PUBLISHED BY THE GLOBAL BUSINESS AND TECHNOLOGY ASSOCIATION

ISBN: 1-932917-09-8

The materials published in this Readings Book may be reproduced for instructional and noncommercial use. Any use for commercial purposes must have the prior approval of the President of the Global Business and Technology Association.

All full papers submitted to the Global Business and Technology Association Conferences are subject to a peer reviewing process, using subject specialists selected because of their expert knowledge in the areas.

Global Business and Technology Association (GBATA) is publishing partner with EBSCO Publishing. This allows researchers from throughout the world to access articles from the Readings Book.

Printed in the United States of America, 2013

Management Research Centre for Rapid and Sustainable Product Development

*The GBATA 2013 Readings Book is
sponsored by the Management Research
Centre for Rapid and Sustainable Product
Development (CDRSP) at the Polytechnic
Institute of Leiria, Portugal.*

FORWARD

The purpose of the conference is to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations of new challenges in global business and technology: strategies, policies and issues.

All full papers submitted to the Global Business and Technology Association Conferences are subject to a peer reviewing process, using subject specialists selected because of their expert knowledge in the areas.

Academicians, practitioners, and public policy makers at all levels throughout the world submitted original papers for conference presentation and for publication in this Readings Book. All competitive papers were refereed (subject to a peer review). The result of these efforts produced 472 empirical, conceptual and methodological papers involving all functional areas of business education with a special focus on international aspects. Of the 348 papers accepted for presentation at the conference, 169 papers are published in this Readings Book.

ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the Fifteenth Annual International Conference of the Global Business and Technology Association (GBATA). The GBATA extends its many thanks to the financial sponsors of this conference: Arcadia University, U.S.A.; Haaga-Helia University of Applied Sciences, Finland; UNITEC Institute of Technology, Faculty of Creative Industries and Business, New Zealand; Polytechnic Institute of Leiria, Management Research Centre for Rapid and Sustainable Product Development (CDRSP), Portugal; Brno University of Technology, Czech Republic; and University Nove de Julho-UNINOVE, Brazil.

A successful conference could not be possible without the special cooperation and care of the program committee members. Furthermore, many thanks go to the reviewers for reviewing the many papers that were submitted to this conference.

The last but not the least important acknowledgement goes to all these who submitted their work to be considered for presentation at the conference. Also, special thanks to the reviewers, session chairs and discussants for taking the extra time to make this conference a success.

N. Delener, Ph.D.
President, Global Business and Technology Association

REFLECTIONS ON MANAGEMENT AND LEADERSHIP IN LOCAL GOVERNMENT IN SOUTH AFRICA: THE QUEST FOR EXCELLENCE IN SERVICE DELIVERY

G. Abera and E. J. van Rooyen
Tshwane University of Technology, South Africa

ABSTRACT

South Africa is internationally acknowledged for its leadership in building democratic local government. As part of its pursuance to public service transformation, the Country has developed systems, which imbed state-of-the art administrative technologies. The South African local government arena is well-endowed with resources and supportive appropriate processes are available. However, practical execution is often hampered by inadequate management and the associated leadership required for the purpose of service delivery. Performance reports indicate significant inadequacies in service delivery, which visibly manifest in the form of regular community demonstrations in municipalities where citizens feel disillusioned by the system.

This paper focuses on the service delivery imperative and its dependence on sound management and leadership by local government institutions. It takes a reflective, theoretical approach to describe the service delivery dynamics more than 19 years into the South African democracy, and the nature of appropriate management and leadership expected in the process. A qualitative study is undertaken, where the authors reflect from their participant-observer status, on the leadership dynamic, coupled with the resources and process mix in the quest towards achieving excellence in local government service delivery.

INTRODUCTION

South Africa is a state with a strong local government system, which constitutionally provides for service delivery among local communities throughout the country. The local government system is mandated to provide services such as health, refuse removal, street lighting, roads and environmental protection. Such services form a constitutionally mandated base to development. Hence, local government in South Africa is developmentally oriented and is set on promoting economic development. Over the years demonstrations and the destruction of local infrastructure has characterized the actions of communities in South Africa. This has raised concern and a need to conduct an analytic review is seen as critical to enhance the performance of these institutions as they strive to fulfil their mandate.

The purpose of measuring performance is to determine whether or not public sector institutions are working towards achieving the fundamental mission and purpose of government, that is, to enhance service provision and improve the lives of the communities. Without measuring the performance of these institutions, it is not possible to determine whether or not services are delivered as expected for the benefit of communities. Thus, in this analysis two concepts are critical. These are *service delivery* and *performance measurement*.

QUALITY SERVICE PROVISION IN THE PUBLIC SECTOR

Excellent service delivery by local government institutions are causal to effective public decision making and planning, community participation, community interest and not the interest of political office bearers. The work of this system can only be known through an intelligible performance, monitoring and evaluation system, taking cognizance of critical indicators of performance and checking whether or not there is

adherence to these pointers in all service delivery actions.

The term 'service delivery' is used interchangeably with 'service provision. It is a concept that is rooted in government operations and underlines the basic functions or *raison d'être* of the state. This implies that the provision should be undertaken in a manner that satisfies communities at the same time balancing such a service with the cost of the service. Consequently, appropriate service delivery is that which maximizes benefits and minimizes costs. This is the essence of an efficient service delivery system.

Rickert (2001:90) defines this concept as follows: "Service delivery is concerned with the provision of a product or service, by a government or government body to a community that it was promised to; of which is expected by that community". Fox and Meyer (1995:118) define service delivery as "the provision of public activities, benefits or satisfactions to [communities or any other user of such products or services]". Thus, service delivery is the basis for the existence of public sector organizations. It is the ability of public institutions to offer service users with what they want in an efficient, effective, responsive and fair manner. The services offered by government are the most tangible outputs of administrative agencies (Shankansky, 1975:334) and this output would be meaningless to consumers or publics (or customers) if they do not derive the intended satisfaction.

In this context, the notion of quality arises. An abundance of definitions of quality exist. Some notable ones include the following:

A 'conformance to requirements': discover what the customer wants, train everyone how to accomplish it, and then deliver that to the customer on time (Crosby, 1992:116); and

A customer-based way of doing business: the user of the product or service can count on it for its intended purpose (Juran and Gryna, 1980:1-2);

Quality is customer oriented and it is a universal concept that exists in both public and private organizations. It is through quality services that the consumer of a service or a product is satisfied.

The question arises then as to how can quality services be improved? The following are the criteria on how quality service provision can be improved:

- *Improving communication* within the organization and with customers, suppliers of goods and services to the organization and other sister government organizations who have a stake in the process of service provision. For example, municipalities need to maintain excellent communication links with the department of local government, the provincial department, NGOs and CBOs. Synergy cooperation is indeed a requirement if there has to be a meaningful impact in providing municipal services.
- *Instituting a vigorous programme of educating and training service providers inclusive of both administrative and professional officers in municipalities* (Ishikanowa, 1984:4).
- *Generating a culture* built on respect for the community members as citizens, secondly as clients who pay for services. This helps to enhance mutual acceptance and tolerance of one another. This is fundamental for the protection of human quality.

Crous (2006:399) indicates that it is not about the constituent characteristics of the product or service but what it yields to the consumer or customer. This is critical as communities are the end users of the service and have knowledge on what they expect. The consultation process goes beyond the mere fact that consumers have a practical inquiry to come up with a service of best fit. Thus, quality service delivery should exhibit the following characteristics: Focus on customer expectations (responsiveness); Timely provision (reliability); Provide through a participatory approach (communities and other stakeholders); Cost effectiveness which is intended to maximize benefits and minimize costs; Provide fairly (equity); Sufficient to satisfy communities (adequacy); and Achieve goal of service provision (effectiveness).

According to Kroukamp (1999:300), quality service delivery can be maintained if the public service is rationalized and restructured, professional service ethos are infused in the service, civil servants are motivated through appropriate employment conditions and labour relations, human resource development and training are adopted, the state is democratized, representativeness and affirmative action are adopted, and management and institution building mechanisms are put in place.

South Africa is a state devoted to building democracy and good governance. Thus its approach to quality service provision should be such that it encapsulates democratic values of liberty, participation,

responsiveness, and equity. In the same vein the service should enhance good governance. Thus, a sound governance system exhibits the following principles considered appropriate for ensuring clean and strong governance: Legitimacy and rule of law; Public accountability; Openness, information and transparency; and citizen participation; and checks and balances (Kanyane, 2006:313).

South Africa has a service delivery and associated performance policy entitled *Batho Pele*. The advantages of *Batho Pele* as a policy are that it facilitates interactions between service providers and clients. It encourages the generation of new ideas to improve service delivery. Service provider tends to focus on what customers want (demand-side of service delivery). But for these gains to be meaningful, service standards must be clear. There should be a clear political will to provide quality service. Public officials should be trained in ethics and commitment to the customer. This calls for management acumen as well as leadership ability.

MANAGEMENT ACTIONS AND LEADERSHIP IN LOCAL GOVERNMENT

Management and its association with leadership is an old concept that existed many centuries ago. For example, many philosophers from all disciplines had different philosophies about the state/politics/management and leadership and some of their philosophies are still practiced today, depending on what type of leadership in place. Niccoli Machiavelli, John Locke, Aristotle, Max Weber, Frederic Taylor mention but a few. Machiavelli views of government as the provider of safety, power and prosperity, where the leader's primary concern was the security of the state while Hobbes and Locke argued that government was a means to an end (Bagby & Franke, 2001:625). Also Max Weber's doctrine contented that government should implement the functions of the state, that there was scientific knowledge to assist administrators in carrying out these tasks and lastly that there should be a competent chief executive to lead and manage the process (Spicer, 1998 in Schoeman, 2008:26) .

Many countries in sub-Saharan African governments were negatively affected by the colonial legacies and pro-market policies. This has crippled local government as the lowest sphere of government. In the South African context, the post South Africa government inherited colonial and apartheid legacies, but failed to correct the mistakes that were made in the past due lack of capacities to use new government systems and to translate policies to actions, the introduction of cost recovery policies as a way to build together approach and so on and so forth. Hence, the failure to do the right thing at the first time crippled service delivery particularly at the local government level. The post South African government had enthusiasm to provide services to all South African particularly those who were marginalised during the apartheid era. Excellent policies and programmes were in place, but the government lacked proper management acumen and leadership ability for the most part. The outcome of these is felt today through service delivery protests and to rectify this, leadership and management issues that guide the provision of services need significant improvement up particularly at the local government.

In this regard, leaders have distinctive characteristics as follows: Leaders trigger a person's "will to do"; leaders show the way and guide group members toward group accomplishment; leaders give vision to their followers and leading is a necessary ingredient of successful management; and a relationship in the person (the leader) influences others to work together willingly on related tasks to attain goals desired by the leader and/or group.

CONCLUSION

South Africa is acknowledged to be a leader in building democratic local government. However, such cannot be done adequately where the nature of service delivery is unacceptable to communities and leadership in service delivery is rather questionable. The problems confronting many citizens today are as a result of historical factors and pro-market policies adopted by the post South African government since 1994. South African society is still fragmented and this has remained a challenge to service delivery. Failure to deal with local government leadership and management challenges will hinder government's intention of providing quality services particularly the rural and semi-rural who were tremendously affected by the unequal distribution of services by the apartheid regime. The nature of leadership determines the nature of services provided to people. This means that it is not about the virtue of being a democratic government only, but to put people first in actions in providing quality services that give them quality life a through, and this can

make sense through active inclusion everyone in society. To attain this leadership together with management ability is crucial. Since government is a means to an end, it is important for it to be have leadership that is committed to go an extra mile to make people's lives better.

RECOMMENDATIONS

Massive education and training should be also the way to go: It remains vital to embrace education and training in any level of governing and leadership at all levels, especially the grassroots level where the very needy of services and goods reside. Education empowers and also offers conscious of utilising services effectively. This will help communities and governments work well together in the whole process of providing services and even in other developmental oriented activities.

Furthermore, information about services should be disseminated to everyone in the country most especially those in the remote rural: quality information is the key to service delivery. i.e. people must be informed of services/goods to be provided to them, and should there be changes due to any reason or circumstance, they are entitled to be informed. This is possible and achievable through setting channels on how information can be disseminated especially to the rural areas. However, this has remained a challenge at the local sphere of government and needs to addressed.

Performance monitoring and evaluation (M&E): Monitoring and evaluation is important since they are right measure of performance. There has been insufficient of M&E at the local government level and when it is done, it is none well. Monitoring and evaluation must be re-emphasised in all levels of government particularly at the local government level.

CONCEPTUAL RELATIONSHIP BETWEEN E-SKILLS PROCEDURAL AND PEDAGOGICAL KNOWLEDGE OF VOCATIONAL BUSINESS STUDIES TEACHERS IN ICT-BASED CLASSROOM

Adegbenro Bolaji Janet and Mwakapenda, W.W
Tshwane University of Technology, South Africa

O.O. Olugbara, Durban University of Technology, South Africa

ABSTRACT

This study was designed to formally unveil the dynamic relationship between e-skills procedural and pedagogical content knowledge of Vocational Business Studies (VBS) teachers, especially as it applies to the effective delivery of Office Data Processing (ODP) teaching and learning in an ICT-enhanced classroom at Further Education and Training (FET) colleges. Based on the extended models of Shulman PCK and Mishra & Koheler TPACK a 65-item questionnaire using a five-point scale was developed and used in this study. The population of this study was made up of 107 novice and veteran VBS teachers in eight Further Education and Training (FET) colleges in Gauteng Province of South Africa. The findings of this study revealed that e-skills procedural has the highest direct impact on pedagogical knowledge and also teacher experience is an important construct that moderates the dynamic relationship between e-skills procedural and pedagogy.

INTRODUCTION

The preparation of teachers in the educational uses of technology appears to be a key component in almost every improvement plan for education and educational reform programs Davis & Falba (2002); International Society for Technology in Education (2002); Thompson, Schmidt, & Davis (2003). According to Gess-Newsome, Menasco & Willis (2003), while some issues in education take on the flavor of their social and historical context, others; such as how to prepare teachers to integrate technology in teaching and learning, remain almost ill-defined. Most importantly, research evidence shows that in spite of many efforts that researchers and educational institutions invested over the years in preparing teachers in the educational uses of technology, they (teachers) still lack the skills and knowledge needed to be able to teach with technology successfully. Rodrigues & Marks (2003).

In the first decade of democracy, the South African government embarked on radical reforms to the apartheid education system. One such set of reforms involved the restructuring of Further Education and Training (FET) sector, entitled “A new institutional landscape for public further education and training colleges: Reform of South Africa’s technical colleges Department of Education (2001) was released in September 2001. The reorganisation of the FET colleges sector brought with it the prospect of meeting the objectives of the country’s Human Resources Development Strategy DoE & Labour (2001). FET colleges would be transformed so that they offered learners “high-quality, lifelong learning opportunities that are essential to social development and economic competitiveness in a rapidly changing world” DoE (2001; 5).

Within a relatively short space of time (2000-2003) public FET colleges were merged from inequitable assortment of 152 small individual colleges to 50 mega-FET institutions, which are multi-site and diverse. Since then the college sector has witnessed huge investment by the state through the recapitalisation process which started in 2005. The government initiative to bridge the digital divide provided schools with fully equipped computer laboratories DoE (2008: 10). The Department of Education

started the integration of Information Communication Technology (ICT) at colleges and schools sector. In a study conducted at South African high schools, SAIDE (2009) found evidence that ICT added value to the learners' motivation and interest in their understanding of the relevance of computers in commerce and industry. The Department of Education (2004) also recognised a global revolution taking place in vocational education and training due to the realities of the information age and has issued a document entitled "Guidelines for ICT integration with National Curriculum Statement subjects in Grades 10-12". The document aims to assist schools and colleges in the process of integrating ICT with their teaching and learning and states that "learners would benefit significantly by using a computer to achieve these learning outcomes and assessment standards". The guideline for accounting and business studies suggests the following software for education at the schools: Pastel, QuickBooks, and Interactive Business DoE (2004).

In 2007, over 25,000 students enrolled for the new National Certificate Vocational (NCV) program in the 50 FET colleges in South Africa. The pass rate for that year was very disappointing at 20 percent, including the alarming rate of drop outs in all the vocational and technology courses particularly ODP (that is very crucial for Secretary) (Department of Education, 2007). The South African Institute for Distance Education (SAIDE) recently reported in their investigation and evaluation of the use of ICT for teaching and learning in FET colleges that no effective teaching and learning take place. They discovered that despite many FET colleges own between 60 to 100 computers with interactive teaching box and some have over 100 computers in their computer laboratories, many teachers still lack adequate knowledge and skills to use ICT in ICT-enhanced classroom environment (SAIDE, 2009).

When technologies are integrated into instruction in authentic ways, they have the potential to support meaningful change in teaching and learning. Without understanding and preparing for how best to use technologies in the classroom, however, instruction and learning may suffer through ineffective use of the technologies (Culp, Honey & Mandinach 2003). According to Cox (1999), despite the teacher training program, there has been slow uptake of ICT in schools and colleges by a majority of teachers as some teachers have shown resistance towards effective use of ICT.

A recent study carried out by DoE (2007) showed that most FET colleges' ODP students are not trained with all the new technologies to prepare them for the world of work or self-employment. Pierson (2001) conducted a case study "Technology Integration Practice as a function of Pedagogical Expertise" and found out that technology use was related to instructors' teaching expertise. Pierson suggested that it is crucial to have experienced teachers who can effectively use technologies to benefit student learning and skills development. Because new technologies are becoming more pervasive in vocational and technology subjects in FET colleges, The research questions that guided the study from which this paper draws were: (1) What is the conceptual relationship between Vocational Business Studies teachers e-Skills Procedural, Pedagogical and Content Knowledge during actual classroom practice? (2) How different would pre-service VBS teachers be from in-service in using ICT tools and solving technical problems?

Integration of ICT in Business Studies Teaching and Learning

In South Africa, ICT is clearly integral to the existing new National Curriculum Statement (NCS) in schools and colleges (DOE, 2004). ICT is used in our colleges but there is little evidence of significant impact on vocational teaching and learning to produce technologically literate learners and enhance vocational teachers' competence. It is all the more important to understand teachers' ICT skills and knowledge needs, to discover their priorities for future development and to establish what will encourage teachers to adopt ICT where appropriate in their professional development. Most of the FET colleges in Gauteng Province in South Africa have acquired computers and access to the internet from the government with pre-service graduating vocational teachers that have pass through teaching experiences and training in the university, but there is little evidence of significant impact on teaching and learning to produce technologically literate learners Cole (2004). If vocational educators are to make the best use of computer and associated resources, they will need substantial support in a range of competencies. (South African Institute for Distance Education, 2007).

The recent Teacher Laptop Initiative (TLI) is part of the government's efforts to improve teaching and learning in the overall educational system in South Africa. The purpose was to help the 386 600 teachers in South Africa schools and colleges to effectively integrate ICT into their Pedagogical Content Knowledge (PCK). This effort turned out to be a major investment of over Rm550 per annum for the next five years to provide laptops for permanent teachers in nine South Africa provinces (Ndlovu, 2009). The primary concern when government makes huge investment in ICT is how the investment will positively influence the education system and the performance of teachers, learners and individuality. However, despite

the huge investment on ICT for the educational system “there is a paucity of empirical research evidence showing the investigation and assessment of the nature of the knowledge of pre-service and in-service teachers in the use of ICT to represent their ideas to the learners so as to enable them to understand the content of the subject matter, particularly in an ICT-based classroom instruction such as Office Data Processing (ODP)” in Business Studies. The National Examination Assessment and Measurement (NEAM) reports suggested that many learners lack ODP skills because of ineffective and underutilization of ICT infrastructure for teaching and there was alarming failure in ODP particularly and Engineering. (DOE, 2007).

Teachers’ Technology use in an ICT-Enhanced Classroom

Lack of ICT-related knowledge and skills globally among pre-service and in-service teachers has been seen as a major obstacle to realizing ICT-related objectives of colleges and schools. Pelgrum & Anderson, (2001). Generally, both pre-service and in-service teachers feel confident about basic skills but less about addressing technical application problems. Flanagan & Shoffner (2011) recently studied two experienced and novice English teachers’ methods in solving computer technical problems and discovered that both novice and veteran teachers rely on trial-and-error methods and often avoided using ICT tools when they did not have access to technological skills and resources. There are numerous challenges that exist in literature related to the integration of technologies in an ICT-enhanced classroom instruction. McKenna et al. (2007); and Schmidt et.al., (2009) have suggested that the most difficult challenge for teachers is lack of training and preparation for technology use in ICT-enhanced classroom instruction. Ruthven, Hennessy & Brindley (2004) report that “teachers trained with obsolete technologies often lack in-service technological training, as well as a desire for better preparation as pre-service teachers and continued preparation as in-service teachers”. There is need to explore the conceptual nature and relationship between VBS teachers’ e-skill procedural, pedagogical and content knowledge in the effective use of new technology tools in ICT-based classroom instruction.

METHOD

Instruments, Sample and Procedures

In this study quantitative and qualitative research methods of collecting data were utilized to address the research questions in this study. The choice of mixed-method explanatory research method was based on the premise that mixed method have an added value of better data triangulation, expansion of findings and reasonable interpretation (MacMillan & Shumacher, 2006:p.48). Using explanatory design, in which quantitative data collection and analysis was followed by a qualitative phase that provide a deep comprehensive understanding of vocational business studies teachers’ e-skills procedural and pedagogical knowledge, skills and attitude towards solving technical problems in an ICT-based classrooms (ontological world). The qualitative portion of this study provided us with opportunities for cross-unit comparison of pre-service and in-service ODP teachers’ technology use.

The quantitative data collection instrument used an ICT-based survey data Template (ICT/SDT) of pre-service and in-service vocational BS teachers’ e-skill procedural, functional, pedagogical and content knowledge (sPrFPACK). Based on the available literature, a 65-item questionnaire using a five-point scale was developed and used in the study to collect quantitative data from 107 pre-service and in-service ODP teachers in eight Further Education and Training (FET) colleges in Gauteng Province, South Africa. For in-depth observation, four novice and experienced ODP teachers were selected from two FET colleges that are well equipped with all ICT infrastructures. Data was collected in the form of questionnaires, classroom observations, and interviews. The survey address knowledge and skills of vocational BS teachers’ specific knowledge domains such as; word processing, spreadsheets, Audio Typing, Advance presentation, Interactive Teaching Box, Internet and Web technology. This is in line with National Certificate Vocational (NCV) new curriculum standard and ICT White paper policy (DoE, 2007: pp, 2-4). The survey questionnaire was pilot tested with 94 ODP teachers in 5 FET colleges in Gauteng province, South Africa. The findings from the pilot test revealed that all 65 items addressing 13 knowledge construct (refer to Table 1) were reliable since Cronbach alpha are all greater than 0.7. The teaching experience of these teachers ranged from 1 to 25 years. Data was analyzed through Partial Least Square (PLS) model and Stata V11 (2009).

Table 1: Knowledge Constructs Description and Corresponding Matrix

Knowledge Construct	Matrix
1. Pedagogical	A response that shows the skills in using different methods and strategies to teach the subject matter
2. Content	A response that shows the understanding of the subject matter (knowing)
3. Functional	A response that shows the ability to describe steps or rules that governs the use of ICT tools and the understanding of how to apply the rules and concepts to achieve the goal in a lesson.
4.e-skill Procedural	A response that shows an effective demonstration of the use of ICT tools to represent the subject matter with dexterity in solving recurrent trouble shooting problems without disrupting the lesson. (e-Skills)
5. Pedagogical content	A response that shows the use of different methods for understanding the subject matter(strategy, methods)
6 Pedagogical functional	A response that shows the knowhow of using different methods and strategies to describe the rules and right steps to follow in the subject matter(knowhow)
7. Procedural content	A response that shows an effective demonstration of the understanding of the subject matter and procedures to use ICT tools and solve recurrent technical problems as the need arises. (e-skill, know)
8. Procedural functional	A response that shows an effective demonstration of knowhow to describe the rules and functions of ICT tools and how to solve troubleshooting problems without disrupting the lesson (e-skills)
9. Procedural functional content	A response that shows an effective demonstration of the understanding and knowhow to describe the functions of ICT tools and solve troubleshooting problems in the subject matter.(e-skills, know-how)
10. Procedural functional pedagogical	A response that shows an effective demonstration of the knowhow of using appropriate methods and following the right steps to teach the subject matter and solve technical problems without disrupting the lesson. (e-skills, knowhow, strategy)
11. Procedural pedagogical content	A response that shows an effective demonstration of the use of appropriate methods and right steps for understanding the subject matter and troubleshoot technical problems (e-Skills, strategy, know).
12. Functional pedagogical content	A response that shows the knowhow of using appropriate methods and strategies for understanding the subject matter and describing the rules and steps correctly(Know how ,strategy, knowing)
13. Procedural functional pedagogical content	A response that shows an effective knowhow of using appropriate methods and following the right steps for understanding the subject matter and solve technical trouble shooting problems without disrupting the lesson. (e-skills, know how, strategy, knowing)

Figure 1 shows the e-skill Procedural, Functional, Pedagogical and Content Knowledge sPrFPACK framework used to explore the conceptual relationships between VBS teachers' e-skills procedural and pedagogical content knowledge in an ICT-based classroom context. This framework is useful for exploiting extensive components of technology knowledge and it defines thirteen knowledge types based on Technological, Pedagogical and Content Knowledge (TPACK) extension.(Mishra & Koehler, 2008). Table 1 shows the explanation of the knowledge constructs and the corresponding matrix.

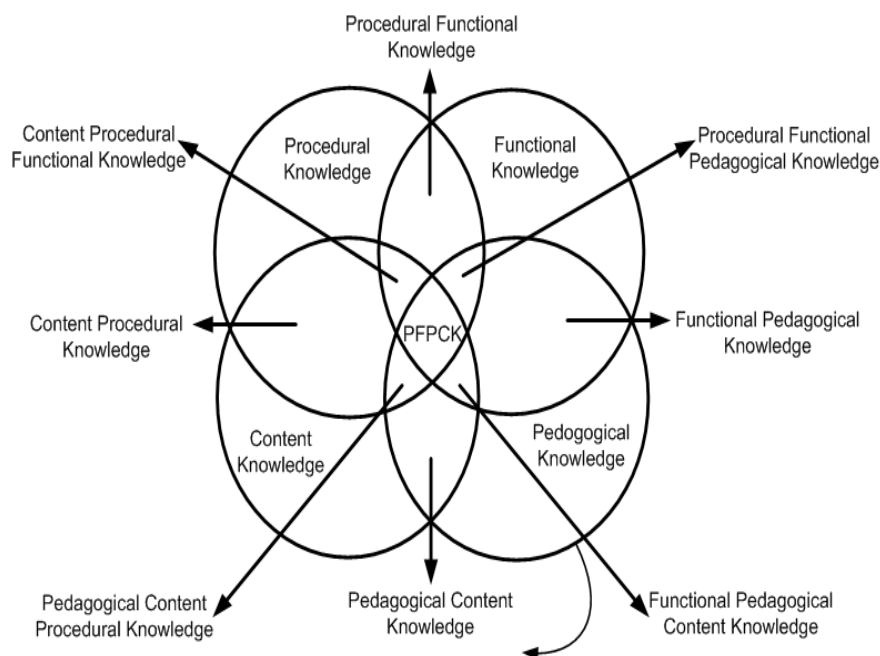

Figure 1: The sPrFPACK Framework (Adegbenro, Olugbara & Mwakapenda, 2012)

Conceptual Relationships among PrFPACK of VBS Teachers

Research question 1: What is the conceptual relationship between VBS teachers' PrFPACK during actual classroom practice in ICT-based classroom? A closed end questionnaire was distributed to all the pre-service and in-service VBS teachers in eight FET colleges in Gauteng province with 65 items to test the suggested conceptual relationships between content Knowledge (CK), Pedagogical Knowledge (PK), Functional Knowledge (FK) and e-skill Procedural Knowledge (sPrK) quantitatively. The raw data was captured into the spread sheet and imported into the software 'Partial Least Squares' (PLS). The summary of the structural model specification is shown in Table 2 below.

Reliability of the Measuring Instrument

The questionnaire was given to 107 novice and experienced ODP teachers in eight FET colleges in Gauteng and was used to test for reliability using Cronbach's Alpha as demonstrated in Table 2. The results obtained and listed in Table 2 below show that all constructs showed good reliability, all are above the threshold of 0.7 (Pallant, 2005). e-skill Procedural (sPrK) had the highest reliability with a Cronbach's Alpha (α) value of 0.8704 out of the four constructs. The implication of this is that the instrument used may reliably be used on different datasets and it will produce good results.

Table 2: Summary of Structural Model Specification

	AVE	Composite Reliability	R Square	Cronbachs Alpha	Communality	Redundancy
CK	0.575080	0.870763		0.815044	0.575080	
Experience	1.000000	1.000000		1.000000	1.000000	
FK	0.616162	0.888396	0.556662	0.841267	0.616162	0.342574
PK	0.572738	0.869900	0.656367	0.812880	0.572738	0.172530
SPK	0.658591	0.906002	0.746352	0.870452	0.658591	0.190984
SPK * Experience	0.415780	0.764592		0.868619	0.415779	

Testing the Relationships

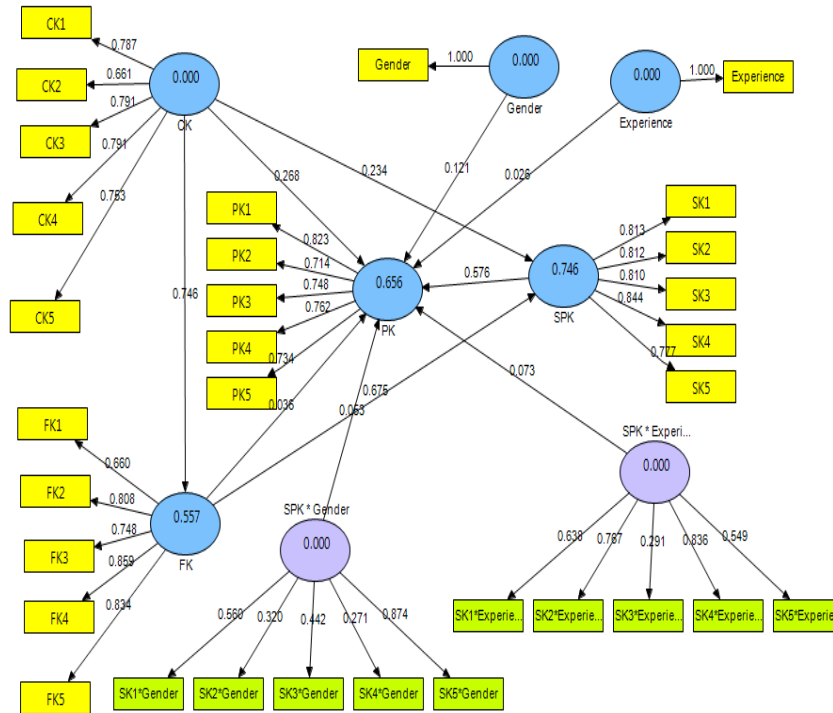

Figure 2 illustrates the hypothesized relationships between the constructs of the model

Hypothesis Testing

Researchers McDonald & Ringo (2002); Hair et al., (2006) recommended that for significance, the critical ratio (CR) also known as the t-value must exceed ± 1.96 . The standardized parameter estimates demonstrated in the model, Figure 2, the Latent Variable Correlations shown in Table 3 and the critical ratios illustrated in Table 4 were compared to deduce the strength of the paths and the interpretations of hypotheses within the model

Table 3: Latent Variable Correlations

	CK	Experience	FK	PK	SPrK	SPrK * Experience
CK	1.00000					
Experience	0.278143	1.000000				
FK	0.746098	0.245295	1.000000			
PK	0.698504	0.266688	0.700572	1.000000		
SPrK	0.737770	0.302079	0.849740	0.773131	1.000000	
SPrK * Experience	0.006070	0.080145	0.048183	0.123240	0.089360	1.000000

Table 3 above shows the correlation between variables and Table 4 below demonstrates the extracted standardized significance levels of the structural model. The values for the critical ratios between the variables that were needed to test the hypothesized relationships were obtained as showed in Table 4.

Table 4: Extracted Standardized Significance Levels of the Structural Model

Paths	Estimate	S.E.	CR	P	Implication
FK <--- CK	.746	.106	3.829	***	Supported

Paths			Estimate	S.E.	CR	P	Implication
PK	<---	CK	.268	.122	3.934	***	Supported
SPrK	<---	CK	.234	.150	3.853	***	Supported
PK	<---	FK	.035	.097	1.556	.060	Not Supported
SPrK	<---	FK	.675	.131	3.852	***	Supported
SPrK	<---	PK	.576	.122	3.965	***	Supported

*** $p < 0.001$; ** $p < 0.01$; * $p < 0.05$

RESULTS AND DISCUSSION

Relationship Outcomes

As indicated in Table 4, the hypothesized relationship between Content Knowledge (CK) and Functional Knowledge (FK) produced a standardized estimate of 0.746, a high correlation of 0.746 and critical ratio of 3.829. The critical level value is above the threshold and estimate value is positively high indicating that the relationship is supported. This means that content knowledge which is the in-depth understanding of the subject matter is directly related to functional knowledge which represents the know how to describe the rules, steps and procedures in the content but not actually performing the action. Shulman (1987) describes content knowledge of the subject matter as a critical aspect in understanding the disciplinary practice of a given subject. This knowledge should include the key concepts, theories, ideas etc. While Ferris (2009) argued that content knowledge as declarative knowledge which is “know that”, is a form of knowledge that is associated with representation of facts rather than the assimilation of facts into constructs for effective action and solve recurrent problems without disrupting the lesson. Biggs (1999) describe functional knowledge as theoretical technology knowledge, having the ability to know how to describe a function and its rules in a content but not to articulate description of what is known and put into practice effectively.

The relationship that was suggested to exist between Pedagogical Knowledge (PK) and Procedural Knowledge (PrK) e-skill exhibited a standardized estimate of 0.576, a correlation of 0.773131 and a critical ratio of 3.965 as shown in Tables 3 and 4. These values indicate that this relationship is significant. PK as the method of instruction is directly connected to the procedure in performing the action and solve recurrent trouble shooting problems. The method of instruction will enhance the appropriate skill performance which leads to clear comprehension of the content. Experienced teachers were observed demonstrating by giving the step-by-step instruction to students using the iBOX to project onto the smart white board. Beginner teachers were also observed verbally explaining the rules, step-by-step instructions and allowing the students to ask questions whenever they were confused.

E-skills Procedural Knowledge PrK

According to (Niess, 2008) and (Biggs, 1999) “Procedural knowledge is the actual application of skills in using technology tools”. All the content of the 10 unit course in Business Studies, ODP NC(V) level 2 in FET college are Computer System based and are all taught with computer system connected to Interactive Teaching Box, projected on the white flat board with internet connectivity and functional Window Media to teach Audio Typing. It was observed that the business studies novice teachers with 2 years teaching experience struggle to achieve the lessons objectives without the effective use of technological tools. Experienced teachers were observed often using iBOX connected with the overhead projector and the Computer System Unit to transform the concept of the content with the functions, and effective pedagogy as the need arose. It was observed that experienced teachers focused on the content, technological tools and functions, the steps and rules the learners must follow to successfully use the ICT tools to enable learners to acquire the required skills. Beginner teachers were hindered by the lack of technical skills to solve recurrent technical troubleshooting problems which made them to always abandon the ICT tools, despite the awareness of the benefits and importance of the technology tools. As (Shafer & Bruewer, 2011) reported “Tasks are designed to be pleasantly frustrating when there is no just-in-time technical support, and the strategy learned in one task becomes a skill in subsequent tasks, leading to a cycle of novice-expertise problem solving activities.” The experienced VBS teachers’ classroom practices support (Shafer & Bruewer’s, 2011) findings. The teachers were able to use all the technology tools effectively and solve all recurrent technical trouble shooting problems through the skills learnt from the technicians over the years of teaching in FET college. As (Selinger, 1996) confirm that, the “Majority of teacher training students are

graduating in an information age without proper guidance on how to use technology tools in the classroom”. However, the context is now changing. As one of the experienced ODP teacher remarked:

The students are just too fortunate compared to our time when we are trained with obsolete manual typewriters. I learnt the technical skills to solve technical problems when the need arises from the technologists on-the-job, by asking them questions and practicing what I have learnt from them instantly, then I became proficient over the years.

The findings in this study gives an in-depth knowledge of the conceptual relationship between pre-service and in-service VBS teachers e-skills procedural, pedagogical and content knowledge demonstrated for their classroom instruction in an ICT-based classroom environment. This study also suggested that there will be a significant relationship between Content Knowledge (CK) and e-Skill Procedural Knowledge (PrK). Table 4 shows that this relationship exhibited a critical ratio of 3.853, a correlation of 0.737770 and a standardized estimate of 0.234. This implies that the relationship between the two variables is significant and that the suggested relationship exists. According to Gavota (2010: 496) Schneider and Stern; Niess (2006) and Biggs (1999), procedural knowledge is knowing how to perform a task correctly at a given point in time and how to solve specific problem as the need arises. Gavota (2010) stated that PrK represents the knowledge that can be directly applied to a task, to perform it correctly. As observed in experienced VBS teachers’ classrooms, experienced teachers often explain the content of the lesson such that the students’ can understand by demonstrating on the smart white board and troubleshooting technical problems, they do this as the need arises without disrupting the lesson.

Analysis of results in Table 3 indicates that experience has a significant influence on all the four suggested relationship. This implies that teachers with experience will demonstrate competency in Content Knowledge (CK) (i.e., having an in-depth understanding of ODP content), Pedagogical Knowledge (PK) (i.e., competent in choosing the appropriate method of teaching and strategies as the need arises), Functional Knowledge (FK) (i.e., competency in being able to describe the concepts, rules and functions of ICT tools). For example, during the classroom observation, in-service (experienced) teacher three (T3) was teaching “touch typing” as a topic in Office Data Processing. She described to the students the steps and rules they need to follow for speed and accuracy after she introduced the topic with clear explanation. One student encountered a printing problem; the student could not print her document at the given period of time. The experienced teacher three (T3) used a flash drive to copy the students’ work from the computer and use another system unit to print the students’ document without disrupting the lesson. The print option of the students’ computer was not responding. Procedural Knowledge (e-Skill) (i.e., having the ability to perform a task correctly at a given period of time on the system unit with the ability to use the tools to solve problems in the content). As compared with pre-service (beginner) VBS teacher two (T2) who often have her lesson disrupted because of technical trouble shooting problems which could not be solved by the teacher. Table 3 analysis agreed with many researchers findings Tozoglu & Varank (2001), Olsen (2000). Their studies showed that experienced teachers are able to effectively enhance students’ motivation in Business Studies and also promotes interest and attention in classroom activities. Olsen (2000) asserted that the effective use of technology by experienced teachers is one of the major strategies in improving throughput. Pierson (2001), conducted a case study on technology integration practice and found that technology use was related to instructors’ teaching expertise.

CONCLUSION AND RECOMMENDATIONS

As Clausen (2007) suggested, “If an institution supports new teachers and provides opportunities for professional growth, teachers are more likely to effectively integrate technology into instructional practices.” Beginner teachers have limited or no teaching experience, thus they may construct e-skill procedural and pedagogical knowledge differently from experienced teachers. Archambault & Carlson (2011: p.99) reported, “Creating technologically rich, pedagogically sound methods that are modeled and taught in their teacher education courses increases the likelihood that teachers will use technology in their classrooms when they teach”. This calls for urgent training of pre-service Business Studies teachers in an innovative pedagogical method of teaching Office Data Processing and other Business studies subjects with technological tools. Vocational teachers’ training institutions should include a holistic instructional technological and pedagogical e-skills that encourages deliberate and creative use of ICT tools with strategies to solve basic technical problems.

LIMITATIONS

The sampling procedure and the nature of the sample were restrictive. The selection of ODP novice and experienced teachers that were interviewed and observed was confined to only two FET colleges in Gauteng province out of the eight FET colleges that were surveyed. However, this limitation did not appear to have much impact on the sample composition in terms of experience. Further, the cases in this study enabled the researcher to obtain a deeper reflection on the context of ODP instruction in business studies.

MOTIVES FOR CORPORATE GOVERNANCE DISCLOSURE IN WEAK INSTITUTIONAL SETTINGS

Ismail Adelopo, De Montfort University, Leicester, UK
Md Humayun Kabir, Tshwane University of Technology, South Africa

ABSTRACT

The aim of this paper is to find out the external drivers for corporate governance disclosure in weak institutional settings. The study used secondary data to gather information and adopts Di Maggio and Powell's (1983) institutional isomorphism to understand the motives for corporate governance disclosure. The study found that corporate governance disclosure practices in a setting with poor market infrastructure, poor economic growth and severe human capital challenges are motivated in ways that are different from documented evidence in existing literature. The study also found that pressure from international organizations, bilateral and regional relationships and affiliation of professional associations to international and regional bodies are key drivers for corporate governance disclosure in a poor economic growth country.

INTRODUCTION

The purpose of this paper is to generate further insight on the motives for corporate governance disclosure in a market setting characterized with poor market infrastructure. This is important in order to articulate firms' disclosure behaviours in a country with poorly functioning markets and thereby improve our understanding on their potential policy and regulatory implications. While previous corporate governance disclosure studies suggest motives such as capital market transaction, corporate control contest, stock compensation, litigation cost and propriety cost hypotheses for disclosures, the literature is silent on the motives for disclosures in environments with severely underdeveloped market, political infancy, and poor human capital record which makes identified motives in the literature inconsequential in these unique settings.

"Corporate governance has dominated policy agenda in developed economies for more than a decade and it is gradually warming its way to the top of the policy agenda on the African continent" (Abor and Adjasi, 2007: 111). Moreover, we know little about the factors that influence corporate governance disclosure in developing countries, particularly in less developing African countries. In this context, this study attempts to provide empirical evidence on the motives for corporate governance disclosure in a poor economic growth country in Southern Africa (i.e. Swaziland). In addition, this study will fill the gap in the literature since research on the drivers for corporate governance disclosure in less developing economy such as Swaziland is underdeveloped.

Swaziland is a Sub-Saharan African country with poor economic growth. Swaziland's governance consists of traditional system and western models system [African Development Bank (ADB), 2005]. The King of Swaziland (King Mswati III) is the head of both systems and has power over legislative, executive, and judicial (ADB, 2005). Swaziland faces serious political and socio-economic challenges such as political parties are banned in the country, HIV infection rate is very high (World Bank Development Indicator, 2011), unemployment rate is more than 40% [Central Bank of Swaziland (CBS), 2010/2011:43], and poverty level is 69.2% (World Bank Development Indicator, 2011). With this respect, it is important to understand the drivers for corporate governance disclosure in this country. Thus, the paper poses the main research questions: what are the external factors that motivate for corporate governance disclosure practices in a country with poor economic growth?

Further, in Swaziland, as in many African countries, there is high incidence of political favouritism and government's appointments are not always based on merit or measurable performance (Dlamini, 2005). The problems and challenges facing Swaziland government constitute a demand for effective corporate governance practices, transparency and honest disclosure. Therefore, an analysis of the motives for corporate governance disclosure in the context of Swaziland as a less developing country will be of great value to academics and business managers to understand the disclosure practice mechanisms in a setting with poor market infrastructure and poor economic growth.

In the next section, this study provides a literature review on the subject matter followed by description of the regulatory and reporting framework in our focal country (i.e. Swaziland). Following sections describe the research methodology, findings and analysis. The last section provides the conclusions and identifies future research opportunity on the subject.

LITERATURE REVIEW

Corporate Governance Convergence

Corporate governance continues to be a hotly contested issue in terms of its meaning and boundaries (Naidoo, 2002). While corporate governance is presented from a somewhat narrow purview of micro-economic concerns of firms and its constituents by some authors (see, Cadbury, 1992; Shleifer and Vishny, 1997), corporate governance has often been presented by international organizations such as the Organization for Economic Co-operation and Development (OECD), the International Monetary Fund (IMF) and the United Nations (UN) from a more broader and macro-economic perspectives. For instance, Shleifer and Vishny (1997: 737) noted that "Corporate governance deals with the ways in which suppliers of finance to corporation assure themselves of getting a return on their investment". On the other hand, the OECD (2004a) suggested that good corporate governance is capable of improving the confidence of domestic investors, lead to reduction in cost of capital and may facilitate access to much needed capital for productive activities. Yet there are others that see corporate governance from completely different perspective. For example, Bhasa (2004) pointed out that corporate governance concerns the desirability or otherwise of the convergence of global corporate governance best practices and global legal system. However, "companies are governed within the framework of the laws and regulations of the country in which they operate" (King II, 2002: 15) and "governance practices are not uniform across nations" (Bhasa, 2004: 5). The OECD (2004b) also pointed out that there is no single framework that is appropriate for all markets as corporate governance arrangements and institutions vary from one country to another. There seem to be more consensus on the fact that country face different institutional constraints and therefore convergence of corporate governance practices may be difficult to achieve (Bhasa, 2004; OECD, 2004b). As a result, over the years, a number of committees have been set up in various countries to look into the various aspects of corporate governance (Hendrikse and Hendrikse, 2004: 121) such as Cadbury Committee (1992), CalPERS Global Corporate Governance Principles (1996), Hampel Committee (1998), OECD Principles of Corporate Governance (1999, 2004), Kumar Mangalam Birla Committee on Corporate Governance Principles (2000), South African King Report on corporate governance (1994, 2002, 2009), and others.

