerman and Davis Jr, 2009). Privacy is at the centre of the question of who gets access to customer data as the most important asset of the online economy (Spiekermann, Grossklags and Brendt, 2001). Moreover, Udo (2001) suggested that security and privacy concerns are the most important reason why users do not purchase on the internet. This is supported by many study findings that indicate that the majority of the online customers nowadays have significant concerns about their privacy and security while shopping online (Udo, 2001). The importance of privacy concerns online is further supported by Ackerman et al. (1999: 2), who contend that “the vast majority of Net users are concerned about threats to their privacy while online”. It is no doubt that privacy holds a very high importance for consumers online and consequently for businesses as well.

As a concept, privacy in general has held a very high level of importance for individuals in a society throughout history. In online environments, privacy is seen as the set of rights of users and businesses to determine for themselves the manner in which information about them is utilized (Ackerman, Cranor and Reagle, 1999). On the other hand, according to Gosh (2001: 189) privacy refers to aspects of individuals or entities that the owner wants to maintain confidential from third party interests. These aspects include data, properties, and behavioral characteristics. On the internet little bits of information are collected about users. These pieces of information are legally termed personally identifying information (Phelps, Nowak and Ferrel, 2000), and when put together they can represent a picture of a person's identity, which can lead to privacy breaches like identity theft, harassment, or stalking (Ciocchetti, 2007: 56). Nevertheless, the nature of privacy has been source of debate for scientists as some argue that that privacy is illegitimate or infeasible in a human society, while others contend that it has become an insignificant right (Ackerman and Davis Jr, 2009). As such, members of the society have always been concerned about how personal data is used mainly by governments, and this concern has evolved into how private data will be used by businesses (Udo, 2001) due to the fact that business today is geared by information collection. These concerns affect the way individuals behave, and perform business practices.

E-commerce, as a relatively new way to transact and do business, has brought new threats to privacy. On the internet it is impossible to make a transaction without revealing some kind of information about oneself. It can be an address, credit card information, telephone number, or product preference (Ackerman, Cranor and Reagle, 1999). The great deal of information that people expose online can very easily be stored and transmitted, leaving data trails that can be a basis for the exercise of power over them by governments as well as private organizations (Udo, 2001: 165). The danger to online privacy is increased by the lack of attention paid to it from individuals and also from businesses. As of 1998, the American Federal Trade Commission (FTC) found that the majority of businesses had failed to adopt even the most fundamental elements of fair information practices (Ackerman and Davis Jr, 2009). In addition, most of the time individuals do not worry about being informed regarding privacy policies online mainly due to the fact that websites post their privacy policies in a very discrete way and make them very difficult for regular users to comprehend (Ciocchetti, 2007: 69). In conclusion, the nature of e-commerce provides for high risk to individual privacy, as its essence is based on the provision of certain types of data by all parties in order to complete the transactions.

Many scholars have worried about who should be responsible for ensuring that privacy is protected online (Udo, 2001; Phelps et al., 2000). For example, Udo (2001: 171) suggested that privacy should be addressed by all parties involved, including governments, businesses and organizations. However, the author fails to identify the fact that consumers, as part of the overall picture, also play an important role in ensuring privacy and security on the overall system. Individuals are very concerned about their privacy; Phelps et al. (2000) created a conceptual framework to describe the inputs and outputs of the privacy concern, which is shown on Figure 1. Individuals with their practices can make a big impact on safeguarding privacy. However, people do not fully understand the importance of disclosing certain types of data. There is a lot of public information regarding the dangers of providing credit card numbers, national insurance numbers, or bank information. However, people more easily will provide other information like medical records, name, and address, as they

may not fully know the sensitivity of it (Ackerman, Cranor and Reagle, 1999: 4). Safeguarding privacy online is an important issue to be resolved. In regard to who should be responsible for protecting consumer privacy online, some suggest that it should be the government who should intervene, some others call for businesses to act ethically and self regulate themselves, and some believe users should be offered the option to decide how their information will be used (Udo, 2001: 167). Nevertheless, consumer self regulation, and control to protect themselves is not taken into account to a very large extent, being that the issue that this research confronted.

**Figure 7: The Privacy Concern: A conceptual Model**

Source: (Phelps, Nowak and Ferrel, 2000)

When using online systems, customers face many kinds of threats, which are specific issues that represent risk to them and increase the probability that something with a negative outcome will occur. A threat is "any potential event or act, deliberate or accidental that could cause injury to employees or assets" (Universal Postal Union, 2009). The more technology advances the more risks and threats to systems there are. Gosh and Swamonatha (2001: 52) state that new threats are always being developed, particularly due to the wireless medium and devices that forms e-commerce platforms. In addition, Ackerman and Davis, Jr. (2009) suggest that threats to security and privacy in e-commerce are a serious problem, and this is due to a combination of factors that include current business practices, media pressure, and consumer fears. For consumers, the internet provides a level of anonymity that gives online scammers, identity thieves, and hackers, access to personal information that is not seen in traditional business settings (Federal Trade Commission, 2007). A bolder statement provided by Gosh (2001: 29) indicates that "the internet infrastructure on which e-commerce is based is fundamentally vulnerable to simple attacks". In addition, one of the main reasons for e-commerce to be more vulnerable to threats is the fact there is no human interaction in the transaction, all other types of trading have it, but not e-commerce (Smith, 2004: 11). As such, some of the simplest ways of attack might be overlooked by users. There

are risks and threats whenever a business transaction takes place; however, due to many circumstances, the potential treats in e-commerce become more evident.

Threats on e-commerce can be classified as internal or external. Internal threats are those that come from insiders like people within the same company, or people with access to the system, while external threats come from strangers who try to enter the system by ways of hacking, or stealing data (Hassler, 2001). The types of threats that customers face are mainly external; however, they can also be internal, as someone in their own office or home getting access to a user's PC can be classified as an internal threat.

Among the many types of threats, malware represents one of the biggest one for customers. Marchany and Tront (2002) identify malware such as trojan horses and viruses as an important source of risk for customers. In addition, Smith (2004: 35) states that malicious software like viruses, worms, and trojan horses signify threats to any individual using a computer. Trojans are programs that allow fraud and data integrity attacks to originate from a client system that appears to be valid (Marchany and Tront, 2002). These attacks could result in website services unavailable, which occur when due to technical problems, or due to denial-of-service-attacks on the system, the services sought by customers are not available. More so, they represent big risks for e-commerce users, who in many cases do not pay attention to this kind of threat as malicious software do not instantly disturb any action that the user is taking.

Some other threats include illegal behaviors such as false trade, counterfeit products, contract cheat, price pushing in online auctions and the impingement of consumers' legitimate rights and interests (Qin, 2009: 59). In addition, online contracts not complied with, such as product not shipped, services not rendered in a timely manner, or failing to ship goods after receiving a payment is another important threat that customers face (Smith, 2004: 35). Furthermore, extortion or threats to commit a computer attack or the use of information gained from a computer crime in exchange for money may represent a danger for consumers as well (Fishbaum and McClenahan, 2001). In conclusion, not only do threats exist from cybernetic attacks, but also from other kinds of illegal practices that represent a potential loss to consumers, whether it is financial or of any other sort.

Unauthorized network penetration is another type of threat that consumers face. Qin (2009: 137) states that "since the information is transmitted online via the routers while the users cannot know which one of the routers are involved in the process, it is possible that someone will be able to view the user's information by scanning and tracking data". On computer networks outsiders may easily get access to other computers, and view private information. As such, network penetration is identified as one of the top threats in e-commerce (Smith, 2004: 35). Matsuura (2002: 48) argues that unauthorized access to the data stored and processed by the system, and unauthorized access to codes or other means of gaining access to the computer system represent big threats to customers in online systems.

Users also face threats from their own direct actions. Incorrect data entry, for example, is another factor of risk to online users. This occurs when customers make incorrect selections or incorrect navigations on the website (Vijayaraghavan, 2003: 81). This type of risk may also occur when a customer wants to perform a financial transaction and make payments, or money transfers of certain amounts, but make a typing mistake and performs a transaction of a different amount than the one intended. This is a serious risk as sometimes users do not double-check the amount of their transactions, and end up accepting amounts that do not correspond to the ones intended.

Denial-of-Service attacks are another way in which customers are affected. This type of attack involves the use of "a flood of false messages to crash a business' systems" (BusinessLink, 2010). This is a simple type of attack that affects mainly business as it may generate considerable losses; however, customers are also affected by this as there might be a significant service or product needed at a specific point in time, which may not become available due to this type of attack. Service or product availability may also represent a loss to the customer, so even though e-commerce customers may have little impact on ways to prevent this attack, it is a threat that may significantly affect them.

Sometimes the simplest attacks happen to online users. "E-commerce is vulnerable to simple attacks, basically due to the internet infrastructure upon which it is built" (Ghosh, 2001: 29). As such, some of the simplest ways of attack might be overlooked by users. One way in which customers might be attacked is by third

parties physically “eavesdropping” on the user’s computer to collect personal information. Due to the ubiquity that mobile computing brings, nowadays users may perform e-commerce transactions in any place where there may be other people present (Gosh and Swaminatha, 2001). Users failing to check behind their back may be vulnerable to another person looking at their personal private information. In addition, one of the most pervasive, least acknowledged attacks is from trusted insiders (Ghosh, 2001: 30). Insiders are people who have access to computer equipment on the network, like company employees, or personal friends. These insiders can get unrestricted access to sensitive information, and use in different ways. Equipment theft is another way in which e-commerce users can be attacked. There is a lot of vital information on emails, website history, or documents stored on a computer. This risk is augmented by the increasingly massive use of laptop computers and mobile devices, which are a lot easier to steal, or loose, than say, a desktop computer.

Consumer security awareness is not ideal, and this leads to unsafe online behaviour. Schmidt et al. (2009) established that users are not fully aware and do not have a clear perception of e-commerce security. This leads customers to display unsafe behaviors, or at least not take appropriate measures as they are not fully aware of the online risks. The first step for creating a culture of online security behaviour would be to create more awareness on consumers.

Individuals know that their security is important, and they want to have a reliable system on which they can transact. Spiiekermann, Grossklags and Brendt (2001) argue that in spite of the privacy preferences that most people have, users do not act according to the privacy preferences, and the practices they execute do not live up to their indications. In addition, Yao and Linz (2008) concluded that adopting self-practices to protect oneself in e-commerce is a function of the person’s attitude toward security perceptions, the protective strategies, and the perception of behavioural control. They also stated that the need for privacy and certainty widely influence their self-protection practices. This means that users practices are subconsciously influenced by their needs, their preferences and their perception toward the system. However, since people’s awareness regarding security is not ideal, their practices do not always support their needs and beliefs.

In regard to policy about self-regulatory practices, there is not much literature available regarding regulations and norms, perhaps due to the difficulty that it represents to control personal practices by users. However, Phelps, Nowak and Ferrel (2000), stated that consumers require policies that provide more control over the dissemination of personal information, and that there is a need for a promotion of self-regulatory practices. In fact, Earp and Baumer (2003) suggest that a significant reason why consumers see a need to protect themselves with their own actions is because there is a certain level of uncertainty in the legal environment. As stated earlier, E-commerce legislation still is in its development process; therefore, there is an underdevelopment in policies and laws regarding secure practices by consumers.

## **CONCLUDING REMARKS**

This section aims at suggesting feasible improvements that can be made in order to make a clear and secure environment regarding e-commerce security, particularly when it comes down to the responsibilities that customers have with their own behaviour. In this section, the fourth research objective for this study is addressed, which was to recommend ways to improve security risk avoidance among e-commerce consumers. This objective meant that actions directed towards improving consumer behaviour regarding e-commerce security would be recommended.

One of the biggest issues that this research allowed to discover is that education is keen in generating more secure practices on users. For that reason, the first recommendation that needs to be made is that systems for education and information regarding e-commerce need to be created so that users can apply with the learning that they gain in displaying secure practices. Some of the questionnaire respondents provided some feedback upon completion of the questionnaire and a lot of this feedback included comments that indicated that users were not even aware of the things they should know, or certain actions they can take to protect themselves and create e-commerce more secure. With these kinds of comments in mind, this researcher is able to arrive at the conclusion that consumers are not fully trained, or even informed to engage in e-commerce transactions. This set up of education systems should come from regulating bodies like the NCC in Britain, or the FTC in The United

States. These entities should work together with the big e-commerce businesses to reach consumers and create a better conscience on the importance of their actions and how they affect internet security overall.

As this research demonstrated that there are no big differences on security practices between heavy and light internet users, actions taken to improve security practices through education should focus on heavy internet users. After all, heavy internet users occupy the majority of the online traffic, they will more easily understand the issues involved, and they will more likely take notice on information provided. With the current growth that internet and e-commerce are experiencing, light internet users will eventually catch up with heavy users, they will gradually increase the usage of the internet, and they will progressively grasp all the general concepts that are needed for an improvement of their security practices.

It is of uttermost importance for consumers to understand the threats they face. This is arrived at through education, as well as through publicity. The complete set of threats to e-commerce users need to be mentioned on every single e-commerce site so that everyone who accesses the system, and wants to use it has a place where they can go to be sure they know exactly every threat they face. Regulations should be set about this to make it mandatory for businesses to include information on the threats that customers face every time they engage on online trading. This way the risks that users face will be more evident to them, and they will be able to take appropriate measures to protect themselves during the act of an e-commerce transaction.

The creation of standards is also very important so that every citizen knows what good online behaviour is and what bad online behaviour is. Those standards should be publicized by governments, and they will tell e-commerce users the set of practices that they should perform every time they engage in an online transaction in order to avoid online risk. If those standards are made public in an appropriate way, customers will have it on the back of their heads every time, and they will remember what it is that they should be doing regarding online security. Any effort spent on publicizing e-commerce security information will not be wasted, especially with the way in which e-commerce is becoming increasingly popular by the day.

## **IMPLICATIONS AND FUTURE RESEARCH DIRECTIONS**

The main conclusion drawn from these results is that information definitely plays a very important role in order to generate an improvement on consumer security practices. If people were better informed, they would know exactly what they need to defend themselves from, how they should be doing it, and what happens if they do not defend themselves appropriately.

By no means is the notion of online risk and security a minor issue. To the contrary, as was evidenced from the review of the extant literature, online security is at the heart of the growth and potential of e-commerce, and through it the internet in general. There have been many studies performed, and there is extensive literature on how security should be improved both in technical and non-technical ways. This demonstrates the importance that has been given to e-commerce security among the academic community. However, in spite of all the attention that has been put on e-commerce security, there seems to be a side of it that has not been quite as widely studied, and that is the side of security that concerns to user responsibilities. All areas surrounding e-commerce risk have been studied to a great extent in the past, and as the part of online user behaviour regarding security matches perfectly as one aspect that would widely increase online security in general thereby minimizing risk. This study demonstrated that in general consumers do not take appropriate precautions regarding online security, and this allows this researcher to conclude that if actions were taken to promote appropriate e-commerce practices on consumers, e-commerce security overall would be increased. There is very little difference between heavy and light internet users on their security practices, therefore all actions that are taken to promote a secure behaviour can be generalized to all citizens, and the results would be equally positive.

In addition, trust seems to be a factor that affects the behaviour that users display regarding security; however, it does not seem to be a determinant factor either. Therefore, the efforts to generate trust on users can continue as they have been going, but they should definitely be mixed with efforts to promote and reward secure online behaviour. Nevertheless, trust is very important in order to create more sense in people regarding the need to behave securely; however, trust needs to be very carefully incited as it has the danger of becoming a factor

that has a tendency to make user “lower the guard”. Future research is needed to undertake empirical research on the risk measurements and the impact of trust on customer retention in the online environments.

# OF MINING ACCIDENTS AND SENSE-MAKING: TRAVERSING WELL-TRODDEN GROUND

**Christian L van Tonder, Curtin Business School, Australia**  
**Johann P Groenewald, Edith Cowan University, Australia**

## ABSTRACT

*Notwithstanding the huge contribution of the mining sector to the fiscal wellbeing of the host country, mining remains a perilous affair - as recent high profile mining accidents attest. Mining Houses make substantial investments and take drastic actions to the point of temporarily closing shafts or mines in an attempt to improve safety and reduce fatal accidents. Despite these initiatives the poor safety (fatality) record of precious metal mines appears to persist. This suggests that the frameworks and mechanisms traditionally employed to interpret and make sense of mining accidents are probably inadequate. The study set out to explore the causes of a 'fall of ground' accident in a platinum mine in which a team leader was injured, and did so from a sense-making perspective. Content analysis of the narrative obtained from 10 key informants and a focus group (nine members) closely associated with the accident revealed that the multiple interconnected human and systemic causes appeared to have escaped detection, preventing a conclusive perspective on the causes of the accident. It is argued that mining investigations, as collective sense-making vehicles are subject to similar biases. The findings are considered from the perspective of sense-making, and mindfulness.*

## CONTEXT

Mining is generally regarded as an 'affluent' industry and a significant contributor to the host country's Gross Domestic Product (GDP). For this reason it is an important source of stability and, by virtue of the scope of its operations, usually a mass employer and a powerful influence on societal wellbeing. In South Africa, where the current study was undertaken, approximately 2.9% of the economically active population is engaged in mining operations. Notwithstanding this significant contribution the industry is somewhat tainted by the high incidence of mining accidents and fatalities and it is justifiably considered a hazardous enterprise. High profile mining accidents across the globe are common with the most recent cases recorded in New Zealand and Chile. Indeed, it is not without reason that mining is the industry with the highest recorded number of fatal occupational injuries (cf. McGwin et al., 2002; Oldfield & Mostert, 2007). From the position that a single fatality constitutes a catastrophe and that one fatality is one too many, it is noteworthy that South Africa recorded 168 and 128 mining fatalities for the 2009 and 2010 years respectively. For the same period a similar decline is noted in the number of South African mining injuries from 3673 to 3019 for the corresponding period, which is encouraging. The recorded number of mining fatalities and injuries, however, are not reassuring and represents an indictment of safety orientation and practice in the mining environment. The South African presidential audit (investigation) into mine safety and health concluded that "*The South African mining industry has a history of unacceptably high accident rates that result in fatal and disabling injuries*" and "*...the number of people that die from occupational injuries from well over 700 in the mid 1980's to the current levels of over 200. Of serious concern is that the fatalities have been steadily decreasing since 1995, but over the last two calendar years, the decrease stagnated with a negligible reduction in 2006 and an increase of about 10% more deaths in 2007*" (DME, 2008, p. 19).

While underground mining is undoubtedly a dangerous occupation (see also Perrow, 1999), this characterization of the industry belies the attempts by Governments and Mining Houses to improve mining safety. Government and regulators, for example, have introduced stringent measures in the areas of training, operating standards, and legislation with the sole purpose of affording mine employees greater protection from mining accidents (e.g. machine-related, slip and fall, and blasting accidents). In 2007, and following a

particularly devastating mining accident, executives took the virtually unheard of and very costly decision to stop all mining operations at the largest platinum mine in South Africa. Paradoxically, injuries and fatalities continued to occur while mining executives continued to pour huge amounts of institutional resources into the containment and management of unsafe practices. This is not uncommon and even from early historical accounts it is clear that the significant risks involved in underground and deep mining endeavors have been an enduring challenge for mining executives. As a result, safety has been a central focus of mine management, not least as a consequence of political pressure to improve safety practices.

## Mining accidents and sense-making

Safety has received extensive coverage in the behavioral sciences especially considerations such as safety climate (Beus, Payne, Bergman & Arthur Jr., 2010; Clarke, 2006; Neal & Griffin, 2006; Zohar & Luria, 2005), workplace psychosocial safety climate (Dollard & Bakker, 2010), safety outcomes (Nahrgang, Morgeson & Hofmann, 2011); safety management systems (Naveh, Katz-Navon & Stern, 2011) and the influence of safety values on safety outcomes (Newnam, Griffin, & Mason, 2008) to name a few. These studies, the majority of which were undertaken in sectors other than Mining (education, health, transportation, etc.) provide a powerful applied perspective on the interrelatedness of organizational safety practices and individual safety behavior. Less common, however, are studies that purposefully consider cognitive-behavioral mindsets (schemata) and the cognitive dynamics that precede, give rise to, and are enacted in workplace safety behavior, especially in mining environments. The latter perspective, instead, is evidenced in notions such as ‘sense-making’ and ‘mindfulness’ in high risk or high-hazard institutions and technologies, and is prevalent in the work of, for example, Weick (1995; 2001; 2004) and Weick and Putnam (2006) on sense-making and mindfulness. ‘Normal accident theory’ (Perrow, 1999), Catastrophe theory (Souder, 1988), Disaster theory (Stein, 2004), and Nonlinear change theory (Van Tonder, 2006; 2008) are some of the typical theory frames with which potential catastrophic failure in high risk and high reliability organizations have been approached. From the vantage point offered by cognitive-behavioral theory, mining safety has received only cursory attention (compared for example to the nuclear energy industry) yet offers substantial scope for deciphering entrenched behavioral phenomena. The current study employs the construct of ‘sense-making’ (Weick, 2001) as a novel perspective on the ‘dynamic equilibrium’ that appears to have stabilized around continuous investment in safety initiatives yet also recurring mining accidents and fatalities – in particular as this pattern recurs despite extensive investigative processes (and purported institutional learning) that have aimed to curb the incidence of mining accidents.

However, as the statistics convey, the exhaustive safety investigations that follow mining incidents and/or accidents do little to meaningfully alter this dynamic. The Presidential audit (DME, 2008) commissioned in South Africa after the 2007 mining accident concluded that not all major hazards were identified and that the approach of most mines to safety risk management “*is a major cause of concern*” (p. 61). Disturbing as this finding may be, it is unsurprising, and for several reasons. Carroll (1995) for example has concluded that incident review programs have many weaknesses, which are evident in part in the inability of these investigations to establish root causes - despite extensive training of investigators in root cause identification. Moreover, as Perin (1995) suggested, the focus on surfacing root causes during incident reviews in ‘high-hazard production systems’ (p. 157) was heavily biased towards technology while systematic or contextual investigation received very little attention. This is problematic as the risks associated with errors in high-hazard organizations (e.g. mining companies) preclude the option of learning by trial and error, thus prompting an inordinate but justified reliance on minor, ad hoc incidents or accidents as primary vehicles for learning (Carroll, 1995; Sitkin, 1992; Weick, 1987). Naturally, and in compliance with mining standards, every incident in a mining environment is the subject of rigorous investigation. This is usually undertaken by an investigating team comprised of safety personnel and the relevant line supervisors, who will systematically investigate and reconstruct the incident, relying, among other, on available eye witness accounts. New procedures and standards typically follow from the insights generated during the investigative process and these are usually incorporated immediately into existing training programmes. The intent, process and character of the inquiry into the incident (e.g. accident) are such that the root causes of the incident / accident should be established unambiguously. Yet, despite this procedural framework, ‘learning’ from such investigations do not meaningfully reduce the number of injuries and fatalities, prompting skepticism around the organisational learning capability (i.e. sense-making capability – Battles et al., 2006; Sitkin, 2010) of the mining community. The ongoing injuries and fatalities suggest an inability to develop an appropriate understanding of the circumstances that give rise to the accidents

(i.e. an inadequate sense-making capability). Secondly, and undergirding the imperfect nature of investigative procedures, is the readily acknowledged notion that sense-making is idiosyncratic. Consequently, the processes whereby employees develop an understanding of confusing events and information are decidedly individualistic – to the extent that marked differences are observed in the meanings that they attach to the same situations or events (cf. Helms Mills, Thurlow & Mills, 2010; Weick, 1995). Moreover, sense-making is a directional process in that it defines the framework through which, for example, management views and interprets otherwise seemingly inconsistent and ambiguous situations, events or information (Möller, 2010, p. 365). A caveat here is that sense-making may not always be helpful and may actually contribute to inappropriate conclusions (Stein, 2004). For our purposes, sense-making is regarded as those cognitive processes through which individuals develop/construct a plausible, logical and coherent account of an otherwise illogical, incoherent and sudden or unexpected event.

Accident investigations ('incident reviews') are technically the only practical approach through which mining officials are able to learn about organizational inefficiencies and systemic risks, but as several researchers indicate these analytic procedures are fundamentally flawed and incapable of revealing the key underlying causes of such accidents. The impact and profound ramifications of mining injuries and fatalities on the other hand necessitate an urgent consideration and exploration of any means that could ultimately reduce the incidence of these accidents. From this perspective the current research with its underlying concern with reducing mining injuries and fatalities, constitutes a critically important perspective as, after all, any injury or fatality is one too many! It is in this regard that alternative theoretical frameworks and/or approaches may assist with improved sense-making and in so doing shed more light on what appears to be a dynamic equilibrium between safety-related investment (expenditure) and ongoing injuries and fatalities, i.e. facilitate greater awareness of the avoidability of mining accidents and thus injuries and fatalities.

Against this setting the researchers hypothesized that sense-making around mining accidents are bound to be inadequate, resulting in fragmented and incomplete data and hence inappropriate conclusions. This it is argued, is particularly true for accident investigation panels who rely on post-accident 'evidence' led by employees impacted by the change. The current study consequently aimed to explore the causes of a recent '*fall of ground*' accident in a platinum mine during which a mining employee (team leader) was injured. Beyond this, and consistent with an interpretive research paradigm, the researchers refrained from formulating specific, pre-emptive propositions (to avoid bias and conceptual contamination), other than presuming that the use of a quasi-phenomenological approach will surface rich data which should allow more valid conclusions with regard to the cause of this accident and provide an expanded perspective from which to approach and consider mining accidents in general.

## EMPIRICAL EXPLORATION

### Research setting

The research was conducted in a typical mining operation in one of the 77 underground mineral mines in South Africa<sup>1</sup>. The work methods and work environment of mining have hardly changed over the past three centuries or so and mining employees are still confronted by challenging working conditions and as a result very demanding physical work. Work sites are noisy, cramped, dark, hot and wet, which further complicates an already dangerous work environment. Geological shifts or disturbances often exacerbate these working conditions. Understandably, under such conditions miners will tend to be hard and mining cultures generally tough and unrelenting. Work areas tend to be dispersed, usually requiring extensive walking from one confined space to another, which places additional strains on supervisors who are usually responsible for four to six such areas. These practicalities often imply that supervisors cannot attend to all work areas simultaneously and as a result mining teams are frequently left under the supervision of (what is referred to as) a team leader only.

The commonly understood task of 'mining' (the ore body) essentially revolves around transporting people to and from the workplace, erecting infrastructure and installing needed support facilities such as water, electricity and ventilation systems, but also specific initiatives such as blasting *raises*<sup>2</sup>, *ledging*, and equipping *stopes*. Traditionally in the South African mining environment and in the mine used in this study, these tasks are performed by separate *specialist* teams e.g. *ledging* teams, who prepare the work area for the mining teams.

Against this context the current study focused on a *fall of ground* or *roof fall* accident (Perrow, 1999) - also referred to as a “Hanging wall” accident. In mining terminology the *hanging wall* and *side wall* refers to the roof and side walls of the area from which the ore is taken, respectively. On an annual basis this category of accidents accounts for the greatest proportion of fatal accidents in South African mining (approximately 35% with 86 and 76 fatalities in 2006 and 2007 respectively – DME, 2008, p. 23). During a “*Fall of Ground*” (FOG) incident or accident the overhead ground and rock formations, and often those on the sides, cave in.

## Design and Methodology

The study was approached from within an interpretive research paradigm and based on the ontological premise that reality is socially constructed. It is argued that mining employees interpret and respond to mining accidents on the basis of personal perception and sense-making and it is these idiosyncratic views that are the target of the study’s exploratory focus and objectives. Knowledge of the causes and dynamics of the *fall of ground* accident is embedded in employees’ individualized sense-making actions i.e. their meaning construction of the accident. Against these ontological and epistemological assumptions the researchers opted for a field study design with face-to-face, semi-structured (audio-taped) interviews with mining officials and a focus group discussion with mine workers - all of whom were directly or indirectly involved with the accident being researched. Relevant supporting documentation and archival data, where available, were used to supplement interview data.

A purposive sampling strategy using specific criteria for selecting / excluding respondents was pursued. Functional proximity to the accident was the first criterion and, as a result, all mining officials who had some role or responsibility that linked him/her to the accident, work area, or the employee who was injured, were approached. This meant that employees who were part of the work team or were located in the chain of command above the work team were involved. The second criterion required that respondents should also be familiar with the specific *fall of ground* or *hanging wall* accident. As a result, in-depth, semi-structured individual interviews were conducted with five (5) senior managers (members of the Mine management team with a responsibility for employee safety), three (3) successive in-line supervisors above the injured employee, the injured employee himself (a team leader), and the technical advisor for the specific shaft. A focus group discussion was conducted with the work team (9 members) that reported to the injured employee (the team leader).

The researchers asked each respondent to provide a step-by-step account of the accident and explored the respondent’s understanding of the causes and consequences of the accident. This was also the focal point of the focus group discussion. Prior to commencing with the interviews respondents were again made aware of the objectives and methodology of the research and the confidentiality of the data and anonymity of the respondents. They were also again offered the opportunity to withdraw from the research should they desire this. The data obtained from the interviews and focus group discussions were then transcribed and basic content analysis, using an open coding approach, undertaken. The data were analyzed by two independent researchers who then met to review and resolve any discrepancies that were in evidence after the independent analyses. Several important perspectives consequently emerged and these are briefly presented in the ensuing section.

## Empirical observations

Thematic content and empirical observations derived from interview data (through content analysis) are introduced with a brief overview of the ‘fall of ground’ accident. This is followed by an account of the reported causes of the accident and a tabular depiction of causes as nominated by the various respondents.

### The ‘Fall of Ground’ accident

On the morning of 19 February a Team Leader (TL) of a *ledging* team was injured while inspecting the roof or ceiling area (the ‘hanging wall’) for loose rock formations in a newly blasted stope. One specific rock seemed problematic to the Team Leader who requested that the Miner<sup>3</sup> be called to verify his concern. The team leader nonetheless continued testing the ceiling area by prodding it with a steel rod or “gwala”, when the rock suddenly dislodged and fell on him, causing him serious injury. Members of the team immediately assisted the injured team leader who was subsequently evacuated for medical treatment. In accordance with mining

regulations the work area was immediately closed down for investigative purposes. The latter typically comprises an investigative panel that conducts interviews with key employees and mining officials (often as many as 20), usually for a period of two or more days<sup>4</sup>.

### Causes of the ‘Fall of Ground’ accident

In response to the researchers’ questions about the primary cause of the accident (the dislodged rock that injured the Team Leader), interviewed employees and officials presented a rich mosaic of different yet intertwined and overlapping cause-and-affect links, which did little to establish the exact cause of the accident with any measure of certainty (see Table 1).

Some respondents were of the view that pre-existing geological "faults" (or *ground conditions*) in the mining area were the root cause of the accident, while others considered *damage to the ‘hanging wall’* as a result of blasting (explosives) by mining teams either 6 to 12 months before or, more recently (the previous day), as primary causes of the accident – especially given the prevailing ground conditions. The *Mine Overseer* affirmed the role of ground conditions but stressed that *incorrect work methods* and *inadequate training* were central considerations. He indicated that the *raise* team did not properly install roof bolts, which are used to attach various layers of unstable rock to the more permanent geological formations. *Employee non-compliance* with the prescribed procedures was cited on the basis of the known difficulty of getting the required volume of cement into the holes drilled for the roof bolts - evidenced in the number of unused cement bags observed in the work place (to curb wastage and reduce costs exact quantities of materials are issued to workers in accordance with previously established requirements). While concurring with this perspective, the *Shift Supervisor* also indicated *coercion* by supervisors as root cause (e.g. threatening the mining staff if production delays or stoppages occur). The issue of coercion is probably best accounted for as *pressure for production*, which is considered by several officials as the primary underlying cause of the accident. This of course raises the issue of power and hence supervisory and managerial roles in the mining process. *Shift supervisors’* work norms and practices were implicated as a significant cause of the accident. Moreover, several safety officers in particular argued that the accident commenced with *inconsistent* or *ambiguous* safety-production ‘*messages*’ by *senior managers*. In the latter instance, both safety and production messages are firmly communicated but without establishing a clear hierarchy of importance or, arguing the overriding importance of safety yet issuing instructions that reveal production as the primary and overriding concern. Apart from these different perspectives on the fundamental cause of the accident, employee *speed* and *haste* was also indicated as a main cause of the accident. This in turn related to various *human factors* that were considered by some to be the origin of the accident. *Fatigue* as a result of demanding physical labor and short rest periods compounded by the fact that a large contingent of employees on a daily basis travel long distances between the mine and their residences with public transport and get very little sleep was indicated by respondents as being quite common. It was also pointed out that production interferences (e.g. as a consequence of insufficient materials / equipment) can introduce delays which reduce the time within which the daily production target (‘call’) has to be achieved. Employees may only leave their work areas when the daily ‘call’ has been achieved. This often results in time overruns with employees consequently missing their public transport, which introduce associated, added difficulties e.g. the employee walking home. This takes up an inordinate amount of time and further reduces sleeping time, exacerbates fatigue and increases the probability of accidents. To avoid delays beyond normal closing times and be in time for public transport, the employees as a consequence start taking *procedural ‘shortcuts’* which will allow them to achieve the production call despite interferences. Commonly acknowledged by officials and employees, but not necessarily recognized as a human condition that contributes to accidents (i.e. *human factors*), is the *impact* and *psychological trauma* of mining accidents. A *fear* of underground work and *stress* are for example mentioned by *focus group members* and the *mine overseer* as primary considerations contributing to mining accidents. An outline of respondents’ accounts of the fundamental cause of the accident, with supporting narrative (excerpts), is presented in Table 1.

**Table 1: Perceived central causes of the ‘Fall of Ground’ accident**

No.	Causes of the accident	Illustrative narrative <sup>a</sup>
1	Pre-existing <b>geological ‘fault’</b> line	<p>“...the ground is not good as the chrome is dominating in this area and might result in unstable ground (falling rocks)” (Resp. 6, Injured TL)</p> <p>“Due to our understanding and experience on the mine, the place was safe and this occurred as the result of natural soil events and was beyond human control” (Resp. 5, FGT)</p>

No.	Causes of the accident	Illustrative narrative <sup>a</sup>
2	<b>Earlier damage</b> to the geological structure (6-12 months ago)	<p>“...the accident basically happened six months ago, or happened a year ago when they mined during the development stage, you understand? Its..., its where your accident started and, and hmm...” (Resp. 1, CSO)</p> <p>“Hanging wall was damaged six months back, injured badly”. (Resp. 4, MO)</p>
3	<b>Recent damage</b> (2 <sup>nd</sup> blasting) to the geological structure previous day	<p>“On this day, it was our second blast in the area and I think this had a negative impact on the incident” (Resp. 6, Injured TL)</p>
4	<b>Poor workmanship</b> (incorrect work methods in terms of drilling; attaching roof bolts)	<p>“Not using the air leg extension in the broad UG2 reef of 2m, forces you to drill upward and in so doing damaging the hanging wall”. (Resp. 4, MO)</p> <p>“Roof bolts are not properly installed, some are loose and do not even have cement on it. It takes 9 bags to fill a 2,2 hole, but they cannot get it all into the hole... they know it does not work and leave it as such” (Resp. 4, MO)</p>
5	<b>Poor training</b> in different mining methods	<p>“Developers at Merensky used to drill 10 cm above the reef. When drilling UG2 they want to do the same, which leads to damage to the hanging wall - ... never coached to do it right” (Resp. 4, MO)</p>
6	Employee <b>non-compliance</b> with prescribed policies, procedures and standards	<p>“All the time people know... in 80% of the cases, of “fall of ground” incidents, they have identified the risk before the time, but ignored it. Yes, sometimes they are forced to carry on” (Resp. 2, SS)</p>
7	<b>Negligence</b> or unsafe conduct by individuals or teams e.g. speed, haste	<p>“It’s faster to install one eyeball and attach snatch blocks than it is to install three. A chain and snatch blocks ...negligence and hastiness to conclude the work... he knows he is taking a chance, but still does it” (Resp. 3, FTSR)</p> <p>“Guys are in a hurry to finish especially when there were shortages of material/resource. They do not want to wait at the ‘green areas’... they will miss their transport, they have paid for monthly public transport and if late they must pay for a taxi” (Resp. 4, MO)</p>
8	<b>Pressure</b> for production	<p>“If you talk to the production guys, they display a very strong production first and then safety” (SM:AG)</p> <p>“People only think of the production...” (Resp. 1, CSO)</p> <p>“If a person does development work and production, for argument’s sake, he will leave the development [work] because a person only does work that drives his bonus in the short run” (Resp. 2, SS)</p> <p>“You can be as safe as you wish, but if the platinum does not come out of the ground, none of us will have work” (Resp. 7, SM:AG)</p>
9	The quality of <b>supervision</b> supervisor norms, practices	<p>“The Shift Supervisor creates norms by what he allows” (Resp. 2, SS)</p> <p>“...depends on the person above him [supervisor] if he’s really very strict, how safe his work is” ((Resp. 2, SS)</p> <p>“I think the miner/shift supervisor can do better at preventing incidents as they have better skills than employees at operator levels. They are blasting certificate holders” (Resp. 6, Injured TL)</p> <p>“Currently our suggestions are not listened to by our leaders and we are only instructed to do the job” (Resp. 5, FGT).</p>

No.	Causes of the accident	Illustrative narrative <sup>a</sup>
10	<b>Fear</b> of supervisors (coercion)	<p><i>"The shift bosses force us to work in dangerous places..." (Resp. 1, CSO)</i></p> <p><i>"... and he says his shift supervisor told him that he would kill him if he does not keep that hole open" (Resp. 7, SM:AG)</i></p> <p><i>"...and when they leave, or look away, he just continues to do it [a life threatening act] because he is so afraid of his shift supervisor, who had said he will kill him" (Resp. 7, SM: AG)</i></p> <p><i>Yes, sometimes they are forced to carry on" (Resp. 2, SS)</i></p> <p><i>"If he does nothing I might give him a hiding tomorrow or something similar... this is the way it is..." (Resp. 2, SS)</i></p>
11	<b>Ambiguous</b> safety-production 'messages' by management	<p><i>"People preach one thing and do another - like talking about safety and then driving at 170 km past you on the road" (Resp. 3, FTSR)</i></p> <p><i>"You can be as safe as you wish, but if the platinum does not come out of the ground, none of us will have work" (Resp. 7, SM:AG)</i></p> <p><i>"...it is difficult to get the right message through; the monetary worth of high production is far more than the penalties related to safety" (Resp. 10, GFM)</i></p>
12	<b>Human Factors</b> - fatigue, lack of pride, maliciousness, personal problems, fear of underground work, stress, trauma, fear of prosecution, inattentiveness e.g. of the injured employee	<p><i>"Incidents, especially if you look at a stoping, in many cases it is very difficult, it is not only a case of being difficult, but it is hard work, the man is exhausted and he wants to now, he wants to finish" (Resp. 2, SS).</i></p> <p><i>"It is actually blatant maliciousness that allows incidents to take place"(Resp. 3, FTSR)</i></p> <p><i>"It could be that the person has personal problems and that his mind is not consistently on the job...he could have financial problems..." (Resp. 3, FTSR)</i></p> <p><i>"No pride in their work - years ago it was as if the mine was your own" (Resp. 1, CSO)</i></p> <p><i>"Incidents are not good, we have seen people die or getting injured and as a result this leaves a lot of stress, trauma and fear of returning to work underground again" (Resp. 5, FGT)</i></p> <p><i>"I experienced FOG [fall of ground incident] when I was still working at the gold mines and I injured my hand – I have prayed that this doesn't happen again but it happened and it's a bad experience because you don't just forget about it" (Resp. 5, FGT)</i></p> <p><i>"The team now is negative and afraid to enter the mine again. They will wait for a higher level to make the place safe, but they must see it physically being done... you can see it touches them... affects their humanity" (Resp. 4, MO)</i></p> <p><i>"...most of the time that an incident occurs the guys stop the panel, so you lose the blast for the day, naturally. Hmm... hmm... I think it creates a bit of panic... because hmm, hmm... if you know... what the guy did wrong, am I not doing the same thing wrong? Am I going to be prosecuted?" (Resp. 1, CSO)</i></p>

*Note.* Illustrative narrative represents excerpts taken from transcribed interview and focus group data.

<sup>a</sup>Job title acronyms used: *TL* - the injured team leader; *FGT* – the focus group comprising the team under the supervision of the TL; *SS* – shift supervisor or 'shift boss'; *MO* – mine overseer; *FTSR* – full time safety representative; *CSO* –chief safety officer; *SM:AG* – safety manager: auditing and governance.

Generally the observations highlighted in Table 1 reveal substantial parallels with similar research, and in particular an earlier study by Souder (1988), which involved 60 carefully selected fatal-accident cases. Of the nine (9) variables that contributed in a statistically significant manner to fatal mining accidents, five (5) were echoed in the current study: supervisors evidencing a low safety norm; the absence of cautious behavior when performing tasks; victims failing to act in avoidance or evading the danger; the inability of victims to extract

relevant information from a complex setting or background; and inadequate regard for personal safety (Souder, 1988, p. 6, Table 3).

Although first impressions suggest notable convergence around the perceived cause(s) of the accident, a conclusive *root cause* in this situation is ruled out because of the level of ambiguity that envelopes the accident. Indeed, nuanced differences in mining officials' perspectives, on closer inspection, emerge as consequential variation around the root cause of the accident. This, incidentally, is characteristic of systems with complex interactions (such as mining) and is "...most apparent in roof falls, or 'falls of ground' as they are usually called, a frequent and dangerous accident" (Perrow, 1999, p. 250). Typically serious or "surprising" events in institutional settings of this nature develop over a period of time from a combination of multiple causes and circumstances rather than a single cause (Carroll, 1995, p. 181). There is clearly no novelty in the observance of multiple contributing factors to mining accidents (despite accident investigators' pursuit of this goal), but at the same time there is no unambiguous statement of cause. This not only suggests difficulty in making sense of mining accidents but comments on the adequacy of the vehicles, e.g. accident investigations, through which sense-making (and organizational learning) has to occur. Against this context, mining officials' sense-making in respect of this accident warrant further attention.

#### Mining officials' sense-making of the 'Fall of Ground' accident

In pursuit of greater clarity the various causes nominated by the respondents (Table 1) are further summarised and categorised in Table 2.

**Table 2: Sense-making around the mining accident: Perceived central causes**

No.	Salient causes of the accident	TL	SS	MO	FTSR	CSO	SM:A G	GFM	FGT
<b>MINING TERRAIN (GEOLOGICAL STRUCTURE)</b>

*Note.* Job title acronyms employed refer to the following: *TL* - the injured team leader; *FGT* – the focus group comprising the team under the supervision of the TL; *SS* – shift supervisor or ‘shift boss’; *MO* – mine overseer; *FTSR* – full time safety representative; *CSO* –chief safety officer; *SM:AG* – safety manager: auditing and governance.

From Table 2 it is evident that sense-making by employees working in the stopes (team leader and team members) position the accident as a consequence of geological features and earlier damage to the hanging wall, but do not acknowledge broader systemic and dynamic influences on safe work practices (e.g. managerial conduct). By contrast, senior management’s sense-making of the accident is structured around employee workmanship (negligence and non-compliance with work procedures), but sense-making at different managerial levels appear to be inconsistent. Sense-making by supervisory management (shift management) places managerial policies and practices at the centre of the accident. Contextual considerations (geological features and the impact of mining operations) and human factors are virtually nonexistent in managerial accounts (sense-making) of the accident. In a similar vein, sense-making by respondents in the specialist safety roles (safety support function) tend to locate the cause(s) of the accident in the domains of managerial conduct and human factors, with minimal awareness of contextual (geological) considerations. These observations underscore both the idiosyncratic and directional i.e. role-based and framework-defining nature of individual sense-making (see Helms Mills et al., 2010; Möller, 2010; Weick, 1995).

However, accidents occur within, and are inextricably intertwined with a specific setting. Perception and hence sense-making, being person-specific and selective, consequently extends to the work environment and accident setting. Respondents' narratives were scanned for evidence of inadequate or compromised perception of the accident environment as this may further impact on the accuracy, validity and consequently utility value of ‘sense’ (understandings) that may emerge during sense-making attempts. Evidence-based themes of such constraints, usually of an intrapersonal, interpersonal and/or institutional nature, were indeed observed (see Table 3 for illustrative excerpts of respondent narrative).

**Table 3: Constraints on sense-making**

No.	Constraints (Themes)	Illustrative narrative <sup>a</sup>
1.	Anticipatory, forward thinking	“Another thing with our people is that they frequently <b>do not think ahead</b> , they do not think of the consequences” (Resp. 2, SS) “At the lower levels they simply <b>do not think ahead</b> ” (Resp. 7, SM:AG)
2.	Reflective, retrospective thinking (and causality)	... I think the guys <b>do not think that far back</b> ...we could have prevented this accident at that time already... (Resp. 1, CSO)
3.	Learning from experience;	“Hmm... well it worries me a bit that <b>the repetitive things</b> ... hmm the guys do not <b>learn</b> from their mistakes” (Resp. 1: CSO)

No.	Constraints (Themes)	Illustrative narrative <sup>a</sup>
4.	Automated, routine-driven behavior (mindlessness linked to causality).	<i>"So the guy is now <b>used to doing the work in this way</b>, so he's been doing it wrong for some time...and this one time, it caught up with him" (Resp. 1, CSO)</i> <i>"The guy's doing something and he wants to finish it, then <b>he stops thinking, he's just doing...</b> that's when somebody gets hurt" (Resp. 2, SS)</i>
5.	Perception and mindfulness	<i>"...then you still have to walk 15 km... you know, ...you know... <b>you do miss a few things</b> (Resp. 1, CSO)</i>
6.	Attentiveness / mindfulness	<i>"People only think of the production and <b>do not stand back and pay attention</b> to their surroundings." (Resp. 1, CSO)</i> <i>"It could be that the person has personal problems and that <b>his mind is not consistently on the job...</b>he could have financial problems..." (Resp. 3, FTSR)</i>
7.	Inappropriate information processing (dissonance)	<i>"In 80% of the cases, of 'fall of ground' incidents, they have identified the risk before the time, <b>but ignored it.</b>" (Resp. 2, SS)</i>
8.	Institutional practices that stifle the unencumbered flow of relevant information.	<i>"It is possible <b>if there is a flow of communication</b> between leaders and employees and suggestions from all angles are taken into consideration" (Resp. 5, FGT)</i> <i>"Currently our suggestions are <b>not listened to</b> by our leaders and we are only instructed to do the job" (Resp. 5, FGT)</i> <i>"I think the guys <b>hide things away</b>, just because they do not want it to go to the topmost guy, so everywhere <b>information is being blocked</b> and in the end he does not develop a 'nice' picture" (Resp. 7, SM:AG)</i> <i>There is still a major <b>culture of hiding things</b> (Resp. 7, SM:AG)</i> <i>"I feel that the people immediately <b>tries to cover up</b> the issue as if it was not that serious. You know... and I think it is fear" (Resp. 1, CSO)</i>

Note. Bold emphasis added.

The themes indicated in Table 3 suggest that constraints to sense-making are located largely in the areas of *individual cognition* (attentiveness or mindfulness, perception, thinking or reflection, analysis) *employee behavior* (especially automated behavior – or 'scripts' cf. Ashforth & Fried, 1988) and *institutional practices*. Contrary to the dominant behavioral frame with which respondents portrayed the nature and causes of the accident (Tables 1 and 2), the illustrative excerpts in Table 3 draw attention to the cognitive 'world' that informs respondents' accounts. These comments are also at odds with the indicated 'cognitive behavior modeling' (*Group Effectiveness Manager*), and specifically the 'Stop, Think, Fix' mantra (*Resp. 3 FTSR, Resp. 2 SS*) that is taught at mining training centers. If an open systems frame is superimposed on the comments in Table 3, it becomes apparent that several deficiencies characterized employees' sense-making processes in respect of this accident. Sense-making is viewed here as consisting of data gathering, processing and exporting or outputting a synthesized understanding or interpretation of the data. So, for example, the perceptual sampling of the work setting (data input process) appears to be impacted by inattentiveness, reduced presence of mind (mindfulness) and various distracting factors of a contextual or personal nature, further bolstered by automated and routine-driven behavior or 'scripts' (see themes 6, 5 and 4, Table 3). Even if cognitive processing was optimal, the potential value or sense that could be obtained from the analysis would be limited as a result of impoverished input data. Commentary, however, suggests that cognitive processing is not optimal. Active cognitive engagement and manipulation of input data appear not to be in evidence, gauging by the limited reflection ('thinking' - see themes 1 and 2) and flawed analysis or 'processing' (themes 3 and 7) conveyed by the commentary. Accurate and effective onward transmission of employees' synthesized understandings (emergent 'sense' – the output process) in respect of the mining accident are unlikely because of the reported managerial disregard for employee perspectives, and the institutional tendency to suppress undesirable data (see Theme 8). Compared to the dominant technology 'bias' of accident investigations (Perrin, 1995) these observations then suggest the need for an elaborated frame-of-reference when analyzing and making sense of mining accidents. This has several implications for ongoing research and institutional management, which are briefly considered in the ensuing section.

## PERSPECTIVES AND IMPLICATIONS

## The contribution of a sense-making perspective

Researchers have approached the root causes of mining accidents from many perspectives but very little attention has been directed at this ‘trend’ from a sense-making perspective. The adoption of a sense-making lens in this (case) study of a nonfatal mining accident has proved beneficial in several ways. Among other, it has surfaced multiple intertwined causal linkages, both temporally and spatially removed from the accident. It also revealed the idiosyncratic and contained nature of individual interpretation frames and how these impose boundaries on the number and range of interpretation options available to those employees associated with the accident. Compounded by impoverished communication practices (see theme 8, Table 3), this naturally precluded an extended appreciation of the dynamics involved in the accident and adversely impacted both individual and collective sense-making processes. Although several mining officials seemed to be aware of contributing circumstances beyond the immediate accident setting, they do not appear to have consciously sampled the total field, or to detect the extended frame and multiple linkages that tie together the potential causes they nominated (Table 2). This absence of systemic awareness prior to the accident is not uncommon (see also *systemic blindness* or the inability to detect crucial indicators of an impending crisis - Van Tonder, 2006). At the same time it is consistent with the position that sense-making during crises will be compromised because communication and feedback channels are constricted (cf. Theus, 1995; Weick, 2001). Multiple considerations contribute to the inability to anticipate impending crises, catastrophes and, in this instance, mining accidents. Systemic awareness and an appropriate internalized understanding of the organization are central considerations in preventing accidents, but ‘blindness’ are influenced also by the impact of past success (and extended accident-free periods in the mining setting), denial, distortions, self-deceit, paradigmatic fixation, and several other (cf. Brown & Jones, 2000; McLarney, & Dastrala, 2001; Van Tonder, 2006). In this mining accident employees (at best) grasped fractional linear sequences of cause-and-effect relations but failed to register and make sense of the multiple, interrelated causes of the accident which were dispersed across the entire mine system - both spatially and temporally. The contribution of sense-making however extends beyond this elaborated perspective and suggests that formal accident investigation procedures and the policy changes that may follow from this will unavoidably be impacted.