However, despite the different legal and institutional structures around the world, the demand for adopting an efficient corporate governance policies and practices is universal among most investors (Spanos, 2005). Thus, international guidelines have been developed by bodies such as the OECD, the International Corporate Governance Network, and the Commonwealth Association for good corporate governance practice among others (King II, 2002) to encourage corporate governance best practices among member states. For instance, OECD (2004a) set up principles which all countries including non-OECD countries could use if they wish to develop their own code of corporate governance. Like OECD, South Africa in 1994 developed its own code of corporate governance called the 'King Report 1994' or 'King I' which was followed by a more revised document referred to as the King Report on corporate governance for South Africa 2002 or 'King II'. Recently, South Africa issued King III which was released at the beginning of September 2009 and it came into effect on March 1, 2010. It should be noted that most of Southern African countries including Swaziland still follow South African King II report on corporate governance model. Considering the corporate governance practice, this study wishes to provide an overview of corporate governance reporting framework in Swaziland.

Corporate governance disclosure practice

The corporate governance principles in respect of financial transparency and information disclosure practice have become more prominent around the world especially due to the global financial crises. Bashin and Reddy (2011: 393) suggested that “corporate governance disclosure is a fundamental theme of the modern corporate regulatory system”.

According to OECD (2004a), the corporate governance framework should ensure that all material matters regarding financial situation, performance, ownership, and governance of the company are disclosed accurately and timely. Adequate corporate “disclosure helps improve public understanding of the structure and activities of companies, their policies and performance” (Hong Kong Society of Accountants, 2001: 4) and subsequently, it improves transparency and results in good corporate governance practice (Bashin and Reddy, 2011). In line with this, this study will provide the motives for corporate governance disclosure practice in Swaziland.

Legal framework for corporate reporting and disclosure in Swaziland

Legal and regulatory frameworks are country specific, and these impacts on disclosure practices (Akhtaruddind, 2005). In Swaziland, accounting and corporate disclosure is underpinned by requirements specified in the Companies Act 2009 and Swaziland Stock Exchange. Listed companies are also required to comply with the specific requirements concerning corporate governance and disclosure. Listed companies are required to disclose relevant information in the annual financial statements in compliance with SSX requirements such as borrowings, headline earnings per share, directors’ interests, share incentive schemes, profit forecasts, full details of all special resolutions passed, individual director’s fees, salary, commission, bonus, share options, etc. (Www.ssx.org.sz). The new Companies Act 2009 also addresses issues related to accounting records and disclosures. For example, in accordance with Section 245 of the new Act, “every company shall keep such accounting records as are necessary fairly to present the state of affairs and business of the company and to explain the transactions and financial position of the trade or business of the company” (Companies Act 2009: 110). Financial statements are prepared in accordance with International Financial Reporting Standards (IFRS) and the requirements of Swaziland Companies Act 2009.

The Swaziland Institute of Accountants (SIA) is the only one professional accounting body in Swaziland. Since SIA is not a member of the International Accounting Standards Board (IASB), SIA is not legislatively strong in terms of issuing accounting and reporting standards. Consequently, the institution persuades the government for adoption and implementation of standards issued by the IASB. SIA fosters acceptance of International Accounting Standards (IAS) and International Standards on Auditing (ISA). However, besides the IASs, Swaziland complies with the disclosure provisions specified in the Companies Act 2009 which are mandatory (see, Section 256 - 258 of Swaziland Companies Act 2009).

METHODOLOGY

The study relies on documentary evidence. It is based on the conceptual analysis and personal observations of one of the researchers considered in this study. The personal observations mainly constitutes of one of the researcher’s work experience in our focal country (i.e. Swaziland) for more than 10 years that provides unique insights on the external motives for corporate governance disclosure in the country. Further, in order to provide an answer to the research question and obtain the objective, the study adopts the idea of Di Maggio and Powell’s (1983) institutional isomorphic pressures. The unfortunate implication of the deficiency is that the majority of the previous studies and their prescriptions on corporate governance motives, mechanisms, and outcomes require reconsideration in the context of the external environmental influence on firms’ governance paraphernalia. As such, as a benchmark, this study uses Di Maggio and Powell’s (1983) three types of isomorphism (coercive, mimetic, and normative) to argue and understand the external drivers for corporate governance disclosure. It should be noted that, with regard to Di Maggio and Powell’s isomorphism, there are several criticisms that placed by other researchers (see, Hambrick, Finkelstein, Cho and Jackson, 2005; Ashworth, Boyne and Delbridge, 2007). However, despite the criticisms, the idea of Di Maggio and Powell’s isomorphic pressure has been widely applied in many studies on management fields, cross-country analysis, environmental protection policies, and economic activities issues to identify and clarify the role of institutions for empirical investigations (see, Hillman, Withers and Collins, 2009; Frank, Hironaka and Schofer, 2000; Guler, Guillen and Macpherson, 2002; Pfeffer and Salancik, 1978). With this respect, this study uses Di Maggio and Powell’s three isomorphic forces in identifying and determining the external pressures for corporate governance disclosure practices in jurisdictions with severe structural and infrastructural imbalance.

FINDINGS AND DISCUSSION

The data analysis involved conceptual analysis and Di Maggio and Powell's (1983) idea with regard to institutional isomorphism has been applied to understand the external factors that influence for corporate governance disclosure.

The External Coercive Drivers for Corporate Governance Disclosure in Swaziland

We identified two main sources of the external coercive forces for corporate governance disclosure in the country. First, the pressure from international organizations and secondly, pressure from regional arrangements with other neighbouring countries. According to Di Maggio and Powell (1983), coercive pressure could be legislative or persuasive; and could be multi-layered, linked to benefits by the focal organization from a conferring organization. They all aim, inadvertently, to drive the focal actors towards actions intended to maintain legitimacy with its conferring publics. In terms of the international organizations, we identified the influential roles of the World Bank Group, IMF and the OECD's corporate governance principles, while the regional influences appear to come mainly from the Southern African Development Community (SADC) and Southern African Customs Union (SACU). We now take these in turn.

World Bank Group, IMF and the OECD Corporate Governance Principle

In 1999, both World Bank and IMF started the standard and code initiative, now popularly referred to as the Report on the Observance of Standard and Codes (ROSC). This initiative enables the organizations to assess member states' compliance and observance of international standards and codes in 12 key areas including corporate governance. Countries' corporate governance postures are benchmarked against the OECD principles. Based on the overall corporate governance situation in Swaziland, African Development Bank (ADB) (2005:27) stated, "Swaziland government has a long way to go in complying with the OECD Principles of Corporate Governance". In complying with the OECD Principles of Corporate Governance, ADB (2005:46) recommended that it is necessary for Swaziland government to review the existing regulatory framework and corporate governance systems including disclosure practices.

Although assessment is at the request of member state however, non-compliance or poor report could have detrimental implications for the country concern, especially developing countries. This is coupled with the well-documented influence both organizations have in the determining the internal policy direction of client countries (Dreher, 2006; Taylor, 1997). Poor showing in the ROSC could have adverse effects on the investment destination by global investors. Apart from this, to benefit from the WB and IMF loan, countries would have to conform to required level of economic and governance transparency and accountability. The initiative has assessed and reported on over 100 countries so far. It is therefore becoming a vital tool for assessing level of corporate governance at national level and invariably pushing countries towards common corporate governance practice. It is not surprising that the Swaziland government has eventually invited IMF for an assessment of compliance with codes and standard in the country.

Regional Arrangements (SADC and SACU)

Swaziland has bilateral arrangements with countries in the Southern African region including through the SADC and SACU. The SADC emerged from the Frontline State; an organization comprising mainly Southern African states set up to facilitates attainment of independence by member states. However, following full independence by most member state, its focus has now moved towards good governance and economic development within the region. The SADC through its objectives that sees a common future and path for the countries in the region, and institutions such as the Development Finance Resource Centre (DFRC) organizes capacity building and training programmes for member states on several issues including corporate governance.

Furthermore, the SACU also provides another strong platform for common economic and governance pattern in the region through common custom arrangement. Revenue from SACU is deposited in a common revenue pool, which is under the custodian of South Africa. The BLNS (Botswana, Lesotho, Namibia, and Swaziland) countries get nearly half of the SACU revenue though the total GDP of BLNS countries is less than 10% of SACU member states' GDP (www.sacu.org). Swaziland relies heavily on

SACU receipts for years; more than 60% of Swaziland's total revenue comes from SACU receipts. South African as the major economy in the region makes most contribution to the fund and consequently wields sufficient influence in its distribution.

These regional relationships require compliance to common pacts and practice. With South Africa as the leading economy in the region, most of the corporate governance practice agenda could be expected to generate from the country. It is therefore not surprising that Swaziland along with other countries in the region is following South African footsteps in their corporate governance ideas with regard to disclosure practice.

The external mimetic drivers for corporate governance disclosure practice in Swaziland

Di Maggio and Powell (1983) described this as threat to legitimacy arising from strategic ambiguity and uncertainty, which may lead focal organization to adopt imitation and modeling of organizations considered more successful as solution to perceived legitimacy gaps.

Swaziland is experiencing a period of sustained poor economic performance evidenced with falling FDI, especially since the end of Apartheid in South Africa in 1994, and high reliance on revenue from SACU. On the other hand, South Africa maintains an impressive economic performance, as the largest and most developed economy in Africa. It is the largest trading partner with Swaziland with about 70% of its exports going into South Africa (World Bank Development Indicator, 2011) who is also its main source of imports.

The country appears to be modeling its policies on South Africa in order to improve its own economic fortunes. For example, its currency is pegged at 1:1 with the South Africa's Rand, which requires substantial coordination by the South African authority and indicates significant dependent on the monetary and fiscal policy of its superior neighbour. There is also a heavy presence of South African businesses and expertise in the country's economy especially in the banking and service sectors. Perhaps a more obvious evidence of imitation and modeling is in respect of the corporate governance reforms and code. South Africa has one of the enviable corporate governance reforms and the King I & II are one of the most popular reports on corporate governance. It is therefore not surprising that Swaziland adopted the King II report as the official corporate governance code. This shows the mimetic influence that gradually leads to homogeneity social actors' strategy, structure and outcomes.

Furthermore, according to Di Maggio and Powell (1983), sharing common resource base could facilitate mimetic pressure. For example, common training provider or consultancy could lead to knowledge transfer with which the focal organization may reduce their perceived legitimacy gaps. As mentioned earlier, the SADC through its organs and institutions facilitates cooperation and coordination among member states on various issues including corporate governance, which could eventually lead to common features and outcomes amongst member states.

The External Normative Drivers for Corporate Governance Disclosure in Swaziland

The normative pressure for corporate governance disclosure in the country appears to emerge from the greater global awareness on corporate governance and due to the country's professional affiliation with international and regional accounting professional organizations.

CONCLUSIONS

The paper aims to investigate the external factors for corporate governance disclosure in a country with poor economic performance. Consequently, this study considered corporate governance disclosure drivers in a unique market setting characterized with poor market infrastructure and poor economic growth. The study finds that drivers for corporate governance disclosure practices in a less developing country (e.g. Swaziland) are mainly derived from external institutional framework because of less pressure from internal arrangements. Further the fewer developing countries would have to implement economic reforms and conform to required level of governance transparency and accountability in order to qualify loan and other

social and economical supports from external sources since the capital markets and markets for corporate control are virtually non-existent in the less developing countries.

The study shows the importance of considering a mid-range theoretical paradigm for the discourse of corporate governance. This is more so the case when due consideration is paid to the institutional context that determines governance mechanisms especially in jurisdictions with severe structural and infrastructural imbalance. This is important in order to understand firms' disclosure behaviours in a country where the markets function poorly. Thus, the study raises the need for extensive research to be carried out to develop corporate governance and disclosure practices in a less developed marked economy.

HIGH INVOLVEMENT VS LOW INVOLVEMENT: RISK PERCEPTION FOR DIFFERENT BRAND IMAGE LEVELS

Ulun Akturan
Galatasaray University, Turkey

ABSTRACT

The main objective of this study is to determine the risk perception of consumers for different brand image levels in the cases of high and low involvement. The data is collected from 600 consumers via face-to-face questionnaire, and cluster analysis and discriminant analysis are used to test the research hypothesis. As a result, it was found that the high and low involved consumers do discriminate on the basis of their risk perception for a high image brand. However, risk perception is not a discriminator between them in the case of low brand image.

INTRODUCTION

Product involvement is generally understood as referring to the “personal relevance of the object based on inherent needs, values and interests” (Zaichkowsky, 1985). In a high involvement condition, individuals are supposed to dedicate more attention and effort to a specific decision problem, product category, or brand (Xue, 2008). Involvement theory can be used to construct profiles of products and buyers, therefore it can be used as a segmentation tool, and can assist marketing management with marketing mix decisions. In explaining consumer decisions, perceived risk is another commonly used concept. First, it is a powerful concept that explains consumer decision making, since consumers are more often motivated to avoid mistakes than to maximize utility in purchasing (Mitchell, 1999). Second, it stimulates information search and risk-handling behavior of consumers (Dowling, 1986). Third, consumers are risk averse and select brands on the basis of minimizing expected loss (Peter and Ryan, 1976). Perceived risk theory argues that consumers are keen to minimize their perceived risk rather than to maximize their utility (Mitchell, 1999). Brand image has been an important concept in consumer behavior research since the early 1950s. Brand image is the concept of a brand that is held by the consumer. It is “largely a subjective and perceptual phenomenon that is formed through consumer interpretation, whether reasoned or emotional” (Dobni and Zinkhan, 1990, p. 118). Consumers organize a cluster of attributes and create an image association related to the brand around both functional and symbolic dimensions (Park et al., 1986). This study aims to determine whether high and low involved consumers do discriminate regarding their risk perception for two different brand image levels- high and low image.

THEORETICAL FRAMEWORK

Perceived risk

The concept of perceived risk was first defined by Bauer (1967, p. 24), in that “consumer behavior involves risk in the sense that any action of a consumer will produce consequences that he/she cannot anticipate with anything approaching certainty, some of which are likely to be unpleasant.” Cunningham (1967, p. 37) conceptualized perceived risk in terms of two similar components, “the amount that would be lost (i.e., that which is at stake) if the consequences of an act were not favorable, and the individual’s subjective feeling of certainty that the consequences will be unfavorable.” Perceived risk was conceptualized as an “expectation of loss”. The more one is certain about this expectation, the greater the risk for the individual (Stone and Winter, 1987). In the present study, perceived risk is defined as the consumer’s subjective expectations of loss for each of the possible choice alternatives for a given decision goal (adapted from Aqueveque, 2006).

The perceived risk construct has been conceptualized and operationalized at different levels of abstraction- low, medium and high. Low level of abstraction focus on the attributes of a single product, medium level of abstraction focus on perceived risk at the product category level or across various product categories, and high level abstraction resemble a personality trait by using of the terms "risk seeker" and "risk avoider". Since fewer other variables will intervene between risk and behavior, perceived risk at a low level of abstraction is stated as a more powerful predictor of consumer behavior (Dowling, 1986). Perceived risk was determined as a multi-dimensional concept including six dimensions (Roselius, 1971; Jacoby and Kaplan, 1972; Stone and Gronhaug, 1993; Mitchell and Kiral, 1999): **(1) Social risk** is the perception that the brand/product chosen may affect others' thoughts. It results from the thought that friends or family might think that the purchase made is a poor choice. It is the belief of consumers that their peers may evaluate them negatively due to a purchase they make (Aqueveque, 2006). **(2) Psychological risk** is the perception that the brand/product chosen might not fit well with the buyer's self-image or self-concept. It is the chances of the specific purchase being inconsistent with the personal or self-image of the consumer. (Pires et al., 2004). It is a potential loss of self-esteem (or ego loss) from frustration at not achieving a buying goal. **(3) Physical risk** is the perception that the brand/product chosen might not be safe or might be harmful or injurious to health. **(4) Performance risk** is the perception that the brand/product chosen might not perform well or work properly. It is conceptualized as the loss incurred when a brand or product does not perform as expected (Horton, 1976). **(5) Financial risk** refers to the perception of the likelihood that the product is not worth the price paid (Tsiros and Heilman, 2005). It is the perception that the brand/product chosen might cause a money loss either because it will not work at all or because it costs more than it should to keep it in good shape. The financial risk arises when consumers perceived the product is less likely to fulfil the value-for-money expectations (Bettman and Park, 1980). **(6) Time risk** is the perception that the brand/product might cause time loss while adjusting, repairing, and replacing it. In that scope, it was stated that time risk reduces the functional and monetary value because of the malfunction and, negatively influences the emotional and social value because of the damaged feelings and social self-concept. Perceived risk has been identified as a dominant influence in the early stages of the buying process. Generally, as consumers recognize a need for a certain product or service, they simultaneously perceive risk. Once a purchase decision has been made and a product has been consumed or experienced, consumers are faced with the consequences of their purchase (Mitchell and Boustani, 1994).

Product Involvement

Involvement has been a key concept in consumer research for almost over two decades (Charters and Pettigrew, 2006). It is defined as the perceived relevance of the product category to the individual- for example, an individual may be very involved with a product category (e.g. cars) or a brand (e.g. Volvo) (Quester and Lim, 2003). In this present study, involvement conceptualized as the degree of psychological identification and affective, emotional ties the consumer has with a product category. Studies have shown that product involvement can influence the decision-making process, information search about the product, the timing in product adoption, the attitudes and preferences regarding the product, the perceptions of alternatives and brand loyalty (Bauer et al., 2006; Brisoux and Cheron, 1990; Charters and Pettigrew, 2006; Lin and Chen, 2006). Product involvement is an enduring situation, and goes beyond mere utilitarian "importance", having both experiential and symbolic significance (Charters and Pettigrew, 2006). Zaichkowsky (1985) examined the level of product involvement for product categories and found that there is a significant difference in product involvement level for various products. For example, consumers have a low level of product involvement was found for instant coffee, bubble bath soap, and breakfast cereal, a medium level of product involvement was found for, facial cream, mouthwash, headache remedies, and tissues, and a high level of product involvement was found for calculators and automobiles. Kapferer and Laurent (1986) also concluded that there is a variance in product involvement for different products.

Brand image

Consumers learn about the brand through their experiences. The resulting brand associations are held in consumer's memory and constitute the brand image (Torres and Bijmolt, 2009). To build blocks of customer-based brand equity brand associations are important (Keller, 1993, 2003). Brand image is generally defined as consumers' perceptions of a brand. Saaksjarvi and Samiee (2011) conceptualized brand image as pertaining to brand credibility, brand character, consumers' overall attitude towards the brand, and consumers' feelings for the brand. Brand image is an extrinsic cue as a reference for evaluating alternatives and reducing risks (Simonian et al. 2012). When consumers perceive that the brand image is getting better,

they have a lower perceived risk (Cox, 1962; Kotler and Keller, 2008; Roselius, 1971). Therefore, brands can improve their image to reduce the perceived risk (Dowling and Staelin, 1994). This study aims to determine whether high and low involved consumers do discriminate regarding their risk perception for two different brand image levels- high and low image. The constructs of perceived risk and product involvement have been extensively used as moderating or explanatory variables in consumer behavior (Dholakia, 1997). The objective of this study is to explore whether high and low involved consumers perceive different kinds of risks, and if so, is this discrimination valid for different levels of brand image- high and low image. Therefore the hypothesis of the study were formulated as:

H1: Consumers can be clustered as high and low involved regarding their interest to a product class.

H2: High and low involved consumers do discriminate regarding their risk perception for high/low image brands.

RESEARCH METHODOLOGY

Perceived risk is a multidimensional concept and the dimensions of perceived risk differ by product class. Consumers evaluate products on some basic features that differ for the product class, and each of these features is a potential risk source (Zikmund and Scott, 1973). In this study, in order to comprehend all the perceived risk dimensions, the automobile product class is studied. Because two different brand image level is investigated two car brands were chosen. Since the manufacturer required privacy, the brand names are not mentioned in the study but are named as High image Brand- HiB and -Low image Brand- LiB.

Sampling and data collection

The sampling frame of the study is determined as “consumers owning cars other than HiB and LiB”; that is, the car owners of HiB and LiB were excluded from the research. This is because including the owners of these brands could create a sampling error (Dowling, 1986). The owners of these brands have already evaluated the risks relating to the brands and have made their purchase decision. Therefore, they would have subjective judgments associated with the risk and value perceptions of these brands. Besides, pre-purchase and post-purchase risk perceptions differ (Mitchell and Boustani, 1994). The data is collected from 600 consumers via face-to-face questionnaire. To measure brand image, the brand image scales developed by Lee and Ganesh (1999) and Hsieh (2001) were used; to measure perceived risk, the scales developed by Stone and Gronhaug (1993) was used; and to measure product involvement, the scales developed by Bauer, et al., (2006), Lastovicka and Gardner (1979), and Bloch (1981) were used.

RESEARCH FINDINGS

Reliability and Validity of the Scales: Cronbach’s Alpha coefficient was used to test the reliability and exploratory factor analysis to test the validity of the scales. The reliability and validity analysis were executed for the two brands separately. As seen in Table 1, the Cronbach’s Alpha coefficients are above the minimum required level of 0,70 and the explained variance is high.

Table 1: Summary Results of the Reliability and Validity Tests of the Scales

	Number of Variables	Total Explained Variance (%)
HiB Brand Image	8	80,705
LiB Brand Image	8	68,014
Product Involvement	7	70,126
Perceived Risk for HiB	17	80,475
Perceived Risk for LiB	18	87,039

Manipulation Check: The brand image perceptions of HiB and LiB was tested by t-test to identify whether they had perceived high and low brand images as pre-specified. As can be seen in Table 2, the brand images of HiB and LiB are different, with HiB having a high image and LiB a low image.

Table 2: Manipulation Check (Paired Samples t-test)

	Mean (HiB)	Mean (LiB)	t-value	df	sig.
...cheap	4,37	3,07	25,583	599	,000
...latest technology	4,42	2,77	32,680	599	,000
...luxury features	4,4	2,72	32,848	599	,000
...prestigious	4,36	2,65	32,727	599	,000
...exciting	4,44	2,93	30,277	599	,000
...fun to drive	4,39	2,86	29,121	599	,000
...made to last	4,38	2,8	29,407	599	,000
...high quality	4,46	2,65	34,122	599	,000

Hypothesis test: In the study, cluster analysis and discriminant analysis was used to test the research hypothesis.

In the study, in order to classify consumers as high and low involved regarding their interest to the automobile class, cluster analysis was used. In order to determine the number of clusters, the results for 2, and 3 cluster solutions were examined by comparing the ANOVA results. Besides the homogeneity within the clusters, the number of cases in each cluster and the distances between the cluster centers were evaluated (Hair et al., 1998, Sharma, 1996). According to the evaluations, two-cluster solution as high and low involved consumers was agreed upon.

As a result of the cluster analysis, H1 is supported- consumers can be clustered as high and low involved regarding their interest to cars. In order to test the second hypotheses, discriminant analysis was used. Discriminant analysis is a useful technique in the examination of whether significant differences exist among in terms of predictor variable (Malhotra, 2004). In order to test the multivariate aspects of the model first of all, canonical discriminant function is checked and found as 0,338. The significance of the discriminant function was tested by Wilks' Lambda. As can be seen in Table 3, the discriminant function is statistically significant.

Table 3: Wilk's Lambda of the Discriminant Function

Function	Wilk's Lambda			
	Wilk's Lambda	Chi-square	df	sig.
1	0,886	70,326	36	0,001

In the discriminant analysis, Wilks' Lambda and univariate ANOVA were used to assess the significance between the means of independent variables for the two groups (Hair, et al., 1998). These tests highlighted that, high and low involved consumers do discriminate regarding their risk perception for the high image brand. However, there is no discrimination regarding their risk perception for the low image brand. Therefore, H2 was partially supported. In interpreting the results of the discriminant analysis, the interpretation is done on the discriminant loadings since they are more valid than weights. Generally, variables loading 0,30 or higher are considered substantive (Hair, et al., 1998). The structure matrix (given in Table 6) shows the discriminant loadings that represent the simple correlation between the predictors and the discriminant function. Besides, for high image brand, all of the perceived risk dimensions have higher loadings and can be used to discriminate high and low involved consumers. In Table 7, the mean and standard deviation of the discriminating variables of high and low consumers are given. As seen from Table 7, high involved consumers perceive less risk for the high image brand than low involved consumers. In the study, the correct classification ratio of discriminant function was found quite high (80,5 %).

CONCLUSION

This study aims to identify the distinction between high and low involved consumers in terms of risk perception on different brand image levels. The data is collected from 600 consumers via face-to-face questionnaire. As subject to the study, automobile was chosen. As a result of cluster analysis, it was found that consumer can be classified into two groups- high involved consumer and low involved consumers. Then, discriminant analysis was run to explore the discriminating perceived risk variables between these

consumer groups. It was found that, high and low involved consumers do discriminate on their risk perception for high image brands, while they do perceived the same risks for the low image brand. For the high image brand, high involved consumers perceive less risk then the low involved consumers. However, the perceived risks for the low image brand are not different for high and low involved consumers.

Involvement is defined as “the general level of interest in the object, or the centrality of the object to the person’s ego-structure” (Day, 1970 p. 45; Bowen and Chaffee, 1974). Howard and Sheth (1969) equated involvement with importance. It is a relation between consumer and product” Similarly, Bloch (1982) defined product involvement as a unique relationship between consumer and product: “an unobservable state reflecting the amount of interest, arousal or emotional attachment evoked by the product in a particular individual” (p. 413).

High involved consumers spend more time and effort and indulge in extensive information search. Zaichowsky (1985) suggests that involvement affects consumers’ cognitive (i.e. information search, processing, attention, satisfaction) and behavioral (i.e. early adoption) responses. Therefore, it is not surprising to find that high involved consumers perceive less risk brand compared to low involved consumers. However, this study highlighted that, in the case of risk perception the discrimination of high and low involved consumers is affected by brand image. For the high image brand, high and low involved consumers do discriminate, but for the low image brand their risk perception is not a different.

This study investigated the research hypothesis on one product class- cars. That is the main limitation of the study. And also, the discrimination of the high and low involved consumers was searched on the basis of their risk perception. As a further research, studying other product classes should be beneficial. Furthermore, besides perceived risk, other variables discriminating high and low involved consumers should be explored.

DOES GOVERNMENT OWNERSHIP AND DISCLOSURE AFFECT PERFORMANCE AND STABILITY OF THE GCC BANKING SECTOR?

Ritab Al-Khouri
Qatar University, Qatar

ABSTRACT

This paper studies empirically the effect of government ownership and the level of disclosure on the performance and the stability of banks, controlling for regulations, concentration, bank and country specific characteristics. The sample used covers 59 banks in six countries which comprise the Gulf Cooperative Council (GCC), for the period from 2004 to 2010. Two methodologies are implemented: The first is the Generalized Least Square Random Effect (GLS RE) methodology; and the second is the Generalized Method of Moment (GMM) methodology, which controls for the endogeneity and the omitted variable problems that occur in this kind of studies. Contrary to expectations, we find that governmentally owned banks are more stable than their counterparts. However, there is very limited evidence on the negative relationship between government ownership and bank performance.. The level of disclosure negatively affect bank performance, indicating that investors may not view information disclosed by the bank as reliable or may not be able to interpret correctly the information disclosed. Therefore, this might have reduced the positive effect of disclosure on stability and bank valuation. Finally, the impact of bank regulations on bank risk taking is negligible.

INTRODUCTION

In this paper we analyze the performance and the risk taking by banks, their level of disclosure, government ownership, concentration, and national bank regulations. The paper measures whether bank performance and risk taking varies with the level of disclosure, and government ownership structure of each bank. In addition, we examine whether the bank risk and performance is affected by national regulations, and banking concentration. This research utilizes data from the Gulf Cooperative Council (GCC) banks during the 1998-2010 period, which includes the financial crisis of 2006-2008. The six GCC countries include the Kingdom of Saudi Arabia (KSA), United Arab Emirates (U.A.E.), Kuwait (K), Bahrain (B), Qatar (Q) and Oman (O).

Governments and quasi government agencies like pension funds and sovereign funds in the GCC countries own a substantial amount of securities in the banking sector. The amount of government ownership in the GCC ranges from 13 percent in Kuwait to around 52 percent in the UAE. If substantial amount of securities are owned by the government, we would expect that managers, working as agents of the government, have incentives to take higher risks than firms with diverse ownership. A high governmental ownership in the banking sector subjects banks to a potential conflict that exists given the government's role as a regulator and its responsibility for the supervision of the financial markets. In addition, political authorities might try to interfere in the bank's day-to-day business for political purposes. Bank ownership, according to the political theories, enables the government to finance the inefficient projects which would not get private financing just because they tend to be politically desirable projects. If the bank with substantial government ownership fails, it will be embarrassing for the government to admit, and consequently might interfere to bail out such a bank. This implicit insurance gives incentives for managers of banks with a high government ownership to take excessive risks. Therefore, we expect that the higher the government ownership the higher the risk taking by banks.

In addition, the actual risk-taking, as well as, risk management process in banks is not clearly apparent, disclosure by banks about their financial position and risk profile that constrains management to follow an optimal risk management process might reveal its quality and hence, might help market participants in their pursuit in firm valuation. Disclosure encourages bank managers to keep firm practices. When banks disclose information about their financial condition and their risk profile to the public, market participants would be able to assess the financial position of the bank and to compare the positions of different banks. Increased information through disclosure, however, does not necessarily reflect higher

transparency. Transparency involves placing that information into meaningful contexts (Greenspan 2003). This is particularly relevant to banks because they have high risk exposures and complex operations. Market participants, however, may not view information disclosed by the bank as reliable or may not be able to interpret correctly the information disclosed. Therefore, these arguments might reduce the positive effect of disclosure on bank risk taking and its valuation.

This research contributes to the literature in many ways. First, we consider the concentrated ownership by governments rather than the ownership by management since the ownership by management is not revealed by most of the banks, and because shareholders with large percentage of ownership can affect the financial decisions by managers. Second, given the importance of transparency, we introduced an index which reflects bank transparency reflected in the level of bank disclosure. Third, we introduce an index for bank regulations. Finally, we look at the simultaneous measurement of performance and risk in the banking sector in the rich oil producing countries.

Two methodologies are implemented: The first is the Generalized Least Square random effect (GLS RE) method; and the second is the Generalized Method of Moment (GMM) to test our hypotheses. This methodology controls for the endogeneity and the omitted variable problems that occur in the ownership-performance analysis (Coles et al. 2006, 2007). The results of the research might help policy makers to adopt decisions concerning rules regarding bank ownership, like for example, to limit government ownership concentration, increase privatization program, provide better disclosure guidelines and/or opening the market for more foreign and domestic ownership in order to increase the level of bank competitiveness.

In the next section we discuss our data, hypotheses, statistical methods. In section 4 we outline our empirical results. Section 4 provides conclusions.

DATA AND METHODOLOGY

Data And Variable Definition

Our database is set to examine whether government ownership, the level of regulation and bank disclosure affect bank risk and performance. We collect information on all banks listed in the stock exchanges of six GCC markets. The Banks in the study satisfy the requirement of complete data over the period 2004 and 2010. The sample comprises 59 banks. The number of banks per country varies from twelve to six. This research uses income statement and balance sheet data collected from Gulf Base database and the annual reports of the banks under investigation. The bank ownership information is collected manually from individual bank's financial statements. All banks comply with international accounting standards to control for differences in accounting standards that might drive our results. The data on regulation is collected manually from different governmental agencies mainly the Central banks of respective countries and an index is calculated by the researcher. In addition, data on disclosure index is collected manually from the annual reports of banks. We classify a bank to have a large ownership if the shareholder voting rights that sum to 10% or more. If no shareholder holds 10% of the voting rights, the bank is classified as widely held (Caprio, Laeven, and Levine (2007)). Additional information at country level is collected from country, World Bank, World Development Indicators.

Dependent Variables

First, bank risk (Stability) (LnZ): This paper uses the Z-score developed by Boyd and Graham (1986, 1988) as a proxy for probability of insolvency. Second, *bank performance measures:* We choose two measures of performance, ROA, ROE which are most commonly used in the literature (Claessens, et al. 2000, Lin and Zhang, 2009). The ROA is calculated as net income to total assets, while the return on equity is equal to net income to shareholders equity for each bank and each year.

Independent variables

Government ownership (G.O): Controlling ownership by of the GCC banks are dominated by different groups of owners, mainly government and government agencies. The banking sector in the GCC in general is domestically owned reflecting restrictions on foreign ownership (For example, Kuwait and Qatar restricts foreign ownership to 49 percent, while Saudi Arabia and UAE restrict it to 40 percent). The share of

government and quasi-government ownership in the banking sector in the GCC is substantial. It represents around 50 percent in U.A.E (including both government, quasi-government (41%), and ruling family (10%) ownerships), 35 percent in Saudi Arabia, and 13 percent in Kuwait. In the GCC markets, the relationship and the links between bankers, politicians and state ownership of banks is significant. According to the literature this allows for a great deal of political influence in credit markets (e.g., Brown and Dinc (2005), Dinc (2005), and La Porta, Lopez-de-Silanes, and Shleifer (2002)). This paper expects risk to increase with the level of concentrated ownership.

Control Mechanisms: Two control mechanisms are supposed to reduce the agency problem and align the interest of managers with those of the shareholders. The first one is internal and includes managerial incentive plans, monitoring by the board of directors. The second one is external such as debt holders, the market for corporate control, the product market competition, the managerial labor market and the regulatory system. Two of the external corporate governance systems will be utilized in this study one is the amount of disclosure and the other is bank regulations. *The Amount of disclosure (Discl)* reflects the level of transparency. The substitute model suggests that with good information disclosure, outside shareholders will be better able to monitor the action of managers. To measure the change in information asymmetry, we include an indicator of information quality in the annual report of corporations (i. e. transparency). Transparency is measured by an index, published by the researcher. It includes the reporting of six dimensions in the financial report for the banks in the sample during the study period (Head of BOD speech, Financial reports data, Audited financial statements, BOD assessment endorsement, Timing and accessibility of information, Auditing and Independency).

Bank Regulations in the GCC (Regulat.): The main justification for bank regulation is usually the reduction of systemic risk that can lead to financial crises, or to protect the depositors by providing the deposit insurance guarantee. More stringent regulations, however, might not be effective in reducing the potential of a crisis since managers find always ways through which they introduce new inventions to get around these regulations. It is vital to consider the restrictions on the type of activities provided by banks and the regulations imposed on this sector. The type and the amount of regulations on banks determine the degree of freedom given to the banking sector and addresses the government ownership of banks and foreign bank ownership, hence the degree of competition in the banking sector. Shareholders protection laws and banking regulations are expected to substitute for the existence of a large shareholder to monitor managers. In this paper we concentrate on the important components of bank regulation: the extent of activities that are permitted, and the restrictions on entry into the market. The author formulate an index which measures regulatory impediments to banks reflecting the rules and regulations on the banking sector in each country. The index reflects the nature of the banking industry which impacts the performance and risk taking of these banks. *Bank concentration (Con.)* is defined as the ratio of deposits held by the three largest banks relative to the deposits held by all banks. Market structure and the relevant degree of competition are measured with concentration ratio. *Control variables* : Three control variables will be used which are: *SIZE* - the log of Total Assets (LnTA); *CAPITAL* - the ratio of Book Value of Equity to Total Assets (EQ/TA) and *L/D*: a bank's ratio of total loans to total deposits. (L/D).

Methodology

In this paper we assume that bank risk, and performance is jointly determined. In addition, some of the regressors used in the study are believed to be endogenous, such as loan to deposit and size. This implies that OLS techniques could produce biased coefficient. Since our main variable to be checked like the government ownership and regulations do not vary over time, the fixed effect estimates would be imprecise ((Wooldridge, 2002). Also, the fixed effect estimates may increase the problem of multicollinearity if solved with least squares dummy variables (Baltagi, 2005).

Therefore, two methodologies will be implemented in this study. The first is to estimate our equations using generalized least square (GLS), random effect technique. We also estimate our two equations (1, 2) using Generalized Method of Moments (GMM) for robustness purposes. The GMM system method retains a system of two equations-the original equation and the transformed one. We test the null hypothesis of no autocorrelation in the differenced residuals. It also does not require a distributional assumption on the error term. The validity of the instrumental variables is tested using Hansen test of over-identifying restrictions and as a test of the absence of serial correlation of the residuals. Since our data contains a small number of banks, we implement one-step GMM-in-System estimator. All models include time dummies and they are estimated by GLS RE and GMM

$$\begin{aligned} \text{Ln}(Z)_{k,i,t} = & \alpha + \beta_1(\text{G.O})_{k,i,t} + \beta_2(\text{LnTA})_{k,i,t} + \beta_3(\text{EQ/TA})_{k,i,t} + \beta_4(\text{Discl.})_{k,i,t} + \beta_5(\text{L/D})_{k,i,t} \\ & + \beta_6(\text{Con.})_{k,t} + \beta_7(\text{LnPCGDP})_{k,t} + \beta_8(\text{GGDP})_{k,t} + \beta_9(\text{Regulat.})_{k,t} + \beta_{10}(\text{inf.})_{k,t} + \sum_{t=1}^{2004-2010} \gamma_t + \varepsilon_{it} \end{aligned} \quad (1)$$

$$\begin{aligned} \text{ROA}_{i,k,t} \text{ or } (\text{ROE}_{i,k,t}) = & \alpha + \beta_1(\text{G.O})_{k,i,t} + \beta_2(\text{LnTA})_{k,i,t} + \beta_3(\text{EQ/TA})_{k,i,t} + \beta_4(\text{Discl.})_{k,i,t} + \beta_5(\text{L/D})_{k,i,t} \\ & + \beta_6(\text{Con.})_{k,t} + \beta_7(\text{LnPCGDP})_{k,t} + \beta_8(\text{GGDP})_{k,t} + \beta_9(\text{Regulat.})_{k,t} + \beta_{10}(\text{inf.})_{k,t} + \sum_{t=1}^{2004-2010} \gamma_t + \varepsilon_{it} \end{aligned} \quad (2)$$

Where: i denotes individual banks, k refers to countries, t time period (2004-2010); β refers to the parameters to be estimated; ε is the error term.; Z-score is reflecting the bank risk, since the z-score is highly skewed; we use the natural logarithm of the z-score, which is normally distributed.; ε_{it} is the idiosyncratic error term.

We report two main tests to determine the appropriateness of our dynamic GMM estimations. The first test is the Hansen test of the over identifying restrictions with the null hypothesis that instruments are exogenous. If the null hypothesis is not rejected, the instruments are valid. A further test is the Arellano-Bond tests for autocorrelation of the errors, with as a null hypothesis of no autocorrelation in differenced residuals. Specifically, the second-order test in first differences tests for autocorrelation in levels.

EMPIRICAL RESULTS

The descriptive statistics for our performance measures, risk measure (Z value), bank characteristics variables, and macroeconomic variables are presented in Table 1. The government ownership variable shows a mean of .16. The mean of the ROA is .02, with a minimum of -.44 and a maximum of .26

Table 1. Descriptive Statistics (Panel of 59 banks of 6 countries, for the 2004-2010 periods)

Variable	mean	Standard deviation	Minimum	Maximum

Table 2 presents the results of Generalized Least Square Random Effect (GLS RE) estimates of our equations (1 and 2) to determine the effect of government ownership, disclosure and regulation factors on bank performance and the amount of risk taken by the GCC banks. Table 2 Panel A and B presents the results of the factors that affect bank performance as measured by ROA and ROE respectively. The regression equation for bank performance is well-fitted with an overall R squared of 16% and 20% respectively and with Wald chi-square statistics which is statistically significant. Results show that government ownership is not significantly related to bank performance, while bank disclosure is negatively related to bank performance. This is consistent with ‘Disclosure-Fragility’ which asserts that disclosure may lead to interpretation of specific information about banks’ financial conditions as indicator of widespread problems in the banking system, ((Calomiris and Mason (1997), Gilbert and Vaughan (1998) and Kaufman (1994)). From the table we can see also that concentration of the banking sector is negatively related to performance. This might imply that the less competitive the banking sector, given everything else constant would lead to the reduction on the profitability of the banks. Bank size is shown to be positively and significantly related to bank performance, larger banks have better risk diversification opportunities and thus lower cost of funding than smaller ones (McAllister and McManus (1993)). In addition, larger banks are

expected to benefit from cost efficiency gains. Loan to deposit is negatively related to ROE, while the level of risk taken by the management is positively related to ROE.

Regression is also run on Z-Score as a dependent variable. The regression equation (3) is well-fitted with an overall R square of around 63 percent. Panel C of table 2 shows an evidence that government ownership influence directly Z-Score, which indicate that governmentally owned banks are more stable and less risky than other banks. In addition, the larger the bank and the higher the risk adjusted return on equity the more stable the bank is. Finally the Wald (1943) test statistic (P) for the joint significance of time dummies is statistically significant at 1% level and hence validates their inclusion in the structural model.

We also perform the analysis by using the Generalized Method of Moments (GMM technique) of Blundell and Bond (1998). Table 3 documents the values for Hansen and the serial-correlation tests. Results of Hansen test and that of the serial correlation do not reject our null hypothesis of correct specification model. Both the P-value of Hansen test and AR (2) test of Arellano and Bond are larger than 5% for ROA, ROE and Z-score which support our estimation results.

Table 3, also, outlines the regression results using the GMM method of the relationship between bank performance and bank risk taking and government ownership structure, disclosure and regulation controlling for bank, and country specific characteristics. Results show a negative and significant relation between government ownership and ROA implies that banks with larger government ownership perform worse than other banks. In addition, the ratio of loan to deposit is shown to be significant and negatively related to performance. This might reflect high loan losses by banks, which might be due to the financial crisis during the 2006-2008 period. In addition, consistent with the literature, bank size and bank stability is significantly related to bank performance. However, and contrary to expectations bank disclosure is negatively related to bank performance.

Regressions are also run on Z-Score as a dependent variable. Table 3 panel C shows a strong and significant evidence that government ownership influence Z-Score positively. This means that risk taking is reduced by banks that are owned by the government. This is consistent with the results of the regression using GLS random effect. In addition, concentration is negatively and significantly related to risk taking, implies that high bank concentration, which reflect the level of competition, lead to more risk taking by banks. Low competition by banks is perceived adversely by investors and consequently more competitive

environments are considered to permit greater stability to the GCC banking systems. Therefore, policy makers should consider the possibility of opening their markets for more foreign banks and other regional banks to boost competition in the market. Finally, the impact of bank regulations on bank risk taking is negligible.

CONCLUSIONS

This study investigates whether government ownership, level of regulation and transparency (disclosure) is related to bank risk-taking and performance. We test whether government ownership, with the existence of regulation and transparency would lead to an increase in risk taking by banks as governments might use these banks to finance the inefficient projects which would not get private financing just because they tend to be politically desirable projects. If this is true then we expect to see that governmentally owned banks are also less profitable than other banks. A high governmental ownership in the banking sector subjects banks to a potential conflict that exists given the government's role as a regulator and its responsibility for the supervision of the financial markets. Therefore, this paper tries to find whether bank transparency is important in determining the amount of risk taking and performance of the banks in the GCC market.

Contrary to expectations, we find that governmentally owned banks are less risky than other banks. However, there is very limited evidence on the negative relationship between government ownership and bank profitability. As seen in the literature, bank size is positively and significantly related to bank profitability and negatively related to risk taking.

Future research will look at different measures of risk taking and performance. In addition, our next step is to see if there is a difference between the performance and risk taking behavior between conventional and Islamic banks. This subject is deemed necessary in this area, given the fast spreading movement of Islamic finance. In addition, we will be looking at the effect of financial crisis on the relationship between government ownership and both performance and risk taking.

AN INVESTIGATION INTO SHOPPING CENTRE EXPERIENTIAL EFFECTS UPON THE FASHION SHOPPING BEHAVIOUR OF INTERNATIONAL STUDENTS IN THE UNITED KINGDOM

Yeremiella Andhitya, JAS Consulting, Indonesia
J. Judith Huliselan and Willy Gunadi
Pelita Harapan University, Indonesia

ABSTRACT

Retail Industry is growing rapidly across country especially in United Kingdom (UK). One of the many ways to keep doing business is to make their shop or retail area up-to-date with the recent trends or constant development to meet up with consumers' needs and wants. Consumers that needs to be given extra attention is the who willing to spend their time and money in shops or stores, those consumer are mostly young people. United Kingdom is the most country chosen for higher education, where international students are considered as part of the consumers group and they often do fashion shopping. This study has revealed that several factors have influence on international students to do fashion shopping and choose a preferred shopping centres which are product and brand variant, promotion and competitive price, and service quality.

INTRODUCTION

Nowadays, retailing is coping with new, more challenging direct distribution channels like catalogues, internet and cable TV. However the main benefit from direct channel distribution is that the conventional retailer is still able to offer their current services (Keng et al. 2007). When retailers preferred to define themselves as goods and service providers, they present a source of memories as an *experience stager* this is what Pine and Gilmore (1999) call an *experience economy*. Consequently, the retail sector has become more competitive, including shopping centre/malls that mean the retailer must create an entertaining experience within the shopping environment.

There is a significant increase of interest in shopping as a research topic in the last decade (Falk and Campbell 1997), and the trends show that shopping in malls have become less interesting and shopping centres are not effectively meeting the customers need (Nicholls et al. 2002). Even though shopping centres have increased in total numbers as well as types in UK since the 1960's, consumers have developed various choices of shopping destination because they have more time, more money or spending power and are prepared to travel further to shop (Kirkup and Rafiq 1999). There are around 156,000 students immigrated from outside EU to the UK and up to 273,435 visas were issued in 2009 (Blinder 2011). According to the Higher Education Statistics Agency (2011), the total number of students in the UK for 2009/2010 was 2,493,415 with 405,810 international (non-UK) students. There was an increase of 10% compared to the 368,970 international students in 2008/2009, composed of 68,450 total EU students and 340,235 total non-EU students (The UK Council for International Student Affair 2011).

In post-modern society, shopping is a cultural phenomenon and it is known as a social realm, experience and interaction that increasingly structure the urban people's daily practices (Falk and Campbell 1997). Today customers are demanding an experience rather than just the products (Howard 2007). Thus, shopping experience is more about stimulating our senses and curiosity rather than only finding out about the products (Fiore and Kim 2007). The purpose of this study is to investigate how the shopping experience factors of the shopping centre can influence international students fashion shopping behaviour.

LITERATURE REVIEW

Definitions

Retailing form the economic structure and the way of life as it is an integral part of the economic structure. There are several definitions of retail by experts. According to Levy and Weitz (2007), retail is a set of business activities that add value to products and services sold to consumers for personal or family use. Armstrong et al. (2006) describe retail as a whole activity in goods and services sold to end consumers for personal use and not for business use.

Shopping is a basic human activity that nearly every person in a civilised community becomes a part of. Services and establishments for shopping are very well associated with structures for entertainment, health, administration and education (Beddington 1991). Even though home shopping services are much more available now, shopping is still mostly going to the shopping areas. Shopping malls and supermarkets are the most visited areas and often shopping is a way of releasing stress and is a household routine (Dholakia 1999). According to Ibrahim and Ng (2002a), shopping centres refers to a combination of stores which are designed, planned, developed, marketed and managed as a unit, usually providing variety of shopping goods and services as well recreation and entertainment facilities.

Seo et al. (2001) stated that the activity when a consumer spends an amount of time and effort in the selection of fashion (apparel or clothing) could be considered as fashion involvement shopping. Behavioural variables in relation to fashion products such as consumer characteristics, product involvement and buying behaviour are predicted mainly using fashion involvement (Park et al. 2006). Fashion itself can be defined as a social judgment of practices, ideas or product from human collective behaviour, which has implication on many aspects in life of human groups (Solomon and Rabolt 2009). Walsh et al. (2001) interpreted fashion consciousness as the degree of involvement someone with style or fashion in clothing and suggested that the fashion conscious shopper who wants their clothing up to date with the latest styles and trend, they are the ones who get pleasure from shopping.

Shopping is a general event in human experience and the group dynamics that influence other elements of life may even be used for shopping related activities as many elements of social comparison are becoming outstanding in the shopping experience (Borges et al. 2010). These shopping experiences offer hedonic value to shoppers and show the experiential advantages of shopping (Babin et al. 1994). Moreover, a shopping centre is the main point of interest for the fashion oriented shopper and consumers who desire a high degree of excitement, fun and enjoyment (Babin et al. 1994), feeling a special experience when they enter the shopping centre (Haque and Rahman 2009). Many elements can contribute to the fashion shopping experience characteristic; Jones (1999), defined retailer attributes and customer attributes as two dominant categories that can affect it. Retailer attributes refer to those shopping centre attributes that might be used to influence shopper experience from shopping centre perspective. Customer attributes are those shopping experience major factors that characteristics and connected with the customers.

In evaluating shopping centres experience there are two important dimensions, namely its utilitarian value and hedonic value. Utilitarian shopping orientation refers to shopping process efficiency (Jones et al. 2006). Efficiency can be understood as maximum ratio between output (buying the right product with the right price) and input (effort needed, time and transportation). Utilitarian shoppers are focusing on efficiency, rational shopping, and time management in shopping to achieve a goal (Shang et al. 2005; Childers et al. 2001). Hedonic shopping orientations are more to the consumer benefits of the shopping process and the product capabilities to satisfy the wants and needs of buyers (Jones et al. 2006; Babin et al. 1994).

Hypotheses Development

As mentioned before, the aim of this research is to investigate the main factor in shopping experience that can influence the fashion shopping behaviour of international student in the UK in the shopping centre environment. Based on previous research in shopping experience topic held by Jones (1999) and Ibrahim and Ng (2002b), the framework is considered to be modified from the last one referring to the retailer and consumers attributes implementation in shopping experience. In addition, the framework shown in Figure 1 will help explain the research's purpose.

Figure 1: Research Framework

As suggested in the shopping experience literature, Jones (1999) divided two categories that contributed in shopping experience, but in this study the researcher will look at the influence of shopping centre attributes in shopping centre environment. By experiencing the shopping experience in shopping centre, there are two general attitude categories that appear. Based on the previous study, there are two general attitudes in shopping, namely hedonic and utilitarian. Hedonic and utilitarian value is the outcome of the advantage that shoppers get from the experience of shopping at the shopping centres Babin et al. (1994). Byoungho and Jai-Ok (2003) also identified that the two categories will affect the shopping behaviour in the future, therefore the following hypotheses are tested;

H₁: Specific factors of shopping centre attributes form a shopping centre experiences that can stimulate international students to become hedonic shoppers.

H₂: Specific factors of shopping centre attributes form a shopping centre experiences that can stimulate international students to become utilitarian shoppers.

On the previous study by Taylor and Cosenza (2002), they explained about mall shopping behaviour and clothing choice, thus the researcher will look at the influence of hedonic and utilitarian value on international student and how it relates to their fashion shopping behaviour. Therefore, the following hypotheses are tested;

H_{3a}: International students who become hedonic shoppers give a positive influence to fashion shopping behaviour.

H_{3b}: International students who become utilitarian shoppers give a negative influence in fashion shopping behaviour.

RESEARCH METHODOLOGY

Data were collected from questionnaires distributed to 150 international students in the UK. The students are older generation Y aged 18-27, both males and females to be the consumers' role. The questionnaire were divided into three parts; first part are personal details that can be used to examine demographic data, the second part are variable questions that were used to measure the hypotheses proposed and the third part are open-ended questions about shopping centres international comparison. All items for variable questions were measured on 5-point Likert scales ranging from strongly disagree to strongly agree. Shopping center attributes variable were measured by five dimensions. The dimensions are atmosphere, brand and product, price and promotion, service quality, and entertainment and facilities. Twenty five indicators to measure shopping center attributes were adopted from several previous studies (Lee et al., 2005; Sit et al., 2003; Michon et al., 2007; Ibrahim and Ng, 2002a; Wong et al., 2001). The four indicators to measure hedonic value and three indicators to measure utilitarian value were adopted from Babin et al. (1994). The six indicators that were utilized to measure fashion shopping behavior were adopted from Park et al. (2006).

In this study, the internal consistency reliability was measured by Cronbach's alpha with minimum score of 0.6 (Malhotra, 2009). We also assessed validity analysis using Pearson's product moment correlation coefficient (r). If the Pearson Correlation r value is greater or equal with the r table, then the indicator is valid (Collis and Hussey, 2003). In order to measure the relationship between independent and dependent variables, we used a linear regression analysis method.

RESEARCH RESULTS

The respondent profile is presented in Table 1. It showed that 68% of total respondents were from Asian backgrounds. This would be in large due to Asia the largest percentage to send its students to study abroad based on information from The UK Council for International Student Affair (2011). The respondents who

were in 26-27 years old are the most respondents in this research amounting to 33.3% of total respondents. Most of the respondents who filled the questionnaire were lived in Bournemouth with 47.3% of total respondents. Apparently, 79.3% of total respondents have their income from their parents (family).

The constructs reached the internal consistency reliability shown through Cronbach's alpha ranging from 0.826 to 0.904. However, only thirty out of 38 indicators were fulfilled the validity criteria. Table 2 has shown that there is a significant effect between specific shopping centre factors that form shopping centre experience and hedonic value. However, it also shows that there is no significant effect between specifics factor of shopping centre attributes that form the shopping centre experience and utilitarian value. It showed that international students who become hedonic shoppers give a positive impact to their fashion shopping behaviour with the magnitude of influence being 64.3%. The result shows that there is a relatively strong positive influence between international students who become hedonic shoppers and their fashion shopping behaviour. Another hypothesis result shows that international students who become utilitarian shoppers give a negative impact to their fashion shopping behaviour with the magnitude of influence 15.9%. It means that there is a relatively low negative influence between international students who become utilitarian shoppers and their shopping behaviour in terms of influence.

Table 1: Respondent Profile

Description	Demographic Description	Respondent	Percentage
Gender	Female	75	50.00%
	Male	75	50.00%
Nationality Group	Asian	102	68.00%
	European	25	16.70%
	American	8	5.30%
	African	15	10.00%
Age Group	18-19	11	7.30%
	20-21	18	12.00%
	22-23	29	19.30%
	24-25	42	28.00%
	26-27	50	33.30%
City that you live in the UK	Bournemouth	71	47.30%
	London	24	16.00%
	Glasgow	33	22.00%
	Newcastle	22	14.70%
Source of income	Parents (family)	119	79.30%
	Scholarships	9	6.00%
	Part time job	15	10.00%
	Others	7	4.70%

Table 2: Hypotheses Testing Summary

No.	Hypothesis	Sig. Value	Magnitude of Influence	Conclusion
H ₁	Shopping centre attributes → Hedonic Value	0.000	0.337	Accepted
H ₂	shopping centre → utilitarian Value.	0.444	- 0.063	Rejected
H _{3a}	Hedonic Value → Fashion Shopping Behavior	0.000	0.643	Accepted
H _{3b}	Utilitarian Value → Fashion Shopping Behavior	0.027	- 0.159	Accepted

DISCUSSION

Shopping centre attributes are the important factors that can influence international student to go fashion shopping. Several shopping centre attributes that have been previously used by Haque and Rachman (2009) and Jones (1999) such as selection of brands, cleanliness, unique interior design and the quality of service were highly considered as the main important attributes. Those particular attributes were also part of the 17 indicators that were found on this research and considered to be the main factor that can form the shopping experience and influence the international students to go to the shopping centre and perform a fashion shopping. Furthermore, the result also reveals that the hedonic international student shopper was stimulated by the 17 indicators of shopping centre attributes because the hedonic shopper are more concern to the shopping experience rather than to fulfil their functional needs. However, the 17 indicators of shopping

centre attributes are not able to stimulate the international students to become utilitarian shopper. The result supports the notion from Stoel et al. (2004) and Carpenter et al. (2005) which states that the motivation behind the utilitarian shopper is about task accomplishment since utilitarian shopper's reason for shopping is merely to enjoy the functional attributes from the product not from the shopping experience.

The findings gives an understanding that there are two values that influence the fashion shopping behaviour of international students in the UK, which are of hedonic and utilitarian value. Moreover, in testing the hypotheses, it was revealed that the international students who were considered as hedonic shoppers gave a positive influence to their fashion shopping behaviour while the international students who were considered as utilitarian shopper showed a negative influence to their fashion shopping behaviour. The positive influence arose as the hedonic shopper tends to have higher fashion involvement, hence the frequency of doing the fashion shopping are also increasing. The result is supported by the previous research from Stoel et al. (2004) and Dholakia (1999), which stated that when doing fashion shopping, consumer with hedonic value tends to be more energised and satisfied because for the hedonic shopper, fashion shopping is a way to express themselves. This finding will become useful for the shopping centres developer and marketer to determine which consumer that they will have to focus on. They need to aggressively pursue the fashion conscious shoppers as these shoppers will shop more often, but while these fashion conscious like shopping and want variety, they also price sensitive.

On the contrary, the negative influence on the relationships between the utilitarian shopper and fashion shopping behaviour can be explained as they only do fashion shopping to fulfil their functional needs. When being compared to previous studies by Carpenter et al. (2005) and Kim and Kim (2005) the result shows a similar pattern where in fashion shopping the utilitarian shopper did not find pleasure in shopping, while they tend to shop less and stop shopping when already find the right product. Moreover, the findings of the research also supported that in the fashion shopping, female international students are more hedonic while the male international students tend to be utilitarian and task oriented. This finding is quite common in fashion research, nevertheless several previous research stated that recently man are no longer define as fashion-less or not interested in fashion, they are changing their focus and orientation from conservative clothing to fashion clothing (Kacen 2000; Vieira 2009).

LIMITATIONS AND SUGGESTION FOR FUTURE RESEARCH

Even though the researcher has attempted to conduct the best practices during this research, like all previous research, there are still several limitations. First, this study focuses on international students who were studying in the UK at the time of the research and due to the limitation of sampling size and scope of the research; the data were collected only in four cities in the UK. Therefore the findings in this study may not generalize well to the entire populations of international students in the UK. To make an improvement on the result of this research, the further research should attempt to include a more representative sample, which can include cross-national comparisons or wider geographic locations. Second, there is also a focus on the respondent's age because broader range of ages may have dissimilar views and purposes towards fashion shopping behaviour in comparison to a specific age group of generation Y.

Third, this study conducted with limited time between January to April 2012, further research may take a longer period of time to conduct better research. Moreover, this research were using four variables as an independent and dependent variable, further research should consider on adding more variables such external attributes (transportation facilities, mass media publications and advertising). With the growth of online retailing recently, further research may consider on investigating the impact of online shopping towards the shopping centres. Furthermore, the study is limited due to the general use of fashion shopping rather than types or brands. In the further research, this study could be extended to different fashion product categories or fashion branding.

PERCEIVED PREVALENCE OF SOCIAL MEDIA ON BRAND IMAGE: A THEORETICAL AND EMPIRICAL INVESTIGATION OF THE LUXURY FASHION SECTOR

Madina Ansari and Wilson Ozuem
University of Gloucestershire, UK

ABSTRACT

It is widely recognised that a better understanding of social media and its implications is essential for formulating effective branding strategies in evolving Computer-Mediated Marketing Environments (CMMEs). However, few studies have examined how social media influences brand image in the luxury sector. The current study intends to examine whether increased exposure in social media influences brand image in technologically-infused marketing environments. Drawing on extant literature from various perspectives (in areas such as marketing, information management, communications studies) this study examines exposure to social media and how this influences consumer perceptions about luxury fashion brands. The current analysis develops a critical examination of social media and the perceived prevalence on brand image by elucidating overwhelming perspectives in the evolving technological marketing environments. Unlike prevailing positivist studies, this analysis provides some insights into qualitative research in terms of social media following a social constructivist perspective.

INTRODUCTION

Consumers have embraced the internet and the social community it has supported in the recent past. Market research has been going through changes and developments in social communications. Social media has changed traditional brand manager- consumer relationships by empowering consumers to communicate with each other instantly (Christodoulides and Jevons, 2011). The rise of Web 2.0 has transformed the way content is generated on the web. Previous studies have addressed social media by examining the role and influence on customer equity (Kumar and George, 2007; Dan and Dan 2011; Kim and Ko 2011) purchase intention (Kim and Lee 2009, Park, Ko and Kim 2010). What these studies have in common is that they consider social media as online applications; platforms and media which facilitate interactions among customers, enabling deeper relationships between them. Kim and Ko (2012), for example, presented statistical analysis of social media on customer equity. Others, presented illustrative statistical evidence of the influence of social media on brand relationships (McAlexander, Schouten, Koenig 2002; Dou, Lim, Su 2010; Cova and White, 2010; Sukoco and Wu, 2010). Regardless of these preliminary studies in the evolving technological tapestry, much is still unknown about how social media influences brand relationships and brand images in the luxury fashion sector. Drawing from a social constructivist perspective and breaking with the trend towards quantitative research, the current study aims to examine consumer brand perceptions of the evolving interactive market space. Thus the purpose of this study is to examine how social media facilitates interactions and brand relations in the emerging technological environments. For this purpose, a social constructivist perspective will be utilized, adopting a postmodern ethnographic approach to question consumer experiences and perceptions of social media in molding brand relationships and brand images in the luxury fashion sector. Kim and Ko's (2011) work on social media and customer equity is helpful in considering the importance of social media on customer equity and brand perceptions. Kim and Ko (2011) note that 'the brand's social media platforms offers venues for customers to engage in sincere and friendly communications with the brand and other users, so the brand's intended actions on the social communication scene were positively affecting relationship equity and brand equity as well' (p. 1484). Kim and Ko suggest that social media leverages and facilitates informal relationships within customer social network activities, but offer few suggestions on how social media creates effective online brand communities. The current study develops on this in seeking to examine how consumer participation and

experiences in social media influences brand perceptions and relationships. The luxury industry has changed significantly in the last decade. With growing interest in using social media as a means to attract more customers through effective communications, luxury brands started to incorporate an e-business into their strategies. In a study of luxury brands in the Internet environments, Balwani (2009) stated that there is a doctrine among brand managers that the Internet is not a luxury market. Of more relevance to the study of Internet and its prototypical subsets, is the higher order of personalization, and closer interaction through social networking sites. With global populations nearing 2 billion having an online presence, this makes the Internet a place where luxury brands must build a presence rather than endangering luxury brands. Although, the nature of internet environments has changed over the last 4 years, our review provides a contribution beyond Balwani's, in addition to reviewing a number of extant work published in the last 4 years. The current paper goes beyond this and adds new details on how social media platforms influence brand image and brand communities in the luxury fashion sector.

THEORETICAL FRAMEWORK AND CONTEXT

Prior to defining social media, it is important to underline its relationship to Web 2.0. During the early stages of the World Wide Web (Web 1.0), users could only view web pages but could not contribute to the content of these. From 2004, the term Web 1.0 transformed into Web 2.0 site. Which allow users to interact and create user - generated content on the virtual community (O'Reilly, 2005). Web 2.0 is not only increasing usage of the internet, but changing the way users reach each other to share comments, thoughts or information about a particular subject. Therefore the new user behaviour prevalent in this Web 2.0 setting are what give the social web an acknowledged accreditation of existence (Berthon et al., 2012). Kaplan and Haenlein (2009, p.60) stated that "a formal definition of social media requires drawing a line between two related concepts that are frequently named in conjunction: Web 2.0 and user generated content". The term Web 2.0 is used to describe a new approach to using the World Wide Web as a co - existing platform for software developers and end-users involved in modifying content and applications at the same time. Kaplan and Haenlein (2010) also describe three elements that identify social media: concept, which consists of art, information, image or video that is passed electronically from one internet user to another; media that can take a physical, electronic or verbal form; and social interface, which are community engagement, social viral or other physical media.

The concept of social media is generating increased interest in marketing and information management (Zarella 2010, Johnston 2011, Dan & Dan 2011, Kaplan & Haenlein 2009). For marketing, Dan and Dan (2011) note that 'the principle underpinning the rise of social media as a current *modus operandi* for the internet is an inherent belief in the value of connecting with other people,' Implicitly, one of the driving forces of social media is the increased number of users in social media environments. Dann and Dann (2011) describe social media as an interconnection between content, users and communications technologies that includes Facebook, Twitter or Google. The theory justifying social media as a rising tool for Internet technology is deep-rooted in an importance of connecting with other people. Dann and Dann (2011) portrayed social media as having three components that link with and complement one another. One element of social media is communications. This virtual infrastructure provides a coexistence between social interaction and content in real time and in the same virtual space. Examples include Facebook, YouTube and Flickr. The second component of Social Media is content which attracts individuals to the site, like photos on www.flickr.com or videos on www.youtube.com. Another component is a social interaction which connects one user with another through the site, for instance on Facebook or Twitter.

Zarella (2010) describes social media in contrast with traditional media, where, with the interference of new technologies, anyone can create or circulate comments. Social media comes in many forms like blogs, social networks, media-sharing sites and others. This definition of social media is supported by Uzelac (2011) who considers social media as "a give-to-get environment"; the opposite of traditional media sites. From another point of view social media is a two-way platform, where people communicate and share information (Johnston, 2011). Blackshaw-Nazzaro (2006) suggests social media has emerged alongside sources of online information that are created, circulated and shared and used to inform other consumers about products, brands, services and issues. Stokes (2008) describes social media as media designed to be shared. Sharing means that it is easy to comment on content and to exchange information. It is also possible to view media at a lower cost. He compares social media and Traditional media in the Table below

Traditional Media
Social Media

Fixed, unchangeable
Instantly updateable
Commentary limited and not real-time
Unlimited real-time commentary

Blackshaw and Nazzaro (2004) describe social media as a variety of online information that is created and used by users in order to educate other users about brands, services or products and other issues. The messages transmitted through social media has a great impact on consumer behaviour and influence decision making. But business press and academic literature have stopped short of advising marketers about how to integrate social media into marketing strategies (Mangold and Faulds, 2009). Chung and Austria (2010) suggest that social media consists of different methods of communication online, such as blogs, social networking, podcasts, company sponsored websites and multimedia sites. According to these authors social media refers to the range of proceedings that involves individuals in online communications. Many authors understand social media as social network sites (Zarella 2010; Boy and Ellison 2007; Fraser and Dutta, 2008). For example, Boy and Ellison (2007) define social network sites as web based services that enable users to create a public or semi-public profile within a constrained system. They enable users to share information with other users with whom they have a connection and extend across their list of connections within the same system. Fraser and Dutta (2008) categorised social networking sites into five groups: “egocentric/identity construction social networking sites”, like Facebook or MySpace; “opportunistic”, which is based on business connections, like LinkedIn; “community” social networking sites. They bounds users by cultural or neighbourhood backgrounds; sites like You Tube or Flickr are “media-sharing” social networking sites and “passion-centric” is a social networking site based on sharing common interests, like Dogster. Marketers attempt to employ the social media in marketing strategies to increase sales and profits. Regardless of interest in social media, there is a lack of academic research to develop an understanding of social media as a new phenomena (Kaplan and Haenlein, 2010).

ONLINE COMMUNITY BRAND ENGAGEMENT

The internet has enabled people around the world to communicate with each other instantly, despite geographical distances and different time zones. Within social media sites, users unite and create their own communities. The modern concept of community embraces the idea of a group of people bonded by culture, who do not necessarily live in a similar neighbourhood (Rheingold, 1996). For community to progress, members have to have shared feelings or belongings (Weber, 1978). According to Preece (2001) the online community can be understood as a group of people who interact socially to satisfy their own needs or play a special role within the community. The notion of organising such a community rests on the basis of similar interests, needs, information or even services. As the popularity of online communities grows, marketers and consumers create and encourage relationships between consumers and brands. While marketers can promote and build brands by advertising their products and services, consumers can build online brand communities and actively attract other consumers to engage in community activities (Lee et al, 2009). Muniz and O'Guinn (2001) introduced the idea of brand community as "a specialised, non-geographically bound community, based on a structured set of social relationships among admirers of a brand". Muniz and O'Guinn's study of brand community revealed the social nature of brands and suggested an extension and a shift away from traditional models of customer-brand relationship towards a customer-customer-brand triad.

SOCIAL MEDIA AND BRAND COMMUNITIES

There is a continuous discussion around whether brands should be present in social media (Cova and White 2010, Brasel 2012, Bruhn, Schoenmueller and Schafer 2012). For example, Laroche, Habibi and Richard (2012) support this idea, as they consider social media to be medium between brands and customers. Companies developing this relationship between brands and customers may become more loyal to the brand. Today, companies and their brands should consider social media as one of the main marketing activities. Social media opens up new channels for interactions and can entirely reposition brands by facilitating interactions between customers and the organisations they interact with (Divol, Edelman, Sarrazin, 2012). According to Mangold and Faulds (2009), social media is a new fusion of the promotion mix. While in traditional marketing communications, promotion is controlled by advertising, selling, direct marketing and harnessing customer services tools. In social media marketing, control over the promotional mix is minimised. Now companies with social media presences have less power to affect consumer choices. Social media platforms are independent and allow consumers to communicate with each other. Even though marketers cannot control the dissemination of information, they can still monitor and input to debates (Mangold and Faulds, 2009).

Mangold and Faulds (2009) argued that few companies regard social media as a significant part of their promotional mix. Despite the fact that social media has an influence on marketplace, the modus operandi in shaping relevant activities is not as effective as it can be. It is important to acknowledge that consumers perceive social media as a trustworthy source of information; moreover that other aspects of the marketing mix (Foux, 2006). For example, social media sites like Facebook or Twitter enable people to 'befriend' or 'follow' favourite brands and to identify germane brand communities. They can also build network relationships and exchange brand information. In 2009, Ferrero's Nutella Facebook page was the third most popular corporate page tallying some 4.9 million fans. Effective communication with customers made Nutella one of most successful brands on Facebook (Wasserman, 2009; Cova & Pace, 2006). There are a few other successful companies like Jeep or Harley Davidson (Shau, Muniz & Arnold, 2009) that have built their brand communities on social media platforms such as Facebook and MySpace (Kaplan & Haenlein, 2010). Brand communities support their members by sharing essential information and they draw attention to different values (Shau, Muniz & Arnould, 2009). "What makes social media so potent: its ability to amplify word-of-mouth effects" (Divol, Edelman, Sarrazin, 2012). Mangold and Fauld (2009) state that one of the functions of social media is to facilitate discussions amongst customers. Social media is an extended form of traditional word-of-mouth communications.

Currently, increased usage of social media amongst consumers helps them to make purchase decisions and assess brands in the evolving internet platform. As a result, companies can reach their customers and influence their decision making and buying behaviour (Swain, 2009). Social media has marginalised the obstacles to the flow of the information amongst people and it is now easier for marketers to communicate with their customers and target the audience that are not familiar with the brand.

According to Shaver (2007) companies need to build a strong social media presence in order to attract customers, as they are influenced by social media. In order to build the relationship and gain trust and loyalty the presence of social media require companies to set strategies for social media presences. However, some researchers argue that brand communities based on social media could produce positive effects for brands. Kim and Ko (2010) stated in their research that social media has had a great influence on brand reputation. Others, like Fournier and Avery (2011) contradict these statements by saying that social media is not always an ideal environment for brands. Companies might be at risk (Fournier & Avery, 2011), as customers have more power than before and companies increasingly struggle to manage information about their brand. Customers can get involved in discussions or online complaints with they are not satisfied with the brand (Kaplain & Haenlei, 2010; Ward & Ostrom, 2006). And also consumers may produce their own understanding of meaning and strategy related to the brands they favor (Wipperfurth, 2005). Hence these consumers produce a linking value that is not always exactly what the brand strategist had carried in mind (O'Guinn & Munis, 2005)

SOCIAL MEDIA AND BRAND IMAGE

The first introduction to the concept of brand image can be traced to 1955 (Gardner & Levy). According to these authors, the understanding of brand image was based on the social, physical and psychological nature of the product. How customers feel and think about the brand and associate themselves with the image of brands was recognized as important. Aaker (1991) describes brand image as a group of associations, grouped in a meaningful way. Brand image suggests the perception of a particular brand and also the image of a company that offers a product or service. The positive experiences of consumers with brand builds stronger relationship between them. Consumers value the brand through brand associations, even though they have no direct experience with the product or service (Aaker, 1991). Similarly, Keller (1998) suggests that brand image is a reflection of brand associations on consumer memories. He categorized brand association into four types as follows:

1. types of brand association: attributes, benefits and attitude
2. favorability of brand associations
3. strength of brand associations
4. uniqueness of brand associations

In addition, Kapferer (2008) states that brands are intangible assets and they create value. This is consistent with Herzog and Britt (1966) who define brand image as the sum of influences over customer experiences, packaging, name, product make, people using the brand, advertising, form and tone of advertising and other brand associations. According to Keller (1993), many scholars have proposed different definitions of brand image and there has been little consensus regarding the most appropriate definitions of symbolism, message, personification, cognition and psychological dimensions (Dobni and Zinkhan, 1990). In this paper, a definition of brand image according to Gronroos' (2010) is accepted as appropriate. Aaker's (1995) model where the organization creates the brand is less relevant in social media context. Gronroos (2010) states that traditional definitions of 'brand' exclude the customer and presumed that the company creates the brand, which then influence how customers perceive brands. Due to the increased usage of social media websites by consumers, brands, products and companies are increasingly judged by more than one-third of social media users (Burshtein & Turco, 2010) and many brands are linked to user-generated content through search engine results (Rein, 2011). This is favourable for brand marketers to promote their brands and encourage customers to engage others by sharing experiences (Parise et al, 2008). Many authors state that the appearance of Web 2.0 allows brands to collaborate with loyal customers and at the same time produce a linking value for the brand (Cova & Cova, 2002). Social media allows brand owners to advertise (using viral marketing), develop products (via consumers involvement in design process) and create market intelligence (by analysing user-generated content) (Richter et al 2011).

CONCLUDING REMARKS

Social media and brands have been studied from many different perspectives. For example, Cova and White (2010) discussed the key concepts of brand community and the co-creation of value as well as emerging new trends in online community behavior. These researchers adopted a case-study strategy, which was based on a dual ethnographic and netnographic method. They revealed that these communities may pose a risk for companies by developing competitive offerings. The findings indicate two reasons that may motivate consumers to switch to non conventional brands. The authors suggested that one of the reasons is when

consumers feel that they are not getting value- for- money product or service from brands. The second reason is when consumers want to develop their own online communities that are not dependent on organisations or brand communities. But it seems much remains unknown about how brands influence brand-consumer relationships. Other researchers such as McAlexander, Shoulten and Koenig (2002) found consumers and marketers building communities together. Companies and their brands will benefit from cultivating a brand community. Because community -integrated customers contribute to brand communities by playing a role of brand missionaries and endorse marketing communications into other brand communities. Customers emotionally attached to a community invest in the welfare of the company and are determined to further develop the company's success. Also Laroche, Habibi and Richard (2012) summarized debates over the activities of brands in social media environments. The aim of their study was to show how brand communities influence the elements within the customer-centric model. Structural equation modeling highlighted the fact that brand communities established on social media are positively effecting customer-customer-brand relationships. These relationships in their turn, positively affect brand loyalty and trust. However, these studies concentrate more on customer centric relationships and less on how brands facilitate interactions with customers.

Sukoco and Wu (2010) argue that there remains a knowledge gap in terms of customer motivations to identify and integrate into brand communities. The study proposed two main consumer motivations: self - related (which consists of enjoyment and knowledge) and social - related (which refers to affiliation and social status). The findings of this research are based on the assumption that members of brand communities support each other and get involved in community activities to update product knowledge. This study underlines that marketers need to consider complex motivations to facilitate and organize brand community activities. The results of this study can be used as reference for academics and marketers engaged with brand communities. But there seems to be a need in future research to explore other motivations by using different motivation theories. For example, to examine how online communities being developed and what drives consumers to join these communities.

Brasel (2012) suggests that many traditional forms of brand communications are no longer relevant in the current media environment. The research shows that incidental exposure to a brand alters consumer behavior in a way that is consistent with brand identity. The findings suggest that strong brand identities can retain effectiveness in the social media environment. Therefore, there is a need to explore the multi-dimensional effects of brand identities on consumer brand perceptions in media environment. Bruhn, Schoenmueller and Schafer (2012) examined the influence of brand communications on brand equity by means of social media while compared with traditional media. This empirical study has shown that traditional and social media communications have had a valuable impact on brand equity. If traditional media mostly influence brand awareness, social media influence the brand image. Constantinides (2004) explored how to attract and retain customers in internet market places. The research was based on identifying factors affecting online consumer behavior. The findings of this study revealed three components of web experience: functionality through usability and interactivity, trust and credibility, and attractive content of online presentations that influence online consumer behavior. This study was very useful in understanding how web experience components input to the online customer decision making process and how they may help to develop an attractive internet presence for brands. To support this study, Erdogmus and Cicek (2012) researched the impact of social media marketing on brand loyalty and revealed that customers are positively influenced when brands offer advantageous campaigns, interesting content and interactive applications on social media. However, there is a need to further explore the nature of technologies delivering new forms of communication to understand interactions and the perceptions of online consumers.

Dou, Lim and Su (2010) studied brand-positioning strategies using search engine marketing. The study showed that search engine results could be used as tools for creating brand positioning. The research sheds more light on the importance of SEO efforts by lesser-known brands. The study also provides guidelines for organisations willing to optimize their display rankings. The employment of search engines as free promotional tools can help organizations build their brands and gain competitive advantage in the market place. Research by Naylo, Lamberton and West (2012) focused on a key practice within the social media domain. The results of their four studies reflect that the presence of online supporters is passively experienced and virtual and their demographic attributes can influence consumers brand evaluations and purchase intentions. Kim and Ko (2011) identified several attributes of social media marketing activities and examined the relationships between these activities. The following are five constructs of the SSM activities of luxury fashion brands: entertainment, interaction, trendiness, customization and word of mouth. Many fashion luxury brands create their own online accounts or communities with the purpose of communicating

with customers. Moreover, social media marketing activities provide the opportunity to minimize misunderstandings and preconceptions towards brands. With the increased usage of social media platforms by luxury brands Kim and Ko (2011) have chosen to quantitatively analyze the effects of social media. The results indicate that brands using social media entertain customers by offering different content including social networking activities and this facilitates customized information searching. It also offers interactions amongst users that leads to word of mouth effects and includes fashion and trend attributes.

For this purpose a social constructivist perspective was employed, adopting a postmodern ethnographic approach to question consumer experiences and perceptions of social media on constructing brand relationships and brand image in the luxury fashion sector. Social constructivism underlines the importance of culture and context. It embraces the understanding of what is found in society and how knowledge is constructed based on this understanding (Derry, 1999; McMahon, 1997). The postmodern ethnographic approach encourages the idea of a reexamination of every aspect of existence, with the goal of finding that which was "holding back" progress, and replacing it with the new one (Denzin and Lincoln, 2011). With the advent of internet technology understanding the communities needs to be re-examined to deeply investigate online communities' characteristics and their role for brands and consumers. The emergence of internet technology ushered in number of online marketplaces. Social media, as one of the marketplace platforms, have become a significant part of modern life. Therefore, companies integrate their presence on the web and use social media as a tool for their brand positioning. This paper has examined a number of conceptual theories related to social media and brand perception. Following this articulation social media and online brand communities were examined against consumer decision making process. However, review of existing literature indicated that there seems to be limited study on how online brand communities influence brand image in luxury fashion sector. To elaborate on the influence of social media on brand image, this study has addressed a set of aims and objectives to explore how social media could be used by luxury fashion brands to improve their presence in brand communities and social media platforms. This study offers a different approach to question customers experiences and perceptions of social media on building brand relationships and brand communities.

NON GOVERNMENTAL ORGANIZATIONS (NGOs) AND HOUSEHOLD FOOD SECURITY: EXPERIENCE FROM SOUTHERN ETHIOPIA

Aklilu Admassu Asha
University of Limpopo, South Africa

ABSTRACT

Chronic household food insecurity has been one of the most critical development challenges in African countries including Ethiopia. The major causes of food insecurity are usually attributed to several internal and external forces that need to be understood at local and global context. In this regard, both local and global actors should enhance their partnership and collaboration for effective planning and implementation of food security initiatives. The purpose of this paper is to investigate the role of Non Governmental Organizations (NGOs) on household food security in Southern Ethiopia with reference to Kale Heywet Church Development Program (KHCDP). It can be argued that NGOs play an important role in the formulation and implementation of food security programmes and projects. The paper used both primary and secondary sources of information to analyze the level of household food security. Primary data collection methods such as household questionnaire, focus group discussion and key informant interviews were applied during the field work. The paper argued that KHCDP, an indigenous NGO in Ethiopia, has contributed to improve household food security in rural areas through promoting different strategic interventions. However, the paper also indicated that current interventions including access to agricultural inputs and technologies, water conservation techniques, agricultural extension and follow-up support need further consolidation. In addition, the paper highlights low levels of community participation and risks in long-term sustainability of food security initiatives. Therefore, it is vital to strengthen policies and practices with regard to partnership and extension services as well as support to small scale farmers in rural Southern Ethiopia.

INTRODUCTION

Food security and the ultimate reduction of poverty are the central issues of concern both at international and national level. At international level the Millennium Development Goal (MDG) targets to halve the proportion of people who suffer from poverty and hunger by 2015 (United Nations, 2000). Accordingly, governments of developing countries including Ethiopia have been committed to contribute towards achieving the MDGs within the given timeframe, 2015. However, food security and poverty reduction remains a huge challenge. For example in Ethiopia, it is estimated that twenty six million (about a quarter of population) live in the food deficit areas and they are suffering from hunger and malnutrition (Diao and Pratt, 2007). Research reports revealed that the country is food insecure (Stephen, 2000). There is a large food self-sufficiency gap at the national level and food insecurity at household level (EEA/EEPRI, 2004/05). According to the United Nations Human Development Report (UN, 2007/2008), 46% of the total population in Ethiopia is undernourished. The report further revealed that, under-nutrition contributes to the death of 58% of children under-five in the country. Moreover, 38% of children under-five are under weight and 51% is stunted. This paper, therefore, identifies household food insecurity as a key problem.

The emphasis is on investigating the contribution by the Kale Heywet Church Development Programme (KHCDP) in its role as indigenous NGO. This study in particular considered the effectiveness of strategies that have been employed to alleviate household food insecurity in the rural areas of Southern Ethiopia. As an indigenous NGO, the KHCDP has been supporting the developmental aspirations of the local community and initiating integrated local programmes for more than thirty years (Dalelo, 2003). However, the effort that has been made with regard to household food security was not adequately documented. This paper serves as an attempt to bridge the gap through focusing on strategies and approaches towards household food security. This approach is of importance as the findings will contribute to the debate concerning household food security interventions in the country.

LITERATURE REVIEW

Food security is defined and interpreted in different ways by different authors and institutions depending on the level of analysis and interpretations. The World Bank (1986) defines food security as access of all people at all times to enough food to have an active, healthy life. The definition of World Bank stressed on the accessibility or entitlement through increasing the purchasing power of people rather than increasing availability. Similarly, FAO of the United Nations (1996) defined food security conditions as 'when all people, at all times, have physical and economic access to sufficient, safe and nutritious food to meet their dietary needs and food preferences for an active and healthy life'. The definition by FAO is broad and encompasses various elements of food security such as availability at all times, accessibility by all people, nutritious especially quality and quantity, and food preference depending on culture and traditions of people. According to FAO (2000), food security depends on availability of food, access to food, and utilization of food. These are key elements that form pillars of food security.

NGOs play crucial role in development process, especially in food security. They generally pursue activities to relieve suffering, promote interest of the poor, protect the environment, provide basic social services, or undertake community development (World Bank, 1989). In similar way De Beer and Swanepoel (2000) described NGOs as autonomous, privately set up, non-profit making institutions that support, manage or facilitate development actions. There are different views regarding the role of NGOs in development. Proponents of NGOs argue about the significance of NGOs in development. According to Behera (2006), NGOs have unique characteristics such as knowledge about local people, operate with greater flexibility, work in inaccessible areas, cost-effective, and adopt appropriate development inputs. He further explained that NGOs also have some inherent weaknesses; limited financial and management experiences; low levels of self sustainability; limited institutional capacity; lack of inter-organizational coordination; and small scale interventions.

Internationally, the role of NGOs on food security has been recognized and the need to strengthen civil society is widely acceptable. In his essay, Baily (2007) shows how NGOs have responded to food security. According to Baily, NGOs response comprises increasing of rights based approach and participatory approaches to food security. Windfuhr (cited in Baily, 2007) clarified that NGOs focus on economic, social and cultural rights such as protecting small farmers from eviction, indigenous people from losing traditional land and fishing grounds, and segment of the population from discriminatory food supply schemes. He further explained that NGOs are developing nutritional rights, as opposed to rights to adequate food, to put pressure on governments to take responsibilities for supplying funding for nutrition in national budget. Howell (cited in Baily, 2007) also explained a participatory approach of NGOs in responding to food security by illustrating an Ethiopian case of Action Aid in promoting sustainable and community solution to food production. According to UN's Department of Economic and Social Affairs (2008), NGOs are collaborating with research institutions and government institutions in Ethiopia, Sudan, Mali, and Eritrea within the Dry land Coordination Group (DCG) in order to share experience and knowledge, and thus build capacity on agriculture and food security in the dry lands through the networks within and between these countries.

In Ethiopia, research shows that NGOs have been contributing towards promoting a wide range of development activities. One of these studies is a research conducted by Dejene (2004) on the contribution of NGOs to household food security. The study indicated that NGOs do play a significant role in improving the quality of life among the poor. Activities included soil conservation and reforestation, improved physical infrastructures and improved health and education infrastructure. These interventions have impacted on areas including livelihood security, improved water supply and other amenities and the introduction of cash crops. Belshaw and Coyle (2001) assessed the impacts of poverty reducing projects selected from different parts of the country. The study revealed that NGOs have significantly contributed to poverty alleviation in both urban and rural areas of the country through applying innovative approaches. Dagneu *et al.*, (2002) found that NGOs have been involved in facilitating accessibility of food to the urban and rural poor through income generation schemes such as, development of micro-enterprises and skills upgrading and vocational training. The research further reported that a significant number of NGOs are involved in improving the nutritional status of rural and urban communities through integrated health programmes, health education, family and nutritional education, access to clean drinking water and sanitation and family planning. According to the study, impacts of development projects lack sustainability, partially due to the kind of intervention approach followed by NGOs.

RESEARCH PROBLEM

The research problem is to emphasize the role of NGOs in the course of fighting against food insecurity in Southern Ethiopia. The research basically focused on investigating the roles played by the KHCDP, particularly the effectiveness of strategies that have been employed to alleviate household food insecurity in the rural areas. As an indigenous NGO, the KHCDP has been supporting the developmental needs of the local community and initiating integrated local development programmes and projects for more than three decades. However, the effort that has been made with regard to household food security was not adequately researched and documented. Prior to this, most studies on household food security in Ethiopia have focused on identifying the causes of food insecurity or impacts of the programmes. Hence, this research is believed to bridge the gap through focusing on strategies and approaches towards household food security. It is impossible to contribute to improving food security without effective approaches in which the complex local situations are addressed.

RESEARCH OBJECTIVES

The aim of this research is to assess the role of the Kale Heywet Church Development Program (KHCDP) on household food security in the rural areas of Southern Ethiopia. The specific objectives of the study are, namely, to:

- Investigate the effectiveness of the Kale Heywet Church Development Program (KHCDP) strategies towards household food security in the Kucha District;
- Assess the perception of community on the Kale Heywet Church Development Program (KHCDP) food security interventions in the Kucha District.

RESEARCH METHODOLOGY

An attempt was made to assess the effective implementation of KHCDP strategies towards household food security in two peasant associations. Mixed techniques, which includes qualitative and quantitative methods was considered in this paper. More specifically, existing documents were examined to review theoretical aspect of household food security and primary data was collected from the field using household questionnaire, interview and focus group techniques.

A household questionnaire was administered to 119 heads of household and face to face interview was done to collect quantitative data from respondents who were mainly subsistence farmers. Additionally, six focus groups and about 10 key informants were involved in the process of collecting qualitative information. The data analysis involved accurate field notes that were recorded throughout the fieldwork stage. The filled in questionnaire was edited for quality and completeness. The raw data were coded, processed and presented in the form of written textual quotes, diagrams, graphs and tables.

FINDINGS

The development work of the Ethiopian Kale Heywet Church is geared towards full human development in a holistic approach. According to Dalelo (2003), the Development Department of the Ethiopian Kale Heywet Church was established in 1984 to integrate all development activities in systematic ways. Since its establishment, KHCDP has been engaged in relief, rehabilitation and integrated rural development programmes, mainly in southern part of the country where the church has its stronghold. The KHCDP development activity has gradually shifted from relief and rehabilitation towards more integrated food security approach. This paper presents the empirical findings in the following sub-categories: provision of farm inputs and technologies; soil conservation methods; water resource utilization methods; training and extension services; participation; and sustainability.

Farm Inputs and Technologies

The results indicated that the KHCDP has introduced and distributed some farm inputs and technologies. The majority of the sampled households (65%) reported that they were able to receive some kinds of improved agricultural inputs. Seeds and seedlings were the dominant types of farm inputs adopted by

farmers. Less adopted farm inputs include equipments, chemical sprays and fertilizers. Of those adopted inputs and technologies, 50% provided with seed, 49% received seedlings, 10% received farm equipments, and only 6% used chemical fertilizers. Additionally, a considerable proportion (8%) reported adoption of beehives and local goats. However, the findings also reveal that a large proportion of households (41%) reported great dissatisfaction in relation to access whereas a considerable proportion (28%) indicated that they were somewhat satisfied. The major reasons behind dissatisfaction with access to farm inputs were inadequate supply (25%), unaffordable (17%), and delayed supply (15%).