## Accident investigations and flawed institutional sense-making

Accident investigations (incident or event reviews) represent one of the very few institutional sense-making instruments available to mining officials. The application of a sense-making perspective however suggests that this instrument, in its current form, is prone to significant flaws and, except for the simplest of incidents or accidents, will not yield the required knowledge and understanding to prevent similar accidents from recurring. In this study the respondents closest to the accident (including the injured team leader) were engaged and being the most important sources of data on the accident, these employees invariably lead evidence at accident reviews.

The nature of sense-making processes is such that individual employees (and these respondents) impose cognitive frameworks on accidents that introduce logic of some form to connect the various information strands to which they have access. From this a ‘coherent understanding’ is developed that aligns more with their belief systems than with actual circumstances, conditions and features of the accident. Indeed, employees’ sense-making are derived from their person-specific and belief-based perception and interpretation of the accidents features (Brown & Jones, 1998; Helms Mills et al., 2010; Möller, 2010). Of particular importance is that the roles occupied by employees within the system will influence the vantage point, scope, breadth, and depth of the incumbent’s accident perception (cf. Möller & Svahn, 2006 who argue that actors’ ongoing sense-making could be constrained by narrow role-based outlooks). As a result employees’ representations of facts will constitute a post sense-making and hence a personalized and unavoidably altered representation of the facts... to enable them to understand and cope with the sudden or surprising event (accident). Their accounts or ‘sense’ of what happened are primarily retrospective reconstructions of the event, characterized by logic and coherence (cf. Battles et al., 2006; Weick, 1995). However, as Van Tonder (2004, p. 187) indicates, employees’ perceptual appraisals of ambiguous situations (e.g. accidents) will invariably prompt misperceptions, which then promote further cognitive elaboration (part of the retrospective reconstruction of ‘understanding’ of what transpired) and which is invariably subject to multiple constraints such as inaccurate or incomplete perception and various

cognitive distortions (recurring reasoning errors – see Van Tonder, 2004, pp. 119, 187). Emotive states ensure that these constraints are pervasive during the sense-making process and in this manner contribute to the idiosyncratic nature of individual accounts of the ‘facts’. This then constitutes the data platform for collective, institutional sense-making initiatives such as the accident investigation panel. This of course raises questions about the validity and reliability of the panel’s observations.

## **Mindfulness as precursor to sense-making**

As useful as retrospective sense-making may be, in the accident considered in this case it did not allow for a conclusive and coherent understanding of the root causes of this mining accident to emerge. Indeed, appropriate degrees of sense-making as a practice, procedure or habit in the lead up to and including the accident are not apparent – as the perspectives obtained from the respondents indicate. Commentary of the various functionaries (themes 1 to 6, Table 3) are indicative, rather, of behavior that “...is performed automatically or mindlessly thus underscoring the oft-noted limitations of cognition in task and role-based behaviors” (Ashforth & Fried, 1988, p. 322). Mindless behavior entails entrenched routines or ‘scripts’ (cf. Ashforth & Fried, 1988) of sequenced behavior that are enacted in seemingly similar (repetitive) situations and are reinforced with every occurrence where the automated enactment of the ‘routine’ appears to work successfully i.e. without adverse consequences. Eventually employees habitually apply automated routines to situations that appear similar but are more intricately connected and have greater risk attached (but remain undetected), resulting in a significant failure, accident or catastrophe (e.g. in situations of ‘tight coupling’ – Perrow 1999; or ‘descriptive complexity’ – Van Tonder, 2006). To avoid such situations Weick and Roberts (2001) suggested the notion of *collective mind* whereby employees have to interrelate substantially to *construct* a commonly understood and mutually shared ‘field’ or environment. However, collective mind in itself may be an insufficient condition for the timely sampling of accurate accident-relevant information – if Krieger’s (2005) position on *collective mind* and *shared mindfulness* is considered. Unlike collective mind that concerns the social construction of a common field or environment i.e. the accident and its context, shared mindfulness propounds the sharing of an *accurate* depiction of the ‘field’ or environment (operating context) in which the accident occurred. Shared mind has the added feature that employees would simultaneously be in an “attending state of perceiving that is continually open to incoming data” (Krieger, 2005, p. 156). Given the strong power-production cultures evident in mines, anything less runs the risk of promoting what Geiger and Antonacopoulou (2009) refer to as self-reinforcing and self-legitimizing narratives or ‘truths’ that are not questioned and which will promote ‘blindspots’ and organizational inertia.

## **Implications for institutional management**

Application of a sense-making framework to the mining accident explored in this study highlights several risk areas that are not pertinently identified and addressed in studies of safety climate and safety performance, but by the same token not adequately attended to during institutional accident investigations either. The predominantly behavioral and technology foci of these respective processes do not adequately account for the perceptions, interpretations and subsequent personal meaning creation, i.e. sense-making of employees. The latter, as argued, tacitly but forcefully inform workplace behavior. The risk however is not limited to accuracy and adequacy of individual sense-making only, but extends to the *collective* construction of an *accurate* representation of the accident circumstances, and these are largely premised on individual understandings of the event.

The challenge for Mining Houses consequently resides firstly in the cultivation of an appropriate, habitual state of awareness among all those involved in these situations and, secondly, to establish accurate and authentic information sharing in century-old power-and-production cultures.

To secure a state of collective and shared mindfulness a significant change in managerial mindsets and attitudes, with a substantive commitment to a safe, fatality-free work environment (Towsey, 2003) reified through appropriate systems and policy changes, are mandated. An approach that embodies the challenges of cognition, especially around improved accuracy of observation skills and perception, may assist in cultivating greater mindfulness and consequently contribute to improved individual and collective sense-making. Formal management education could certainly be reviewed and augmented to incorporate elements of systemic

awareness; mindfulness and hyper vigilance (cf. Van Tonder, 2006) – acknowledging also that the impact of conventional training in this setting is not entirely effective (or certain - cf. Monforton & Windsor, 2010). Much can be gained from a careful consideration of the air traffic control industry where situational awareness and related skills have been a primary focus for decades (cf. Carstens et al., 2008; Van Tonder, 2008). At the same time extensive training and retraining – to the point of habit - of non-managerial mining employees in observational and cognitive skills beyond the current ineffectual ‘Stop, Think, Fix’-mantra of the mining community, would serve a powerful role. Indeed, from this account it seems necessary to enforce an ‘Observe and Think’ component before invoking the mantra.

## CONCLUDING PERSPECTIVE

On the basis of the high incidence of occupational injuries and fatalities, the Mining industry is generally considered to be the most dangerous employment sector. Political sensitivity around injuries and fatalities in the South African mining environment has steadily increased over the past decade and likely to become a worldwide concern. The probability of a single fatality at some stage in the future becoming a tipping point and prompting political intervention and/or the premature closure of otherwise productive and profitable mining operations cannot be disregarded. In an attempt to gain insight into the apparent equilibrium that seems to have stabilized around safety-related investment (expenditure) and ongoing injuries and fatalities in South African precious metal mines, the current study set out to explore the causes of a ‘fall of ground’ mining accident, from a micro-level sense-making perspective. The qualitative research methodology employed in this very focused and contained study of a “hanging wall” accident preclude any form of generalization, but the findings do suggest that mindsets and habits are far more pervasive and enduring than is generally acknowledged. Indeed, human neglect and error in the domains of perception, mindfulness and sense-making currently manifest in ways that will prevent appropriate institutional sense-making with regard to accidents. This will prevent needed changes in relevant policies and practices and unless a meaningful, sustainable commitment to mining safety is made, the lure of gold and platinum will lead through well-trodden ground... and this is bound to be fatal for some unsuspecting and probably undeserving employee.

## ENDNOTES

1. The mineral industry in South Africa can be dissected into five broad categories i.e. gold, the precious metals group (PMG), diamonds, coal and vanadium. The Department of Minerals and Energy (DME, 2008) suggests that the safety hazards in the Gold and Platinum sectors are predominantly associated with rock falls and rock bursts as a result of mining at great depths; the interaction of people and machines in confined spaces; falling materials and rolling rocks; inundations by mud or broken rocks; falling into excavations or from structures; exposure to dust, gases and fumes; explosives and fires; seismicity and high temperatures (up to +60°C if uncontrolled).
2. Terminology commonly in use in the mining environment and used in this paper include:  
***Hanging Wall***: Refers to the ceiling of an underground mining tunnel or ‘stope’. New ‘tunnels’ are developed through blasting with explosives, clearing out the metal carrying ore and reinforcing the ceiling / hanging wall with wooden supports.  
***Footwall***: The ground surface of the working area (where the ore is extracted)  
***Stoping***: The activity of removing ore, which creates stopes (tunnels in the mining area)  
***Raise***: A tunnel that is cut into the rock to link work areas, enable movement of mining staff between work areas, and bring fresh air into the work area.  
***Ledging***: Is the activity opening and equipping a mining tunnel or stope for production purposes.
3. Team Leaders constitute the first level of supervision and are usually responsible for the direct supervision and safety of a team of 12 employees. Several team leaders (five or six) report to a Miner who reports to a Shift Supervisor. The latter supervises between four and six miners and in turn reports to a Mine Overseer with a similar span of control (five or six Shift Supervisors).
4. Clarifying and contextual commentary provided by the *Group Effectiveness Manager* of this platinum company, during an in-depth review of the data and empirical observations pertaining to this specific accident.

# **A RESEARCH AGENDA FOR THE IMPACT OF MATERIAL VALUES AND LIFE SATISFACTION IN NON-DECEPTIVE COUNTERFEIT LUXURY BRANDS CONSUMPTION**

**Viet Dung Trinh and Ian Phau**  
**Curtin University, Australia**

## **ABSTRACT**

*Counterfeiting of luxury brands has been growing steadily in the past few years in spite of to the joint efforts of individual organizations and law enforcement agencies. The issue of counterfeit consumption seems to remain a permanent feature of the marketplace for time to come. In recent years, counterfeit luxury brand consumption continues to expand worldwide, and it is now sometimes regarded as a common act of consumption. Without reservation, counterfeit luxury brands are among the most critical issues for not only genuine luxury brands but also law makers around the world.*

*The main purpose of this conceptual paper is to extend existing literature on counterfeiting of luxury brands by building a research model to examine the influence of materialism and life satisfaction on consumer willingness to buy counterfeit luxury brands (WTBCLB).*

## **BACKGROUND**

Counterfeit is a term used to describe any product that bears names, signs, content or trademarks that identical from those registered to another party (Grossman and Shapiro, 1988). From the perspective of consumers, counterfeit brands are divided into two categories: deceptive counterfeiting occurs when a consumer is misled to buying a counterfeit product, believing it is a genuine branded one. The other category is non-deceptive counterfeiting, occurs when a consumer recognizes that the branded product is not authentic and still proceeds with the purchase. Also known under several names such as replicas, imitation, bogus, fakes, copy, and knock-off, counterfeit luxury brands are often thought to be lower quality (Lai and Zaichkowsky, 1999) but it is no longer the truth.

The quality of counterfeit luxury brands has continued to improve in the last 10 years, and as a result, the demographics of its consumers have also changed. Results from recent research show that people who actively seek and purchase counterfeit luxury brands are no longer limited to those who cannot afford the genuine products anymore (BASCAP Report, 2009). With continuous development in manufacturing process, great attention to details, extensive distribution and logistics networks, counterfeiting of luxury brands will remain as one of the most critical issues for the luxury industry for time to come.

## **RELEVANT LITERATURE AND MODEL DEVELOPMENT**

Determinants associated with counterfeit luxury brands consumption have been studied extensively (Wee *et al.*, 1995; Lai and Zaichkowsky, 1999; Nia and Zaichkowsky, 2000; Penz and Stottinger, 2005; Wilcox *et al.*, 2009). Among the identified determinants, attitude towards counterfeit luxury brands is one of the most important antecedents of consumer's WTBCLB (Wee *et al.*, 1995; Penz and Stottinger, 2005; Wilcox *et al.*, 2009). While most of previous studies focused on product attributes such as prices, quality, hedonic values and

availability – the supply perspectives - (Bloch et al 1993; Lai and Zaichkowsky, 1999; Gentry et al, 2001; Bian and Veloutsou, 2007; ) or lawfulness, ethical and moral standards - the demand perspectives - (Cordell *et al.*, 1996; Harvey and Walls, 2003; Tan, 2002; Phau *et al.*, 2009), there is a smaller stream of research examining the association between consumers' attitude towards counterfeit luxury brands and other variables such as "adventure-seeking", "value consciousness" and "material values". However, these works are yet to provide unambiguous results or reach a concrete conclusion (Eisend and Schuchert-Guler, 2006; Furnham and Valgeirsson, 2007; Phau *et al.*, 2009). But among those variables, material values – namely success, centrality and happiness – also known as the three dimensions of materialism (Richins and Dawson, 1992), stick out as potential factors that could sway the WTBCLB of consumer. And therefore, it has been suggested as a possible future research direction for non-deceptive counterfeit luxury brands consumption (Furnham and Valgeirsson, 2007; Swami *et al.*, 2009; Lu and Lu, 2010).

## Materialism

In an extensive review of counterfeit trade published in the European Journal of Marketing, Staake *et al.* (2009) presented a detailed list of literature related to the subject dated from 1978 to 2008. There was only one paper investigated counterfeits consumption using materialism as a key component among those studies (Furnham and Valgeirsson, 2007). But despite the lack of its presence in counterfeit luxury brands literature, materialism is not a new factor in marketing and consumer research (Belk, 1985; Richins and Dawson, 1992). In fact, it has been studied thoroughly, specifically in luxury related subjects (Belk, 1985; Richins, 1987; Fitzmaurice and Comegys, 2006; Han *et al.*, 2010). Richins and Dawson (1992) defined materialism as "the importance ascribed to the ownership and acquisition of material goods in achieving major life goals or desired states". Materialistic consumers are driven to consume more than average people. They use acquired goods to generate social recognition and status in order to distinguish themselves from others (Mason, 2001). Because materialistic consumers can find all that they wanted in luxury brands, previous literature has accepted materialism as a term associated with luxury brand consumption for over a century (Veblen, 1899). But since the quality and distribution networks of counterfeit luxury brands have dramatically enhanced in the last few years (Wilcox *et al.*, 2009), the question arises as would materialistic people turn their attention to counterfeit luxury brands as an alternative solution for authentic luxury brands?

The attitude towards counterfeit luxury brands plays an essential role in defining the WTBCLB (Penz and Stottinger, 2005; Gentry *et al.*, 2006). Favorable attitude towards buying counterfeit luxury brands are expected to increase WTBCLB of consumers (Penz and Stottinger, 2005). However, the attitude towards counterfeit luxury brands can be swayed, temporarily or permanently, depend how the consumer is satisfied with life. Literature from the disciplines of psychology and sociology suggest that people may have unusual behaviors when they are not happy with life (Harris, 1981; Keinan, 1987; Mick and DeMoss, 1990; Driskell and Salas, 1991). According to these literature, when people are unhappy with life they may cheer themselves up by shopping, especially buying gifts for themselves (Mick and DeMoss, 1990). This explains the spurt in sales of cosmetics during the recent recession while the sales of necessities experienced a drop (Queensland Business Review, 2010; L'Oreal, 2010). These findings fit closely the profile of a materialistic consumer.

Furthermore, ethical standards and morality level of consumers were usually given significant roles in defying attitude toward counterfeit luxury brands in previous studies (Swami *et al.*, 2009; Phau *et al.*, 2009; Wilcox *et al.*, 2009). Would ethical standards and moral values defy the attitude toward counterfeit luxury brands of materialistic consumers? A study by Muncy and Eastman (1998) suggested that there is a negative correlation between materialism and consumer ethics. And this has been fortified by recent studies in North America and Asia (Martin and Prince, 2009; Lu and Lu, 2010). This finding has strengthened the prospect of materialistic consumers in committing unethical consumption activities such as buying counterfeit luxury brands.

## Life satisfaction

Previous literature suggested that highly materialistic consumers, who do not have the spending power to pursue their material dreams, are most likely to turn to counterfeit luxury brands (Gentry *et al.*, 2001). Other materialistic consumers, including those who have a sound financial capacity, might also turn to counterfeit luxury brands subject to their satisfaction with life. The major deficiency in the literature to the best of our

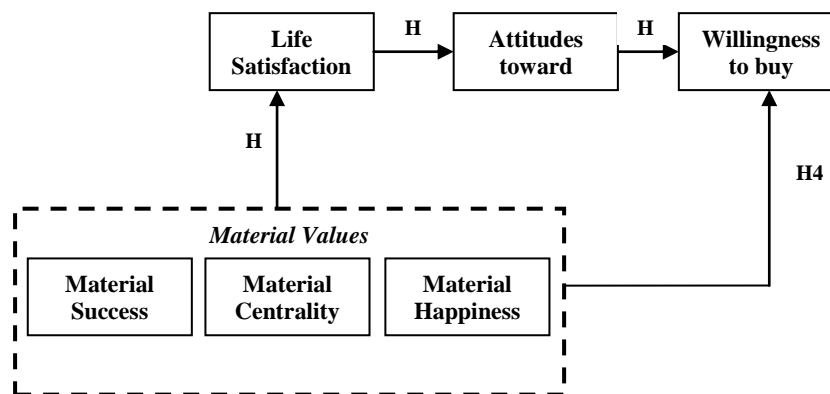

knowledge is that there is no previous study that examines the relationship between life satisfaction and WTBCLB of consumer.

However, there are several studies investigating the relationship between materialism and life satisfaction (Csikszentmihalyi and Rochberg-Halton, 1981; La Barbera and Gurhan, 1997; Sirgy, 1998; van Boven, 2005; Froh *et al.*, 2011). Results from these studies have established that materialistic people constantly feel unsatisfied with their lives (La Barbera and Gurhan, 1997; Sirgy *et al.*, 1998; Froh *et al.*, 2011). These people, consequently, are driven to consume more as a mean to pursuit happiness. Materialistic people believe life satisfaction cannot be achieved by any other means but through possessing and interacting with goods (Csikszentmihalyi and Rochberg-Halton, 1981; Richins, 1987). Important notes from materialism literature point out that materialistic people evaluate life differently in comparison with their non-materialistic counterpart (Sirgy *et al.*, 1998). Materialistic people tend to employ affective-based expectations, using ideal, deserved, and need-based expectations, to evaluate life rather than cognitive-based expectations, using past experience, predictive and ability-based expectations (Sirgy, 1998). Affective-based expectations are value-laden and they lead to experiencing intense emotions. These emotions can be positive feelings of elation, joy, and pride as well as negative feelings of anger, envy, and possessiveness (Sirgy, 1998; Sirgy *et al.*, 1998). Because of these emotions, materialistic consumers can be very happy with the acquisition of authentic luxury brands, but then may become very unhappy to see another person with a luxury product that not in their possessions (possibly with lack of financial means or unavailability). There is a likelihood that this may trigger their change of attitude toward counterfeit luxury brands, which eventually may lead to an increase in WTBCLB.

From the preceding discussion, a research model (Figure 1) with some initial hypotheses are formulated and presented as follows:

- H1: Material values have a negative effect on life satisfaction
- H2: Life satisfaction has a negative effect on attitudes toward counterfeit luxury brands
- H3: Attitude towards counterfeit luxury brands has a positive effect on WTBCLB
- H4: Material Values has a positive effect on WTBCLB

*Figure 1: Proposed Research Model*

## PROPOSED METHODOLOGY AND SAMPLING

The survey instrument utilized to measure materialism is adapted from the materialism scales developed by Richins and Dawson in 1992. On top of the adapted materialism scales, questions regarding life satisfaction (Sirgy, 1998), attitudes toward counterfeit luxury brands (Wilcox *et al.* 2009), and WTBCLB will also be administrated.

According to Richins and Dawson (1992), there are three dimensions of materialism. The first dimension is material success, the extent to which materialistic people use possessions as indicators of success and achievement in life, both in judging themselves and others. The second dimension is material centrality, the

extent to which materialistic people place possessions acquisition at the centre of their life. And finally, materialistic people believe that possessions are essential to satisfaction and well-being in life.

In order to improve Richins and Dawson's scale, items are going to be categorized into sub-dimensions. The first two sub-dimensions are spawned from materialism literature, namely conspicuousness and status. The conspicuous consumption theory ties luxury goods with the function of flamboyant display of wealth to indicate status (Veblen, 1899; Mason, 2001, Han *et al.*, 2010). And according to recent study, status is what buyers seek when buying counterfeit of luxury brands (Wilcox *et al.*, 2009). Previous literature points out that the purely conspicuous consumer derives satisfaction from the reaction of other people to the wealth displayed and not from the value of the product itself (Mason, 2001). Status and conspicuousness therefore seem to be two different constructs of materialism in the consumer behavior literature. Status consumption was defined as the personal nature of owning status-laden possessions, which do not necessary to be publicly displayed. Conspicuous consumption is more oriented toward the evidenced display of expensive possessions.

A convenience sample of 40 consumers was asked to classify each item of the original materialism scale to be whether "conspicuousness" or "status" related. The results showed that the Richins materialism scale is dominated by questions regarding conspicuousness, with only one question regarding status. This actually gives an explanation why the scale performed poorly in previous attempts to study counterfeit luxury brands consumption.

Previous findings also suggest that materialistic consumers purchased authentic luxury brands to distinct themselves from others (Eastman *et al.*, 1999) while counterfeit luxury brands buyers were looking for an economical alternative to become less distinctive from those who own authentic luxury brands. And thus, distinctiveness is added as the third sub-dimension, besides status and conspicuousness, in the new scale.

Using the preceding explanations of materialism, the study uses three methods to generate a set of potential scale items: literature reviews, thesaurus searches, and experience surveys, and follows the steps for scale development set out by DeVellis (2003). Items were generated from previously developed materialism scales and the materialism literature. More than 70 items from the three sub-dimensions (status, conspicuousness and distinctiveness) were generated and put into three main dimensions: material success, material centrality, and material happiness.

The items are scored on a 5 point Likert format from strongly disagree to strongly agree. Item scores are summed within dimension to form indices for each dimension, and can be summed to form an overall materialism score. Before administering to the larger sample, these items will be sent to a panel of experts for screening and review.

Upon received feedbacks from the panel of experts, ambiguous and redundant items will be removed from the scale. Then it is going to be administered to a sample of over 300 students, local and international, at a major Australian university. The results will be tested using exploratory factor analysis, reliability analysis, confirmatory factor analysis and social desirability testing.

## **SIGNIFICANCE, IMPLICATIONS AND CONCLUSION**

The above hypotheses are proposed with the goal of closing a number of gaps inherent to the literature. Conceptually, this proposed research provides a new perspective of non-deceptive counterfeit luxury brands consumption by synthesizing extant literature from two bodies of relevant research stream. While there are a small handful of previous studies on the relationship between materialism and counterfeit luxury brands consumption, the findings have been fairly inconclusive and lacking in rigor (Eisend and Schuchert-Guler, 2006; Furnham and Valgeirsson, 2007; Phau *et al.*, 2009). This is also the first study, to the best of our knowledge, to examine the role of life satisfaction in context with counterfeit luxury brand consumption. Methodologically, a unique scale may have to be developed to measure materialistic tendencies specific to attitudes towards counterfeit luxury brands. Managerially, the research findings can be used to formulate strategies for academia, practitioners and, more importantly policy makers to help eradicate, or at the very least curb counterfeit luxury brands consumption.

In general, this conceptual paper lays a foundation for using materialism and life satisfaction as key components in studying counterfeit luxury brands. This would lead to several theoretically and managerially important research directions. For example, research suggests that people from different cultures will have different views on status and conspicuousness (Aaker *et al.*, 2001). Compared with the West, Asia is home not only to luxury brands counterfeiting but also to a more collectivist cultures, in which people are under lot of pressure to conform and save face. People in Asia takes pride in possessing and displaying luxury brands and it is supposed to be a shameful act to use counterfeit, if revealed. However, it is reported that people in Asian developing countries have knowingly purchased and displayed counterfeit luxury brands, without any remorse (BASCAP, 2009; Lu and Lu, 2010). As the wealth gaps in developing countries are widening, so are the life satisfaction levels between people from different social classes (Graham, 2006; Shin, 2009; Park and Peterson, 2009). Therefore, the dynamics of counterfeit luxury brands consumption might be different in these countries, compared to Europe or North America. Further research into these directions will be essential to a richer understanding of the global demand for counterfeit luxury brands.

# COMBINING MULTIPLE FORECASTING EXPERTS FOR CORPORATE REVENUE USING COMBINATORIAL FUSION ANALYSIS

**Roger Tsai, Christina Schweikert, Samantha Yu, and D. Frank Hsu**  
**Fordham University, USA**

## ABSTRACT

*We present and test results for a new methodology that uses Combinatorial Fusion Analysis (CFA) for quantitative prediction by combining opinions and judgments of multiple experts. In this situation, each expert is considered a system whose decisions are represented by a scoring system which consists of a score function, a rank function, and a Rank Score Characteristic (RSC) function. Score and rank combinations are applied to fuse decisions from multiple experts, and RSC functions of the experts are used to measure the diversity in their scoring / ranking behavior. Our approach introduces a novel way of breaking the ranges of values for the target variables into multiple buckets, treating each bucket as a candidate in a contest with multiple judges. Since the original problem does not have multiple candidates in the mind of the judges, there are no multiple scores given by each judge for the range of candidates, thereby voiding the availability of score functions. We explore novel ways to cognitively construct score functions to allow for the application of combinatorial fusion, which depends on the presence of scoring systems. We apply such new methodology to predicting corporate sales revenue of a computer manufacturer and show that the new method outperforms each individual forecaster for each quarter as well as the average performance through four quarters. Further work will be done to explore ways to use parametric optimization of score functions, as well as finding the relationship between diversity and performance to derive the optimum strategy.*

## INTRODUCTION

Corporations rely on forecasting information in order to most efficiently strategize and manage operations. Dependable projections for quarterly sales of products will enable a corporation to better meet customer demands and optimize resource allocation. Combination of multiple forecasting experts has been shown to improve the accuracy of predictions. The experts or systems to be combined should be diverse in terms of their methods and rely on useful but independent sources of information. Combinations of multiple forecasts is especially useful in an uncertain environment in order to avoid large errors, since the combined forecast will be no worse than the worst performing component, and usually will be a considerable improvement compared to the average forecast (Armstrong 2001). Despite the increased amount of data and enhanced statistical methods available, there is still a need for improved forecasting methods (Houston et al 2010, Rieg 2010). A combined forecasting approach will enhance the performance of existing individual forecasting methods. In this paper, we describe and demonstrate a forecast combination method utilizing forecast scoring systems and Combinatorial Fusion Analysis (CFA) (Hsu et al 2006) that outperforms even the best individual forecaster on average over a period of time.

## FORECAST COMBINATION APPROACHES

Sales forecast projections within a corporation may come from human expertise (i.e. judgmental forecasters), quantitative methods (i.e. forecasting models), or an approach that incorporates judgment into a model or system (Armstrong et al 2001, Franses 2008, Marmierab and Cheikhrouhou 2010). Employee stakeholders (i.e. a manager) from various functional units of an organization draw on their unique and diverse

perspectives to make individual judgments as to the number of sales projected for a particular quarter. Alternatively, a chosen quantitative method (parametric or non-parametric, and linear or non-linear) can be applied to the requisite data to arrive at a forecast. Given a set of judges (either human or quantitative experts), their respective forecasts need to be combined to obtain one final projection. These individual forecasts can be combined by utilizing a variety of methods, which can also be divided into two general types: human expertise (i.e. an executive making a decision based on given inputs) or a quantitative method for combining forecasts (i.e. information fusion). Prediction markets and the Delphi technique are structured methods for combining the judgments of diverse experts and are both based on the idea that the collective wisdom of the group will outperform individual experts (Ivanov 2009, Rowe and Wright 1999, Wolfers and Zitzewitz 2004). There are a variety of quantitative approaches for combining forecasts, ranging from simple and weighted averages to artificial neural networks, genetic algorithms, and machine learning techniques (Lemke and Gabrys 2010, Vijayalakshmi et al 2010). Innovative and successful work has been done in the optimization of dynamic forecasting for risk and demand management, as well as sales and operations planning (An et al 2004, Gung et al 2002, Lee et al 2003, Tsai 2004, Tsai et al 2003).

In this case, we are looking at sales forecasts from various functional business units of a corporation which arise from judgment with consultation of quantitative information. Figure 1 shows the weekly sales projections of four functional units compared to the average of all projections and the quarter's actual sales. We then utilize a new information fusion approach called Combinatorial Fusion Analysis, described in the following sections, to find the optimal combination of these individual forecasts.

Figure 1: Weekly sales projections from four functional business units

## COMBINATORIAL FUSION ANALYSIS FOR FORECAST COMBINATION

Combinatorial Fusion Analysis (CFA) is an information fusion method that provides a framework to combine data, features, and decisions from multiple scoring systems (Hsu et al 2006). CFA has been applied to various domains including: information retrieval (Hsu and Taksa 2005), portfolio management (Vinod et al 2010), biomedical and health informatics (Lin et al 2007, McMunn-Coffran et al 2009, Schweikert et al 2009, Yang et al 2005), target tracking (Lyons and Hsu 2009), among others (Hsu et al 2010, Li et al 2009, Mesterharm and Hsu 2008). The Combinatorial Fusion Analysis architecture can enhance performance of forecasting methods at the feature level (within a system) and optimize forecast combination and at the decision level (multiple systems). Figure 2 illustrates the traditional business approach to forecast combination, based on

executive or group judgment, and Figure 3 shows the forecast combination method with Multiple Scoring Systems and Combinatorial Fusion Analysis.

The sales projections from the following functional business units: E (End User Sales), G (Geographic Planning Exec), H (Headquarter Planning Exec), and C (Trend / Seasonality) are the decisions from each respective forecaster/expert/judge. These decisions/judgments are made based on sales information data, which translates into various features such as how the current quarter's partial (up to the current time at some point in the middle of the quarter) sales compare with the corresponding partial quarter historical sales (prior quarters). To facilitate application of CFA, a scoring system is created for each of these judges, resulting in a set of Multiple Scoring Systems (MSS): E, G, H, and C. A scoring system is characterized by a score function (and corresponding rank function) on a set of documents/items/candidates. In this case, we use the sales projection value to construct a score function on a set of projection intervals (buckets) of a specified size. Each scoring system X will have a score function  $s_X(d_i)$  that assigns a real number to each bucket  $d_i \in D$ , where D is the set of buckets  $D = \{d_1, d_2, d_3, \dots, d_n\}$ , where  $n$  is the number of buckets under consideration, and  $i \in [1, n]$ . The buckets are chosen in such a way that the center bucket is centered at the combined mean (arithmetic average) of all the judges' original forecasts.

Figure 2: Traditional Business Approach to Forecast Combination

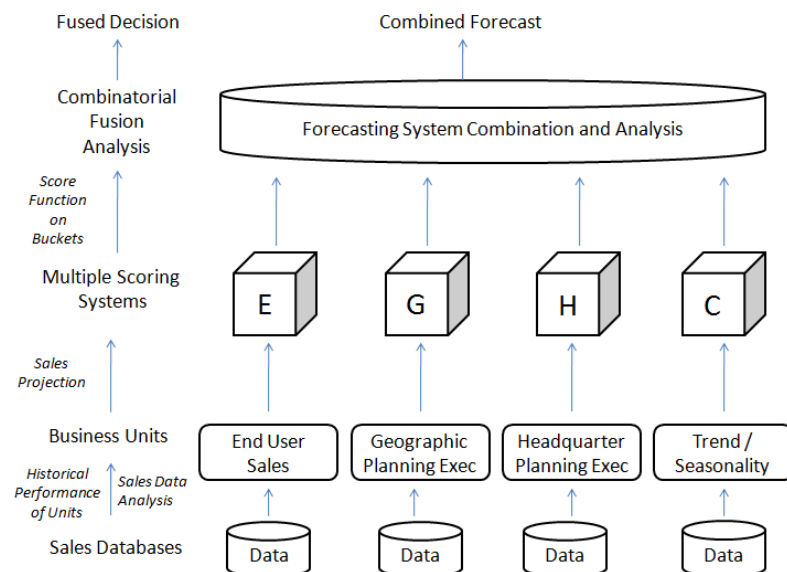

Figure 3: Forecast Combination with MSS and CFA

One of the novelties of this method is to impart a score function that is consistent with the judge's choice, as well as scores that reflect the fact that the farther away a bucket (candidate) is from the prime choice, the lower the score should be, and if possible, the score bears some physical meaning. One choice we made is that the score function is the probability of having the actual beyond the bucket or candidate value. This is defined as follows:

$$s_X(d_i) = \frac{1}{\sqrt{2\pi}\sigma} \int_{d_i}^{\infty} e^{-(x-d_m)^2/(2\sigma^2)} dx \quad \text{if } d_i \geq d_m$$

$$s_X(d_i) = \frac{1}{\sqrt{2\pi}\sigma} \int_{-\infty}^{d_i} e^{-(x-d_m)^2/(2\sigma^2)} dx \quad \text{if } d_i \leq d_m$$

In the above,  $d_i$  takes on the additional role of being the value at the center of the bucket.  $d_m$  is the prime choice of the original judge. The score function defined above is based on the assumption that the statistical distribution characterizing the error of forecast for a given judge is modeled as a normal distribution with mean 0 and standard deviation  $\sigma$ . Given this assumption, it follows that when the judge makes a prediction  $d_m$ , the actual demand or sales for the quarter has a normal distribution with mean  $d_m$  and standard deviation  $\sigma$ . The poorer the prediction accuracy of this judge has been in history, the larger  $\sigma$  is, making the score function flatter and less discriminating between different candidates. Figure 4 shows the shapes of the score functions for these four judges for a particular quarter. These mean and sigma values are exactly the ones mentioned in Figures 4 and 5. The shapes and sizes of such score functions can be tweaked parametrically by numerical search to optimize the system performance, which is our next work item. The mean  $d_m$  (which is individual judge's forecast) and  $\sigma$  are shown in the lower half of Figure 4.

A rank function,  $r_X(d_i)$ , from  $D$  to  $N = \{1, 2, 3, \dots, n\}$  assigns a rank to each bucket after sorting the buckets in descending order according to its score given by  $s_X(d_i)$ . Given the score and rank functions for a system, we can capture its scoring behavior by computing its Rank Score Characteristic (RSC) function. An RSC function  $f$  for system  $X$ ,  $f_X: N = [1, n] \rightarrow R$  is given by  $f_X(i) = (s_X \circ r_X^{-1})(i) = s_X(r_X^{-1}(i))$  (Hsu and Taksa 2010, Hsu et al 2010). The goal in forecast combination is to create a new combined forecasting system that will possibly outperform each of the individual forecasters. It has been observed that combination is most beneficial when the individual systems have relatively good performance and the systems are diverse (Hsu et al 2006). The diversity among two scoring systems  $X$  and  $Y$  (bi-diversity (Hsu and Taksa 2010, Hsu et al 2006) can be measured by the

$$d(f_X, f_Y) = \sum_{i=1}^n |f_X(i) - f_Y(i)|$$

distance between their RSC functions,  $f_X$  and  $f_Y$ , over  $n$  ranks:

$$\sum_{j=1}^m \binom{m}{j}$$

Given  $m$  scoring systems and  $j \in [1, m]$ , there are  $\sum_{j=1}^m \binom{m}{j}$  system combinations. In this case, we have 4 forecasting systems, giving 15 possible system combinations, including individual forecasters, 2-combinations, 3-combinations, and 4-combinations. Each combined system can be derived either by score or rank combination. Combination by score is performed by taking the average score given by the score functions of each system for a particular bucket, and combination by rank is the average rank given by the rank functions of the systems being combined. The score combination for  $c$  systems:  $X_1, X_2, \dots, X_c$ , where  $c \in [1, m]$ , is defined as

$$s_{SC}(d_i) = \frac{1}{c} \sum_{j=1}^c s_{X_j}(d_i)$$

for each bucket  $d_i$  in  $D$ . Similarly, the rank combination of  $c$  systems is computed for each

$$s_{RC}(d_i) = \frac{1}{c} \sum_{j=1}^c r_{X_j}(d_i)$$

bucket as  $s_{RC}(d_i)$ . The bucket that yields the highest combined score is the winner. Sometimes, there could be ties. For forecasting problems, due to the symmetric nature of the score function, the buckets that tie often occur in a continuous stretch. We pick the center point on the tied buckets as the winner. Note that sometimes, the center point may not be at the center of a bucket. In such case, we take the actual center point even if it is not at the center of any bucket.

We now define the performance evaluation of the method. The performance evaluation is not only important for assessing the effectiveness of the method, it also is a key part of the methodology since it drives the selection of the best combination (one among the  $15-4=11$  combinations) that performs the best in training or testing (using backward simulation on historical data), so that combination can be applied to the current forecasting task at hand. Furthermore, it allows the iterative and automated optimization of the score function shapes or other system settings to maximize the performance. For each particular combination, the performance  $P$  is the forecast accuracy, defined as

$$P = 100\% - |Err/A|$$

where  $A$  is the actual or true value of the revenue for the quarter,  $Err$  is the forecast error with  $Err = F - A$  and  $F$  is the forecast. Therefore,  $Err/A$  is the percent error. Since  $|Err| \leq A$ , it follows that  $|Err/A| \leq 100\%$  and therefore,  $0 \leq Err/A \leq 100\%$ .

When we evaluate quarters already past, since we know the actual and the forecast,  $P$  is measurable. When the method is applied to several quarters, the performance is defined as the average of all the performances for these quarters.

Score function construction for the individual scoring systems (E, G, H, and C) is demonstrated in Figures 4 and 5. The score/rank combinations, and the performance evaluation of individual judges and score/rank combinations (2-, 3-, and 4-combinations) are illustrated in Figures 6, 7, and 8.

Figure 4 – Score functions constructed based on each unit's sales projection for week 9 in Figure 1

From the results shown in Figures 9 and 10, we can see that the best average performance (95% after rounding) was achieved by Rank Combination of GC and EG, with 27% and 25% reduction of the error for the best judge H. Score Combination also achieved 95% performance for EH, it is a bit worse than the rank combination before rounding. But the biggest difference between the score and rank combination is that there are seven different combinations for Rank Combination that achieved significantly higher performance than the best individual judge (more than 5% reduction from the error of the best performing judge), while only three combinations for the Score Combination were able to do so. The average reduction of error across all  $15-4=11$  combinations is 10% for Rank Combination, double than that for the Score Combination. This means that rank

combination boosts up the performance more in general, and has a high chance of achieving more robust or better performance.

Figure 10: Test results with four quarters, using Rank Combination

One more thing that deserves attention is that, the forecasting task under test here is for forecasting worldwide sales revenue of personal computers and low end servers as a whole. When such forecasting task is applied to forecasting individual categories or models, the error will be higher, making the difference between the performance of the individual judge and the combined judge much more important and pronounced.

One important result or observation is that the new method outperforms the traditional statistically optimum combination (namely, a linear combination of all the judge's forecasts weighted by the inverse of historical forecast error variance, so that the larger the variance, the smaller the weight) significantly. For example, for the first quarter under test, the statistically optimum combination yields 86% accuracy or 14% error, which is almost three times worse (in magnitude of error) than the new method.

## CONCLUSIONS AND FUTURE DIRECTIONS

We applied the new method of forecast combination to predicting sales revenue for a pc and low end server manufacturer. Each quarter, four versions of revenue outlook, provided by four different functional units of the company responsible for revenue projection and supply decision, are available for the quarterly sales revenue at the beginning of each week during the first 12 of the 13 weeks of the quarter. A unified sales projection for the quarter needs to be made each week to help the company make business decisions. We test the performance and behavior of the methodology by applying it to a particular quarter in history and compare the accuracy of the outlook with the actual sales revenue to study how the combinatorial fusion of multiple outlooks helps in forming the quarterly sales revenue projection. In all the four quarters we tested, although any individual judge may do well in a particular quarter, it may not do well in all quarters. The new combination method, however, is much more robust and immune to such fluctuating performances. In the four quarters we tested, the new method outperforms each individual judge for each quarter as well as the average performance through the four quarters. More tests will be done to allow us to carry out optimization of the various system parameters of the methods such as the shapes of the score function, as well as how the diversity measure can be used to optimize the performance. For now, the diversity does not correlate well with the performance. We will explore changing the score function and see if the diversity would correlate better and if the performance can be optimized.

# ESTIMATING THE PROBABILITY OF WINNING A MAJOR COMPETITION

A. Vasilopoulos  
St. John's University, New York

## ABSTRACT

*Probability of success is a parameter which always plays an important role whenever an assessment is made of various business opportunities for any corporation. This paper presents a procedure for statistically deriving a probability of success equation, based on the outcomes of past and present corporate programs, which is a function of several important factors. Parametric plots of the equation allow the calculation of each program's probability of success, and indicate several other possible uses of the results.*

## INTRODUCTION

Probability of success is a parameter that always plays an important role whenever an assessment is made of various business opportunities for any corporation.

The probability of success,  $P_s$ , can be considered as a product of two factors;  
 $P_F$ (= Probability of program being **Funded**), and  
 $P(W/F)$  (=Probability that program will be won, given that it is funded).

In equation form

$$\begin{aligned} P_s &= P_F P(W/F) & (1) \\ &= P_F P(F, W) / P_F & (2) \\ &= P(F, W) & (3) \\ &= P(F) P(W) = P_F P_w & (4) \end{aligned}$$

because of the assumed independence of the two events.

Obtaining workable estimates for  $P_F$  and  $P_w$  is not an easy task. These estimates are almost always subjective in nature and, as a consequence, not very accurate. Also, the consistency of these estimates is questionable.

One method to evaluate  $P_w$  is to ask a committee, comprised of several members, to evaluate each program in a number of categories which have been postulated to represent the critical areas by which a contract is either won or lost. Each member of the committee does his/her evaluation independently, and each program or proposal is also judged individually. The outcome of past corporate competitions does not enter into this evaluation explicitly and, perhaps, not even implicitly. On the basis of this evaluation each committee member recommends to either Bid or Not Bid on the current proposal.

A separate methodology, consisting of a sequence of steps, is used to evaluate  $P_F$ . Our aim, at present, is toward finding a better method of obtaining  $P_w$ . No attempt will be made to modify  $P_F$  at the present time. Our efforts toward finding an acceptable solution to this problem have been twofold:

1) To use statistical methods (based on outcomes of past and present programs the corporation participated in) to evaluate  $P_w$ .

2) To use empirical means to evaluate  $P_w$ . This is accomplished by modifying the equal probability concept for each competitor by considering what each competitor has done in the general area of the program in the recent past.

The objective of this paper is to describe and evaluate a statistical method developed for the evaluation of  $P_w$ . The proposed method is substantially different from other methods used. Even though it too is somewhat subjective, because it requires a program manager's input, the method uses the outcomes of previous company programs to form a basis for the evaluation of the "probability of win" equation. The equation that has been selected as the best has been evaluated and the results appear in Figures 1-5. These figures, showing  $P_w$  in parametric form, can be helpful in pointing "the way to go" to increase  $P_w$ . The resulting estimates for  $P_w$  are consistent and at least as accurate as those provided by various other existing methods.

## DISCUSSION

The proposed method uses regression analysis to obtain  $P_w$  in the form of an equation. The data needed for the regression analysis are obtained from past and current corporate projects, as follows:

- 1) The six (6) categories below were postulated to represent the critical areas by which a contract is either won or lost. Five different levels of relative standing were postulated for each category.
  - a) Pre-proposal Effort
  - b) Competitive Position
  - c) Price Strategy
  - d) Desirability
  - e) Responsiveness
  - f) Customer Rapport
- 2) Fourteen (14) programs were selected for inclusion in the study, shown in Table 1 below as programs 1, 2,... , 14, together with their outcomes.

**Table 1 - Programs included in the study and their outcomes**

Program #	Program Outcome
1	WIN
2	LOSS
3	LOSS
4	LOSS
5	LOSS
6	WIN
7	WIN
8	LOSS
9	LOSS
10	WIN
11	LOSS
12	WIN
13	WIN
14	WIN

- 3) Program managers were asked to evaluate their own programs on the six categories listed above, and also to state any reasons which they felt influenced the outcome of their respective programs. The grade on each category is a number between 1 and 5, with 5 being the best and 1 the worst ranking of the programs in each category.

Table 2 below is a list of the most important reasons stated by the program managers as having had an influence on the outcome of their programs.

**Table 2 Most Important Factors Influencing the Outcome of a Program**

- 1) Technical position relative to competition
- 2) Customer must be convinced that proposal management will continue with program if won
- 3) Be in a position to demonstrate rather than simply recommend solutions

- 4) Degree of confidence of customer in the company's top management .
- 5) Financial Stability of the company as viewed by the customer
- 6) Current Performance on other projects
- 7) Political Considerations
- 8) Cost Credibility
- 9) Selection of proper team
- 10) Quick and honest response to customer's questions

These are all valid recommendations and should be considered whenever a new proposal is being prepared. As a result of these recommendations "Political considerations" was also included as an additional category in the evaluation of the programs because the others are already covered by the previous six categories, thus making the total number of categories for evaluating each program equal to seven (7).

The number of programs included in the study constitute the sample size. For a truly statistical study a much bigger sample size is needed. But a bigger sample could not be obtained.

The independent variables in the regression analysis are the categories selected as influencing  $P_w$ . The X matrix is formed from the inputs provided by the program managers.

The dependent variable is the probability of win. The  $P_w$  vector is a column of ones or zeros, depending on whether the corresponding program was a win or a loss, respectively.

**Table 3** summarizes the data collected for this study. The step-by-step procedure for evaluating the "probability of win" equation is given in Appendix 1.

CATEGORIES AND VALUES								
Program	Outcome	X1	X2	X3	X4	X5	X6	X7
1	WIN=1	2	2	4	5	1	3	4
2	WIN=1	2	3	2	3	2	2	4
3	WIN=1	2	3	4	3	4	2	4
4	WIN=1	3	4	5	5	1	5	4
5	WIN=1	3	5	5	5	5	5	5
6	WIN=1	3	3	5	5	3	4	4
7	WIN=1	5	5	5	5	5	5	5
8	LOSS=0	3	5	5	5	5	5	1
9	LOSS=0	3	4	5	5	5	5	3
10	LOSS=0	3	3	5	4	5	5	3
11	LOSS=0	2	3	5	5	3	5	3
12	LOSS=0	2	3	5	5	4	4	1
13	LOSS=0	2	3	5	5	3	1	3
14	LOSS=0	3	3	4	4	4	1	3

where: X1=Pre-Proposal Effort;  
X2=Competitive Position;  
X3=Desirability;  
X4=Responsibility;  
X5=Customer Rapport;  
X6=Price Strategy;  
X7=Political Considerations.

When all the data were collected a regression routine, having the ability to search through all the possible combinations of the independent variables and come up with the best possible fit to the given data, was used.

Originally, with all the selected programs in the base, a single one-variable, physically realizable (i.e. with positive coefficients) equation resulted. When some of the more obviously inconsisted programs (i.e. programs

which were voted very high on each category but were losses) were removed from the base, the number of physically realizable equations that resulted increased rapidly. With five such programs out of fourteen removed from the base, we obtained the following number of physically realizable equations:

- Linear Regression
  - a) 6, 1-variable equations with positive coefficients
  - b) 3, 2-variable equations with positive coefficients
- Log Regression
  - a) 5, 1-variable equations with positive exponents
  - b) 6, 2-variable equations with positive exponents
  - c) 2, 3-variable equations with positive exponents

Of these 22 meaningful equations the one that was judged best is:

$$P_w = 0.0166 X^{0.322} Y^{0.668} Z^{1.5553}, \text{ where:} \quad (5)$$

X = Competitive position (Independent Variable  $X_2$  in Table 3)

Y = Price Strategy (Independent Variable  $X_6$  in Table 2)

Z = Political Considerations (Independent Variable  $X_7$  in Table 3)

This equation has been completely evaluated, and the results appear in graphical form in Figures 1, 2, 3, 4, and 5. These curves can be used to find the probability of win of a new program when the parameters X, Y, and Z of the program have been estimated

For a fixed  $P_w$ , there may be several combinations of the parameters X, Y, and Z that can result in this fixed level of  $P_w$ . Figures 1-5 can be helpful in selecting the combinations of parameters which are most feasible. For example, if a given level of  $P_w$  is desired, it may be easier to arrive at it by improving the position of the company in one area (say Price Strategy) than in another (Political considerations for example).

## INTERPRETATION OF RESULTS

- Using a threshold of  $h=0.5$ , the "probability of win" equation can accurately predict the outcome of every program in the base, except one (i.e. correctly predicts the outcome of eight out of nine programs in the base).
- Again, using a threshold of  $h=0.5$ , this equation accurately discriminates between wins and losses in three out of five programs left off the base. It should be remembered, however that the reason these programs were excluded from the base was the fact that their rating was completely out of proportion to their outcome. It is not suggested here that the ratings were wrong; only that to obtain a reasonable fit to a set of data, the data must appear to possess a certain relationship.
- In addition to the logarithmic equation presented above, two linear regression equations were identified as being able to do almost as good a job as the model proposed above.

These equations are:

$$P_w = -0.51 + 0.31Z \quad (\text{one-variable equation}) \quad (6)$$

$$P_w = -0.54 + 0.02X + 0.30Z \quad (\text{two-variable equations}) \quad (7)$$

These two equations, with a threshold of  $h=0.5$ , perform as well as the logarithmic model. They are much easier to use, and they would have been selected outright if it were not for the fact that for some values of the parameters X and Z these equations give a negative value for the probability of win. We can, of course, change these values to zero and use the equations. But then we could use the logarithmic equation, which does not present any such problems.

- As more programs enter the base (i.e. as the sample size increases) the ability of the equation to predict the outcome within the base will improve, and with it the ability of the equation to predict outside the data base should also improve.