The KHCDP introduced and distributed farm inputs and technologies with a view to increase food production and incomes. The KHCDP also played a significant role in increasing access to farm inputs, such as fruits and seeds. However, the distribution of farm inputs was inadequate in terms of quantities and coverage. There was shortage of supplies to address demand by beneficiaries at large and individual household were provided with insufficient amount of inputs for farming activities. What is more, the poor households were unable to afford the costs for inputs such as quality seeds and fertilizers. The finding is supported by other researchers (Dagneu et al., 2007; Behera, 2006) who indicated that NGOs the limited scale of operation of NGOs affect their effectiveness in terms of addressing the needs of poor donors, private sectors and government agencies to increase access to improved inputs and technologies by households for boosting their agricultural production and food availability.

Soil Conservation

The finding shows that the KHCDP has promoted soil conservation measures at household level. Most households exercise terracing such as soil, stone bands, and check dams. Generally, 69% of the sampled households practice terracing while 34% plant trees. Furthermore, 31% practice various cultural methods including mulching.

Soil conservation measures were widely adopted and practiced by households to improve soil fertility so as to increase food production. At household level such measures comprised terracing, tree planting and cultural methods, whereas at community level area closure is an example of conservation methods. On the other hand, there is dissatisfaction due to insufficient back-up supports with equipments and technical advices. As a result, the practice of soil conservation is declining at household level. This finding is supported by Shiferaw *et al.* (2003) that interventions related to household food security should give emphasis to improving soil fertility. Such soil conservation activities should promote farmers capacity through upgrading their skills and providing them with relevant equipments to reduce soil degradation. It entails that NGOs must make sure that there is adequate access to soil conservation equipments by poor households. NGOs should play a vital role in revitalizing soil conservation practices in order to improve food production.

Water Resource Utilization

The findings reveal that the KHCDP has played insignificant role in promoting improved water resource utilization for increasing food availability at household level. The majority of sampled households (84%) were not practicing improved water utilization methods. However, only a few (16%) of households use shallow wells, rain water harvest, and irrigation to produce crops. In answer to questions regarding the type of crops produced by households through improved water-utilization techniques, the results revealed that roots, vegetables, and fruits are the dominant crops.

Improved water resource utilization technique was not promoted properly to address the scarcity of water to produce adequate food at household level. An irrigation scheme was underutilized and roof- water harvesting technology is just at demonstration level. The main reasons were, namely, weak collaboration between government and the KHCDP, inadequate extension support, and poor performance of the water committee. According to UN's Department of Economic and Social Affairs (2008), NGOs should collaborating with research institutions and government institutions in order to share experience and knowledge, and thus build capacity on agriculture and food security in the dry lands .

Training and Extension

The results indicate that the KHCDP has contributed towards increasing awareness of households on food production and food utilization methods. A considerable proportion of households (39%) reported that it

was exposed to awareness creations on various training topics such as vegetable and fruit production, improved crop production, soil conservations, family planning, home care, food processing, beekeeping, and goat management. Most households were trained on three topics such as crop production, soil conservation, vegetable and fruit production. The finding also revealed that majority of sampled households was exposed to experience sharing visits. Figure 4 shows that 42% involved in farmers to farmers visits, as well as 42% who participated in visiting demonstration centers.

Training and extension services have increased households awareness of food production and utilization. Their capacity was built on improved agronomic practices, food preparation and sanitations. In addition, exposure to experience- sharing visits and demonstrations on improved technologies benefited households to familiarize themselves with new varieties. However, to improve delivery of training and extension services, KHCDP should consider the following issues: selection of trainees; follow up and technical advice; number of participants; duration of the course; refresher courses; and formation of small self-help groups. However concerning the application of lessons through training and extension services, majority of the sampled households reported that they failed to put into practice what they learned in the process. According to the study, only 31% of the trained households have applied lessons to improve household food security status.

Regarding follow up visits by extension workers of KHCDP, majority of sampled households reported that it was unsatisfactory. According to the study, 68% of the households were not visited by the project extension workers. However, only 18% reported that they received monthly visits. In addition, the opinion of focus group members was assessed on problems related to training and extension services. Thus the majority of the focus groups reported that the main constraints were poor selection of trainees, weak follow up of training events, low level of participation, short duration, and lack of refresher courses.

Participation

The majority of poor households were not involved in food security interventions. However, in some activities such as credit in-kind and soil conservation poor households were included. The beneficiaries selected for demonstrations of improved crops and trainings were model farmers. In the community based activities, particularly soil conservation on communal land, public sense of ownership in the project was increased. Community participation was also limited to giving feedbacks to visitors and external evaluators. The finding shows that community lacks of genuine interest to participate in project activities without incentive.

Public activities on communal land have had good participation of community members. There was, however, poor involvement of households in the planning and evaluation of food security interventions. Poor households had limited opportunity in identifying needs, formulating strategies, and sharing the benefits from the interventions. Though there is belief that NGOs are close to the community, the finding shows that there is still a lot to be done to improve participation of community in food security interventions. The problem could be attributed to NGOs limited institutional and management experiences (Behera, 2006). Hence, beyond the common belief that NGOs are in close contact to the community, attention should be given to improve participation of community in food security planning and implementation.

Sustainability

Respondents from among the key informants stated that the sustainability of food security intervention is questionable when it comes to long term benefits. The constraints identified are, namely; low level of participation, dependency on foreign aid, lack of policy on KHCDP food security programme, and poor extension approach.

The interventions related to training, fruit production, soil conservation and credit in-kind seem to have short-term sustainability. Overall, the long term sustainability of food security intervention depends on several determining factors. These include the following: access to inputs; collaborations of partners; extension approach; local resource mobilization; and implementation of comprehensive policies and strategies at the KHCDP level. Literature indicates that the impacts of development projects by NGOs lack sustainability partly due to limitations in interventions followed NGOs (Dagnew *et al.*, 2002). The implication is that consideration should be given to long-term sustainability of food security interventions.

CONCLUSION

KHCDP had contributed to the improvement of household food security in most vulnerable areas through improving the productivity of small farms and increasing the incomes of poor households. However, the paper also indicated that the current interventions including access to agricultural inputs and technologies, water conservation techniques, agricultural extension and follow-up support need further consolidation. In addition, the paper shows low level of participation and risks in long-term sustainability of food security initiatives. Therefore, it is vital to strengthen policies and practices with regard to strengthening partnership and extension services as well as support to small scale farmers in rural Southern Ethiopia.

THE IMPACT OF CUSTOMER SATISFACTION ON THE EVOLUTION OF THE NIGERIAN AIRLINE INDUSTRY

Veronica Bakam, London School of Business and Finance, UK
Wilson Ozuem, University of Gloucestershire, UK

ABSTRACT

Customer satisfaction is a very important concept that various organisations, especially those in the services industries, must continuously augment if they are to remain relevant in today's extremely competitive market. The competitiveness of modern day business environments requires a sustainable strategy that delivers superior competitive advantage and this grid lies in satisfying the customers. Therefore, this study aims to evaluate customer satisfaction levels in developing countries with specific emphasis on the Nigerian airline industry. The choice of airline industry offers, we suggest, appropriate dimensions for this analysis based on two primary reasons. First, it provides deeper insights into one of the largest and untapped markets in the Sub Saharan Africa. Second, it highlights the level of service provisions and offers some effective marketing strategies for improvement. Our overall aim is to develop a more inclusive understanding on the Nigerian airline industry, and to offer some insights into the level of customer satisfaction within the industry.

INTRODUCTION

Customer satisfaction is a broad description and can be achieved in varying degrees or forms depending on different individual standards (Gilmore, 2003; Lovelock et al., 2009; Godson 2009). Parker and Mathews (2001 p. 38) espouse that, "for over three decades the word satisfaction has been a fundamental concept in marketing. The word has its origins in the Latin, *satis* meaning 'enough' and 'faction', (from the Latin '*faerce*' –to do/make), thus, the most common interpretation connotes satisfaction being a feeling that results from evaluating what was received against what was expected, the purchase decision itself and/or the fulfilment of needs or wants. Further, Jajae and Ahmad (2012) explain that customer satisfaction is one of the main areas of interest in marketing, business and the academic world. However, opinions vary in terms of whether achieving customer satisfaction automatically translates into customer retention, repeat purchases, loyalty or increased profit. The term 'customer satisfaction' in theory and practice has attracted much attention and debate continues around the extent to which customer satisfaction is integral for success in an extremely competitive environment such as the airline industry.

THEORETICAL FRAMEWORKS

Customer satisfaction has been defined differently by various authors. The most widely adopted description of customer satisfaction is "of a process; an evaluation between what was received and what was expected" (Parker and Mathews, 2001). Ehigie, (2006, p. 497), stated that, "customer satisfaction is believed to be influenced by some other variables, which include service quality, perceptions and expectations". Also, Angelova and Zekiri, (2011, p.233) asserted that "customer satisfaction is an overall customer attitude towards a service provider, or an emotional reaction to the difference between what customers anticipate and what they receive, regarding the fulfilment of some needs, goals or desire". Other authors define customer satisfaction as a prerequisite for customer retention, loyalty and profitability. For example, Stauss and Neuhaus, (1996, p. 236) suggest that "customer satisfaction is considered as a necessary condition for customer retention and loyalty and therefore helps in realising economic goals like turnover and revenue".

Nevertheless other authors disagree with this view and insist that there is no concrete evidence to support any remarkable relationship between satisfaction and profitability (Omachonu et al., 2005; Ehigie, 2006; Jham and Khan 2009).

In what can clearly be described as contextual definitions, other authors suggest qualities such as “friendly employees, knowledgeable employees, helpful employees, accuracy of billing, billing timeliness, competitive pricing, good value, billing clarity and quick service” count as key factors that lead to satisfaction (Angelova and Zekiri, 2011, p.234). Another similar definition suggests that basic services such as; prompt arrival and departure of flights, proper hygiene standards are maintained in-flight, appropriate refreshments and entertainment are provided, friendly front-line staff, fast and reliable customer-related services and prompt response services are the service qualities that airline customers are keen on (Meyer and Mostert, 2010). This perspective captures part of the focus of this research and as Anderson and Fornell, (1994) suggest, the best way to resolve the never ending argument among critics as to how satisfaction (an attribute that is intangible) or feelings should be defined easily in certain contexts. Also as Ringle et al. (2011) assert, the significance of customer satisfaction can only be relevant within the “service-oriented industry when customer views are considered relevant. Indeed, these definitions capture some of the most important service aspects within airline operations that customers would naturally expect. Customers increasingly expect and demand high levels of service quality and this poses as a challenge in terms of designing strategies that match customer needs that are imperative for most businesses to survive in a highly competitive business environment (Jobber, 2004). Another definition describes customer satisfaction as a “...multidimensional construct which has been conceptualised as a prerequisite for building relationships” (Jham and Khan, 2009, p.110). It has arguably become paramount for organisations to create and establish a cordial bond with customers. Indirectly, it initiates an on-going link between provider and customer that helps businesses understand each individual customer better leading to a competitive edge over your competitors. Despite these resounding attributes of customer satisfaction, some authors argue its acclaimed importance to marketing management and insist that customer satisfaction and service quality are mere concepts that stop short of supporting a concrete justification for their viability (Sureshchander et al., 2002). Based on this review of extant literature, this research intends to examine in more detail several marketing concepts enshrined within customer satisfaction.

NIGERIAN AVIATION INDUSTRY: YESTERYEARS GIANT

Civil aviation in Nigeria dates as far back as 1925 in the ancient city of Kano. There are presently four international airports and eighteen domestic airports. Of these, seven are ranked as major domestic airports. The Nigerian airline industry has experienced rapid growth in recent years with the potential to achieve even more with the right kind of investment and infrastructure. Currently there are about eleven domestic and twenty eight international airline operators in Nigeria. However, only a handful of those domestic operators are active operations at the moment.. Eze (2013), in an interview with the CEO of British Airways indicated doubts about potential investments in the market due to the absence of a national carrier that once existed (Nigerian Airways). However, the CEO expressed optimism over the African market which is developing and holds the ace for massive growth. In 2009, an estimated two hundred and twenty one million, two seventy thousand passengers culminated in 15% growth for the aviation industry in terms of aircraft movement. Over seven million passengers were recorded from both international and domestic air travel in 2011. These phenomenal statistics reveal the underlying potential of the industry.

Presently, the Nigerian airline industry is undergoing significant changes defined by increased numbers of international carriers and destinations leading to fiercer competition among both domestic and international players. Although, safety records are not as strong as they might, and the history of air crashes over the last twenty years has been alarming. A total of ten accidents are recorded averaging one crash every two years. Further, “this situation has put African aviation safety back into the spotlight, although IATA claims the rate of hull losses per million sectors flown improved to 6.17% in 2011 from 15.68% the previous year at a summit a five-point action plan was drawn up for the region”(Frankfurt, 2012). The role of the International Aviation Transport Authority in formulating regulations that protect customer safety has not been too successful in the Nigerian context. Customers need to be assured of safety. Following these disasters, domestic airline operators have been given an ultimatum by the Nigerian Civil Aviation Authority to install an Automated Flight Information Reporting Device (AFIRS); the newest safety device in the aviation sector. This technology is a safety device that automatically records mistakes that pilots make within a period of six months. Failure to engage with this technology can mean airlines face sanctions

(Adekola, 2012). Further, British Airways, an international air carrier that has served Nigeria for seventy six years, have pledged their commitment to support the Nigerian government to ensure the transformation agenda in the aviation sector succeeds having identified huge potentials that abound in both the international and domestic markets (Leadership News, 2012). According to Eze, (2012), in the first half of the year, the Nigeria Air Space Management, (NAMA), announced that aircraft movements within Nigeria's airspace has increased by 12.8% with an estimate of five hundred aircraft passing through daily. This is achievable as a result of the newly upgraded Total Radar Coverage of Nigeria (TRACON) indicating the massive potential the airline industry can generate for the economy.

Indeed, the service industry is a unique phenomenon in the national development of a country. Since the 1980's the service industry has developed into an extremely important element in the development of many countries especially in both developing and advanced countries (Natalisa and Subroto, 2003). With the aid of technological innovations, the airline industry must also evolve to tap into the rapid growth that has been seen in developing economies. The Nigerian airline industry must therefore, decisively invest in superior facilities, human capital and aircraft technology.

DOES CUSTOMER LOYALTY REALLY EXIST?

Customer loyalty connotes a customer's commitment or faithfulness to an organisation or a brand. With the present competitiveness in the service industry, customer loyalty plays an important role and in most cases can only be earned. While some authors define customer loyalty in terms of repeat purchase and profitability, (Zeithaml, 2000; Dick and Basu, 1994) others are wary of differentiating between customer loyalty and customer loyalty programmes as extant research posits that the latter may increase loyalty toward the programme than loyalty toward the company, (Evanschitsky et al., 2012; Yi and Jeon 2003). Stauss and Nehaus (1996) also argued that, the measurement scale used in evaluating customer satisfaction poses doubts as, often, positive customer responses do not necessarily translate to loyalty. Further, Olajide and Israel (2012, p.230), opine that, "customer satisfaction is not necessarily a guarantee of customer loyalty. They maintain that in certain industries up to 75% of customers who switch providers say that they were 'satisfied' or even 'very satisfied' with previous providers, however, "40% of satisfied customers defect to other suppliers". Thus, it becomes pertinent that these two concepts are in no way misinterpreted. The challenge exists in a severe competitive environment an organisation should not be misled with their business outcome when in real terms loyalty programmes are meant for a short period and susceptible to being imitated (Evanschitsky et al., 2012).

The benefits of customer retention in marketing and operational management continually take a high pedestal. According to Nitzan and Libai (2011, p.24), "over the past two decades, practitioners and academics have paid considerable attention to customer retention and to its antecedents and consequences primarily because of the impact of retention on customer lifetime value and consequently the firm's bottom line". There is also the famous Pareto rule also known as the 80-20 rule which says 80% of an organisation's patronage is generated from only 20% of its baseline. This means that acquiring new customers comes at a higher cost than retaining existing ones. Reicheld and Scheffer (2000) asserted that, it costs between 20-40% more to acquire new customers. Nevertheless, there has been an on-going debate over the plausibility between retention and profitability. Other authors argue that retaining some customers might be costly in the long run (Angelova and Zekiri, 2011). Most researchers however, agree as to the importance of retention as it no doubt leads to greater profitability (Gupta et al., 2006; Nitzan and Libai, 2011). In another fusion of concepts, Angelova and Zekiri, (2011, p. 232) asserted that, "satisfied customers form the foundation of any successful business as customer satisfaction leads to repeat purchase brand loyalty and positive word of mouth". There exists an inter-related connectivity between these concepts as the resultant effect of one could lead to another.

EFFECTIVE AND CONSISTENT OF CUSTOMER SATISFACTION

The existing literature clearly indicates that several factors are enshrined with the concept of customer satisfaction. From similar studies conducted, marketing concepts like; relationship marketing, customer relationship management and service quality were always identified as having a direct relationship with customer satisfaction. Humanity has thrived on various forms of relationships and for whatever reason a relationship is formed, the tenets should be guarded if that relationship is to last the test of time. Ndubisi

(2007, p.98), argues that “there is undoubtedly a growing interest in the subject of relationship marketing. The strong rivalry characterising today’s business environment has led to the building of stronger firm-customer relationships”, thus, in all marketing relationships, the core assumptions and principles remain the same: the need for trust and commitment and to address issues of risk, flexibility, power and return on relational investment, (Ward and Dagger, 2006). Further, Jham and Khan (2009, p.111), asserted that, relationship marketing aims at increasing customer profitability while providing better services for customers. In recent times, most organisations have realised the importance co-creating, nurturing and maintaining relationships with customers due to increased competitiveness in the marketing environment. So much now depends on how an organisation is able to establish and sustain strong links with its customers. Nevertheless, there remains no universally accepted definition of relationship marketing. There has been an on-going debate among academics and practitioners to decide how to define relationship marketing, who should be included and even when a relationship may exist between relevant parties (Harwood and Garry, 2006).

Another definition relates relationship marketing to customer loyalty. Relationship marketing forms the basis for trust, commitment, communication and conflict handling whose influence comes as a result of customer loyalty, Ndubisi (2007). Consequently, a long-standing relationship could afford an organisation the leverage of assured patronage due to the intimate bond they have been able to build. Further, Zineldin and Philipson (2007) stated that, relationship marketing focuses on how to develop, maintain and enhance customer relationships over the customer cycle rather than on attracting new customers. Repeat business is the lifeblood of any business. Indeed, the ulterior motive of a relationship is to ensure sustenance which precipitates growth. Further, Zineldin and Philipson (2007) stated that the purpose of business is to create and keep customers; it has only two central functions- marketing and innovation. The basic function of marketing is to attract and retain customers at a profit which means an on-going relationship may, for example, offer the customer security, a feeling of control and a sense of trust along with minimised purchasing risks and, in the final analysis, reduced costs of being a customer, (Gronroos, 2004). In other words, relationship marketing strives to create not only a bond with customers but to offer the advantages of retaining existing customers which far outweighs the cost of attracting new ones.

Nevertheless, some authors disagree with the concept of relationship marketing. For instance Williams (2007) identified certain flaws that are easily misconstrued in relationship marketing. Customers might not be interested in developing a deeper relationship which could be a turn-off. The mere fact that customers are satisfied does not guarantee grounds for a relationship and there is a misconception that necessity translates to loyalty. Also, Gronroos (2007) suggested that the term ‘marketing’ should be replaced in the concept of relationship marketing as historically the term was used to describe transactional exchanges which some authors find “unnecessary” and even “heretic” in some quarters. In other words, relationship marketing might not necessarily be beneficial worthy as the case might be, thus, organisations must carefully sift through their customer base to unravel the basis that best defines their relationship and how best this relationship can be sustained.

DIMENSIONS FOR CUSTOMER RELATIONSHIP MANAGEMENT

The term Customer Relationship Management (CRM) was first introduced by Levitt in the late 1960’s to emphasise the importance of creating relationships with customers and to acknowledge the fact that the evolution of relationship marketing is directly linked with evolution in the business environment (Mendoza et al., 2007). Payne and Frow (2006, p.137) suggest that, “though the term CRM is relatively new, the principles behind it are not”, which has equally developed into a very important aspect in marketing that has been given so much attention in recent times. It is based on the principles of relationship marketing which is regarded as one of the key developmental areas of modern marketing and one which has generated great research interest. There is no doubt that so much attention and strategies are continuously designed to reflect the manner by which customer relations are managed. Sheth (2002) argued that relationship marketing has gradually evolved into what is now customer relationship management marked by a shift in market focus from customer acquisition to customer retention. Customer relationship management has therefore become a popular and new paradigm. Similarly, Parvatiyar and Sheth (2001) observe that CRM is a comprehensive strategy and process of acquiring, retaining and making selective customers partners so as to create a superior and unique value for both the company and the customer. This ability to manage customer relations thus, in a way creates superior advantages when customers feel appreciated and valuable to an organisation.

In a more recent study, Rust and Huang (2012), observe that, automation has played a significant role substituting for labour to increase service productivity. Nevertheless, automated telephone services have replaced the presence of a human representative and although cost effective for most organisations, this could lead to huge losses due to the intricacies or steps described as a “runners-up for daily irritations in people’s lives”. In addition, Accenture, (2005) reported that despite the increased use of new technologies intended to improve customer service, such as automated telephone systems, poor customer service attributes for customers switch off service providers, also, “this type of trade-off is typical in the service world” (Rust and Huang, 2012, p.47). In other words replacing the human representative can lead to lower productivity which is a cost to any organisation. This situation has become a dilemma for most executives and organisations because decisions must be taken to save costs and maximising production while retaining a customer relationship at the same time.

Despite these views, critics are of the opinion that CRM practices have not been rewarding in terms of returns. In a survey conducted by Frosyth using a sample of about 700 companies the main causes of failure were identified as organisational change, company policies/inertia, lack of understanding of CRM and poor CRM skills (Mendoza et al., 2007). Equally, Ebner et al. (2002) suggest that CRM practises are often misconstrued as meaning any IT technology software which has evidently led to failure in implementation. Indeed, not every software system that is successful is suitable for every business. In such cases, organisations must design systems that are in harmony with their processes. Also, Bain (2001 cited in Rigby et al. 2002), stated that customer relationship management ranked amongst the bottom three aspects for satisfaction and “a Forrester research conducted in 2006 shows that only “10% of businesses and information technology executives surveyed strongly agreed that expected business results are achieved from implementing customer relationship management strategies” (Bena and Sandru Iona, 2009). Although the outcome of such critiques has been discouraging, it has not in any way deterred heavy investments to initiate CRM strategies and programmes with the confidence that keeping current customers, as well as the inevitability of building long-term relationships with customers instead of the customer-oriented transaction method in order to augment the profitability of the institutions, especially in today’s increasingly competitive economy (Soliman 2011). Therefore, it is only logical that before an organisation implements any CRM strategy they must ensure that it integrates seamlessly without interfering with their original template.

IS THERE ANY NEED FOR SERVICE QUALITY MEASUREMENT?

Most organisations within the service industry are beginning to fathom a secret that their counterparts in the manufacturing industry discovered in the 1980s- “that quality doesn’t improve unless you measure it” (Reicheld and Sasser, 1990, p.105). A very common tool used in the measurement of customer satisfaction is the SERVQUAL model. The intangibility of service makes it rather complex to define and more so difficult to measure, “a consistent issue in managing service quality” and the ability to identify what is synonymous between a service offered to what the customers expect (Chau and Kao, 2009, p.108). In 1988 Parasuraman, Zeithaml and Berry, in an attempt to create a means of measurement developed what was known as the SERVQUAL model. Their ulterior aim was to assess the gap between customer expectations and performance from service experiences or product usage. Indeed, service is crucial in marketing and could easily be a point of differentiation when there is high intensity in competition.

The SERVQUAL model has since been scrutinised. Buttle (1994) argues that, the model falls short both theoretically and operationally, thus in relation to the former it is based on a disconfirmation rather than an attitudinal paradigm and there is insufficient evidence to support that customer assessments of service are based on performance and expectations gaps. Service delivery should be measured based on the outcome and not the process and lastly the five dimensions of reliability, assurance, tangibles, empathy and responsiveness do not suggest a comprehensive list for a detailed service evaluation. While the latter emphasises that customer expectations as they relates to service quality have more to do with standards rather than mere expectations and customer assessments will also vary depending on the outcome of events; “the reversed polarity on the scale causes respondent error”. Depending on the intellectual capacity of respondents sometimes the reversed polarity can be difficult to comprehend. The argument still continues as to the extent to which the model was originally designed to measure perceived service quality but inevitably measures customer satisfaction (Oliver 2010, Mittal et al. 1998).

MANAGERIAL IMPLICATIONS AND FUTURE RESEARCH DIRECTIONS

The sheer neglect on the path of the Nigerian airline industry to invest in professional training programmes for their staff is the bane of their failure in providing quality service. The nature of the service industry is such that there is a constant exchange with different calibres of people from all walks of life. It becomes paramount that only professionals who understand the complexities of dealing with people are assigned the responsibility to manage such positions. Further, it does not end with just training so there must also be continuous development, close supervision and reviews of staff and customer skills at all levels for relationships between customers and airline staff to suffice. The aspect of training has been established to be fundamentally absent, which explains why the staff act in a manner that is provocative to customers. Unless a customer is absolutely irrational the demeanour and expertise by which a well-trained staff member will handle situations in times of crisis will, to a certain level, mitigate any impending escalation of events or flared tempers. Customers are an invaluable asset for the survival of the airline industry which is why they must, as a matter of immediacy, reorganise their training programmes to ensure that those at the forefront are seasoned professionals.

It is very important to effectively communicate important information across to customers. Thus, the channels and facilities that are in place to convey these messages must be such that vital information expected by customers for instance; delays to expected time of departures and arrivals, reservations and updating passengers regarding the progress of flights are effectively conveyed. Customers reserve the right to know because they have paid for a service. It is a major flaw in the design of service specifications to neglect this important responsibility which this study has identified as one of the major shortcomings experienced by customers. Modern day technological innovations have made it inexcusable for such lapses. Rather it accords a variety of channels whereby information can be easily transferred. The principle of communication within the service industry is a key component that ensures customers are kept abreast with relevant information. Considerable evidence from this investigation reveals that customer feel slighted and undervalued for neither getting any compensation nor apology for any misgivings on the part of the service providers. Customers are the bedrock of the industry's success and if they place such value on the customer, then they will never miss a chance to properly tender an apology or pay compensation to an aggrieved customer. Findings revealed that customers if ever, got impersonal apologies or not at all and will never as matter of fact get compensated. It is not only ideal but compulsory for the airline industry to incorporate this standard practice as part of their corporate ethics as customers are priceless and should be treated with respect and dignity. The present study has several limitations in that it only explicates on the existing theoretical issues. First, empirical and granularly research is needed in order to examine the level of customer satisfaction in the Nigerian airline industry. In addition, a much more nuanced comparative study is needed to examine the level of customer satisfaction in other developing countries.

2011 MUNICIPAL ELECTIONS IN SOUTH AFRICA: BETWEEN PARTICIPATION AND APATHY IN DURBAN (SOUTH AFRICA)

Sanjay Balkaran and Adewale O Banjo
Tshwane University of Technology, South Africa

ABSTRACT

South Africa is poised to hold its next municipal elections in 2016. The last municipal elections held in 2011 provided invaluable insights from which all stakeholders can benefit. This study starts by reviewing related studies on political participation and voter apathy, elections, national and municipal elections that have been conducted in South Africa since 1994. Thereafter, by using responses to questionnaires sent a sample of 200 respondents that were randomly selected in Durban, the study investigates the level of Durban resident's attitude towards voting with reference to the 2011 Municipal Elections. The study finds that 58% have voted in previous elections, 70% were registered to vote in the 2011 Municipal elections, but 66% actually voted in 2011 Municipal Elections and 68% intends to vote in future. Several reasons were advanced for participating by those who voted and those who could or did not vote in the 2011 municipal elections offered explanations.

INTRODUCTION

In 1994, South Africa transitioned from an apartheid system to a democratic system of government. The 1994 elections resulted in a change in government, with the African National Congress (ANC) coming to power and have won subsequent elections at national level in 1999, 2004 and 2009. Since elections are a cornerstone of democracy, the Constitution of South Africa (Act 108 of 1996) thus makes provision for this major political exercise at local government level. Hence, the people elect councillors every five years to serve. The experience of South Africa with post-1994 democratic elections has therefore attracted the interest of academics, political scholars who have all diagnosed, analysed and seek to explain varying dynamics associated with the few elections held so far in South Africa.

In this paper a few of these studies will be reviewed to place the study in context and to underscore the fact that electoral studies is beginning to generate a great deal of interest, at least amongst scholars in post-1994 South Africa. To start with Hamill (2004, pp. 691-708) investigated South African politics, the political systems, political participation with regards to the 2004 elections and political parties wherein the article discusses the securing of another emphatic victory by the ANC in South Africa as well as obtaining a two thirds majority and a clean sweep in provincial elections in April 2004. It also assesses the principal opposition parties and considers why some have performed so poorly. Lemon (2007, p. 26) investigated the outcomes of the elections and these outcomes are examined in relation to indicators of participation and competition. He also pays attention to the influence of ethnic, regional and other divisions on outcomes. McLaughlin (2008, pp. 23-34) assesses competing hypotheses about the micro-foundations of South African vote choice: by studying the correlates of a strategic voting behaviour, split-ticket voting. This is accomplished by analysing data from a 1997 survey in which respondents participated in a 'mock election'. This was after many scholars were worried that South African liberalization would result in racial and ethnic conflicts or election would be little more than ethnic/ racial consensus.

Davids & Hadland (2008, pp. 277-291) argue that stable elected representation institutions, relatively well run elections and a constitution are not sufficient for democratic consolidation. He argues that democracies require people who are willing to support, defend and sustain them. The study also found that the government performance in policy areas such as housing had no significant impact on satisfaction with democracy. Tonkin (2009, pp. 1-14) discusses the South African elections held in 2009 in terms of moral and ethical values. The political parties in South Africa include the African National Congress (ANC), the

Democratic Alliance (DA) and the Congress of the People (COPE) and the results of the election resulted in the ANC receiving 65.9% of the national vote. Other findings by this study were that South Africa has the fullest spread of values than anywhere else in the world and that these values set the political parties and will thus surely move the country towards a more developed model. Perry (2009, pp. 38-41) investigated the South African parliamentary and presidential election on April 22, 2009, and how the African National Congress (ANC) party is expected to win a fourth consecutive term. The author describes how Nelson Mandela's ANC, has been affected by scandal, infighting, and the financial crisis. The article describes the effect of the economic crisis on the country's Eastern Cape and why it has not been alleviated by the ANC. Africa Monitor (2004) investigation on how voter apathy raises concerns about the health of the country's democracy, and may possibly be a strategic worry for the ruling ANC. A second round of registrations may improve the outcome, but so far, less than one-third of potential new voters have signed-up.

The study claimed that Independent Electoral Commission (IEC) had greater success with females than males, and in cities compared to rural areas. The commission prepared for another round of registrations in January/February 2013 in the hope of attracting more interest. Clearly, it is difficult to know without detailed research why so many people decided not to register, and it is highly probable that many failed to do so due to work commitments. Yet it is easy to suspect that given the still-prevalent very high levels of unemployment and poverty after ten years of ANC rule, frustration with the ruling party is also a major explanation.

STUDIES ON VOTER APATHY

The following articles look specifically on voter apathy. Neo Bodumela (2011), interviews people of different demographics to acquire reasons behind voter apathy, and in response they had this to say, "I don't think I'll vote because the political situation is in chaos. There is so much in-fighting and corruption. Whether I vote or not, won't make any difference because the ANC will still win." Cindi Mde, Motherwell: "What is the point of voting? Putting that X is just a waste of ink because we are still struggling and suffering".

The South African Broadcasting Corporation (SABC) reported that voter apathy in local government elections is an international phenomenon which statistics have also shown that in South Africa, voter turnout in these elections is much lower compared to national elections. The lower turnout has been prompted by, in most instances, the failure by local government to deliver services to the people. The Protea South informal settlement in Johannesburg has learnt that on occasion, protesting does yield results. Many people in the area do not get government built houses allocated to them, because they are being sold. The Protea South community has had enough of living in squalor, without basic services. They also complain that elected councillors are now shunning them and do not perform their mandated responsibilities.

With the May 2011 Local Government Elections, politicians and their parties blazed campaign trails across the length and breadth of South Africa's municipalities. Equally, the spate of community protests has increased over the years. The reasons include concern over a lack of service delivery, corruption and lately, disagreement over candidate lists. The Morning Call Source (2004) discusses how apathy could keep many registered voters from the polls. It discusses how the poor service delivery in some of the country's rural areas and slow development and progress in these areas could be the leading source of apathy. Butcher (2004, p. 10) investigates one of the reasons for the lack of interest 10 years after democracy is the failure by government to meet up with the thousands of demands of its people still living in shacks. Elliott (2004, p. 14) points out how President Mbeki and the ANC were poised (prepared) to retain or even increase its sweeping parliamentary majority in the 2004 elections. Davids & Hadland (2008, pp. 277-291) argue that participation in the mainstream economy is so severely compromised for blacks that there is still, and will be for some time, a need for state-driven actions to ensure transformation of South African society. It will certainly be to the South African government's advantage if it was to improve on its strategy to communicate with its citizens. The study, for example, found that respondents who believed that government is preventing citizens from criticizing it as well as censoring information that is given to the public were less likely to be satisfied with the way democracy is working. Benjamin (2011, p. 2) argues that, it is hoped that a campaign by the Independent Electoral Commission (IEC), appealing to the pride of South Africans and playing on emotions stirred up by the hosting of the 2010 World Cup, will encourage voters to vote. The last two local elections saw only 48% of registered voters make their mark. Houston (1999, p. 20) reported on how the South African citizens were wrapped in blankets against the cold, lining up even before the sun came up, many of them giddy with the excitement of voting for only the second time in their lives. Lines outside voting booths sometimes stretched for nearly a mile. Though the polls were

supposed to close by 9 p.m., many remained open much later to accommodate those who had stood for hours but had not yet had a chance to mark their ballots. Mavuso says the rationale behind voter apathy over municipal elections is yet to be established. However, for 21-year old Wits student, Ayabonga Cawe, the upcoming municipal elections are nothing more than a futile exercise. Cawe is an active member of the radical group, BLACKWASH, whose members do not take part in elections, whether local or national.

MOTIVATION AND METHODOLOGY

There has not been any research conducted which specifically looks at the vagaries of residents participation and or apathy with reference to voter apathy in Durban. Durban is a major city in South Africa, with a population of about 2.5million. Thus, the objective of the study was to find out possible reasons for political participation and voter apathy amongst Durban residents. In terms of methodology, the study adopted two sampling strategies, namely the judgmental/purposive sampling strategy. The sample of 200 was randomly selected from the above population. The questionnaires were delivered by hand to respondents to fill and return, while the investigators filled some based on responses from interviewers. The adoption of both methods helps to summarize data in graphs, tables as well as pie charts.

DATA ANALYSIS

The following section deals with the analysis of data, presentation of the results using tables, graphs and or charts. The demographic information shows that there is gender imbalance with more female respondents than males. Therefore, the results are biased towards female opinion. The dominant age range was between the ages of 30-40 years, with the oldest being over 50 years. The respondents seem to be literate as most of them were able to answer and interpret the questions without any form of assistance

Table 1. Gender and racial category of respondents

GENDER	NUMBER OF RESPONDENTS
Female	112
Male	86
RACIAL CATEGORY	NUMBER OF RESPONDENTS
African	82
White	44
Indian	38
Coloured	34

Table 1 indicates that there are 112 female participants (57%) and 86 male respondents (43%). The majority of the respondents were female participants. As the frequency table clearly shows, there is imbalance between male and female respondents. The extremely small number of male respondents will make it difficult to influence the results. This tendency for young females to respond to the survey may be indicative of politics in general and elections in particular. It has been reported that men are more dominant in politics and political leadership, but this study shows that females are the majority participants. The table also illustrates the racial representation of the respondents. Majority of the respondents were Africans 82 (41%), followed by Whites 44 (22%), Indians 38 (19%) and Coloureds 34 (17%). The results of the study reflect the opinions of the dominant race, the African race, as well as the gender with the majority of respondents being female.

Table 2 illustrates that the majority of the respondents were between the ages of 20-30 and 30-40 with both having a total number of 53 (27%) respondents. The lowest number of respondents being over 50 (9%) and 40-50 with 43 (22%) respondents.

Table 2: Age Respondents

Under 20	20-30	30-40	40-50	Over 50
30	53	53	43	18

Figure 1 - Age Respondents

Table 3: Respondents who participated in any previous Municipal Elections and those who did not

Response	Figures in %
Yes	114 (58%)
No	84 (42%)

The respondents illustrate that a larger number did participate in previous Municipal Elections. These are some of the reasons for not participating in previous elections:

- ‘Did not see local elections as important only national.’
- ‘Still underage at that time and not legible to vote.’
- ‘Generally not interested in politics.’
- ‘Do not believe in politicians, they make empty promises’
- ‘No development taking place in our area’
- ‘Angry with the slow developments’
- ‘Have never owned an ID’
- ‘Worked outside the country till 2007’
- ‘Do not want to be involved in politics’
- ‘Was not in the right state health wise’
- ‘Was not happy with the party in power’

Figure 2 - Participated in Previous Election

Table 4: Respondents who registered to vote in the 2011 Municipal Elections and those who did not

Response	Figures in %
Yes	138 (70%)
No	69 (30%)

Majority of the respondents did register to vote in the 2011 Municipal Elections with 70% who registered and only 30% who did not register.

These were the reasons stated for not participating:

- Voting stations were too far
- No change or developments in their areas which has made them loose interest
- Not interested in politics
- Not satisfied with government
- Lost their ID books
- Don't work in their regions and it expensive to travel back to their respective regions to cast their votes
- Too busy to register
- Do not believe their vote will make a difference ANC will be victorious anyway
- No faith in government

- Scared to participate in politics their areas are politically intolerant.
- Could not get registered on time, work schedules are not flexible enough

Majority of the respondents participate in the 2011 Municipal Elections, 66% said yes and only 34% did not vote in those elections. These were the highlighted reasons:

- They could not be in their region in time for the elections
- Did not register
- They do not believe that voting will make a difference in their situations and it is therefore pointless to vote
- People who get into power only enrich themselves
- Not interested in South African politics
- The results are always the same and so there's no point in voting
- The government does not provide services so why vote
- Government does not respond and does not create employment
- No ID books
- Municipal elections are not important only national elections are worth participating

Figure 3 - Voters Registered

Table 5: Respondents who voted and those who did not vote in the 2011 Municipal Elections

Response	Figures also in %
Yes	130 (66%)
No	68 (34%)

Figure 4 - Voters who voted/did not vote

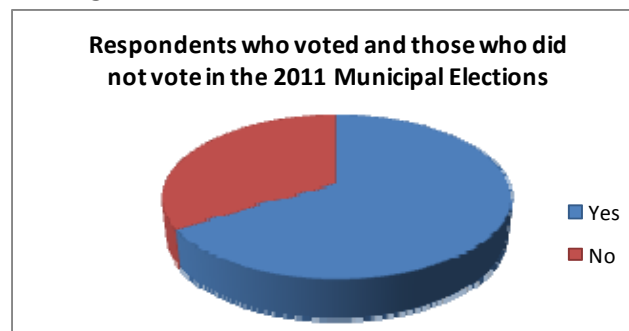

Table 6: Respondents who will vote in future elections and those who will not

Response	Figures in %
Yes	134 (68%)
No	64 (32%)

The majority of the respondents will vote in future elections, 68% responded positively. However, 32% of the respondents do not anticipate in voting in future elections and these were some of the reasons:

- They do not see any party as deserving of their vote they have all let them down
- They do not see any change in leadership that is progressive

- They just do not see the need to vote... they have no interest
- Others claimed they are still poor after so many years in democracy and they don't see government doing anything to change their circumstances
- They feel that politicians are looking out for themselves and have forgotten about them,
- They indicated that government is useless
- Politics is dirty and they do not want to be part of it
- They don't believe their single vote makes a difference
- Some respondents felt that the people in power often fail to deliver.
- Some are battling with poor health; do not think they will be doing themselves a service to go stand on lines for several hours.
- ANC will still be in power
- Others argue that it takes too much time to vote

Figure 5 - Future-Voting Pattern

CONCLUSION

The study focused on political participation and voter apathy with reference to the 2011 Municipal Elections. This was done through a development of a questionnaire and interviews. The respondents in Durban indicated that majority of those interviewed participated in previous elections, registered in the 2011 Municipal Elections, voted in the 2011 Municipal Elections and will vote in future elections. The minority also stated legitimate reasons as to why they did not participate, their lack of interest in politics, dissatisfaction with the slow developments and response from government as well as job creation were some of the major issues raised by the respondents. This study also finds that the high rate of unemployment amongst other things has played a significant role in the lack of interest and unwillingness to participate in such political exercise.

SOUTH AFRICA, CHINA, AND THE ETIOLOGY OF COMPETING ECONOMIC AND GEOPOLITICAL INTERESTS IN 21ST CENTURY AFRICA

Sanjay Balkaran
Tshwane University of Technology, South Africa

ABSTRACT

Background: The greatest future of any sector lies in Africa. The framework of South-South cooperation draws on earlier frameworks of a new international economic order and non-alignment where western conditionalities (Amanor, 2013) are seen as imposing policies on Africa that do not necessarily meet African needs. There is a pragmatic acceptance of South Africa's hegemonic strength in Africa yet South Africa might be walking "a political tightrope" (Burrows, 2013) as there is growing African leader resentment in the way South Africa professes to speak for Africans. South Africa needs to consult more to strengthen its credentials to speak on behalf of Africa (Fraser & Dube, 2013), especially if African priorities are drawn from a continental (AU) dialogue. Sovereign African nations with varying policy perspectives maintain special relationships with erstwhile European Union colonial masters, BRICS nations and strategically align themselves with South Africa. Nonetheless the growth of regional economies in Africa help undermine South Africa's "right to be the key gateway for the continent", coinciding with global economic recession and the focus on Africa as a favourable source of raw materials. **Objective:** The paper analyses South Africa's continental opportunism in BRICS; non-judgementalism of the Chinese and their willingness to expose themselves to risk, whilst South Africa is risk-averse. **Methods:** The etiology of ideology in 21st century is a relatively new phenomenon; this paper adopts a contemporaneous analysis of and draws inferences from interviews, intergovernmental reports, journal articles, and interlocutory proceedings.

INTRODUCTION

Globalization is transforming the nature of authority in international relations, impacting the dynamics of regional and global relationships. Geo-governance is gradually replacing hegemony thereby extending representation and accountability to a wider group of states and stakeholders to reflect the emergence of these new forces. Schraeder (2004, pp. 57-59) asserts that 'the era of globalization' is the preferred term to describe the current period that is significantly impacting the developing world. Contemporaneous notions of imperialism and capitalist empire have gained importance in critical globalization studies, with (Fuchs, 2010, p. 33), Fakir (2013), CDKN (2013) and UNDP (2013:43) averring that the number of emerging countries which are evolving as major economies and are reshaping the developmental landscape of geopolitics.

With the dawn of the 21st century, Africa has embarked on an expansive drive for a new democratic geopolitical order a mosaic of old structures and new arrangements for international development and global governance (Brosig, 2011, pp.147-167). Africa is this century's most visible economic battleground as the current surge in investment activities in Africa (with more countries per continent than any other) being best described as a 'new scramble for Africa's resources' (Benkenstein, 2011, pp. 271-274).

Takhal (2013), Zhu (2012, p. 1) and Burrows (2013, p. 29) agree that in recent years, this "scramble" has intensified and targeted by the economic bloc comprising Brazil, Russia, India, China and South Africa (BRICS). BRICS is an emerging super-power, which is rearranging the world order and perceptually challenging the 60-year hegemony of the Bretton Woods Institutions. BRICS countries are the new largest investors and trading partners to the African continent with strong exponential growth potential for the future.

The conceptual theoretical framework/s informing BRICS as an economic bloc in Africa is a relatively nascent phenomenon and amorphous, lending credence to such theories continually evolving. The absence of a theory on BRICS and its nation states has led scholars explore the interplay between international regimes and to develop typologies. The construct of this paper will draw occasionally on the theories such as the Goldman Sach's thesis underpinned by Development Theory for a new world economic order, supported by the International Relations theory and the Neo-Patrimonial Power System.

The first part of the paper will review the BRIC phenomenon targeting Africa as a growth avenue. The second part of the paper will specifically look at the enantiodromiac South African and Chinese strategic competing interests as BRICS nations in Africa. It will also offer some reflections on the neo-patrimonial power system of African leaders engaging their own personal interest as contrasted to that of the greater economic welfare of the nation.

BRICS - Competing Regionalism in Africa

Putin (2013) asserts that BRICS holds a unique place in the global economy; a position validated by Soko and Qobo (2010) and Sanwal (2013) who believe that BRICS wield significant economic, political, and diplomatic authority and have become crucial power brokers in the developing, volatile, multi-polar world order. The establishment of BRICS and IBSA (India, Brazil, and South Africa) was to define a collective new role within the existing world order rather than to create a new order based on an alliance that is not yet mature, nor one that has a clear political doctrine of its existence. The modest agreement on establishing a development bank and pooling of currency reserves has seriously catapulted BRICS beyond a dialogue forum to cooperative mechanisms challenging the 60-year hegemony of the Bretton Woods Institutions.

Oxfam underscores the close relationship where BRICS investors are targeting low-income African countries with weak internal governance. In interrogating African leaders' acquiescence to BRICS's initiatives in their countries, African countries are driven largely by personalized governments often held hostage to the political will of such leaders lending credence to the maxim "enrichment without development". There are growing internal and external pressures on African leaders to introduce good governance and democracy, through the gatekeepers of the African Union (AU), the peer review mechanism of NEPAD structured around an independent review process of an African country's adherence to good governance criteria.

These rising powers, once predominantly regarded as aid recipient countries, are now becoming more active as donors in their own right, raising important issues for debates on the future of international development cooperation. Whilst Tull (2006, p. 459) opines that China is building roads and airports in Africa, Brazil is supporting reconstruction in Angola, and India is promoting wind power in East Africa, Donnelly and Benjamin (2013, p. 2) iterate that although BRICS countries share common goals, there are however many areas and issues where they differ and exhibit internecine rivalry amongst the cohorts. According to Standard Bank research analysts Simon Fremantle and Jeremy Stevens (2013), despite increasingly robust trade between BRICS and the African continent, member nations compete more than they collaborate.

Clark (2013) claims that by 2020 the combined economic output of Brazil, China and India will surpass the aggregate production of Canada, France, Germany, Italy, the United Kingdom and the United States. Much of this expansion is being driven by new trade and technology partnerships within the South itself.

Lund (2013) argues that although BRICS promotes cooperation and mutual benefit in the alliance; however, the relationships are not always smooth and are filled with contradictions. Ferrando (2013) identifies that mounting tension around BRICS nations competing for the same finite resource and attacking each other's sovereignty, a situation that could degenerate international relations and create diplomatic tensions and deeper political instability. China's "dumping" of cheap goods in South Africa and the rest of the continent has been blamed for contributing to the decline in local manufacturing. However, the Chinese reaction to these concerns was that 'any move by the South African government to restrict textile imports from China would violate the WTO free trade agreement' (IRIN News29.6.2005). Similarly, South Africa has approached the World Trade Organization (WTO) in a dispute about chicken imports from Brazil and regulatory hurdles faced by South African based MTN to abandon a tie-up with Indian owned

Bharti Airtel while South Africa's Shoprite abandoned an Indian venture in 2010 due to the Indian government's curbs on foreign ownership of retail businesses.

The diversity of BRICS member states' interests means it is difficult to act in concert leading to competing industrial growth strategies often in the same sector and same African country. For Gumede (2013, p. 23) the success of the BRICS partnership will depend on whether individual members can overcome the dilemma of being allies as well as fierce competitors for markets, goods and geopolitical influence, whereas African nations must learn to trust themselves, in order for Africa to move forward.

BRICS Development Bank

After the financial crisis of 2008, there is a questioning of the free market ideology, or “Washington Consensus”. Sanwal (2013) posits that the development bank signifies that BRICS, and others, will not look to the West for developmental guidance and will evolve their own state-driven infrastructure led frameworks that will support sustainable development. Learning the five Rs has become all-important in diplomatic and commercial circles. These are the real (Brazil), rouble (Russia), rupee (India), renminbi (China) and the rand (South Africa). More importantly, each of the individual BRICS countries is a rising regional power.

Gentle (2012) believes that a battle is being waged over the role of the dollar. The US dollar's relative decline has opened the door to a number of potential challengers. Therefore, a new “BRICS Consensus” will have to respond to resource scarcity as the most dominant global trend, making the shift more than just a continuation of the current system, requiring new global rules based both on markets and on social considerations.

The rise of the South is also creating new possibilities for financing equitable and sustainable human development. The 2013 Fifth (5th) BRICS Summit held in South Africa resolved to establish a BRICS Development Bank that draws upon considerable reserves to finance projects in developing countries. Such a bank like the European Bank for Reconstruction and Development, could offer a range of instruments, including loans, equity and guarantees. In addition to financing productive projects, this flow of resources would also assist with global financial re-balancing (UNDP, 2013, p. 117).

Gumede (2013, p. 23) argues that it would be easy to impute that BRICS want to compete with existing multi-lateral institutions like the World Bank and the International Monetary Fund (IMF), yet all the BRICS countries have a relationship with the bank and this line of thought, of a competing institution, is hard to accept at face value. While institutions matter, the new BRICS development bank is not just a ‘litmus test’ but a major step in reforming the World Bank, including towards infrastructure projects.

In Africa, its establishment could be particularly relevant because key for Africa is sources of funding for infrastructure projects. Naidu (2013, p. 29) contends that it seems China wants such a bank to be based in Beijing, but India and Russia oppose this. There is consensus amongst Fraser and Dube (2013), Sanwal (2013) and Fakir (2013) that China will most likely carry the bulk of the financial burden of the bank, as it has the largest reserves (a quarter larger than the other four combined) compared to other BRICS countries. China already has a number of financial institutions (China's Development Bank and the China-Africa Development Fund) which are well established and active on the African continent, linking it to its own strategic needs within the African continent.

It would also be prudent to have the bank in South Africa's territory that is more ‘neutral’; however, South Africa's lobbying to host the bank has more to do with status. Geopolitical reset is being matched by a change of domestic economic interests in South Africa, with a concerted move away from Western capital. However, Africa is not the only region-requiring infrastructure.

The future positioning of BRICS as the new alternative to old Anglo-Saxon capital is a vexing one with the BRICS bank attracting some hostile commentary and Fakir (2013) argues that it is not a radical departure from the norm nor will it bring about the demise of the World Bank. Similarly, Gentle (2012) notes that progressive Latin American countries had earlier mooted a Bank of the South, as a real development bank without the neo-liberal conditionalities of the International Monetary Fund (IMF) and the World Bank.

The IMF has however endorsed (April 2013) the mooted establishment of the BRICS Development Bank.

Antithetical Views - African Scholarship

While globalization should be encouraged, no nation should be a dumping ground or doormat for another. Unlike their national political leaders who are supportive of partnerships, several African scholars and civil-society such as Esiemokhai (2013), Okpa II (2013) and Ferrando (2013) have displayed a more ambivalent attitude towards the BRICS's growing presence in Africa (the elephant in the room syndrome) and decry especially China's increased presence in Africa.

Okpa II (2013) questions Africa's morality and challenges African leadership to firmly stand up, deal with, and embrace trade policies that suit her best. Africa appears to take and welcome any and everything because it lacks national pride and a sense of purpose to reject some of the foreign prescribed solutions.

It is both remarkable and ironic that BRICS member-states are made up of nations that suffered under colonial and oppressive regimes and it is this feeling of solidarity which informs their unity of purpose to overturn the existing international order that tends to perpetuate inequality among members of the "international community" (Esiemokhai, 2013). As global players in need of economic expansion Ferrando (2013) believes that the BRICS's rhetoric of 'respect of national sovereignty' and the 'promotion of solidarity' are inconsistent with the current large-scale investments in African land, which is an issue of mounting global concern, and has been described as 'land grabbing,' 'neo-colonialism,' 'modern imperialism,' 'green rush,' 'scramble for Africa,' etc. Crucial for this are the diplomatic and legislative strategies adopted by the governments of the BRICS.

From an African perspective, Adisu, et al. (2010, pp. 3-9) postulates that BRICS investment has been good in many situations, but as with other investments, it comes with a substantial price. The price includes dominance of local culture and considerations. It has also negatively impacted local trade and commerce. In some cases, African labour has not benefited from such foreign investment and in some instances, investment has even propped up some rogue regimes.

Naturally among the prime reasons complicating effective regional cooperation in Africa are the deep divisions that permeate the continent (Franke, 2007). Africa should not be behind anyone, but rather join in a symbiotic win-win relationship.

SOUTH AFRICA'S ROLE IN AFRICA

This section of the paper explores South African geo-governance and its impact in Africa vis-à-vis its strategic importance (political and economic), the construction of South African state power and its regional and international influence as a member of BRICS.

South Africa has developed a fluent narrative of global development, especially on the imperative of bridging the North-South chasm and has earned international recognition on its own intellectual and normative weight. South Africa's strategic importance to industrialized nations and its indispensability and relevance to world development, global technology and the wealth of nations is derived from the involuntary African largesse (Plato, 2013).

South Africa (Africa's largest economy) hosted the fifth BRICS Summit, which was a defining moment for the South African state thereby fostering a supportive international environment for the African continent. Zuma (2013) reiterated South Africa's foreign policy to align Africa as the centrepiece of BRICS in supporting the African integration agenda. South Africa's continued consolidation as an emerging economic powerhouse is evident in its role in formations such as the BRICS and the G20. However, South Africa's engagement with the BRICS must not be guided by ideological whims, but by a strategic paradigm that is grounded in its own domestic needs and fundamental interests.

Emerging Economic Powerhouse

As it orients its international relations according to the economic needs of its national investors, South Africa has signed several Bilateral Investment Treaties (BITs) since the end of the apartheid era (Ferrando, 2013). Hauff (2012, p. 312) and Burrows (2013, p. 29) identify South Africa as a gateway to Africa, strongly underpinned by its high and well-recognized standards of corporate governance. This position is strongly supported by Donnelly and Benjamin (2013, p. 2) and Anthony Thunstrom of KPMG Global Africa Practice, who believe that South Africa does have a significant responsibility to represent the broader interests of Africa as a BRICS member and has taken concrete steps to be inclusive. Gentle (2012) robustly defends that South Africa is not a weak partner in the BRICS nor a mere conduit; rather “it is by far the biggest “foreign investor” on the rest of the continent as South African capital is crossing the borders of Mozambique, Zambia, Swaziland, the Democratic Republic of Congo, Angola, Benin, Congo and Ethiopia. South African Transnational Corporations (TNCs) and parastatals dominate investment in SADC countries by 80% and at 40% of the continent, as a whole, it simply dwarfs the United States (US) and the European Union (EU), not to mention China, India and Brazil.

However, Volchkova and Ryabtseva (2013, pp. 1-21) view the possibility of a conflict of interest in South Africa’s strategic interaction within BRICS and how it represents other African countries’ interests. South Africa claims to have lobbied hard for Africa’s inclusion in BRICS, yet critics draw attention to the missive that it was conditional “through South Africa”. This conflictual position is now being interrogated, as South Africa is a leading economy on the continent, is strategically positioned in Africa, and uses existing contradictions on the continent for its own interests. Oberholzer (2011) argues that South Africa’s role as Africa’s gateway is under threat as offshore investment companies become “less scared of Africa” and are directly targeting African countries rather than opt base their operations in South Africa.

Walking the Political Tightrope

The perceptions (outside Africa) are that South Africa might be walking “a political tightrope” Fraser and Dube (2013); as there is growing resentment amongst African leaders about the way in which South Africa professes to “speak” for the rest of the African continent in its role as a BRICS member; a position which does not resonate well with the African leadership (Sanusi, 2013). Many African leaders are resentful of South Africa having too great a role in the leadership of Africa, where other African countries do not enjoy parallel forms of special relationships but they have traditionally cloaked their concerns in emollient diplomatic language.

Eurozone and the Move to BRICS

The 2007/2008 global financial crisis, which had underscored the importance of diversifying South Africa’s export markets away from Europe, which currently absorbs 40% of its exports, and to explore new markets, particularly those in the fast-growing developing economies. The Eurozone is South Africa’s largest trading partner Lund (2013) but intra-BRICS investment is growing. Soko and Qobo (2010) position China, the bedrock of BRICS and the only credible contender for global superpower status, as South Africa’s single biggest trade partner. Hauff (2012) and Fakir (2012) argue that South Africa wants to reduce its dependence on European markets and is keen for economic trade, at least with China and India, to slowly displace Europe’s capture of trade relations with Africa economies which had enjoyed better economic growth in the past three years, hoping that BRICS would be an integral part of this diversification strategy. Going forwards, not only African firms but also western multinationals are now finding it increasingly hard to compete with Chinese companies (Konings, 2007, pp. 341-358).

BRICS versus IBSA

BRICS and IBSA are both active in Africa’s economy, which was historically the preserve of former colonial powers and recently, also the march of South African multinational corporations into the continent. South Africa’s elevation to BRICS membership implies that its transformative policy agenda within IBSA will now be promoted within the confines of the BRICS and raises the question whether it also signals the beginning of the end of the IBSA forum (Soko and Qobo, 2010)?

With the emergence of BRICS/IBSA countries as economic giants Hauff (2012, p. 312), Africa is gradually emerging from the shackles of imposing Structural Adjustment Programmes (SAP), giving African nations the ability to escape the clutches of neo-colonial dependence on foreign aid, and the policies and 'advice' of Western-controlled financial institutions. This is reflected in capital flows from the rest of the world, which are growing at a slower pace to South Africa than to many of its rivals. One of South Africa's biggest rivals for a leading role on the continent is Nigeria.

Nigeria: Internecine Rivalry

Nigeria is the only "regional power in West Africa" prompting Esiemokhai (2013) and Adusei (2013) to articulate the Bosas International Law Bureau (Abuja) position - why has Nigeria has not been recognized by the comity of nations (BRICS), while South Africa has become a force to reckon with? However, since the late 1990s Nigeria's status has been declining, leading to greater instability and insecurity in the Western African sub-region. Although the 2012 Mo Ibrahim Index of Good Governance ranked Nigeria 13th out of 15 best-governed countries in West Africa and 43 out of 52 in Africa, in the last six years, Nigeria is ranked amongst the top 20 most failed states. Meanwhile Nigeria continues to find herself in the club of G77.

In comparison, the Southern African Development Community (SADC) as a region is considered the most progressive region in Africa courtesy of South Africa. South Africa is frequently cited as a rising power with substantial growing economic, political, diplomatic, and military power with influence and power to reshape global development. South Africa is providing leadership, mobilizing, organizing, and building coalitions on key regional issues with SADC countries. South Africa is counted among global elite groups.

South Africa, though, is losing ground as its trade in Africa has increased, but not deep and fast enough prompting Gigaba (2013) to declare that South Africa needs to view Africa with a renewed business interest and develop greater economic and political diplomatic partnerships with the African continent than it has done in the past in order to grow its export destinations. In 2011, South Africa's total exports to Africa's largest economies lagged that of China significantly. Of South Africa's total exports to Africa, 0.5% was to Egypt and 4% to Nigeria compared to China's 13% and 16% respectively for the two countries. There is also some debate about whether goods exported from South Africa are actually manufactured in the country (Fakir, 2012).

Underwriting Infrastructural Spend

South Africa is limited in its ability to underwrite essential infrastructure deals given its shrinking tax-base and the overall state of finances and future infrastructure spend (including nuclear programmes) will depend on the availability of sizeable amounts of capital. There is potential for cheap money to be provided through a BRICS development finance institution or alternative funding mechanism under its auspices. China will be agreeable to provide the full package of finance and construction as well as run the nuclear plant. In return, China would ask few questions and be happy to drive hard bargains that are often not financial in nature only. The Chinese have capital, planning long term, and are willing to expose them, and their parastatals/banks, to risk. This makes South Africa leaders happy.

Neo-Imperialism

Gentle (2012) arrogates South Africa's credentials to represent the rest of the African continent are suspect, 'given the sizable intra-Africa investments made by South African companies, and its assessment how best to safeguard its citizens investment (Ferrando, 2013). As a consequence of South African intra-regional expansion, its government has BIT-type agreements on the promotion and reciprocal protection of investment (plus related protocols) with Angola, Cameroon, Democratic Republic of the Congo (DCR), Gabon, Guinea, Ethiopia, Mauritania, Namibia, Sudan, Tanzania, Zambia and Zimbabwe. This is cold comfort for ordinary Zimbabweans, Malawians and Congolese people when their experience of South African corporations is destroying local producers (as Shoprite is doing to small-scale Zambian producers) tax breaks and capital repatriation (as AngloGold Ashanti is doing in Ghana) and losing competitiveness, as the strong rand is doing in the Southern African Customs Union (SACU) countries and Zimbabwe (where the rand has become the medium of exchange).

Growl of a Paper Tiger

There are further aversions that South Africa's buckling economy and regressing human development index makes its claim as the regional power player sound like the "growl of a paper tiger". While it is seen as bold and vigorous outside, South Africa suffers a growing hollowness from within. If its economy does not grow, it will be challenged by continental rivals who may be doing better on development indicators. Soko and Qobo (2010) and Fakir (2012) and interrogate the carefully cultivated image of South Africa as an assertive regional power amongst its other BRIC counterparts.

Ma, et al. (2012) observes that while Africa ships large volumes of raw materials to China, South Africa believes that China's trade with African nations should be better balanced thereby prompting President Jacob Zuma (South Africa) to raise the unequal partnership status with Beijing where trade patterns were unsustainable in the long term if Africa was to export commodities and import only manufactured goods. China is so attractive to Zuma's South Africa because it is not judgmental, given the current context of poor governance and accountability that continues to pervade many levels of the South African state. Moreover, our political leaders will be hard-pressed to explain why the rest of BRICS is advancing while South Africa is making slow progress.

In the long-term, economic sustainability and growth in South Africa - shared with the region - and fixing problems in Africa, will be mutually beneficial. If it fails to grow the economic cake, South Africa's assertion of leadership on the global stage will be done with great constraint and continued reluctant acceptance from neighbours and the African region as a whole.

CHINA

Ncube (2013) and Walters (2013) both posit the question - does Africa need China as much as China needs Africa? In an article entitled "China and Africa", Gerald Segal predicted that China, as a rising global power, would be more important to Africa than vice versa, he even surmised that Africa would be the region of least importance to China's foreign policy. However, a review of current Sino-African relations clearly refutes Segal's prophesies. Africa is very important to China (Anshan, 2007, pp. 69-93). China has moved aggressively into Africa, as China needs Africa mainly for its raw minerals and other extractive resources. China is not looking to make loans; China is looking for reciprocal trade (Spector, 2013).

There has been a substantial growth in the relationship between China and Africa (Adisu, et al; 2010, pp. 3-9). China's vastly increased involvement in Africa over the past decade is one of the most significant developments in the region. Akhavan and Sadoddin (2013, pp. 121-124), Adisu, et al. (2010, pp. 3-9) and Muekalia (2004) extol China's foreign policy as one of the cornerstones of Chinese-African relationship which began after the 1955 Bandung Conference where after China cultivated economic, technical, and military support to African countries and liberation movements in an effort to unite with them against both superpowers. Stahl (2009:40) in Akhavan and Sadoddin (2013) advocates that China's presence in Africa can therefore not be considered as a transient and temporary phenomenon as China claims that it looks at Africa as a partner, not a poor continent in need of aid with unnecessary strings attached.

Beijing Consensus

Chinese foreign policy aims are a critical determinant of its investment and foreign aid, since most of its firms are agents of the Chinese government. According to Kaplinsky, McCormick and Morris (2007) in Adusei (2013, pp. 3-9), the Chinese model of investment, known as the "Beijing Consensus" in essence brings economic growth objectives and foreign policy together guiding trade and invests decisions in Africa along with "no strings attached" financial and technical assistance. China's principle of non-interference has served to safeguard China's own sovereign rights.

By offering aid without preconditions, China has presented an attractive alternative to conditional Western aid Tull (2006, p. 459) and gained valuable diplomatic support to defend its international interests, despite a generally asymmetrical relationship differing little from previous African-Western patterns. Chinese foreign policy is rooted in the "Harmonious World Theory", emphasizing the increase of justice in the international system as well as democratizing this system, respecting the rights of the nation-states as well as their sovereignty, considering developing countries' interests.

Chinese Trade Policy

Chinese trade policy, as promised in the Chinese government's Africa Policy paper, would help Africa- "... The Chinese government will adopt more effective measures to facilitate African commodities' access to the Chinese market and fulfil its promise to grant duty-free treatment to some goods from the least developed African countries, with a view of expanding and balancing bilateral trade and optimizing trade structure...."

Foreign Direct Investment

According to Gentle (2012), Adisu, et al. (2010, pp. 3-9) and Brautigam (2003), Chinese investment has been motivated by a desire to access critical resources and Africa's new middle class, yet opting to downplay political issues. Dunning's Eclectic Model best illustrates China's Foreign Direct Investment in Africa, based on three sets of advantages. Firstly, for Multi National Enterprises (MNEs) to compete by producing in another country must have advantages specific to their ownership. Secondly, it must be in the best interest of the firms that have an ownership advantage to transfer resources within their own firms, rather than sell them or the right of use to foreign-based enterprises. Thirdly, to ensure that the location of production is in the best interest of the firm.

Tull (2006, pp. 471) claims that the combined effect of the US-sponsored 2000 African Growth and Opportunity Act (AGOA), and the flexible strategies of Chinese companies contributed to the 'South-South' solidarity. According to Sautman and Hairong (2007), China's profound impact on African economies has the highest return on FDI, ranging from 29% in 1990 to 40% in 2005. Although China's trade with Africa is relatively small compared to US\$1.76 trillion in world trade, it has grown from US\$3 billion in 1995 to US\$55 billion in 2006. It is predicted that Chinese investment will top the US\$100 billion mark by the end of the decade (Taylor, 2006).

Chinese "Predatory" Trade Practices

China's position is unique: it has one foot in the developing world and another in the developed one, with a seat in the United Nations (UN) Security Council. This dual status gives it considerable leverage in the pursuit of its interests. Despite being a decade into the 21st century, Tapscott and Williams (2010, p. 260) and Konings (2007, p. 361) maintain that African states seem to accept the paternalistic Beijing role in preserving their (African) interests in multilateral settings. China is the most active BRICS investor in but Tull (2006, pp. 468-476) offers that China's foreign trade policies are not driven by altruistic motives.

Judging from its increasing influence, China's elite-centred modes of assistance have proven extremely effective. The Chinese have no qualms about making deals with oil-rich dictators, however corrupt they may be. China's diplomacy towards Africa is aimed at cementing a strategic partnership and maintaining sovereign protection. China conceives its investments as goodwill projects to woo the sympathies of African state leaders, enabling it to gain political influence, which often opens the doors to commercially or strategically more attractive businesses in other sectors, e.g. to win tenders for oil and mining concessions. Konings (2013, pp. 363) and Tull (2006, pp. 468-471) highlight that many African political elites appear to regard China as both an appealing economic model worth emulating and a potential catalyst for socioeconomic development. Lucien (2011, pp. 367-370) posits that the Chinese finance grandiose and prestigious buildings (presidential palaces, football stadiums) that African leaders highly appreciate for their own political reasons. Moreover, China is willing to offer what is referred to as a 'total package': cash, soft loans, investments, bribes, technology, the construction of infrastructure and prestige objects, arms sales, political protection from international pressures, using its seat on the UN Security Council and other incentives to bolster their competitive advantage (Konings, 2007, pp. 341-352). In return, Beijing can count on valuable diplomatic support from African governments to defend its interests at the international level, particularly in multilateral organizations with 'one country-one vote' arrangements.

In concluding, Anshan (2007, pp. 69-93) avers that there are many critics of China's absolute adherence to the principle of non-interference, even in the face of human rights violations and political corruption in African countries. China does not consider itself qualified to make

judgments on the domestic affairs of African countries and considers the African Union more qualified to do so.

De-Industrialization and Underdevelopment of Africa

Okpa II (2013) posits that Africa practices “voodoo economics” whereby Africa subsidizes the economies of western nations and now China, paying high interest rates and selling their national resources at a fraction. Sanusi (2013) accuses China as a major contributor to the de-industrialization as well as underdevelopment of Africa, warning governments and policy makers to review Chinese interests in Africa as Africa was “opening itself up to a new form of imperialism”. China as the second biggest economy in the world was no longer a fellow underdeveloped economy, but an economic giant and competitor yet continuing to portray itself as a developing nation at least to African audiences. Gumede (2013, p. 23) contends that China keeps its renminbi artificially undervalued to boost Chinese exports and so power its industrialization and growth. Unfortunately, the cheap Chinese currency hurts other BRICS countries. Gumede urges African countries to respond to this such as subsidies and currency manipulation, which give Chinese exports an advantage.

In the 2000, Beijing Declaration of the China-Africa Cooperation Forum, China, and Africa agreed to establish a “strategic China-Africa axis” for close future cooperation in international affairs, which would result in concrete gains for both sides. In 2006, Beijing hosted the FOCAC China-Africa summit in Beijing had made eight major commitments aimed at strengthening its “strategic partnership” with Africa. In assessing its efficacy, China has implemented almost all of its eight pledges, representing an impressive record of accomplishment, reaffirming its African Agenda”. China has doubled its assistance to Africa through preferential loans and credits; building a headquarters for the African Union; cancelling debts of thirty one (31) poorer African countries totalling some \$1.27 billion; further opening-up of China's markets to more African product; establishing trade and economic cooperation zones in Africa and training African professionals.

Political Motives in African Policy

The promotion of democracy is not an objective of China's foreign policy, since it does not square with Beijing's relativistic conception of individual human and political rights of the political elite of the one-party state. This is one of the reasons why Beijing doggedly clings to the dogma of non-interference. Konings (2007, pp. 341-361) maintains that China's renewed interest in Africa is not only economically motivated but also derives from its political concerns - anti US global hegemony, Taiwan diplomatic space in Africa in recognition of the ‘one-China’ principle.

For some scholars Jaffe and Lewis (2002) and Pan (2006), China's renewed interest in Africa during the era of neoliberal globalization can be ascribed to a single motive in the relationship, which is the drive to secure energy resources for the country's rapid economic expansion is behind China's growing engagement with Africa. In terms of China's imports from Africa, nine of its ten most important trading partners are resource-rich countries successfully driving home the message that increased Sino-African cooperation will inevitably result in a ‘win-win situation’ for both sides. While this is certainly debatable with respect to Africa and its ordinary citizens as a whole, there can be little doubt that sizeable benefits of China's return will accrue to state elites.

Finally, food security is a growing concern in the wake of China's diminished grain output in 2003. The Soviet Union's humiliating dependence on American and Canadian wheat is a scenario Beijing possibly fears. With a projected increase in population, the loss of vital agricultural land to industry and increasing consumption amongst its urbanizing population, Beijing sees a need to obtain stable sources of key foodstuffs (Lucien; 2011, pp. 367-370).

Consequences of Economic Aid

China's aid has become particularly attractive to African leaders, precisely because it comes with no conditionality on governance, fiscal probity, and the other concerns of western donors. Between 1960 and 1989, it provided Africa with nearly \$4.8 billion in economic aid, an amount that constitutes almost half of China's total aid budget during this period.

Table 1 - Sino African Relations (1960-1989)

Chinese aid to Africa in comparative perspective, 1960-89 (in millions of US dollars)	
Region of Chinese Aid	Amount
Africa	4,728
Middle, East and South Asia	4,053
East Asia	514
Latin America	314

Sources: Brautigam (1998:44) and Bartke (1992)

While Africa has been transformed by China's growing presence on the continent, conflict has also surfaced with expanding interaction, particularly with labour practices and market strategies Mohan and Lampert (2012). Currently (2013), more than one million Chinese immigrants live and work on the African continent. Lucien (2011, pp. 367-370) believes that the cohabitation between the Chinese people living in Africa is becoming a source of tension. A frequently heard complaint from Africans is that of the reliance of Chinese firms upon imported Chinese labour for infrastructure projects. The recent resentment against Chinese expatriates in Africa stems from the fact that Chinese companies import a large number of Chinese workers rather than employing locals where levels of employment can reach 70% of the youth, contrary to the needs of economies where unemployment is already a serious problem.

Sino-African Relationship

Ademola (2009, pp. 485-505) and Walters (2013) express that the Sino-African relationship as having provided many benefits to Africa and China alike. China has stressed deepening economic ties with Africa. Africa needs China, not only as a trade partner but also for investments, financial (development) assistance, and cooperation, whereas the presence of China in Africa has enabled African countries to get much-needed infrastructure, even though many of these deals come in the form of minerals-for-infrastructure barter agreements.

China in BRICS

International scholars' according to Hauff (2012, p. 312) express the view that BRICS would be a "toothless tiger" without China as China is mobilizing huge sums in credit grants to developing countries by the China Development Bank and the governmental Export-Import Bank amounted to \$ 110 billion in 2009 and 2010. The usage of the Yuan in international transactions has been increasing at an unbelievable 170% per year (Spector, 2013).

Sanusi (2013) contends that the continent must build infrastructure and invest in education so that African businesses can compete for continental trade as Chinese labour costs rise. Africa must seize the moment and move manufacturing of goods consumed in Africa out of China to the African continent.

GEOPOLITICAL APPROACHES

Tull (2006, pp. 472-476) concludes that in economic terms, BRICS impact on Africa's place in the global economy is palpable. Africa cannot currently compete as an equal with China, a result of which is that its exports to China are largely limited to capital-intensive commodities. This imbalance has the effect of Africa creating jobs in China, while imports from China have undermined job markets in Africa.

China says it looks at Africa as a partner, not a poor continent in need of aid with unnecessary strings attached. While this is the result of legitimate market competition, it contravenes Chinese statements that enhanced Chinese-African interaction always results in win-win situations. On the other hand, the policies of Western governments towards Africa have come to reflect a more normative and reform-oriented edge in recent with US President Barack Obama stating that America's dealing with "Africa was new donor-recipient model that is based on partnership and recognizing that no continent has greater potential or greater upside than the continent of Africa".

Africans should seek a transfer of knowledge, while Africa is in a position to choose; that is before their natural resource dries-up, and its leaders should educate tomorrow's workforce.

NEO-PATRIMONIAL POWER SYSTEM

Many African politicians will sign agreements for a mere million dollars as foreign interests take away billions. Given Africa's leadership of politics at the expense of business, Africa is a playground of politicians whose actions hardly improve the lots of their immediate constituents, instead such leaders become tools used by foreign interests (Okpa II, 2013). The instruments of the African security architecture are not just theoretical.

In interrogating African leaders' acquiescence to BRICS's initiatives in their countries, this paper also evaluated "enrichment without development" against the Neo-Patrimonial Power System. Economic relations with BRICS, under conditions of rampant cronyism, corruption and poor economic governance, is not necessarily about the development of the country and the interests of the poor, but encourages political entrepreneurs to further their interests first before anybody else. Iraj Abedian (2013) argues that's "more often than not, the Chinese are willing to pay bribes to those in office to get whatever business license or favour they require". The Chinese are not apologizing for their activities Wu (2010) and claim that the investments are now more 'market driven' and are willing to work with the African governments and have rejected the criticisms.

Regionalism in Africa is driven by personalized governments, and is often held hostage to the political will of African leaders. Africa's autocratic leaders have only seldom relinquished any of their direct power to supranational organizations and even when they have done so it is seemingly only to hijack these organizations as vehicles for their personal ambitions (Franke, 2007).

In trying to counter this lascivious conduct, "Lions on the move", best describes Africa's dynamic new beginning. Rising young South Africans argue that Zuma's perspective increasingly has "an almost-sepia-toned generational bias built into it". Spector (2013) claims that in their view, "...young people of Africa feel let down by the revolutionary leaders who are looking and treating China with scepticism. They are waiting for their chance to lead better in an age where information, education, and skills are as equal to any place in the developed world. Their 'sense of leadership' betrays the style of always looking for an outside saviour – to rescue, yet again Africa. In the next decade, all the octogenarian leaders are likely to be eliminated either by coup d'état or death and there will see the emergence of new leaders who are born in Africa, educated in the West and want a new renaissance of Africa, on Africa's terms".

Adisu, et al. (2010, pp. 3-9) believe that this relationship is likely to endure since it provides a strong commitment to Africa. It is also attractive because it does not prescribe behavioural outcomes for African leadership.

CONCLUSION

This paper's purpose was to shed some light on the concept of BRICS as an economic superpower and two of its luminary member states' (China and South Africa) internecine competition and its effect on Africa's architecture.

The limitations of this study include its conceptual nature and none of the conclusions has been supported by quantitative or statistical analysis. So, most of the views are clearly those of the authors. Africa has been addressed at the macro level rather than on a country-by-country basis, with the exception of a comparison between Nigeria and South Africa.

Future engagement in South-South cooperation calls for a critical look at global governance institutions to promote a fairer, equal world, greater transparency and accountability and for greater decision-making power for those most directly affected by global challenges, who are often the poorest and most vulnerable people in our world.

The author agrees with the following contributions by Sanwal (2013) and Fakir (2012) that Africa must move the manufacturing of goods consumed in Africa out of China to the African continent. The new framework should look at transformational shifts in growth pathways driven by infrastructure development with a focus on consumption, rather than production. Leadership without the weight of financial capacity

and economic muscle make South Africa vulnerable to counter-strategies from other African rivals including BRICS member nations who all compete equally for Africa's finite resources.

Whilst most African nations have matured in its democratic processes, China's powerful "return to the continent" and the concomitant diversification of Africa's external relations may change the position of African states in the international system. However, in political terms, China's patronization may well decide future Africa's future in either Beijing or Washington with the reality of South Africa having little to offer other than posturing.

EMPLOYEE PERCEPTIONS OF TALENT MANAGEMENT PRACTICES IN LOCAL GOVERNMENT INSTITUTIONS

Nicolene Barkhuizen
North-West University, South Africa

ABSTRACT

Talent Management is a concept increasingly on the minds of managers and practitioners, but still remain neither a strategic or operational priority in many organisations. The main objective of this research is to determine employee perceptions (N=518) of the applications of Talent Management Practices in South African local government institutions. The results showed that talent management practices are applied below average in the organisations. Large gaps exist between the current applications versus the importance of talent management practices. Significant differences exist between the employee perceptions of talent management practices based on their demographic characteristics.

INTRODUCTION

Talent Management is a concept increasingly on the minds of managers and practitioners as it becomes more difficult to attract, develop and retain talented employees in a fierce competitive business world. This situation is problematic in the South African context as The Global Competiveness Report continues to rank the country low in terms of labour market efficiency and people development. Horvathova and Davidova, (2011) cites Mikusova (2008) who maintains that without a skilled workforce no organisation will be able to keep up with competition and survive in an ever changing business world. Talent Management is thus of strategic importance for emerging markets such as South Africa (Kaye & Smith, 2012; Tarique & Schuler, 2010; Tymon, Stumpf & Doh, 2010). Recent research by the Human Capital Institute of South Africa shows that only 57% of the companies surveyed have a department formally referred to as Talent Management (Human Capital Institute of South Africa, 2011). The results of the survey further showed that more than half of the companies indicated that it is difficult to implement Talent Management Practices.

The main objective of this research is to determine employee perceptions of the applications of Talent Management Practices in South African local government institutions. More specifically the research aims to determine first the current application of the talent management practices and the importance thereof. Furthermore this research also aims to determine whether a significant gap exists between the current applications versus the importance of Talent Management practices. Finally this research also aimed to investigate whether significant differences exist between the respondents' perceptions of Talent Management Practices based on their biographic characteristics.

TALENT, TALENT MANAGEMENT AND TALENT MANAGEMENT PRACTICES

The field of Talent Management is still enshrouded with a thick veil of confusion. First and foremost several scholars debate who we should regard as our "talent" in organisations. One line of research argues that a talented employee represents an extraordinary efficient individual with high potential who can make a significant contribution to an organisation's success. Other researchers maintain that everyone in an organisation that contributes to its objectives can be regarded as a talented employee (Horvathova & Davidova, 2011). The first definition thus reserve the term "Talent" for "high-value staff and/ or high potentials, in contrast to 'inclusive' perspective where 'talent' is merely a synonym for 'staff' (Iles, Preece & Chuai, 2010).

The available literature also shows that researchers differ greatly in their understanding of Talent Management (McDonnell, Lamare, Gunnigle & Lavelle, 2010). Moreover Huang and Tansley (2012) maintain that talent management seem to be a highly contentious issue that requires further examination. Tarique and Schuler (2010, p. 124) provides a broad definition of Talent Management which refer to a “systematic utilisation of HRM practices and policies to attract, develop and retain individuals with high levels of human capital consistent with the strategic directions of the organisation.” This requires an understanding of what core talent means, and how to leverage the talent in a manner that allows organisations to act decisively to attract, retain, and develop talent as well as secure the future success of organisations in South Africa (Stanz, & Barkhuizen & Welby-Cooke, 2012).

METHOD

A quantitative research approach was followed. The sample consisted of employees (N=518) from various local government institutions in South Africa. An adapted version of the Human Capital Index (Human Capital Institute, 2008) was administered. The HCI consisted of 41 items and measure nine Talent Management Practices: Management Commitment, Talent Review Process, Workforce Planning, Staffing, Talent Acquisition, Talent Commitment, Talent Development, Performance Management and Talent Retention. This measure makes use a dual scale. Respondents are first requested to evaluate the current application of Talent Management practices in the organisation on a five-point Likert scale ranging from Poor (1) to Excellent (5). Second the respondents are required to indicate the importance of the Talent Management practices on a five-point scale ranging from Not (1) to Critica (5). Data analyses were done with the aid of SPSS 20.

RESULTS

Table 1 below reports the results of the respondents’ perceptions of the current application of talent management practices in their organisation.

Table 1 Current Application of Talent Management Practices

	Mean	Std. Deviation	Cronbach Alphas	Rank
Management Commitment	2.7486	.96495	.894	7
Talent Review Process	2.7243	.89606	.864	8
Workforce Planning	2.7699	.82768	.845	6
Staffing	2.9570	.77464	.695	3
Talent Acquisition	3.0053	.77923	.738	2
Talent Commitment	3.1766	.76472	.747	1
Talent Development	2.8988	.84850	.824	4
Performance Management	2.7815	.82004	.817	5
Talent Retention	2.4865	.92073	.826	9

The results in Table 1 show that the respondents perceived that most of the talent management practices are applied below average in their organisations. The Talent Management practices that seem to be most problematic include Talent Retention, Talent Review Processes, Management Commitment and Workforce Planning. Next the results of the importance of the Talent Management practices as viewed by the respondents are reported.

Table 2 Importance of Talent Management Practices

	Mean	Std. Deviation	Cronbach Alphas	Rank
Management Commitment	3.6884	.97757	.926	7
Talent Review Process	3.6309	.91932	.894	8
Workforce Planning	3.5745	.95239	.914	9

Staffing	3.7592	.81216	.825	4
Talent Acquisition	3.7973	.81240	.840	3
Talent Commitment	3.8813	.79721	.842	1
Talent Development	3.8042	.90324	.897	2
Performance Management	3.7112	.91706	.892	6
Talent Retention	3.7230	.99879	.856	5

The results in Table 2 show that the respondents view all the listed Talent Management practices as important. The practices listed as most important include Talent Commitment, Talent Development and Talent Acquisition. Table 3 and Graph 1 reports the comparison between the current versus the importance of Talent Management Practices.

Table 3 Current versus Importance of Talent Importance of Talent Management Practices

	Current	Important	Gap
Management Commitment	2.749	3.688	-0.940
Talent Review Process	2.724	3.631	-0.907
Workforce Planning	2.770	3.575	-0.805
Staffing	2.957	3.759	-0.802
Talent Acquisition	3.005	3.797	-0.792
Talent Commitment	3.177	3.881	-0.705
Talent Development	2.899	3.804	-0.905
Performance Management	2.781	3.711	-0.930
Talent Retention	2.486	3.723	-1.236

Graph 1: Current versus Importance of Talent Management Practices

The results in Table 3 and Graph 1 show that large gaps exist between the current versus the importance of Talent Management Practices. The largest gaps were observed between Talent Retention practices, talent review processes and performance management.

The Manova analyses between Demographic Variables and current Talent Management Practices are reported in Table 4 below.

The results in Table 4 shows that significant differences exist between the respondents' perceptions of Talent Practices based on their job level and years of work experience. Further posthoc analyses revealed no significant differences between talent management practices and the respondents based on their job level.

The Wilks' Lambda for work experience is equal to 0.878 [$F(36, 1894.206) = 1.866, p \leq 0.05$]. Analysis of each dependent variable, using a Bonferroni adjusted alpha level of 0.025, showed that the respondents differed in terms of their perceptions of Management Commitment ($F_{(3, 518)} = 4.039, p \leq 0.05$, partial $\eta^2 = .023$), Talent Acquisition ($F_{(3, 518)} = 3.726, p \leq 0.05$, partial $\eta^2 = .021$), Talent Commitment ($F_{(3, 518)} = 3.486, p \leq 0.05$, partial $\eta^2 = .020$) and Talent Retention ($F_{(3, 518)} = 2.962, p \leq 0.05$, partial $\eta^2 = .017$). The results showed that the respondents employed for more than 30 years in their organisation experienced less Management Commitment towards Talent Management practices than those employed between 0 to 10 years in their organisation. Respondents employed between 0 to 10 years in their organisation experienced less talent acquisition than those employed between 11 and 20 years in their organisation. Respondents employed between 0 to 10 years in their organisation also experienced less Talent Commitment than those employed between 20 and 30 years in their organisation. Finally respondents employed between 0 and 10 years experienced more talent retention strategies than those employed for more than 30 years in their organisation. The effects however were small.

Table 4: Manova Analyses: Demographic Variables and Talent Management Practices

	Value	F	Hypothesis df	Error df	Sig.	Partial Eta Squared
Gender	.960	1.169 ^b	18.000	1014.000	.280	.020
Age	.913	1.289	36.000	1894.206	.117	.022
Job Level	.878	1.866	36.000	1894.206	.001	.032*
Qualifications	.947	1.026	27.000	1478.423	.427	.018
Years Experience	.859	2.933	27.000	1478.423	.000	.050*

The Manova analyses between Demographic Variables and the importance of Talent Management Practices are reported in Table 5 below.

Table 5: Importance of Talent Management Practices

	Value	F	Hypothesis df	Error df	Sig.	Partial Eta Squared
Gender	.984	.457 ^b	18.000	1014.000	.975	.008
Age	.905	1.425	36.000	1894.206	.049	.025*
Job Level	.928	1.066	36.000	1894.206	.364	.019
Qualifications	.964	.684	27.000	1478.423	.887	.012
Years Experience	.910	1.803	27.000	1478.423	.007	.031*

The results in Table 5 shows that significant differences exist between the respondents' perceptions of Talent Practices based on their age and years of work experience.

The Wilks' Lambda for job level is equal to 0.905 [$F(36, 1894.206) = 1.866, p \leq 0.05$]. Analysis of each dependent variable, using a Bonferroni adjusted alpha level of 0.025, showed that the respondents differed in terms of their perceptions of Management Commitment ($F_{(3, 518)} = 2.342, p \leq 0.05$, partial $\eta^2 = .018$), Talent Review Process ($F_{(3, 518)} = 3.647, p \leq 0.05$, partial $\eta^2 = .028$), Workforce Planning ($F_{(3, 518)} = 3.751, p \leq 0.05$, partial $\eta^2 = .028$), Staffing ($F_{(3, 518)} = 3.676, p \leq 0.05$, partial $\eta^2 = .028$), Talent Acquisition ($F_{(3, 518)} = 3.441, p \leq 0.05$, partial $\eta^2 = .026$), and Talent Development ($F_{(3, 518)} = 2.791, p \leq 0.05$, partial $\eta^2 = .021$). The results showed that the respondents aged between 20 and 29 years regarded Management

Commitment and Talent Development more important than the respondents aged between 40 to 49 years. Respondents aged between 20 and 29 years regarded Talent Review Processes, Workforce Planning, Staffing and Talent Acquisition as more important compared to respondents aged between 30 and 39 years and 40 and 49 years.

The Wilks' Lambda for work experience is equal to 0.910 [$F(27, 1478.423) = 1.803, p \leq 0.05$]. Analysis of each dependent variable, using a Bonferroni adjusted alpha level of 0,025, showed that the respondents differed in terms of their perceptions of Management Commitment ($F_{(3, 518)} = 5.089, p \leq 0,05$, partial $\eta^2 = .029$), Talent Development ($F_{(3, 518)} = 3.926, p \leq 0,05$, partial $\eta^2 = .022$) and Talent Retention ($F_{(3, 518)} = 4.599, p \leq 0,05$, partial $\eta^2 = .026$). The results showed that respondents employed between 0 to 10 years regarded Management Commitment, Talent Development and Talent Retention as significant more important than those employed between 11 to 20 years in their organisations.

CONCLUSION

This research provided some important empirical information on the current state of Talent Management practices in local government institutions. From the results it was clear that talent management practices are applied below average in their organisations with Talent Retention, Talent Review Processes, Management Commitment and Workforce Planning practices the most problematic. Further results also showed that large gaps exist between the current applications versus the importance of talent management practices in the organisation. The largest gaps were observed between Talent Retention practices, talent review processes and performance management. The Manova analyses also showed that organisations should take cognisance of the talent management of different generations in organisations and their tenure in the organisation.