## HOW TO FIND $P_w$

To obtain  $P_w$  for a new program one must first obtain values for the three parameters: Competitive Position, Price Strategy, and Political Considerations. It is then a simple matter to read off the answer from the appropriate graph. Enclosed as Appendices 2, 3, and 4 are three separate charts marked, respectively:

- o Evaluating Competitive Position
- o Evaluating Price Strategy
- o Evaluating Political Considerations

Each parameter requiring evaluation has five different statements under it marked (T,F). Read each statement and decide whether it is true or false for the program under consideration. For each statement marked T, add 1 point to the value of the parameter being evaluated. If all the five statements are marked T, the value of the parameter is 5. If all the statements are marked F, the parameter is assigned the value 1.

When all three parameters have been evaluated, read off the corresponding  $P_w$  from the appropriate graph.

## HOW TO USE THE CALCULATED $P_w$

- If one is interested only in ranking several programs, simply evaluate the three parameters for each program and then use the appropriate graph to obtain the  $P_w$  for each program. The program with the highest  $P_w$  has the highest ranking.
- To rank several competitors for the same program, evaluate the three parameters for each competitor, and then obtain the  $P_w$  for each from the appropriate graphs. The competitor with the highest  $P_w$  has the highest ranking (has the best chance of winning), assuming that all competitors can be described by the same equation.
- If one is interested in achieving a predetermined level of  $P_w$  for a single program, the following procedure is suggested.
  - o For a fixed  $P_w$ , determine all the possible parameter combinations that would result in the desired  $P_w$ . These combinations can be found directly from the graphs for each fixed  $P_w$  (see Figure 6, which plots  $P_w$  versus  $N$ =Number of Parameter Combinations).
  - o Select from these combinations of the parameters that combination which can best achieve the desired  $P_w$ . For example, if a given level of  $P_w$  is desired, it may be easier to arrive at this level by improving the position of the company in one area (say Price Strategy) than in another (Political Considerations for example).

Using exponential curve fitting techniques an equation can be derived between  $P_w$  and  $N$ , and the result is:

$$P = 0.8785 e^{-0.02298N} \quad (8)$$

or

$$N = 5.637 - 43.5161 \ln P. \quad (9)$$

This equation is shown on figure 6, together with the curve resulting by plotting actual data.

## CONCLUSIONS AND RECOMMENDATIONS

The primary advantage associated with using the proposed methodology is that it offers a consistent way of comparing the win probabilities among Programs, and a means of evaluating the sensitivity of alternative strategies that can be tried for improving  $P_w$ .

How useful these equations can be depends to a large extent on how objectively and accurately a program can be evaluated to determine values for the parameters of the equation  $X$  (=Competitive Position),  $Y$  (= Price Strategy), and  $Z$  (= Political Considerations).

If this evaluation is done by someone intimately connected with the program, it will probably be biased but accurate. If it is done by someone outside the program, it will be more objective but perhaps less accurate. If the evaluation of several programs is done by the same outsider, the evaluation may not be very accurate but it will be consistent, and these equations will rank the programs consistently.

$$P_w = 0.0166 X^{0.322} Y^{0.668} Z^{1.553}$$

X = COMPETITIVE POSITION

Y = PRICE STRATEGY

Z = POLITICAL CONSIDERATIONS

$$P_w = 0.0166 X^{0.322} Y^{0.668} Z^{1.553}$$

X = COMPETITIVE POSITION

Y = Figure 1

Z = POLITICAL CONSIDERATIONS

PROBABILITY OF WIN ( $P_w$ )  
VS

N=NUMBER OF PARAMETER COMBINATIONS  
 EXAMPLE: THE # OF PARAMETER COMBINATIONS THAT CAN PRODUCE A PROBABILITY OF  
 WIN  $\geq 0.5$  IS 23

## APPENDIX A: PROCEDURE FOR OBTAINING THE "PROBABILITY OF WIN" EQUATION

1. Identify the important factors affecting the probability of win of each program/project.
2. Select representative company programs of past and current status, both wins and losses.
3. Have the Program Manager of each program/project rate it in each of the categories included in Step (1), above, by assigning a numerical grade to each category.
4. These grades will form the X-matrix required in the proposed regression analysis.
5. The Pw-matrix is formed as a column of ones or zeros depending on whether the corresponding project was won or lost, respectively.
6. Obtain the best fit to these data,  
 i.e.

$$Pw = b_0 + b_1X_1 + b_2X_2 + \dots + b_nX_n \quad (10)$$

by evaluating the coefficients  $b_i$  of equation (10) where:

$X_i$  : i-th important category in Step (1) above.

7. "Normalize" by dividing through by an appropriate constant to insure that  $0 \leq Pw \leq 1$ .
8. As new programs become available, either "modernize" the data base by deleting the "oldest" entries or enlarge the base. In either case a new regression equation is obtained, and therefore a new prediction equation.
9. To evaluate the probability of win for a new program/project do the following:
  - a) Have a committee of experts rate the new program/project on each of the categories of Step (1)
  - b) Average over the number of experts.
  - c) Use these averaged  $X_i$  as inputs into the "prediction" equation.
  - d) The "prediction" equation is the regression equation of Step (7).

## APPENDIX B: EVALUATING "COMPETITIVE POSITION"

- |       |   |   |
|-------|---|---|
| (T,F) | O | Procuring agency has higher confidence in this company's management than in the management of the competition.                      |
| (T,F) | O | This company's financial position, as viewed by the procuring agency, is better than that of the competition's.                     |
| (T,F) | O | This company's performance on current projects is better than the competition's.  |
| (T,F) | O | This company's technical position is better than the competition's.   |
| (T,F) | O | This company's proposed solutions not only are more innovative than those of the competition, but they can be demonstrated to work. |

## APPENDIX C: EVALUATING "PRICE STRATEGY"

- |       |   |   |
|-------|---|---|
| (T,P) | O | This company's manufacturing cost is no higher than that of the competition's.            |
| (T,P) | O | This company's design cost is no higher than that of the competition's.                   |
| (T,P) | O | This company's overhead cost is no higher than that of the competition's.                 |
| (T,P) | O | This company's price per man month of effort is no higher than that of the competition's. |
| (T,P) | O | This company's total price is lower than that of the competition's.                       |

## APPENDIX D: EVALUATING "POLITICAL CONSIDERATIONS"

- |       |   |   |
|-------|---|---|
| (T,F) | O | Unemployment in this business area (location of company under study) is worse than the unemployment of the ' same business area in the geographic locations of the major competitors. |
| (T,F) | O | No major contracts in this business area have been awarded in the corresponding section of the  |

- country in the past 5 years.
- (T,F) O This company is among the competitors that have not won a major contract in this business area in the last 5 years.
- (T,F) O This company's team is politically more acceptable than the competition's teams.
- (T,F) O The overwhelming majority of this state's Congressional delegation is making a concerted effort on this company's behalf.

# THE LINK BETWEEN MARKETING INFORMATION, STRATEGIC MARKETING AND ORGANIZATIONAL SUCCESS: SOUTH AFRICAN PERSPECTIVES

**Peet Venter, Mari Jansen van Rensburg and Johan Strydom**  
**University of South Africa, South Africa**

## ABSTRACT

*Quantitative research among 167 South African marketing decision-makers determined that the relationship between marketing information and strategic marketing clearly lies in the extent to which marketing information quality and segment (customer) insight influence overall perceptions of marketing information quality. There was little evidence to suggest any strong influences on financial performance, suggesting that marketing information and customer insight are important contributors to market orientation and thus indirectly to organisational performance, rather than direct contributors.*

## INTRODUCTION

As a boundary-spanning organizational function, marketing is highly dependent on internal and external information to support marketing decision-making. It is therefore not surprising that marketing research, with primarily an external focus, originated as early as the 1930s (see e.g. Taylor, 1936), followed by marketing intelligence (Kelley, 1965) and marketing information systems (Brien & Stafford, 1969). The apparent importance of information to support marketing decisions has endured, with the Marketing Science Institute (2010) suggesting that, in its view, the most important research priority in marketing is “using market information to identify opportunities for profitable growth”. While marketing research, marketing intelligence (and its ‘evolved’ form, competitive intelligence) and marketing information systems has enjoyed considerable research attention over many years, these topics have been remarkably absent from many of the top marketing journals. In particular, the interplay between marketing information, strategic marketing decision-making and organization success is an aspect that has not been adequately studied if we are to understand how marketing information adds value to the marketing function. For purposes of our analysis we use the term ‘marketing information’ (MI) to encompass both marketing intelligence and marketing information systems.

In this paper we are addressing two research questions in the South African context:

- 1) What is the relationship between marketing information practice and strategic marketing practice?
- 2) What is the relationship between marketing information and organizational financial performance?

In exploring this research question we next examine marketing information and strategic marketing practice.

## LITERATURE REVIEW

The importance of MI is put into perspective when the notion of market orientation is examined. The marketing concept suggests that, if you satisfy your customers’ needs, you will attain organizational objectives. The marketing concept manifests in organizations as market orientation, which Shoham, Rose and Kropp (2005) describe as the firm’s ability to anticipate, react to and capitalize on environmental changes, leading to superior

performance. In practice, this could be described as the gathering, dissemination and use of information in decision-making (Jaworski & Kohli, 1993). Market orientation has been linked positively to organizational performance in several studies. Kara, Spillan and DeShields (2005) found a positive correlation between market orientation and the performance of small service businesses in the USA while Aldas-Manzano, Küster and Vila (2005) found a positive relationship between market orientation and certain aspects of innovation in Spanish firms. Shoham et al. (2005) conclude that market orientation positively affects organizational performance and behavior in general. The conclusion from this is that marketing information can contribute to organizational performance.

Information technology (IT) has become a central component of marketing information gathering, dissemination and usage. Technologies such as the internet, intranets, and data warehouses have become critical to many organisations and can play a key role on the generation and dissemination of marketing information. It is not enough to generate marketing information, and in this regard several technologies are useful in the marketing environment. On the other hand, the development of systems to support marketing decision-making should also take cognisance of the needs of marketing decision-makers. There is a wide range of technology tools to support marketing decision-making (see e.g. Daniel, Wilson & McDonald, 2003, for a comprehensive review of IT in marketing).

It is also important to ensure the perception that the quality of marketing information is acceptable to marketing decision-makers. Conradie and Kruger (2006) suggest that quality in all aspects of information and information delivery is important. This may include timeliness, accuracy, clarity of presentation and completeness. There is a distinction between the inherent quality of the data, such as accuracy and reliability and the pragmatic quality of the data such as timeliness and format that makes it more useful to end-users.

In order to determine the relationship between marketing information practice and strategic marketing practice it is also important to determine what we mean by strategic marketing practice.

Based on the mainstream of academic literature, strategic marketing revolves around four key activities (confer Best, 2009; Cravens & Piercy, 2006; Venter & Jansen van Rensburg 2009):

1. Defining a market according to the customer need being addressed.
2. Segmentation, targeting and positioning that includes the division of a market into submarkets with similar characteristics, quantifying and qualifying the needs of the defined customer groups (or segments) and selecting attractive segments as market targets (targeting). Positioning entails the development of appropriate value propositions to meet the expressed needs and to gain a competitive advantage in the segment.
3. Formulating and implementing marketing strategies that encapsulate marketing objectives and strategies for each segment and the strategies and tactics to attain the objectives.
4. Measuring performance in each segment against marketing objectives.
- 5.

Leading authors suggest that value is the key to successful strategic marketing and considers marketing as a value creation entity that defines markets and understands value, determines value propositions, delivers and monitors value (Best, 2009).

Over the years, various authors have contributed towards the discussion on the need for strategic and marketing intelligence systems, how they should be developed (Goretsky, 1983) and an idealized design (Trim, 2004; Montgomery & Weinberg, 1998; Mockler, 1992; Rothschild, 1979; King & Cleland, 1974). Others have suggested that information specialists could participate more in the strategic decision-making process and have outlined conceptual processes for doing this (Trim & Lee, 2008). Most of this research has focused on the normative, in other words what it should be, rather than what it actually is. In our study, we attempt to focus on the practice of marketing information and strategic marketing.

Studies to determine the contribution of marketing or strategic intelligence to marketing decision-making have been scarce. Lackman, Saban & Lanasa (2000) conducted descriptive research on this relationship, with a limited geographical focus (western Pennsylvania). This study also did not address the relative complexity of marketing intelligence and focused on MI as one broad concept, rather than as a complex and interrelating set of subsystems and activities. Despite these possible criticisms, the study did confirm the important contribution of MI to the core elements of strategic marketing, suggesting that more research in the nature of the relationship

between MI and strategic marketing could be beneficial. This is something that we set out to explore in more detail.

## RESEARCH METHODOLOGY

A quantitative research approach was used in support of the broader objective of exploratory research, and seeking to establish a pattern of organizational behaviour around the practice of strategic marketing. In order to elicit a higher response rate, structured telephone interviews were conducted with the selected respondents using a survey approach. Computer-assisted telephone interviewing (CATI) was the primary data gathering method, using questionnaires with a predetermined set of questions. Respondents also had the choice of completing the survey in their own time online. This method reduced costs, increased timeliness and improved data quality (Couper, 2005).

A sampling frame of marketing decision-makers representing more than 700 organizations was compiled representing relatively high marketing spenders with more than 100 full time, permanent employees. This ensured that we targeted organizations with formal MI and strategic marketing processes. A questionnaire was designed that measured the following aspects:

- MI requirements and availability
- *MI practices and processes*
- *MI tools and functions, the extent to which it is used in the organization and its value to the strategic marketing process*
- *Strategic marketing practices and organizational performance*

Data was analysed in PASW (SPSS) software, using descriptive analysis as well as factor analysis and regression analysis. The analysis centred on five components of the questionnaire. First, the items relating to marketing information practices and strategic marketing practices respectively were subjected to factor analysis to reduce the data and reveal the underlying dimensionality of the data. Second, the identified factors were correlated with each other and with the two questions on the overall quality of marketing information and the overall financial performance of the firm. The Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy and Bartlett's test of sphericity were used to determine the suitability of the item scales to factor analysis. Varimax rotation was employed to derive a simple, more explanatory structure, and factors with Eigenvalues less than 1 were screened out (Hair, Black, Babin, Anderson & Tatham, 2005). Factor loadings of 0.5 were used as a cut-off point, as were Cronbach's alpha coefficient s of 0.7 as a measure of internal reliability for the identified factors. Correlation analyses using Spearman's rank correlation coefficient was used to assess the strengths of relationships between the identified factors and dependent variables.

## RESEARCH FINDINGS

A total of 167 respondents completed the survey. The companies represented in the analysis represented mainly the manufacturing industry (43.7%), followed by services (36.5%) and trade (19.8%). Approximately 17% of companies employed more than 1 000 full-time employees, and 27.4% of the companies employed between 500 and 1 000 employees. Companies that employed between 250 and 500 staff members constituted 27% of the sample and the remainder (28.5%) of companies employed between 100 and 250 employees. Respondents were generally in higher level management positions, with 8.4% of the respondents indicating that they were directors, 49.9% in a senior management positions and 43.7% of the respondents were middle managers. We concluded that the sample was generally representative of marketing decision makers in formal South African business organizations.

The first step was to subject the marketing information and strategic marketing practice item scales to factor analysis. For both scales the KMO test of sampling adequacy yielded a test statistic well above the level of 0.8, while the Bartlett's test of sphericity also yielded highly significant results. Visual inspection of the communalities suggested that these were generally in an acceptable range. The overall results of the analysis are represented in Table 1.

Analysis of the marketing information items revealed five factors explaining 60% of variance. However, two of the factors displayed low levels of internal reliability ( $\alpha < 0.7$ ) and were subsequently excluded

from the analysis. The remaining three factors are outlined in Table 1. Factor 1 relates to *MI quality*, i.e. those factors that determine the perceived quality of marketing information. Factor 2 addresses the *support that information technology (IT) provides to marketing information*. Marketing information is also about the usage of information in the way that it is shared and forms part of decision-making, and this element is the focus of Factor 3, *interdepartmental coordination*.

Analysis of the marketing information items revealed two factors Factor 1, *segment-based marketing* postulates that strategic marketing is based on the company's ability to clearly define markets and market segments. Specific segments should then be selected and served with specific objectives and strategies per segments. The second factor was labelled *segment insight*, as it relates to the overall understanding of the needs and opportunities found in each segment. These factors are in line with the requirements set by leading authors for successful strategic marketing, namely a clear market orientation (expressed through customer insight) and the STP formula as a prerequisite for successful marketing strategies.

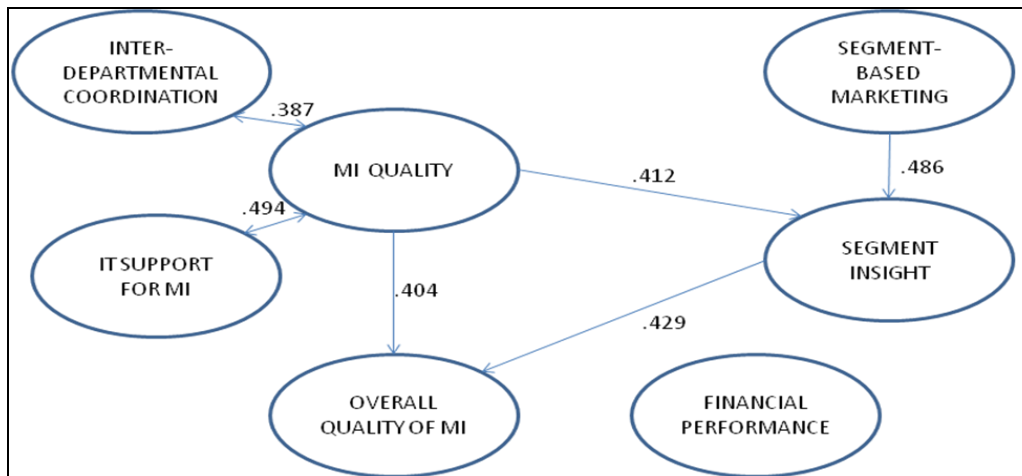

**Table 1: Marketing information and strategic marketing factors**

<b>Factors</b>	<b>Items</b>	<b>Loadings</b>
<b>MI Factor 1</b> <b>MI Quality</b> $\alpha = 0.806$ Mean = 3.08	It is easy for me to obtain market intelligence in the format I require	.679
	As a user of market intelligence my requirements are always taken into account when marketing information systems are designed	.676
	The IT dept really understands the information needs of marketing	.659
	Information is usually available to me by the time I need it	.623
	I routinely receive mark intelligence relevant to my responsibilities without asking	.705
<b>MI Factor 2</b> <b>IT support for MI</b> $\alpha = 0.737$ Mean = 3.14	IT makes it easy to get access to the right market intelligence	.640
	Our marketing strategy influences our IT strategy	.762
	IT assists me in making better marketing decisions	.825
<b>Factor 3</b> <b>Interdepartmental coordination</b> $\alpha = 0.737$ Mean = 3.89	We have interdepartmental meetings at least once a quarter discussing market trends	.807
	Marketing personnel discuss customers' needs with other divisions	.791
	Departments periodically plan a response to changes taking place	.689
<b>SM Factor 1</b> <b>Segment-based marketing</b> $\alpha = 0.778$ Mean = 4.3	We have a clear definition of the market(s) we serve	.769
	We have identified clearly defined market segments	.814
	We focus on specific segments that are attractive to us	.694
	We have specific marketing objectives for each market segment	.757
	We have a clear strategy for each of our chosen market segments	.720
<b>SM Factor 2</b> <b>Segment insight</b> $\alpha = 0.838$	We have a deep understanding of needs of each segment	.647
	We know exactly how we perform in our chosen segments compared to our competitors	.778

Mean = 3.8	Our information systems are geared to provide us with the information we require for segments for each segment	.814
	We have formal processes in place to identify marketing opportunities	.726

We followed the factor analysis with correlation analysis to determine the relationships between the five identified factors and two key variables: the perceived overall quality of MI and the financial performance of the organisation compared to its industry peers. The relationships between the factors and variables are depicted in Figure 1. In order to present the essential relationships, only relationships that are significant at the 95% level of confidence are depicted, as well as only those relationships with a moderately strong relationship (Spearman's Rho of higher than 0.35)

**Figure 1: Key relationships between factors and variables**

The findings depicted in Figure 1 suggest that MI quality and segment insight are two pivotal factors that play a mediating role. MI quality is influenced by interdepartmental coordination and IT support for MI, and in turn has a significant influence on the perception of the overall quality of MI. Segment insight is similarly influenced by segment-based marketing, and also has a significant influence on the perceived overall quality of MI. Segment insight is also influenced by MI quality. There are no particularly strong influences on the perception of financial performance.

## CONCLUSION

The process of analysis has identified five factors from the MI and strategic marketing data respectively. The analysis of the relationship between these factors and two measures (overall quality of MI and financial performance) suggested that MI quality and segment insight are two pivotal mediating variables that determine the overall perceived quality of MI. MI quality is influenced by the level of IT support and the extent to which interdepartmental coordination takes place. In other words, MI quality is influenced by the activities that enable the gathering, dissemination and usage of MI.

Segment insight is determined by MI quality, as well as segment-based marketing activities. This suggests that the mere activity of segmenting-targeting-positioning has little value if segment insight is not achieved. This supports the notion that market orientation is key to the success of the organisation.

The findings thus emphasise the key role of MI in the organisation. However, there was no strong evidence of influences on organisational performance, suggesting that there are perhaps many more variables that affect performance, making it difficult to isolate just a selected few influences.

# **TECHNICAL ENGINEERING DOCUMENT MANAGEMENT: MANAGING CRITICAL DOCUMENTS WITHIN AN OIL PIPELINE AND TERMINALS COMPANY**

**Conceição Maria Sande Vieira,  
Salvador University – Unifacs, Brazil**

## **ABSTRACT**

*The starting point of this research work is the belief that in nowadays society – known as information/knowledge society – one of the main challenges for an organization is to identify, validate, and make available the necessary, up-to-date, and correct information for its collaborators, partners, and stakeholders. Since Information and Communication Technologies (ICT) have moved beyond data management to content management, more and more organizations have been moving towards the automated management of document lifecycle. Development of new content management solutions in organizations requires new content production strategies and changes in business processes and work practices. Therefore, the identification and effective management of critical documents have become one of the main pillars supporting organizations in a competitive world. In this context, this paper discusses the role of technical engineering document management based on the case of the Oil Pipeline and Terminals Business Unit of Transpetro, with special attention to the importance of strategic information contained in a certain category of documents – the critical documents category. It aims at presenting a conceptual framework for identifying and managing critical engineering documents in competitive organizations, as a contribution for the advancement of knowledge in the field of strategic content management.*

## **INTRODUCTION**

Nowadays, information and knowledge have become critical, strategic assets for most organizations. All organizations today, local and global, large and small, use information systems to achieve their business objectives and value propositions, such as operational excellence, customer and supplier intimacy, better decision making, and innovative and safe products and services. A new social structure has been created based on electronic data processing technologies, and supported by multiple computers linked in networks.

In this scenario, organizations face the challenge of having the relevant information, accurate and accessible for decision-making processes related to their business strategies and operations. On the other hand, every day they generate more and more new information that needs to be treated and managed with strategic focus.

Development of new content management solutions are enabling entrepreneurs and innovative traditional firms to create new products and services, to develop new business models, and to transform the day-to-day conduct of their businesses. From this perspective, some businesses, even whole industries, are disappearing while new businesses are springing up.

In other words, each business has its own information value chain, in which raw information is systematically acquired, and transformed through processes and routines that add value to the previous information. In competitive organizations, documents stand out as being one of the most important ways by which the necessary

information will flow to ensure the effective management of their business processes. In addition, information systems are part of a series of value-adding activities for acquiring, transforming, and distributing information that managers can use to improve decision-making and enhance performance aligned to organization's value propositions (Treacy and Wiersema, 1997).

Aligned to that vision, the identification and effective management of critical documents have become one of the main pillars supporting organizations in a competitive world. In this context, this paper discusses the role of technical engineering document management based on the case of the Oil Pipeline and Terminals Unit of a whole-owned subsidiary of a large Brazilian energy company – Transpetro.

This paper discusses the role of technical engineering document management in competitive organizations, specially the importance of strategic information contained in a certain category of documents – the critical documents category. It aims at presenting a conceptual framework for identifying and managing critical engineering documents in competitive organizations, as a contribution for the advancement of knowledge in the field of strategic content management.

## THEORETICAL BACKGROUND

Van Wegen and De Hoog (1996) point out that the value of information is a function of its effect on decision-making process. In general, the real value of information can be directly associated to how information helps decision-makers to pursue and achieve their objectives and goals within their organizations. According to these authors, the quality of information has been assessed taking into account the following three dimensions:

- *Content*: information should be accurate, relevant, and complete;
- *Time*: information should be timely and current;
- *Form*: information should be provided at the appropriate level of detail and in the most appropriate form.

In other words, information should have certain characteristics to make it valuable, as being accurate, verifiable, timely, organized, meaningful, useful, and cost effective. As postulated by Laudon and Laudon (2006) and summarized here in Table 1, these quality attributes indicate the undoubted importance of the role of information in contemporary organizations.

**Table 1: Quality attributes for assessing the value of information**

Attribute	Definition
Accuracy	The accuracy level depends on the use of information. In some cases, it is sufficient that information is just correct. In other occasions, it must be accurate and detailed as much as possible. Inaccurate information often is worse than no information, once inaccurate information can lead to incorrect decisions.
Relevance	Meaningful information is relevant to the person who receives it. Because certain information is meaningful only to specific individuals or groups, unnecessary information should be eliminated.
Availability	Possibility of immediate access to information.
Reliability	In a statistical sense, the reliability of information is the percentage of times that it is conducted within the limits considered accurate by the system.
Timeliness	The need for timely information can change for each business decision. Some decisions require weekly or monthly information while other decisions require daily information. Timeliness is an aspect of information that depends on the situation.
Verifiability	Verifiable information means that the information can be confirmed by the user.
Cost-effectiveness	Cost-effective information costs less to produce than the value of the resulting information. Most organizations periodically review the information they produce in reports to determine if the reports provide valuable information. Based on that review, the companies can determine whether to continue, scale back, or even eliminate these reports.

Source: Laudon and Laudon (2006).

Since the late 1990s, after the adoption of new information and communication technologies (ICTs), organizations experienced a fast, partly uncontrolled growth of information assets in many forms and media such as text documents, engineering drawings, XML, still images, audio and video files, and many other file types and formats. Since then, practitioners, consultants, and professional communities have actively discussed the

problems related to content management in organizations and a great number of tools have been made available. Among them, Enterprise Content Management (ECM) technologies have been widely adopted. In this paper, we define ECM as technologies used to manage the content of assets like documents, web sites, intranets, and extranets in organizational or inter-organizational contexts (Smith & McKeen, 2003).

The main benefits of ECM technologies depend on their application area, but the following benefits can be considered for all areas: (i) quality improvement of business processes, in general; (ii) distributed, ready access to the data by users and systems, including the ability to onramp content to line of business systems, ERP systems, CRM systems, and others; (iii) the ability to eliminate mail delay, mail costs, and mail loss; (iv) the ability to introduce forms interfaces, automated workflow, and more automatic routing of content; (v) the ability to capture and retain the document image and thereby eliminate paper; and (vi) the ability of online sharing of information, and enabling decision-making processes with more participants and with less risks. According to Tyrväinen et al. (2006), ECM can be viewed from four perspectives (Figure 1): content, technology, enterprise, and process.

The content perspective refers to the identification of content items, their semantics, structuring, and organization, as well as the creation and use of content. Within the technology perspective, we can include the development of hardware, software, and standards for content management in organizational context. The enterprise perspective is concerned with organizational, social, legal, and business issues of content management. Finally, from the process perspective, one can consider the development and deployment of new content management solutions in a given enterprise.

For the purpose of the present work, we will focus especially on the content perspective. Tyrväinen et al. (2006) argue that although the word ‘content’ has a number of meanings, it always refers essentially to something contained in an entity. Compared to the use of the terms ‘data’ or ‘information’, content clearly is associated with a container. Content is often opposed to some other aspect of the container, for example, structure or form or representation, and carries the most substantial semantics of the entity.

**Figure 1: Constituent elements of a Enterprise Content Management System**

Source: Tyrväinen et al. (2006).

The content perspective comprises three views, as follows:

- *Information view*: it refers to the semantics of the content, and how the content is represented and made accessible to users. It includes issues such a clustering content of an information repository into meaningful content units, granularity of content, metadata, text transformations, content search and retrieval, and content representation;
- *User view*: it focuses on the relationship between content and users, including both users creating and maintaining content and users reading and using the content;
- *System view*: it focuses on various systems in which the content resides and is made accessible to the users, on the granularity of content used for processing and storage, on interoperation of systems within and across organizational borders, and on formats related to these.

Development of new content management solutions in organizations requires new content production strategies and changes in business processes and work practices. From this perspective, the complexity and overload associated to information contained in technical engineering documents; the need to comply with the legal and

organizational requirements for achieving operational excellence; and the need for more efficient management of technical risks and commercial strategies; constitute key issues for anyone involved in managing documents within a competitive organization. In the next section, we provide a conceptual overview of technical engineering documentation management as a basis for introducing and presenting the case study developed during the academic research.

## **TECHNICAL ENGINEERING DOCUMENTATION MANAGEMENT**

The technical engineering documents comprise a corporate collection with special characteristics. Based on the author's experience as IT consultant and academic researcher, the main characteristics of this type of documents are:

- document size variety;
- the need to update their content every time the situations that they represent suffer any type of intervention;
- the need to support the documents during their creation and revision by a workflow process, which consists of preparation of the draft; incorporation of comments and textual graphics; approval of comments; the final document generation; approval and archiving;
- the demand for human resources with specific capabilities for managing the collection.

Besides the above-mentioned characteristics, Baldam et al. (2002) consider 'timeliness' as a prominent attribute associated to technical engineering documents' quality. According to them, "a technical document will always be in accordance with the life of the equipment/facility/process to which it relates. [...] In some legal cases, such as nuclear installations and others, a permanent custody may be required."

In a world characterized by globalization, where information and communication technologies play a key role, it has become crucial to support the documents regarding new engineering projects carried out in different countries with. This support improves the capacity of organizations involved to act on information flows, and to make available documents in electronic format, in real-time (Joia, 1998).

The technologies that integrate ECM system are: Document Management (DM); Workflow and Document Imaging; and Computer- Aided Design (CAD). They support the management of technical engineering documents in order to meet the information demands within a globalized context of engineering activities. The new macro process based on ECM technologies dramatically changes the concept of corporate technical file.

## **MANAGING CRITICAL DOCUMENTS WITHIN AN OIL PIPELINE AND TERMINALS COMPANY: THE CASE OF TRANSPETRO**

The primary focus of this study was to present the experience of Transpetro in adopting an innovative conceptual framework for identifying and managing critical engineering documents, focusing on its entire collection comprising over 345,000 technical engineering documents. To that end, the author used the case study approach for an in-depth study of strategic content management implementation in Transpetro's Oil Pipeline and Terminals Business Unit.

Case studies have been employed in sociological studies in business before, offering understanding of phenomena in a real-life context. Case studies are used to collect data in order to gain a sharper understanding of a subject and what might be important for further, more extensive research later (Yin, 2009). Yin suggests that case studies describe events within a framework, where problems or issues emerge as the case is analysed and developed. Stake (1995) points out that information generated from case studies often resonates experientially with a broad cross section of readers. Tellis (1997) proposes the case study as a reliable method for study of information technology issues, as those discussed in this paper.

This study is a combination of an exploratory case study and a narrative case study. Exploratory case studies are used to understand processes, where the authors wish to explore unfamiliar phenomena before designing and implementing a larger study. Exploratory case studies allow researchers to identify questions and research issues, develop measurable constructs, and develop measures. In turn, narrative case studies present findings, focusing on perceptions, actions, and reactions of subjects. According to Yin (2009), the present case study is single and holistic. The analytical unit is the Oil Pipeline and Terminals Business Unit of Transpetro.

Transpetro is the largest oil and gas transportation company in Brazil. It works with transportation and storage activities of oil and byproducts, ethanol, biofuels and natural gas. It is responsible for a network of more than 11,000 kilometers (7,000 mi) of oil and gas pipelines, connected to terminals and an oil tanker fleet. The company is a fully owned subsidiary of Petrobras, established on 12 June 1998, as per legislation (Act n° 9.478/1997) which restructured the oil sector in Brazil. In addition to Petrobras, Transpetro provides services to several distributing companies and to the petrochemical industry.

The strategic management model adopted by Transpetro is supported by Balanced Scorecard (BSC) tool, created by Kaplan and Norton (1996). This tool is able to carefully define and monitor business strategies and results, in order to ensure competitiveness and profitability. Based on this conceptual framework, Transpetro has defined its value proposition as being '*operational excellence*'. This value proposition, in turn, comprises the following attributes: cost, quality, and timing of operational processes; excellence in relationships with suppliers; and the speed and efficiency of supply and distribution processes. These attributes are highly dependent on effective information systems, especially those related to the management of technical engineering documents. In 2001, Transpetro began to develop studies regarding the potential use of ECM technologies for management of its entire collection of engineering documents that belonged to the Oil Pipeline and Terminals Business Unit. These documents were geographically dispersed in many cities and in multi-site locations in Brazil. The need for adopting new procedures for managing properly these documents, with the use of updated technology resources, was mainly due to the following circumstances: (i) difficulties in locating and retrieving documents, 2) need for compliance with the legal requirements established by the National Oil, Gas, and Biofuel Regulatory Agency (ANP); and (iii) need for aligning the generation and processing of technical engineering documents to the state-of-art of ECM technologies, in order to improve process efficiencies by making needed information readily and reliably.

During the preparation of a project plan focusing on the implementation of ECM system within the Oil Pipeline and Terminals Business Unit of Transport (with the author acting as coordinator and technical consultant), it was perceived that the engineering documents could be classified into different degrees of importance. These differences indicated the need for new content production strategies and changes in business processes and work practices concerning technical engineering documents. In turn, the introduction of innovative ECM tools, new practices, and procedures required a robust conceptual and practical background, justifying both purposes and intentions.

Within this perspective, in the last quarter of 2002, Transpetro carried out a benchmarking study in cooperation with Enbridge Pipeline Inc. focusing on pipeline integrity, but also including relevant issues on the use of ECM technologies in collections of technical engineering documents. Enbridge Pipeline Inc., a Canadian company, is a leader in energy transportation and distribution in North America. This company operates, in Canada and the U.S., the world's longest crude oil and liquids transportation system. Enbridge also has a growing involvement in the natural gas transmission and midstream businesses.

Throughout the analytical phase concerning the introduction of ECM technologies for improving the Transpetro's technical engineering document management, it was possible to learn about the policy of the Canadian company regarding the management of its design and engineering documents. According to Buchanan (2002), the Enbridge collection of technical engineering documents has been segmented into 11 categories, each one with a specific management format.

The convergence of these factors – the perception of different degrees of importance associated to Transpetro's technical engineering documents, and the existence of a document taxonomy and classification currently used by Enbridge, which included an specific category concerning critical documents – led the author to identify an opportunity to carry out an academic MSc. project focusing on the development of a conceptual framework for strategic content management, which could be purposeful for Transpetro (Vieira, 2004). On that

occasion, it was assumed that the resulting conceptual framework could be implemented by Transpetro and would significantly improve its process of technical engineering document management. Specific objectives of the MSc. project were to: (i) conceptualize and identify the critical documents within the collection of technical engineering documents; (ii) identify strategic information considered necessary to ensure operational continuity and excellence; (iii) define the accessibility and reliability of the strategic content of these documents; and (iv) present the constituent elements of a management model for this particular category of documents.

Transpetro had at that time a collection containing over 345,000 technical engineering documents. All operations related to design; conceptual and basic projects; construction and maintenance of industrial installations of pipelines and terminals were subject to specific engineering projects. In turn, the technical information that was necessary to enable these industrial installations to operate within proper conditions was generated throughout specific engineering projects. The set of documents generated during the development of these projects was called '*Collection of Technical Engineering Documents of Oil Pipelines and Terminals Business Unit*'. Such a collection has been considered vital to ensure continuity of business and to improve decision-making processes at institutional level, both managerial and operational.

As mentioned before, the information contained in these documents may be classified into different categories, according to their degree of importance for decision-making in different organizational levels. For the purpose of this case study, the most important category is that called '*critical documents category*'. All the information classified under this category must be permanently updated in function of changes occurring in pipeline and terminals' installations.

Following a case study protocol, as conceived by Yin (2009), it was possible to systematize the knowledge for an effective management of technical engineering documents and build up a conceptual framework that would be the basis for a management model concerning the particular category of critical documents (See Table 2).

For the field research phase, a questionnaire was designed to gather data from a potentially large number of respondents within the Oil Pipelines and Terminals Business Unit. It comprised six dimensions, deployed into 25 questions, as follows:

- *Concept of documents* (questions 1 to 10): to survey the perception of respondents concerning the concept of critical document within the technical engineering documentation of Transpetro; the identification and importance of these critical documents; and users.
- *Conditions for establishing the reliability of the content of critical documents* (questions 11 to 16): to identify the meaning of verifying the content of a critical document; to identify the people responsible to attest its reliability; and requirements associated to its permanently update.
- *Conditions to ensure the accessibility of critical documents* (questions 17 to 19): to investigate the existence of facilities necessary to enable appropriate access to critical documents and, if so, to identify what were these facilities.
- *Technological support* (questions 20 to 22): to identify whether the ECM system, with its current capabilities on that occasion, allowed management of critical documents, and if not, what would be the functionalities of this system for the effective management of critical documents.
- *Human resources to manage the critical documents* (question 23): to check if Transpetro had human resources (quantitative and qualitative) to manage critical documents, and, if not, what should be the required qualifications;
- *Critical success factors associated to the management of critical documents* (questions 24 to 25): to identify the critical success factors that should be considered to support a future model for managing critical documents (Rockart, 1979; Boynton and Zmud, 1984; Popo, 2001).

The results from the field research phase indicated that the content of critical documents could be considered as strategic assets for Transpetro, once it was perceived as crucial resources for maintaining or even improving the competitive position of the enterprise compared with congener enterprises. It was also found that this strategic information constitutes the basis for decision making in different organizational levels of Transpetro. As a strategic content, it must be available and reliable, according to the most of answers (95%).

Critical documents were defined by respondents as those which allow: (i) safer operations of the oil and terminal units; (ii) prompt and accurate decisions for any emergency situations; (iii) to map potential problems that can generate a need for interventions in equipments and operational sites; (iv) to leverage technical expertise and collaborative culture within the company through access to right information.

The results from the field research also allowed the proposition of a management model for the category of critical engineering documents, whose constituent elements are presented in Table 2.

**Table 2: Constituent elements of the management model for the category of critical documents**

Element	Function
Governance	To maintain a professional group officially designated and coordinated by a Transpetro's manager. The attributions of each member of the group must be registered in a matrix of responsibilities concerning management of the category of critical documents.
Technological support	To support the use of ECM technologies; workflow, electronic email; and intranet, providing all required integrations between them. ECM system should enable the identification of critical documents during the process of indexing the technical engineering documents. The processes of creation and revision of critical documents should be supported by a workflow technology, since it will enable traceability of all critical documents. During the process of creation of new documents, it must be included a task of indexing new critical documents into ECM immediately after their approval. During the process of revision of existing documents, the interface with electronic email must be kept. An automatic notice should be sent to the ECM manager, when required updates of critical documents are delayed. The technological resources should be provided continuously for technical and managerial teams, which depend on strategic information contained in critical documents for decision-making in their respective areas and business processes.

**Table 2: Constituent elements of the management model for the category of critical documents (Cont.)**

Element	Function
Procedures for creating and updating critical documents	To create a procedure for creating and maintain critical documents continuously updated and aligned to the evolution of technological resources and responsibilities, focusing on the specific category of critical documents.
Procedures for creating and updating critical documents	To create a procedure for creating and maintain critical documents continuously updated and aligned to the evolution of technological resources and responsibilities, focusing on the specific category of critical documents.
Performance indicators	To keep management performance indicators (number of critical documents that were updated and those that are pending updating) published monthly in the Intranet and considering the progress month by month. This mechanism allows the monitoring of the management process of critical documents for the elimination of bottlenecks and their continuous improvement.
Mechanism for monitoring, evaluating and updating the management model	To create and maintain an institutional mechanism (corporate procedure) for monitoring, evaluating and updating the management model concerning the category of critical documents. This procedure, in turn, should be permanently updated in total alignment with the evolution of technological resources and changes on responsibilities of those involved the management of engineering documents that are considered critical for business operations.

## CONCLUSIONS

From the perspective of competitive organizations adopting or intended to adopt ECM technologies, the conceptual approach here presented, and illustrated by the study case of Transpetro, reinforced the importance of identifying and managing critical documents, with particular attention on the criticalness of technical engineering documents for strategic purposes.

It was found by an illustrative case study that the importance of identifying and managing critical documents can be directly associated to the efficiency of decision-making processes at different organizational levels. Decisions are taken by professionals from different activities within the enterprise: engineering, pipeline

and terminals' operations; maintenance; inspection and reliability of pipelines; and conformity assessment regarding attendance to legal requirements.

The lack or the unreliability of such information, or even the difficulty to access and retrieve them, could undermine the performance of those activities and the decision-making processes *per se*. Consequently, these negative impacts of lack, delay or unreliability of critical information can lead to financial losses, besides increasing the risks of accidents that could affect the work force, local residents in the disaster zone and cause environmental damages.

From the case study results, we conclude that, in function of the importance of critical documents for Transpetro, its effective management can be achieved from the segmentation of the collection prioritizing this documentary category. To that end, the requirements that must be observed and attended are: (i) the availability of critical documents for access according to user's specific needs; (ii) efficiency of retrieval process concerning these critical documents; and (iii) the reliability of their contents.

We suggest that the new conceptual approach presented in this paper – *the segmented management for collections of engineering technical documents* (focusing on the category of critical documents) – could be applied to other documentary collections at Transpetro, assuming that they can also contain critical documents.

Finally, we strongly believe that not only Transpetro, but also other organizations that possessed similar documentary assets, could improve their decision-making processes with strategic information identified and recognized as such. The adoption of this conceptual approach aligned to business unit's competitive strategy could significantly change the manner in which business has been conducted, in order to give the organization a sustainable competitive advantage.

# STRATEGY FOR FORWARD MOMENTUM: SOCIAL NETWORKING

**Anandasothy Vignarajah**  
**Johns Hopkins University, USA**

## ABSTRACT

*The importance and impact of social media on each of the rebellions in recent times have shown us how we communicate during moments of historic crisis and transformation. What we have witnessed on the ground in Tunisia and Egypt has challenged our preconceptions, as did the evidence that emerged from Libya and Bahrain. The author looks at some of the features of social networking websites and the fundamental problems with today's social networking services. Some of the popular ones looked at are: Twitter, Facebook, and Myspace, A possible solution would be to build social networking into the fabric of the next generation Internet itself.*

## DEFINITIONS

Social Network is a social structure made up of one or more nodes with a specific type of interdependency.

Network analysis – is an analytic approach which has moved to be a paradigm.

Ning – online platform for people to create their own social networks.

## INTRODUCTION

Social Network views social relationships in terms of network theory consisting of nodes and ties called connections, edges, or links which are individual actors within the network, and ties are the relationships between the networks. The concept of social networking was envisioned by engineers who laid the foundation for the Internet. In 1968, Licklider and Taylor referred to social networking as geographically separated members, who were working together grouped in clusters or working individually (Kirkpatrick, 2010).

Network analysts generally find it impossible to directly observe anything other than interaction and relations, thus social networks are the only structures capable of constituting an acceptable starting point. Most relations originate within circles (family, organizations) from which they become progressively independent. Network effects are not characteristic of the “higher” categories of profession and formal education (Grossetti).

Research on networks usually distinguishes between structural and functional network aspects. They also describe qualitative and quantitative aspects of a network. Important structural aspects in theory and research are the size and composition of the network. Functional network aspects refer to the quality and the content of a communication relationship. There are social networks for visually impaired and blind adolescents that are catered for a group of 15 persons on small networks (Kef, Hox & Habekothé). Facebook is one among them that is committing to make it more accessible for visually challenged users.

The virtual community became a reality with the use of the Internet, chat rooms, and computer bulletin boards. In 1992, the French launched an online Postal service called the Minitel. In 1988, IBM and Sears launched a commercial online called the Prodigy. The World Wide Web (WWW) advanced the notion of an

online community a little later. Services like the TheGlobe.com, Geocities, and Tripod emerged and users were able set up home pages which could link to pages created by other users. In 1995, Classmates.com helped people to be identified by their real names to find and communicate with former school friends. In 1997, a New York based startup called sixdegrees.com inaugurated a service based on real names. In 1997, Boyd and Ellison articulated a true social network, where users “can construct a public or semi-public profile” and “view and traverse their list of connections, and those made by others within the system”.

In 1945, Vannevar Bush was excited just to imagine the possibility of a hyperlink (Turow & Tsui). With an MIT-trained electrical engineer who cofounded the Raytheon in the 1920s, Bush headed the Office of Research & Development (ORD). During World War II, his office oversaw the development of radar, the proximity fuse, and the atomic bomb. As the main force behind the establishment of the National Science Foundation, he pushed the federal government to fund what he called “The Endless Frontier”. Other technologies shared his enthusiasm. In the mid 1960s, Ted Nelson, the technology philosopher coined the word hyperlinks. These foundations paved the way for the links that most Internet users know of today – the highlighted words on the web page that takes them to other places on the Web. These “embedded” links are only the tip of an iceberg of types of instant connections. A healthy way to promote a healthy society offline as well as online is to pay close attention to the links. We need to think in terms of what political, economic, and social factors provide guidelines in linking mainstream media with individuals such as bloggers and wikipedians (Turow & Tsui). The hyperlinks were used to express social relationships before social networking sites like Friendster, Orkut, MySpace or Facebook. Club Nexus was launched by a Turkish computer science student Orkut Buyukkkten while at Stanford. These are some of the early findings of social network websites.

## **Social Hyperlinks**

The social links provided information contained in each home page, as to which could be linked and which could not be linked. Web server software was developed soon by Mosaic communications with a layer of security, which none had provided so far. It would be embedded in its browser called the Secure Sockets Layer. They would use 40-bit digital keys to encrypt on-line communications.

## **Network Models**

Social selection in network occurs when individuals form social relationships on the basis some of the characteristics they possess. The models are networks of relational ties which depend on attributes of the actors who are members of the network (Robins, Elliott, & Pattison). A social network is constituted by a set of relational ties among a set of actors. By actors, we mean the individuals among whom relational ties may exist. An actor is presumed to develop relational ties with some but not necessarily all. These ties come about for they recognize qualities in each other that may stimulate a social linkage between them. The qualities are referred to as actor attributes. Individual attributes shape patterns of relationships. Some of the social networks are looked at here.

## **LinkedIn**

LinkedIn is a business-oriented social networking site. Founded in December 2002, and launched in May 2003. It is used for professional networking. It has 100 million registered users, spanning more than 200 countries and territories worldwide. Employers can list jobs, and others can use it to search for these opportunities. LinkedIn Answers questions like Yahoo Answers and the service is free. Due to corporate policies it is restricted in some countries like Cuba. The site is available in English, French, German, Italian, Portuguese, and Spanish.

## **Plaxo**

It is an online address book and social networking service. Sean Parker, Minh Nguyen, and two Stanford engineering students Todd Masonis and Cameron Ring founded it. It provides automatic updating, where users and their contacts store the information on Plaxo’s servers. A Plaxo plug-in supports major address

books including Outlook, Mozilla Thunderbird, and Mac OS. In 2007, Comcast partnered Plaxo in the launch of its universal communication service. It is a subsidiary of Comcast.

## **Friendster**

Jonathan Abrams, a programmer with Ryze, built and launched it in February, 2003. Friendster is a social networking website where users share videos, pictures, messages and comments. It is among the top 1,000 global websites based on web traffic. It was created and launched before MySpace and Facebook. Tom Anderson, MySpace co-founder was an avid Friendster user.

## **Ryze**

Ryze is a free a social networking website designed to link business professionals and was launched in late 2001 by Adam Smith. It claims to have 500,000 members in 200 countries with over 1,000 external organizations hosting sub-networks on the site. It is intended to evoke a manner in which members would “rise” up to improve the quality of their personal networks (Kirkpatrick). Member profiles focused on work accomplishments, networking with their co-workers and business contacts. They levied a fee for searching their databases for professional gains. It prospered among the San Francisco tech cognoscente.

## **Flickr**

Flickr is an image hosting and video hosting website acquired by Yahoo. It is a popular website used by bloggers to host images which they embed in blogs and social media.

Flickr was developed by Ludicorp, a Vancouver-based company, and launched in February, 2004. By 2008, Flickr permitted paid subscribers to upload videos limited to 90 seconds and 150 MB in size. It also had the ability to upload and view HD videos permitting an upload of normal resolution videos.

Flickr’s functionality includes Really Simple Syndication (RSS) and atom feeds, which are web-based formats to feed an Application Programming Interface (API) that permits independent programmers to expand their services. The functionality of the site depends on standard Hyper Text Markup Language (HTML) and Hyper Text Transfer Protocol (HTTP) features enabling wide compatibility among other platforms and browsers. Flickr is popular with Macintosh and Linux users who are not able to access photo-sharing sites which require Windows and Internet explorer.

## **SixDegrees**

SixDegrees is a social network service which was active from 1997 to 2001. It is open to the public again by the site administrators and former owners after “heavy re-building, restructuring, and overall maintenance” is completed.

## **Twitter**

Twitter is a website, created in 2006, referred to as a social networking and micro-blogging service permitting users to send and receive messages called tweets. They are texts up to 140 characters displayed on the user’s profile page. It is compared to a web-based Internet Relay Chat (IRC) client. Users may use group posts by topic or use of hash tags or phrases prefixed with a “#” sign. Similarly, the “@” sign followed by a username is used for replying to other users. In order to re-post a message from another Twitter user, and share it with your own followers, the re-tweet (RT) function is used in the message. It permits pictures and videos to be seen without leaving twitter itself, by clicking individual tweets which contain links to images and clips from a variety of supporting websites including YouTube and Flickr.

It is estimated that it has 200 million users and is referred to as the short message system (SMS) of the internet. It generates 65 million tweets with 800,000 search queries per day. People who Twitter are not

necessarily friends. You can sign up to follow anyone's tweets; the names users give its telegraphic updates. A large percentage of Twitter accounts use aliases or company names. And unlike Facebook, Twitter connections are one-way. Twitter is a broadcast platform – perfect for companies, brands, bloggers, celebrities, and any information you want a lot of people to know about. Twitter, like Facebook opened itself early as a platform for other applications. Many users tweet and view the tweets of others on independent sites like TweetDeck. Twitter, upped Facebook in 2009. It enjoyed the placement Facebook had in 2007 and 2008. By mid-2009, Twitter had 50 million members.

Tweets are publicly visible by default. Senders can restrict their message delivery to their followers. Users can tweet via the Twitter website, compatible external smart-phones or by short message service (SMS). While the service is free, accessing through SMS may incur phone provider fees. As a social network, it revolves around the principle of followers. Users can subscribe to other users' tweets which are referred to as followers or tweeps.

**Figure 1:** Content\_of\_Tweets.svg

**Table 1: Content of Tweets according to Pear analytics:**  
[San Antonio based Market analysis firm]  
From August 2009 for 2 weeks (10 AM – 5 PM)

Pointless Babble	40.1 %
Conversational	37.6 %
Pass along Value	8.7 %
Self Promotion	5.9 %
News	3.9 %
Spam	3.8 %

San Antonio based research group Alexa's web traffic analysis using data for a 2 week period in August 2009 from 10 AM – 5 PM ranked it worldwide among the 10 most visited websites for web-trafficking. In February 2009, Compete.com ranked it as the third most used social network. Nielson.com ranked Twitter as the fastest growing website with an annual growth of 1,382 percent increasing from 475,000 visits to 7 million followed by Facebook. It has a retention rate of forty percent. According to an industry analyst Jeremiah Owyang, studying social media, Twitter is mainly used by older adults who may not have surfed on any other social website. According to Quancast Corporation for research and investment information, 27 million people have used Twitter since September 2009.

The centralized client-server architecture has not scaled with user demand, resulting in server overload and significant loss of availability. To enhance scalability, some decentralized architecture has been built-in like Fehr and Cuckoo. Twitter released several open source projects developed while overcoming technical challenges to their service, notable among them are Gizzard Scala Framework for creating distributed data-stores, and the distributed graph database FlockDB. Twitter Web Interface uses Ruby on Rails which is an open source application framework for the Ruby programming language. There are numerous tools for adding content and conversations including Tweetdeck, HotSuite, and Twitterfeed. Based on an analysis by Sysomos, half the tweets are posted using web interface, mostly by third party applications. In 2009, Twitter added a search bar and a side bar for "trending topics", meaning the most common phrases appearing in messages. All the messages are instantly indexed. With this newly launched feature, Twitter has become unexpectedly a very important website, which has a discovery engine for finding out whatever is happening right now.

When Twitter experiences an outage, users see the fail whale error message showing eight orange birds using a nest to hoist a whale from the ocean captioned, "Too many tweets. Please wait a moment and try again". Twitter has been used for an array of purposes in many different industries and scenarios. It has been used to organize

protests referred to as “Twitter Revolutions”, notable among them are 2011 Egyptian turbulence, 2010 - 2011 Tunisian protests, 2009 – 2010 Iranian uprisings, and the 2009 Moldova unrest. Twitter has also been used in emergencies and political campaigning. Twitter is also used for direct communication among social groups and organizations with the help of “hashtags”. For example, #edchat at the end of a tweet would mean that it will be viewed by all users following the topic like an ongoing chat among educators. It is also used increasingly for making TV more interactive and social, referred to as “virtual water cooler” or social television. Twitter has been used successfully to watch TV events like Oscars, Super Bowl, and other awards.

Twitter messages are public, but users can also send private messages. Twitter collects personally identifiable information about the users, and shares it with third parties. It reserves the right to sell the information as an asset if the company changes hands. It does not display any advertising, but can target users based on their history of tweets. Security vulnerability was reported on April 7, 2007. Within a few weeks, Twitter introduced an optical PIN for its users to authenticate their SMS-originating messages.

## **MySpace**

In 2002, a complete infrastructure of finance, human resources, technical expertise, bandwidth, and server capacity was available for the site, with no typical startup issues for the project. A team of programmers and resources were provided by eUniverse who used its users and e-mail subscribers to move it to the top of social networking websites. It was to be for online data storage and sharing, and intended to be used as a web-hosting site.

MySpace is a social networking website. Its headquarters are in Beverly Hills, California where it shares an office building with its immediate owner News Corp. Digital Media owned by News Corporation. It became the most popular social networking site in U.S. in June 2006, a position which it has held till 2008 when overtaken internationally by Facebook on April 19, 2008, in the Alexa rankings. MySpace redesigned many of the features of its site in both layout and function. The first function to be redesigned was the home page with status updates, application, and subscribers. In the Profile 2.0, the simplification of the navigation bar also made it easier to find the features quickly. Profile 3.0 enabled users to have more creativity with a simpler interface, simpler creation methods and theme buildings, and module control. In the newer profile, building templates has become simpler without the use of custom Hyper Text Markup Language (HTML) and Cascading Style Sheets (CSS). Users can upload photos from their computers or find background images on the Internet by using a Uniform Resource Locator (URL). HTML and CSS can still be used on the profile, but a HTML or CSS module must be added.

MySpace operates solely on revenues from advertisements. It is second only to Yahoo in its ability to collect data about its users. They can also customize their user profile pages with HTML but not JavaScript. Users can also change the appearance of their home page by entering CSS into one of these fields to override the page’s default style sheet using MySpace editors. There are several independent websites offering MySpace layout design utilities with a user selection option, so a user can preview what their page will look like using them.

## **Facebook**

Sophomore Mark Zuckerberg, a sophomore computer science major, arrived at Harvard’s Kirkland House in 2003 dragging an eight foot long white board, which was his brainstorming tool. There was only one wall in the four-person suite that would hold it, the hallway on the way to the bedrooms. The white board became a tangle of formulas and symbols as he made multicolored lines on it with markers in hand. He spent endless hours writing software code. He wrote an Internet software called Course match to help students to pick their classes. Zuckerberg took ideas from his own register.com, Course Match and Facemash. Facebook was launched in February of 2004. He took ideas from the social network Friendster where he was a member, and MySpace, a social network launched in Los Angeles in August 2002. By 2008, the Facebook was five years old, and with the inclusion of photos and the News Feed, and its expansion with the application platforms and the translation tools, it had fundamentally altered and transformed the user experience. The most significant was the change to two separate components of your profile, the “wall” where friends sent you direct public messages, and the personalized News Feed displaying information about you. At the top of your profile was a box called “publisher”, an enhanced version of the old shot – photos, videos, and links to articles and sites of interest on the

Web. Whenever, they shifted to a new version, the company gave users a trial version which they could run parallel to the old version.

In 2008, Zuckerberg aimed at embedding Facebook into the very fabric of the Internet. With a fundamental change to its platform, the company launched Facebook Connect, which was appealing to the software developers to start building on top of Facebook in a new way. Connect permits you to use any site on the Web using your Facebook account. This lets you take your identity with you wherever you go online. Connect sends back information to Facebook feed, which is a way to project information about the actions you take on those sites back to your Facebook friends as if they were actions inside Facebook. Along with the “like” button, it enables Facebook to transmit information to many friends or any website that wants to take advantage of it.

Facebook Connect and the platform outside offer what could turn out to be a universal Internet log-in. By November 2010, about 150 million Facebook members were using it and it included the top 100 websites in the world including the largest content website Yahoo, the big media site CNN, hot startups like TechCrunch, and devices like iPhone. When discussants log in under their real name, dialogues become more civilized. There is no charge to use Facebook’s platform, but customers expect it to change. By February 2011, 600 million users were using it to create personal profiles, and add users as friends, exchange messages including automatic notifications when they update their profiles. Users are also able to join common interest user groups organized by workplace, school, or colleagues or others with common characteristics.

Connect can also become a vehicle for advertising, though the possibility has been downplayed by executives so far. Zuckerberg, said about his company policies, “History tells us that systems are most fairly governed when there is an open and transparent dialogue between the people who make decisions and those who are affected by them. We believe history will one day show that this principle holds true for companies as well, and we are looking forward to moving in this direction with you”. In 2009, Facebook had 200 million active users, and with the revised Statement of Rights and Responsibilities, the Facebook Consumerist pronounced itself satisfied and Internet activists were impressed. Jonathan Zittrain, a professor at Harvard Law School and author of “The Future of the Internet – and How to Stop It”, wrote an admiring article noting that Zuckerberg had encouraged Facebook’s users to view themselves as citizens of Facebook.

In March 2009, Facebook explicitly wanted to co-opt with Twitter. The changes were not visible on the user’s profile with its “wall”, but on the home page where you first get in with information about your friends, there is a publisher box at the top of the page just like the one on your profile. The New Feed is updated in real time (like Twitter), and it is not based on an algorithm (so is Twitter). The old News Feed depended on software that watched your past behavior and guessed what you wanted to do. Facebook also added filters on the left side of the home page to help you control what appeared in your stream. A new feature was also added to the redesign, new privacy settings enabling you to open parts or all of your profile to everyone on the Facebook.

By April 2009, Facebook released something called Facebook Open Stream Application Programming Interface (API), laying the groundwork to transform the way people used its service. The Stream API is a companion to Facebook Connect. If you consider Connect as a way to extend Facebook’s platform across the Web, the Stream API represented a way to distribute the experience of being on Facebook outside the service itself. Some managers say Facebook on the Internet could become like an Intel chip inside a PC – something that you use, but seldom think about. They think of it as a piece of software which in effect contains your friends – a persistent and potentially live connection to any of them. As we traverse the real world, most people will carry devices with an Internet connection always available to them: Facebook’s iPhone, Blackberry, and Google Android applications as well as those on other mobile phones used by more than 200 million users worldwide. In the future, the main way people use Facebook will be on a mobile device. In August 2009, Facebook acquired FriendFeed. By bringing the FriendFeed’s technology and Google’s ex-founders (star coders), Facebook wants to significantly bolster its ability to compete with Twitter. It became the top social network in 2010, with more people visiting it than Google the week ending March 13, 2010. It became the top social network in most English speaking countries including U. S., U.K. and Canada, and in 8 individual markets in Australia, Philippines, Indonesia, Malaysia, Singapore, New Zealand, Hong Kong, and Vietnam. It also won the “Best Overall Startup or Product” for the third year in a row.

## CONCLUSION

As the saying goes, “the net does not forget”, it is important for management to mitigate the risk of employees engaging in abusive or ingenuous conduct. Social networks may influence attitudes and behaviors, but the measurement of network characteristics has systematic problems (White & Watkins). Facebook and MySpace have become so pervasive for communication that many people of all ages barely use email anymore. From SixDegrees to Friendster to Facebook, social networking has become a familiar and ubiquitous part of the Internet. There are others like the YouTube which is a video-sharing website whose users, upload, share, and view videos. It uses Adobe Flash Video, and HTML5 (Hypertext Markup Language) to display a wide variety of user generated video content including those by CBS, BBC and others as a part of their YouTube partnership program. It is not a social network, but it has enhanced the technologies of today.

Economic sociologists stress the protective and beneficial role of social networks. Social ties improve transaction outcomes. White-collar criminologists focus on the harmful and exploitative nature of social networks. They prove social ties facilitate successful economic crimes (Baker & Faulkner). Ethan Beard, a Google veteran, the marketing boss of Facebook’s platform compares the evolution of Facebook with its additional connections and while monitoring every user’s interactions with them, he makes a comparison to Moore’s law, the prediction by Intel’s Gordon Moore back in 1960, that the number of transistors that could fit on a computer chip would grow exponentially over time. Ethan thinks there is a similar exponential phenomenon in social networking (Kirkpatrick). Social network could develop to an extent in the future, where you will know which of your friends on Facebook is at the match. Or which ones at the match have been at a match prior to that with you. Facebook Platform marketer Ethan Beard is of opinion he will be able to tell Tivo to record whatever shows your friends are recording. Shopping is another arena. It will be interesting if when you are contemplating an expensive purchase like a house in a particular development, or a car, or camera, and which of your friends had contemplated it. One of the developer’s will probably have Facebook tell you that. Or you may have some auxiliary memory built in that can tell you when you visit a place, looking down memory lane, when you were there last.

# **ECONOMIC RESULTS AND MARKETING INCENTIVES ON INSURANCE MARKET**

**Nada Djordjevic Vignjević**  
**State University of Novi Pazar, Serbia**

## **ABSTRACT**

*Over the past five years of extensive political and economic reforms, Serbia has developed into a stable democratic country with a fast growing market economy. Western-oriented, democratic political parties have a strong majority among citizens and the Government is shaping an attractive environment for doing business, while legislative activities are intensely bringing the legal framework in line with the EU regulations. As a member of the International Monetary Fund, Serbia exercises a sound and consistent economic policy resulting in strong economic growth, state budget surplus, and rapid export expansion. The country's progress is fully supported by leading international development institutions, such as the World Bank and the European Bank for Reconstruction and Development, while the processes of the European Union and the World Trade Organization accession are under way. On the insurance field, in the next period there is strong competitive fight, on the insurance market, involved by entrance of foreign insurance companies, mostly by buying domestic insurance companies. The insurance market significant developing in the next period, involved by the entrance of foreign insurance companies.*

## **MARKET POSITION OF THE CENTRAL BANK, BANKS AND INSURANCE BUSINESS HOUSES**

For all the financial markets one of the most important factor is the formation of credit potential changes in the level of central bank credit activity in the current period, whereas in the case of under-developed financial systems to the most important course. In addition, central bank credit is the primary activity in two ways: 1. immediately credit the commercial banks and 2. the central bank creates money by crediting the state.

In the first case of commercial banks are not obliged appropriations received the mandatory reserves of the central bank loans. Once the commercial bank the funds invested by forming a new deposit of potential commercial banking, which creates the obligation of banks to set aside the potential of the newly formed deposit reserve requirements. In the second case it is permissible institutional funding model deficitnog state, where the periodic excess expenditure over revenue funded debit state with the central bank. Since the state of water resources in the account of the central bank approved a loan is recorded as a deposit with the central State Bank.

Once the state starts spending of these funds, it is transferred to the deposits of the economy by commercial banks. Now that commercial banks are obliged to deposit the amount of increased resources set aside additional reserve with the central bank. In both cases the central bank's credit growth, first act in the full amount of the increase in financial resources of banks, that in the next moment caused an obligation to set aside the business of banking reserve requirements at the central bank, in proportion to the newly established deposit potential. In these cases there is no change in the rate of compulsory reserves, but the quantum of statutory reserves changes only on the basis of the increase of deposits in commercial banking.

This further means that if the central bank keeps monetary policy expansionary, the more will be created over the potential rate of credit growth of banks. ( <sup>1</sup> There are two major factors forming the potential

bank credit arising from the credit-deposit relationships of the central bank and commercial banks. First, the foreign relations of a country induce foreign exchange transactions with foreign countries, that is. overflow deposits based on transactions with foreign countries. In fact, current balance deficit with other countries at a given time (period) causes the reduction of foreign exchange reserves at the central bank, while the economy to withdraw funds on demand deposits with commercial banks. Conversely, if there is a surplus in the balance of foreign exchange transactions, the level of foreign reserves by central banks is increasing, along with the increase of demand deposits in national currency at commercial banks.

The inter-relationship of the central bank and commercial banking and insurance, there is a potential factor in the formation of credit of commercial banks in case of spill-over of funds between the commercial banking system and central-banking system. The point is that similar to the business banking and the central bank has a deposit system that included:

- Required reserves
- Liquidity reserves of commercial banks,
- deposits of the state (and institutions) and
- blocked by deposits of the economy that are drawn from the credit potential of banks.

Bearing in mind the dynamic relationship of the central bank and commercial banks, there may be spill-over funds to the central bank and charged to commercial banks, which will manifest as a reduction of deposit resources, time and credit resources of banks. Conversely, the current overflow of central bank deposits in favor of the deposit potential of banks, effectuates as a potential increase in time deposit and credit resources of banks. Finally, as a potential factor in the formation of credit reports and overflow deposits at commercial banks and the amount of cash in circulation. The starting point is the assumption that the program of cashflow is only by the Central Bank through commercial banks and the total amount of cash found in the population. Accordingly, the total mass emitted cash is in the balance of central bank liabilities. Also, the insertion of cash in circulation is done by commercial banks through the payment of salaries and the expense of demand deposits of commercial transactors, as well as the withdrawal of savings at the expense of citizens' deposits at commercial banks. The opposite course is going conversion of cash in demand deposits in banks through various forms of consumption of the population and the payment of money in savings deposits at commercial banks.[1, 236-239] Given that these processes are dynamic, the banks are conflicting with periodic balance deficits in cash, especially at the time of payment of wages, which exceeds the cash reserves of the formation and implementation of modern forms of payment in the form of deposits with various banks. At the time of reduction of demand deposits and savings deposits due to their conversion into cash, reducing the potential credit. The proportion between the amount of demand deposits and cash, and their mutual conversion, depends on the level of income, as well as the financial preferences of the population in terms of ratio between savings and consumption, ie. between savings deposits at banks and cash stocks.

## **OFFER OF FINANCIAL SERVICES**

Dealing with crisis and preventing future crises is as much a matter of politics as it is a matter of economics. There is large scale to eliminate market imperfections as well as a call for new regulation.

Political paralysis is inevitable if the government does not make reforms given inconsistent demands of particular interests. Restoration of prosperity needs a new set of arrangements based on trust between all interest groups and between the generation in crisis and the following generations. The policy model in crisis, however, does not automatically guarantee success. Success is conditioned upon the ability of the government to properly assess the nature of emerging economic trends and design (and implement) a viable, country specific anticrisis program. Objectives of the anticrisis program must address the core causes of the crisis and going-forward solutions. In other words, exit from the crisis must bring the economy to a sustainable growth path by balancing threats and opportunities. Sustainability is the new global trend. Its fuel is competitiveness. Sustainability includes economic, social and environmental perspectives (so-called "triple bottom line"). Sustainability assumes balance between maximizing the achievement of objectives for all stakeholders in the business ecosystem (business, social, and more broadly defined environment with open-minded clients) and certain set of limits.

Tensions between policy makers and business executives in a crisis are truly daunting. From one side, the government has been charged with driving prosperity by fostering economic growth. Most of business executives understand that this tenet requires primarily the market forces rather than the state.

On the other side, the government must maintain a social safety net and education. Also, government takes on a large role, from setting the rules and enforcing them to providing infrastructure (physical and social) for recovery. Some parts of social infrastructure like education and healthcare have crucial roles in competitiveness improvement. In playing its role the government must eliminate short termism. The argument for the government to think with a long term view is even greater than for business executives, knowing transition.

Progress in four transition sub-processes is not. For the most part, privatization has been complete. Macroeconomic stability (single digit inflation) has maintained for almost a decade now. However, institutions reforms have not been completed yet and reinstitution which hinges upon new investment has been postponed. The global economic crisis amplified consequences of preexisting structural problems in an uncompetitive economy. Let's now drill into the complications. The output is a crucial problem. The GDP in 2009 was at 69 percent of real GDP level recorded in 1989, the last previous year. Moreover, the equivalent level of industrial production is below 40 percent. Furthermore, more than percent of GDP is government related. The economy not only important but also uncompetitive. The trust in economy as a manifestation of the quality of domestic economy has evaporated. The lack of confidence in domestic economy feeds continued EUR indexation. **More 70 percent of all business transactions are denominated in EUR.**

## THE ROLE OF STATE AND MACROECONOMIC LIABILITIES

This further increases demand for foreign exchange and tilts the equilibrium towards depreciation of the local currency. Currency risk is another big problem. It is a trigger for growing credit risk exposure or threat of that is not manageable.

Output gap and high unemployment are advertised. Unemployment rate (ILO defined in 2009) was 16.9 percent. It masked the real demand employment. Official unemployment rate does not include people who had dropped out of labor force or even keep looking, people from grey and people who had to accept only part-time. Upward of a third of all unemployed are considered long term (or structurally) unemployed and to rejoin the workforce any time soon. Many unemployed chose currency as well as large country risk. Consequently, cumulative rate is very high. [2, 421-432]

The central bank continually expresses high paternalism *vis-a-vis* commercial banks. The price of maintaining the high profitability expectation for commercial banks is the ballooned balance sheet of the central bank (triggered from liability side). It could be another inflation push factor. But as long as the unemployment rate remains high, the threat is as much deflation as inflation. With the ballooned balance sheet all solutions for the central bank to stimulate investments are coming from an empty space. If it takes out liquidity rapidly, expanded claims for the governments in crisis will raise debt to GDP ratio. Today, in OECD countries the debt level, on average, is approaching 80 percent of GDP which is a looming time bomb.

Moreover, in 2014, debt levels will likely rise to 120 percent of GDP. The developing world has an additional factor toward a bigger role of the government, growing demand for investments in physical and social infrastructure in order to catch up to the developed world. Generally, the role of the government expands every time when society needs collective and long term actions. An anti-crisis program is the collection of interrelated initiatives with the purpose to eliminate the crisis distortions. It is a causal and chronological order of different initiatives reflecting certain set of principles. According to J. Stiglitz [3, pp: 59-62], a well designed anti-crisis program reflects the following principles:

(1) it should be fast, (2) it should be effective, (3) it should address the country's long term problems, (4) it should focus on investments, (5) it should be fair, (6) it should deal with the short run exigencies created by the crisis, and (7) the stimulus should be targeted on areas of job losses.

## Serbia: The Story in Short

Serbia's economic crisis is different in so many ways from any other. The economy entered the 2008 global crisis with the legacy of its own structural problems. Its root cause is related to incomplete transition reforms curve is a perverse triple -shaped curve, which after typical fall never record level. As the summer rolled into autumn, the number of unemployed to grow to 20.1 percent. Serbia's economy financial and real sectors are tuned. Transitional strategy neglected the real sector, financial sector was in focus. Previous particularly refers to industries producing tradable goods as well as strategic sectors, mostly energy and networks. Two facts provide support to these claims. Low competitiveness of the Serbian real sector is best illustrated by the low share of exports in GDP (18 percent in 2009). For a country of similar size sustainable level is more than 50 percent. In the same year, the share of public and private foreign debt in GDP was at dangerous 75 percent, quickly approaching the 80 percent level of high indebtedness. With the weakening of the industrial base, middle class jobs in Serbia have been disappearing. Another defect of this strategy is growing income inequality. Service based economies tend to be less equal than manufacturing economies. The *Gini* coefficient as a measure of the difference between top and bottom earners is two thirds higher for the service sector than for manufacturing sectors. Financial sector in Serbia is bank centric. Capital markets are shallow because they have played only the infrastructure role in privatization. After completion of privatization, capital markets are in retardation. In banking sector retail dominates the corporate business line. In the corporate line, lending is not based on small and medium-sized businesses, which are the basis for job creation in any economy, but instead concentrates on the state sector or investment banking. The central bank does not play the role of lender of last resort but it has jumped during the last crisis into the deposits guarantee function (limited to EUR 50 thousands). The prime rate is on a high 8.5 percent level. On the other side, commercial rates are influenced with high level of obligatory reserves (40 percent of deposits in foreign currencies).

## STRATEGIC MARKETING SERVICE PROVIDERS IN THE MARKET

The first phase of value creation and delivery of course the choice of the value of a task of strategic marketing of insurance companies. Segmentation, targeting and positioning are the essence of strategic marketing. Creating and communicating value are a thing of tactical marketing. The space between marketing strategy and the insured to whom it is directed and filled with tactical activities. The aim of marketing strategy for the insurance company can increase profitability (to sell insurance to existing clients - increasing loyalty), and increase market share in the old or new markets or both markets (to attract new policy holders). Also, the goal of marketing strategies of insurance companies can be both connected to a target which is mostly practice. Before formulating marketing strategies to the objectives of which would be directed to segmentation, targeting and positioning is necessary to perform situational analysis of the insurance company. Situational analysis provides relevant information on the sale of insurance policies, insurance company costs, competitive insurance companies and various factors in the macro environment.

Market segmentation is the process of identifying significant differences in the characteristics of customers in order to divide the market into two or more groups of consumers for the purpose of: 1) selection of the parts market to serve the company and 2) to create products and programs to meet the different needs of each customer group. The benefits of market segmentation strategy are manifold: 1) allows for better identification of marketing opportunities, 2) facilitates the marketing mix adjustment instruments target specific consumer groups, 3) help better allocate marketing resources, 4) directs the positioning of products to the consumers and to competition; 5) directs the product development plan.

Market segmentation is not aggregate and indicates that there are different demand curves where until recently it was assumed that there is only one. With a strategy of differentiating the company tries to control the market and isolate its products from competitors price of other companies, using a very intensive promotion as a marketing tool. Segmentation strategy starts from the heterogeneity of the market and the fact that there are a number of smaller homogeneous markets for different preferences of consumers. Segmentation as a strategy of adaptation of products to the needs and demands of customers. Segmentation strategy is gaining market in depth In order to create the insurance market segmentation strategy it is necessary to work a greater number of activities and make more decisions. Activities begin with the

identification of dimensions for market segmentation, to create the profile relative to the market segments and on the basis of these activities provide the total market potential for each segment. Within each segment, identify the factors of competition, and then define the marketing mix for serving each segment, offering a complete range of insurance products often entering the banking sector and business.

Marketing environment consists of external factors, which directly or indirectly affect the supply of inputs of the organization and generating output. Marketing environment can be understood as a set consisting of six categories of power: political, legal, legislative, social, economic and technological. Regardless of whether you are changing quickly or slowly, the forces are always dynamic environment.

For insurance companies change in the environment creates uncertainty, threats or favorable conditions [5, 306-309] is quite easily foreseeable future, companies can assess what will happen. One can safely say that the same will continue modifying their marketing strategies in response to changing environment. Directors of marketing in insurance companies must be ready not to miss changes in the forces of the environment and to take advantage of favorable opportunities and disadvantages ready for the environment, otherwise the company can be found in big problems.

Analysis of the environment [6, 54-59] is a process of evaluation and interpretation of information obtained by market research. Management evaluates the company's information as to the accuracy, attempts to resolve inconsistencies in the data and, if warranted, determine the meaning of certain knowledge. Through analysis, marketing director of the company is trying to describe the current changes in the environment and provides them in the future.

Evaluation of change manager should be able to identify threats and opportunities associated with favorable fluctuations in the environment. Understanding the current state and taking into account the threats and opportunities coming from the changes in the environment, helps marketing managers to ensure that the assessment activities and results of marketing efforts undertaken in the present and develop marketing strategies for the future.

In dealing with the forces of the environment in marketing, can be used two general approaches: accept power environments such as those that can not be controlled by, or oppose them and try to shape them. If the forces of the environment seen as the same, which is impossible to control, the company remains a passive and reactive to the environment. Instead of trying to influence the environmental forces, some directors are trying a marketing factors that affect the expected service to the propaganda, advertising and pre-verbal experience.

**External marketing** has a direct impact on the promotion of insurance services [6, 286-299] and indirect - through design service offers insurance in accordance with the requirements and desires of the insured and the creation of marketing mix elements on previous experience and oral propaganda. Since the indirect result of the impact of previous results, it is based on real possibilities and capabilities of the company, which contributes to the formation of previous expectations in most cases is completely objective.

Through external communication explicitly give the insurance company promises regarding the future of insurance services, its quality and satisfaction of the insured. Promoting the services offered, [8, 13-17] the company has direct influence on the formation of previous expectations. As the level of previous expectations are higher, the quality must be higher to keep it insured and those perceived. Implies [9, 28-32] the necessity to increase the expected increase in objectively measured performance quality, so that a higher perceived quality. Otherwise, the insured tend to perceptions of low quality, even in conditions in which quality is measured objectively satisfactory. The reason lies in the fact that they are not fulfilled (unreasonably) high expectations (at the same time is really small and the initial inclination of a potential policyholder to complete the insurance, but also higher ahead of his indignation when the quality of delivered services is not at the level of promise).

## CONCLUSION

In the future for the Insurance companies and insurance market in Serbia, there would be a strong competitive struggle in the insurance market, due to the entry of foreign insurance companies in the market, most likely, the purchase of existing insurance companies. Insurance market growth is expected in the future, which

will require, as noted the entry of foreign insurance companies. It is expected that strong competitive struggle, and this will require intensive use of market research, both by the current leaders, and those companies that want to become leaders in our market insurance.

# CONSTRUCTION COMPANIES AND BUSINESS NETWORKS IN RUSSIA

**Nina Vladimirova,  
National Research University, Russia**

## ABSTRACT

*Under the conditions of open innovations, technologies, knowledge and competences exchange which go beyond the borders, the nature of competition between the companies acting on different national markets has undergone changes. The establishment of long-term trusting relationships with local organizations and communities becomes one of the primary challenges for companies entering new markets. This article describes the results of a research of Finnish companies working in the Russian construction sector. The author defines the role of network aspects in companies' strategic processes and illustrates how strategy and cooperation vary according to construction project stages.*

## NETWORK ASPECTS IN STRATEGIC MANAGEMENT

As the companies pass the borders, so do interorganizational ties becoming full-fledged players on the international markets. Achieving and preserving competitive advantage is hardly possible without experience, knowledge and best practices exchange between the companies' representatives as well as internal organizations. Under conditions when developing strategic partnerships is one of the obligatory factors for a company's success, developing and implementing strategies for business expansion outside the national market require considering new factors which reflect the type of cooperation with the network partners, institutional and industry-specific peculiarities.

Construction sector is a strategic sector of economy. It represents a system of jointly working branches of material production which ensure the construction process. Historically, the construction complex has been characterized by a number of ties existing between companies, institutions and governmental authorities which predetermine the results of joint projects. Together with international construction companies, engineering and design bureaus, foreign suppliers of equipment and materials enter the Russian market. The issues of companies' management in the situation of a great number of various types of cooperation and development of strategic partnerships come on agenda.

The existing researches in the field of developing international strategies evaluate the importance of interfirm cooperation in the sphere of decision-making process. However, the fragmentary types of research works, obscurity of their practical application make it impossible to form a unified approach to forming and choosing strategic alternatives on the new international markets.

During the last 15 years a large number of publications have appeared which examine various aspects of network relations: classification of the networks (Möller and Rajala 2007, Achrol 1997, Castells 1996, de Man, 2004), mechanisms of their development and managing (Möller and Rajala 2007, Gulati et al 2000, Kogut 1990, Dyer and Singh 1998, Jarillo 1993), evolution of relations (Ford 1997), role of informal communications inside a firm (Hakansson and Shenota 1995, Dyer and Singh 1998).

Developing a network on a new national market largely depends on the strategies (corporate, business and functional ones) of the headquarter company, implementing of which influences in its turn the choice of partners on a specific market. The strategy of a network level acts as an integral one (de Witt, Meyer, 2005) linking separate elements of a strategic process into one whole (fig.1).

Within a framework of a company one can specify several networks in which the company is involved. Decisions related with cooperation in certain networks can be made on different management levels. Thus, a company may be a part of one or several, which is more often, networks. If the organization is diversified, each of the businesses can act within their own network. And finally, some of the subdivisions, for instance, R&D or marketing departments, can develop relations within a framework of cooperation with research institutions or consulting agencies. That is why a network level strategy unifying different networks has a complex compound dynamic structure, and networks between external and inner networks of a company influence implementing of the strategies of all the levels.

**Fig. 1 The role of network strategy in strategic processes of a company**

In spite of a large number of publications dedicated to the issues of cooperation, the mechanism of including network relations into the company's strategies has been given almost zero attention. This article would attempt at including the network aspects of management into a company's strategic processes.

## METHODOLOGY

The article reflects the results of the research of Finnish companies working in the Russian construction sector. It specifies the peculiarities of companies' strategic processes (making decisions and taking action) when business expands beyond the national borders. We use the definition of a business network as a model of cooperation between firms and institutions. Factors influencing choice of globalization strategies and legal and organizational forms of their implementing, establishing and developing partner relations when developing foreign markets, as well as decisions on strategic control of international branches (affiliates), are given with consideration for the role of strategic context. National, regional, industry-specific and interorganizational conditions of doing business are examined as contextual factors.

The research is based upon a complex of quality and quantity methods of data analysis. Tools of quality analysis include structured interviews with medium-level managers and executives in Finnish building companies and their Russian affiliates. The interviews featured 40 questions on different issues of the company activities which influence strategic process. In addition to the interview we used companies' inner documents as well as secondary information: companies' sites, materials of World Economic Forum and World Bank.

## RESEARCH FINDINGS

The results obtained in the research make it possible to conclude the following: expanding a model of partnership cooperation on the Russian market is obstructed by barriers which appear due to considerable difference in institutional, economic, socio-cultural factors, legal regulations and standards.

### Barriers to developing network in Russia

The results obtained in the research make it possible to conclude the following: expanding a model of partnership cooperation on the Russian market is obstructed by barriers which appear due to considerable difference in institutional, economic, socio-cultural factors, legal regulations and standards.

Level of technology development, dynamic integration and participation in global processes while preserving national interests make Finland rather an information society country. Key peculiarities of such society is generating knowledge with help of information technologies, implementing network relations in different industries, developing infrastructure for an effective performance of a network. The Russian economy is currently at the development level typical of an industrial society. Characteristic features of this level are traditional market mechanisms and more strict organizational structures.

Considerable differences between Scandinavian countries and Russia also consist in underdevelopment of financial, social and legal institutions the goal of which is to ensure contracts executing, investors, intellectual and other property protecting, as reflected in World Bank's Ease of Doing Business index, where Russia is ranked 120, and Finland 16.

Differences in the development of institutions bring about difficulties related to intransparency of tenders and building orders procedures. Moreover, the business stability is threatened by a high level of corruption and economic crimes especially in the construction sector, as noted by the interviewers and reflected in a number of foreign and domestic researches. Transparency International agency ranked Finland as the world's fourth least corrupt country, Russia – 154 out of 180, and the situation in Russia has a tendency to worsen. Intransparency of management conditions while receiving orders, especially municipal ones, obstructs implementing joint programs on regional and city modernization.

Institutional socio-cultural conditions of doing business predetermine differences in firms' behavior in forming partnerships on the Russian and Finnish market. Finnish companies are mostly oriented towards relational contracts - business relationships of trust between the parties when the contract is not formal. On the contrary, Russian companies aim at setting up regulations of joint activities prior to beginning of works and overseeing every possible detail of a future project. Thus, a paradox appears, when relations with local, regional and governmental authorities are strictly regulated and transparent in Finland and other Scandinavian countries, while in Russia this is a sphere of informal relations with a high degree of intransparency and corruption. At the same time the rules of network cooperation adopted by the foreign companies and based upon trust within the partner cannot be implemented due to cautiousness of Russian companies in the beginning of joint business.

As construction complex has regionally specific, the noted factors appear differently in Russian regions. However, the research shows that practically all respondent companies establishing partnership strategies come from peculiarities of national culture and socio-political situation in Russia, not taking into account specific situation in separate regions and cities.

From the position of strategic management and control over affiliates there appear difficulties brought about by legal regulations and peculiarities of the law regulating business of foreign companies on the Russian market. Central-office companies evaluate foreign affiliates in the view of organizational hierarchy, limiting its rights and obligations from the viewpoint of the position of a given business unit in the whole system of the company. However, in accordance with the law on Foreign Investments in the Russian Federation, the representatives of the company are separate legal entities, and their directors are entitled with all the rights and obligations of general directors. This results in a problem of discrepancy between management and legal structure which causes not only difficulties in personnel management but also obstructs forming and implementing partnership.

Conclusions made by the author are given proof by the empiric research which allows it to single out major factors obstructing doing business in Russia (fig.2). The following barriers were identified by the respondents:

The analysis of companies' strategic processes shows that decisions for network cooperation are of tactical character and are independent from the general strategy of the company. Finnish companies entering the Russian market are oriented at long-term contracts without building a network, at the same time recognizing the importance in interorganizational cooperation and its influence on the whole activity of the company. Thus, the analysis shows the necessity of developing a complex model of a strategy of expanding business outside the national market which would take into account not only external context factor, but also a structure of inner cooperation between the affiliates of the company, as well as influence of different groups of partners.

**Fig.2 Barriers for doing business on the Russian construction sector (percentage of respondents)**

## Strategy transformation of a construction company

Two main alternatives can be pointed out from the perspective of provided products and services (Bartlett and Ghoshal 1995):

1. *multinational* strategy, based on account and usage of specific national features of concrete segments on the world market
2. strategy of *globalisation* providing application of standardised approach towards realization of competitive advantages with negligible changes in relation to national markets.

The choice of strategy is defined by two major factors: possibility of standardization of world market and efficiency of economy of scale. Implementing these strategies, a company makes decisions on degree of core competences' centralisation, considering requirement for coordination and bureaucratic costs (Morrison, Ricks and Roth 1991).

The research tackles distinctive features of each stage of a building project in regard of two factors: necessity of global integration and consideration of local differences.

One of the specified features of construction sector is a project type of business. The composition of factors influencing an international strategy of construction companies is subject varies at different levels of a project. Five stages of a building project can be defined: preconstruction, contract award, building and construction works, exploitation and substantial completion.

At the stage of preliminary preparation receiving the very order for building a project becomes the crucial factor. Not only the political decisions of the receiving part are of great importance, but also the influence of the local public authorities which can either support or obstruct the whole project. The other crucial aspect appearing at this stage is the projects' funding. Local resources are not always enough for implementing large-scale projects especially when entering the markets of developing countries. In some cases there is a necessity of receiving an access to the international financial and investing groups. Conversion of part of the funds into local

currency, legal tax restrictions, profits transfer into the basing country, credit security, country-specific risks also shift the international strategy to the deeper consideration of local factors.

Despite the fact that building standards differ, the access to the more advanced building technologies is crucial for obtaining the contract. One of the reasons of the investments increase of the developing countries to the developed ones is the access to unique technologies and growth of competitiveness when most technologically developed companies enter their markets. Some specific projects require strengthening relations with local institutions for the venture's success. At the same time large projects require established connections between two or several national institutions in order to gain access to the funds or other recourses for better stability of the competitive advantage. Thus, at the stage of preliminary preparation of the project both global integration and consideration of local differences are of importance.

At the stage of signing contracts, despite the synergy of standardization processes, local-specific factors prevail. The budget would mainly include local component parts and units, including raw materials, equipment and human capital. Although tenders require global resources, for example, in case of inviting international banks, the core of decision remains at the receiving country. Signing the works contracts, negotiations and organizing work also take place at the building site.

Building and operation of the objects include project managing, resources distribution, works production, composition of a system of measurements and evaluation parameters, supervision and training the personnel. This stage is influenced by local factors. Global integration is necessary only for securing communication between affiliates and providing some technical services.

At the stage of building commissioning maintaining partnership relations with local business communities and customers remains important as the strategy presupposes not only single projects but expanding the number of building objects in the receiving country. Thus, cooperation has a cyclic character as they help to receive orders in future and bring the process back to the initial stage.

The analysis of possible international strategies shows the importance of the factors, global integration and consideration local differences, at each stage. However the degree of their influence varies depending on the building process stage and is of a cyclic character.

Following the *global* strategy, a building company focuses on distribution of its resources and receiving synergy from their usage. At the stage of preliminary preparation the company emphasizes the importance of lobbying the national government for the company's interests, inviting international financial institutions, centralized purchases and international transfer of technologies and best practices. The stage of building project estimation and commissioning is performed by one of the foreign affiliates of the company in the receiving country. The requirements of the work with partners and clients are often standardized.

*Multilocal* strategy presupposes more independent activities of the affiliates. At the stage of preparing the project strategic priorities are aimed at receiving support from the local government, usage of local financial funds, inviting local companies for executing exploration and design works. However general planning and developing standards takes place in the head office.

*Multinational* strategy is characterized by a high degree of decentralization of operations, including marketing and financial ones. Each foreign affiliate possesses unique knowledge and technologies necessary for this competitive market. All stages of building are controlled and implemented by the company's affiliates with the usage of local resources and firms.

*Transnational* strategy combines the characteristic features of the both strategies with maximal consideration of the local differences and usage of global integration synergy. In practice following this strategy is connected with considerable expenses and difficulty of managing the affiliates in different countries.

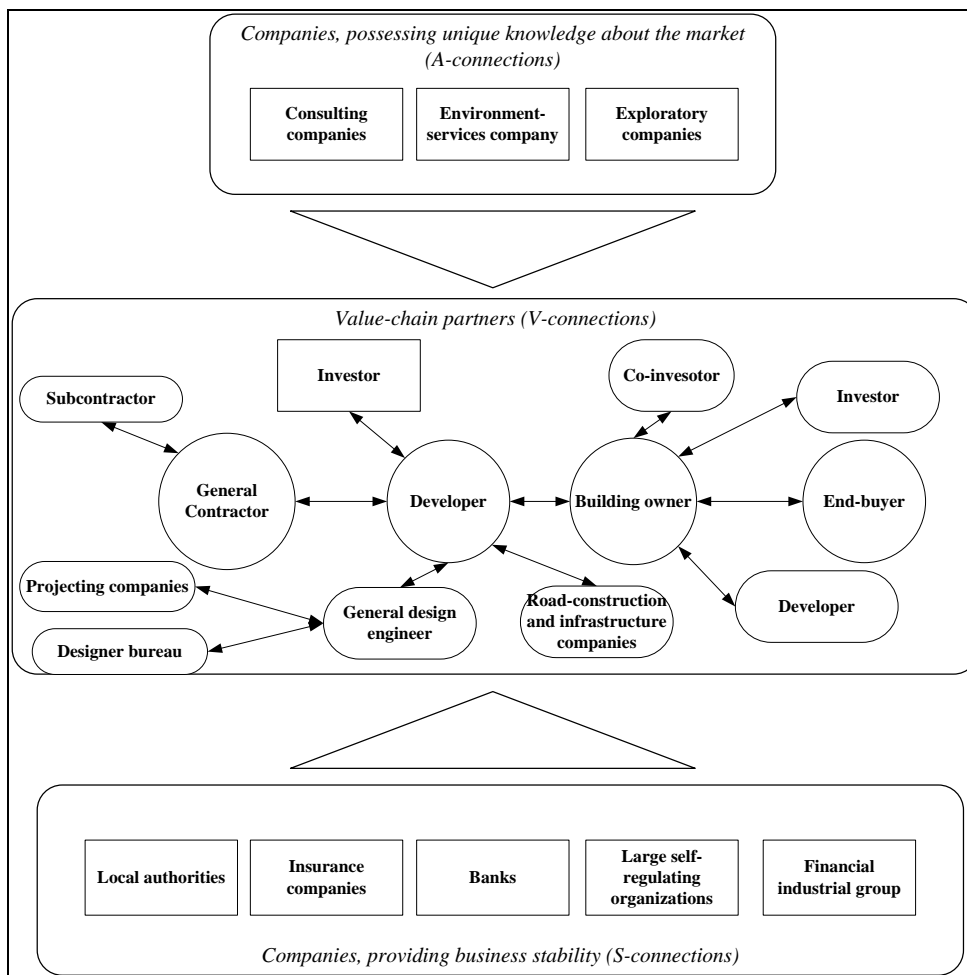

Thus, despite following one of the international strategies, the correlation between the arguments in favor of either globalization or consideration of local differences is subject to change depending on the building stage.

## DISCUSSION AND CONCLUSION

Simultaneously with the transformation of international strategy the priorities in establishing partnership relations also change. Depending on the specific features of the market and singled out obstacles, possible structure of partnerships can be singled out. The building companies are pressed by the deadlines of project completion, therefore it is necessary to build stable relations in the framework of creating the value (in accordance with characteristics specified in the model – relations of V type). The author specifies possible partnerships in the framework of each cooperation types (fig.3).

Quality control and control over the dates of the project completion require the company's tough approach when selecting the contractor and designer. This is the reason to let the participants of the inner network – daughter affiliates of the head company-the management control over the project. Simultaneously, the Russian construction market has a number of companies who have the knowledge on the requirements and standards in the constantly changing legislation. Therefore, local companies are invited to ensure access to the necessary strategic assets (licenses, knowledge about the market). Business sustainability is defined through access to financial resources and relations with insurance companies. Market of insurance for building works and the banking industry are in the formative stage, so when the company enters the Russian market it should firstly develop relations with representatives of foreign financial and insurance institutions. Establishing permanent relations with local authorities and regulators is one of the key components of doing business in Russia.

**fig.3. possible partnerships in the framework of different types of cooperation**

Building sector is characterized by a dozen of interrelations influencing the dates of building projects completion. Within a framework of a value chain complex interactions are being formed the participants of which can combine different roles. The interactions have both external and inner character, i.e. a corporation's affiliate working at the certain marking or planning to enter this market can act in the capacity of the general contractor.

Correspondingly, the process of forming and changing a strategy should always have a structured and cyclic character and reflect not only changes of the inner environment but also the specific features of the industry in which the company acts.

Thus, the results of our research suggest the following conclusions. Specific characteristics of the business, in particular, project character of organization and management of works in the construction sector, limit choice of clients and suppliers after works beginning under projects. However, the stability of the partnerships within construction projects promotes greater stability of construction companies in the financial crisis. The company international strategy, in particular degree of localization or globalization, changes depending on stages of the project and influences a choice of priority partners in the new market.

# CORPORATE ELITES AND CONTEXT

**Sibel Yamak and Ali Ergur and Artun Ünsal**  
**Galatasaray University, Turkey**

## ABSTRACT

*This paper focuses basically on the business networks. Businessmen's associations together with their respective ideologies and member profiles are investigated to have an understanding of the business networks of the corporate elite. Thus, the study aims to identify the networking patterns of new and established business elites to assess the impact of the changing conditions whose fundamental traits appear to be liberal economic policies and an accentuated concept of religion. In this study, we basically compare and contrast elites' networks to understand the relative influence of individual differences and the contextual changes.*

## INTRODUCTION

Studies on business elites seem to have attracted limited attention in spite of the calls of prominent authors (see for ex. Pettigrew, 1992; Whittington, 2004; Savage and Williams, 2008). Whittington (2004:62) stresses the need for a sociological agenda interested in “understanding strategy's elites” since their actions may have important repercussions for society. Drawing on perspectives from sociology, management and political science, this multidisciplinary study aims to unfold the impact of the liberal policies and conservative forces prevailing in the Turkish context on business networks of the corporate elites. The adoption of liberalization policy in 1980 and Islamic tendencies increasingly surfacing in the same period makes Turkish business milieu a valuable setting to investigate the impact of the context on corporate elite's business networks. Businessmen's associations together with their respective ideologies and member profile are investigated in a way to assess the impact of the changing conditions whose fundamental traits appear to be the liberalization of economic policies and an increased emphasis on religion.

## CONTEXTUAL CHARACTERISTICS

Turkey is a civil law country and its legal system contributes to the central role of the state in the Turkish business system (Yamak and Ertuna, 2011). Consistent with the predictions of the Legal Origins theory, the economy is mostly guided by state desired allocations rather than market based outcomes (La Porta et al., 2008). Turkish business context is typically characterized by the family-controlled, diversified big business groups (Guillen, 2001) whose development was encouraged by the state. The state formed partnerships with these businesses, provided credits from state banks and low cost inputs, and protected them from foreign competition (Bugra, 1994). The intricate nature of the relationship between the state and the business firms necessitates a careful handling of this link and enforces owning families to take part in the management of their companies (Bugra, 1994).

These basic characteristics of the business system in Turkey continue in spite of the major macroeconomic policy shifts. Turkish economic policy reached a breaking point in the beginning of 1980. The preceding decade was subject to high inflation rate coupled with the erratic regulatory regimes caused by political instability which made high levels of uncertainty the basic characteristic of doing business in Turkey (Yurtoglu, 2004). Abandoning import substitution policy that has been focusing on the domestic market, a trade liberalization program based on export promotion was launched in the early 1980s (Yurtoglu, 2000). Turkey was to adapt herself to the realities and requisites of the global economy and the globalization process, which demanded a “restructuration” of the national economy. Therefore, the system of mixed economy was abandoned,

state economic enterprises were privatized, and a series of neo-liberal policies were launched in order to quit the existing “nationalist development model” in favor of the transition to global capitalism (Türe, 2008: 89). As a consequence several initiatives were taken. In 1986, Istanbul Stock Exchange was founded. With these large scale reforms supported also by the majority of the economic elites, the control on foreign currency was abandoned, the value of the Turkish Lira was determined by the market, foreign capital entry controls was suppressed and attempts to develop capital from Islamic, especially Arab countries were made (Öniş, 2004). The same period was also characterized by an attempt to combine Islamic identity with liberal economy (Lacinok, 2007). This tendency further enforced by the victory of pro-Islamist parties in 1990’s and 2000’s. For example, the pro-Islamist AKP that have been governing since 2002 promised to respect integrally the neo-liberal economic policies deployed since the 1980’s. The Anatolian conservative entrepreneurs, weary of AKP’s predecessor’s politically risky discourses (pro-Islamic parties have already been banned several times by the Constitutional Court, on grounds of anti-secular activities destined to install an Islamic regime) needed a political organization which allied Islamic belief with pragmatism, but gave priority to private enterprise, free market, competition and profits (Kumbaracıbaşı, 2009).

Following the liberalization, the industrial production, primarily limited to Istanbul and Marmara region became scattered throughout Anatolia, thanks to the proliferation of export oriented small and medium size enterprises operating in various industrial zones that reflected the dynamism of the ambitious entrepreneurs passing from local to global markets, even without transiting by the national one (Keyman, and Lorasdağı, 2010). This proliferation was also stimulated by the large businesses of the Marmara region, which outsourced part of their production to the Anatolian companies (Buğra and Savaşkan, 2010) while competing in international markets.

Transition to liberal economy and the attempts to combine Islamic identity with liberal economy influenced considerably business networks. A proliferation of the businessmen associations with a religious accent characterized the period following the economic and social transformation. The new Anatolian conservative economic and political elites who once felt that they were socially and culturally “excluded” savored their common triumph, and displayed openly their interests in securing their proper seats among the established elites. The religiously conservative entrepreneur groups, not only those dwelling in Anatolian cities but also those operating in Istanbul and Marmara region were also willing to improve their social networks. As an alternative to the “Turkish Association of Industrialists and Businessmen” (TUSIAD-Türkiye Sanayici ve İşadamları Derneği) founded in the 1971 by the modernist established economic elites of the Istanbul area, the Anatolian entrepreneurs, close to then leading pro-Islamist Welfare Party (RP), created in 1990, MUSIAD (Müstakil Sanayici ve İşadamları Derneği) “The Association of Independent Industrialists and Businessmen” (Pamuk, 2008). The first three letters of the denomination of “Müstakil” meaning independent could also be read as “Muslim”. While TUSIAD’s membership size is relatively small and composed of large firms mainly located in Istanbul and surrounding areas, MUSIAD’s membership size is larger and geographically spread and mainly composed of SMEs (Öniş and Türem, 2001). However, TUSIAD’s members manufacture 65 percent of total industrial production. Their share in total exports is about 85 percent (Buğra and Savaşkan, 2010). MUSIAD has close ties with the pro-Islamist parties and intends to play a pressure group role in favor of its members at governmental spheres (Buğra and Savaşkan, 2010). Another example of network for religiously conservative businessmen is the one known as “Anatolian Tigers”, ASKON (The Association of Anatolian Lions Businessmen), founded in 1998. Though sharing similar cultural characteristics with MUSIAD, ASKON was basically an Anatolian organization. While the former had the ambition of uniting Turkey’s all religiously sensible entrepreneurs, the motto of ASKON, who represents small and medium sized Anatolian industrial enterprises and local liberal professionals, is “fair wealth”, symbolizing its main principles: integrity, respect of business ethics, freedom, refraining from waste, quality production, fair distribution of revenues, and loyalty”.