In conclusion this research contributed to the limited empirical knowledge that currently exists on Talent management in the South African context. The research highlighted the importance of the effective management of talented employees and the outcomes thereof for employees and the organization. Therefore it is recommended that the local government institutions revisit their Talent Management practices as it has important implications for both the individual and the institution.

CO-EFFECT OF CULTURE AND PERSONALITY TRAITS ON BUSINESS SUCCESS OF SOUTH AFRICAN ENTREPRENEURS

**Charles Ekitike Bondima, Edward Rankhumise and Jan Grundling
Tshwane University of Technology, South Africa**

ABSTRACT

This study investigated the co-effect of entrepreneurial traits and culture on business success and proposes recommendations for entrepreneurial success. The research question under investigation is: "Can distinctive entrepreneurial traits and cultural elements be identified that will predict entrepreneurship success in South Africa?" The survey research method was used and data was collected from South African entrepreneurs through standardized questionnaires. The main findings revealed that business success is dependent on personality traits and culture, and the findings and conclusions may assist South African entrepreneurs, and others to be successful in South Africa.

INTRODUCTION

Various studies have attempted to determine the influence of either personality traits (Timmons, 2007); or culture (Peltokorpi & Froese, 2011; Davidsson & Wiklund, 1997) on business success. However, little research, has been done on the combined effects and predictive value of personality traits of the entrepreneur and culture on business success, despite the fact that literature acknowledges that the entrepreneur, the type of venture and the environment are crucial determinants of business success (Trevisan, Grundling & De Jager, 2003). This article will attempt to explore the co-effect of personality traits of the entrepreneur and culture on business success in a developing country, namely South Africa. When researching the entrepreneur as an individual, particularly interested in establishing whether identifiable personality characteristics, that drives the decision to enter into entrepreneurship and be successful, exist. Numerous literature focus on the personality of an entrepreneur, by identifying specific traits that characterise an entrepreneur. The personality traits most frequently cited as being characteristic of the entrepreneur include the desire for independence (Collins & Moore, 1964), locus of control (Brockhaus & Horwitz, 1986), creativity (Wilken, 1979), risk-taking propensity (Rauch & Frese, 2005), and credible role models (Bygrave, 1995). Unfortunately, these traits identify an entrepreneur's personality characteristics and its influence on new-venture formation and are not related to new-venture performance (Dvir, Sadeh & Pines, 2006). Perhaps the absence of a link between personality traits and new-venture performance could be attributed to the fact that personality traits are not linked to specific tasks undertaken to achieve venture performance. It is extremely difficult to demonstrate a causal relationship between personality traits and entrepreneurial behaviour and success (Cooper, Dunkelberg & Woo, 1988). Borman and Motowidlo (1997) are the only scholars who have been able to indicate that personality factors contribute more strongly to contextual performance – performance in a specific environment - than to task performance.

LITERATURE REVIEW

In this research the Grid Group Cultural theory of Douglas (1970) and the Five-Factor theory of McCrae and Costa (1987) was used as theoretical framework. A brief description of their respective evolvments and the nature of each theory are described below.

THE ESSENCE OF PERSONALITY TRAITS

Portraying a person's personality, is generally done by utilizing expressions of particular facets of personality, known as traits. *A personality trait is a hard-wearing temperament to conduct in a specific way, in an array of situations* (Weiten & Lloyd, 2006). A distinction can be made between common and

individual traits. A **common trait** is a temperamental aspect that is common to numerous people. Traits that come out to some degree within every person are sociability and fierceness. However, **individual traits** are traits that are confined to the individual only (Nicholas, 2003). In this research, only the common traits that entrepreneurs share in the cultural environment of South Africa will be analyzed.

Most trait theories of personality, such as Gordon Allport's trait theory (1937, 1961) and Raymond Cattell's factor analytic trait theory (1950, 1966) presume that a number of traits are more influential than others. Following on this view a small number of basic traits determines other, more outward traits. Hans Eysenck's, cited by Halonen and Santrock (1993), personality model suggested two dimensions (as opposed to traits) of **neuroticism-stability** and **extraversion-introversion**. Afterwards, he expanded the model by adding **psychoticism** as a third dimension. **Extraversion** implies being unsubmitive, energetic, active and lively. **Neuroticism** incorporates being nervous, temperamental, and low in self-esteem. **Psychoticism** involves being egotistic, impetuous, cold and unsociable. Eysenck put forward the theory that the most important personality traits were determined mainly by a person's genes (Nicholas, 2003; Caligiuri & Tarique, 2012).

Eysenck's model was a forerunner to the 'five-factor' theory designed by Costa and McCrae (1992, 1995) which was utilized in this research. Recently, McCrae and Costa (1987, 1997, 1999) maintained that the broad mainstream of personality traits should be known as the five higher-order traits that in turn should be known as the "big five". These are: extraversion, neuroticism, openness to experience, agreeableness and conscientiousness (Weiten & Lloyd, 2006). Following the same order, the big five traits are defined:

Extraversion. Extraversion is defined as the tendency to behave vigorously within the social and material milieu and includes traits such as sociability, activity, assertiveness and positive emotionality (John & Srivastava, 1999; Migliore, 2011). People who score high on extraversion are characterized as outgoing, sociable, upbeat, friendly, assertive and gregarious (Watson & Clark, 1997). Those who score at the opposite end of this personality dimension are characterized as quiet, reserved, retiring, and unassuming (Nicholas, 2003). Bad management performance increases the risk of entrepreneurial failure. Hence, extraversion may promote trait adjustments such as developing leadership virtues (Judge, Ilies & Gerhardt, 2002), that allow entrepreneurs to do better at tasks related to management in pioneering firms (Barrick & Mount, 1991). As a result, improved management performance associated with extraversion could assist to avoid entrepreneurial failures. Higher extraversion may lead to meting out trait adjustments that are useful in team and dyadic relationships (Mount, Barrick & Stewart, 1998). Therefore, extraverted entrepreneurs that run pioneering ventures are probably less likely to fail because of interpersonal problems (Barrick, Mount & Judge, 2001).

Neuroticism. People who score high in neuroticism tend to be anxious, hostile, self-conscious, insecure, and vulnerable (Migliore, 2011). Like extraversion, this trait has been the subject of thousands of studies. In some trait models it is called *negative emotionality* (Church, 1994). The people who score low in neuroticism tend to be unemotional, calm, secure, relaxed (Nicholas, 2003). The practice of neurotic individuals to be annoyed and to have negative emotions (Lahey, 2009) may be not advantageous with admiration to interactions with other stakeholders (Barrick, Mount & Judge, 2001). Thus neuroticism is expected to develop interpersonal problems. Consequently, efficient team decisions might be held back by neurotic entrepreneurial team members, ending in failure.

Openness to experience. Openness is associated with curiosity, flexibility, vivid fantasy, imaginativeness, artistic sensitivity and unconventional attitudes. Citing evidence that openness fosters liberalism, McCrae and Costa (1996) asserts that this trait is the key determinant of people's political attitudes and ideology. Those who score at the opposite end of this personality dimension are characterized as conventional, predictable and unimaginative (Nicholas, 2003).

Agreeableness. Those who score high in agreeableness tend to be sympathetic, trusting, cooperative, modest, and straightforward. People who score at the opposite end of this personality dimension are characterised as suspicious, antagonistic, and aggressive. Agreeableness may have its roots in childhood temperament and appears to promote altruistic (helping) behaviour in social interactions (Graziano & Eisenberg, 1997). Agreeableness may assist to obtain personal adjustments that partially make plans for transformational leadership (Bono & Judge 2004), which probably improves work inspiration, job contentment and the fulfilment of staff member needs. Thus, inspiration, contentment and fulfilment of needs may result in entrepreneurs feeling a high sense of belonging and attachment to a business that provides a personal impetus to the success of the business and a personal guard against its failure. Agreeableness relates negatively to innovative firm failure. The propensity of agreeable entrepreneurs is to

be impartial (Ekehammar & Akrami, 2007), for example with management team members, customers, employees or financiers, perhaps eases attempts to raise funds, making efficient decisions, or perform lucrative deals, and hence reduce business failure chances.

Conscientiousness. Conscientiousness people tend to be diligent, disciplined, well organised, punctual, and dependable. Referred to as *constraint* in some trait models, conscientiousness is associated with higher productivity in a variety of occupational areas (Hogan & Ones, 1997). The people who score lower in conscientiousness tend to be careless, aimless, and unreliable (Nicholas, 2003). A small number of traits for personality and entrepreneurship success like: sturdiness, independence, influence are very similar to traits that connect with conscientiousness. Conscientiousness can be typical of the entrepreneur according to Howard and Howard (1995). Traits such as organised and methodical (Goldberg, 1990, p. 1216-1229), realistic (Saucier, 1994, p. 506-516) can be significant for entrepreneurship success. Conscientious entrepreneurs perform poorly because they stress task accomplishment rather than gaining economic rewards (Stewart, 1996).

GRID GROUP CULTURAL THEORY

The cultural environment defines the parameters for contextual performance and also shapes the personality traits of an entrepreneur through the process of learning. Barnouw (1979, p. 5) defined culture as "...the configuration of stereotyped patterns of *learned behaviour* which are handed down from one generation to the next through the means of language and imitation...". Kroeber and Parson's (1958, p. 583) earlier cross-disciplinary definition of culture included "...patterns of *values*, ideas, and other symbolic-meaningful systems as factors in the shaping of *human behavior*". Hofstede (1980, p. 25) referred to culture as "the collective programming of the mind which distinguishes the members of one human group from another ... and includes systems of *values*". The Grid Group theory of Douglas (1970, p. 2) used in this research defined culture as "the creation of classifying processes". In brief, grid/group theory asserts that any community (group, organization, society) can be thought of in terms of two types of societal controls: (a) membership within surrounded social groups (group) and (b) restriction by outwardly enforced regulations (grid). These aspects address "two vital and constant questions of human existence: "who am I?" and "Which way should I behave?" (Schwarz & Thompson, 1990, p. 6). The notion of *group* addresses identity (Am I a member of an existing social unit or do I form my own social group?), whilst *grid* addresses behaviour (Are my social circumstances limited by far-reaching rules or do I have the freedom to bargain my own behaviour?).

Sociologists (Kemper & Collins, 1990) understand that Douglas's two dimensions are dimensions of power (grid) and status (group) and consequently vital variables for sociological analysis. The extent of pecking order or ranking within groups is indicated power or grid, whilst status or group connects to the extent of "emphasis on restrictions between the society and outsiders" (Kemper & Collins, 1990, p. 47). High grid is equal of "caste-as inflexibility", whilst high group shows the notion of a person's loyalty to a group. Here group membership determines identity.

The Grid-Group theory results in four main grid/group configurations representing four distinct national cultures expressed by Figure 1.

Figure 1: The descriptions of attitudes toward nature in each of the quadrants are drawn from Schwarz and Thompson (1990)

Grid	Isolated Culture (Fatalism) <i>(Freedom because of loneliness, individuals not taken seriously, repute for apathy, blame fate)</i>	Positional Culture <i>(Roles are attributed, strict hierarchy, controlled behavior, encourages custom and command, expects loyalty, blame deviance)</i>
	Individualistic Culture <i>(Competition, positions attributed by merit, excellence, committed to private benefit, no commitment to group, respects wealth and power, blame incompetence)</i>	Enclave Culture <i>(Avoid individual defection, avoid group division, hold up boundaries, focus on core society, egalitarian, regulating through ranking and ordering, blame the system)</i>

Group

THE ENTREPRENEUR-VENTURE-CULTURAL ENVIRONMENTAL FIT

The concept of Entrepreneur-Venture-Cultural Environmental fit signifies that in order to be like a fish in water, the entrepreneur, the venture and the culture and the environment should go hand in hand in order to favour new venture success. The congruence between the cultural context and the entrepreneurs will be examined. If an entrepreneur operate in an environment that does not hinder entrepreneurship and foster entrepreneurial behaviour, a good entrepreneur-venture-cultural environmental fit exist.

PROBLEM DESCRIPTION AND STATEMENT

Previous research in entrepreneurship has examined either the traits of individuals or entrepreneurs to be or the external environment. Researchers argued whether research should concentrate on the personality traits theory approach or the external environment. However, the personality traits are relevant to the immediate environment of the entrepreneur. In addition, research on entrepreneurial success based on a personality trait theory approach within a specific cultural setting has never been applied in an innovative way in order to improve entrepreneurs shape and decrease the rate of failure. For this reason the researcher decided to investigate how the findings of this research can be applied in the construction of a model for entrepreneurial development in Southern African countries.

Based on the above articulations, the research questions is: **‘Could distinct entrepreneurial traits and cultural elements be identified that will predict entrepreneurship success in South Africa?’** Following on the main research question, two sub-questions were formulated, namely, (i) What are the entrepreneurial traits that are deemed important in South Africa? and (ii) What are the entrepreneurial traits that predict business success in the South African culture?

HYPOTHESIS FORMULATION

The researchers formulated the following general hypothesis for each combined cultural dimension (isolated culture, individualistic culture, enclave culture and positional culture) and personality trait (extraversion, neuroticism, agreeableness, conscientiousness and openness to experience):

H₀: Culture_i and personality trait_i has no influence on business success in South Africa

H_A: Culture_i and personality trait_i has an influence on business success in South Africa

The testing of this hypothesis is based on the assumption that the population in South Africa possess a particular culture and that different personality traits contribute to business success. If the alternative hypothesis will be accepted in both cases, the hypothesis can be assumed that both personality characteristics and culture determines business success. All hypotheses will be tested at the significant level of 0.01 ($p = 0.01$).

METHODOLOGY

A quantitative research design was followed. The study population consisted of 7614 entrepreneurs representing 14 economic sectors in South Africa. A samples of entrepreneurs owning small businesses and operating in the formal business sector were proportionately drawn from the database SAyellow using province, business sector and business size as stratification criteria. Within each strata, convenient sampling was used to distribute 100 standardized questionnaires. Only 67 questionnaires were returned, indicating a 67% response rate, which the researchers found to be consistent with expectations of viable response rates. Data was collected using the 100-item International Personality Questionnaire (Goldberg, 1999) and the Grid-Group questionnaire. The instruments have been used to measure dimensions of personality and culture in several countries. Five major dimensions of personality namely extraversion, agreeableness, conscientiousness, neuroticism, and openness to experience were evaluated. The questionnaire contained four sections. Section A consisted of biographical items, section B business related information, section C, the Grid-Group Cultural Questionnaire (consisting of 20-items) and section D, the 100-item International Personality Questionnaire. The returned questionnaires were checked for completeness. Questionnaires with more than two missing responses on the demographic, business related information, cultural profile and five-factor model scales were rejected. In total 67 respondents were included in the analysis. SPSS v.21 was used

to analyze data. Due to the categorical nature of the data and the simple random sampling nature of the study, the data analysis was conducted using marginal probability, probability tree and simple descriptive statistics. Coding was done according to the prescribed guidelines of the 100-item International Personality Questionnaire and the Grid-Group Questionnaire.

RESULTS

Personality Traits

The personality traits of respondents were determined by summing all the values assigned by respondents to each trait to obtain total trait scores for the sample. The personality dimension with the highest aggregate was considered to be the most dominant, the second highest score was indicative of the second most important dimension, while the lowest score was indicative of the least prevalent personality trait in the selected sample.

Table 1: An entrepreneurial personality trait profile

CULTURAL ENVIRONMENT	ENTREPRENEURIAL PERSONALITY TRAIT PROFILE OF RESPONDENTS									
	Extraversion		Neuroticism		Agreeableness		Conscientiousness		Openness to experience	
South African cultural origin (N=67)	Total score	Rank	Total score	Rank	Total score	Rank	Total score	Rank	Total score	Rank
	4609 3.44	4	4394 3.28	5	5166 3.86	2	5321 3.97	1	5050 3.77	3

Table 1 shows that the personality traits in sequence of importance are conscientiousness, agreeableness, openness to experience, extraversion and neuroticism. This implies that respondent entrepreneurs strongly tend to be diligent, disciplined, well organised, punctual, and dependable; also sympathetic, trusting, cooperative, modest and straightforward; in addition, curious, flexible, have a vivid fantasy, imaginative, artistic sensitive and hold unconventional attitudes in the largest variety of environments.

Dependence of Personality Traits on Business Success

To determine whether personality traits act independent of or dependent on business success the theory of marginal probability was utilized based on the assumption that marginal probability if $y = P(A_1/B_1) = P(A_1 \text{ and } B_1) / P(B_1)$ and $x = P(A_1)$ to occur then personality traits acts independent from business success. However in the case of conscientiousness, $P(A_1/B_1) = P(A_1 \text{ and } B_1) / P(B_1) = y$ and $x = P(A_1) = 0.29$
 $P(A_1/B_1) = 0.06/0.25 = 0.24$

$y = 0.24$ and $x = 0.29$ so $y \neq x$; therefore, business success is dependent on conscientiousness. Similar results were achieved for the other four personality traits. This provides evidence for the H_0 hypothesis should be rejected in favor of the H_a . The results clearly demonstrate that business success is influenced by the personality traits of entrepreneurs.

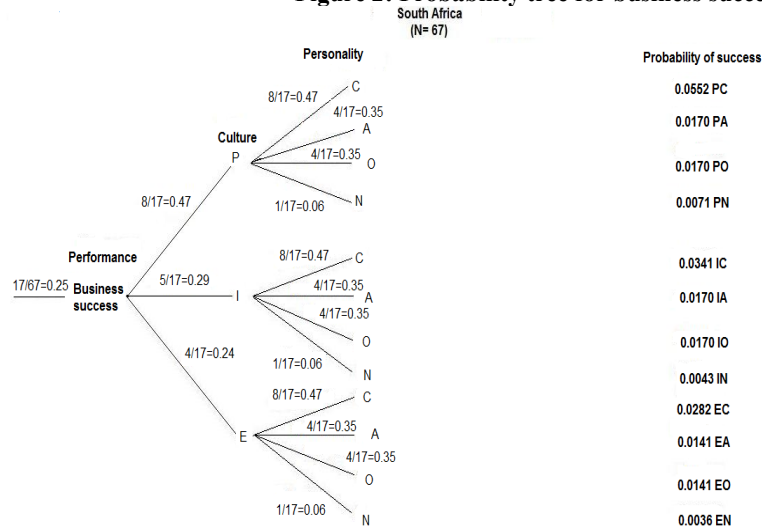

Table 2: Personality traits as determinants of business success calculated using marginal probability

PERSONALITY TRAITS (A)	Business success (B ₁)	Moderate business success (B ₂)	Business failure (B ₃)	Total probability (P _A)
South African origin				
Agreeableness (A ₁)	4/67= 0.06	15/67= 0.22	1/67= 0.01	0.29
Conscientiousness (A ₂)	8/67= 0.12	19/67= 0.3	2/67= 0.03	0.45
Openness to experience (A ₃)	4/67= 0.06	3/67= 0.04	3/67= 0.04	0.14
Extraversion (A ₄)	0	0	0	0
Neuroticism (A ₅)	1/67= 0.01	6/67= 0.1	1/67= 0.01	0.12
Total probability (P _B)	0.25	0.66	0.09	1

Co-effect of Personality Traits and Culture on Business Success

The co-effect of personality traits and culture on business success was calculated by means of a probability tree approach. Both success and moderate success were included in the calculation and treated as one concept “success” (Figure 2). Out of a probability of 1, the greatest probability for business success occurred in a positional culture in South Africa, where roles are attributed, a strict business hierarchy exists, behavior is controlled, staff is expected to obey customs and commands, loyalty is expected and deviance is blamed within a business. Within such a culture, conscientiousness, agreeableness and openness to experience are the dominant personality traits that predict business success the best. The same personality traits are required for success in the less dominant individualistic culture of South Africa. The aggregated probability co-effect of the three mentioned personality traits (conscientiousness, agreeableness and openness to experience) and the positional-individualistic culture explains 15.73% of business success achieved. The remaining percentage of business success should therefore be explained in terms of other entrepreneurial factors and personality characteristics. However, this co-effect percentage of culture-personality contributes significantly to business success and provides evidence for the existence of an optimal environment-entrepreneur fit. The aggregate personality trait mean scores for the entrepreneur respondents in South Africa who achieved business success was 3.97 for conscientiousness, 3.86 for agreeableness and 3.79 for openness to experience.

Figure 2: Probability tree for business success

Research by Goldberg (1990), Saucier (1994), and Howard and Howard (1995) revealed that a small number of personality traits cause business success such as sturdiness, independence and influence, organized, methodical and realistic. These traits correspond to conscientiousness in the Five Factor model and thus confirmed the results of the previous researchers. This research also finds confirmation in the research done by Bono and Judge (2004) and Ekehammar and Akrami (2007) that agreeableness relates positively to business attachment and negatively to business failure.

LIMITATIONS OF THE STUDY

The study was conducted with number limitations. The study was conducted in two countries with limited responses from Mozambique as a result of lack of interest in the study. Furthermore, the study was voluntary and perhaps those who did not participate could provided different view on the subject investigated. Funding was also another limitation to include more than two countries.

IMPLICATIONS AND RECOMMENDATIONS

It is recommended that entrepreneurs in South Africa promote and nurture conscientiousness, agreeableness and openness to experience in people, after age 3 and before age 50, who may still have the potential for change regarding their general personality traits. Support for this deduction can be found in studies done by Lewis (2001) who stated that the level of continuity in childhood and adolescence is much higher than originally expected, especially after age 3. Other research findings demonstrate that personality traits are

essentially steady and fixed after age 30 (McCrae & Costa, 1994). However, the meta-analytic findings show that rank-order steadiness reaches its highest point some time after age 50, but to a very modest extent. Furthermore, traits such as agreeableness and conscientiousness evolve from age 30 and become static before age 50 (McCrae, Ostendorf, Angleitner & Hrebickova, 2000). In the society of South Africa, children at pre-and primary schools; teenagers at high schools and institutions of tertiary education; and adults at companies, firms, and enterprises or in workplace, should be taught by objectives. Knowledge imparted to them should aim to achieve a particular goal to ensure that their personalities match the personality traits required in this society to be a successful entrepreneur. To achieve that ideological goal, the members of the sample should be placed in practical situations where they will have to think, act and react in a conscientious and agreeable manner towards one another. The behaviour and reactions should be demonstrated, taught and explained to the learners. Furthermore, they should be corrected if they react and behave inappropriately or not according to what conscientiousness and agreeableness advocate. These actions will have to be done repetitively over a certain period until the members of the sample will become conscientious and agreeable over a wide spectrum of issues relating to people. Apprenticeships should be in phases: from age 3 to age 24; between 24 and age 30; and lastly, between 34 and age 50. Knowledge imparted should stress development of characteristics such as: willingness to accommodate others; ability to gain acceptance among peers; ability to control anger and control emotions during interpersonal conflicts; and pro-social behaviour/self-control and an ability to pay attention during infancy and childhood; dedicated attention in adulthood; willingness to obey authority and conform to group norms; and positive engagement within task-related endeavors through innovative or active methods such as business/computer game simulations (Hindle & Cutting, 2002); video and films (Verduyn, Wakkee & Kleijn, 2009); role models or guest speakers (Hegarty, 2006); games and competition; settings of real small business ventures; workshops and presentations (Keogh & Galloway, 2004).

Previous research done by Wardekker (2005) in Critical theory of education and personality formation stated that: personality formation can be achieved through education. Developing children in a peculiar society should be aim-oriented. Knowledge conveyed to them should have a particular goal to make sure that they are not misfits, but rather interpret and identify themselves appropriately in their own cultural environment. The objective or goal of that knowledge embodies the values of a society where an ideology is promoted depending on the extent to which limited influence is exerted by one culture over other cultures in a country (Wardekker, 2005).

CONCLUSION

The purpose of this study was to determine the co-effect of culture and personality traits on the business success of South African entrepreneurs. The results revealed that it has a moderate, but significant effect on business success. Operating within a mixed positional-individualistic culture requires personality traits of conscientiousness, agreeableness and openness to experience. In conclusion, support was found that business success is dependent on both personality traits and the culture in which entrepreneurs function.

AN EXPLORATORY STUDY OF CONSUMER BEHAVIOR IN DIFFERENT RETAIL FORMATS IN INDIA

Hemantkumar P. Bulsara and Kshitij G. Trivedi
Sardar Vallabhbhai National Institute of Technology, India

ABSTRACT

Although the Indian Retail is dominated by the Unorganized format of retail, this paper guides through the different retail formats presently operates in India and their behavior on the consumers towards their purchasing pattern and different factors that lead to their selection of their retail formats in India based on the different reviews that have been gathered. As the policies regarding the FDI in India has been passed by the Government of India the retailing in India would reach an another level by the entry of multinational brands in India, It also attempts to identify what role different technology, channel of purchase plays in the buying behavior of the consumers play while selecting the different retail formats. An attempt has also been made to find the variables that can be identified to develop a co – existence model between the organized and unorganized forms of retail formats for sustaining in the Indian broader markets with quality, product choice, and brand affecting the buyers.

INTRODUCTION

The Indian consumers are evolving rapidly and are towards the acceptance and in search of new retail formats. The retail industry is divided into organized (8%) and unorganized (92%) formats as show in the figure below. As the Indian government has introduced the FDI in Single and Multiple Brands in India, there would be an inflow of different foreign retailers in India along with their brands that can directly be placed in the Indian markets. Retail industry in India stands at \$390 billion and organized retail is fast catching up. Over 12 million outlets operate in the country and only 4% of them being larger than 500 sq ft in size (Pandya & Bariya, 2012, p. 7). India's vast middle class and its almost untapped retail industry are key attractions for global retail giants wanting to enter newer markets (Khidir, 2011, p. 7).

Figure 6 Retail format distribution in India (Source: IBEF website, 2012)

With the fact that the consumer needs and buying behavior are very different for each other within cities (Gokhale & Sinha, 2012, P. 7) they are no longer shopping from the local market; rather the place of shopping has shifted to the stores in malls (Jhamb & Kiran, 2012, p. 7). In recent times rural retailing is witnessing explorations by both corporate houses and entrepreneurs – ITC's Choupal Sagar, HLL's project Shakthi and Mahamaza M & M Shubh Labh stores, Escorts rural stores, Tata Kisan Sansar, and Warnabazaar, Maharashtra are some of the models being tried out. Thus there lies a huge potential in tapping

the rural retail market (Sinha & Kar, 2007, p. 8). In the Figure below, it is observed that we have classified the different format that the consumers prefer in the term of Traditional v/s Modern and Organized and Unorganized format. Domestic retailers are already on the move in rural India, with innovative chain retailing models that have been well-received by rural communities, engaging local farmers and enterprises successfully. One example is Hariyali Kisaan Bazaar, one of the largest national rural retail chains in India, which operates 290 locations, including 20 opened in 2011 alone (Devonshire-Ellis, Tse, Shira & Associates, 2012, p. 8).

Figure 2: Consumer Perception towards Organized Vs. Unorganized & Modern Vs. Traditional

With this initiative it will become a great deal of study in the field of consumer behavior, their choice of the product, channel and the brand that they would prefer. The new line of consumers would also include the buyers and users who prefer the electronic channel like Websites, Online purchase, online services, etc. as this channel is more appropriate as it saves time and is more convenience as compared to the traditional way of purchasing. In the AT Kearney GRDI report (2009 – 2012) [Table 1] it can be observed that India is a very prospectus country for the Global retailers to invest in the country through the DFI policies. Also it will benefit the local players to tap the rural markets with the best quality, so first initiative was taken in 2007 by Wal-Mart, who announced an agreement with Bharti to establish a joint venture, Bharti Wal-Mart Private Limited, for wholesale cash-and-carry operations in India. Other Global Retail eying Indian Markets are Carrefour, Metro MG to invest in India with “cash and carry Wholesale markets” with integration with the policies and the regulations of the sector.

Table 1 : GRDI ranking & parameters – INDIA

Year	Rank	Country Risk	Market Attractiveness	Market Saturation	Time Pressure	GRDI Score
2009	1	54.0	34	86	97	68.0
2010	3	51.3	35.4	62.2	97.8	61.7
2011	4	59.9	28.9	63.1	100	63.0
2012	5	66.7	31.0	57.6	87.9	60.8

LITERATURE REVIEW

Title	Author	Contribution in study
A study on consumer behaviour of organized and Unorganized retail outlets in Vadodara city	(Pandya & Bariya, 2012, p. 8)	The choice of the purchase is determined by the type of product they purchase and that determines their retail format choice.
Impact of Organized Food Retail on Customer Buying Behaviour in India	(Bandyopadhyaya & Sengupta, 2013, p. 7)	There can be shift in preference for organized shops based on better quality, choice, availability this increase preference for organized shops.
A study of consumer behaviour in Malls vis-à-vis Mom & Pop shops	(Shah, 2009, p. 8)	To understand the behavior, perception, shopping experience in context of buying tactics, shopping priority and experience of malls v/s mom-&-pop

		shops.
Next-Generation Retailing In India: An Empirical Study Using Factor Analysis	(Dash, 2011, p. 7)	To study “Next- Generation Retailing” and describes its characteristic features by using factor analysis to focuses on the advantages of Next Generation Retailers in the Indian context.
Effect of Situational Factors on Store Format Choice Behaviour in Food and Grocery Retailing In India - Multiple Discriminant Analysis	(Cherukuri, 2010, p 7)	Examine the impact of situational factors such as task definition, perceived risk, physical surroundings, social surroundings and Temporal aspects on retail format choice decisions relating to kirana stores, convenience Stores supermarkets and hypermarkets in the fast growing retailing in India.
Consumer Behaviour In Selecting Retail Format: The Perspective Of Theory Of Planned Behaviour	(Ardhanari, et al, 013, p. 7)	Understand the factors that motivate the behavior in which social status becomes the background of the consumer behavior through implementation of the Theory of Planned Behavior to explore consumer behavior in selecting retail format at shopping can be conducted.
Impact of Attributes of Store Format on the Choice Behaviour in Organized Retail Sector	(Singh, 2012, p. 8)	The study identifies that shopper’s education, occupation and income levels also are the major determinants for type of food and grocery retail outlets. The customers visiting organized food and grocery stores are status and quality conscious they always look for the benefits of shopping in a store in terms of self- selection, variety, comparison of brands and discounts available and value for the money.
Drives of retail shopping : An Exploratory study	(Mohanty, 2012, p. 8)	The present paper aims at evaluating the consumers’ attitude towards nearby market, big bazaars and shopping malls and to analyze the related reasons age wise, education wise and income wise.
Would Indian consumers move from kirana stores to organized retailers when shopping for groceries?	(Goswami & Mishra, 2009, p. 7)	Customer perceptions of grocery store attributes differ for kirana stores and organized retailers positively related to location, helpful, trustworthy salespeople, home shopping, cleanliness, offers, quality and negatively related to travel convenience
Determinants of Retail Selection Decision in Malaysia	(Wel, Hussin & Omar, 2011, p. 8)	Mentioned that shopping trends have shifted from standalone traditional grocery outlets and department stores to hypermarkets and shopping malls.
Retailing research: Past, present, and future	(Grewal & Levy , 2007, p. 7)	To study the performance in a technology-based environment, which track and observe actual movement or perhaps determine actual usage and consumption which can be classified into ten broad topic categories: price, promotion, brand/product, service, loyalty, consumer behavior, channel, organizational, Internet
Mall shopping behavior of Indian small town consumers	(Khare, 2011, p. 7)	This study specifically focuses on exploring the differences across age and gender groups. Consumers’ gender and age play an important role in determining their attitude towards shopping in malls with attributes such as de’ cor, layout, services, variety of stores, and entertainment facilities must be considered while planning malls in smaller cities. The mall shopping behavior of metropolitan city shoppers should not be generalized with that of shoppers in smaller cities.

Retailing in India: A Critical Assessment	(Joseph & Soundararajan, 2009, p. 7)	In terms of the shopping behavior traditional outlets are preferred as consumers can bargain along with proximity to residence, goodwill, credit availability, bargaining, choice of loose items, Easy timings, home delivery, etc.
---	--------------------------------------	---

RETAIL SCENARIO IN INDIA

As FICCI report says (2012), the Indian retail sector accounts for over 20% of the country's gross domestic product (GDP) and contributes 8% to total employment (p. 7). Many of the big retailers have forayed into the on-line mode without much success. This clearly indicates the huge gap between the retail setup between India and other developed countries (India retail blitz, A T Kearny, p. 7). As described by Gupta (2012), with the changing retail scenario the consumers are bound to look beyond traditional retail stores towards organized outlets may be with some reservations (p. 7). Organized retailing, absent in most rural and small towns of India in 2010, refers to trading activities undertaken by licensed retailers, that is, those who are registered for sales tax, income tax, etc. These include the publicly-traded supermarkets, corporate backed hypermarkets and retail chains, and also the privately owned large retail businesses. Majority of the Indian Consumer who are more focused towards retail purchase, is in the hands on Unorganized retailers as compared to Organized Retail chain, but the young generation population which are in their mid-30's which are considered to be the most potential segment to conquer the Indian markets needs to be taken care by the new global retailers.

Unorganized retail format

Unorganized retail trade enterprises, we mean all those local kirana & general shops, family managed – Own Account trade enterprises (Mom-Pop shops), registered under the Shops and Establishment Act (s), administered by the local authorities. The other of retailers include small shops such as tiny grocery and vegetable shops run from a room of a house, kiosks (often selling a variety of items, like small toothpaste tubes, tooth brushes, soaps, pouches of shampoo, etc.), way-side vendors, and hand carts operating without any licenses. As explained by Kalyanasundaram (2012), most Indian shopping takes place in open markets or millions of small, independent grocery and retail shops. Shoppers typically stand outside the retail shop, ask for what they want, and cannot pick or examine a product from the shelf. Access to the shelf or product storage area is limited (p. 7). The unorganized retail shops typically offer no after-sales support or service. Finally, most transactions at unorganized retail shops are done with cash, with all sales being final.

Organized retail format

The first category retailers comprise traders who possess legal permissions or licenses to undertake the activity, are registered with sales tax/VAT, etc. Such enterprises are supermarkets, hypermarkets, retail chains, and also the privately-owned large retail businesses. Following are the type of organized retail format present in India. Organized retailers are initiating measures such as tracking of consumer behavior and consumer loyalty programmes to retain their market share (Mukherjee & Patel, 2005, p. 8). Significant development has been taking place in urban areas in the form of organized retailing like Mega stores or Malls, in southern parts of the country particularly in Bangalore, Chennai and Hyderabad, as well as New Delhi and Mumbai in the North. It is expected that the tier II cities would take another five years to absorb modern retailing opportunities (Ramappa et al., 2012, p. 8).

Table 2: Different Organized Retailers in India and their formats

Organized retailers	Stores / Formats
Future Group	Big Bazaar, Food Bazaar, Pantaloons, Central, Brand Factory, E – Zone.
RP – Sanjiv Goenka Group	Spencer's.
The TATA Group	Westside, Star Bazaar, Croma.
Reliance Retail	Mart, Super, Fresh, Footprint, Living, Digital, Jewelry, Trends.
K Raheja Corp Group	Shoppers Stop, Crossword, Hyper City.

Aditya Birla Group	More

Online buyers (e – retailers)

As mentioned in India Internet outlook (2013), India now has 3rd largest Internet population in the world with about 150 million Internet users after China (at 575m) and the US (at 275m). At 150 million total Internet users, the Internet penetration in India remains at 12 per cent vs. 43 per cent in China and 80 per cent in the US. India's retail sector has undergone several technology evolutions to enable retailers to increase efficiency, improve customer service and become more competitive. Online sales accounted for less than 1 percent of all retail sales in India in 2012, even though a large number of diverse online retailers exist (ystats.com, 2012, p. 7). Boston Consulting Group (2012) estimated that the retail sales were \$ 471 billion with 7 percent share for the organized retail (\$ 34 billion) in 2011. It also shows that by 2020 the size of the organized retail to be around \$ 260 billion with a penetration of 21 percent. Industry estimates suggest that 56% of the country's online shoppers came from tier-II cities and towns in 2012. As per Eroglu, Machleitb & Davis (2001), the retail market is difficult to predict, consumers are evolving, and retailers are expanding operations, further driving the need for IT adoption. The consumer point of view, online shopping offers convenience, value and hedonic consumption possibilities (p. 7). CRM, Supply Chain, Payment Solutions and Security are the key drivers that are looked upon by any e retailers to provide the effective use of their online services.

FUTURE SCOPE OF STUDY

The Indian retail Industry is on a verge of a new Retail forms that are about to take place in terms of FDI investing in India. These global players will be able to adopt the different shopping behaviour in Rural and Urban population Variables namely income, age, technology, social, cross culture consumer across India with a wider sampling and heterogeneous groups. As the study focuses on the different broad concepts of retail formats it becomes very effective and necessary to study whether these formats are acceptable by the consumers markets, so it becomes very necessary to develop a customer profiling model using the Demographic and Sociological factors to study consumption pattern in determining retail format choice by keeping the perceived risk variables into consideration as the consumers are more inclined towards the risk factors involved during buying. There is also the scope in the study of the location of the organized mall that are required to be setup as the consumers prefer the location as the most important factor in buying from a retail outlet, this in return also implies that what type of the product the consumers purchase will determine the type of retail outlet it prefer. The largest scope in study of the retail format resides in the lower income, dwellings, education and locality like towns and villages consumers whether they are willing and ready to accept the different format and the channel of retail in India by studying their behaviour through different consumer perception, attitude. To propose a co-existence model for both Unorganized and Organized type of retail format in India, this in return will benefit the overall performance of different retail players. Due to development of the technology nay factors are need to be adding these technological transformation, channel selection of retail can be understood by applying the Technology Acceptance Model (TAM) on the consumer behaviour.

Proposed Research Framework

The main objective is to identify the impact of the FDI and the current situation of different retail formats in India. It also studies how the development of the different retail formats especially the organized retail format and the online retailer's buyers who prefer these channels of purchase. What are the important factors that the consumer seeks into the type of the retail format they select to purchase or shop from it? It also attempts to identify the consumer behavior in this changing retail scenario. How the technology will changed the way these retail formats are need to be organized in the country like India. It would be important to study that how the product plays an important role in selecting the retail channel and how the consumers look beyond the traditional pattern of purchase for a significant shift towards an organized retail format for better price, quality, choice, variety. To have a new set of variables those are important in coexistence as they fulfill different needs and serve different clientele. That will help the small as well as the bigger player along with the customers to have a wider contribution in the development of the economy and employment of the country. So looking at the Indian markets and their consumers, we need to apply the integrated approach towards different concepts of the consumer Behavior to understand the way in which they interpret the retail

format and their different channel of purchase also how the perceived risk has interdependency among behavior and formats in India which can be as follows:

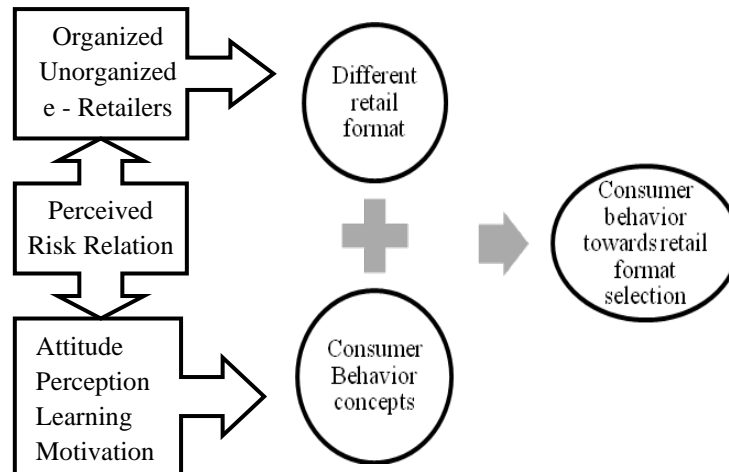

Figure 3: A Proposed Research framework for retail format, perceived risk and consumer behavior concepts

CONCLUSION

Looking at the Indian Consumers, they are more inclined towards the unorganized retail format due to demographic, sociological factors like education, religious belief, type of purchase, the type of product they utilize, their daily requirement and technology in terms of the channel they select to purchase and buy. The Indian retail experience has gone beyond the traditional store and includes numerous touch points such as online stores, social networks, call centers, etc. As the inception of the FDI into the Indian markets have boosted the Indian local players to be more focus in their quality, preferences along with factors about how the system should be developed and implemented which should have parameters like Trust, Security, data and privacy of these data can be effectively preserved during the transaction through online format.

GREEN MARKETING IN INDIA: AN EXPLORATORY STUDY

Hemantkumar P. Bulsara, S V National Institute of Technology, India
Manita Matharu, Amity University, India

ABSTRACT

One business area where environmental issues have received a great deal of discussion in the popular and professional press is marketing. Terms like "Green Marketing" and "Environmental marketing" appear frequently in the popular press. Many governments around the world have also become so concerned about green marketing activities. Attention was drawn to the subject in late 1970's when the American Marketing Association organized a workshop on Ecological Marketing in 1975. Green Marketing has been an important academic research topic since its inception. But at the same time one of the biggest problems with the green marketing area is that there has been little attempt to academically examine environmental or green marketing. Although environmental issues influence all human activities, few academic disciplines have integrated green issues into their literature. This paper attempts to examine the concept and evolution of green marketing, identify what makes marketing green. An attempt has also been made to discuss some examples of green marketing practices in Indian context and ascertain the ways to improve consumer appeal for environmentally preferable products through different marketing strategies.

INTRODUCTION

Environmental marketing has been defined in terms of customer satisfaction in a sustainable fashion which refers as 'the holistic management process responsible for identifying, anticipating, and satisfying the requirements of the consumers and society, in profitable and sustainable way' (Peattie, 1999, p.7). Investopedia explains 'Green Marketing' as; Green marketing companies seek to go above and beyond traditional marketing by promoting environmental core values in the hope that consumers will associate these values with their company or brand. Engaging in these sustainable activities can lead to creating a new product line that caters to a new target market. Also known as sustainable marketing, environmental marketing or ecological marketing, refers to an organizations effort at designing, promoting, pricing and distributing products that will not harm the environment (Pride & Ferrell, 1993, p. 8). Green marketing has been defined as all activities designed to generate and facilitate any exchanges intended to satisfy human needs or wants, such that the satisfaction of these needs and wants occurs, with minimal detrimental impact on the natural environment. (Polonsky, 1994, p. 7)

Although an agreed upon definition of GREEN does not exist, a focus on GREEN is generally considered as a holistic effort to reduce the impact of resource use while making products or delivering services that won't harm people or the planet. (Carlson, p. 7) Green marketing that has been previously and primarily focused on the ecological context has been shifted to more sustainability issues in the marketing efforts and main focus now is in socio-economic and environmental context. Whereas, green market is identified as a part of market segments based on the greenness' of the consumer (Simintiras et al., 1994, p. 8). The term green marketing refers to the strategies to promote products by employing environmental claims either about their attributes or about the systems, policies and processes of the firms that manufacture or sell them (Prakash, 2002, p. 7). Clearly, green marketing is part and parcel of the overall corporate strategy (Menon & Menon, 1997, p. 8). Along with manipulating the traditional marketing mix (product, price, place and promotion), it requires an understanding of public policy processes. Green marketing also ties closely with issues of industrial ecology and environmental sustainability such as extended producers and resource flows, and eco-efficiency (Prakash, 2002, p.7).

EVOLUTION OF GREEN MARKETING

The concept of green marketing has been around at least since the first Earth Day in 1970. But the idea did not catch on until the 1980s, when rising public interest in the environment led to a demand for more green products and services. Manufacturers responded to public interest by labeling hundreds of new products "environmentally friendly"—making claims that products were biodegradable, compostable, energy efficient, or the like. The term Green Marketing came into prominence in the late 1980s and early 1990s. The American Marketing Association (AMA) held the first workshop on "Ecological Marketing" in 1975. The proceedings of this workshop resulted in one of the first books on green marketing entitled "Ecological Marketing". In 1992, the Federal Trade Commission (FTC) stepped in to prevent further deception. The FTC created guidelines for the use of environmental marketing claims such as "recyclable," "biodegradable," "compostable," and the like. The FTC and the U.S. Environmental Protection Agency defined "environmentally preferable products" as products and services that have a lesser or reduced effect on human health and the environment when compared to other products and services that serve the same purpose. The label "environmentally preferable" considers how raw materials are acquired, produced, manufactured, packaged, distributed, reused, operated, maintained, or how the product or service is disposed. During the late 1990s, green marketing received a large boost when President Bill Clinton issued executive orders directing federal offices to purchase recycled and environmentally preferable products. Some industries adopted similar policies. Examples of environmentally-beneficial products and services:

- Paper containing post-consumer wastepaper
- Cereals sold without excess packaging
- Shade-grown coffee beans
- Cleaning supplies that do not harm humans or environment
- Wood harvested from sustainable forests
- Energy-efficient light bulbs
- Energy-efficient cars
- Energy from renewable sources of energy such as windmills and solar power

Today, special labels help the public identify legitimate environmentally preferable products and services. Several environmental groups evaluate and certify products and services that meet FTC standards—or their own tougher standards. One popular product that has received certification is shade-grown coffee, an alternative to coffee beans that are grown on deforested land in the tropics. Green marketing is a way to use the environmental benefits of a product or service to promote sales. Many consumers will choose products that do not damage the environment over less environmentally friendly products, even if they cost more. With green marketing, advertisers focus on environmental benefits to sell products such as biodegradable diapers, energy-efficient light bulbs, and environmentally safe detergents. (Ottoman, Jacquelyn, Miller & Edmond, 1999, p7). Though green marketing has in recent years received considerable attention from both marketing practitioners and academicians, it has existed for decades and has been practised by business firms without having been formally termed and recognized as such (Kuhre, 1997, p. 7). The green marketing has evolved over a period of time. The evolution of green marketing has three phases: The first phase was known as "Ecological" green marketing, and during this period all marketing activities were concerned to help environment problems and provide remedies for environmental problems. The second phase was "Environmental" green marketing and the focus shifted on clean technology that involved designing of innovative new products, which take care of pollution and waste issues. The third phase was "Sustainable" green marketing. It came into prominence in the late 1990s and early 2000. This was the result of the term sustainable development which is defined as "meeting the needs of the present without compromising the ability of future generations to meet their own needs." (Peattie 2001, p.129).