Another business network “The Confederation of Turkish Businessmen and Industrialists” (TUSKON), that shelters religiously conservative entrepreneurs was founded in 2005. But its founders and members belong to Fethullah Gülen’s religious community, and keep a certain distance with MUSIAD and ASKON (Buğra and Savaşkan, 2010). Gülen maintains a “concept of the secular world as “dar-ul hizmet” (the abode of service to mankind), which he substitutes for the traditional notion of dar-ul harb (the abode of war against infidels) (Mango, 2006). This perspective is similar to the basic tenet of Opus Dei that all work should be performed as divine service” (Mango, 2006). In TUSKON Islamic references are kept in second plan while nationalist

discourses are deployed: Islam is characterized as an important element of Turkish nationalism (Buğra and Savaşkan. 2010: 104). TUSKON especially provides network for local KOBİ's willing to reach to foreign markets and find also raw materials for their productions. The impressive educational institutions created by Gulen's followers in five continents, from Asia to Africa, from Australia to USA are also of help for additional contacts for infiltrating global markets (Buğra and Savaşkan. 2010). In these schools the instruction language is Turkish along with English and the curriculum familiarizes students with Turkish culture.

A widely shared common idea about the role of the religion in Turkey is that it functions as a basis for the generation of a closed and defensive world conception. Consequently, religion has long been conceived as the main theme of a polarization between a modern attitude and a conservative posture (Mardin, 2004: 82). Nevertheless, recent studies expose a series of data asserting that religion in Turkey does not only coalesce with a self-protectionist anti-modernism, but rather it furnishes instruments to a personal inner guide-line through a rapidly changing society and facilitates the integration in a world of global fluencies. (Göle, 1991; 2000). In this study we study its impact on business world.

## METHODOLOGY

Drawing upon the view that "elites are those groups that hold or exercise domination within a society or within a particular area of life" (Scott, 2008:32) we have defined business elites as the leading executive figures (such as chairperson, vice chairperson and CEO) of the holding companies whose affiliates are listed among the largest 500 companies in Turkey. This definition is also consistent with previous studies which perceive corporate elite as "a configuration of capitalists (major shareholders and top executives) and organic intellectuals occupying positions of ultimate authority within leading corporations" (Carroll, 2008:47).

The sample of the study was drawn from the owners and the managers of the largest Turkish companies for a larger study on elites in 2010. A sub sample of 36 interviews is used for the present analysis. Elite networks are assessed through the membership to the largest businessmen associations in Turkey namely. TUSIAD, MUSIAD and TUSKON. The data concerning businessmen associations are gathered both through interviews and secondary information sources. This is an exploratory study which assumed an interpretive paradigm. An interpretive qualitative study consists of a research design involving the exploration of a research topic or theory rather than being a test of it (Myers, 2009:23). Discourse analysis is conducted to analyze the data.

## FINDINGS

Given the multidisciplinary nature of the work we draw on the theories from sociology, political science and management. Thus, elite theories (Carroll, 2008; Scott, 2008) social network perspectives are used to unveil the context-elite networks relationship. Capitals of Bourdieu (1979) are utilized to assess characteristics of network members as well as their actions towards domination. Drawing on Bourdieu's theory we tried, among other key issues, to understand, in the limits of this article, the importance of the social capital as well as economic and cultural ones in Turkish business elites' context. Our analysis on the formation, structure and functionality of the business associations in Turkey revealed both an articulation with the network-basis perspectives, especially the one developed by Granovetter, and a reevaluation and a micro-adaptation of the Bourdieusian notion of social capital in today's changing Turkish business world.

A theoretical abstraction of our results gave way to a middle-range model concerning the formation and the functions of existing and emerging networks in Turkish business system. Different business networks (in form of businessmen's associations) accomplish specific functions, with sometimes complementing and mostly conflicting interests. Nevertheless they are subject to the same contextual forces (general situation of the world economy, equilibrium of the international relations, political stability at the national level, crises and social movements, ideologically-driven trends) at the same historical moment, while each one represents a different stage of the organizational evolution (e.g. while the long established one is at the peak of its integration with the global market and is sufficiently mature, the one succeeding it is in the phase of growth while it acquires, with a high motivation, the necessary dispositions for being more active in global market). They are also subject to differing imprinting effect of their foundation time. We observe that founding time seems to institute a different organizational habitus in each association. TUSIAD was born in 1971 in an unstable context characterized by

social unrest and employer-employee conflicts where social democrats and liberal conservatives used to compete for the government. It was founded to reveal the social existence of the private sector rather than to go after the special interests of business people (Bugra, 1998). Both MUSIAD and TUSKON emerged after 1980 where religious tone was remarkable in the discourse of the governments. Each network is born as a semi-reactionary movement towards the cultural codes represented by the older one. Every network is constituted of main components and the systematic cooperation evokes the establishment of (and around) a social capital, allowing in, those who share the same cultural codes (cultural capital) and exclude those who do not. Similarly those not sharing the same characteristics do not dare or want to become a part of the network. This was quite evident in the discourses of the businessmen who did not join TUSIAD. “TUSIAD is too big for us” *Chairman and CEO in a holding from Istanbul*.

In fact, there are significant discrepancies between the economic, social and cultural capitals of the adherents of TUSIAD, MUSIAD and TUSKON in our sample. Given the overlaps between the MUSIAD and TUSKON members and the commonalities in their religious tone we preferred to put them together. Our findings show that TUSIAD membership is associated with the largest economic power. Its members in our sample are usually from companies whose sales exceeded 500.000.000 or even 1.000.000.000 USD. The association with relatively smaller size companies is worth nothing in the cases of MUSIAD and TUSKON members. The divergence between the respective cultural capitals of these different networks' members is also considerable. TUSIAD members appear to have an undergraduate degree often from a university in USA or UK. They are also likely to have a graduate degree. The majority of TUSIAD members are also graduates of prestigious high schools where the instruction language is a foreign language. This is consistent with the fact that majority of this group seem to be able to speak more than one foreign language. Among this group, there seems to be a trend about collecting paintings and (to a much lower degree) antiquities as well as establishing private universities bearing the name of the family. MUSIAD and TUSKON members in our sample seem to differ considerably from TUSIAD members along the cultural capitals. Large majority does not have an undergraduate degree and none a graduate degree. The distance of the university to the city of dwelling appears as a major problem causing this limited time in educational institutions. The expectation that the older son should work in the family business was another reason which prevented further studies.

However, it is also worth mentioning that the children of MUSIAD and TUSKON members seem to achieve better education levels. They have undergraduate degrees and some of them prefer US universities. Thus heirs have a better education record and are able to speak foreign languages. Half of the TUSKON members in our sample do not know any foreign language. Most of them seem to have spent little time abroad and only for business trips. When we evaluate the presence of elite tastes as defined by Bourdieu we see that such tastes are inexistent. For example, none of them collects paintings or antiquities in contrast to TUSIAD members. However, the trend of establishing universities is also observed among TUSKON members. They get together with similar others to create new universities usually for a “foundation” and get actively involved in the board of trustees. Their more collectivistic orientation is worth noting.

Significant differences are also observed along the social capital dimension among TUSIAD and MUSIAD/TUSKON members in our sample. The notion of social capital appears to be the underlying concept of Bourdieu's thinking on the phenomenon of domination (Bourdieu, 1979). He conceptualizes social capital as a sum of actual or potential resources deriving from the very fact of possessing a more or less institutionalized network of durable relationships. The latter are also shaped in a process of *interconnaissance* or *interreconnaissance* which means that the social capital implies an affiliation with a group which is not only a set of common features, but also a system of permanent and useful links (Bourdieu, 1980: 2). Social capital creating useful links display various characteristics for the businesspeople networks we analyzed. One of the dimensions we wanted to assess it is the father profession. In the case of TUSIAD members, the father profession appears to be industrialist. On the other hand “merchant” or “craftsman” appears as the father profession for MUSIAD/TUSKON members in our sample. There is only one exception who is farmer. Another dimension to assess social capital is the city of birth. Interestingly, we see that more than half of the TUSIAD members in our sample were born in cities other than metropolitan areas. On the other hand, all the MUSIAD/TUSKON members in our sample were born in non-metropolitan areas.

Given the findings of our study we develop a model which is composed of interconnected parts. Therefore, a network involves the articulation of interconnected parts which are: needs and functions, that

necessitate a form of organization, based on the use of cultural signs and a shared habitus to nurture trust system which generates legitimacy, credibility, economic cooperation and ideology.

The whole process, at the end, turns into a form of domination which leads to an exclusion of those who are not culturally conform and generates a feeling of incompatibility on the part of those who hit the barrier of the domination. Consequently, a new network defining itself 'other' than the one preceding it, emerges as sufficient need is condensed around a motivational force towards global market. This being 'other' is explicitly encoded in cultural assets. However, different networks meet on the aims of an economic mutuality for a growing business and global integration. This is how we can explain the synchronic existence of a series of networks, diverging culturally or ideologically, but completing thus an evolutionary landscape of the business world. As mentioned above these businessmen networks differ in the type and level of their needs. TUSIAD members are big players and they are well connected with the rest of the world. They have mostly western cultural references. On the other hand, MUSIAD/TUSKON members seem to be less familiar with the foreign markets and cultures. However especially in the case of TUSKON this is being overcome thanks to the schools of Gülen all over the world (Buğra and Savaşkan, 2010) which are attended, especially in less developed countries, by the children of local elites.

On the other hand, network theory claims that human behavior even concerning economic relations, is not conjugated only in terms of instrumental rationality, but also of sociability, approval, status and power (Granovetter, 1985). Instead of emphasizing the affective features of the human action which is constructed upon similarities and familiarities engendering trust in human relationships, Granovetter initially stressed that action develops rather in a network of seemingly less-affective ties, namely weak ties, that the use by actors results in a type of relationship involving greater number of individuals (Granovetter, 1973: 1369). He also argues that not every weak tie but rather, the ties capable to establish direct and unique links between unconnected actors (bridges) have the capacity to shape an effective relationship (Granovetter, 1985: 208). Although the emergence and development of business networks in Turkey, have some divergent aspects vis-à-vis Granovetter's weak ties approach, the crucial role played by bridges in a network of business relationships seems to display similarities. Instead of communal relationships based on proximity, familiarity, traditionally-determined trust systems, newly emerging networks of businessmen in Turkey, offer, to their adherents a quite different type of cooperation. Although they seem to have an implicit ideologically-driven motive in their formation (religious orientation, conservatism, protectionism, secular and modern conception of the world, etc.), they, in fact, tend to form a new kind of ad hoc action group to resist the pressures and necessities of the globalization. Biggart and Delbridge (2003) with their typology of exchange systems, point out an alternative perspective. By a distinction between price system (universalistic instrumental rationality), associative system (particularistic instrumental rationality), moral system (universalistic substantive rationality) and communal system (particularistic substantive rationality), they classify major forms of exchange based on the openness level of the group towards outsiders (universalistic/particularistic) and their relation with the instrumental logic (direction of the calculus between means and ends). Most of the Turkish business associations seem to be characterized by a blend of moral and communal system. Especially the newly rising ones, appear to prioritize the in-group harmony through an apparent ideological or moral motivation, paving the way to an integration with a global price system. Granovetter (1983) has further developed his initial theoretical model with other empirical data, which confirm that weak ties in inter firm relationships facilitate the creation of cooperation and coordination in the national network of economic actors.

Burt (2005) proposes in his both challenging and complementing approach to Granovetter, a consideration of a relatively under-estimated aspect of network system and focuses on "structural holes". He accentuates the contribution of the network relationships to the enrichment of the social capital. According to Burt, a network rich of holes (unconnected persons or clusters of relationship) is more promising than that paved of familiar connections, because relatedness depends on the communicative capacity offered by the discontinuous network. Unknown, unexplored identities and beliefs can be an effective source to multiply the social capital (Burt, 2005: 17). On the other hand, Townley (2002:561) criticized the taken-for-granted characteristic of the modernist rationalistic and mechanical models that try to analyze the macro-structures, but often under-estimate the importance of the "micro-physics of power". Instead, she proposes a notion of organization which is complex, interactive and dynamic, consisting of multiple and complex interactions and circular causality. In fact, in this study we wanted draw attention to power and domination within and around the businesspeople networks in Turkey. Lounsbury and Ventresca (2003) claim that Bourdieu's approach to the

conception of capital and consequently to the meaning of social relationships instigated the rise of a new structuralism in management studies. This approach emphasizes the comprehension of the connection between intraorganizational networks and broader societal dynamics that influence the prospects for voice in specific surroundings. The impact of Bourdieu's theory on the producing of domination through social capital has thus interwoven a wide range of critical reflection in the management and organization studies. Based on these perspectives, the present study investigates the inner dynamics of the Turkish businessmen networks as well as the supportive or inhibiting forces in the context contributing to their survival. The changing political and economic climate after 1980 facilitated the rise and growth of new networks. The rise of Islamic tendencies at the government level further encouraged new businessmen networks which seemingly base their discourse on religion. This supportive environment was also reflected in the comments of the interviewees from MUSIAD/TUSKON.

In fact, our research focusing on the transformation of the economic elites' networks following the contextual shift delineates a significant change in the relative position of the religion among Turkish businessmen. Despite the manifestation of nuanced attitudes, religion (the Islamic faith) in general seems to have become the primary common denominator in the new elites' networks. According to the findings of our study, the newly emerging economic elites, who are mostly from a provincial-origin, adopt a more or less manifest religious attitude in their self-expression and manners. Majority of MUSIAD/TUSKON members in our study state that they fully live the religion. However, they are highly motivated for constituting business networks that aim integration with global liberal market, instead of preserving the reactionary conservative point of view. The existing metropolitan-origin established business networks display mundane and western-oriented cultural characteristics while the new formations rather use religious themes and the explicit conservative attitude as a kind of ingredient of articulation with the capitalist relations at the world scale. In other words, conservatism functions, in rapidly changing social-economic context of Turkey, as a protecting cocoon, a kind of anti-shock armor for the sufficiently motivated individual who desires to be integrated into the global market, but who does not dispose the necessary cultural equipment that should support the logic of competitiveness. This might also be one of the main reasons that frequently generates an inner debate between conservatives-Islamists on being or not hypocritical about religion. (Vergin, 2000: 62) We think that from bottom up this is an inevitable conflict triggered by the social change and forms of adaptation shared by conservative strata. In spite of such a distance towards the non-material aspect of the globalization, the apparently conservative economic elite seems to approach to the values relative to a pluralistic point of view, a remarkable tendency to moral tolerance, a systematic recognition of cultural differences, often intellectually supported through the traditional humanism that the references are found in the traditional humanism reminiscent of the Sufi philosophy of Rumi or other historical Anatolian half-mythic and thus flexible stance towards Islam since centuries. In fact, Turkish Islam has a traditional orientation towards the state which facilitated its pragmatic and flexible tone. "In other words, because Turkish Islam, as represented by religious functionaries, has traditionally done the state's bidding, it accepted the secularist order without demur (Mango, 2006:56). This flexible stance is also visible in the discourses of the MUSIAD/TUSKON members "...I do practice my religion however I have many friends who do not. For example, I often go out with them for a dinner, they drink alcoholic beverages and I don't and I do not mind it. Everybody is free to do what he wishes..." Male, chairman in an Anatolian company. This trend may also be interpreted as yet another confirmation of the underlying attributes of a certain Volkislam, perpetuated by a series of mystical beliefs (Mardin, 1986: 114).

## CONCLUSION

While established metropolitan business elites adopt values directly linked to the global-liberal pluralistic ideology throughout a mostly western orientation in education and socialization, the newly emerging counterparts construct ties to the same economic rationale with the help of both the preservation of traditional seriousness, and the not-too-much-stabilized pluralism together with an implicit open-mindedness. It is observed that the degree of integration with the world-scale economic activities of the economic elites (exportation, distribution, provisory or permanent representation, production in foreign countries) enhances the capacity to develop global and liberal values. Nevertheless, in newly emerging Anatolian capital, this liberalism seems to realize itself as such, at least in most of the cases. On the contrary, what constitutes the appearance (manifest discourse as well as physical aspects) is more or less decorated with the well-known attributes and symbols of the Islamic conservatism. This is just at that point that the actual conservatism serves to establish social ties with

ideologically-driven businessmen associations or networks. Yet, we should also consider that ‘economic institutions do not emerge automatically in response to economic needs’ and structurally embedded individuals seem to have a major effect in the formation of institutional relations. (Granovetter, 1992:7) These increased networks, in exchange, provide them with their high motivation for the global liberal market, additional tools for the continuation of a growing commercial activity, while maintaining their conservatism in scope. The latter leads to a certain valorization of the attitude of respect for religious matters without creating an explicit contradiction between them and the liberal mind. To conclude, our findings show that contextual transformation had its repercussions in both business elite characteristics and elite networks. Both in-group characteristics and needs and contextual trends seem to influence business people networks. Domination desire and possibility of different groups is related to the fit between the social, cultural and economic capitals possessed by this group and the contextual forces.

# ENTRY MODES AND BUSINESS STRATEGIES IN GLOBAL CONSTRUCTION MARKETS: TURKISH CONTRACTORS IN LIBYA

Mehmet Akif Yildiz, Consultant, Turkey  
Emanuel Gomes, The University of Sheffield, UK

## ABSTRACT

*International construction firms need to decide on the appropriate market entry mode and business strategies when undertaking projects overseas. This research aims to investigate the effective market entry modes for Turkish construction firms (TCFs) and the effective business strategies for managing projects in Libya. The research method is based on a structured questionnaire and the data was collected via postal and online survey. Interviews were conducted in order to gain a deeper understanding of the construction sector in Libya and to help design the questionnaire. This paper explores the modes of entry chosen by TCFs firms investing in Libya on the basis of internationalisation entry mode theory and the competitive advantage of the firm. Results show that establishing a wholly owned subsidiary in Libya has been the most effective entry mode for TCFs. Results also show that the adoption of a differentiation strategy through the provision of high quality and customized services, seem to be the most suitable competitive strategy followed by TCFs.*

## INTRODUCTION

Globalization fosters international business through an increasing movement of goods and services, flow of capital and mobility of workforce around the world (Hermann and Datta 2006). In this context, internationalisation is no longer an option but rather a requirement for firms seeking growth and global reach. However, internationalisation of the firm is a complex process as organisations face a variety of problems related to the specific characteristics of each international market. An important research strand considers *where* subsidiaries should be located (i.e., the location choice) (Chen and Chen, 1998; Dunning, 1988). The selection of an adequate entry mode has also received considerable attention (Buckley and Casson, 1976), and according to the literature, an entry mode is a way that a company uses to sell its products and services in a market which is out of its national borderlines. The existing body of knowledge acknowledges five major modes of entering foreign markets: exporting, licensing and franchising, strategic alliances (including joint ventures), and wholly owned subsidiaries. A third research strand focuses on how MNEs compete in the foreign market based on their strategic capabilities (Rugman and Verbeke, 2001). However, these three decisions are interrelated and affect one another, e.g. choice of location can influence the entry mode choice and this can subsequently influence the competitive business strategy to be adopted. In this respect, Madhok (1997) proposed that organizational capabilities of a company give the reasons and assumptions as to market entry mode choice. Chen views ‘market entry mode and business strategies’ as ‘international strategies’ and asserts that successful internationalisation depends on companies adopting coherent and suitable international strategies (2008:313).

The body of knowledge on market entry modes focus mostly on manufacturing and retailing industries. In recent years, however, academics have recognised the need to study entry modes in the context of the construction industry. In this respect Chen states that “given that the construction sector has unique characteristics that do not allow for the direct transfer of concepts and theories applied to the manufacturing sector, there is a need for adapting this knowledge and for developing new concepts and frameworks to meet the unique characteristics of the construction sector” (2008: 303). As construction firms intensify their internationalisation process, two key questions are of particular interest to both scholars and business practitioners: Which entry modes are more effective for construction firms to penetrate foreign markets? And which business strategies should be adopted in emerging markets like Libya? The aim of this research is,

therefore, to investigate which are the preferred entry modes for Turkish construction firms (TCFs) to enter Libya and the most suitable competitive business strategies for managing projects in Libya. For this purpose, we will draw upon existing body of knowledge on international entry modes theory and related it with the competitive advantage of firm theory. Results should, therefore, have important managerial applications for Turkish firms expanding abroad, especially to Libya and other African countries. This study also aims to contribute to the existing body of knowledge on the internationalisation of the firm by providing insights on the interrelationship between entry mode decision and the choice of competitive business strategy in foreign markets.

The next session will provide a review of the existent literature on entry modes and competitive strategy. This will be followed by discussion about the methodological aspects of this research. Then we discuss the results of data analyses. The final section summarizes the key findings and contributions of the study as well as identifies avenues for further research.

## **THEORETICAL PERSPECTIVES ON ENTRY MODES**

The existing body of knowledge on international entry modes is divided into three main strands. An important research strand tend to focus on the study of entry modes through the theoretical lenses of the TCT (Transaction Costs Theory) (e.g., Blesa and Ripolles, 2007; Zhao, Luo, and Suh, 2004). Based on his review of the internalization theory, Dunning (2003) suggested that the international entry mode is normally designed to minimize costs, in terms of transaction cost theory.

However, following the RBV (Resource Based View) theory suggest that analysing entry mode decisions only on the basis of TCT is insufficient as firms internationalise not only with the objective to cut costs but also to gain advantages that will in turn increase profits (Pehrsson, 2008). In an attempt to understand the relationship between the two, Tsang (2000) compared the effects on international JVs of TCT and the RBV. His findings show that actually the two theories complement each other in terms of seeking the firm competitive advantage, with the TCT focusing on cost, and the RBV focusing on profit. Given their complementarities and since both explain the internationalisation activities of firms, some authors have used both to theories to underpin their research studies on entry mode decision (Delios and Beamish, 1999; Tesfom, Lutz, and Ghauri, 2004; Yu-Ching, Fang-Yi, and Chow-Ming, 2010).

Another important research on the topic, underpinned by the institutional theory, suggest that entry mode decision is primarily dependent on the target market economic, political, and social/cultural conditions (Ang and Michailova, 2008; Dikova and Witteloostuijn, 2007; Lee and Paruchuri, 2008). In their study, Geringer et al. (2000) asserted that generally external factors of the MNC affect the way they apply the entry strategy. Standing on this, it can be inferred that MNCs' subsidiaries should adopt more flexible resource allocation strategies, if any changes occur in their external environment (Buckley and Casson 1998). This is particularly important for MNCs entering into emerging markets (Meyer, 2001) as the institutional factors are more likely influence their operations. In line with this, Kwok and Reeb (2000) suggest entry mode decisions need to be informed by a good understanding of the differences between the institutional conditions of home and host countries (Kwok and Reeb 2000). For these reasons, recent studies on international entry modes in emerging economies have begun to use institutional factors in their theoretical constructs (Meyer, 2001).

Because entry mode decisions are complex and informed by a variety of factors, some studies have analysed entry mode decisions by integrating the various theoretical perspectives (Yu-Ching, Fang-Yi, & Chow-Ming, 2010). Meyer and Rowan (1977) have extended the boundaries of TCT by examining the relationship between firms and the surrounding environment. This more holistic views become particularly important in the case of emerging economies, in which the exploitation of resource-based advantages by MNCs may not occur due to the poor institutional environments normally characterized by high levels of uncertain and of government intervention (Luo, 2003). In this type of environments choices of entry mode are highly conditioned by higher levels of transaction cost associated to certain institutional environmental factors in the host country (Puck, Holtbrügge, and Mohr, 2009; Yu-Ching, Fang-Yi, & Chow-Ming, 2010). One of the main factors conditioning entry mode decision, especially in the construction industry is risk. When comparing to domestic construction, international construction projects hold significantly higher economic and political risks (Ashley and Bonner, 1987). *Political risks leave firms exposed* to practices of political authority within a country such as confiscation risk by political authority, regulatory changes, war and government's attitudes. The recent events in Libya are evidence of the potential impact of institutional political conditions on MNCs. Apart from political risk, MNCs

are also more exposed to economic *risks such as* currency devaluation/ revaluation, unfairness in tax system and others.

## Characterization of International Market Entry Modes

The existing literature on the topic identifies five major modes to enter a foreign market: exporting, licensing and franchising, strategic alliance (joint venture), wholly owned subsidiaries. Early studies on international entry modes tended to focus on making decisions with regards to licensing or foreign direct investment (Buckley and Casson, 1976). From the various entry modes, exporting is normally the first step, especially for Small Medium Enterprises because it helps firms to quickly expand and diversify their sales and obtain international experience. It is also the entry mode that carries the lowest risk. Licensing and Franchising are long-term contracts and involve technology and human resources transferring. Licensing allows the licensor firm to authorise the licensee firms to use its production processes, logos, trademarks and brand names in the specified market for an agreed period of time, against royalty fee. Strategic Alliances take place when partnering firms agree to share their capabilities and resources in the pursuit of mutually beneficial interests. The most common type of alliances used in the international construction industry are: Cooperative Joint Ventures (i.e. Project JV) and Equity JV (i.e. fully mature JV). Project JV takes place when two or more companies agree to undertake a project together with a specific business contract, which last until the project is delivered. Equity JV is a limited enterprise in which the JV partners share management, savings, risks and profits, based on their equity in venture. Depending on the institutional environment and legal system of the country, partners opt for more durable Equity JVs or shorter term Project JVs. JVs are more common in emerging and less developed countries because this entry mode reduces the level of risk while increases technology transfer, capital inflow and employment potential. A company's involvement in a foreign country can take place through "Wholly Owned Foreign Subsidiary" by establishing either a "Foreign Subsidiary" or a "Representative Office" in a foreign market, depending on the desired degree of control. The Representative Office option is preferred when firms want to gain understanding of market at first attempt. It allows firms to observe market, get into connection with local firms and consumers. However, in most countries construction companies are not allowed any commercial activity through representative offices. They are obligated to possess a firm which has to be registered in country's commercial system (UN, 1990).

## Entry modes and Competitive Advantage

Associated with the entry mode decision, is the selection of the firm's differentiation or cost leadership competitive strategy, which, according to Porter (1990), depends on its capabilities and resources. By differentiation strategy, firm aims to develop high value added products and services which will allow it to gain market share in particular segment of markets. Firms which have strong competitive advantages and promotion mechanisms are likely achieve this strategy. Value is offered through special, unique products and services to consumers. Cost leadership strategy involves minimum level of differentiation within a product and services provided by a company. The main aim of a company which implements cost leadership strategy is to achieve economies of scale with low price products and services through increasing number of sales (Hamel and Prahalad 1994). In contrast to Porter's generic strategies, Christensen (1997) asserted that apart from Porter's strategies (differentiation and cost leadership) companies should develop strategies which allow them to create new segments and eliminate competitors' existence in market. The main objective of a company should be to satisfy costumers' needs without considering which strategies are used by competitors. This can be realized by organization's top-level commitment and agreement on this issue.

The achievement of a competitive advantage, especially in the case of the construction industry, seems to be directly related to the strategic management of a firm's Human Resources (HR). This is the case because HR allow firms to increase their competitive advantage through raising distinctive functionality of workforce within the company (Barney 1991). In their research, Bjorkman et al. (2007) found the correlation between operation of HR practices and company performance, based on theoretical and experimental verification. Their study showed that the effect of global workforce flow in traditional HR practices leads to convergence in HRM in global business (Geary and Roche, 2001). Correspondingly, the administrative practices are getting more international and global according to institutional theory, which proposes that businesses are shaped under the influence of 'traditional industry mentality' or 'classic management requirements' without taking consideration

of cultural diversities (McGaughey and DeCiri, 1999). The choice of entry mode will determine, to a great extent the HRM policy and practices to be adopted. In the case of construction companies, there is a tendency of employing host country's workers due to cost related reasons and availability of large number of workers.

## RESEARCH METHODS AND CHOICE OF CONTEXT

The choice of examining the international expansion of TCFs into Libya is justified for two reasons. Firstly because the Turkish international construction services sector has undertaken between 1972 and 2010 more than 5000 projects in 81 countries worth \$161 billion. This reflects its comparative advantage in terms an advanced workforce, technical knowledge and ability to adopt new technologies, business experience and discipline, and the ability to capitalise on its political and cultural closeness with its neighbours (DTM, 2010). Secondly, Africa became an important geographical market for Turkish firms when in 1998 Turkey launched its Africa policy document entitled "Opening up to Africa Policy". More recently, the Istanbul Declaration on Africa, which took place in 2008, further encouraged the development of closer relations with African countries (SETA, 2008). In this context, Libya became the most attractive market for TCFs after Russia in recent times (IGEME 2008) and to date, more than 350 projects with a total value exceeding \$20 billion have been undertaken by TCFs in Libya. This became evident when in November 2009 the Turkish prime minister visited Libya accompanied by hundred Turkish business men representing various sectors. Among other benefits, this resulted in the promise of \$125 billion of investment in the construction sector by the Libyan government. Since Libya lacks capacity in terms of qualified labour force in the construction industry, it has been contracting foreign firms to undertake high magnitude, long-term projects. The percentage of projects carried out by Turkish contractors in Libya between 2003 and 2008 was of 10.9%, being the second largest percentage of the total projects carried out by Turkish contractors over the globe (DTM 2009). This context justifies, therefore, the need for this research in order to identify the best entry modes and competitive strategies for TCFs moving into Libya.

This research follows a survey, cross-sectional design. Data was collected through a self-administrated questionnaire, which was sent to TCFs operating in Libya. The population of TCF operating in Libya consisted of 151 firms operating in Libyan construction sector. The list of firms was obtained from the Turkish Tripoli Embassy's website. All the firms operating in related sectors such as architecture, construction consultancy, were excluded and only 121 firms were finally considered for the purposes of this research. A short pilot study with three firms was conducted to test the questionnaire before sending the final questionnaire to all firms. The data collection process took place between June and August 2010. Out of 121, only 90 firms could be reached due to incorrect and missing addresses of 31. Out of the 90 firms, 35 returned the questionnaire, representing a 40% response rate. The characteristics of the firms participating in the research are summarized in Table 1.

**Table 1: Characteristics of questionnaire respondent firms**

Characteristic		Turkish firms	
		Number	%
<i>Respondent type</i>	Senior executive	28	80
	Middle level executive	7	20
<i>Size</i>	Medium size	5	14.7
	Large size	30	85.3
<i>Number of respondents</i>	<i>N</i>	35	
<i>Response rate (%)</i>		40	

The questionnaire structure was as follows. Section one was composed by three demographic questions and a question regarding the chosen entry mode. Questions in section two were used to identify the factors that influence the investments of TCFs in Libya. Open-ended questions were asked in section two in order to investigate the factors that influenced and motivated TCFs move into the Libyan market. In section three, a five-point Likert scale ("1-not important at all" up to "5-very important") was used to assess the effectiveness of the various entry modes and competitive strategies.

## DATA ANALYSIS AND RESULTS

Data gathered through questionnaires were analyzed with SPSS 18.0, software for statistical analysis. One-way ANOVA, Kruskal-Wallis and Friedman tests were applied in this research for the interpretation of the data obtained. The Kruskal-Wallis test was applied to test one-way ANOVA. Before starting to interpret the entry modes based on the results gathered from Friedman test, validation of the Friedman test was conducted. A parametric test one-way ANOVA, an alternative of the Friedman non parametric test was applied so as to see whether difference between groups (i.e. entry modes) statistically meaningful. In Table 2, Wilks' Lambda test value (0.338) allowed to see that difference between comparing groups (i.e. entry modes) is statistically significant ( $p: 0.00 < 0.05$ ).

**Table 2: ANOVA Test Results for Entry Modes**

Effect	Value	F	Hypothesis df	Error df	Sig.	Partial Eta Squared
mode Pillai's Trace	.662	5.668 <sup>a</sup>	9.000	26.000	.000	.662
Wilks' Lambda	.338	5.668 <sup>a</sup>	9.000	26.000	.000	.662
Hotelling's Trace	1.962	5.668 <sup>a</sup>	9.000	26.000	.000	.662
Roy's Largest Root	1.962	5.668 <sup>a</sup>	9.000	26.000	.000	.662

The next step was the assessment of the size effect. This allowed to investigate the degree of correlations and differences between groups or variables within sample. Results showed (see Table 2) that the sample used in this research has a considerable effect on result's validation ( $PSE=0.662 > .14$ ) which means either judgment towards obtained results have to be cautions or to get substantial results, more data needs to be collected.

Table 3, illustrates 10 potential market entry modes that can be used by TCFs to penetrate the Libyan construction market. It shows that the wholly owned subsidiary (EM1) has the highest score which indicates EM1 was found to be the most effective entry mode for TCFs to enter the Libyan construction sector. EM7 and EM3 were indicated as the second and third most effective entry modes.

**Table 3: Friedman Test Mean Ranks for Entry Modes**

	Mean Rank
EM1:Establish wholly owned subsidiary in Libya	7.21
EM2:Doing company merger or acquisition in Libya	4.70
EM3:Establish representative office in Libya	6.73
EM4:Form a joint venture with a Libyan firm	3.57
EM5:Form a joint venture with a Turkish firm	5.63
EM6:Form a joint venture with foreign company (not Libyan and Turkish)	4.99
EM7:Doing a strategic alliance with a financial institution	6.90
EM8:Doing a strategic alliance with a Turkish firm	5.14
EM9:Doing a strategic alliance with a Libyan employer invested in Libya	3.01
EM10:Doing a strategic alliance with a foreign firm invested in Libya	5.91

There are two options available for a construction firm to establish own its own subsidiary abroad. First option is setting up a new operation; second option is acquiring an existing firm in foreign market. This research revealed that TCFs are unlikely to form a merger or to make an acquisition in Libya, EM2 (see Table 3). Acquisitions involve high risks and potential issues such as managerial, organizational incompatibility make acquisitions unattractive option for TCFs. According to Friedman test results in Table 17, either establishing a representative office (EM3) or wholly owned subsidiary (EM1) in the Libyan market are the modes which have high potential of success. Firms that use these modes to enter the market should take consideration of all factors involved in foreign market activities. Another crucial point is that these entry modes (EM1 and EM3) require higher levels of initial investment and carry higher risks than other entry modes.

It can be inferred that big construction companies intend to do business alone without creating a venture with another company because they have enough resources and capabilities to overcome projects by their own and not willing to share revenue of projects. Additionally, these firms have full control upon their operations abroad and have full control on intellectual property and know-how which are important issues an international construction have to firm take care of (Bontempi and Prodi, 2008). The representative office is preferred when a

firm wants to explore and get an understanding of market in which it is planning to undertake further projects. Representative office of a construction firm in a foreign country will provide a positive impression to local stakeholders that its subsidiary is supported by a powerful foreign parent firm in comparison to local Libyan firms which may lack of experience and know-how.

In some circumstances, Libya's foreign policy obligates and promotes JVs between Libyan and foreign firms with the objective of developing the local sector (DTM, 2010). Our research results show that joint ventures (EM4, EM5 and EM6) are not effective modes for TCFs to enter the Libyan construction market. However, according to this research results, it is not effective choice (see Table 3). Though, JVs are not favoured by TCFs, they have potential benefits such as learning the culture, language and market conditions from local partners (Chen and Hennart 2002).

Results show that in general, alliances are not perceived as effective modes to enter the Libyan construction market, except the formation of an alliance with a financial institution (EM7) with the objective to finance the projects to be undertaken in Libya. In terms of forming strategic alliances with other construction firms, TCFs do not distinguish whether the partner is from their home country (EM8) or is a foreign company (EM10). However, TCFs are not so willing to work with Libyan firms (EM9) due to managerial, operational and inadequate capabilities. Forming alliances with the Libyan government needs to be evaluated separately from the alliances formed with Libyan firms because TCFs can secure their presence in market through working with government and thus, it will be a good reference for future bids. Furthermore, TCFs that formed strategic alliance with the government are protected from corruption and other issues that foreign firms may encounter in Libya.

## Business Strategy and competitive advantage

According to results, it is essential for construction firms to provide high quality special products and ultimate services (BS1 and BS2) to clients ( see Table 4). TCFs can also create differences by finishing undertaken projects within short period of time (BS4) and offering integrated customized services (BS3). Based on research results it can be inferred that differentiation is an essential strategy adopted by TCFs to compete in the Libyan market. Differentiation strategy allows firms to offer unique and special projects which are beyond market expectations to the clients. Apart from doing basic construction buildings, firms can also provide project management services as a source of differentiation in order to win bids in Libya where the market is very competitive and many foreign contractors can offer low prices in bids, especially Chinese firms. Nevertheless it is not enough to provide differentiated projects and services for TCFs to be successful, unless they are able to offer competitive prices. Because high quality and special customized services bring high costs which damage competitiveness of contractors. Results show that that TCFs need to offer competitive prices to undertake projects in Libya construction market (BS6).

Results showed that client satisfaction is another important subject that needs to be paid attention by TCFs (BS6) such as completing projects in shorter time scale, offering high quality products and services with competitive prices. This requires a very good HRM policy and practices to ensure that employees of TCFs are well trained to be able to very efficient and provide excellent quality, while being able to establish good rapports with clients.

**Table 4: Friedman Test Mean Ranks for Business Strategies**

	Mean Rank
BS1:Provide high quality products and services	10,84
BS2:Provide ultimate products and services	9,81
BS3:Provide integrated/ packaged services	7,76
BS4:Complete projects in a short time	8,50
BS5:Pay attention to client satisfaction	8,81
BS6:Offer competitive price	9,87
BS7:Employ globally	6,56
BS8: Employ a Libyan staff to manage project.	3,37
BS9:Assign a management staff from head office to manage project	11,24
BS10:Working with a Libyan subcontractor	4,44
BS11:Working with a Turkish subcontractor	9,67
BS12:Taking an share in the project	3,54

BS13:Arranged financial plan	9,23
BS14:Build network and contacts in Libya	11,83
BS15:Become member of a consortium in Libya	10,50
BS16:Turkey's political backing in international projects	11,01

Still related to HRM, results show that it is essential for TCFs to assign management staff from head office to manage projects in Libya (BS9). Assigning managers to a foreign market enables TCFs become more familiar and gain a deeper understanding of Libyan market. It also has the advantage of enabling a faster decision making process. Results show that TCFs do not favour employing Libyan managers (BS8) and working with Libyan subcontractors (BS10) for projects undertaken in Libya. Turkish engineers and architects have strong background on construction technologies that is why they are preferred by Turkish employers. Furthermore, due to lack of well educated and experienced Libyan staff in the construction industry, TCFs generally employ managers from Turkey. It was revealed that TCFs tend to work with Turkish subcontractors in their projects in Libya (BS11). However, bringing staff from Turkey to Libya increases the cost of the projects and reduces the competitiveness of TCFs in the market. Since costs would be significantly lower if TCFs could employ more local Libyan staff, HRM policies and practices would be required to train and improve the capability of local employees.

## CONCLUSIONS

This research findings show that the most suitable modes for TCFs to enter the Libyan construction market are the establishment of wholly owned subsidiaries and representative offices. Firms that entered the Libyan construction market through establishing a wholly owned subsidiary are the ones that have enough financial resources allow them undertake big projects without the need to form any ventures with other partners. Results show that JVs are not commonly preferred modes since they can carry various implementation issues, normally associated with disagreements between partners. Our findings show that forming JVs or other type of alliances with local Libyan firms is not favoured because of managerial disorientation, lack of knowledge and experience of Libyan firms on construction business in spite of political backing they can provide. This is in line with earlier research by Inkpen and Beamish (1997) showing that disagreements between JV partners are a common issue in international collaborative activity.

This research also shed some light on the effectiveness of competitive strategies to be adopted by TCFs in order to gain a competitive advantage in the Libyan construction industry. The most outstanding finding is that TCFs effectively use a combination of 'differentiation and cost leadership' strategies. This result contradicts Porter's argument that firms should only adopted one of the two strategies to avoid getting stuck in the middle. In the case of the Libyan construction industry, high levels of international competition forces firms to offer low price in bids and based on the requirements of the projects, to build high quality works. In such scenario, TCFs are recommended to create innovative works to achieve low cost competitiveness along with ability to deliver high quality projects. This innovative advantage can be achieved through the application of Christensen's (1997) 'Disruptive Innovation Strategy'. According to this model, firms should adopt a disruptive innovation strategy in order to enhance their core competence to allow them to gain a competitive advantage. Our research findings also showed that the adoption and implementation of HRM policies should be consistent with the choice of the entry mode and of the competitive strategy. This is particularly important in the context of Libyan construction market, characterised by high levels of international competition and limited availability of a skilled local labour force.

However, the recent events in Libya, i.e. the revolution against the Kaddafi regime, shows that the selection of the entry mode should not only be underpinned by Transaction Costs and the Resource Based View theories, but primarily by a good understanding of the institutional target market economic, political, and social/cultural conditions (Ang and Michailova, 2008; Dikova and Witteloostuijn, 2007; Lee and Paruchuri, 2008). In this case if TCFs had followed previous recommendations from previous studies (Buckley and Casson 1998; Meyer, 2001) and adopted a more flexible and less risky form of operation in Libya rather than the preferred whole own subsidiary, they would have been able to more easily react to recent changes occurred in Libya.

# SERVICES FINANCIAL MANAGEMENT ANALYSIS

**Anna Zhilkina**  
**State University of Management, Russia**

## ABSTRACT

*Services enterprises and organizations occupy an increasingly prominent place in the economy in recent times. These are companies and organizations of housing and communal owners' properties, domestic sphere, consulting and auditing firm. The article is devoted to the applicability of the methods of analysis and financial management of service enterprises designed for the real sector of the economy.*

## INTRODUCTION

Enterprises and organizations that provide services are occupied more and more weight in the structure of the economies of all developed countries. The concepts of goods and services have become synonymous with the terms of their economic substance. This is promoted by scientific and technological progress. However, the question arises: is there a difference in "management" services and goods, is the same whether these mechanisms of marketing, advertising, selling, whether there is specific application of scientific and technological progress, the financing of the current activities of development, whether applicable to service management practices, in broadest sense, designed to control merchandise.

## METHOD

There are six main particularly important things to keep in mind when examining a balance sheet and Income Statement: (1) level of finance stability, (2) level of liquidity, (3) probability of bankruptcy level, (4) return on assets, (5) return on assets, and (6) return on equity.

### Level of finance stability.

The level of finance stability is rated in five categories (Formulas see on tabl.1):

- absolute finance stability;
- normal finance stability;
- permissible finance instability;
- impermissible finance instability;
- critical finance stability.

**Tabl.1: The levels of finance stability**

State	Formula
absolute finance stability	$FA + Inv \leq Eq$ , were: FA - fixed assets; Inv - inventory Eq - equity
normal finance stability	$FA + Inv \leq Eq + LTD$ , were: LTD – long-term debt

State	Formula
permissible finance instability	$\begin{cases} Eq + LTD < FA + Inv \leq Eq + LTD + STC \\ FA + Inv(s) \leq Eq + LTD \end{cases}$ <p>were: STC - shot-tern credit, Inv(s) –part of inventory, that can be sale</p>
impermissible finance instability	$\begin{cases} Eq + LTD < FA + Inv \leq Eq + LTD + STC \\ FA + Inv(s) > Eq + LTD \end{cases}$
critical finance stability	$FA + Inv > Eq + LTD + STC$

#### Level of liquidity

The level of liquidity is rated also in four categories (Formulas see on tabl.2):

- absolute liquidity,
- permissible liquidity,
- low liquidity,
- critical liquidity.

**Tabl.2: The levels of liquidity**

State	Formula
absolute liquidity	$DA \geq DD$ , were: DA - discount asserts (Cash + 0,5* Accounts receivable + 0,3* Inventory; DD - discount debts (Accounts payable + 0,5* Short-term debt + 0,3* Long-term debt)
permissible liquidity	$DA \geq 0,75 * DD$
low liquidity	$DA \geq 0,5 * DD$
critical liquidity	$DA < 0,5 * DD$

#### Probability of bankruptcy level

The level of bankruptcy probability is rated also in three categories (Formulas see on tabl.3):

- low probability of bankruptcy,
- middle probability of bankruptcy,
- high probability of bankruptcy.

**Tabl.3: The levels of bankruptcy probability**

State	Formula
low probability of bankruptcy	$MCA \geq CL$ , were: MCA - material current assets (cash and inventory), CL - current liabilities
middle probability of bankruptcy	$MCA \geq 0,75 * CL$
high probability of bankruptcy	$MCA < 0,75 * CL$

#### Return on sails, return on sails, return on equity.

There are no normal levels of the indexes – return on sails, return on sails, return on equity (Formulas see on tabl.4). But everybody prefers the following situation:

$$\begin{aligned} ROS_{bp} &> ROS_{ep}, \\ ROA_{bp} &> ROA_{ep}, \\ ROE_{bp} &> ROE_{ep}, \end{aligned}$$

were: bp – a beginning of the analyzing period;

ep - an end of the analyzing period.

**Tabl.4: Return on sails, return on assets, return on equity**

Index	Formula
return on assets	$ROS = \text{Net income} / \text{Net sales}$
return on assets	$ROA = \text{Net income} / \text{Total assets}$
return on equity	$ROE = \text{Net income} / \text{Owners' equity}$

## RESULTS AND FINDINGS

Conditionally can be divided into advisory (provide consulting and auditing firms), consumer (public utilities, hairdressing, dry cleaning, laundry), transport, education (early childhood education, secondary, secondary, higher education, postgraduate education), financial (provided by credit institutions), state (provided through the budget at various levels).

Terms of the global financial crisis, rising unemployment, and consequently, lower purchasing power of the population, have led to the fact that even healthy prior service companies are encountering problems, were forced to curtail production and lay off workers, to change the usual methods of control. With regard to the enterprises of housing and communal services and domestic servicing of them were in a better position, because the population can not refuse their services as opposed to household services.

Specificity utilities lie in the fact that the overall financial results of their work affects the structure of consumers and, consequently, the application of different tariffs for the products (services). Feature of the productive activity of some municipal enterprises and public services is uneven consumer demand for certain types of services not only in certain periods of the year, but within days, weeks, months. This affects the organization of their finances. Uneven consumption of services resulting in some periods is decrease profits. Seasonal excess of expenditure over income shall be compensated by the creation of reserves and own funds or bank loans.

If we calculate the finance indexes on six main finance statement characteristics: level of finance stability, level of liquidity, probability of bankruptcy level, return on assets, return on assets, and return on equity we will have the following results (tabl.5):

**Table 5: The finance statement level criterions.**

Index	Finance index (fact) in analyzing period		Tendency
	at the beginning	at the end	
finance stability	finance instability or critical finance stability	critical finance stability	bad
liquidity	low liquidity	low liquidity or critical liquidity	invariable
probability of bankruptcy	middle probability of bankruptcy	middle probability of bankruptcy or high probability of bankruptcy	invariable
return on assets	from 0.35 to 0.13	from 0.10 to -0.15	bad
return on assets	from 0.42 to 0.23	from 0.10 to -0.13	bad
return on equity	from 0.47 to 0.13	from 0.20 to -0.10	bad

After world finance crises a lot of service enterprises have poor finance state. The authors analysis insure us that more, then 60% of enterprises can not provide industrial assets (fixed assets and inventory) by normal resources of foundation (owners' equity, long-term debt and quick-term credit); 24% of enterprises have fixed assets to current assets ratio more then 0.3; 51 % of enterprises have ratio debt capital and current liabilities

to owners' equity more than 1; 73% of enterprises have current ratio (liquidity) less 2; 75% of enterprises have profit margin low then 20%; 69% of enterprises have day's turnover off enterprise bills receivable more than 30 days and 80% of enterprises have day's turnover off enterprise bills payable more than 30 days.

## CONCLUSION

So the most part of service enterprises have a lot of problems in its financial statement and there financial managers must make a solution how the enterprise can return in unstable finance state and how it can increase it's profit. Therefore the problems of a quality control, management quality and financial management quality can be solving by constant enterprise financial monitoring and by using knowledge management in service companies.

# OPPORTUNITIES CREATED BY ALLIANCES IN THE TOURISM INDUSTRY: THE CASE OF LEADING HOTELS IN RIO DE JANEIRO

**Mariana de Queiroz Brunelli and T. Diana L. van Aduard de Macedo-Soares**

**Pontifical Catholic University of Rio de Janeiro, Brazil**

## ABSTRACT

*This article presents the results of a study of leading hotels in the city of Rio de Janeiro. Motivated by Brazil's prospects as a country that has been chosen to stage the 2014 FIFA World Cup™ and the 2016 Olympic Games, the study sought to identify the opportunities created by these hotel's alliances, considering not only their aim of competing at a global level, but also their role in the development of the tourist destination itself. Thus, an overall strategic assessment was undertaken with the help of a relational strategic analysis framework that has already been tested in other industries, but never in the tourism industry. The results showed the great potential gains that could be obtained by the hotels' alliances, in terms of their ability to contribute to the city's socio-economic development through their activities as central actors in the tourism industry's network of relationships.*

## INTRODUCTION

The development of a tourist destination is linked to its firms' ability to act in a pro-actively strategic fashion (CLAVER-CORTÉS, MOLINA-AZORÍN & PEREIRA-MOLINER, 2007), taking into account their socio-economic responsibilities (TIMUR & GETZ, 2008). To achieve this, the organizations of a destination must adopt a competitive stance that is compatible with their macro-environmental and relational context.

Thus, as shown by the literature, in order to act in a strategically assertive manner in the global competitive arena, it is increasingly necessary for firms, in their analyses and decision-making processes, to take into account, the strategic implications of not only factors related to their industry and internal resources, but also of their relationships with other organizations (MACEDO-SOARES, 2010).

This article presents the results of a study which, in the light of the above considerations, applied a relational strategic analysis framework to the case of leading hotels in Rio de Janeiro which is the most famous tourist destination in Brazil, a country which has been in the world spotlight due to its rapid development over the past decade (THE ECONOMIST, 2009). The latter has now been crowned by the decision to stage the 2014 FIFA World Cup™ and the Olympic Games in 2016, in Rio de Janeiro, thus enhancing the country's, and principally its tourism industry's growth potential.

Motivated by the Brazilian tourism industry's current situation, the study at issue here sought to identify the opportunities created by the leading hotels' alliances, considering not only their aim of competing on a global level, but also their role in the development of the tourist destination itself. The hotels were chosen as the tourism firms to be studied because they are considered to be one of the main actors of the network formed by the tourism industry (SCOTT, BAGGIO & COOPER, 2008; TIMUR & GETZ, 2008; MARCH & WILKINSON, 2009).

The decision to focus on these actors is justified by their important responsibilities, such as those related to the communication of the destination's development planning, their role as mediators to facilitate collaboration between stakeholders, the growing need to increase network members' awareness of socio-environmental issues and the coordination of efforts to achieve the industry's goals (TIMUR & GETZ, 2008).

In order to fulfill its objectives, the study undertook a strategic assessment of the firms studied, analyzing, on the one hand, non-relational factors (macro-environmental) and those pertinent to key strategic actors in the performance of their traditional roles and, on the other, relational factors, i.e. pertinent to relationships of an alliance type, in order to identify their most significant opportunities and threats at industry-level. This assessment was undertaken with the support of Macedo-Soares (2011) “Global SNA” relational strategic analysis framework.

Thus, the study sought, in parallel, to contribute to the development of a theoretical approach that highlights the importance of carrying relational strategic analysis from a network perspective (GULATI, NOHRIA & ZAHEER, 2000), also in the case of the tourism industry (SCOTT *et al.*, 2008), considering the context of global competition in which firms in this industry operate.

This article is divided into seven sections, including this introduction. The second section describes some of the main aspects of the tourism industry and hotel sector of the country and city focused on. The third and fourth sections explain the theoretical references and methodological approach adopted. The following two sections present and analyze the study’s results. The final section highlights the study’s main lessons and makes some recommendations for future research.

## THE TOURISM INDUSTRY IN BRAZIL

Despite its clear touristic vocation and position as the American continent’s fourth main tourist destination, Brazil has only a 3.4% share of this market and accounts for 3.2% of the revenue generated by this group of countries (UNWTO, 2010). According to Brazil’s Tourism Ministry (MTUR, 2007), the industry accounts for 3.2% of all revenue generated by the country’s exports of goods and services. It also accounts for around 9% of all jobs generated in Brazil and 15% of this country’s total service sector employment (IBGE, 2008).

Most foreign tourists visit Brazil for leisure purposes; in fact, almost twice the number who come on business (MTUR, 2010). However, in terms of the average daily amount spent, the business tourist is more interesting for Brazil, spending 68% more than those who come for leisure and staying the same average of 12 days in the country (MTUR, 2010).

The above figures show that Brazil has the potential to increase its share of the international tourism market, and the big events planned, notably the 2014 FIFA World Cup™ and the 2016 Olympics, provide an excellent opportunity to achieve this. However, in order to take full advantage of these opportunities, a great deal remains to be done to transform Brazil into a major touristic destination. The sector needs huge investments – especially in infrastructure, such as airports, roads and hotels – and the government will have to fulfill the plans it has been announcing to improve the country’s touristic facilities (GARRIDO, 2010; MACIEL, 2010).

Rio de Janeiro undoubtedly stands out among Brazil’s main touristic destinations. According to Gomes (2010), this has to do with its wide variety of touristic features and attractions such as its long coastline, with its internationally famous beaches and other countless natural attractions, folkloric and cultural feasts and manifestations, and its rich and historically important architectural heritage.

For these reasons, the city of Rio de Janeiro continues to be the main tourist destination for international tourists who visit Brazil for leisure purposes, as well as also being important in the business tourism segment, coming second only to the city of São Paulo (MTUR, 2010). These figures confirm the importance of the tourism industry for Rio de Janeiro, which accounts for 8.5% of this Brazilian city’s overall economy (GOMES, 2010).

However, similarly to the rest of Brazil and despite its existing structure, the city of Rio de Janeiro still faces big challenges in the tourism area. They are related mainly to the modernization of its infrastructure, the expansion of its tourist reception capacity and the reduction of violence. Since it was announced that Rio de Janeiro would hold the 2016 Olympics, with expected investments totaling around US\$ 18 billion (GOLDBERG, 2010), the city’s leaders have been striving not only to consolidate the destination’s positive image, but also to develop its urban infrastructure and tourist services, in order to leave a great legacy for its citizens (ROCHA, 2010).

The hotel sector is considered to be a main tourism sector and is therefore fundamental for this industry’s development (CLAVER, ANDREU & QUER, 2006). With a view to gaining a better understanding of the city of Rio de Janeiro’s hotel sector, it was deemed relevant to also analyze some national-level figures. The most recent ones show that Brazil has over nine thousand hotels that provide approximately 440 thousand

beds, 48% of which are located in the southeastern region, 23% in the northeast and the remainder is divided among the other parts of the country (JONES LANG LASALLE HOTELS, 2010). However, the country's hotel sector is still fragmented and thus provides opportunities for rapid consolidation (EXAME.COM, 2010).

Following a worldwide pattern, the Brazilian hotel sector is composed of firms that own hotels and firms that manage them, but both may develop their own brands. Note that the indicators used to draw up rankings of the main hotels refer to the number of hotels and rooms supplied (JONES LANG LASALLE HOTELS, 2010), not financial performance. Thus, it is assumed that the biggest hotels, that is, those with the largest number of rooms, also generate the largest revenues, or at least have the greatest earnings potential.

The city of Rio de Janeiro's hotel sector currently has a total capacity of 28 thousand rooms (ABIH-RJ, 2009) and the objective is to attain 32.5 thousand by the 2014 FIFA World Cup™ and meet the target of 50 thousand rooms in time for the Olympic Games in 2016 (GOLDBERG, 2010; ALMEIDA & NOGUEIRA, 2011).

Rio de Janeiro's investment and expansion expectations have already begun to affect the hotel sector. Various groups of investors and hotel administrators have announced projects in the city. These include the EBX Group's renovation of the Gloria Hotel and the Brazilian Hospitality Group's (BHG) acquisition of the Intercontinental Hotel. Another sign of this investor interest is the legal dispute the latter group is involved in regarding the contract to manage the building currently occupied by Accor's Sofitel Hotel. In addition, the traditional Méridien Hotel was bought by the Windsor Hotels network which re-inaugurated it in 2010.

Another important feature of Rio de Janeiro's hotel sector is that a high percentage of its guests – 48% in 2009 – are business tourists (ABIH-RJ/FECOMÉRCIO, 2009). Although most of the city's tourists come for leisure purposes, business customers guarantee demand and revenue for hotels throughout the whole year.

As a final note regarding the hotel sector, we should like to highlight the fact that based on the national ranking (JONES LANG LASALLE HOTELS, 2010), and using the same kind of indicators collected for this study from documentary sources, we found that the following networks – in this order - are the city of Rio de Janeiro's leading hotel firms: Windsor Hotels, Accor, Othon Hotels, BHG and Starwood/Sheraton.

## THEORETICAL POSITIONING

The strategic analysis framework used for the purposes of this study is Macedo Soares' (2002, 2011) *Global Strategic Network Analysis Framework (Global SNA)*, which was adapted in our study to the tourism industry. This framework adopts Gulati's (1998) definition of alliances as a voluntary arrangement between one of two firms for exchange, co-development, production or marketing, and emphasizes that, to be considered strategic, the alliance must contribute directly to a firm's competitive advantage (MACEDO-SOARES, 2002).

The Global SNA uses a typology of alliances and linkages classified according to their degree of intensity/interdependency, as defined by Contractor & Lorange (1988), Parise (2000) and Nohia & Garcia-Pont (1991), ranging from the most intense ones, constituted by mergers and acquisitions, to the least intense agreements/partnerships. This typology was adapted to the tourism industry based on Contractor & Kundu (1998), Chen & Dimou (2005), Johnson & Vanetti (2005), Martínez & Esquivel (2006), Ayoun & Moreo (2008) e Pansiri (2008). The concept of strategic network is based on Gulati, Nohia & Zaheer (2000), where three network dimensions are analyzed at industry level: network structure, network composition and tie modality.

The Global SNA framework can be used to analyze a firm's network of relationships, or ego net (MACEDO-SOARES, 2002), and also the network of alliances formed by firms of the same strategic group – macro ego net (MACEDO-SOARES & MENDONÇA, 2010), as was done in the case of our study. The study used Cool & Schendel (1987) and Aacker's (1992) definition of strategic group, as a group of firms that compete in the same industry based on similar combinations of scope and resources.

The Global SNA framework is composed of three main components: (1) a methodology to conduct global relational strategic analysis; (2) reference lists to guide data collection and analysis; and (3) a conceptual model to help map the ego net of the focal firm or the macro ego net of a strategic group.

The Global SNA methodology is composed of the following stages that should be followed (MACEDO-SOARES, 2011) to perform industry-level analyses:

1. Characterize focal firms' competitive and market strategies, using Mintzberg's (1998) and Fahey e Randall' (1998) typologies and constructs, as well as those developed by Bartlett & Ghoshal (1989; 1998), Harzing (2000) and Hitt, Ireland & Hoskisson (2009).

2. Identify and analyze the strategic implications of macro-environmental factors in accordance with Austin (1990), as well as the role of firms' key strategic actors (PORTER, 1980; BRANDENBURGER & NALEBUFF, 1996), in terms of constituting real or potential threats and opportunities.
3. Identify and classify the characteristics of strategic alliances and other important linkages between the partners that constitute the focal firms' ego net, according to the typologies adopted and, based on the reference lists, analyze the implications of these characteristics at industry level, in terms of constituting real or potential threats and opportunities.

The reference lists for relational factors are based principally on Gulati *et. al.* (2000) and Galaskiewicz & Zaheer (1999) and the complete lists are presented in Macedo-Soares (2011), which also includes constructs and indicators that are pertinent to global alliances/networks. The present study focused on the following constructs in the three respective categories of the Global SNA framework's relational characteristics: 1) Network Structure - density, scope, centrality; (2) Network Composition– identity/status of partners and access to resources; (3) Tie Modality - strength of connections (strong/weak) and nature of ties (collaborative/opportunistic).

The Global SNA Framework's conceptual model concentrates on the characteristics of the network of linkages identified as being strategically significant for the focal firm's operation in the global competitive scenario (MACEDO-SOARES, 2011). The model's author suggests the use of different sizes, shapes and colors to identify the three relational dimensions focused on. In Figure 1 it is possible to visualize this characterization for the macro ego net of the leading hotels in the city of Rio de Janeiro that were the focus in our study.

**Figure 1 – Macro ego net of firms studied**

Source: prepared by the authors.

## METHODOLOGY

This study can be considered an exploratory one. The case-study method was used to operationalize the research because it is the most appropriate for the generation of theory regarding a little known contemporary phenomenon (YIN, 2005; EISENHARDT & GRAEBNER, 2007). Moreover, this method is also considered to be suitable for investigations such as ours that use a network perspective. This is because business networks are considered to be complex and dynamic (HALINEN & TÖRNOOS, 2005; DREDGE, 2006).

The study was undertaken using the triangulation strategy method (YIN, 2005), and data was collected by way of a documental investigation, a perception survey using a structured questionnaire (one questionnaire per firm, which BHG did not reply to), and interviews with top managers at the firms studied (the Marketing and Institutional Director of the Windsor Network and the Othon Network's Commercial Director) and with a director of a hotel sector trade association (Associate Director of the ABIH-RJ).

The study's unit of analysis was limited to the strategic group of leading hotels in the city of Rio de Janeiro - in terms of the number of hotels and rooms supplied - which have a business/event tourism profile. The

analyses were based on the data collected from the documental investigation, confronted with the replies to the questionnaire and complemented by information obtained from the interviews. The results were analyzed in the light of the literature reviewed, especially in relation to the constructs and indicators presented by the theoretical framework used. As the latter have already been tested in other empirical studies, it is assumed that the reliability of this study's results is correspondingly greater.

## RESULTS

First of all, a summary is presented of the history and performance of the firms studied. Information about these firms was obtained from their websites, interviews, and publicly available financial statements.

### **Windsor Hotels**

For 25 years, Windsor Hotels, a Brazilian hotel network, has been pursuing a strategy of providing a superior quality service for the business tourism segment. The firm both owns and manages its undertakings and its hotels are located in Rio de Janeiro's strategic touristic districts. The Windsor network is a privately-held group and each hotel has a different ownership structure. The network has estimated annual revenues of around US\$ 150 million. Its performance can be gauged from its expansion plans in the city, where it will build three more hotels until 2016. This shows that the group has a solid investment capacity which evidences its good financial and strategic performance.

### **Othon Hotels**

Founded in 1943, the Othon group may be considered Brazil's first big hotel network. The firm operates according to three business models: real estate, management contract and franchise. The Othon group is a publicly quoted company and has hotels in Brazil and cities like Lisbon, Paris and São Francisco. In 2010, the Othon group's gross revenues increased by 12% over the previous year but recorded a net loss of US\$ 6 million.

### **Brazil Hospitality Group**

The BHG was created by the 2009 merger between Latin America Hotels and InvestTur Brasil. The group, which is publicly quoted, currently forms one of Brazil's biggest hotel networks, owning or managing more than 30 hotels. The firm has an exclusivity contract with Golden Tulip Hospitality Group for the use of its brands in South America, but its operations are currently concentrated in Brazil. BHG recorded EBITDA of US\$ 6.5 million during the third quarter of 2010, a 124.3% increase over 2009. During the same period it reported a cash balance of US\$ 97.7 million and its intention to invest US\$ 362 million in the construction of 40 hotels in Brazil over the next five years.

## Strategic Group's Strategy

The information obtained throughout the study strongly suggest that the three firms focused have a similar profile in terms of scope and resources and could be considered a strategic group, according to Cool & Schendel (1987) and Aacker's (1992) definition.

Using the data collected from the questionnaire, interviews and documents, the research verified that the strategic group pursues, in Mintzberg's (1998) terms, a generic strategy of **differentiation in terms of quality oriented towards tourism customers, especially business customers**.

The above assertion is reinforced by the following declarations made by member firms:

Our focus is customer satisfaction. We are a family business, totally oriented by our chief executive to focus on service. It is his main concern. No matter the cost, the routine, what matters is that the customer must be satisfied (Marketing Director of the Windsor network in an interview given to the authors).

We are currently focusing on quality of service. Which is going to be our differential in building a strong brand [already achieved]. Over the past three years we have been concentrating on quality of service (Commercial Director of the Othon network in an interview given to the authors).

With an eye on the future, work with a motivated and ethical team, with clear objectives, using international level standards and criteria. Be commercially aggressive, with cost efficiency and excellent service. Have rapid and sustainable growth, with well located and up-to-date products, always valuing our greatest star, "the Customer" (Mission of the BHG group at [www.bhg.net](http://www.bhg.net)).

Before describing the firms' most important alliances and ties, we present the results pertinent to non-relational industry-level factors. As these firms belong to the same strategic group, they face similar industry-level strategic implications and, thus, may be considered to be part of the same wider value net.

## **Opportunities & Threats of Macro-Environmental Factors and Strategic Actors in their Traditional Roles**

The macro-environmental factors' most significant opportunities and threats, according to Austin (1990), as well as those of strategic actors in their roles as supplier, customer, rivals, substitutes (PORTER, 1980), or complementors (BRANDENBURGER & NALEBUFF, 1997), are presented below.

### **Main Opportunities**

- The 2014 FIFA World Cup™ and the 2016 Olympics may lever touristic demand and generate improvements in Brazil and the city of Rio de Janeiro's tourism infrastructure.
- Government institutions, due to the big events that will take place in Brazil, launch special financing programs for tourism and private investment funds begin to invest in the sector, attracting new commercial partners.
- Brazil's natural resources, especially those of the city of Rio de Janeiro's, are tourist attractions and sources of competitive advantage.

### **Main Threats**

- Brazil's social inequality and urban violence represent a threat to the attraction of tourists and a risk for the big events that will be held.
- Brazil's tourist infrastructure needs to be improved to increase its competitiveness.
- Workers lack skills and knowledge of foreign languages, which represent an obstacle to the growth of the country's hotel sector and tourism industry firms.
- The non-sustainable management of natural resources may jeopardize one of its main competitive advantages.
- The Brazilian hotel sector is expanding, motivated by the big events that the country will host, making room for consolidations in the sector and the entry of new competitors.
- Expanding the supply of hotels is a big risk when it occurs without an effective plan to capture demand during the period after the 2014 FIFA World Cup™ and the Olympic Games that will be held in Brazil.
- The bureaucracy involved in obtaining a Brazilian visa, especially in relation to the USA, reduces the destination's attractiveness, as it hampers access and increases travelers' inconvenience.
- In order to compete globally, the strategic group needs to maintain a high level of investments in order to catch up with experienced and traditional global hotel sector competitors.

## **Strategic Group's Alliances**

According to the linkage typology and the definition of the concept of alliances adopted, our study verified that the hotel networks possess important relationships with customers, suppliers, complementors, competitors, government bodies and sector/industry trade associations. The Othon group was alone in declaring that it had linkages with substitutes and the research did not identify relations with new entrants. Another strategic actor identified as having linkages with the firms studied – notably Windsor and Othon – were non-profit organizations focused on social development, called NGOs.

In response to the questionnaire, the Windsor network stated that it had commercialization contracts and exchange of services agreements with customers, while Othon Hotels declared that it established joint sales/marketing, information/technology sharing and commercialization contracts/agreements. In the case of BHG, the research identified agreements related to the co-development of products/services with customers (PR NEWSWIRE, 2010).

In the questionnaire, the Windsor network reported that it established service and product co-production contracts as well as joint sales and marketing partnerships with suppliers. The same types of alliance were

identified in the case of BHG (PR NEWSWIRE, 2010; BRASILTURIS JORNAL, 2010). Besides these, the Othon network, also mentioned long-term service supply contracts.

According to data from the questionnaire and interview, the Othon network established management contracts for the operation of hotels belonging to competitors. In addition, competitors were also partners of the firm in brand franchise, joint purchasing, promotion and advertising and exchange of services contracts. In the case of BHG, linkages consisted mainly of acquisitions ([www.bhg.net](http://www.bhg.net)). This firm clearly seeks to grow through the acquisition of existing hotel undertakings or management contracts and thus one can say that its competitors are its main partner. This is also ratified by the brand franchise contract that the group has with Golden Tulip Hospitality Group. In the questionnaire Windsor did not say that its competitors were one of its main strategic partners. However, the interview revealed that agreements are established to meet customer demand if its hotels are fully booked and in order to promote the destination. As the company's institutional relations director explained: "We often need each other. They accept [our] guests, charging the same rate as ours. We join our competitors to promote the city together".

According to questionnaire replies, trade associations are partners of the Othon network in contracts/agreements related to information and technology sharing, to joint purchasing and to exchange of services. In addition, the Windsor network also mentioned contracts related to service and product co-production, joint sales/marketing and promotion and advertising partnerships in the questionnaire. In the case of BHG, the research also verified the existence of team training partnerships (ABIHONLINE, 2010; BRASILTURIS JORNAL, 2010). On the basis of the interviews, agreements with trade and industry associations are usually related to actions in international fairs aimed at increasing the destination's visibility and touristic demand.

The Windsor network affirmed, in its replies to the questionnaire, that the kind of linkages it develops with trade associations are also developed with government entities. Othon, however, mentioned this actor in the questionnaire only as a partner in exchange of services agreements and the BHG said that it had financing agreements with it (EPOCA NEGÓCIOS, 2010).

As regards complementors, the BHG benefits from the contract it has with the Golden Tulip group related to partnerships with airlines, car rental firms and credit card operators (<http://corporate.goldentulip.com>). The Othon network informed in its replies to the questionnaire that it establishes contracts/agreements related to joint sales and marketing, information/technology sharing, long-term services supply and commercialization with this strategic actor. In the interview Windsor confirmed that it had no strategic linkages with complementors.

The Othon network was the only actor that stated in the interview and questionnaire that it had linkages with substitutes, characterized by franchising and commercialization contracts. NGOs were identified as an important strategic actor for the industry's value net, given the increasingly important role played by corporate socio-environmental responsibility in the global competitive scenario. (NIDUMOLU, PRAHALAD & RANGASWAMI, 2009; LUBIN & ESTY, 2010). Therefore, alliances with NGOs can be considered strategic in terms of adding value to firms' competitiveness.

Thus, the documentary data and interviews showed that both the Windsor and Othon networks have social capital and support agreements/partnerships with NGOs. One should note that these terminologies were established by this research as no specific terminology for these cases was found in the literature and references adopted. Social capital agreements refer to partnerships entered into with entities like the SEBRAE (Brazilian Micro and Small-Firm Support Service) to develop workforce training and absorption. The support agreements, on the other hand, are those which firms establish with NGOs for one-off actions, in general of a philanthropic nature involving donations. No relationships of this kind were identified in the case of BHG.

As the research identified the Windsor, Othon and BHG hotel networks as belonging to the same strategic group and therefore part of a wider value net, it was possible to represent its ties in a macro ego net within this value net (MACEDO-SOARES & MENDONÇA, 2010). As can be seen in Figure 1, shown at the beginning of this article, the macro ego net is constituted by the partner strategic actors who are common to the firms studied – set out in the central ellipse. The main ties and alliances of each firm with the strategic actors identified, characterized by different shades of grey (type of alliance), by the width of the lines (intensity and strength of connections) and the direction of the arrows (nature of connections) can also be seen in the conceptual model presented.

The density of the ego net researched was calculated using Knoke's (KNOKE & YANG, 2008, p. 53) formula and produced a moderate density result of 0.22 (SCOTT *et. al.*, 2008). Actor centrality – an indicator of the influence and power exercised – was measured by the number of linkages they possess with the net (KNOKE & YANG, 2008; TIMUR E GETZ, 2008). Thus, the Othon network may be considered the most central actor

researched, given that it had the greatest number of linkages with other members. However, Windsor and BHG's centrality is also evident from the leading positions they occupy in their sector.

## Opportunities Created by the Strategic Group's Alliances

We now present the main opportunities created by the strategic group's alliances and which were identified by means of the data collected. In order to analyze the results in terms of the relational constructs and indicators used, the study quantified each firm's individual results and those which, when summed, generated the highest averages were considered to be most characteristic of the strategic group analyzed. These results are presented in Table 1 below. Note that the density and centrality constructs were presented in the previous item.

**Table 1 – Characteristics of the Macro Ego Net Researched.**

Dimension	Constructs	Indicators (Result)
Network Structure	Density	Moderate
	Scope	Broad / Global
	Position & Centrality	Central
Network Members	Identity/status of global firm	Strong; Success; Rich; Global-Local
	Identity/status of partner	
	Access to and volume of global partners' resources	Easy / Abundant
Tie Modality	Strength of connections	Strong
	Nature of ties	Collaborative

Source: prepared by the authors.

The most important relational opportunities, based on the reference's list of the framework adopted, are listed below:

- The positive profile of macro ego net members may enhance the focal industry's profitability.
- The easy access to partners' resources constitutes an opportunity for developing more intense and lasting relations with network member and the large amounts exchanged represent a potential opportunity for the development of innovations in the industry.
- The strong connections between the members of the macro ego net provide an opportunity to increase the strategic group's productivity and thus contribute more effectively to enhancing the destination's competitiveness. (Note, however, that when connections are strong there is always a risk for the strategic group of being locked into unproductive relations).
- The collaborative alliances may generate positive results for the destination in the long term, also regarding its sustainable development.
- Through existing collaborative alliances, the members of the macro ego net may influence public policy and actions related to tourism aimed at the socio-economic development of the city as a tourist destination.

## DISCUSSION OF RESULTS

In this section we discuss the main results of the research. With a view to achieving the study's objective of identifying the main strategic implications for Rio de Janeiro's leading hotels from a relational perspective, we confronted the opportunities and threats identified from a traditional perspective with those captured by way of a relational perspective.

**Table 2 – Confrontation of Traditional and Relational Strategic Implications.**

Traditional Analysis		Relational Analysis	Resulting Implication
Macro-environmental factors / Value net actors			
1) <b>Potential Threat</b> If the investments that are being undertaken are not sufficient and/or effective, this may jeopardize the attraction of tourists to the destination and put the big events that will be held at risk.		1) <b>Real Opportunity</b> Through existing collaborative alliances, the strategic group can influence public policies and actions related to tourism aimed at the destination's economic, social and environmental development.	<b>REAL OPPORTUNITY</b>
2) <b>Real Threat</b> The bureaucracy involved in obtaining a Brazilian visa, especially in relation to the USA, the main emitting country, reduces the destination's attractiveness by making it more difficult to enter the country.		2) <b>Real Opportunity</b> Collaborative alliances with a broader and more global scope enable the strategic group to avoid dependence on tourists from countries with which Brazil has reciprocal entry visa agreements.	<b>REAL OPPORTUNITY</b>
3) <b>Potential Threat</b> Expanding hotel supply without an effective post-event - World Cup and Olympic Games - plan.		3) <b>Real Opportunity</b> The strategic group's collaborative alliances improve the service provided, opens up new business opportunities and increases the destination's visibility, thus assuring its attractiveness even after the country's big events have taken place.	<b>REAL OPPORTUNITY</b>
4) <b>Potential Threat</b> The non-sustainable management of the destination's natural resources may jeopardize one of its main competitive advantages.		4) <b>Potential Opportunity</b> By assuming its leadership role, the strategic group can contribute to improving the efficiency of communication between its members and disseminate norms of conduct among the sector's firms, aiming at the conservation of the destination's natural patrimony.	<b>POTENTIAL OPPORTUNITY</b>
5) <b>Real Threat</b> Workers' lack of skills and knowledge of the foreign languages needed to cater to tourists represent a serious obstacle to the growth of the country's hotel sector and tourism industry firms.		5) <b>Real Opportunity</b> The strong connections of the macro ego net researched can contribute to increasing the strategic group's productivity and thus contribute more effectively to the destination's competitiveness.	<b>REAL OPPORTUNITY</b>
6) <b>Real Threat</b> To compete globally, the strategic group needs to continue to undertake significant investments in order to be able to catch up with experienced and traditional global hotel sector competitors.		6) <b>Potential Opportunity</b> Existing global partnerships can be reinforced and encouraged to increase the quantity of services provided and transfer globally standardized processes to the strategic group that can generate economies of scale and maintain its competitive position on a par with global competitors.	<b>POTENTIAL OPPORTUNITY</b>
7) <b>Potential Threat</b> Need for large investments, knowledge of the market, economies of scale and geographical location constitute barriers to entry for new entrants to the hotel sector, but the increase in the volume of funding available due to the big events mentioned above, may encourage the entry of new competitors.		7) <b>Real Opportunity</b> The density of the macro ego net researched, which is a consequence of the great number of alliances established between actors, represents competitive advantages for the strategic group and, thus, barriers to new entrants.	<b>REAL OPPORTUNITY</b>
8) <b>Real Threat</b> There are many competitors in the sector, which is expanding significantly and undergoing a process of consolidation, with networks acquiring independent hotels.		8) <b>Real Opportunity</b> The strategic group's centrality in Rio de Janeiro's tourism industry shows that it has first-come advantages and the investment capacity needed to compete in the scenario presented.	<b>REAL OPPORTUNITY</b>

Source: prepared by the authors.

As is evident in Table 2, most of the threats revealed by the traditional analysis, i.e. of macro-environmental factors and strategic actors, are neutralized when a relational perspective is adopted. Below, we comment briefly on each of the items presented above.

Item (1) concerns the risk that Rio de Janeiro runs, as a destination, of not managing to carry out the investments planned to modernize its tourism structure and reduce urban violence (ROCHA, 2010, LOUREIRO, 2009). From a relational viewpoint, this potential threat is mitigated by the real opportunity constituted by the strategic group's strong ties with trade associations and government entities. These relationships have already been producing results in this direction as shown by the group's participation in the discussion regarding alterations in the legislation that governs the construction of new hotels in the city (RÖTZSCH, 2009).

Item (2) is related to the complaint made by executives interviewed regarding the obstacles created by the Brazilian government to the entry of tourists from visa emitting countries with a big impact on the market, especially the United States. However, from a relational perspective, it becomes clear that the global alliances that managers established, especially with large global customers composed of travel agencies that distribute world demand, minimize their risk of depending on countries with which Brazil has reciprocity agreements for visa issuance.

Item (3) refers to the potential risk that supply exceeds demand forecasts, a risk that hotels face when exploiting the special financing opportunities created to prepare for the big events that will take place in Brazil, (GOLDBERG, 2010; ALMEIDA & NOGUEIRA, 2011). However, from a relational perspective, it becomes evident that the strong and collaborative ties of the strategic group mitigate this risk. Indeed, they constitute an opportunity for promoting the destination with a view to maintaining a high level of demand and, thus, generating new business opportunities, such as those represented by other large-scale events that the country will host like the Military Games, in 2011, and the United Nations Conference on Sustainable Development, in 2012.

Item (4) refers to the potential threat of not preserving one of the greatest competitive advantages of the Rio de Janeiro destination, represented by its natural patrimony. In their institutional web pages, the firms that belong to the strategic group show that they have policies and perform actions aimed at reducing the environmental impacts of their operations. Thus, according to the relational view, by assuming their leadership role in the city's tourism industry network, this group can potentially contribute to improving and disseminating

norms of conduct among the sector's firms aimed at preserving the destination's environment and, thus, neutralize the potential threat mentioned above.

Item (5) involves the issue of Brazilian workers' lack of skills, especially regarding knowledge of foreign languages, which limits hotel sector firms' expansion. By forming collaborative alliances, the strategic group minimizes this threat by implementing skill development programs such as technical and language courses jointly with government entities and trade associations linked to tourism (ABIHONLINE, 2010).

In item (6), the strategic group's ability to compete globally is threatened by the lack of a clear global expansion stance. However, the fact that these firms have global alliances minimizes this threat because the resources contributed by these partnerships, such as globally standardized processes, knowledge of markets and brand promotion, can generate scale economies to support the group's quest to conquer and maintain a competitive position on a par with their global competitors.

Item (7) refers to the potential threat of new entrants to the hotel sector identified from traditional perspective, which is mitigated when one adopts a relational view. According to the traditional view, new entrants constitute a potential threat due to the substantial increase in the level of financing available for hotel sector investments to prepare for the big events that will take place in Brazil, and which minimize the need for the large capital investments that constitute a powerful barrier to entry in this sector. From a relational perspective, the density of the strategic hotel group's network of alliances creates barriers that hinder the entry of new players in the short term and thus neutralize the threat posed by them.

Finally, item (8) refers to another traditional threat, created by the high degree of rivalry existing in a fast-expanding sector with many competitors and moves towards consolidation (JOURNAL DE TURISMO, 2010). The relational analysis verified that this threat is neutralized by the central position occupied by the strategic group in the macro ego net, given that centrality provides the group with first-comer advantages as well as the investment capacity needed to assure its competitive advantage in the sector.

The results discussed in this section strongly suggest that, given its competitive positioning, performance and strategic relationships, the strategic group at issue is able to take advantage of the various opportunities revealed by relational analysis, thus contributing more effectively to Rio de Janeiro's development through its tourism industry.

## FINAL CONSIDERATIONS

This article presented the results of a multiple case study of leading hotels in the city of Rio de Janeiro that have a business and event profile. The study sought to identify and analyze the strategic implications – opportunities and threats – of alliances established by the strategic group studied, using a relational strategic analysis framework that had already been tested in various industries and was being applied to the tourism industry for the first time.

The results showed that hotel executives' adoption of a relational perspective contributes positively to their strategic analyses, by enabling them to capture new insights for decision-making processes that changes overall analysis results. The investigation also revealed that most threats identified by traditional analysis, that is, generated by macro-environmental factors or strategic actors performing their traditional roles, are neutralized when one adopts a relational view which, by taking into account alliance characteristics from a network perspective, permits a more accurate understanding of the industry's competitive context. As well as evidencing the importance of adopting a relational perspective, our study thus showed that hotels, with the support of the Global SNA framework can, in practice, perform more complete strategic analyses.

Considering the significant responsibilities attributed to hotels, as one of the most critical actors of the tourism industry's macro network, we make the following recommendations for the hospitality sector's managers. Leading hotels, such as those focused in this article, should assume their central role in this industry and give special attention to their collaborative alliances. Thus, while obtaining more valuable resources from their partners, the hotels could contribute better to leveraging the tourist destination in the sector's global ranking, by way of its modernization, use of global standards, stimulating innovations and sustainability of its environment.

The research had some limitations that may be seen as opportunities for future research. The first is that the analysis was performed solely at industry level. Therefore, to better gauge whether the strategic group is able to assume a leadership role in the macro ego net researched and thus really take advantage of the opportunities identified, this study should be complemented by an analysis at the level of firms in order to identify their strengths and weaknesses. Another limitation is that this study only analyzes a specific moment. Therefore, we

recommend further research, especially after the major events of 2014 and 2016 have taken place, with a view to verifying whether the tourist destination levered its competitive potential by taking advantage of the opportunities here identified. Finally, studies of strategy, in particular regarding strategic alliances and networks, in the tourism industry are rare (DONAIRE, SILVA & GASPAR, 2009), both in Brazil and abroad. So the field to conduct research in this area is broad and presents real opportunities for researchers wishing to investigate this industry.

# **ANALYSIS OF ENTRY STRATEGIES AND OPERATIONS OF BRAZIL AND CHINA**

**Edmir Kuazaqui and Teresinha Covas Lisboa**  
**Escola Superior de Propaganda e Marketing, Brazil**

## **ABSTRACT**

*This article is aimed at conceptualizing and contextualizing the international market entry and operations which have as host country The People's Republic of China, and this participation in the Brazilian international trade. At first, a documental and bibliographical research was carried out, having the qualitative approach as a pattern. Then, a qualitative exploratory research was conducted, having as samples Brazilian businessmen and professionals who have been involved in operations with the Chinese market. It was concluded that, before undertaking or ceasing a business and developing the strategies in international marketing, the companies must identify and understand the factors related to the environment in which they will develop their activities by evaluating the economy, the cultural aspects and the political risks in order to adapt their business portfolio, products and services.*

## **INTRODUCTION**

The trade and international relations have been evolving significantly, intensified firstly by the richest countries' necessity in keeping their economic leadership posts, as well as by the changes in the economy of the less favored nations – in some cases, from underdeveloped economies to industrialized ones; like China for example. According to World Trade Organization [III], the international trade has been trading more than ten trillion dollars a year, and this scenario has been increasing in the last years especially because of the economic and sociopolitical changes in certain countries.

The importance of this article lays on conceptualizing, developing and, mainly, evolving into a discussion about the business possibilities with the Brazilian and Chinese markets and respective entry strategy modes and operations, especially to micro, small and medium enterprises. To obtain data and insights to the strategies of entry and operation in international markets, in depth interviews were conducted with key managers of the companies which intend to reach the international market, the approach mode recommended by Kotler and Armstrong (1999) was followed. As Malhota (2009), interviews were conducted in a direct manner and in a non-structured and individually using a structured interview with the authors discussed previously and according to the research objectives.

## **ENTRY STRATEGIES AND OPERATIONS IN INTERNATIONAL MARKETS**

According to Dalmoro (2008: 62), “a relevant factor to the international activities of a company is the ability to establish and develop relationships with foreign partners”. There are different strategies, which may be classified in two groups: the entry strategies and operations in international markets and the international marketing mix strategies.

Terpstra and Sarathy (1994) interpret that a company, after deciding which entry strategy and operations will be adopted, must decide which international marketing mix balance and consistence will be necessary to obtain the

real and perfect fulfillment of needs and desires of a specific market in a sustained and planned way. They indicate that their components – products, price, place and promotion – can be adapted according to the distinct characteristics of each market and also satisfy the company's and its business portfolio growth and expansion objectives.

Besides Kotler (1999), Onkvisit and Shaw (1993) confirm the use of entry strategy modes and operations that were previously referred. So, below there is a brief definition and analysis of these strategies and after their application in the international market.

**a) Indirect exporting:** considering the level of knowledge and the necessary resources to accomplish an exporting and importing operation, most of the businessmen choose, at first, to outsource the services, with the objective to attend to infrequent or even low value demands of international purchasers. This can involve situational and unplanned questions. According to my research, with the whole process outsourced, even the customs and financial ones, it is possible to reduce the margin return on the operation, and also the risk of having mistakes related to the bureaucratic process of the operation, all at the same time.

**b) Direct exporting:** the company may choose to have an importing and exporting department when it achieves the commercial evolution with a portfolio of operations and when it acquires a certain expertise in the foreign and international trade. This happens with the objective to add synergy to other processes and to increase its return on the operations. It can also allow the management control. Also according to my research, in a certain way, nothing can avoid the company to use a mixed mode – direct and indirect exporting – according to the different characteristics of each market and traded volume. Both modes are the most used in micro, small and medium enterprises, being the direct exporting the most used in large enterprises.

**c) Exporting and importing consortiums:** a strategic way to give power and resources, generally to the micro and small enterprises, with the only objective of exporting and importing. They are constituted by the union of companies, usually from the same economic sector, that originates a third entity which will develop the process of researching, planning, negotiating, business development and bureaucratic respective proceedings. It will be obtained as benefits: increase of negotiation power with the suppliers, distributors, and consumer market exposition, besides the possibility of improving its process constantly. My research indicates that there are different types of consortiums, like sales and commercial promotion. In the sales type, the companies identify a unique brand, in detriment of the individual ones. In the promotion one, it is developed a group brand, but the sales can be done by each company. One of the major flower exporter of the world, Holambra's Agricultural Cooperative, obtains part of its results from a cooperative way and partnership practices with its distributors.

**d) Merger:** it is a strategy that generally involves the strategic partnership among companies of different market segments. In this case, the evaluation and identification of market opportunities – the monitoring of changes, the environmental transformation and the strategic relationship construction – are the major subjects to use this strategy successfully. As the businessmen that I interviewed said, from the moment that the company acquires a certain expertise in the national and international market and also has some resources, growth needs and economic evolution, it can opt for some of the following entry strategies and operations:

**a) International franchising:** it is a way to expand business of a company from the investment of others; in this case, the company must have a well positioned brand as well as a business portfolio, products and services that can be offered with a standardized plan that will become the franchise's core. This offers, as mentioned before, a possibility to expand the company, but with a possible profitability and financial return reduction.

**b) Joint-venture:** it is a contractual agreement which determines and normalizes rights and duties between the involved companies, generally from the same sector, but in different countries. It is a contemporary way to make business and it is based on the international law practices and also has become a very usual way to facilitate the foreign capital entry into countries that need this kind of resource without having the intention of burdening its internal market.

**c) Acquisition:** it is a strategy which establishes the purchase of a company's assets in another international market with the objective of franchising, in a more rapidly way, the company's entry by assets acquisition and

all the other implications, legal or commercial. In a certain way, the customers are one of the main benefits of the company.

**d) Direct investment:** it is the direct financial resource application into the host country. It can be applied to assets purchasing, as well as to the installation of a new plant. It provides more control over the operation, differently from the ways previously described for large enterprises. However, the company must be aware of the increasing risk in this kind of operation.

As a conclusion, the strategy modes selection (entry strategies and operations or marketing mix strategies) generally involves specific size, opportunities, technical criteria and specific needs or even the current situation of the company. Next, it will be analyzed the strategies and the practical illustration in the Brazilian market, having the professional experience in this area as a start point.

## **THE BRAZILIAN EXPERIENCE IN THE PRACTICE OF THE STRATEGY MODES IN THE INTERNATIONAL AND CHINESE MARKETS**

The Brazilian exporting is mainly represented by the large enterprises (94.2%), followed by the medium (4.5%), micro and small ones (1.2%) and individuals (0.1%), according to the Ministério do Desenvolvimento, Indústria e Comércio [II].

The large enterprises represent, related to the amount of operation, about 23.9%, while the medium enterprises represent 25.2% and the micro and small ones, 48.3%, this means that there is a spread of small exportations by the micro, small and medium enterprises and there is a big concentration distributed among the large enterprises of relevant commercial operations. Brazil export around 44% of manufactured goods, 13.4% of semi-manufactured goods and 40.5% of basic goods, besides other special goods which represent 2.1%. The state of São Paulo, Minas Gerais and Rio Grande do Sul represent slightly more than 50% of our exportations, with 27.76%, 12.76% and 9.96% respectively. The first two mentioned states represent a selective sample of intellectual capital, justifying the non-probabilistic sample selection, which will be presented next.

According to my interviewers, the initiative taken by Lula's government, since 2003, with the propose of increasing the commercial activities with China has as objective the diversification of host markets – nowadays quite concentrated in the United States and Europe –, besides the necessity of exploring the abrupt and fast growth of the Chinese market. Next, some characteristics about the cultural, political and legal aspects will be analyzed in a direct way.

In relation to China, the growing of its middle class and the gradual increase of purchasing power are relevant aspects which may propel different kinds of business, for example the fruit juice one. Although, the current per capita consumption is small, the economical transformation has brought significant consumption changes. Follow, I mentioned the most representative cases of entry strategies and operations that the Brazilian businessmen remembered.

Brazil is one of the biggest exporters of processed tobacco in the world and Souza Cruz SA Company has obtained a large participation with the tobacco sales to the Chinese market, competing against other suppliers as United States and Zimbabwe. This company is among the five biggest enterprise groups in Brazil and it is a subsidiary of British American Tobacco, which commercializes its products in 180 countries and has around 16% of the estimated worldwide five-trillion-cigarette market.

Pinhalense – an industry from Espírito Santo do Pinhal – is one of the biggest producers of coffee processing machinery in the world. It is located in São Paulo state countryside. It has dealt with the Chinese market the exporting of machinery and has developed a technical structure that included an after-sales service in order to train the future Chinese users.

Coocachaça (Cooperativa da Cachaça) and Canivetes Lan, both from Minas Gerais state, are developing business with the Chinese market. The first negotiates handmade cachaça, taking advantage of the fact that there is no similar product in China and the opportunity of competing against the distilled beverage made of rice, *shochu*, which is well esteemed in the area. The latter has done business involving the sales of handmade jack-knives and is getting prepared to the possibility of other business.

The exportation consortiums are another mode frequently divulged since the 1980s, and they are interesting modes of entry in the international scenario. However, in Brazil, its use is not common because of several factors, generally related to the entrepreneurs' needs – owners of different businesses generally from the same sector – of having hegemony in the management decisions and similar objectives. In Brazil, there are different experiences involving craftsmanship, clothing, and fruit, as papaya and grape, among others to Europe. (Kuazaqui, 2007)

To the three previous described modes, the events and trade fairs promoted by Apex [I], Brazilian Trade and Investment Promotion Agency, may establish an initial contact between importers and exporters. After that, new relationship and business must be established as well as the contact with new technologies and knowledge, which, if not directly transformed into international operations, may boost the processes and work ways in the national market.

The international partnership operations (mergers) are constituted in the exploration of market opportunities and in the relationship construction. They are not very frequent, but involve a certain level of intellectual capital and experience. One of the first examples is the partnership between the North-American Company Hewlett-Packard (HP) and Spal Indústria Brasileira de Bebidas S/A (beverage company) with the objective of developing better technology to monitor the beverage market in Brazil.

The international area of Petrobrás (Petróleo Brasileiro S/A) signed, in 2004, partnerships with some Chinese government companies in order to perform operational agreements in integrated activities in the oil sector, like refining, duct construction and exploration, and products from the oil resources in China and in other regions of the world.

The most used mode in relation to the Chinese mode, joint-venture, as observed before, was the adopted option by a Brazilian company of automotive body, Marcopolo, that established a joint-venture with the Chinese IVECO-CBC, obtaining scale-enhancing and insertion in the Chinese market.

At first, Embraco, a refrigerator compressor manufacturer, did a joint-venture with a Chinese company, creating Embraco Snowflake. After this, it was made several investments and a large part of the production was gradually transferred to China, and it could give the Brazilian company more competitiveness. Another example of direct investment is Companhia Vale do Rio Doce, because of a concluded business in China involving the construction of a plant with the propose of pelletizing iron ore. The operation will be done along with Zhunhai Yueyufeng Iron and Steel (owner of 40% of the business), Pionner Iron and Steel Group (35%) and Companhia Vale do Rio Doce (25%).

Due to the characteristics of entry strategies and operations, they are generally executed by large enterprises which already have structure and operational control. In this way, companies like Sony, Panasonic, Nike and Siemens and other large corporations could keep their brand in a great position in the market, even having their products made in China, taking advantage of industrial structure and characteristics which make the production process more interesting. A part of the foreign investors do not necessarily want an investment return in short or medium-term, but the institutional strengthening of the investment in face of the international community.

There is a great business potential between Brazil and China involving the international and foreign trade, propelled by the Brazilian government strategy of acting in different markets, like the Chinese one.

# **THE CHINESE EXPERIENCE IN THE USE OF STRATEGIC MODES WITH THE INTERNATIONAL BRAZILIAN MARKET**

China has registered expressive growth, considering the worldwide crisis that happened in 2009. In February 2010, the country registered a trade surplus of US\$ 7.61 billion, a larger amount than the one registered in February 2009 (US\$ 4.84 billion). Part of this recovery is due to Yuan cambial control policy, in which the government keeps the currency devalued, what encourages the companies to export more. (Apex, 2010). Although Cavusgil, Knight and Riesenbergl (2010) depict a series of considerations such as cost of doing business, country risk, competitive landscape and protectionist barriers, China is a major shopping destinations, both for its power consumption by internal or competitive advantage of low production costs.

In 2009, Brazilian Balance of Trade registered the figure of US\$ 281 billion in its flow, constituting US\$ 153.0 of exporting and US\$ 127.6 billion of importing. Of this amount, China was involved in US\$ 15.9 billion, fact that placed it as the second biggest Brazilian supplier and the United States were the first one. In Brazil, 16,853 companies imported Chinese products, most of them manufactured and semi-manufactured products, as examples, parts of computers (US\$ 767 million), integrated electronic circuits (US\$ 648 million) and electrical engines, generator and transformers (US\$ 479 million) according to Ministério do Desenvolvimento, Indústria e Comércio.

The Brazilian government has demonstrated concerns with the continuous growth of the Chinese participation in Brazil's importations. One of the most recent demonstration occurred in the year, 2010, which resulted in the surcharge over the Chinese footwear which enters into the Brazilian market with much lower prices than the national similar products, endangering the Brazilian footwear industry. Besides this surplus, there is a monitoring of the Chinese products origin.

According to brazilian businessmen and professionals who have been involved in operations with the Chinese market that I interviewed, one of the reasons of the Chinese interest in deepening their relationship with Brazil, besides the evident trading relationship, is that this country is categorized as a building block, i.e., it is the natural entry door to the Latin-American market. This situation can also be confirmed by the capital entry of other markets, the European, for example.

According to Bacoccina (2004), the Chinese invested around US\$ 400 million in the world annually during the 1980s. During the 1990s this annual average turned up to US\$ 2.3 billion, and nowadays it is about US\$ 35 billion. This strategy in relation to a direct investment in other nations is part of an expansion and growing strategy provided by a large amount of foreign resources internalized in the last two decades, besides the surplus in its balance of trade.

One of the sectors of China interest in Brazil is the mineral one. The country is getting through a transition phase in its economic mode, from an emergent to an industrialized economy. In this way, China empowers itself in the intermediary sector and can acquire raw material from Brazil, once the mining sector has competitive costs like the Chinese one. In this sense, China can enlarge its suppliers, increasing the productive and values chain with the enlargement of competitors to the raw material supplying. The Chinese strategy goes together with Lula's government strategy, which is gradually reducing the industrialization in the country. Besides this, the exporting policy is concentrating itself in reducing the manufactured products exportation to the USA and increasing commodities exportation to the Chinese market.

It is estimated a capital entry of US\$ 12 billion into Brazil. This amount is classified as direct investment, although part of that resource may be reflected in the debt conversion and in the capital increase of the companies already established in Brazil, emphasizing the Direct Foreign Investment (DFI). Another possibility is the capital entry to develop part of our infrastructure (roads, ports and airports).

Therefore, China has been using different strategies in order to enlarge its expansion and balance its capital, receiving investments mainly by the means of joint-ventures and investing part of its economical resources in countries which can guarantee its growing sustainability and economical mode.

## CONCLUSIONS

China has become, in the last past years, the main Asian partner of Brazil, surpassing Japan, for example. As for the Chinese market, the professionals that I interviewed point out some insights for a Brazilian company to be able to develop its activities in this market:

01. The construction, maintenance and specially the directed orientation to long-term relationships are important factors to do business with China. In this way, strategic contacts in Brazil and China are important keys and public relations to the foreign companies;
02. The company must adapt its capacity and production resources, besides the technology concerned to the Chinese market, as well as its subsequent planned production to the purchaser market, establishing criteria and quality control;
03. The company must create a financial engineering in order to adapt its resources and cash flow to the Chinese investment, which has, mainly, as a return a long-term orientation;
04. To manage the whole process of creation, development and maintenance of the business and to have a flexible and articulated capacity in order to adapt to the significant cultural, historical and behavioral differences between the countries.

In a certain way, the size shows the company's capacity of attending to the international and national markets and its respective business potential. It also shows the resources – concerned to the financial, intellectual or workforce sectors – needed to make the internationalization programs operational. Therefore, the micro, small and medium enterprises choose basic entry strategies and operations, which may be direct or indirect exporting; it doesn't mean that they must necessarily be linked to the modes. The creative and entrepreneurial capacity may enable the use of hybrid modes also on entry modes and operations like the strategies modes involving marketing mix.

So, when trying to develop the fruit market, specially the avocado one, Brazil started to export the fruit to the North American market with a sort of manual in English teaching how to consume this product raw, as the fruit itself or in a salad for example. Small Brazilian enterprises attend individually or by exporting consortiums to certain foreign markets, such as products and accessories to North American theme parks.

A large part of business developed with China reflects a long-term determination. Having the Brazilian foreign trade as the subject, micro and small enterprises must develop direct and indirect exporting programs in a planned way, in order to obtain a sustainable growth and the future use of other internationalization modes, according to the operations and expertise growth in business.

Primordial to companies of this size is to identify their limitations and create a distinguished and exclusive chain of standards and stand out in different markets. To do so, the identification of a niche market is relevant for a company to obtain focus and, consequently, the best use of resources and results. As the necessary average time to begin the concretization of a business with Chinese companies is around 10 years, the operations may evolve naturally with the own company's sustainable growth.

To invest in the Chinese market means to establish long-term relationships and commitment which will bring significant changes and transformations to the company profile. Therefore, the internationalization, which uses any of the entry strategies and operations previously described, will result in contributions which may be operational, tactical and strategic to the intellectual capital and, at the same time, to the organizational structure. The dissemination of the exporting intelligence, defended by Cadogan Diamantopoulos and Suguaw (2002), or

even of the intelligence related to internationalization, becomes a differential and, specially, a competitive advantage.