REVIEW OF LITERATURE

The green awareness began in between of the 1960s and early 1970s with increasing concern about the negative impact of consumption pattern, impact of economic and population growth on the environment (Cohen, 2001, p. 7). The concept of green marketing 'is the business practice that considers consumers concerns with regards to preservation and conservation of the natural environment (Coddington, 1993, p. 7). Green marketing practices generally promoted as the genuine concern for the nature of inputs as well as outputs waste reduction and the impact of these upon the environment and society as a whole both in present & future conditions (Walker and Hanson, 1998). Green marketing that has been previously and primarily focused on the ecological context has been shifted to more sustainability issues in the marketing efforts and main focus now is in socio-economic and environmental context. Whereas, green market is identified as a

part of market segments based on the greenness of the consumer (Charter et al., 2002; Simintiras et al., 1994).

It is difficult to find an industry that does not harm the environment 100%. But there are some products that can be called "environment friendly", if these products aim at limiting the environmental negative effects (Hindle et al., Pujari & Wright, 1993, 1996, p. 7, 8). Gura'u, & Ranchhod (2005) compared between six British companies and six Romanian companies with regard to presentation of environment friendly products. They found that the Romanian companies concentrate in presenting their products on asking for help of foreign mediators, in the contrast British companies which their trademarks and concentrate on distribution of their products. This study is concentrated on four green marketing elements (product, pricing, distribution and promotion) (p. 8). Green marketing research has come a long way since then, indicating a growing consciousness among the consumers about the environment in developed part of the world like USA and Western Europe (Curlo, 1999, p.37). Research in the last decade (Lee, 2009; Rahbar & Wahid, 2011; Lee, 2008; D Souza, 2004) has further pointed out that purchasers of goods and services are aware and are willing to pay more to "go green". Nevertheless not much research on these lines has been done in developing countries like India (Bhattacharya, 2011).

SEGMENTATION AND MARKETING MIX IN GREEN MARKETING

It has been identified that the segmentation for companies and for consumers. According to Ginsberg and Bloom (2004), Companies can be classified on the basis of utilization of these elements companies can classify in four categories:

1. Lean Green- These companies adopt the green practices but they do not focus to publicize these initiatives. They implement the environment friendly practices just for the cost reduction & improve the efficiency.
2. Defensive Green- This kind of marketer use green marketing as a precaution to avoid the crisis situation or to counter the competition. They use green marketing to create the positive brand image. Environment initiatives may be sincere but temporary just to differentiate from the competitors.
3. Shaded Green- The companies those adopt shaded green strategy invest in long-term, environmentally friendly processes that require a significant financial and nonfinancial dedication. They differentiate their product on the basis of greenness.
4. Extreme Green- Extreme green adopt green marketing mix in the holistic manner. They integrate environmental concern in overall marketing strategy. The greenness is the main driving force for the companies. Concept of life cycle assessment, total environmental quality management, waste reduction, and environment friendly promotion deeply embedded in the company philosophy. They serve the niche segment of the market.

According to a study by Roper (2002), 58% of U.S. consumers try to save electricity at home, 46% recycle newspapers, 45% return bottles or cans and 23% buy products made from, or packaged in, recycled materials. So it is clear that some consumers already demonstrate sporadic green sentiments in their habits and purchasing behavior. Understanding the target consumer will help marketers to know whether "greenness" is an appropriate selling attribute and how it should be incorporated into the marketing mix. To respond to consumers' varying degrees of environmental concern, marketers can segment the market into different shades of green. The Roper survey divides consumers into the following groups:

1. True Blue Greens (9%): True Blues have strong environmental values and take it upon themselves to try to effect positive change. They are over four times more likely to avoid products made by companies that are not environmentally conscious.
2. Greenback Greens (6%): Greenbacks differ from True Blues in that they do not take the time to be politically active. But they are more willing than the average consumer to purchase environmentally friendly products.
3. Sprouts (31%): Sprouts believe in environmental causes in theory but not in practice. Sprouts will rarely buy a green product if it means spending more, but they are capable of going either way and can be persuaded to buy green if appealed to appropriately.
4. Grousers (19%): Grousers tend to be uneducated about environmental issues and cynical about their ability to effect change. They believe that green products cost too much and do not perform as well as the competition.
5. Basic Browns (33%): Basic Browns are caught up with day-to-day concerns and do not are about environmental and social issues. (Roper, 2002, p. 8)

According to Al-Bakry (2007), the elements identified of the green marketing mix are:

- 1- The green products: Green products are products that respond to environment needs and requirements. As the customer's needs are necessary to improve and develop products, the customer needs in an environment more safe and healthy are also important and should be considered.
- 2- The green pricing: The green pricing refers to the price specified in the light of company's policies with regard to environmental consideration imposed by rules and company instructions or its initiatives in this regard.
- 3- The green distribution: This is related to distribution gates use that deal with green products, which are appropriate for consumers, in terms of facilitating their delivery, and to secure cycling procedures conducting within environmental conditions and requirements.
- 4- The green promotion: This refers to providing real information about the products in a way that does not hurt the materialistic and moral consumers' interests (p. 7)

Therefore, it has been analyzed that Green Marketing takes a special effort and a different approach as how to Appeal to Green Consumers. Since 1989, Jacquelyn Ottman, a green marketing pioneer, adviser to the Fortune 500 and acknowledged guru of all things green, has been tracking the transition of the green consumer from fringe to now mainstream. In her new book, which is sure to become the go-to resource guide on the topic, Ottman (2008), reveals what it takes to succeed in this new green marketplace, providing insight into the specific needs of today's mainstream consumers, and how companies large and small have responded with fresh green marketing strategies (p. 7). Five Simple Rules of Green Marketing:

1. Know your customer
2. Empower consumers
3. Be transparent
4. Reassure the buyer
5. Consider your pricing (Ottman, 2008, p. 7)

TOP 10 GREEN BRANDS & GREEN INDIAN COMPANIES

According to the 2011 Green Brands survey, findings emphasize that brands must not only develop environmental strategies to address their environmental impact, but they must also connect with consumers in a compelling and relevant way on a market-by-market basis. Today, being only eco-friendly is not enough—brands should be both green and consumer-friendly, and only this can help them win big India:

Top 10 Green brands in India:

1. Amul
2. Dabur
3. Infosys
4. Taj hotels
5. Britannia
6. Suzlon
7. Hindustan Unilever
8. Wipro
9. Maruti
10. Godrej Consumer Products

The Top 10 Green Indian Companies:

Suzlon Energy - The world's fourth largest wind-turbine maker is among the greenest and best Indian companies in India. Tulsi Tanti, the visionary behind Suzlon, convinced the world that wind is the energy of the future and built his factory in Pondicherry to run entirely on wind power. Suzlon's corporate building is the most energy-efficient building ever built in India.

ITC Limited - ITC strengthened their commitment to green technologies by introducing 'ozone-treated elemental chlorine free' bleaching technology for the first time in India. The result is an entire new range of top green products and solutions: the environmentally friendly multi-purpose paper that is less polluting than its traditional counterpart.

Tata Metaliks Limited (TML) - Every day is Environment Day at TML, one of the top green firms in India. A practical example that made everyone sit up and take notice is the company's policy to discourage working on Saturdays at the corporate office. Lights are also switched off during the day with the entire office depending on sunlight.

Tamil Nadu Newsprint and Papers Limited (TNPL) - Adjudged the best performer in the 2009-2010 Green Business Survey, TNPL was awarded the Green Business Leadership Award in the Pulp and Paper Sector.

Wipro Technologies - The list of top 10 green Indian companies is never complete without Wipro which climbed to the top five brand league in Greenpeace's 'Guide to Greener Electronics' ranking. Despite the global financial crisis, Wipro held fast to its commitment towards energy efficiency and was lauded for launching energy star compliant products in the market.

HCL Technologies - This IT major may be considered as the icon of Indian green initiatives, thanks to the "go green" steps taken in solving the problem of toxics and e-waste in the electronics industry. HCL is committed to phasing out the hazardous vinyl plastic and Brominated Flame Retardants from its products and has called for a Restriction on Hazardous Substances (RoHS) legislation in India.

Oil and Natural Gas Company (ONGC) - India's largest oil producer, ONGC, is all set to lead the list of top 10 green Indian companies with energy-efficient, green crematoriums that will soon replace the traditional wooden pyre across the country. ONGC's Mokshada Green Cremation initiative will save 60 to 70% of wood and a fourth of the burning time per cremation.

IndusInd Bank - Green banking has been catching up as among the top Indian green initiatives ever since IndusInd opened the country's first solar-powered ATM and pioneered an eco-savvy change in the Indian banking sector. The bank is planning for more such initiatives in addressing the challenges of climate change.

IDEA Cellular - One of the best Indian companies, IDEA, paints India green with its national 'Use Mobile, Save Paper' campaign. The company had organized Green Pledge campaigns at Indian cities where thousands came forward and pledged to save paper and trees. IDEA has also set up bus shelters with potted plants and tendril climbers to convey the green message.

Hero Honda Motors - Hero Honda is one of the largest two-wheeler manufacturers in India and an equally responsible top green firm in India. The company's philosophy of continuous innovation in green products and solutions has played a key role in striking the right balance between business, mankind and nature.

India's First Eco-Friendly Green Stadium

Thyagaraj Stadium, constructed for the Commonwealth Games in New Delhi has been tagged as India's first ever energy-efficient stadium. This majestic structure stands in the heart of the very quiet residential colony behind the famous INA market of Delhi. It has been built using the latest green building technology and energy-efficient construction material such as fly-ash bricks.

India's First Green Railway station

Railways has inaugurated India's first green station at Manwal on the Jammu-Udhampur rail route. With the tiny station facing frequent power cuts, it has been provided a supply of solar power. The lighting and fans are working on solar power. The state electric supply is a standby source, which can be used in case of any failure of solar system.

Eco-friendly Buildings

The Indian Green Building Council (IGBC), one of the only two organisations that certify buildings on green quotient defines it as "one which uses less water, optimises energy efficiency, conserves natural resources, generates less waste and provides healthier spaces for occupants, as compared to a conventional building." The Green Rating for Integrated Habitat Assessment (GRIHA) of The Energy and Resource Institute (TERI), the second of the two organizations, that gives green certification has certified seven buildings in Gurgaon.

Indian Oil's Green Agenda

As an active partner of the Global Compact Programme of the United Nations, Indian Oil is fully Focused on "sustainable development." As a dominant player, the Corporation recognizes protection of environment as a core commitment of its business. As part of this commitment, all operating units and installations of Indian Oil have a comprehensive safety, health & environment management system in place. The facilities are periodically reviewed and upgraded from time to time for better performance.

Green Fuel alternatives

In the country's pursuit of alternative sources of energy, Indian Oil is focusing on CNG (compressed natural gas), Auto gas (LPG), ethanol blended petrol, bio-diesel, and Hydrogen energy.

Agartala to be Northeast India's First Solar city

Tripura has planned to make all public and private vehicles in Agartala run on compressed natural gas (CNG) by 2013, thus making the capital "India's first green city". Tripura Natural Gas Co (TNGCL) — a joint venture of the Gas Authority of India Ltd (GAIL) and the Tripura and Assam governments—has undertaken a project to supply CNG to all private and government vehicles. CNG will also be available to those now using electricity, petrol and diesel to run various machineries.

Green rickshaws

Power distribution company BYPL has agreed to set up ports for charging eco-friendly rickshaws that will be powered by batteries and will soon be introduced in East and Central Delhi. The company signed an agreement with the HBL Soleckshaw Pedi Cab, makers of the eco friendly-rickshaws, offering to set up infrastructure that will be needed for charging the batteries of these rickshaws. According to a BYPL spokesperson, the Pedi Cabs can play at the maximum speed of 30 km per hour, are run on battery, do not emit any smoke or cause noise pollution. These rickshaws have been designed and promoted by Council of Scientific and Industrial Research (CSIR) through one of its national research and development laboratory, the Central Mechanical Engineering Research Institute (CMERI).

FUTURE SCOPE OF STUDY & CONCLUSION

Green Marketers need to Promote “Added Value”. As green products have begun to rival their “brown” counterparts in quality and ubiquity, savvy marketers have moved beyond targeting “deep green” consumers with a “save the planet” pitch. Instead, they appeal to today’s newly mainstream consumers by promoting the added value their products provide: better health, superior performance, good taste, cost- effectiveness—and even status. (Menone, 2011, p. 7) The present study opens a lot of scope for future research in the area of Green marketing as to how much practice of the concept of ‘green’ is in Indian companies. It can be identified that the companies incorporating green in the segmentation and design green marketing mix to the consumers and thereby in their corporate social responsibility programs. The study of consumers’ perception towards such practices also requires researcher’s attention. Further, this study opens the scope of research how companies can create competitive edge.

CONSUMERS' BEHAVIOR FOR USING SMART PHONE APPS

**Yu Chao,
Chung Hua University, Taiwan**

ABSTRACT

Smart phone users are expected to exceed one billion in the world by 2013. Using smart phone has become a part of human's daily life. The purpose of this research is to study smart phone users' behavior intention and use behavior of selected applications. The author measured actual usage behavior of mobile applications in an empirical study of 342 Taiwanese smart phone users. An online survey was deployed for collecting data to test the Unified Theory of Acceptance and Use of Technology (UTAUT) model and explaining behavior intention to use behavior. This study proves the UTAUT model could measure smart phone mobile applications as a generic concept by using partial least squares (PLS) techniques. The adoption of mobile application is influenced by consumers' performance expectancy, effort expectancy, social influence, facilitating conditions, hedonic motivation, price value and habit.

INTRODUCTION

Smart phone users are expected to exceed one billion in the world by 2013. Using smart phone has become a part of human's daily life. Smart phone entered the market so quickly, in addition to the progress of 3C products, but also it has many powerful features as well as convenience, all-encompassing applications, those will be free downloaded and provide consumer choice (Xu et al. 2011). The smart phones entry-level sales jumped 500 percent year-on-year in Taiwan last year (Jiang & Huang, 2013). Since Apple launched the smart phone – iPhone on June in 2007 those are accumulated \$150 billion sales revenue for Apple. And the Apple store has driven a new business model of mobile applications (Chen, 2012). Apple's App Store has accumulated more than 15 billion apps on July 7, 2011 (Wikipedia, 2013). Android market is the proportion of free applications the highest for a market. The download numbers of applications are more than 30 billion since Apple store operation. There are 600 thousands download numbers of applications on Google Play. The overall download numbers are exceeded 20 billion (Chen, 2012).

The purpose of this research is to study smart phone apps users' behavior intention and use behavior of selected applications. This study tries to find out what drives the behavior intention and use behavior of smart phone mobile applications in Taiwan.

The remains of this study are organized as follows. Section 2 introduces literatures reviews. The methodology is presented in section 3. Results are carried out in section 4. The conclusions are described in the last section.

LITERATURE REVIEW

The unified theory of acceptance and use of technology (UTAUT) comes together Innovation Diffusion Theory (IDT), Theory of Reasoned Action (TRA), Theory of Planned Behavior (TPB), Social Cognitive Theory (SCT), Technology Acceptance Model (TAM), Model of PC Utilization (MPCU), Motivational Model (MM) and Combined TAM and TPB (C-TAM-TPB) to give a useful instrument for managers to recognize the drivers of technology acceptance (Venkatesh et al. 2003). The UTAUT model consolidates previous TAM related studies. There are many researches deployed the UTAUT model to examine users' behavior in using course management software (Marchewka et al., 2007), adoption of mobile devices/services (Carlsson et al., 2006), citizens acceptance for e-government services (Alshehri 2013), students' adoptions and attitudes towards electronic placement tests (Tan 2013) etc.

For examining several sources of data on smart phone use, Oulasvirta et al. (2012) used the controlled field experiment to check smart phone users' habits. There are several findings in their study:

1. Brief usage sessions repeating over time, or "checking behaviors," comprise a large part of smart phone use.
2. Checking habits are particularly characteristic of smart phone use.
3. Habits may increase overall phone use, especially other applications.
4. Quick access to dynamic content can induce habits.
5. A smart phone use habit is tightly associated with a particular triggering context.
6. Smartphone-related habits are not yet perceived as problematic.

Based on the abovementioned, the author proposes the following hypothesis:

H1: performance expectancy has a positive effect on behavioral intention enabled by users of smart phone apps.

H2: effort expectancy has a positive effect on behavioral intention enabled by users of smart phone apps.

H3: Social influence has a positive effect on behavioral intention enabled by users of smart phone apps.

H4a: Effort expectancy has a positive effect on behavioral intention enabled by users of smart phone apps.

H4b: Effort expectancy has a positive effect on use behavior enabled by users of smart phone apps.

H5: Hedonic Motivation has a positive effect on behavioral intention enabled by users of smart phone apps.

H6: Price value has a positive effect on behavioral intention enabled by users of smart phone apps.

H7a: Habit has a positive effect on behavioral intention enabled by users of smart phone apps.

H7b: Habit has a positive effect on use behavior enabled by users of smart phone apps.

H8: Behavior intention has a positive effect on use behavior enabled by users of smart phone apps.

METHODOLOGY

An online survey was developed base on the instrument developed by Venkatesh, et al. (2003). The pretest in this study was deployed from October 1 through October 7 in 2012. The Cronbach's Alpha was .91. And the accumulative explanation variance was 79.3%. Data was collected from November through December 2012. There were 342 participants and Table 1 shows a summary of the participants' ages and Table 2 summarizes their smart phone operation system. An online survey was used for collecting data to test the UTAUT model and explaining behavior intention to use behavior.

Table 1: Participant ages (n = 342)

Age Group	Frequency	Percent
40+	11	3.2%
30-39	22	6.4%
20-29	253	74.0%
19 and below	56	16.4%

Table 2: Participants' smart phone operation system (n = 342)

Smart Phone Operation System	Frequency	Percent
iOS	116	33.9%
Android	217	63.4%
iOS + Android	3	1.0%
Others	6	1.7%

In addition, a reliability analysis was conducted for the scales via Cronbach's Alpha. As summarized in Table 3, the several of the scales that represent the UTAUT constructs shows to have a good degree of reliability since each is above .70. Unfortunately, it shows that the Facilitating Conditions, Price Value, and Habit are questionable because those respective test statistic values are below .70.

The PLS structural equation modelling (Fornell and Cha, 1994) was applied to test the relationships among the constructs. PLS allows for themeasurement model and the structural model to be examined simultaneously (Gefen et al., 2000). PLS is appropriate for this study for two reasons. First, PLS employs a component-based approach and can handle both reflective and formative constructs (Gefen et al., 2000). Second, PLS has a minimal restriction on the sample size and residual distributions (Chin et al., 2003). We specifically employed the SmartPLS (Ringle et al., 2005), which allows the simultaneous testing of hypotheses whilst enabling single- and multi-item measurement and the use of both reflective and formative scales (Fornell and Bookstein, 1982). A PLS model is usually analysed and interpreted in two stages (Hulland, 1999). In the first stage, the measurement model is tested by performing validity and reliability

analysis on each of the measurements of the model. In the second stage, the structural model is tested by estimating the paths between the constructs in the model, determining their significance and the predictive ability of the model. This sequence is followed to ensure that reliable and valid measurements of the constructs are determined before conclusions about the nature of the construct relationships are drawn (Hulland, 1999).

Table 3: Reliability analysis (n = 342)

UTAUT Construct	Cronbach's Alpha	Number of Items
Performance Expectancy	.82	4
Effort Expectancy	.86	4
Social Influence	.72	3
Facilitating Conditions	.39	4
Hedonic Motivation	.91	3
Price Value	.45	3
Habit	.46	4
Behavior Intention	.84	3

RESULTS

Table 4 shows the summary of a Spearman's correlation analysis to test the relationships between UTAUT constructs. It appears the UTAUT constructs have a positive relationship between Performance Expectancy and Effort Expectancy, Effort Expectancy and Social Influence, Social Influence and Facilitating Conditions, Facilitating Conditions and Hedonic Motivation, Hedonic Motivation and Price Value, Price Value and Habit, Habit and Behavior Intention.

Table 4: Spearman's Correlations for n=342

	PE	EE	SI	FC	HM	PV	H	BI
Performance Expectancy (PE)	1							
Effort Expectancy (EE)	.39	1						
Social Influence (SI)	.33	.30	1					
Facilitating Conditions (FC)	.42	.33	.37	1				
Hedonic Motivation (HM)	.31	.37	.28	.29	1			
Price Value (PV)	.22	.34	.26	.23	.29	1		
Habit (H)	.39	.34	.42	.31	.45	.23	1	
Behavior Intention(BI)	.53	.40	.44	.38	.48	.30	.65	1

The PLS method used to estimate the sample correlation coefficient method did not provide a goodness of fit index (GFI), in which the path coefficients and R^2 values are mainly indicators that judge the suitability of the measured models (Chin, 1998). R^2 values provide an indication of the predictive ability of the independent variables.

Performance expectancy, effort expectancy, social influence, facilitating conditions, hedonic motivation, price value and habit are positive effect on behavior intention. Behavior intention, facilitating conditions and habit are positive effect on use behavior.

The key PLS outputs for this analysis are as follows. First, R^2 values reported in Figure 1 provide an indication of the predictive ability of the independent variables. Hulland (1999) examines the R^2 values ranges from a low of 12 per cent (Cool et al., 1989) to a high of 64 percent (Birkinshaw et al., 1995). The R square value (.556) for an endogenous construct on behavior intention is higher than .12. Unfortunately, the R square value (.100) for an endogenous construct on use behavior is lower than .12. The path coefficients are also reported in Figure 1. PLS, a distribution-free technique, uses the bootstrapping re-sampling technique to determine the significance of the paths. The results reveal that all the links in the model are significant at the 0.1% level.

Additionally, path coefficients are reported in Figure 1. Of the all hypotheses concerning the direct relationships between performance expectancy, effort expectancy, social influence, facilitating conditions, hedonic motivation, price value, habit and behavior intention – H1, H2, H3, H4a, H5, H6, and H7a – are supported H1, $\beta = .238, p < .001$; H2, $\beta = .066, p < .001$; H3, $\beta = .111, p < .001$; H4a, $\beta = .052, p < .001$; H5, $\beta = .157, p < .001$; H6, $\beta = .012, p < .001$; H7a, $\beta = .395, p < .001$. The hypotheses considering the links between facilitating conditions, habit and use behavior is supported (H4b, $\beta = .012, p < .001$; H7b, $\beta = .082, p < .001$). The hypothesis about the relationships between behavior intention and use behavior are verified (H8, $\beta = .252, p < .001$).

Figur1: Structural model results

CONCLUSIONS

Performance expectancy, effort expectancy, social influence, facilitating conditions, hedonic motivation, price value and habit are positive effect on behavior intention. Behavior intention, facilitating conditions and habit are positive effect on use behavior. The research limitation in this study is that the data of this study consisting young smart phone users and most of them are students that makes the results generalization difficult. The author summarizes the practical implications of this study as follow: First, habit and performance expectancy influence behavior intention more than effort expectancy, social influence, facilitating conditions, hedonic motivation and price value. Second, behavior intention influences use behavior more than facilitating and habit.

The manager should focus on consumers' habit and expectancy influence to increase consumers' behavior intention to enforce use behavior. To design the smart phone applications for meeting consumers' need and enforce consumers to rely on these applications to be consumers' habit. And to use smart phone apps can help consumers to complete their daily work more quickly and increasing users' productivity. The value of this study is to prove the UTAUT model could measure smart phone mobile applications as a

generic concept. The adoption of mobile application is influenced by users' performance expectancy, effort expectancy, social influence, facilitating conditions, hedonic motivation, price value and habit.

DRIVING FORCES WHICH ENTHUSE THE CONTINUOUS GROWTH OF CHINESE STUDENTS IN U.S. COLLEGES-A PRELIMINARY STUDY ON CHINESE STUDENTS MOTIVES

**Chiang-nan Chao, Niall Hegarty, Leonora Fuxman, and I. Hilmi Elifoglu
St. John's University, USA**

ABSTRACT

China has emerged as the second largest economy after the U.S. in the world, and it is the leading source of international students for the U.S. schools in the recent years. Educators and researchers seek to understand this phenomenon and identify better ways to serve this population. This research, through an empirical setting, explores the motives of Chinese students who choose to study in the U.S. in order to provide insights and direction for both educators and university administrators. The research finds that Chinese students are highly motivated to come to the U.S. to gain a new perspective and study in a better environment. The research has only explored a glimpse of Chinese students studying in the U.S., while the future researches in this area can further enhance a better understanding of the Chinese students and provide better services to this population.

INTRODUCTION

The number of international students worldwide rose from a mere 0.8 million in 1975 to 4.1 million in 2010, according to the International Organization for Economic Co-operation and Development. [Sood, 2012]. The U.S. is the leading destinations for international students, and attracted 764,495 international students during the 2011-12 school year, which is about 3.7% of the total number students enrolled in the U.S. and spent about US\$21.81 billion in 2011/12. By any measure, international education makes a significant contribution to the U.S. economy. In New York State for example, the portion of this contribution was about US\$2.6 billion, which accounts for over 10% of the national total contribution of international students. The economic impacts are not limited to the spending of these foreign students, but also their families residing in the host country. [NAFSA, 2012]. International students can also boost a country's higher education standards, with universities doing their best to attract the world's best and brightest in their chosen fields of specialization [Sood, 2012]. Conversely, countries that see their students study abroad normally hope that these students return home and contribute to their home economy.

The U.S. has maintained its position as the leading destination worldwide, however its share of international students has been shrinking, attracting 16.6% in 2010 [Marmolejo, 2012]. Undoubtedly, China is too big to ignore as the second largest economy in the world, the country is also the heavyweight with regards to outbound international student mobility. China has emerged as the leading source of international students for the U.S. schools in the recent years. Recent statistics from the U.S. Immigration and Customs Enforcement (USICE) show that the number of active Chinese students on F-1 or M-1 visas at Student and Exchange Visitor Approved schools at the end of 2011 increased by about 23% to nearly 194,029 versus the previous year. [Choudaha and Chang, 2012]. Educators and researchers seek to understand this phenomenon and identify better ways to serve this population. This research, through an empirical setting intends to explore the motives of Chinese students who choose to study in the U.S. in order to provide insights and direction for both educators and university administrators-

REVIEW OF LITERATURE

Education has been a high priority in China for thousands of years. On average, the country's high-net-worth individuals spend 170,000 yuan (about \$27,000), to educate each of their children. This was the third-highest area of their spending, after travel and luxury goods.

American businesses, management know-how, and capital have been flowing to China for the past 30 years, but it is education that reverses the tide. Studies show that an overwhelming majority of China's wealthiest want to send their children to foreign universities and the United States is their first choice. Ninety percent of the country's richest people have plans to send their children abroad to study; according to independent research by China's Industrial Bank Co. and the Hurun Report. Their Chinese Luxury Consumer White Paper 2012 reports that 9 of out of every 10 Chinese with assets of more than 100 million yuan (\$16 million) plan to send their children abroad, while 85% of those with at least \$1 million said they would send their children overseas for education.

The first graduate from China may well have been Yung Wing, who had graduated from Yale in 1850. By 1880 there were 70 Japanese and 108 Chinese students studying in American universities, compared with a dozen Japanese and almost no Chinese in European universities [*The Chinese-American Museum of Chicago*, 1880]. Noticeably, since then China has become the largest source of international student source for the U.S. schools in the recent years. Figure 1 shows the growth of the total number of students from China.

Figure 1. Total number of Chinese Students Study in the U.S., 2001-2012

Source: Data from the National Center for Education Statistics, <http://www.iie.org/Research-and-Publications/Open-Doors/Data/Special-Reports/Economic-Impact-of-International-Students>

For Chinese students in the 2010 to 2011 term, the top field of study was business/management, with engineering following close behind. The benefits of studying abroad are felt both by individuals and entire nations. For this reason educators and researchers are interested in the motives and reasons that encourage Chinese students study in the U.S. For thousands of years, education has been placed top priority by the Chinese families and with China's economic reforms during the past leading a growth in wealth and a shrinking family size (only one child per family) sending children to international universities has become less burdensome. Currently, more than 92% of these students have their studies funded privately, according to CGG's report [Wang, 2012]. Meanwhile, many U.S. universities are facing an increasingly tough financial situation with a shortage of domestic students, a decrease in corporate and declines in government subsidies. In such a situation, Chinese students with money to spend may fill the financial gap [Joseph, 2012].

Besides economic well being, many Chinese students decide to study abroad because they believe there is a better quality education in foreign countries. [Yan, 2012; and Albrecht, et al 2012].

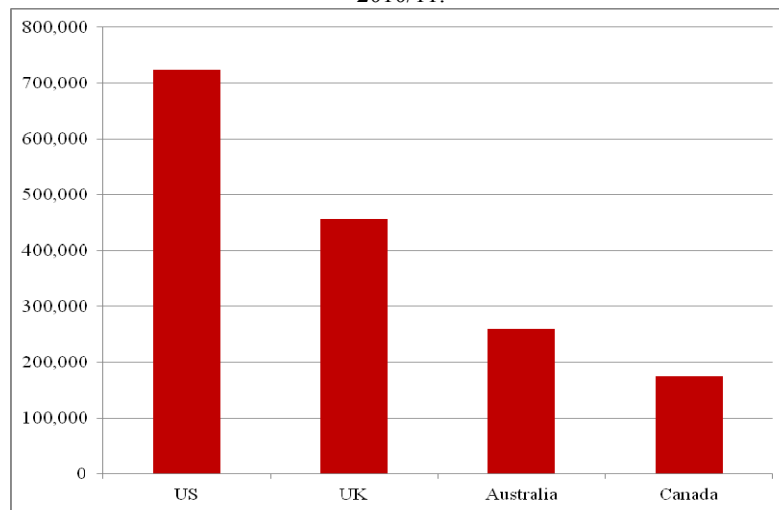

The growth in Chinese students may also reflect a confluence of factors. First, more Chinese citizens are completing college and thus eligible to apply to grad school. Second, many U.S. schools are recruiting more aggressively overseas, marketing their programs to a wider talent pool. Word of mouth then fuels the trend. Once some students attend a program, they recommend it to friends back home. Many schools have set up their gateway offices in China, i.e. Columbia University and Ohio State University. The latter saw the applications from China to the university's Fisher College of Business jump 30% between the 2010 and 2011 academic years. Meanwhile, new specialized master's programs appeal to students, particularly those from China, eager to delve deeper into a single subject and gain a credential to compete with the growing population of educated young adults, without taking much time out of the workforce. As previously stated, perhaps the most incredible figure is that some 90% of China's mega-rich want their children to study in the US, according to one recent study, not to speak of the top leaders' children, including the Party Chief, Xi, whose daughter studies at Harvard University. [Korn, 2012; Ark et al 2008; Casiano, 2011; Foadi, 2006; Lee, 2012; and Fischer, 2012].

When looking into the Chinese applicants' backgrounds, many schools find some outstanding characteristics the Chinese applicants possess. First, they are China's best students who are probably aware that if they attend universities in China, they may not able to go to the best universities in the world. For

example, the recent QS ranking listed just 7 universities out of the top 100 that were situated within China and Hong Kong. Another recently published list from the Times of London has just 3 in the top 100. Even the best universities have been hit by scandals. Second, their parents are rich, and it may make more sense to aim for a US colleges, rather than letting their children go through the highly competitive transition from high school to preferred universities in China where the road from secondary to post-secondary education involves the dreaded hurdle of the strenuous national university entrance examinations. Unlike U.S. institutions that value candidates who present themselves as unique, their Chinese counterparts want students who excel on entrance exams that require years of rote learning and poses a strong grasp of math and science. Some critics say China's state-run education system — promoted as the hallmark of Communist meritocracy — are being overrun by bribery and cronyism. Such corruption has broadened the gulf between the privileged and non-privileged classes-[Levin, 2012]. Third, these young individuals are ambitious and many want to go to Ivy League schools, a symbol for those parents who raise their children successfully. Fourth, they desire to learn more about critical thinking, and very importantly, they want to be exposed to things aside from just test taking. [Mellman & Hilburn, 2012; Henze & Zhu, 2012; Taylor, 2012; and Zhang, 2012].

The four leading English speaking destination countries – the U.S., the UK, Australia, and Canada – all witnessed sizable growth from 2002 to 2011. Figure 4 shows the total number of international students in these four countries in the 2010/11 school year. It is a surprise that the UK with about a fifth of the U.S. population, had 455,600 international students compared to the 723,277 international students studying in the U.S. that same school year.

Figure 4. The number of international students in the four leading English speaking destination countries, 2010/11.

Source: Data from the National Center for Education Statistics, <http://www.iie.org/Research-and-Publications/Open-Doors/Data/Special-Reports/Economic-Impact-of-International-Students>

Despite the continued growth of international enrollments in U.S. schools, the country's share of globally mobile students has been steadily declining over the last decade, from the peak of 27% in 2002, to 20% in 2009, and a continued decline to 16.6% in 2010. Meanwhile, foreign students contributed more than \$21.8 billion to the U.S. economy in the 2011/12 academic year, through living and educational expenses [NAFSA, 2012]. Although the majority goes to the United States, other English-speaking countries such as Britain, Canada and Australia attract most of the rest. This has caused some concern for those in the U.S. who worry that the country might be losing its appeal among international students. The Chinese comprise 25.38% of all international students newly enrolled in American schools, or about one in every hundred American college students, which means that they and their families contribute more than \$4 billion to the American economy, according to the U.S. Department of Commerce [Mong, 2012]. How can the U.S. maintain its leadership position in this globally competitive market? Do American educators understand Chinese students?

METHODOLOGY

With the focal questions in mind, this research focused on Chinese students' motives for studying in the U.S. A survey was developed to investigate the issues related to the subject of this study, Chinese students' motives to leave their home country and study in the U.S. The following variables were based on literature reviews.

Variable Selection

The following variables serve as motives that affect Chinese students in their decision making for studying abroad from the literature review.

- 1. Gain a new perspective on my own country.*
- 2. Can attend a better school overseas, but not able to attend the schools I want due to Gaokao.*
- 3. It is easy to be admitted by a foreign school.*
- 4. It is also costly if I study in my home country.*
- 5. My friends have gone abroad, so I would.*
- 6. I want to be away from my country.*
- 7. I must study abroad because my parents' wish.*
- 8. There are more fields of studies offered by foreign schools.*
- 9. Political easiness in programs abroad.*
- 10. Better living conditions, housing, eating, and environmental, i.e. clean air, etc.*
- 11. The educational system is better overseas.*

Hypothesis, test of hypothesis, and sampling

The hypotheses for this research are to find if there are any significant differences in the Chinese students' motives for choosing to study in the U.S.

- | | |
|-----------------|--|
| H ₁ | There is no significant difference for Chinese students to gain a new perspective between China and the U.S. |
| H ₂ | There is no significant difference for Chinese students to attend a better school either in China or in the U.S. |
| H ₃ | There is no significant difference for Chinese students to be admitted by a foreign school either in China or in the U.S. |
| H ₄ | There is no significant difference for Chinese students to attend schools either in China or in the U.S. as far as cost is concerned. |
| H ₅ | There is no significant difference for Chinese students to attend school either in China or in the U.S. because their friends have gone. |
| H ₆ | There is no significant difference for Chinese students to attend school either in China or in the U.S. as there is no difference between the two countries. |
| H ₇ | There is no significant difference for Chinese students for where their parents wish them to study. |
| H ₈ | There is no significant difference for Chinese students to find more fields of studies either in China or in the U.S. |
| H ₉ | There is no significant difference for Chinese students to find political easiness in programs either in China or in the U.S. |
| H ₁₀ | There is no significant difference for Chinese students living conditions, housing, eating, and environmental, i.e. Clean air, etc. either in China or in the U.S. |
| H ₁₁ | There is no significant difference for Chinese students between the educational systems in China and the U.S. |

Alternatively, there is significant differences in each of these hypotheses.

Due to the nature of this empirical study, the questionnaires were distributed to Chinese students in a large university campus in the Northeast of the United States for a convenient sampling. The respondents were asked to evaluate the selected variables in a five point Likert scale, with 5=most important, 4=important, 3=neutral, 2=not important, and 1=least important.

One sample Student's *t*-test. A *t*-test is any statistical hypothesis test in which the test statistic follows a Student's *t* distribution if the null hypothesis is supported. It is most commonly applied when the test statistic would follow a normal distribution if the value of a scaling term in the test statistic were known. When the scaling term is unknown and is replaced by an estimate based on the data, the test statistic (under certain conditions) follows a Student's *t* distribution. The estimate value for testing hypotheses in this study is 3 which are either important or not important. The one sample *t*-test requires that the dependent variable follow a normal distribution. When the number of subjects in the experimental group is 30 or more, the central limit theorem shows a normal distribution can be assumed. If the number of subjects is less than 30, the researcher should plot the results and examine whether they appear to follow a normal distribution. If the distribution appears to be non-normal, and/or if the number of test cases is significantly less than 30, then a one sample median test, which does not require a normal distribution, should be used to test the hypothesis. [Hamburg, 1977; Conover, 1980; Davis and Cosenza, 1985; SPSS^x, 2002; Wikipedia, 2012]. Five percent of the *t*-tests one tailed probability level was selected to signify the differences between preferences.

RESULTS

Over 200 respondents were surveyed at a college campus in the eastern U.S., with 87 completed responded for analyses, representing 43.5 percent of the total surveyed. Table 1 presents the general background information of the respondents.

Table 1. Backgrounds of the Respondents

Variables	Groups	Valid %
1. Age	<18	9.4
	18-35	90.6
2. gender	Male	58
	Female	42
3. Family annual income	<\$30k	21.4
	\$30-50k	27.4
	\$50-75k	17.9
	>\$75k	33.3
4. Education	College	83.5
	Graduate	16.5
5. Marital status	Married	8.2
	Single	91.8
6. Sources of financial supports	Parent	57.6
	Own saving	3.5
	Obtained scholarship or GA	18.8
	Combination of various sources	20
7. Number years studied in the U.S.	<1 year	17.6
	1 year	9.4
	1-2 years	8.2
	>2 years	64.7
8. How many schools did you apply to?	1 school	9.5
	2 schools	3.6
	3 schools	15.5
	>3 schools	71.4
9. If you took Gaokao, you stood at	top ¼	45.5
	top ½	51.5
	lower ½	3

It is noticeable that roughly a third of the Chinese who took the survey has a family income over US\$75K a year equivalent, and most of the students were born after 1978 when one child per family policy was initiated [Source: <http://healthland.time.com/2013/01/10/little-emperors/>.] Over 97 percent of the respondents took College entrance-exams and stood at the top 50 percent, while currently, over 50 percent of Chinese high school graduates are able to go to college in China. In comparison, in the U.S. over 70 percent of the high school graduates go to college [Source: <http://www.bls.gov/news.release/hsgec.nr0.htm>; Source: <http://zhidao.baidu.com/question/57277001.html>]. In another word, these respondents had alternatives for their college selections: either stay in China or go to the U.S.

Table 2 presents the test results of One-Sample *t*-Test, with means, *t* values, degrees of freedom, and significance of the tests.

Table 2. One-Sample *t*-Test Results, test value=3

	Mean	<i>t</i>	df	Sig.
1. Gain a new perspective on my own country.	3.36	2.33	83	0.02
2. Can attend a better school overseas, but not able to attend the schools I want due to Gaokao.	2.94	-0.38	79	0.71
3. It is easy to be admitted by a foreign school.	2.54	-3.44	83	0.00
4. It is also costly if I study in my home country.	2.46	-3.91	83	0.00
5. My friends have gone abroad, so I would.	2.33	-4.48	83	0.00
6. I want to be away from my country.	2.38	-4.12	83	0.00
7. I must study abroad because my parents' wish.	2.23	-5.65	83	0.00
8. There are more fields of studies offered by foreign schools.	2.81	-1.24	83	0.22
9. Political easiness in programs abroad.	2.48	-3.77	82	0.00
10. Better living conditions, housing, eating, and environmental, i.e. clean air, etc.	2.64	-2.51	83	0.01
11. The educational system is better overseas.	3.07	0.45	83	0.66

MANAGERIAL IMPLICATIONS AND RECOMMENDATIONS

The test results of One-Sample *t*-Test reject eight null hypotheses: *Gain a new perspective on my own country*, *It is easy to be admitted by a foreign school*, *It is also costly if I study in my home country*, *My friends have gone abroad, so I would*, *I want to be away from my country*, *I must study abroad because my parents' wish*, *Political easiness in programs abroad*, *Better living conditions, housing, eating, and environmental, i.e. clean air, etc.* In other words, these eight variables present that they are either more important or less important in Chinese students' motivations to come to the U.S.

In One variable- *Gain a new perspective on my own country*, the respondents indicate that it is significantly more important as a motive. This would recommend that researchers should focus on this motive, and further explore the issues related to it.

With regard to the other seven variables: *It is easy to be admitted by a foreign school*, *It is also costly if I study in my home country*, *My friends have gone abroad, so I would*, *I want to be away from my country*, *I must study abroad because my parents' wish*, *Political easiness in programs abroad*, *Better living conditions, housing, eating, and environmental, i.e. clean air, etc.*, the respondents express that these are less important. The insignificances of these variables should advise researchers that these may not be their primary research focus on Chinese students' motives for studying in the U.S.

The test results of One-Sample *t*-Test accept three null hypotheses: *Can attend a better school overseas, but not able to attend the schools I want due to Gaokao*; *There are more fields of studies offered by foreign schools*; *The educational system is better overseas*. In another words, the acceptances of these hypotheses recommend that the Chinese students do not view these issues differently.

What comes through from this search is that non-academic reasons are primarily driving Chinese students to study in the U.S. Cultural aspects and a desire to gain a non-Chinese world perspective emerge as primary motives for study in the U.S. This may be due to the understanding and realization by the Chinese of a global economy and the need to understand the 'internationalization' of business. These attitudes could also be considered to be consistent with attitudes of all affluent middle classes who have moved beyond daily sustenance and have achieved long term security.

LIMITATIONS AND FUTURE RESEARCH

While this study is limited by sample size and confined to Chinese students studying at one university in the northeast United States it does provide direction and insight for future researchers to build upon. The sample size can be accepted as a good representation of the motives of Chinese students who wish to study in the U.S. as the northeast United States has a large number of Chinese students (as opposed to a state with very few Chinese students where such a sample would be non-representative).

However, due to the limited sample size and issues addressed in this study, we believe that there are additional issues which need to be explored. Academic research on the motives of international student populations (4% of the total US college students), particularly Chinese students (about 1% of the total US college students) in the U.S. is limited. While much has been written in terms of their numbers and how universities are accommodating international students there is limited primary research on the understanding of 'why' Chinese students choose to study in the U.S. It is imperative in servicing this population that universities first understand the motivation behind studying in the U.S. as only then can colleges and universities hope to build programs to cater to the long term facilitation of this population.

Future empirical studies would better serve the advancement of knowledge in this area by increasing the sample size across numerous colleges, and broadening the scope by examining any differences in motivation in terms of major, public versus private colleges, and geographic location within the U.S. A further recommendation would be to look at any major differences between undergraduate and graduate Chinese students as well as differences between graduate Chinese who completed bachelor degrees in the U.S. and those who didn't.

The growing number of the Chinese students in the U.S. has raised some challenging questions for both educators and researchers. In the future, researchers will need to know more about: what are the expectations of these Chinese students when they land in the U.S.? Are their expectations met during their studies or after their studies? If their expectations are not met, what educators in the U.S. schools need to do?

CHINESE OUTWARDS INVESTMENT AND ITS IMPACT ON AUSTRALIA

Mona Chung, Deakin University, Australia

Bruno Mascitelli, Swinburne University of Technology, Australia

ABSTRACT

Chinese investment along with Chinese exports, are growing rapidly and even strategically throughout the globe in an unstoppable manner. Much of this has occurred since China's entry into the World Trade Organisation (WTO). In bilateral terms, Chinese investment in Australia has long been desired yet at the same time treated with caution. While Chinese investment has been focused on Australia's mineral resources, the moment this investment ventured into food or agriculture, there would be uproar in Australia on the potential for Chinese domination. The purpose of this paper is to explore how Australia perceives Chinese investment and responds to this growing level of Chinese investment in the world and in Australia.