According to data, the Chinese economy is in a growing moment, but it will have stabilization in the future, inverting the process and the logic related to the foreign and international trade. If nowadays Brazil competes with different economies in order to sell to China, in a few years, it will have a strong competitor, mainly in the commercialization of semi-manufactured and manufactured products. The learning in this situational scenario can be very relevant to Brazil in the next years, and to understand this future scenario, in a contextualized way, is maybe one of the biggest challenges to the Brazilian entrepreneurs. To the true, the case studies listed in article highlight the contemporary importance of the effects of globalization, as well as those directly affected sectors such as logistics and distribution. As Dicken (2007) the circulation processes that connect one geographical point to another is absolutely essential and indispensable for any economy to global developments.

# ENJOYMENT OF WORK: A POSITIVE DIMENSION OF WORKAHOLISM

**Dong-Myong Lee and Jae-Wook Um**  
**Korea Aerospace University, Korea**

## ABSTRACT

*This study examines the mediating effect of workaholism, which is composed of work involvement, inner drive to work, and enjoyment of work, in the relationship between occupational cyee's mental health. Data were collected from 742 employees in white-collar job such as clerical workers, nurses, and customer recipients. From the hierarchical regression analysis and Sobel test, this research presented that enjoyment of work, one dimension of workaholism, has a positive mediating effect in the relationship of occupational commitment and employee's mental health, but work involvement, another dimension of workaholism, has a negative one. From the above results, this research testifies the value of identity-commitment approach to workaholism.*

## INTRODUCTION

These days, owing to development of information and communication technology, the boundaries of white-collar jobs between "in" and "out" companies have blurred (Cooper, 1998; Fletcher and Bailyn, 1996; Sullivan, 1999). In addition, organizational restructuring such as M&A imposes too many roles and tasks on employees. So the issue of the labor hours of white-collar workers, workaholism in this study, has etched different from those of blue-collar employees(Fassel, 1990; Robinson, 1998; Smith and Seymour, 2004). This study will focus on the effect of workaholism on employee's health.

Workaholism has been studied in the aspect of negative effect on health such as in Oates(1971)' work. In other words, workaholism means long working hours, and this cause negative effect on employee's health. For examples, workaholics had problems in conjugal relations (Robinson, Flowers, and Carroll, 2001) and work-family conflict (Bonebright et al., 2000). But in some cases, workaholism has positive effect on employees. For example "work enthusiasts" who are high in work involvement and enjoyment of work, and low in inner drive to work (Spence and Robbins, 1992) may experience high positive emotionality, low negative emotionality, and low burnout (Burke and Matthiesen, 2004).

This study will focus on the positive effect of "a certain" workaholism, which work enthusiasts have, on employee's health, especially mental one. The most important factor in workaholism is that employees decide to work hard autonomously (Dembe, 2009). In other words, the problems of workaholism come from compulsory work without self acceptance(Chamberlin and Zhang, 2009). So, this study will examine occupation commitment as the antecedent of work enthusiasts. In other words, this study will examine the positive mediating effect of workaholism between occupational commitment and employee's mental health.

## LITERATURE REVIEW

### **Workaholism and Employees's Mental Health**

Workaholism has many effects on employees. Workaholism may be connected to high wage and promotion (Ng et al., 2005). But workaholism has been studied in the aspect of negative effect on employee's health such as in Oates(1971)' work. Workaholism means long working hours, and this cause negative effect on employee's health (Dembe, 2009). For examples, workaholics had problems in conjugal relations (Robinson, Flowers, and Carroll, 2001) and work-family balance (Bonebright et al., 2000).

But in some cases, workaholism has positive effect on employees. For example "work enthusiasts" who are high in work involvement and enjoyment of work, and low in inner drive to work (Spence and Robbins, 1992) may experience high positive emotionality, low negative emotionality, and low burnout (Burke and Matthiesen, 2004).

The above studies have revealed that workaholism consists of multiple dimensions and it has positive and negative effects. In other words, workaholics are located continuously between work enthusiasts who are high in work involvement and enjoyment of work, and low in inner drive to work, and work addicts who are high in work involvement and inner drive to work, and low in enjoyment of work (Fry and Cohen, 2009; Fry, Matherly, and Vitucci, 2006). Employee's health can be different from each other, according to the location in the line of various workaholism

Fry et al. (2006) defined two types of workaholics, nonenthusiastic workaholics who are high in work involvement and inner drive to work, and low in enjoyment of work, and enthusiastic workaholics who high in work involvement and enjoyment of work, and low in inner drive to work. Similar to Fry et al. (2006)'s, Vallerand et al.(2003) and Burke and Fiksenbaum (2009) defined harmonious passion(HP) which has many similarity in characteristics of enthusiastic workaholics, and obsessive passion or addiction(OP) similar to that of nonenthusiastic workaholics. Behaviors or their consequences of enthusiastic workaholics who have harmonious passion are different from those of nonenthusiastic workaholics who have obsessive passion or addiction.

Nonenthusiastic workaholics are motivated by external rewards. They deny their values. They represent features such as order, perfectionism, and interpersonal control. They also have emotional motivation to get high wages at the cost of low activities with family and in non-work areas (Bonebright et al., 2000). They don't get enjoyment from work, do try to control all the process and results on work, and do display tendencies such as hostile human relations, refusal to compromise, and low empowerment (Bonebright et al., 2000; Porter, 1996; Scott et al. 1997). With the above characteristics, nonenthusiastic workaholics might not be good at mental health.

Enthusiastic workaholics are defined such employees as feel accomplishment and enjoyment from work. They do work according to their internal motive, which increases their values and organizational performance. They do work long hours because they like working (Canatrow, 1979; Machlowitz, 1980). They pursue involvement, accomplishment, and creativity through work. They are also spurred on by the competition and pursue their success as nonenthusiastic workaholics do. But they are different from nonenthusiastic workaholics in so much that long work hours are based on their own volition. They continuously try to think and do the work beyond organizational demands. But they do their jobs pleasantly, creatively, and satisfactorily. So they are high in organizational commitment and are inclined to work for organizations (Bonebright et al., 2000; Kiechel, 1989; Scott et al., 1997). They know the ways to escape from work for a moment without hindering organizational performance. They hardly get angry, respond to environment effectively, and are creative (Scott et al., 1997). In conclusion, enthusiastic workaholics might have good mental health.

## **Occupational Commitment as a Determinant of Enthusiastic Workaholics**

This study will present the concept, occupational commitment, as a determinant of enthusiastic workaholism or harmonious passion.

Commitment means employee's attitude to be connected to a certain object (Meyer, Becker, and Van Dick, 2006). Individuals can identify with director, teams, and organizations (Becker, Billings, Eveleth, and Gilbert, 1996; Siders, George, and Dharwadkar, 2001). And they also feel connected to jobs, objectives, and programs (Klein, Wesson, Hollenbeck, Wright, and DeShon, 2001; Herscovitch and Meyer, 2002; Morrow, 1993). Occupational commitment is conceptualized here as a affective link between a person and his or her occupation (Lee, Carswell, and Allen, 2000).

A person with high occupational commitment will more strongly identify with that occupation (Lee, Carswell, and Allen, 2000). So there will be possibility that persons with high occupational commitment will try to do work long hours, but they will experience more positive feelings about that.

According to previous literature review, this study derived the following predictions; High occupational commitment has a positive effect on employee's mental health, mediated by enthusiastic workaholism. In more details, this study formulates three hypotheses such as follows;

Hypothesis 1 : High occupational commitment has a negative effect on employee's mental health, mediated by work involvement.

Hypothesis 2 : High occupational commitment has a negative effect on employee's mental health, mediated by inner drive to work.

Hypothesis 3 : High occupational commitment has a positive effect on employee's mental health, mediated by work enjoyment.

## METHODOLOGY

### Participants and Procedure

The questionnaires in this study were completed by employees who were working for service industry such as hotels, airlines, hospitals, and public agencies. The data were collected during the period from August of 2008 to December of 2008. Respondents were requested to fill out the questionnaire, and to post it in a special box at their workplace. The confidentiality of the answers was emphasized before employees began to answer the questionnaire.

A total of 742 service employees returned the questionnaire (response rate of 74.2%). Of these, 463 (62.4%) belonged to recipients who interacted with clients and 279 (37.6%) belonged to office workers, of whom public agents were 172 (23.2%). The sample included females 486 (65.5%) and males 256 (34.5%). It also contained single persons 351 (47.3%) and married ones 391 (52.7%), and their mean age was 33.9 years. In working shift type, the sample included "no" 429 (57.8%) and "yes" 351 (42.2%).

### Measurement

The measurement of occupational commitment in this study was designed with reference to Blau (1985) and Mowday et al.(1979). The scale of occupational commitment consisted of nine items such as "If I could, I would go into a different occupation (reverse)", of which 8 were based on Blau (1985)'s and 1 on Mowday et al. (1979)'s. These items were measured by a 5-point Likert scale with the following anchors: never (1), rarely (2), sometimes (3), often (4), and always (5). The internal reliability was 0.733.

The three dimensions of workaholism consisted of 10 items referred to Buelens and Poelmans(2004)', which are developed from Spence and Robbins(1992)'s. Of 10, 4 items belong to enjoyment of work, such as "I am involved in important decisions", 3 belong to work involvement, such as "I often do overtime", and 3 belong to inner drive to work, such as "I get angry when things do not go the way I want". These items were measured by a 5-point Likert scale and the internal reliabilities were 0.863, 0.892, and 0.825. Mental health was measured by 14 items based on Short Form - 36. Control variables in this study were gender, marriage, age, job family, working shift type. Gender, marriage, job family, and working shift type were operationalized as dummy variables such as follows: men 1; married 1; working shift 1.

## RESULTS

### The Effect of Occupational Commitment on the Three Dimensions of Workaholism

The first requisite is that occupational commitment should have a significant effect on the three dimensions of workaholism in order that they may function as mediators. For this, we conducted two hierarchical regressions where personal and organizational characteristics entered in the first step and occupational commitment entered in the second step. As shown in Table 1, occupational commitment additionally explained significant variance in work involvement( $\Delta R^2 = 0.032$ ,  $\beta = 0.186$ ;  $p < 0.01$ ), inner drive to work( $\Delta R^2 = 0.007$ ,  $\beta = -0.088$ ;  $p < 0.05$ ), and enjoyment of work( $\Delta R^2 = 0.325$ ,  $\beta = 0.529$ ;  $p < 0.01$ ) respectively.

Those results mean that occupational commitment has a positive effect on work involvement and enjoyment of work, but negative on inner drive to work. They also mean that the first prerequisite in this study is satisfied. Therefore I can progress to the next stage of the analysis.

**Table 1: Regressions of occupational commitment predicting three dimensions of workaholism**

Variables/ Statistics	Workaholism1 : Work involvement		Workaholism2 : Inner drive to work		Workaholism3 : Work enjoyment	
	Model 1	Model 2	Model 1	Model 2	Model 1	Model 2

b) Standardized coefficient is shown except statistics and B that is non-standardized coefficient

## The Effect of Three Dimensions of Workaholism on Mental Health

The second prerequisite is that the effects of three dimensions of workaholism on mental health should be significant. I conducted hierarchical regressions that were connected with the next Sobel test where I would calculate the significance of mediation effect.

I examined whether the three dimensions of workaholism have direct effects on mental health significantly, while controlling the effects of occupational commitment, gender, age, marriage, job family, shift type. As shown in Table 2, the three dimensions of workaholism additionally explained significant variance in mental health ( $\Delta R^2 = 0.039$ ;  $p < 0.01$ ) beyond those explained by occupational commitment (see Model 2 and Model 3). It was certain that all three dimensions of workaholism had significant effects on mental health because the values of  $\beta$  (work involvement = -0.130; inner drive to work = -0.105), and enjoyment of work = 0.179) satisfied the generally accepted significance level ( $p < 0.05$ ).

This analysis means that there is a possibility that through workaholism occupational commitment has a positive or negative effect on employees' mental health. In other words, occupational commitment might increase mental health, mediated by enjoyment of work but decrease it, mediated by work involvement and inner drive to work.

**Table 2 : Regressions of workaholism predicting mental health**

Variables/ Statistics	Model 1	Model 2	Model 3
Gender	0.147**	0.141**	0.116**
Marriage	-0.084 <sup>+</sup>	-0.094*	-0.076 <sup>+</sup>
Age	0.118*	0.084 <sup>+</sup>	0.080 <sup>+</sup>
Office workers	0.063	0.000	0.036

△ R	0.095	0.103	0.039
R <sup>2</sup>	0.095	0.198	0.236
Adjusted R <sup>2</sup>	0.086	0.189	0.225

a) N=742. +<0.10, \* p<.05, \*\* p<.01.

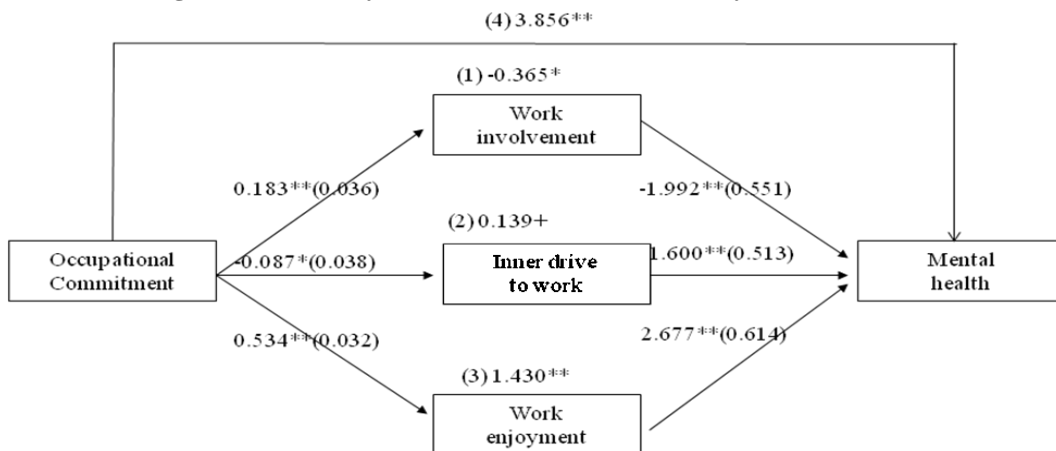

b) Standardized coefficient is shown except statistics and B that is non-standardized coefficient

## Sobel Test and Mediation Results

To determine the significance of workaholism in the relationship between occupational commitment and mental health, I conducted the Sobel test (Baron and Kenny, 1986; Preacher, Rucker, and Hayes, 2007). The Sobel test presents the level of significance of the indirect effect of the independent variable on the dependent variable through a mediator. For the Sobel test, I set the mediation model, such as Figure 1, which is composed of occupational commitment as an independent variable, three dimensions of workaholism as mediators, and mental health as a dependent variable.

Figure 1 presents the summary of the mediation results in this study. Hypothesis 1 and 3 were supported because work involvement and enjoyment of had significant degrees of indirect effect ( $p < 0.05$ ) respectively. But hypothesis 2 was not supported because the degree of indirect effect of inner drive to work was beyond tolerant level ( $p > 0.05$ ).

**Figure 1: Summary of mediation result in this study**

a) (1), (2), and (3) are mediation effects of three dimensions of workaholism

b) Unstandardized coefficients are shown. The values in ( ) are standard errors

c) + $p < 0.10$ , \*  $p < 0.05$ , \*\*  $p < 0.01$ .

d) The degrees of significance of indirect effect result from Sobel test.  
Statistic in Sobel test is the value of  $z$ .  $z = a*b / \sqrt{b^2*s_a^2 + a^2*s_b^2}$ .

## DISCUSSIONS

This study examines the mediating effect of workaholism, which is composed of work involvement, inner drive to work, and enjoyment of work, in the relationship between occupational commitment and employee's mental health. From the hierarchical regression analysis and Sobel test, this research presented such as follows.

First, work involvement, one dimension of workaholism, has a negative mediating effect on the relationship of occupational commitment and employee's health, physical and mental. Second, enjoyment of work, another dimension of workaholism, has a positive mediating effect on the relationship of occupational commitment and employee's mental health. Third, inner drive to work, the last dimension of workaholism, has no mediating effect on the relationship of occupational commitment and employee's health, physical and mental.

From the above results, this research presents the value of identity-commitment approach to workaholism (Ng and Felman, 2008). Workaholics have possibility that they might not be good in health. But this paper represents that occupational commitment provides the greatest motivation for employees to spend more time and energy on their work, but if employees have pleasure in doing work, in other words they are high in work enjoyment, through they work for long hours, there is high possibility that they are good in mental health.

# **INSTITUTIONAL MECHANISM OF FUNCTIONING OF THE INNOVATION CITY SKOLKOVO**

**Tatiana Leonova**  
**State University of Management, Russia**

## **ABSTRACT**

*The current status of the Russian economy, its role in the international division of labor and status of innovational potential leave much to be desired. Overcoming of these negative tendencies is possible only under activation and development of venture innovative activity, creation of new forms of innovative infrastructure. One of such projects is a project of innovation city Skolkovo, which has to take worthy position in the infrastructure of venture innovative activity development. Skolkovo could become the element of innovative system, which will facilitate creation of a new innovative community, new mechanisms and models of interaction among science, business and management for the production and circulation of innovation in Russia.*

## **INTRODUCTION**

Innovation Center Skolkovo is a combination of infrastructure of the innovation center's territory and mechanisms of interaction of persons involved in project implementation, including the use of this infrastructure. The complex will be located on the territory of the Novoivanovskoye and Odintsovo cities, nearby the Skolkovo country, in the eastern part of the Odintsovo district, Moscow region, 2 km west from Moscow to Skolkovskoye highway. The aim of this project is to create an enabling environment for the concentration of intellectual capital capable to generate innovation.

Territory of the Centre (380 ha) is the land that is situated within the territory designated for the project realization according to procedure established by the President of the Russian Federation. The right of territory property belongs to a management company. There are plans to add compartments for research, postgraduate and doctoral studies, laboratories, housing, offices, kindergartens, schools and hospitals. According to preliminary calculations 25-30 thousand people will live in the new city.

## **ORGANIZATIONAL STRUCTURE AND LEGAL SUPPORT**

The implementation of research and development in the Innovation Centre Skolkovo will be held according to following orientations:

1. energy efficiency and conservation, including issues of development of innovative energy technologies;
2. nuclear technology;
3. space technology, especially in the field of telecommunications and navigation systems (including the establishment of an appropriate infrastructure on the ground);
4. medical technology: equipment, drugs;
5. strategic computer technology and software.

According to the law, the main legal entity which is responsible for creating and maintaining conditions of innovation city is the operating company - a Russian legal entity, which is liable for realization of the project. This realization is established under the procedure of the President of the Russian Federation. Ownership of the land will be fixed solely by the management company. The law also provides a special procedure for interaction

between local authorities of the corresponding territory and the management company. In addition, for the purposes of state control in their respective fields, violation of the requirements used by the management company will have the same legal effect as a violation of similar Russian standards. In order to determine any special rules for interaction between persons who are on the territory of the centre, the responsibility of the management company includes approval of the documents containing such rules, as well as inclusion in all transactions concluded with entities carrying out activities on the territory of the centre, what is a necessary condition of their compliance with approved rules.

In Skolkovo has been established a Fund for project management. Its co-founders are several public and private organizations. These are the Russian Academy of Sciences, “Rosnano”, the Russian Venture Company, the Fund of promotion of small enterprises in scientific and technical sphere, land owner (i.e. the State through the Fund for Housing Development) and non-profit organization, which will include a number of universities. It is assumed that the staff of the Fund will consist of 50-70 people. There is created the Board of Trustees as well, which is led personally by the President of the Russian federation, Dmitry Medvedev. Viktor Vekselberg, who became the President of the Foundation, is also the co-chair of the Foundation, along with ex CEO of Intel, Craig Barrett. As part of the Fund there was established the Advisory Council for Science, which is headed from the Russian side by Nobel laureate in physics, academician Jaures Alferov, and internationally co-chaired by Nobel laureate Roger Kornberg - American biochemist and professor of medical school at Stanford University.

There are suggestions to create the specified elements of infrastructure in the innovation centre Skolkovo, what can provide the necessary conditions for the emergence of innovation and its implementation in modern industries. Educational institutions, institutes and other organizations will be constructed, which should be focused on fundamental research, as well as office buildings will be built and small businesses involved in the development of innovations, laboratory facilities will be constructed for those industries which require specific studies, tests. Expensive equipment will be provided in the sharing of innovative companies in the established centers of collective use. In the city will be located schools, kindergartens and hospitals, as well as restaurants, sports centers and other institutions. The city will be connected with Moscow by the Minskoye, Skolkovskoe and Borovskoye highways and rail lines of Smolensk and Kiev directions. Nearby is the Vnukovo airport.

Innovative company, established in the project area in Skolkovo, has the status of a management company in accordance with the requirements set forth in the draft of federal law for a period of ten years. The party of the project, who violates the requirements set forth in the draft of the federal law or established in accordance with the rules, will be deprived of its status. Party acquires a wide range of benefits, which include the fact that all the resident companies will be exempt from income taxes, property taxes, land taxes, transport taxes and VAT and social contributions will be calculated at a reduced rate - 14%. Participants will be eligible for duty-free import of equipment or grants for the reimbursement of duties as long as Customs Service of the Russian Federation is ready to provide both modes. Zero tax for companies will operate for ten years or until reaching of an annual revenue of 3 billion rubles. Attention will be paid to design and copyright protection, deals with patents. For these purposes there has been already signed a memorandum on direct cooperation with the Russian Patent, which will have its office in the Innovation City.

Adoption of the Federal Law “About the innovation center “Skolkovo” required changes in following acts of federal legislation:

1. Federal Law, 21 December 1994, № 69-FZ “About the fire protection”.
2. Federal Law, 21 November 1996, №129-FZ “About Accounting”.
3. The tax code of the Russian Federation.
4. Federal Law, 30 March 1999, №52-FZ “About sanitary-and-epidemiologic welfare of the population”
5. Federal Law, 6 October 1999, №184-FZ “About the general principles of the organization of legislative (representative) and executive powers of the government of subjects of the Russian Federation”.
6. Federal Law, 15 December 2001, №167-FZ “About obligatory pension insurance in the Russian Federation”.
7. Federal Law, 25 July 2002, №115-FZ “About a legal status of foreign citizens in the Russian Federation”.
8. Federal Law, 27 December 2002, №184-FZ “About technical regulation”.
9. Federal Law, 6 October 2003, №131-FZ “About general principles of local self-government in the Russian Federation”.

10. Federal Law, 29 December 2004, №191-FZ “On implementation of the Development Code for City construction in the Russian Federation”.
11. Federal Law, 13 March 2006, №38-FZ “About advertising”
12. Federal Law, 24 July 2009, №212-FZ “On the insurance contributions to the Pension Fund of Russian Federation, the Social Insurance Fund of the Russian Federation, the Federal Health Insurance Fund and territorial funds of obligatory medical insurance”.

Particularly we would like to pay attention to the law amendment “About a legal status of foreign citizens in the Russian Federation”, because it is planned to attract foreign citizens to Innovation City Skolkovo. Thus according to amendments, it is necessary to consider workers with an annual size of a salary exceeding 2 million rubles as highly qualified foreign experts. Such experts will be relieved of fingerprinting procedure, and also will not be photographed at statement on the account in FMS. Validity of work permits for these foreign citizens will not be only a year as for regular migrant workers, but three years with the right for an unlimited number of renewals.<sup>11</sup> It is proposed to amend the tax law, namely to reduce the tax rate on personal income for foreign experts from 30% (if he/she works in Russia for less than 183 days) to the usual 13%.

To invite qualified professionals to Russia it will be enough for employers to send a written request to the FMS. In addition, quotas on migrant workers will not consider qualified professionals. Also, the amendments provide that a foreign expert and his/her family will not have to go through the procedure of migration control in both the short (up to 30 days) moving in the subjects of Russia and departure from Russia for no more than 90 days.

The effectiveness of these measures is in doubt. Firstly, the classification itself of foreign specialists to upscale is not objective and rational when only wages factor is considered, because high wages do not guarantee that the employee is suitable for the activities in the Innovation Center Skolkovo. Also significant factor is the fact that high wages are usually available for experienced, qualified professionals. But the strategic thrust of the idea Skolkovo is primarily in innovation, which is inextricably linked with new ideas, new approaches, and innovative solutions. Therefore the goal of invitation of young foreign professionals to work in Skolkovo arises.

To involve young perspective experts it is necessary not only to soften the administrative barriers connected with their entrance to the country, but also to create for them favorable conditions in the innovative center. So that they wanted to remain there for living and working, at least, during a certain period of time. For this purpose it is necessary to develop a social infrastructure of a city, to create creative atmosphere where it would be comfortable to share the ideas, and what is the most important, to generate them. The problem is in a necessity of supply of hi-tech equipment in workplaces and it causes the necessity to create such high-quality equipment in Russia, and to establish relations with foreign importers.

As a whole, it is possible to allocate following factors which can attract foreign experts to work in Russia:

- High salary;
- Possibility to work in those directions which are not the priority in the homeland of scientists;
- Presence of the newest equipment;
- Comfortable conditions for residing of the expert and his/her family;
- Possibility of cooperation and exchange of experience with experts from other countries on the territory of Innovative Center Skolkovo;
- Granting of various privileges for staying and working in Russia.

Thus, there is a problem of attraction of foreign experts who can really bring the considerable contribution to development of innovative activity in Russia, and creation of conditions for their life and work in Innovative Center Skolkovo. The Federal Law as at 28 September 2010, №244-FZ “About the Innovation Centre Skolkovo” does not have a well-defined evaluation. The advantages of the Law are as follows:

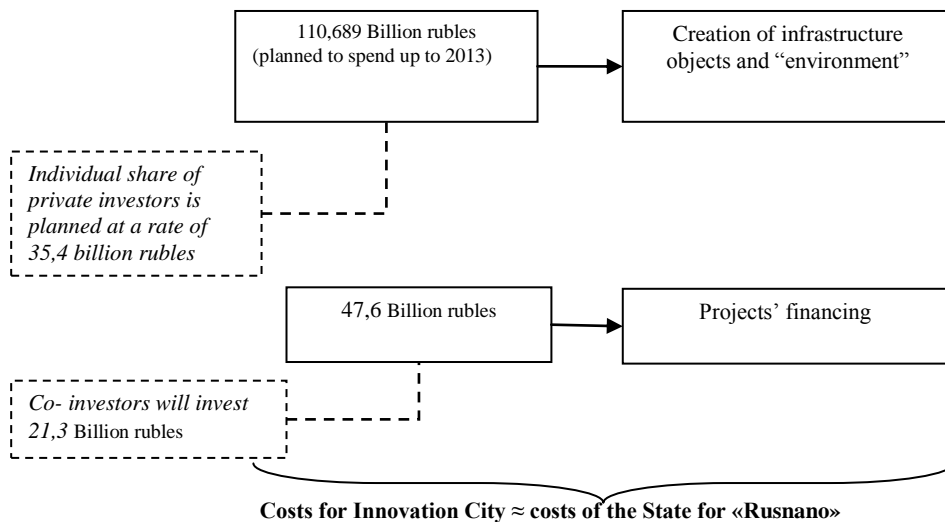

- Working out of the current law and its definitive acceptance has occurred in short terms;
- The law covers the big spectrum of subjects such as the rights and duties of the criminal code, affiliated companies, the state and municipality and participants of the project are clearly and accurately defined;
- For the participants of the project (both for residents and for non-residents) was developed the system of privileges;
- The law assumes presence of annual reports on activity of the Centre Skolkovo in the Internet.

The disadvantages of the Law could be defined as follows:

- The relations of scientific research with productions are poorly prescribed. According to the Law the privilege is meant only to the companies engaged in developing of new technologies, but those companies which carry out their introduction and deduce production on the market do not receive privileges. If favorable conditions for realization of scientific ideas are not created there will arise a situation when none Russian company or corporation could be able to buy and realize production of the innovation city Skolkovo. It will reduce to the fact that Russian innovations will be bought abroad and the basic rent will be taken by foreign firms;
- In the law there is no clause which describes «intellectual property of participants of the project». It is necessary to register accurately who will possess the results of intellectual activity of participants of the project, mechanisms of protection of the property rights, possibility of its use, both for developers and for investors, and the sum of penalties for illegal introduction in an operation of results of scientific activity on the territory of Skolkovo;
- It is necessary to consider a variant of labor relations of the employer and the worker which actually does not exist on a workplace by means of telecommunication. The current point will simplify mutual relations with foreign citizens and our compatriots who are abroad and with the persons, willing to take part in the project without residence change as well;
- In our opinion, to five priority directions of research activity, it is necessary to add one more direction which is not less important. It is development of technologies and the equipment, intended for reduction of negative influence of the person to environment;
- The necessity of accurate allocation of department which will check and supervise activity of innovative center Skolkovo about conformity of development's direction of the project to national priorities of Russia, to carry out financial control.

In spite of the fact that there is still not presented an exact project of the organization of business processes in Skolkovo, the approximate budget of the project is already ready (fig.1)

**Figure 1. The Scheme of financing of innovative center Skolkovo**

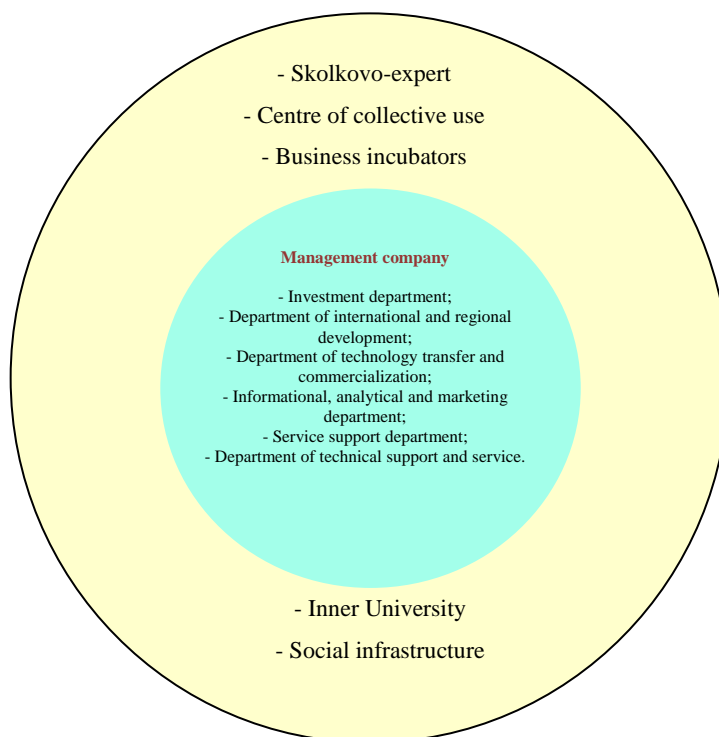

At the first stages project financing will be carried out at the expense of the budget. Under the government order, in the Fund of development of the Research and Commercialization of New Technologies Center is already allocated about 4 billion rubles. The law analysis also gives some representation about organizational structure of innovative center Skolkovo. The First level is occupied with founders of Innovation city Skolkovo, among them there are the Russian Academy of Sciences, Foreign trade and investment bank, Fund of assistance to development of small forms of the enterprises in scientific and technical sphere, Rosnano, the Russian venture company, Fund of assistance to housing construction development, and also supervising

bodies which concern the Ministry of Finance, the Ministry of Justice, Ministry of Economic development, Ministry of Sciences, Ministry of Commercial Trade and other ministries and departments. Thus for realization of the state powers and the state control on the territory of the center and concerning the persons who are on the territory of the center, there are created special divisions directly subordinated to federal enforcement authorities, realizing powers in spheres as follows:

- 1) internal affairs;
- 2) migrations;
- 3) tax control;
- 4) customs business;
- 5) preventions and suppressions of fires, as well as protection of territories and the population from emergency situations;
- 6) protection of the rights of consumers and welfare of the person;
- 7) intellectual property, patents and trade marks».

Thus it is not mentioned nowhere in official documents concerning Skolkovo, to which department or agency the management company will be accountable and its status is watered down enough – it is neither the state structure, nor the commercial enterprise (since there is no motive of benefit). The Law mentions that "the management company is developing the special forms to provide information to government bodies and local authorities, these forms are strict reporting forms and must be registered in the federal government's exercise of the functions of formulating and implementing of government policies and regulations in the sphere of registering non-profit organizations".

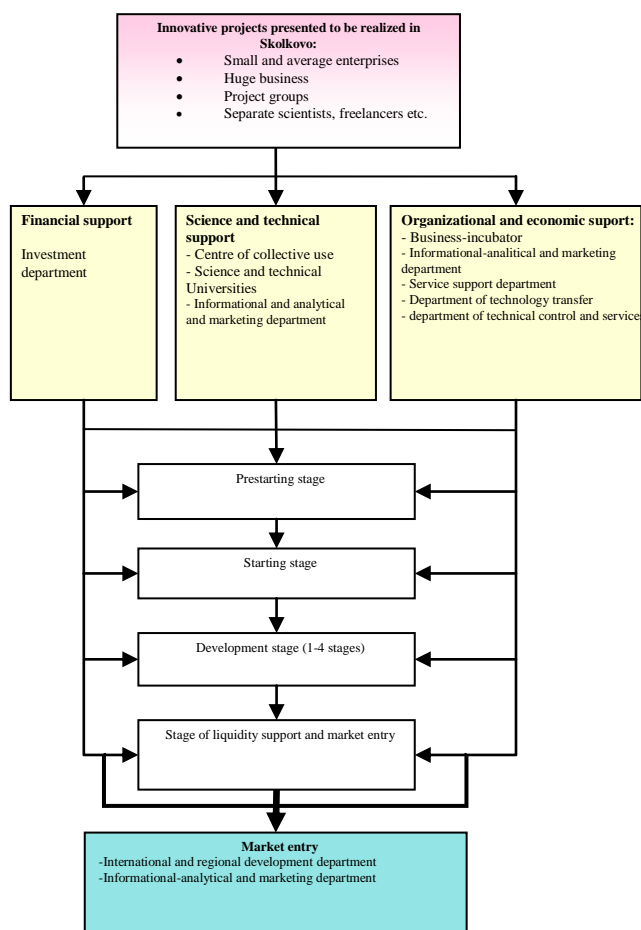

**Figure 2. An internal infrastructure of innovative center Skolkovo**

But the concrete structures which control the distribution and development budget in Skolkovo for example are not specified. In this case, it is needed to allocate such structures separately, because, such a huge project in economic terms, as Skolkovo, which even has a separate federal law requires such refinements. At the second level there are the Advisory Council for Science, headed by J. Alferov, the Development Fund for Innovation Centre Skolkovo, which is headed by V. Vekselberg and Board of Trustees, chaired by Russian President Dmitry Medvedev.

The third level is occupied with a management company which will be responsible for the functions on project realization in an order, established by the president of the Russian Federation. The management company has the right to create affiliated companies and to transfer them a part of the functions on project realization.

**Figure 3. Realization of innovative projects in Skolkovo**

The management company has the right to establish additional management company has the proprietorship to the ground areas where the innovative center is constructed, and also the premises which are a part of an infrastructure of the center. Financial maintenance of activity of the center is carried out at the expense of own means of a management company, its subsidiaries, means of the federal budget, and at the expense of other sources according to the legislation of the Russian Federation.

The management company forms «project rules». The activity of its participants should correspond to this rules, and gives them a mode in which, in its opinion, researches and workers should be realized effectively. De facto powers of a management company are close to the similar rights of the proprietor in the territory, thus the state powers there are limited (special divisions of state bodies from the Ministry of Internal Affairs to Rospatent).

At the fourth level there are residents of Skolkovo to whom concern small and average business, the large Russian and foreign companies, the design groups, separate scientists, etc.

Innovative center Skolkovo inherently will be the intermediary structure, called to accelerate interaction and information interchange processes between groups of researchers and developers and the companies showing demand for technological developments. It is possible to allocate 3 primary goals of the innovative city Skolkovo:

1. Assistance to independent researchers and design groups in realization of the innovative products;
2. The help to high schools and research groups in commercialization of the acquired scientific knowledge;
3. Solving of technological problems of manufacturers by recruiting (or import) of technological decisions from the free market of innovations.

According to listed above problems facing innovative center Skolkovo, it is possible to present its internal infrastructure as follows (fig. 2):

- The Investment department is engaged in formation of a favorable investment climate in a city for attraction of internal investments through establishment of steady contacts with investors, agents of real estate, logistics services, i.e. through timely informing of the investor on existing conditions for placing of its means in the innovative center. Makes examination of innovative projects.
- The Department of the international and regional development provides interaction of the companies developing in a city with regions and with an external world. It namely establishes communications with the domestic and foreign companies which are engaged in similar lines of activity, carries out the analysis of the domestic and foreign market in search of a free market niche, contacts to the regional and foreign centers of collective using.
- The Department of technologies and commercialization transfer provides commercialization of results of the scientific and technical activity created in Skolkovo, in the first place through creation of the small hi-tech enterprises and the conclusion of license agreements.
- Information-analytical and marketing department is engaged in monitoring of five priority lines of activity of companies-residents Skolkovo, i.e. providing of access to statistical base, state-of-the-art reviews, as well as marketing researches in the innovative market, analyzes behavior and preference of consumers and competitors.
- The Department of service support renders legal services, consulting services in management, protection of objects and premises, office services, gives premises, prepares and holds presentations, etc. Rent services - office premises, laboratories the equipment, warehouses, ranges etc.
- The Checking department and service is responsible for observance of all developed norms, specifications and rules, and also is engaged in repair work in territory of the innovative center.
- The Skolkovo-expert-association, is a network of the companies which started in Skolkovo and continue its activity out of the innovative center. It was created to support new projects. Meetings of the given association should be held regularly, there should be discussed problem aspects of activity of the companies functioning in Skolkovo at present.
- The Social infrastructure is a set of branches and the enterprises functionally providing normal life activity of the population. It will include schools, kindergartens, hospitals, libraries, restaurants, and also communication media and energy, heating, water supply, etc.
- The Center of collective using provides services in use of the unique equipment and instrument base, program complexes to the residents of Skolkovo.
- Business Incubators give Business in rent on a preferential basis of a premise, and render consulting, accounting and legal services.
- Internal university is nonexistent, but the important part of the infrastructure which is necessary for successful creation and introduction of technologies. By consideration of foreign experience of innovation cities creation, it is noticeable that all of them were created on the basis of operating university. In Russia it is not presented, but eventually, in process of functioning and development of "Skolkovo" there will be created preconditions for creation of university which becomes a key link in innovative development of Russia.

## **THE MASHANISM OF REALIZATION OF INNOVATIVE PROJECTS IN INNOVATION CITY SKOLKOVO**

Based on the above developed infrastructure of Skolkovo, we propose a mechanism of projects realization in the Innovation Centre Skolkovo (Fig. 3). For the innovative project at the Innovation Center Skolkovo and for obtaining of financial, scientific, technical, organizational and economic support it is necessary to pass the examination of projects. With the positive decision of the expert commission investment department of the management company will allocate funding for the project. Also project participants receive a technical and scientific support, which consists of the ability to use equipment at the Center for collective use, use of

information and analytical materials in the information-analytical and marketing department, cooperation with research universities in the infrastructure of Skolkovo.

Depending on the stage when the innovative project was approved by the expert commission, it consistently goes through the stages of its implementation that would yield an innovative product or service to the market. If the project occurs in the innovation city Skolkovo initially, then it goes through following phases: prelaunch, launch, development and exit, or providence of liquidity. At the time of the project realization, all kinds of support are available for the residents of Skolkovo, what is provided by subdivisions of Skolkovo.

It is supposed that the infrastructure of Skolkovo will start operating only in three years, and actually it could be stretched to the longer period of time. For those companies which will be working within three years on the basis of Kurchatovsky institute or in other places, it will be probably not favorable to change a site as long as process of their manufacture will be already adjusted in three years, they can face the expenses which won't be compensated. At the same time, if they don't move to the territory of Skolkovo during certain term they can lose their privileges as participants of Skolkovo. Therefore it is necessary to develop measures on transfer of the companies in three-four years in Skolkovo.

Also it is necessary to specify the concept of "resident Skolkovo" - geographical expansion of the given concept will allow the companies, which are not situated on the territory of Skolkovo, but carrying out projects, which are suitable for characteristic approaching an innovative city and five priority directions, to get the advantages given by the status of the resident, without transferring the manufactures in Skolkovo.

## IMPLEMENTATION

Acceleration of process of development of the definitive project in infrastructure and its realization taking into account recommendations presented in this article, and granting bigger volume of the information on a social infrastructure and an expenditure of the budgetary will promote faster and successful realization of the project of Innovation city Skolkovo.

# **THE EFFECTIVENESS OF APPLYING SOCIAL NETWORKING (FACEBOOK/TWITTER) IN A TERTIARY INSTITUTION AS A METHOD OF TEACHING & LEARNING WITH TECHNOLOGY - THE CASE OF TSHWANE UNIVERSITY OF TECHNOLOGY (FACULTY: ECONOMICS & FINANCE)**

**Sindi Mathonsi**  
**Tshwane University of Technology, South Africa**

## **ABSTRACT**

*The aim is to assess whether social networks are an appropriate tool to be utilised as one of the teaching methods as the world is moving towards applying technology in media, business and education. A literature review will be conducted to determine to what stage previous studies have gathered information in terms of teaching and learning with technology. A stratified sampling will identify the characteristics of the effectiveness of social networking in a tertiary institution. A survey consisting of questionnaires will be conducted across the Faculty of Economics and Finance students and lecturers which comprises of five (5) departments. Using the gathered information will positively assist institutions in applying social networks for academic purposes in future.*

## **INTRODUCTION**

A social networks service makes it possible to connect people who share interests and activities across political, economic and geographical borders. They are being used by lecturers and students as a communication tool. The current students fall into the category of the Y generation (it is generally marked by an increased use and familiarity with communications, media, and digital technologies) and lecturers have to familiarize themselves with the trend and use it to their advantage. This paper endeavors to assess whether social networks are an appropriate tool to be utilised as a teaching method. A literature review will be conducted in national and international higher education policy requirements on the utilization of technology in teaching and learning in tertiary institutions and other various platforms on education networking. A survey will be conducted that will assess students & lecturers on applying social networking system as an education tool. Therefore the students will be assessed on their perception on learning using social networks and lecturers will be questioned to ascertain whether their integrity will not be jeopardized in the process. Confronting both enables one to establish an understanding on the necessity of implementing social networks for academic purposes.

## **LITERATURE REVIEW**

The influence of social networking on education has sharply increased in the 21st Century. According to Phillips (2007), the name 'Facebook' derives from a book that was handed out to students to begin with the academic year by the institution in the United States. Then in the early 2000 the book was then published online with more logging requirements, an option to enter your details, photos and other relevant information.

The networking life is surely taking over in our lives and we must acknowledge. The internet has become the center of many studies globally. Social networking has recently been applied to several aspects, such as business, media, and recreation, but the most important application is in education. Teaching through networking creates less face-to-face interaction and often does not take place in a classroom setting. Therefore, there is limited information about social networks within formal education. However, Lockyer and Patterson (2008) integrated social networking technologies in education through a case study that provided a formal learning environment. Lockyer and Patterson questioned if they could bring evidence from an informal learning theory, with the observations of current and emerging social networking theories, to formal education. They determined that it is possible to bring an informal theory to a formal education setting, but students require guidance and feedback from the facilitator, just as they would from a formal learning theory.

The philosophy (Policy) of teaching and learning of Tshwane University of Technology (TUT) (2004) stipulated that technology is understood to be knowledge and skills which reside in individuals, and will lead to the development of useful products and rendering of services. The transition into the information era demands from higher education institutions to place a much stronger emphasis on the importance of technology in their education and R&D programmes. It is clear that South Africa and in particular the higher education sector must position itself with regard to the ICE era (Internet Changes Everything). A new digital economy is on its way, demanding a new economic learning enterprise in order to address the worldwide shortage in well trained IT experts. The technology within the ICE era enables higher education institutions to develop and implement strategies for a flexible learning system. The teaching and transfer of technology offers unique opportunities for technology enhanced delivery modes including multimedia, computer based education and online learning. (TUT, 2004)

The University Committee on Educational Policy of the University of California (UC), 2010 has discussed that it is also appropriate for UC to investigate how online education can help improve the scope and quality of education in a variety of areas. While the Senate has repeatedly recognized the benefits of face-to-face instruction, they also realize the need to stay current with alternate modes of education and developing technologies that can leverage our expertise and funding in ways that help us meet our educational objectives. (UC, 2010)

According to Ken Bain (2004), learning does not only affect what you know, it can transform how you understand the nature of knowing. At the most elementary level, students think that learning is a simply matter of checking with the experts, getting the right answers and memorizing, these are called received knower's, and they can ingest information but not evaluate or create it for themselves. Bain, 2004 said this kind of student is basically reflecting the banking mode of teaching, a model that is commonly used in a regular classroom setting and is often not very effective.

Yang in 2003 has outlined one major concern of online education is whether the learning is effective? Many studies have been conducted to explore the effectiveness of Web-based distance learning. Although most studies showed that the learning outcomes of distance learning are as effective as or more effective than those of traditional face-to-face teaching (Hiltz, Turoff, 2002), the results were not conclusive since the learning materials and goals might exert significant influence on outcomes. Negative effects such as decrease in group effectiveness, increase in time required to complete tasks, and decrease in member satisfaction were confirmed. Ricketts, Wolfe, Norvelle, and Carpenter in 2000 Students' feeling of isolation may also become an obstacle in pure online education. In the year 2000, 2001 and 2002 studies were done to explore the adjunct mode and the mixed mode of online education that should be explored in more detail because these two modes of online education could possess the advantages of both pure online and traditional face-to-face teaching. Yet, few studies have been conducted to explore the adjunct mode of online education. Little is known regarding the learning effectiveness of these forms of online learning confirms Yang, 2003. The last study was done in 2003 that broadly discussed the applying of social networking in higher learning institution. Therefore there is a huge gap that is still needed to identify the effectiveness of implementing social networking as an educational tool.

## **RESEARCH METHODOLOGY**

The aim of the study is to assess whether social networks are an appropriate tool to be utilised as a teaching method, whether it will be feasible for students and lecturers. To do so, information from students and lecturers

are assessed and analysed: Firstly data will be collected from students and secondly from lecturers. The study will adopt the qualitative method in acquiring data. Data collected from students will assess whether they will be comfortable with the impersonal lecturing method and the data that will be collected from the lecturers will be to obtain a background about how their integrity will be upheld on a social network whilst teaching.

A randomised stratified sampling of 850 from a population size of 4 254 using the 5 departments available in the faculty will be used as part of the data analysis. These questions comprise amongst others the attitude towards social networks, the traditional face-to-face learning approach vs. the social networking learning approach, advantages & disadvantages of applying social networking in education and teacher-to-student relationship. This will determine as to whether social networking plays an important role as an educational tool.

This sampling divides the faculty of economics and finance into strata in the different departments because of different nature of field of study in the faculty. The students and the lecturers will not be allowed to reveal their identity for true and honest opinions to be shared.

Using the above data sources consent to confirming the idea already suggested that lecturers need to use social networks as a method of teaching and learning with technology.

## **FINDINGS**

Five departments has been questioned and assessed with a total of 850 students together with 17 lectures have been assessed. Only 720 data was usable from students and 15 data collected from lectures.

According to the feedback received from students the following was the outcome:

- 56% (406 of 720) prefer both the traditional face-to-face method of teaching and the modernised social networking system.
- 39% (278 of 720) prefers only the social networking approach of learning
- 5% (36 of 720) prefers the only traditional and conserved face-to-face method of teaching

According to the feedback received from lecturers, the following was the outcome:

- 11 out of 15 of the lecturers mentioned that they can easily adapt to the social networking method of teaching.
- 4 out of 15 of the lecturers were not in support of the newly suggested method of teaching.

With the information gathered thus far in support to Nielsen, (2004) that lecturers need to use the tools that are common in social context as no one is too old for social networking, in determining the way students learn. It is clear that students will learn more if social networking is adopted as one of the learning methods.

## **RECOMMENDATION**

Teaching and learning with technology is becoming an important component in the learning environment. As higher learning institutions are moving towards teaching and learning with technology one can strongly recommend that social networks be adopted as one of the teaching methods. Face-to-face method should not be completely phased out as there will be a need for further clarification by the lecturer to students required. As found in the results most lecturers that recommended social networks are young and the other two who is against, is in their middle age and therefore educating the middle and older generation technology will be highly recommended as it will be to the advantage of the students and the lecturer. The gathered information show a vast need of social networking in higher education institutions and this study may positively contribute to tertiary institutions teaching and learning with technology policy on establishing social networking as an educational tool.

## **CONCLUSION**

This intends to evaluate the effectiveness of implementing social networks such as Facebook/Twitter as one of the teaching methods in the faculty of economics and finance. Deriving from the first results that were gathered students and lecturers are ready to teach and learn with technology. The researcher will be able to make a recommendation to the teaching and learning with technology officer to implement the technology starting with a smaller group to a larger group depending on its effectiveness.

# **STRATEGIC MANAGEMENT DECISION MAKING: ITS IMPORTANCE AND CHALLENGES FOR GLOBAL CORPORATIONS**

**Erach D. Munshi**  
**St. John's University, New York**

## **ABSTRACT**

*Strategic management decision making is a very critical component of corporate strategic planning for all global corporations as they have to deal with uncharted events, such as severe recession of 2007 to 2010, that affected growth, and survival of many corporations adversely. In the whole strategic management process, a well defined 'vision' statement by an organization, remains as a 'road map' for achieving long-term strategic objectives and goals in order to gain competitive advantage over competitors in the same industry. but not always as it happened in the case of recalls of Toyota car models by millions in 2010. The case did prove that the management of Toyota Motors did make wrong strategic decisions that created bad quality control problems.*

*Due to huge global markets, top executives of Nestle, and other organizations constantly face a challenging task of revising critical strategic decisions in order to achieve annual sales targets, overall corporate efficiency, and profitability for each of their subsidiary. The author, through research, has discovered that authors of many text books on "Strategic Management, and Business Policy, have dealt with this important topic very lightly. Due to the fact that more and more corporations are going global, strategic management decision making will remain a challenging task for many global corporations for years to come.*

## **INTRODUCTION**

The known concept of 'business policy' has become strategic management in the context of national, international, multinational, and global corporations. A strategy is a game plan, used by army units all over the world for centuries. The function of a specific strategy at a corporate level is to bring all of its core strengths, and value- adding resources into play in order to achieve planned organizational objectives and goals effectively. The major components of strategic management, as a process, are strategic vision, strategic mission, strategic objectives, long term goals, developing a strategy, implementing, and verifying the results against the benchmarks.

This challenging and dynamic topic represents a combined case study of the four global market leaders: Nestle', Johnson & Johnson, General Electric, and Ford Motor Company. Discussion of applicable strategic management concepts is well incorporated into the text of the paper.

The major difference between international, multinational, and global corporations, lies in the total market share in the same industry. Global corporations have their global vision, global strategic plans, global strategic decision making,, and derives the benefit of cost efficiency through economies of scale. CEOs of global corporations are visionary and well experienced strategic leaders who possess abilities to handle the multinational landscape filled with counter strategic moves from close competitors to gain competitive advantage. The example of General Motors, Ford, and Chrysler proves how badly their CEOs failed in their vision to see what the CEOs of Toyota, BMW, and Honda saw the new generation of technologies for building fuel efficient small and medium size cars. The American auto industry became the victim of dysfunctional corporate culture that had lost its vision, and out of customers preference for the models manufactured. It took some twenty-five years, and over \$100 billion in capital outlays, between the three car makers, to regain global competitiveness. Today,

growth through innovations is the new mantra for the three companies. The example also proves that strategic problems of global corporations cannot be solved with the help of traditional management theories.

It is evident that there are no specific management theories that are applicable to solving critical strategic problems of global dimension. Only through applicable strategic management concepts, such as, to expand either through related or unrelated diversifications, through mergers or acquisitions. The CEOs of Nestle', J & J, GE, and Ford Motor Company, do excel in their strategic vision, in strategic leadership, in strategic decision making. And they have been managing their corporation as an intrapreneur, managing their corporation as the owner. In essence, strategic management as a process, represents the full set of commitments, strategic actions and decisions required for a firm to achieve strategic competitiveness and earn above average returns, Hitt, Ireland, Hoskisson., 2009, discussing strategic management. It should be remembered that strategic management problems of global corporations are not compartmentalized, dealing with only one set of functional activities such as R&D, engineering, manufacturing, or marketing. But the global problems represent a gamut of multidivisional problems that may even require a new CEO with a new vision, and new strategic leadership to solve them, and possibly turn around the corporation that is losing market share to competitors.

## **Strategic Decision Making at Global Level**

After reviewing quite a few text books on the subject, it was difficult to find a standard definition of the term. But the group study of Nestle', J&J, GE, and Ford has brought out a central definition that strategic decision making is a holistic, value-adding management approach that encompasses global vision, global mission, corporate core competences, global market standing, corporate culture, and CEO's strategic leadership having good judgment. This is covered in the discussion of the four global corporations. Corporate strategic decision making is the major responsibility of the CEO in consultation with the Board of Directors. CEOs who are good visionary, and could visualize demand for future products in anticipation, are normally very successful strategic decision makers. For example out sourcing of finished electronic parts, chips, to save millions of dollars in operating costs, and an increase in profitability for the corporation. And with greater profitability, stock price would go up. The following " Strategic-Making., Strategic- Execution Process consisting of four phases," is a very effective model for the global corporations in this paper. Thompson, Strickland, Gamble.2008.Crafting and Executing Strategy. The four phases are: Developing a strategic vision; Setting corporate objectives; Crafting strategies to achieve the objectives; Implementing and executing the strategy; and Monitoring developments, evaluating performances, and making corrective adjustments.

Top management executives must realize that even highly experienced, superbly competent, and well – intentional managers are fallible. Organization must realize that decision making process, not individual genius, is the key to a sound strategy decision making. Kahneman, LoNillo, Sibony, 2011, discussing decision making.

## **Landscape for Global Corporation**

American markets have reached the maximum growth potential, and must go global for further growth . Whether it is soft drink industry, fast food, drug and pharmaceutical, IT, hotel, and service industry. The real driving force behind globalization of corporations is the growing economy of developing countries. According to the dictum of Capitalism, known as free market system, only the fittest corporations with the right products, and services would survive, and the inefficient ones would be driven out of the markets by consumers. Nestle', J & J, GE, and Ford Motor Co. are over hundred-year old corporations. They have well developed global learning curve, highly diversified, equipped with state-of-the-art technology , having highly competent and skilled employees and managers, possessing distinct competences, strong cash reserve( EVA), low corporate debt, having number one in market ranking globally, and visionary CEOs.

The middle class population in China and India combined is close to 550 millions, each country representing 25% or more of its total population. The consumer market with 550 million customers with good purchasing power is a much bigger and potential market than the American, the Canadian, and the European markets combined. And it is growing at the rate of 2 to 3% annually. So is the case with the rising middle class market in Russia. Globally established corporations like Nestle', J&J, GE, and Ford will continue to reap rich, competitive advantages by leveraging their global resources, core competences, diversified product mix, use of synergies,

and strategic fit, efficient use of logistics for distribution of products, and services low cost provider due to huge economies of scale, and providing excellent strategic leadership by CEOs.

## **Strategic Management Concepts Applicable to the Four Global Corporations**

1.Strategic vision; 2.Strategic mission; 3.Corporate objectives, and long term goals; 4.Core and distinct competences; 5.Related and unrelated diversifications; 6.Corporate culture and globalization; 7.Strategic intent; and synergy; 8 Alliances, mergers, and acquisitions; 9.Strategic fit; 10 Economies of scale, and economies of scope; 11 Strategic leadership; and 12, Strategic decision making.

“Strategic vision describes the route a company intends to take in developing and strengthening its business. It lays out the company’s strategic course in preparing for the future.” Thompson, Strickland, and Gamble. The Managerial Process of Crafting and Executing Strategy. 2008

It is worth noting that vision statements of some corporations are vague and unclear. In some cases, stated mission statement overlaps its vision statement.

Nestle’, J&J, and GE have retained their number one global market position for a long time. Nestle’ yearly revenue is over \$100 billion, has 70 brands of products, has manufacturing operations in 160 countries, has some 19,000 employees globally, has sales offices in more than 150 countries. It carries related and unrelated products including Pets Foods. Nestle’ vision is “to provide a variety of nutritious food products to customers all over the world,” Such as quality chocolate and confectionary products, beverages, Nestle’ controls 50% of the bottle water market by owning six brands, Nestle ice cream, evaporated milk, etc.

J&J’s stated mission, which is a major part of its “Credo.” “We believe our first responsibility is to the doctors, nurses, and patients, to mothers, and all others who use our products and services.” J&J carries nine different product lines, starting with Baby products; Band-Aids; Women’s health products; skin care, nonprescription drugs, etc. In contrast to J&J’s mission, Pfizer’s mission is “to apply scientific knowledge to help people around the world enjoy longer, healthier, and more productive lives.”

GE’s Vision statement covers both vision and mission statements. Company’s vision statement is based on its distinct core competences to “innovate high-tech products and services that would contribute to the process of industrialization of nations.” Products such as: household equipments, locomotives, electric control equipments, MRI technology, turbines, generators for electricity, development of new technology for harnessing solar and wind energy. Specific mission statements have helped Nestle, J&J, GE, and Ford in their quest for global market leadership.

## **IMPORTANCE OF THE DYNAMICS OF MERGERS AND ACQUISITIONS FOR GLOBAL CORPORATION.**

**“You have no choice but to operate in a world shaped by globalization and the information revolution. There are two options. Adopt or die.” Andrew Grove, Former Chairman, Intel Corp.**

Merger and/or acquisition strategy creates a synergy between two companies with equal strengths, core competences that would create a more powerful entity for gaining competitive advantage over rivals in the industry. Nestle’, J&J, and GE are very good examples. However, Ford Motor Company falls under the category of corporate strategy that follows intent strategy to make sure that all functional units operate at high level of efficiency in line with Total Quality Management that would eliminate defects in the cars, and SUVs manufactured. Auto manufacturing companies, by and large, are also known as single business companies, and are not diversified as they want to remain focused on development of their core competence related to R&D, and on their line of products. The new culture of auto industry is not only to manufacture cars without defects, but to design fuel efficient cars that customers would continue to buy.

Nestle', J&J, and GE became global industry leaders through acquisitions of companies that created good strategic fit consisting of resource fit, financial fit, core competences, synergy fit that would give competitive advantage over the competitors to gain more market share through introduction of new value added products. There are four factors that are required for a viable strategic fit: strategic objectives; resource and financial fit; matching corporate culture; and fit between corporate structure, systems, and processes. Carpenter and Sanders, 2009. Strategic Management

In case of mergers, the strategic fit may be there, but not synergy. Meaning it would not make  $2+2=5$ , in terms of resource, technological, and cultural fit. For example, in 1998, the merger between AOL, and Time Warner failed because of mismatch of human resource, operational technologies. In 2003, the merger between Daimler Benz and Chrysler failed because of conflict between two sets of cultures, an autocratic versus democratic. A total absence of synergy, and strategic fit. Also, strategic decision making did not work because of conflict in chain of command.

On the other hand, in case of Nestle', J&J, and GE, acquisitions due to excellent strategic fit created strong economies of scale that help the corporations to bring down operating variable cost per unit. So was the benefit the three corporations received from the economies of scope by capturing additional readymade new markets and loyal customers. It is worth noting that the concept of economies of scope, which creates additional market share, works very well in case of related diversifications.

## Strategic Leadership

The global domination of the four corporations is based on the fact that the CEOs are visionary, proactive, and proven strategic leaders. Strategic leadership is the ability to anticipate, envision, maintain flexibility, and empower others to create strategic changes as necessary. Hitt, Ireland, Hoskisson, 2009.

In case of **Nestle**, Peter Brabeck-Latmathe, CEO, made the company an icon of the industry by pursuing three major goals as the driving force: Expand company's range of products, related and unrelated; remain a low cost provider, and speed up company's product innovation using "organic approach." that would transform the company to become the "world's leading nutrition, health, and wellness" food company that made consumer health and safety its prime concern." Nestle' Annual Report. 2009. Also, under Brabeck-Latmathe's global expansion strategy, Nestle' paid \$18 billion to acquire U.S Companies Ralston Purina, Dreyer's Ice Cream, and Chef America. Also, he benchmarked its operating costs to those of competitors like Kraft Foods, and Unilever, and found that operating costs of Nestle' were significantly high. He closed 150 factories, reduced workforce by 20% and reduced operating costs more than 20%

## Johnson & Johnson

Recently, J&J acquired Synthes, a Swiss-American Medical Device for \$21.3 billion to gain competitive advantage over its competitors. This is a \$37 billion a year, world market for orthopedic medical devices. This is a classical example in case of Nestle', and J&J how visionary CEOs can penetrate the future, spot strategic opportunities for expansion, and make value-added strategic decisions that help increase not only corporate core competence, market share also. In this acquisition, a very strong fit exists between resource and financial strengths that would be complementary and supplementary to each other. Both the Companies have healthy corporate culture for innovations that would continue to bring out new and improved devices. Also, with all this gained distinct technological competences, J&J would continue to dominate the global market for orthopedic medical devices for years to come. Also, at J&J, managers and employees at all levels of management follow and practice ethical values and norms stated in Company's "Credo" in their strategic decision making.

J&J, unlike Nestle' and GE, followed related diversification strategies to capture global markets. The advantage of related diversifications is that matching strategic fits between two sets of resources are easy to find. J&J's global products are Baby products, Band-Aids and other first-aid products, Personal Care products for women, Neutrogen & Aveeno Skin Care products. J&J with over \$50 billion in revenue, 200 plus operating companies organized into three divisions: Drugs, Medical Devices and diagnostics, and consumer products. J&J's annual growth of ten to fifteen percent comes from acquisitions. Also, its pharmaceutical division contributes nearly

50% of the revenue, and 60% of the operating profits. Recently, due to losses, J&J decided to close down its department that manufactured drug-coated stents to keep arteries open following angioplasty.

### **General Electric**

GE's global market dominance resulted from its well defined vision statement and from strategic leadership of Jack Welch, and his successor Jeffrey Immelt.. In the portfolio of diversifications, GE always acquired companies with unrelated, but specialized products with engineering technology. This strategic decision of GE created a common strategic fit. GE operated in more than more than ten such industries. In 2009, GE's annual revenue was \$157 billion. In the last quarter of 2010, it earned \$4.54 billion on the revenue of \$41.38 billion.. Also during the period of 1990 to 2001. GE acquired 600 new corporations, mostly in Europe, Asia, Latin America. GE succeeded in developing talented and result-oriented, some 85,000 managers and professionals for its global organization. GE's strategic policy requires that 60% of the total revenue should come from international operations.

In 1981, Jack Welch, former CEO, formulated the company policy that GE would enter the markets in high performing businesses in which GE would be number one or number two competitor in the industry. The revised GE's corporate objective is to be the leader in a \$4 trillion Healthcare Industry that is growing at 8% per year. Also, GE's Consumer-finance division is growing at 10% per year in a \$40 trillion global market. January 22-23, 2011. The W.St.Jl. In 2001, Jeffrey Immelt, CEO, decided to divest Company's plastic , and incandescent bulb divisions. He also decided to reduce GE's business units from 11 to 6 by adopting downsizing operating units

### **Ford Motor Co.**

Major corporate decisions made by CEOs, related to alliances, mergers, and acquisitions, are strategic decisions that are holistic in the sense that they affect the existing, functional strategic fits of all business units. New fit requires selected shifts in managerial positions, and resource allocations. Effective strategic decisions tend to be in line with the established vision, and mission statements. In 2009, GM, Chrysler applied for the Federal Government financial bailout program to avoid bankruptcy. Ford Motor Co. made a strategic decision to mortgage most of its assets, including Ford's " Logo", to borrow \$23 billio.

Ford sold off foreign brands, Volvo, Jaguar, Land Rover, and Aston Martin, reorganized its finances, trim down its operating costs, achieved needed compromises with the Auto Union, redesigned its plants and made them cost efficient, and developed new energy efficient passenger cars that would sell by themselves.

Alan R. Mullaly, former CEO of Boeing,, became the CEO of Ford Motor Company in the Spring of 2006. Ford lost \$14.8 Billion in 2008. William Clay Ford, Chairman, shook Company up, a calcified culture and kept Ford independent and free from the U.S. Treasury Loan Bailout Program Mullaly decided to change Ford's corporate culture. He made transparency a watchword for all executives, making it harder to hide problems. Mullaly made a very valuable strategic decision in hiring James Farley, who worked for Toyota for twenty-two years, and achieved sales growth every year. Mullaly saw value in Lincoln, and in Taurus, a very famous model of 1980s.He asked engineers to redesign both the brands, as high price models to be marketed in 2012.

Ford was not also adversely affected by supply chain after earthquakes in Japan in last March. Ford's first quarter profit rose to 22% due to higher vehicle sale. The Company earned \$2,806 on every vehicle it produced. As a result, Ford raised its second –quarter production forecast to 1.5million cars. Mullaly has proven to be a very effective strategic leader. For example, any suggestion from senior managers that he did not like, he will repeat his coined sentence, "That does not work for me." Ford spends \$7 billion a year on R&D. Ford's revised mission statement, "We are a global family with a proud heritage passionately committed to providing personal mobility for people around the world." Under the strategic leadership of Mullaly, Ford succeeded in recapturing its North American No.2 Market rank.

From the discussion of Nestle', J&J, GE, and Ford Motor Company, as the case study, it leads to two conflicting realities. First, that mature global corporations realize that number one market ranking is transitory, vulnerable to technological disruptions, upstart competition, priorities for capital layouts, new regulations, etc. The second

reality is based on the fact that today's global corporate structures are flat, designed to gain operational competency over the rivals. Mainardi, Kleiner, Winter, 2010, Strategy + business.

## **CONCLUSION**

Strategic management decision making remains a very versatile, and challenging game plan for all future CEOs of global corporations. There is a possibility that flat corporate structure may inspire corporate thinkers to create mega-corporations. This might create a strong need for a new generation of CEOs, not necessarily very smart, but who could be powerful visionaries, creative thinkers, and less inclined to follow the crowd. It seems that strategic management concepts would slowly take over management theories that are not directly applicable to intricate web of problems of global corporations.

# OPEN INNOVATION AND BUSINESS INTERNATIONALIZATION

**Leonel Cezar Rodrigues, Waldir Rechziegel, Narciso Gomes Bastos and  
Aurélio Fiorillo  
Universidade Nove de Julho – São Paulo, Brazil**

## ABSTRACT

*This work analyzes the internationalization process, through open innovation, of Mar & Terra company, a leader company in growth, production and commercialization of fish, native from Brazil. The study was qualitative in nature and exploratory, using the case study as research method. The main results indicate that Mar & Terra has gained control of technology in genetics, nutrition and industrialization of native fish, allowing it to expand in the international market. Its technological expertise was built through open innovation. The main findings indicate that Mar & Terra is incipient in the internationalization of its business, but given the pattern of technological domain, Mar & Terra can support its internationalization strategy.*

## INTRODUCTION

The open innovation model proposed by Chesbrough (2003, 2006), as quick access to external technologies and innovations, represents an alternative strategy to innovation that can result in significant competitive advantages for the company. In the traditional form of closed innovation, research and development occur only within the company. Differently from the traditional, the open innovation model proposes the pursuit of knowledge and innovations that can be quickly incorporated by the company. This strategy enables further gains to the company resulting from the expansion of internal competences and technological domain, accelerating the income from distinct sources and the exploitation of new market segments (Chesbrough, 2003). One implication of this model is the possibility of smaller, but technologically more aggressive companies to operate in international markets.

Certainly the process of internationalization of firms is not restricted to intrinsic motivation resulting from a greater competitive ability, allowed by the open innovation strategy. In addition to efforts to compete, innovate and ensure their local markets, supported by innovation strategies, companies are constantly challenged to seek markets elsewhere. Such challenges require an even broader set of skills and capabilities, since the entry of business into more demanding markets, like those in developed countries, requires dominion of more sophisticated technologies. It is in this context that open innovation can enable companies more rapidly and in more diverse ways to internationalize themselves.

Cassiman and Golovko (2011) argue that during the internationalization process, companies usually pass through several stages, beginning with the export operations and then moving on to the systematization of its export activities based overseas. They show that the export is a process of the internationalization strategy that starts the companies' experience in its own internationalization process. The export is regarded as a relatively simple and low risk of insertion of a company into foreign markets. But there is much controversy in the literature about the internationalization process, since evidences show that internationalization could happen or requires to happening the enabling technological dominion previously, or simply requires commercial and production capacity sufficient to meet international demand. It appears, therefore, there is no patterns to companies internationalize their business. Normally, the internationalization process is associated with the specificities of each economic sector.

In this article, we explore the mechanism of internationalization of a small company with a higher technological content, based on the open innovation process. The company studied, Sea & Land (S&L) is a subsidiary of a larger company, a holding that carries a diversified set of businesses in Brazil. S&L focuses on

the production and commercialization of Brazilian exotic native fishes. The contribution of open innovation to the process of business internationalization is an issue that still lacks some more scientific studies to consolidate and deepen the knowledge in the area. Therefore, the objective of this paper is to characterize the mechanisms and corporate strategy to innovate carried out by Sea & Land and used to build corporate competencies that have supported this company's internationalization process.

## THEORETICAL PRECEDENTS

### Open Innovation

Open innovation is a widespread process in the recent work of Chesbrough (2003, 2006) and has received increasing attention from expert literature, since it represents a different strategy as compared to traditional innovation strategy, carried out in walls in companies. Under this process, companies must explore new knowledge and technologies not only internally but in the external environment too, where "pockets of expert knowledge"(Santos, Doz and Williamson, 2004) can be found.

The open innovation model is defined as the intentional use of external inputs of expert knowledge to accelerate internal innovation and to gain new market segment (Chesbrough and Schwartz, 2007). To seek innovation externally also requires the adequacy of the business model of a company to some critical contents of the innovation sought. This search retrieves new knowledge and technologies from various outside expert sources, allowing to increasing the value of goods and services (Chesbrough, 2003). On the other hand, it is a way of making greater use and optimization of foreign technologies, to increase the flow of internal expertise and to accelerate the production of innovations (Chesbrough, 2006).

Under West, Vanhaverbe and Chesbrough (2006) view, open innovation, besides representing a set of practices to augment profits, constitutes a cognitive model useful to create, interpret and investigate such practices. It means, combining knowledge from various internal and external channels in order to create and bring to market more sophisticated technologies and products with attractive innovations. The authors also emphasize the importance of universities and research centers, as producers and disseminators of new knowledge and technologies, needed by the enterprises that have adopted the open innovation model.

Looking at open innovation from the point of view of challenging opportunities to internal capabilities, West and Gallagher (2006) insist that open innovation, in fact, is the combination of external sources with the exploitation of internal resources and capabilities, leading to build opportunities for innovation in business. This combination of opportunities and internal resources requires an integrated effort to expand the capabilities and the search for market opportunities through multiple channels. Henkel (2006) points out that, in recent years, the opening of the innovation process to external contribution has changed the dynamics of supplying technologies to companies. In addition to commercialization, companies must also forge partnerships to develop technologies in collaborative manners.

As per innovation generating, Chesbrough (2003) argues that the open innovation model emerges as a new paradigm that promotes the locus of innovation's shift. Laboratories of largest companies are now working together with several smaller and incipient companies, universities, research consortia and other similar external organizations. The involvement of this group of actors is seen as the new dynamic in the innovation process. So, thinking on ways of optimizing external innovation uses, Chesbrough outlines three ways of doing so: (a) using it in the existing business; (b) licensing it to other companies; and (c) launching a new venture based on the new technology (spin-off). Despite of the advantages of open innovation, Chesbrough (2006) calls attention to the needs for compatibility between the innovation process and the company's business model. He warns that the technology reaches maximum efficiency only when used under an appropriate business model.

The most distinctive characteristic of open innovation model is the incorporation or internalization, through acquisition or licensing, of innovations developed by other companies or research institutes. Such innovations function is to increase the technical capability of the acquirer. In contrast, in the traditional model of closed innovation, the emphasis is on internal development of technologies used exclusively for the company's own consumption (Chesbrough, 2003). The main advantages of open innovation model are to reduce the development costs and to generate new sources of revenue. Figure 1 shows the implications of the open innovation model on the sources of income for the company.

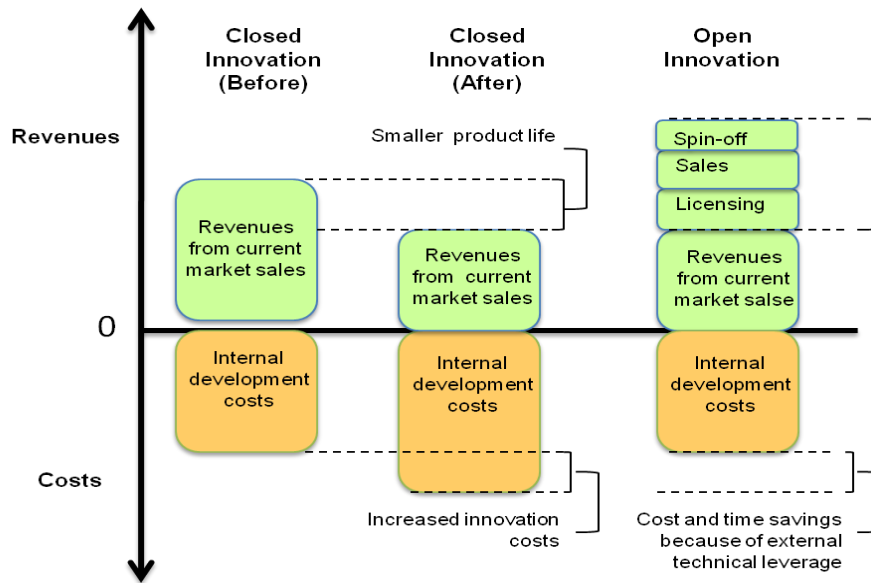

Figure 1. Business changes: traditional innovation vs. open innovation  
Source: Adapted from Chesbrough (2003).

In the classification of the distinctive formats that the open innovation processes could occur, Gassmann and Enkel (2004) distinguish three main formats. The importance of each one varies among companies. The first one is the process in which the expert knowledge comes from outside to inside. Its implication is on the enrichment of the knowledge base of a company through the integration of customers, suppliers, universities and research centers. The second one is the process from the inside out, in which profit is the exchanging coin, by taking outside internal ideas and by selling or licensing intellectual property. And the third one is a coupled process, a combined form of outside in and inside out process, in which a company works in alliance with partners to expand the knowledge base.

Among several important contributions in the literature to deepen knowledge on open innovation, comes the work of Santos, Doz and Williamson (2004). To capitalize on the benefits of innovations generated in the distinct cognitive expert bases in the world, these authors suggest that companies should engage in a three key process: prospecting, accessing and incorporating external innovations. In the prospecting process, companies seek to identify valuable pockets of new knowledge all around the world that can provide or contribute to access the innovation of interest to the company. In the access process, companies make a dynamic balance of innovations available, on the basis of their own technological footprint. In the incorporation process, companies are involved with transferring innovations to operating environment of the company. Thus, companies may seek external innovations that are of their interest, without incurring higher costs of accessing technology. In terms of competitive advantages, Santos, Doz and Williamson (2004), mention that by harnessing the diversity of existing relevant knowledge in the world, meta-national innovating companies have been able to generate more innovations of higher market value and lower cost.

## The Internationalization Process

In the expert literature, according to Barkema, Bell and Pennings (1996) there are three different dynamic models process-oriented of internationalization: (1) the model of the product life cycle; (2) the adoption of innovation curbing the internationalization models; and (3) the Uppsala model, attributed to Scandinavian university in which the model was generated.

The model of the product life cycle involves the introduction, growth, maturity and decline phases. According to this model, the internationalization of business is almost exclusively determined by considerations of production costs. A new product will be sold mainly in the country of origin and when reaches maturity it is introduced into the international market. The second model is based on behavioral theory of the firm. It classifies the stages of internationalization in a compartmentalized way, lacking explanation on how companies

move from one stage to another. This model explains the internationalization of small and medium enterprises and is based on the maturity of its export process. The company is said to be internationalized when exports become a mainstay of its operations.

The Uppsala model is based on learning cultural nuances or on the level of familiarity the company with other countries' cultures as the driving force of internationalization. The Uppsala's stages model refers to the organizational learning of the export process and of the nuances of bureaucratic and cultural characteristics of the foreign nation. It regards to the gradual increase of the participation of enterprises in the international market (Johanson and Vahlne, 1977), through the empirical cumulative learning from previous experiences. The model postulates the internationalization into four distinct phases: 1) to export, but without regularity, 2) systemic export, via independent agents, 3) creation of a multinational affiliate for sales; and 4) production facilities abroad.

The Uppsala model suggests a systemic ritual in the geography of internationalization, since firms only shift to more distant countries after establishing presence in the closer countries. Enterprises go further afield, increasing psychic distance, considering that psychic distance consists of factors that impede or disturb the flow of information between the company and the target nations, including linguistic, institutional, cultural and political factors.

The decision to internationalization, according to Dunning (2001), are determined by three sets of issues: a) general competitive advantages that firms possess one nationality over those of another nationality, b) the extent to which companies perceive to be the interest to explore its core competencies in foreign markets, and c) the option of an opportunistic move to add value, beyond the borders of their country.

Associated to the innovation, Andersen (1993) proposed the I-model, which analyzes and explains the internationalization process from the innovation perspective. The model discusses the sequential stages of learning to domain an innovation, with the company's internationalization process. In similar rationale as Andersen (1993), Dosi (2006) advocates the internationalization as an attitude from innovative companies. More in line with Andersen, however, Knight and Cavusgil (2004) argue that the innovation may be a capability needed for a company to go global. For these authors the knowledge generated by innovation in their environment provide special advantages that facilitate the operations for foreign market entry. Knight and Cavusgil (2004) developed studies in identifying global companies considering three elements as essential for the internationalization process: (a) understanding of the market it serves - without experiencing simpler market operations it is impossible to enter markets with more complex operations, (b) ability to add partners – partnerships, however, are not pre-determined, they should be established in areas where a company judges necessary; and (c) dominion of technologies and processes – it is necessary to consolidate a technology base area that helps the company to compete in foreign markets. Their studies lead to the conclusion that, despite limited resources, typical of incipient companies, global companies are born with a distinctive mix of strategies that allow them to succeed in diverse international markets.

To Autio et al. (2000), McDougall et al. (1994), Zahra et al. (2000) the capacity of early internationalization and be successful in foreign markets of some companies is also a function of performance in the domestic market and the firm's resources and capabilities. The company's resources lead to new processes, products and knowledge that facilitate the internationalization process.

Summarizing, we can post that the literature on internationalization can be categorized into two or three large blocks of theories. One group of theories, represented mainly by the Uppsala model, internationalization is a result of organizational learning in the management of international commercialization. In another group, internationalization is a result of the consolidation of core competencies that gives businesses a competitive advantage in international markets. And finally, a third group of theories argues that the internationalization process is a result of technological innovations in the field that allows the company to earn specific niches in international markets. For this group, the company, that goes international, holds a strong technological capability

## **METHODOLOGY**

This research designed as a case study, according to the concept of Yin (2001), illustrates the process of internationalization of companies in the context of open innovation. In other words, the research aims at determining what mechanisms, what processes and what factors, actually led to the internationalization of the selected company, considering that its innovation strategy is based on open innovation processes. The method of

case study selected is adequate to conduct applied research in order to test the existing theoretical base or expand the frontiers of knowledge (Eisenhardt, 1989).

To select the company as the research field subject, we considered the existence of systematic participation in the international market; the relative weight of international sales in the firm's total sales volume; the existence of a technology base dominion in the firm and how it was built; and finally, the importance of the company in its economic sector in the country. The company selected was Mar & Terra, a subsidiary of the holding Axial-Par, founded in 2001 targeting at farming exotic Brazilian native fishes.

The survey data were collected through semi-structured interview script directed the three social subjects. The social subjects, the General Manager, the Manager of Research and Development and Export Manager, were chosen because of their internationalization experience in the company. For protective reasons, the names of respondents are here omitted. To meet the objectives of this study, we considered in the formulation of the interview, the internationalization process of Mar & Terra, according to Knigh and Cavusgil (2004) - understanding of the markets it serves, the ability to add partners, and mastery of technologies and processes – as well as the process considered in Uppsala model of internationalization.

## **RESULTS ANALYSIS**

### **The enterprise**

The Mar & Terra is a secluded fish farming company, established in 2001, aiming at producing and commercializing exotic fish with a high quality standard. It is a company specialized in production and processing of Brazilian exotic native fish species of freshwater, such as the Pintado, Pacu, Pirarucu and Tambaqui. These are fish species from Amazon and Swamp region in Brazil. They are, in general meat eating fishes that furnish redish fish meat. After consolidating its mark in the Brazilian market, supplying processed frozen or just chilled fish, Mar & Terra started, from 2005, its learning in the international market. The company first started exporting to Latin America countries. Given the specialty of its market niche, Mar & Terra is now the largest producer and processor of exotic fish in Latin America. It currently exports to 11 countries in the world, from Latin America to Asia. In each region the company has specialized sales representatives, who take care not only of sales issues but also of the respective contracts.

Since its establishment in 2001, Mar & Terra devoted, according to its executive director, to the production and processing of Brazilian exotic native fish as a differentiated product to market penetration. This niche is strategic, not only because of market opportunities due to low competition, but also because of the existing unmet demand in gourmet restaurants and demanding kitchens in the Brazilian market, especially in large towns. Moreover, the marketing of exotic fish meat is a strong possibility of entering the international market of elite, a highly profitable market.

Mar & Terra, as informed by the company's export manager, is the largest Brazilian company in volume and sales production of native exotic fish. The company's production has increased gradually, especially after its entry in the international market, since 2005. In 2009, the company reached the production of 700 tons., with revenues just over US \$ 5 million. In 2010, the production volume reached close to 2.500 ton. and in 2011, the production has been forecasted at 3.800 tons., with revenues approaching to US \$ 27 million. Since 2009, the percentage of production exported reached 40% of the company's total production.

### **Interpretation of Results**

Mar & Terra firm belongs to a group of companies with a calling for international business, sustainable in nature. Despite not being born global, it has an entrepreneurial and innovation culture that makes the enterprise capable to move along international markets competitively. The competences to operate in the international market, however, were developed in two directions. In one direction the technological capability of the company has been focused. The manager of R & D emphasizes that the acquisition of technologies evolved in three distinct phases. In the first phase, the company targeted at techniques of basic nutrition and more recently, at more sophisticated nutrition techniques. In a second phase, the company turned to the reproduction techniques in captivity, involving genetic improvement of breeding species. While evolving genetic improvement techniques, nutrition techniques were also evolved and became more sophisticated in order to accelerate the fish growth, protein mass and color of fish meat. Such concerns have resulted in products with texture, color and taste distinctive, paving the way of the international market for Mar & Terra, especially to

market in countries such as the USA, Germany, France and Japan. Finally, technological dominion base was enlarged to comprise industrialization techniques, especially fish cuts. Considering fish cuts, the sophistication of cuts is such that gourmet restaurants can buy chunks of predetermined culinary standards, such as longitudinal filets or transversal flitch with customized dimensions and weight.

The strategy of investing in technological dominion did not drive investments for internal R & D. Moreover, the intention of internal R & D function is more to increase the capacity of Mar & Terra to understand the technologies acquired externally, since most of the existing technologies has been acquired by the company from external sources. Mar & Terra bet on open innovation model to sustain the needs for technological dominion and innovation. The company recognizes that innovation is essential to offer competitive products in the international market. To this purpose, it has a long list of partnerships that enable Mar & Terra the domain of fish genetics technologies, fish nutrition and industrialization as the company needs. The most important partners and their contributions to the base of technology dominion of Mar & Terra are:

*Universities* - do research, experiments and develop new technologies of reproduction and nutrition diagnose and analyze supply chains in the region. *Laboratories* - Provides for the physical development of experiments and new technologies; manipulation of substances and properties of experiments; quality tests of products. *Research Funding Agencies* - promote research and development through supporting policies. *Producers* - Use the technologies of genetic breeding and nutrition developed by Mar & Terra and other partners. *Suppliers* - Develop and provide the raw material to the specifications required by Mar & Terra for fish breeding and fattening. *Technicians, and working staff* - Provide technical expertise for development projects. *Municipalities* - Support the local projects, especially those involving extra income for local producers. *Fish culture Experts* - Work in research activities, development and training teams. *Sales Representatives* - to research new markets tell about tastes, nutritional needs and preferences of each country. *Aquaculture Centers* - Provide management and technical-scale production of farmed fish (India, China).

To hold an external supply system support its technology dominion base, however, was not the only option chosen by Mar & Terra. The Export Manager of the company throws some more light on other factors and strategies followed by the company in the process of internationalization. In its ten years of operation, since its inception, the company has learned to deal with the particularities of fish market in the domestic market. This experience involved bulk sale, retail, fish stowing and packaging, and logistics of transport. It was from the domestic market experience that the company after all got its fish cutting technology sophisticated.

The commercialization dominion in the domestic market has enabled Mar & Terra to start for real the process of internationalization by selecting their representatives in the countries of destination. Information from local markets and acceptance of products, gradually customized for each country, and brand awareness in niches of interest paved the way for the expansion of the company's market share in the various international markets. Since 2005, Mar & Terra has nearly geometrically grown in international market participation of industrialized exotic fish.

## FINAL REMARKS

The study revealed that the Mar & Terra is a company engaged in the international market with a carefully designed and carried out strategy. The company was not born global, but its proposed business (industrialize and commercialize exotic Brazilian native fish) is resulting from viewing a unique market opportunity that would allow the company to quickly operate in the international market. The trajectory of technological dominion and commercialization experiences supports the theoretical knowledge available, which explains and describes the processes of internationalization of companies.

Contextually, Mar & Terra open innovation system, which allowed the company to quickly access technologies that it needed to compete in the international market, follows the assumptions of external search and incorporation of technologies and innovations proposed by Chesbrough (2003) and Santos, Doz and Williamson (2004). In fact, Mar & Terra has created a nebula of partners with distinct capabilities that have provided the company, very quickly, an indisputable wealth of capacitating technologies, enabling it to compete in more aggressive and demanding markets. The strategy of open innovation the company has not only consolidated his technological dominion base, but has also enabled it to expand that base through incremental and more sophisticated innovations.

We could, likewise, observe Mar & Terra internationalization process obedience to the premises Knight and Cavusgil (2004) - understanding of the market it serves; ability to add partners; and dominion of technologies and processes. The previous understanding of fish market was learned by Mar & Terra, which

intuitively, more than planned, tried to learn the issues and manage the market of native exotic fish domestically, in a first step. And, in a second step, it could venture into the international markets. The second Knigh and Cavusgil (2004) premise - the ability to add partners - for the process of internationalization is more clearly discernible in the system of open innovation of the company. Mar & Terra established a partnership in the areas of most interest to it, that is, partnerships with institutions and businesses that became cognitive bases of expert information and sources of technology and innovation. The company has licensed multiple technologies to support and, through them, can compete in international markets, demonstrating mastery of the basic technologies and processes. Breeding technologies ensure proper color and texture to the taste and palates of consumers. Cutting technologies, packaging (frozen and chilled) and distribution logistics (sea and air) ensure compliance with the requirements and standards demanded by the international market.

Finally, it is important to emphasize that the basis of technological dominion of Mar & Terra was what allowed the company to consolidate its internationalization process. The company is incipient in the international market, but it is already in the second stage of internationalization under Uppsala model (systematic export, with foreign permanent representation of its business) in the process of internationalization. The company's consistent strategy of internationalization guarantees the allocation of 40% of the total production in the international market.

# **GENDER, EMPATHY, & TRANSFORMATIONAL LEADERSHIP: A SOUTH AFRICAN PERSPECTIVE**

**Yvonne Senne**  
**Tshwane University of Technology**

## **ABSTRACT**

*This study investigates the relationship between empathy, as a component of emotional intelligence and leadership style. More specifically, the objective of the research is to examine the influence of demographic profile on empathy and leadership style, as posited by the emotional intelligence model. The conceptual model was tested on a sample of some 100 Master of Business Leadership (MBL) students at a South African metropolitan university. While findings, overall, suggests that there is no significant relationship between race and emotional intelligence or leadership style, gender yielded significant results. This is consistent with past research, which also indicates a greater proportion of women respondents showing more tendencies towards empathetic behaviour than male respondents. Given that research in the area of transformational leadership, within the context of a democratic South Africa, is yet to reach critical mass, this study not only contributes to the literature, but also to the practice of management and leadership.*

## **INTRODUCTION**

Although numerous authors simply explain leadership as the act of stimulating and inspiring employees (Robbins & Coulter, 2009), practising leadership is not that straight forward. This complexity is reflected in the literature by the lack of consensus on what constitutes effective leadership. Several leadership theories attempt to capture the essence of effective leadership including the challenges pertaining to ethics, diversity, and gender differences. According to Robbins and Coulter (2009), leadership theories range from trait to behavioural to contingency theories. Also in the recent past, the leadership literature increasingly reports on the importance of transformation, empathy, and emotional intelligence in the practice of leadership (Goleman, 1998). This is especially true in a diverse and transforming society such as South Africa. These phenomena, while they have been studied in various Western contexts, research into phenomena in developing nations has not yet reached critical mass. To address the paucity of leadership research, at least, in South Africa, this paper considers the complexity of gender, empathy, and transformation in the practice of leadership. More specifically, the study aims at examining the relation between empathy, and assessing any gender and racial differences that might exist within the sample under study. In addition, the study also aims at determining the roles of empathy in transformational leadership context, with specific reference to South Africa.

The remaining sections of the paper are as follows. In the next section, a brief overview of the South African society is presented. Thereafter, the literature of as it relates to leadership, emotional intelligence, and empathy are discussed. Following on, the methodology utilised is presented. Finally, findings and discussions conclude the paper.

## **LITERATURE REVIEW**

### **South Africa: a diverse and transforming nation**

South African population is characterized by diversity, a “rainbow nation,” coined by Archbishop Desmond Tutu but also used by Nelson Mandela in his inaugural speech (Habib, 1996). The democratization of South Africa after 1994 brought significant changes, most discriminatory laws were scrapped and new legislation was

introduced to facilitate social and economic empowerment of the black majority. The population consists of people of different origins: blacks, whites, coloured, Indian, and foreign nationals. South Africa's migrant population is mostly African, but also a significant proportion comes from western and eastern origins. All of which enrich the already diverse culture with more than eleven official languages. The economic disparities of South Africans are very glaring with 80 % of the population (mostly Africans) living below the poverty line, this racial character of the economy needs to be addressed to enable consolidation of its democracy (Habib,1996). The political system previously was aimed at discriminating the black majority and ensuring that they are kept on the fringes of the society as well as advantaging the few whites and keeping them in a favourable position.

## **Emotional intelligence in South Africa**

Judging by the popularity of the concept in the past two decades, a misconception might be created that Emotional intelligence is a relatively new concept. Cooper (1997) indicate that term 'emotional intelligence' was coined as social intelligence as early as 1925 by scholars like Thorndike.

Emotional Intelligence is defined as the ability to motivate oneself and persist in the face of frustration, control impulse and delay gratification, to regulate one's own moods and keep distress from swamping the ability to think, to empathize and hope (Goleman,1998), it is a set of interrelated skills relating to the ability to perceive accurately, appraise and express emotions, the ability to understand emotions and to regulate emotions and promote emotional and intellectual growth(Mayer and Salovey,1990): it is the use of intelligent and intentional emotions to work for us and guide our actions in order to enhance results(Weisenger,1998)

Emotional intelligence as a concept has gained popularity in the last two decades (Mayer and Salovey, 1990; Goleman, 1998, Cooper, 1997, Weisenger, 1998). There are many definitions of the concept, but all of them emphasize the ability to use emotions effectively in relations with others. Goleman (1998) coined the term emotional intelligence. In the past decade more researchers have modified his version of the concept (Salovey and Mayer ,2000, Rahim,2010).The modification was motivated by the need to move from the measurement of personality traits only to include also aspects of abilities in the measurement of emotional intelligence(Polychroniou,2009).

This research is based on Goleman's conceptualization of empathy as a cornerstone of emotional intelligence. According to Goleman (1998) emotional Intelligence consists of four cornerstones:

- Self awareness, the ability to understand our emotions, weaknesses, needs strengths and drives, which enables us to understand the effect we have on others and deal with our problems effectively.
- Self Regulation, the ability to manage our emotions effectively
- Motivation, it involves an inner drive to achieve beyond the expected
- Empathy, the ability to bring more of ourselves in our relations with others to enable us to listen effectively and to achieve a deep understanding of others.

Empathy is identified as a very important cornerstone of emotional intelligence required in dealing with people and helping others regulate their emotion to achieve desirable goals (Polychroniou, 2009).

## **Research Objectives**

The study, as previously indicated, aims at examining the relation between empathy, and assessing any gender and racial differences that might exist within the sample under study.

## **RESEARCH DESIGN**

In keeping with the research objectives of determining the effects of demography on leadership style, a cross-sectional quantitative design was undertaken (Cooper & Schindler, 1998). To ensure that relevant data was collected, two previously tested and validated instruments: the Emotional Intelligence Questionnaire and the Multifactor Leadership Questionnaire were used (Avolio, 1995; Wong & Law, 2000). Items from these

questionnaires were used to compile questions for the data collection instrument. A self-completion questionnaire was used.

## Sampling and sample size

Since the sampling frame consisted of all leaders and managers from South African firms, the sample was drawn from managers attending a master of business leadership (MBL) programme at a leading university in Gauteng Province, South Africa. Since Gauteng is the economic hub of South Africa, the majority of head offices of various firms are present there; it made sense to collect a sample from Gauteng. Also, considering MBL students meant that a diverse population from different organisations and backgrounds could be easily accessed (Calder et al., 1981). Table 1 below presents a summary of the sample characteristics.

**Table 1**  
Demographic Characteristics of the sample

Demographic Characteristics		Percentage
<i>Gender</i>	Male	81
	Female	19
<i>Age Group</i>	26 – 30 years	20
	31 – 35 years	44
	36 – 40 years	19
	41 – 45 years	9
	46 – 50 years	6
	51+ years	2
<i>Ethnicity</i>	Black	48
	White	43
	Coloured	2
	Indian/ Asian	7

In total about 120 questionnaires were distributed. Of these, only 100 were returned and used for analysis. Given that the study was considering managers as respondents, the fact that there were no participants under 26 years of age was not surprising. However, researchers had anticipated that a much more mature sample would be accessed. All the same, given that the study is explorative in nature, this was not considered too problematic.

## RESULTS

The study, as previously indicated, aims at examining the relation between empathy, and assessing any gender and racial differences that might exist within the sample under study.

Factor analysis was conducted to test construct validity of items. This produced a 7-factor structure, as shown in Table 2.

**Table 2** Seven-factor solution

Factor	Questions loading onto the factor
<b>1: Idealised Influence</b>	Q. 1 Q. 8 Q. 15
<b>2: Inspirational motivation</b>	Q. 2

	Q. 9 Q. 16
<b>3: Intellectual stimulation</b>	Q. 3 Q. 10 Q. 17
<b>4: Individualised consideration</b>	Q. 4 Q. 11 Q. 18
<b>5: Contingent reward</b>	Q. 5 Q. 12 Q. 19
<b>6: Management by exception</b>	Q. 6 Q. 23 Q. 20
<b>7: Laissez faire</b>	Q. 7 Q. 14 Q. 21

The above findings seem to be in order and consistent with past research, hence indicating that construct validity was acceptable. In other words, the questions were in actual fact measuring what they were supposed to be measuring.

In addition, the demographic variables (age, race, and gender) were considered as covariates in order to assess their effect on the relationship of the dependent and independent variables. A Fisher's Exact Test was used to compare leadership style and the various demographic profiles. In all three cases, the covariates indicated results that were not significant (Table 3). This therefore shows that regardless of age, gender, or race, the effect of leadership style and empathy is not significantly changed.

**Table 3:** Personal differences and leadership style

	$\chi^2$	P-value
Gender	1.97	.880
Race	2.64	.908
Age	.98	.646

## Emotional intelligence an gender

In order to measure respondents' emotional intelligence, the Emotional Intelligence questionnaire was utilised. The scale contained 16 items measuring two dimensions of emotional intelligence. The first is self-emotion appraisal, which is one's awareness of one's emotions. The second part looks at awareness of others' emotions (including those of fellow managers and subordinates). In the latter, a manager's ability to use and motivate others using emotions is also assessed. A 7-point likert scale (1 = high emotional intelligence and 7 = low emotional intelligence) was used by respondents to rate their perceived level of emotional intelligence. In total the scale measures four dimensions: (1) self-emotional appraisal, (2) Others' emotional awareness, (3) use of emotions, and (4) regulation of emotions.

Of the four dimensions, significant differences between male and respondents were realised on only two dimensions: self emotional appraisal and others' emotional appraisal. Tables 4 and 5 summarise the results. Females scores very high on empathy and self awareness. For instance 70 per cent of the female respondents indicated that they strongly agreed to the question asking if they understood whether they were either happy or unhappy, another 30 per cent agreed to this question (Table 5). This is a stark contrast to only 51 per cent of males who strongly agreed to the same question (Table 4).

Female respondents further scored very high on the empathy items, from 96 to 100 per cent of female respondents strongly agreed to agreed while only 59 to 74 per cent scored in the same ratings for males.

**Table 4:**  
Emotional intelligence: Male respondents

**Key:**

SA = Strongly Agree  
A = Agree  
Sl.A = Slightly Agree  
NS = Not Sure  
Sl.D = Slightly Disagree  
D = Disagree  
SD = Strongly Disagree

Count (percentage)

	SA	A	Sl. A	NS	Sl.D	D	SD
<b>Self Emotion Appraisal</b>							
Having certain feelings	13 (28)	40 (44)	6 (13)	5 (11)	1 (2)		
Understand own emotions	14 (31)	22 (49)	4 (9)	3 (6)			
Understand one's feelings	9 (20)	22 (49)	9 (20)	3 (7)	2 (4)		
Know if happy or unhappy	35 (51)	21 (47)	1 (2)				
<b>Other's Emotions' Appraisal</b>							
Understand friends' emotions	5 (11)						
Good observer	7 (15)						
Sensitive	12 (27)						
Understands emotions of people	3 (7)						

**Table 5:**  
Emotional intelligence: Female respondents

**Key:**

Sl.D = Slightly Disagree  
D = Disagree  
SD = Strongly Disagree

Count (percentage)

	SA	A	Sl. A	NS	Sl.D	D	SD
<b>Self Emotion Appraisal</b>							
Having certain feelings	1 (10)	5 (50)	1 (10)	2 (20)	1 (10)		
Understand own emotions	1 (10)	6 (60)	3 (30)				
Understand one's feelings	3 (30)	5 (50)	2 (20)				
Know if happy or unhappy	7 (70)	3 (30)					
<b>Other's Emotions' Appraisal</b>							
Understand friends' emotions	9 (90)	1 (10)					
Good observer	1 (10)	8 (80)	1 (10)				
Sensitive	2 (20)	7 (70)	1 (10)				
Understands emotions of people	1 (10)	6 (60)	3 (30)				

## Limitations

South African organizations face increased diversity due to advancement of previously disadvantaged group within the mainstream economy. More companies appoint women and black (Africans) people categories as designated groups in the Employment Equity legislation. Empathy is a very important requirement in managing diverse organizations. Lack of empathy signifies a possible need for managerial intervention programmes which employers might not realize. The sample size was relatively small the results can therefore not be generalized. Further research is required to explore the relationship between leadership style further and a bigger sample might yield better results.

## DISCUSSION AND CONCLUSIONS

The intention of the article is not to confirm the historical negative gender stereotyping that is aimed discriminating against women especially within organizational context. The general believe that females are more emotional than males suggest that females are incapable of managing their emotions and therefore cannot be good leaders. This article aims at valuing empathy as an emotional skill possessed by females that makes them to be better leaders especially in environment that is characterized by transformation and change (Fondas, 1997). Leadership is about understanding what motivates people and not system contains them. Emotional literacy and empathy in particular will facilitate the implementation of transformation (Maddock, 2002). The study adds to the current empathy literature and brings in a South African perspective. The study confirms results from previous studies which suggest that female leaders tend to be more empathic than their male counterparts. This is consistent with past research, which also indicates a greater proportion of women respondents showing more tendencies towards empathetic behaviour than male respondents. The suggestion of these results is that female managers show more resilience and effectiveness, as leaders in a transformational environment, than their male counterparts. This finding was consistent across all ethnic profiles, which yielded no significant relationship between race and emotional intelligence or leadership style. Given that research in the area of transformational leadership, within the context of a democratic South Africa, is yet to reach critical mass, this study not only contributes to the literature, but also to the practice of management and leadership. Also, given that the current study was conducted in Gauteng Province, looking at managers in different provinces may provide the opportunity to widen the scope.