INTRODUCTION

After the reforms and opening up of the Chinese economy in the late 1970s, China found itself with insufficient capital itself to engage in production and manufacturing. This was alleviated with its joint venture investment attraction schemes to global investors which opened up the Chinese economy and at the same time provided China with much needed technology transfers and capital for production. In less than twenty years and partially as a result of these investment schemes, China saw phenomenal growth across infrastructure, manufacturing and export industries. Such rapid growth has been linked to China's rapid economic growth leading to increased activities in international imports, exports and investments.

With growing inward investment, it was only a matter of time before China started to engage in outwards investment which also started to take off in the late 1970s, focusing mainly on small investments in developing countries such as Africa. China continued as a benefactor in these developing markets and is moving into all segments of the global economy in that region (UNCTAD, 2013). One of these locations of investment expansion includes that of Australia – the theme of this paper.

Consequently, Chinese outwards FDI has grown rapidly and recent data from UNCTAD (2009) puts China among the top five providers of FDI in the world—ahead of Japan—and is also the single largest developing country undertaking outwards FDI. By the end of 2009, a total of 6,298 Chinese MNEs were operating in more than 160 countries with a total stock of outwards FDI estimated at US\$ 184 billion, compared to only US\$ 23 billion in 2002 (MOC, 2009).

Such phenomenal increases have attracted renewed attention from international business scholars on the subject. Although a plethora of research exists on outwards FDI in general, most are concerned with outwards FDI from advanced industrialized countries. Outward foreign direct investment by emerging and developing market economies over the last decade such as China is a relatively new research area (UNCTAD, 2009) although some limited research on FDI from “third world” countries dates back to the 1970s (Heenan & Keegan, 1979; Yeung, 1995).

The aim of this paper is to explore and ascertain the nature and direction of Chinese investment in Australia, why it has a “schizophrenic” view of this investment and the hue and cry which certain forms of Chinese investment solicit. Moreover the investment trend has focused around strategic products and resources aimed at supporting its industrial base or with intentions of power accumulation.

CHINA'S OUTWARDS INVESTMENT

Research on outwards investment from developing countries remains poorly-developed as it is a relatively

recent phenomenon. As a result, investments from developing countries to advanced industrialised countries is poorly understood and questions regarding the motivations of MNEs from developing countries investing in developed countries remain unanswered. Therefore it is timely for the researchers of this paper to pursue this area in order to fulfil the gap.

In 2002 investments from China accounted for only 0.5 per cent of world FDI flows and 0.29 per cent of world FDI stock. By 2008 China had improved its global investment position to account for 3.3 per cent of flows and 1.24 per cent of stock, on a global scale China remains a small contributor relative to its dominant position as a recipient of inward FDI and as a net exporter of manufactured goods to the world (Morck, Yeung, & Zhao, 2008). By way of example by April 2013, China's total exports reached US\$ 1.871 trillion (Economics, 2013). During the same period, China has enjoyed a trade surplus every year which measured an estimated US\$ 298 billion in 2008 alone (MOC, 2009). In the same year China's total outwards investment amounted to US\$55 billion. Given China's growing economic power through exports, large trade surpluses and substantial foreign exchange reserves, its potential to expand outwards FDI remains strong (UNCTAD, 2009). By 2012, China's total OFDI was 62.4 billion, 0.8 per cent of the world total FDI (OECD, 2013). Although its outward investment is still small in absolute terms, especially compared to the huge inward flow, China's overseas enterprises have been quietly gaining importance as new sources of international capital (Wong & Chan, 2003). The growth of Chinese investments has attracted a great deal of tension in the recent years due to its rapid growth as well as the fact that much Chinese outward investment emanates from the State owned corporations or enterprises.

THE ROLE OF CHINESE GOVERNMENT POLICIES

The activities of MNEs globally are often subject to political influence (Buckley & Freeman, 1998), and in China MNEs are seen with even greater political influence than in normal market economies. MNEs are often viewed as large corporations capable of transferring valuable knowledge, skills and capital while also providing jobs to locals. In this respect, host governments often attempt to attract MNEs by providing local business conditions favourable to MNEs through MNE-friendly policies.

Two such policies in recent years in China are believed to have acted as a major trigger for numerous Chinese MNEs, particularly state owned enterprises, to go overseas. The first development was the 'Go abroad' policy introduced by President Jiang in March 2000 which is believed to have been a major catalyst for many Chinese MNEs, particularly those belonging to state owned enterprises, to venture offshore and 'experience' international competition (Buckley & Freeman, 1998). These MNEs did so with the political and financial support of the Chinese Government and the vast international networks and Chinese diaspora. For these and other reasons, Chinese investments in many parts of the world, including in Australia's resource sector, is regarded with suspicion.

The second Chinese Government policy which acted as an incentive to 'go abroad' was the overseas investment by Chinese nationals under the title of the Qualified Domestic Institutional Investor (QDII) Scheme implemented in 2005 (MOC, 2005). Under this scheme, it became easier for Chinese nationals to undertake foreign portfolio investments in equities and equity funds. Although portfolio investments are different from FDI, this policy was a further indication of the Chinese Government's proactive role in increasing China's investment in foreign businesses and, broadly speaking, to encourage domestic capital to be invested overseas. Although the role of proactive government policies in influencing FDI is not new, its use by governments of developing countries to encourage outward FDI is a new phenomenon.

THE SIGNIFICANCE OF CHINESE OUTWARDS INVESTMENTS

China is the largest investor among the BRICS countries, with a total of nearly \$425 billion in FDI stock worldwide. However the investment to other BRICS countries accounts for only 2.2 per cent of the total. South Africa and the Russian Federation have been important targets of outward FDI from China. With FDI stocks of US\$4.1 and US\$3.8 billion, respectively, by the end of 2011, the two countries were the eighth and ninth largest recipients of Chinese FDI (Cao, 2013).

The services sector accounts for a major share of Chinese FDI stock in Brazil and India. At the stock level, the amounts of Chinese FDI in Brazil and India were comparably small, at US\$1.1 billion and US\$657 million respectively, but their recent flows have been high, in particular in the Brazilian M&A market, only behind acquirers from the United States. For example, China Petrochemical Corp. (Sinopec) made a big upstream acquisition in Brazil in 2010 for US\$7.1 billion, though the value of which is not necessarily all translated into FDI (Cao, 2013).

CHINESE INVESTMENT IN AUSTRALIA

In Australia Chinese investment has grown significantly in the last two decades. By the end of 2012, China's total accumulated investment reached \$US51 billion (\$49 billion) in Australia, followed by \$US50.7 billion in the USA and \$US36.7 billion in Canada. Other major recipients of Chinese investment included Brazil and Russia. According to KPMG, Chinese direct investment into Australia grew 21 per cent in the past year to \$US51 billion, up from \$US9.4 billion (KPMG, 2013) inwards investment.

Chinese investment in Australia is predominately in mining and resources to date and there were signs of greater diversification toward natural gas, agriculture and property. Mr Ferguson, the head of KPMG China practice in Australia, said a notable development was the increased proportion of investments by privately-owned Chinese companies in 2011. But the numbers show the shift was gradual. Private Chinese investors completed 26 per cent of all deals by number, and 13 per cent by deal value while historically State-owned enterprises accounted for about 94 per cent of deals by value (KPMG, 2013). "We are starting to see the next wave of Chinese investment in Australia being made by privately owned companies, and this trend will continue under the new investment visa program, which opens the door for high-net wealth Chinese investors," Mr Ferguson said (KPMG, 2013).

China has overtaken the U.S. and Japan to become Australia's top trade partner in 2007 (DFAT, 2008). Rapid growth in trade between the two countries has also been accompanied by rapidly evolving Sino-Australian relations, and bi-lateral economic, investment, cultural and political ties. According to the ABS, bilateral trade (exports and imports) in goods and services grew from US\$ 23 billion in 2003 to more than US\$ 73 billion in 2008. This represents an increase of more than 217 per cent over just six years. During the 2003-2008 period, Australian exports to China have grown more rapidly than Australian imports from China, with exports growing by 313 per cent compared to 158 per cent for imports. For the first time in 2008 Australia's exports to China (US\$ 37.2 billion) exceeded imports from China (US\$ 36.7 billion). Among the largest exports, iron ore and concentrates, coal and copper ores were the top three Australian exports to China in 2008 and accounted for more than 50 per cent (69 per cent in 2009) of the total value of Australian exports to China that year (Morck et al., 2008).

In the early 2000s, China started to change its procurement strategy from importing to acquiring controlling interests through FDI for the supply of key raw materials and energy resources. As a result, the stock of Chinese outwards investment in Australia increased from US\$ 0.4 billion to more than US\$ 3.4 billion between 2003 and 2008; an increase of more than 750 per cent. During the same period the annual flow of Chinese outwards investment to Australia increased from US\$ 0.03 billion to more than US\$ 1.9 billion—an increase of more than 6233 per cent. It is important to note that despite such rapid increases the stock and flow of Chinese OFDI in Australia still constitutes less than 3 per cent of total Chinese OFDI worldwide, making Australia a relatively small destination for Chinese outwards investment (Morck et al., 2008).

In 2011-2012, China's total investment in Australia totalled A\$16.2 billion. China now represents the third largest investor in Australia after America (A\$36.6 billion) and the UK (A\$20.3 billion). China has the largest number of investment approvals totalling 4,752 with the main areas being Mineral exploration and development (A\$10,505 million) and real estate (A\$4,187 million) (FIRB, 2012).

Statistics from the Chinese Ministry of Commerce indicate that in 2008 more than 73 per cent of China's outwards investment in Australia went into the resource sector, compared to 45 per cent the previous year (MOC, 2009). Investments in the services sector declined from 30 per cent to less than 6 per cent during the same period.

This trend is consistent with China's overall strategy of securing supplies of energy resources to support the continued growth of its industrial sector by acquiring such resources overseas rather than relying on imports. However, it is also clear that Chinese investments in the Australian resource sector is disproportionate to Chinese investments worldwide in mining, which accounts for only about 10 per cent of

its total FDI (MOC, 2009). It is also interesting to note that the Australian industries which have experienced rapid growth in Chinese FDI are also the same industries which are the top three exporters to China. This indicates China's strategy of reducing its reliance on imports for key industrial inputs by acquiring a controlling interests and ownership of such resources.

THE VIEW OF CHINESE OUTWARDS INVESTMENT

The view that China is strategically and permanently interested in Australian assets has been challenged by recent developments. Investment reports recently released indicate that China may not always be keen on pursuing investment in Australia. According to a recent media report China has already begun to look elsewhere for investment (Wen, 2013). The report indicates: "Australia's status as a favoured destination for Chinese direct investment is being eroded by increasing competition from countries such as the United States and Canada" (Wen, 2013).

An even more recent report has highlighted the Chinese attraction to Canada as a source of collaboration and investment in the area of mineral resources (KPMG, 2013).

These developments were also in contrast to the much-vaunted launch of the Asian Century white paper by the Gillard government in 2012 which assumed that Chinese interest in Australia resources was without risk and almost guarantee (DPMC, 2012). This scenario undoes much of the thinking in Australia about Chinese dependency on Australian resources.

China has a different approach towards its neighbours and security than that expressed by the Australian White paper. While China has evident strategic global interests they present themselves in far different terms than those of Australia or other western governments. As summarised by one observer and significantly different from that expressed in the White Paper. It stated:

"In short, our goal is to integrate the interests of the Chinese people with the common interests of the rest of the world, expand the convergence of interests with other countries and build communities of interests with other countries, so China and the rest of the world can realize peaceful development" (Zheng, 2013, p. 8).

DRIVER FOR CHINESE INVESTMENTS INTO AUSTRALIA

In Australia, there has been a gradual liberalisation of investment rules over the last 20 years, making Australia a more attractive location to invest in and also making Australia more MNE-friendly. Changes include the loosening of investment administrative processes and tax rules relating to foreign businesses. Together with the two major policies implemented in China, a trend of outwards investment has certainly been one of the major drivers for Chinese outwards investment.

More relevantly, China's focus in the resource sector provides China with two outcomes which clearly aligned its strategy:

1. To secure the supplies of valuable and scarce raw material and inputs necessary to sustain its international competitiveness in the global market place;
2. To continue supply its ever growing economy domestically to fulfil the needs of the domestic market.

Security of access for rare resources through control and ownership by undertaking FDI is a long-term and effective method.

The stable political environment in Australia and the evolving Sino-Australian political and economic relations suggest that Chinese outwards FDI in Australia is still in its infancy and is likely to increase substantially over the coming years to reflect the growing trade relations between the two countries. Given that consumer demand in China is likely to continue to grow and that China's export manufacturing sector will also continue to grow, there will be increased pressure on Chinese MNEs to secure long term supplies of raw materials and energy—both of which are in abundant supply in Australia. Thus, Chinese OFDI in Australia is likely to accelerate further in the future driven by resource seeking and strategic asset seeking motives as well as aggressive government policies which encourage Chinese MNE activities abroad.

THE FUTURE OF CHINESE INVESTMENT IN AUSTRALIA

China will continue to pursue its own national interests and it has already defined the future scenarios. In China Daily it stated:

"International relations are complex and many different factors are at play. However, major countries have only three options before them. The first is to adopt a Cold War mentality and to engage in Cold war strategies. The second is to engage in local hot wars as another world war is not possible. The third is to build communities of interests for common development. History has shown us that the first two options should be rejected. As globalisation deepens, countries around the world are facing common and completely new challenges. It would be dangerous if any country responded to these global challenges in the first half of the 21st century with the old mindset and old strategies employed before the 1970s (Zheng, 2013, p. 8)".

From the Australian government perspective, Chinese investment is declared to be welcome in all sectors though public opinion as expressed in a 2012 Lowy Institute poll found that 81 per cent of Australians were against the Australian government's allowing foreign companies to buy Australian farmland (Edwards, 2012). More recently, Australian firms have been looking at Chinese investment in a range of areas such as agriculture. 'As Australia's mining boom runs out of steam, the long dormant agricultural sector is expected to be the country's next engine of growth' (Edwards, 2012). This is also in line with the Asian Century white paper aiming to build Australia into 'the food bowl of Asia'. From Australian perspective, the Asian Century white paper is the broader strategic roadmap for Australia on its engagement with Asia and in specific with China. The latest investment migration visa category 888 (FIRB, 2012) is a very clear indication of investment strategy for Australia.

"Australia's reputation for quality and its strong regulatory system place it as an attractive agro-destination for Chinese businesses and investors. However, despite this enormous opportunity for growth, a great deal of fear exists among Australians regarding food security, foreign investment and the potential for a monopoly and pricing interference," economic expert Thomas said (Edwards, 2012).

The view that China is strategically and permanently interested in Australian assets has been challenged by recent developments. Investment reports recently released indicate that China may not always be keen on pursuing investment in Australia. According to a recent media report China has already begun to look elsewhere for investment (Wen, 2013). A 2012 report by accounting firm KPMG and the University of Sydney noted that China had begun looking elsewhere to invest. The report stated:

"The USA and Canada in particular are catching up with Australia. While Australia's accumulated Chinese direct investment is still ahead of its main international competitors, there is no denying that the rest of the world is hot on our heels and aggressively competing for Chinese capital" (KPMG 2012).

An even more recent report has highlighted the Chinese attraction to Canada as a source of collaboration and investment in the area of mineral resources. This was confirmed in another media report which stated:

"Chinese mining companies have long been attracted to Australia, due to its proximity to China and rich deposits of iron and coal, but attention is shifting to Canada thanks to the government's raising of limits on foreign investment in natural resources" (Lok, 2013).

CONCLUSION

The desire by Australia to attract foreign direct investment has been a national priority and deemed in the national interest. However when it comes to Chinese inward investment, at times these sentiments of its "openness" has been wanting. The moment Chinese investment touched sectors outside of the mineral resources, howls of complaints arose indicating that the welcome mat was not always offered. Much of this concern mirrors the same fears that Australia experienced during the 1980s with Japanese investment in North Australia. Today that investment has all but dried up and returned home. The outcry from segments of Australian society over Chinese investment in Australia flies in the face of the much-vaunted launch and sentiment of the "Australia in the Asian century" White Paper sentiment emanating from the Gillard government in 2012 which assumed that Chinese interest in Australia resources was without risk and almost guaranteed. Moreover Chinese investment is expanding to areas outside of mining. This scenario undoes much of the thinking in Australia about Chinese dependency on Australian resources.

In conclusion the future for Chinese investment in China is a confronting and challenging development to many in Australia. Old legacies and prejudices emerge and the Australian “open economy” discourse takes a back seat. Australia has little luxury in demonstrating its “protectiveness” of its economy along the lines which was once defined as “selling the farm”. Like the case of Japan, not appreciating the investment and placing unacceptable conditions could cost Australia dearly.

THE INFLUENCE OF EIGHT INTERNAL MARKETING ELEMENTS ON BRAND AWARENESS IN THE SERVICES SECTOR – A DEVELOPING ECONOMY PERSPECTIVE

**Elizabeth S. Conradie, Council for Medical Schemes, South Africa
Mornay Roberts-Lombard, University of Johannesburg, South Africa
HB Klopper, Monash University, South Africa**

ABSTRACT

The internal marketing mix for services typically consists of seven elements (product, price, place, promotion, people, processes and physical evidence). In this study another element, performance, was added to the mix to determine the influence of these eight elements on the brand awareness as perceived by customers of car rental companies in South Africa. Although car rental companies may have a strong brand position, the brand's successful awareness depends on the role the employees play in delivering the service (Wilson, Zeithaml, Bitner & Gremler, 2012, p.249). This research aimed to provide guidance to South African car rental companies to improve their respective brand awareness, enabling them to expand customer bases whilst retaining existing customers through improvement of internal marketing programmes.

INTRODUCTION

The internal marketing mix for services typically consists of seven elements (product, price, place, promotion, people, processes and physical evidence). In this study another element, performance, was added to the mix to determine the influence of these eight elements on the brand awareness as perceived by customers of car rental companies in South Africa. Irrespective of the fact that service organisations, such as car rental companies, may have developed a well-conceived positioning for their brand, the brand's successful positioning and awareness depend on the role the employees play in delivering the service (Wilson, Zeithaml, Bitner & Gremler, 2012, p.249; Papasolomou & Vrontis, 2006, p.39). In order to achieve the goal of internal marketing, service organisations need to recognise that marketing strategies should not only be aimed at external customers, but should also be implemented internally and achieve better internal communication. This research aimed to provide guidance to South African car rental companies to improve their respective brand awareness, enabling them to expand customer bases whilst retaining existing customers through improvement of internal marketing programmes.

LITERATURE REVIEW

The traditional marketing mix for products consists of the well-known four elements, product, price, place and promotion. A key factor distinguishing the services marketing from the marketing of physical products is the human element. The distinctive characteristics of services require the addition of three more Ps to overcome the limitations of the traditional marketing mix (Wilson et al., 2012, p.23; Mudie & Pirrie, 2006, p.6). The elements of the three additional Ps of the marketing mix are:

- People – the appearance and behaviour of service personnel;
- Process – how the service is delivered, the actual procedures and flow of activities; and
- Physical evidence – everything from the appearance, design, layout of the service setting, to brochures,

- Physical evidence – everything from the appearance, design, layout of the service setting, to brochures, signage and equipment.

The unique characteristics of services cause customers to search for evidence of the service in each of their interactions with the organisation. The additional elements of the service mix, namely people, process and physical evidence, provide customers with that evidence and allow them to form their own judgement (Chen, Chen & Huang, 2012, p.107). Since employees are a powerful element tool of customer persuasion and a major parameter affecting the customer's perception on the delivered service quality, Grove, Fisk and John (2000, p.74) added performance of employees as another critical element to the marketing mix (Constantinides, 2006, p.421).

Kotler & Keller (2009, p.288) stated that marketing and branding theories support the idea that there is a functional connection between the marketing of services and the awareness of the brand. Establishing favourable brand awareness is an important factor to ensure business success (Park, Cho & Kandampully, 2009, p.134). Brand awareness refers to the strength of a brand's presence in the customer's mind. Awareness is measured according to the different ways in which customers remember a brand, ranging from recognition (exposure to the brand) to recall (what can be recalled about the brand) to first in the mind (the brand appearing first in the mind) and finally to dominant (the only brand recalled) (Aaker, 2004, p.10). Brand awareness is created by increasing the familiarity of the brand through repeated exposure and strong associations with the relevant cues enabling the customer to recall the brand effectively. Brand associations are divided into three major categories, these being attributes, benefits and attitudes (Keller, 2009, p.139). In this study attributes refer to the trustworthiness of the vehicles; benefits refer to perceived quality, translating into the overall evaluation of the service customers receive; and attitudes refer to the customer's loyalty towards the brand (Kapferer, 2005, p.149).

In order to enhance the brand awareness of a service organisation, the organisation has to adapt its marketing activities to mix and match the internal marketing mix elements that will reinforce the brand awareness (Song, Hur & Kim, 2012, p.332). Car rental companies need to implement internal marketing programmes that include at least some of the internal marketing mix elements to ensure employees deliver service excellence to customers, thereby improving the awareness of their brand amongst external customers. Customers who are aware of the brand of car rental companies and who receive excellent services should become committed to the company and will most likely remain long-term and loyal customers of the specific car rental company (Boshoff & Du Plessis, 2009, p.15). Since employees of car rental companies create the customer's perceptions and awareness of the brand during the service encounter, it is important that they are exposed to internal marketing programmes. If the programmes are implemented effectively, customers have a satisfactory experience and positive brand awareness is created.

Although most South African car rental companies' brands are well-known, formal research is required as it is not evident that internal marketing programmes are implemented in these companies. Furthermore, it is also not evident what the influence of internal marketing is on brand awareness of car rental companies as perceived by their customers.

PROBLEM STATEMENT

Although car rental companies have internal programmes, such as loyalty and other incentive programmes to motivate employees, the success of these programmes have not been researched nor linked to the internal marketing elements applicable to this study (First Car Rental, 2011; Hertz, 2011; Avis, 2009). Furthermore, despite a strong interest in internal marketing research amongst marketing researchers, little research has been conducted related to brand awareness in service brands (Song et al., 2012, p.331). This is relevant because if all elements of the internal marketing mix do not contribute positively to the overall brand awareness of car rental companies in South Africa, it could receive reduced attention, which could damage the overall image of the brand of the car rental company. Additionally if certain activities demonstrate ineffectiveness, they could be altered and improved, thereby creating more competitiveness for car rental companies. Customers in a services environment become aware of the brand through their experience during consumption of the service, which is created by employees of the organisation. This raises the question of whether the internal marketing (internal product, price, promotion, place, people, processes, physical evidence and performance) presented to employees have a positive influence on brand awareness (brand recognition, trustworthiness, overall evaluation and loyalty) as perceived by the external customers of car rental companies.

RESEARCH OBJECTIVES

The primary research objective is to determine the perceived influence of eight internal marketing mix elements on the brand awareness of selected car rental companies in South Africa.

The secondary research objectives are:

- To determine whether there is a difference between the perceived influences of the eight internal marketing mix elements on brand awareness of selected car rental companies in South Africa.
- To determine which of the eight internal marketing mix elements have the largest influence on brand awareness of selected car rental companies in South Africa.

RESEARCH METHODOLOGY

The research format was described as descriptive research. As the objectives of this research were to describe a current situation, a cross-sectional format was appropriate. The target population in this study includes car rental companies in South Africa. Although seven car rental companies, namely Avis, Budget, Europcar, First Car Rental, Hertz, Tempest Sixt and Thrifty, were invited by the researcher to participate, only three agreed to participate, namely Avis, First Car Rental and Hertz. Therefore, the sampling unit for this study included customers of Avis, First Car Rental and Hertz over a period of three months. Probability sampling in the form of directly proportional stratified sampling was used in terms of selecting only customers of the three car rental companies, not including employees, because customers are directly influenced by the branding of car rental companies. Directly proportionate stratified sampling was used in the study, as the goal was to draw a probabilistic sample from a population to describe the population's characteristics or parameters, based on statistics calculated from the sample. The sample unit that was used in the study included customers who rented cars from the Avis, First Car Rental and Hertz over a period of three months, which included business and holiday months. The sampling elements were customers of Avis, First Car Rental and Hertz who rented vehicles at airports, namely OR Tambo, Cape Town, Durban, Bloemfontein, Port Elizabeth, East London, George, Nelspruit, Kimberley and Lanseria, and city branches, including Johannesburg, Cape Town, Durban, Bloemfontein, Port Elizabeth, East London, George, Nelspruit and Kimberley. The airports and related cities were identified as the major airports in South Africa and therefore they were selected for this study. The required sample size of respondents for structural equation modelling was between 375 and 750 and the actual sample size was 581. The data collection was conducted by means of a survey. A five-point Likert scale, ranging from 'strongly disagree' to 'strongly agree', was used for all questions within the questionnaire (Vagias, 2006, p.1). Structural equation modelling (SEM) was the statistical technique used for the empirical investigation because SEMs are well recognised as the most important statistical method to evaluate a series of simultaneous hypotheses about the impacts of latent variables and manifest variables on other variables, and take the measurement errors into account (Lee, 2007, p.1).

FINDINGS

The findings from the SEM analysis are described next:

- *Process had a significant and strongest influence on all four dependent variables, namely brand recognition ($p = 0.014$), trustworthiness ($p = 0.001$), overall evaluation ($p = 0.033$) and loyalty ($p = 0.043$).*
- *Performance had a significant influence on trustworthiness ($p = 0.000$), overall evaluation ($p = 0.026$) and loyalty ($p = 0.001$).*
- *Performance and trustworthiness were the second strongest relationship ($p = 0.000$).*
- *There was a strong relationship between performance and loyalty ($p = 0.001$).*
- *Physical evidence was the factor that had the smallest or lowest influence on brand recognition ($p = 0.723$) at a 0.05 level of significance.*
- *People (employees) had a negative influence on brand recognition ($p = 0.081$), trustworthiness ($p = 0.078$), overall evaluation ($p = 0.183$) and loyalty ($p = 0.082$).*

The fact that people (employees) had a negative influence on brand recognition, trustworthiness, overall evaluation and loyalty was an interesting finding, since the literature states that employees played a significant role in creating a positive customer experience, especially in a services industry. This means that car rental companies have to focus more on employees to ensure that they are correctly trained and equipped to deliver a positive service experience. Based on the findings of the research, the hypotheses were accepted.

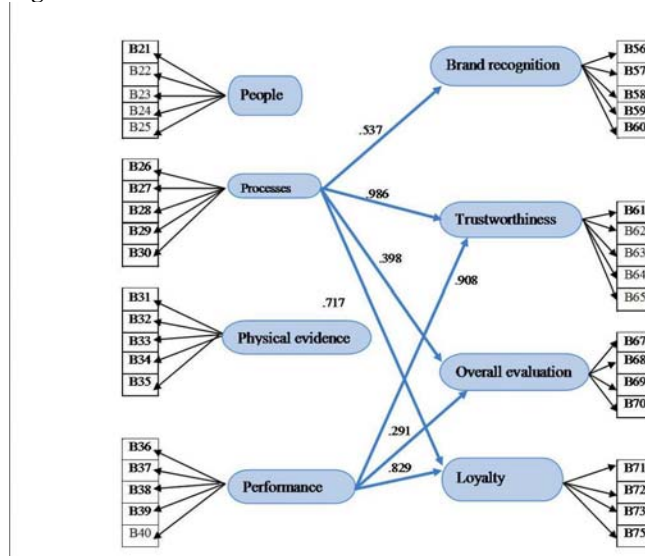

Since the traditional marketing mix elements, namely product, price, promotion and place did not have a significant influence on brand awareness constructs, the null hypothesis for traditional elements is accepted. The alternative hypotheses of the services internal marketing elements, including the recently added element (performance) were accepted due to the difference in influence and difference in the level of influence of the services elements on brand awareness constructs. The accepted hypotheses are as follows:

There is a difference in the influences of the services internal marketing elements (people, process, physical evidence and performance) on brand awareness (recognition, trustworthiness, overall evaluation and loyalty) of selected car rental companies in South Africa.

There is a difference between the level of influence of the services internal marketing elements (people, process, physical evidence and performance) on brand awareness (recognition, trustworthiness, overall evaluation and loyalty).

Based on the final results of the SEM and hypotheses testing, the final SEM model is depicted in Figure 1. Due to the complexity of the model and space constraints, the arrows and circles that connect the errors with the scale items were not indicated in the Figure. The negative relationships and influences were also not included in the figure, as well as the positive influences, which were not statistically significant.

Figure 1: SEM model

MANAGERIAL IMPLICATIONS FOR CAR RENTAL COMPANIES

The findings of the study indicated some areas where car rental companies could improve their internal marketing efforts to enhance the overall brand awareness of the company as experienced by customers.

The most significant findings indicated that internal processes followed by car rental companies influence customers' perception of brand recognition, trustworthiness, overall evaluation and loyalty. Car rental companies should therefore ensure that their processes are of high standard to retain existing customers and to build their reputation to attract new customers. Car rental companies provide accessibility through numerous branches nationally and some internationally and thereby increase the accessibility of their services and products to customers. However, all branches have to ensure that their processes are well planned, consistently implemented and coordinated throughout the organisation. The internal process has to be reliable and must have integrity to provide a satisfying experience to the external customer in delivering

the service or product. Car rental companies should review their internal processes from time to time and make improvements where required. Feedback from customers is also very valuable to assess if existing internal processes have a positive effect on the service delivery to customers. If car rental companies ensure that processes are functioning optimally, customers will regard them as trustworthy.

Customers of car rental companies regarded internal performance of the car rental company as very important. This implies that if car rental companies improve their performance and ensure that such performance is of a high standard, customers will trust the car rental company. Customers that regard their car rental company as trustworthy ultimately results in customers being loyal towards the car rental company.

Employees of car rental companies play a significant role in the performance of the organisation, and car rental companies will only be able to perform well if their internal performance is managed effectively. Employees should have the same values as the company and should be able to adopt the culture of the car rental company. Performance cannot be sustained if there is no measurement in place. Therefore, car rental companies have to measure employee performance, as well as the overall performance of the organisation.

Constructive feedback from employees should be encouraged and management and employees should be committed to each other. They should also have fun together, be helpful and compassionate about one another. Employees who are satisfied tend to put more effort in to ensure that the organisation performs better, and therefore continuous training and performance measurement are imperative to increase the car rental company's overall performance. Furthermore, satisfied employees who are motivated to perform well, create satisfied and loyal customers who have trust in the organisation.

SUGGESTIONS FOR FUTURE RESEARCH

Future research regarding the topic of the research can be extended to include employees of car rental companies and comparative studies can be conducted between employees and customers. The research can also be extended to other services industries, such as the banking or insurance industries, and comparisons between those studies and this study can be drawn. The model and measuring instrument of this study can be applied to other industries, for example, the tourism and hospital industries could perhaps benefit. It is also possible that other constructs, not included in this study, can have an influence on the brand awareness of car rental companies' customers.

CONCLUSION

The model developed through the findings of this study provides car rental companies with guidance on which internal marketing elements are important for positive brand awareness as perceived by their customers. In addition to the model, the study indicated that car rental companies should implement strategies to improve their internal marketing programmes. These strategies will contribute to improvement of employees' satisfaction and subsequently customer satisfaction. Satisfied customers will remain customers of their car rental company and ultimately profits and competitiveness of the particular car rental company will prosper. Car rental companies function in a very competitive industry and therefore they should recognise the importance of the brand awareness they are creating with customers. They are also participating in a global economy. Should they succeed in ensuring positive brand awareness, employees, customers and car rental companies and the whole economy of South Africa will eventually benefit from their successes.

IMPROVING OPERATIONAL AND CLINICAL SUCCESS OF HOSPITALS AND HEALTHCARE FACILITIES WORLDWIDE: ADOPTION OF INTERNATIONAL STANDARDS RECOMMENDED FOR MONITORING WATERBORNE PATHOGENS

Mark A. Cwiek, Zigmond A. Kozicki, Stephanie J.S. Baiyasi-Kozicki, Siddarth Anney and Ethan Pauwels, Central Michigan University, USA
and
Gerald R. Ledlow, Georgia Southern University, USA

ABSTRACT

Waterborne pathogens are found worldwide, and are a source of human discomfort and death. The sick are susceptible to waterborne pathogens. That is why hospitals, nursing homes and other medical facilities must be especially careful to have ongoing monitoring and water treatment. There are no international standards for medical facilities to protect patients, employees and visitors from waterborne pathogens. This can prove very costly to medical facilities, as healthcare-acquired infections can bring legal liability, civil penalties, loss of payment for medical treatment, loss of business due to diminished public trust, and generally poor public relations. The authors recommend a series of protocols to which healthcare facilities everywhere should ascribe. The authors further recommend that the World Health Organization, in tandem with governmental public health agencies and non-governmental organizations dedicated to healthcare, develop meaningful and straightforward waterborne pathogen testing and treatment protocols for all medical facilities across the globe.

“Without water monitoring we cannot be certain that drinking water does not contain any microorganisms known to be pathogenic” (World Health Organization, 1997).

INTRODUCTION

Microorganisms are found all around and in human beings everywhere. Microorganisms are essential for normal human existence. However, there are many microorganisms that are insidious, waiting in tainted water or food and that can severely compromise comfort, health and even life. Many times people become exposed to a microorganism through improperly cooked food or tainted water, and afterward feel uncomfortable – and often this feeling passes as the body’s natural defenses retake control. Human beings are exposed to a wide variety of tiny organisms, including bacteria, fungi and protozoa, as well as viruses and normally people are equipped with biological defenses that eventually overtake and control offending invaders.

This is not true in certain situations, however. Human beings are weakest when otherwise ill and perhaps fighting off one or more kinds of infection at the same time. Human beings are vulnerable in infancy and in the feeble older years of life. Human beings are susceptible to debilitating infection when the body’s immune response is reduced or absent (immunosuppression). The hospital represents a very real point of intersection for all of these sorts of risk factors, and therefore the healthcare facility should be the place where waterborne pathogens are least likely to be found. Unfortunately, this is often not the case. In too many situations, the healthcare facility is where patients and guests are introduced to otherwise avoidable waterborne pathogens.

Global Water Quality Problems – In General

Regardless of where one is traveling in the world, the usage of water in restaurants, hotels and other public places is largely a matter of faith. If one has a lot of faith or a daring sense of adventure, or perhaps a non-caring attitude, then few precautions generally are taken while traveling. If one has less faith, perhaps gained through hard experience over time, then generally greater precautions are taken with water usage while traveling. Seasoned travelers for example often choose not to drink water from the tap or to order drinks with ice, and many even purposely avoid ingestion of water while showering.

It has been estimated that up to eighty percent of the world's fresh water supplies are in danger from man-made interventions, such as overuse of water, pollution and exotic species introduction (Inman, 2010). There are hopeful signs in many countries with large densities of population, when policies are adopted to better "work with nature."

In the developed world, contaminants in surface water supplies take many forms. Industrial pollution, agricultural run-off and even disposed medicines have found their way into lakes, rivers and streams. The anti-depressant Prozac and its active ingredient fluoxetine have been discovered in Lake Erie in the United States, and this is having the effect of destroying normal microbial populations in the Great Lakes (Kaufman, 2011).

In developing world countries, the importance of securing clean drinking water is understood by nongovernmental organizations (NGOs), government and now business. In rural Punjab, India, near the Pakistani border, local citizens benefit from a for-profit model called Healthpoint which provides clean water and clinical visits with medical assistants (Ydstie, 2011). The Healthpoint model combines videoconferencing with a physician (perhaps hundreds of miles away), low-cost diagnostic tests and inexpensive water filtration, all in a single building. The poor in these environs have discovered that these are health measures even they can afford.

In developing countries, approximately four-fifths of all illnesses are caused by waterborne diseases, with diarrhea being the chief cause of childhood deaths. It is estimated that nearly 1.1 billion people still lack access to improved drinking water sources and some 2.4 billion people have inadequate access to proper sanitation. There is evidence that water, sanitation and hygiene-related diseases account for approximately 2,213,000 deaths annually and there is an annual loss of 82,196,000 Disability Adjusted Life Years (DALYs) (Lenntech, 2013). See Table 1 below for a list of waterborne pathogens and their significance to the world water supply (WHO, 2007).

Table 1: Waterborne Pathogens and Their Significance in Water Supplies^a

Pathogen	Health significance ^b	Persistence in water supplies ^c	Resistance to chlorine ^d	Relative infectivity ^e	Important animal source
Bacteria					
<i>Burkholderia pseudomallei</i>	High	May multiply	Low	Low	No
<i>Campylobacter jejuni</i> , <i>C. coli</i>	High	Moderate	Low	Moderate	Yes
<i>Escherichia coli</i> – Pathogenic ^f	High	Moderate	Low	Low	Yes
<i>E. coli</i> – Enterohaemorrhagic	High	Moderate	Low	High	Yes
<i>Legionella</i> spp.	High	May multiply	Low	Moderate	No
Non-tuberculous mycobacteria	Low	May multiply	High	Low	No
<i>Pseudomonas aeruginosa</i> ^g	Moderate	May multiply	Moderate	Low	No
<i>Salmonella typhi</i>	High	Moderate	Low	Low	No
Other salmonellae	High	May multiply	Low	Low	Yes
<i>Shigella</i> spp.	High	Short	Low	High	No
<i>Vibrio cholerae</i>	High	Short to long ^h	Low	Low	No
<i>Yersinia enterocolitica</i>	High	Long	Low	Low	Yes
Viruses					
Adenoviruses	High	Long	Moderate	High	No
Enteroviruses	High	Long	Moderate	High	No
Astroviruses	High	Long	Moderate	High	No
Hepatitis A viruses	High	Long	Moderate	High	No
Hepatitis E viruses	High	Long	Moderate	High	Potentially
Noroviruses	High	Long	Moderate	High	Potentially
Sapoviruses	High	Long	Moderate	High	Potentially
Rotavirus	High	Long	Moderate	High	No
Protozoa					
<i>Acanthamoeba</i> spp.	High	May multiply	Low	High	No
<i>Cryptosporidium parvum</i>	High	Long	High	High	Yes
<i>Cyclospora cayentanensis</i>	High	Long	High	High	No
<i>Entamoeba histolytica</i>	High	Moderate	High	High	No
<i>Giardia intestinalis</i>	High	Moderate	High	High	Yes

<i>Naegleria fowleri</i>	High	May multiply ^f	Low	Moderate	No
<i>Toxoplasma gondii</i>	High	Long	High	High	Yes
Helminths					
<i>Dracunculus medinensis</i>	High	Moderate	Moderate	High	No
<i>Schistosoma</i> spp.	High	Short	Moderate	High	Yes

Note: Waterborne transmission of the pathogens listed has been confirmed by epidemiological studies and case histories. Part of the demonstration of pathogenicity involves reproducing the disease in suitable hosts. Experimental studies in which volunteers are exposed to known numbers of pathogens provide relative information. As most studies are done with healthy adult volunteers, such data are applicable to only a part of the exposed population, and extrapolation to more sensitive groups is an issue that remains to be studied in more detail.

^a This table contains pathogens for which there is some evidence of health significance related to their occurrence in drinking-water supplies.

^b Health significance relates to the severity of impact, including association with outbreaks.

^c Detection period for infective stage in water at 20 °C: short, up to 1 week; moderate, 1 week to 1 month; long, over 1 month.

^d When the infective stage is freely suspended in water treated at conventional doses and contact times and pH between 7 and 8. Low means that 99% inactivation at 20 °C generally in <1 minute, moderate 1–30 minutes and high >30 minutes.

^e From experiments with human volunteers, from epidemiological evidence and animal studies. High means infective doses can be 1–10² organisms or particles, moderate 10²–10⁴ and low >10⁴.

^f Includes enteropathogenic, enterotoxigenic and enteroinvasive.

^g Main route of infection is by skin contact, but can infect immunosuppressed or cancer patients orally.

^h *Vibrio cholerae* may persist for long periods in association with copepods and other aquatic organisms.

ⁱ In warm water.

Adapted from “Waterborne Pathogens and Their Significance in Water Supplies,” by the World Health Organization, 2007.

“In the United States, microbiological organisms are common to tap water meeting the highest treatment and regulatory standards. While some of these organisms may be harmful to healthy individuals, others are considered acceptable “normal flora” of general water supplies but may cause serious disease in severely immunocompromised persons. Hospitals serve food and water to some of the most susceptible populations to chronic and deadly infections. Conservatively, it’s estimated one in 10 hospitalized patients will contract an infection from the hospital environment itself. These acquired infections are termed “nosocomial” and are a great concern to health care providers” (Reynolds, 2003, July).

Global Water Quality Problems – Healthcare Facilities

The problem of waterborne pathogens in healthcare facilities is a continuing worldwide problem, with serious and often lethal cases reported in the media. In Belfast, Ireland, for example, it was reported in early 2012 that four infants died in two hospital maternity wards due to hospital acquired infections (HAIs) from tap water contaminated with the *Pseudomonas aeruginosa* bacterium (McAdam, 2012).

A \$600 million class-action law suit was filed as a result of a Legionnaires’ disease outbreak at Seven Oaks Home for the Aged in Scarborough, Canada. While twenty-one residents died as a result of this outbreak, thirty employees, twenty-six visitors and four people who lived in the area were also afflicted (Parker, 2005).

An important study of a fungus *Exophiala jeanselmei* outbreak was conducted at the university hospital Universidade Federal do Rio de Janeiro 450 bed tertiary care hospital in Brazil. In this carefully controlled study, three main sources were determined: deionized water from the hospital’s pharmacy, a particular water tank, and water from a sink in a non-patient care area (Nucci et al., 2002).

A Japanese study looked at hot bath and shower accommodations in three hospitals and one nursing home, and most samples did not yield a positive result for targeted organism *Legionella pneumophila*. However, *Legionella* did have a positive match in one particular bathtub in one location. As a result, the investigators recommended that the concentration of chlorine in the water be increased from 0.1 mg/l to 0.2–0.4 mg/l, the amount otherwise required in public baths in Japan (Fujimura et al., 2006).

An outbreak of Legionnaires’ disease in a nursing home in Slovenia in August of 2010 affected 15 of 234 residents in the facility, and four patients were confirmed to have contracted Legionnaires’ disease.

The probable source of the contamination in the water supply was identified as the piping within the facility with “dead end” sections – a possible source of biofilms, etc. Chemical disinfection of the water supply was applied, and proper temperature control of water was affirmed (Trop Skaza et al., 2010).

Microorganisms attach to surfaces and develop biofilms. Biofilm-associated cells can be differentiated from their suspended counterparts by generation of an extracellular polymeric substance (EPS) matrix, reduced growth rates, and the up- and down- regulation of specific genes. Biofilms are homogeneous deposits of cells and accumulated slime, forming complex communities of surface-associated cells enclosed in a polymer matrix containing open water channels. Their distinct phenotype makes them resistant to antibacterial agents. Their matrix makes them resistant as well to the antibacterial molecules and cells mobilized by the host. Biofilms have great importance for public health because of their role in certain infectious diseases and in a variety of device-related infections. Biofilm infections can be “stealthy,” in that they develop slowly and initially produce few symptoms. In time, they may be very damaging because they promote immune complex sequelae and act as reservoirs for acute exacerbations (Donlan & Costerton, 2002). In addition, biofilm associated infections require a different approach, both clinically and para-clinically (Lazăr & Chifiriuc, 2010). There are many such cases reported in the international media. One can only ponder the probable greater number of unreported cases around the globe.

It is important to note that waterborne pathogens can infect individuals through the breathing process, as well as by other contact means. This situation was demonstrated by the Aurora, Wisconsin hospital that installed a decorative fountain in its lobby and then at least eight non-patient visitors to the lobby contracted Legionnaires’ disease by simply breathing in bacteria-laced water droplets produced by the fountain (Haupt et al., 2012). This occurred even though regular cleaning of the fountain was maintained.

The existing standards and regulations for control and prevention of water contamination in community water supplies seldom consider protection of special populations from waterborne nosocomial infections. A four-step approach to prevent nosocomial waterborne infections in healthcare facilities should be considered as important for immunocompromised patient populations (Anaissie, Penzak, & Dignani, 2002).

1. Reduce exposure—Minimize all immunocompromised patient’s exposure to tap water, regardless of documented presence of opportunistic organisms. Drinking water should be purchased sterile or boiled for three minutes. Distillation is also effective. Showers should be replaced with sponge baths.
2. Education of staff and patients—Implementation of existing infection control measures, i.e., hand sterilization, equipment sterilization and aseptic techniques.
3. Targeted surveillance—Monitoring infection rates of nosocomial illnesses and contamination levels of water system supplies.
4. Other measures—Heat treatment of water, i.e., maintain hot water at >60°C (although risk of scalding increases). Establish a maintenance schedule to repair and disinfect contaminated water systems at hospital sites including storage tanks, distribution lines, and filtration systems.

Additional other measures include hot water flushing of the plumbing system, chlorination, chlorine dioxide, monochloramine (used exclusively at the municipal treatment level in the United States), copper-silver ionization, UV light, and ozonation. Each method has advantages and disadvantages related to ease of implementation, cost, maintenance issues, and short- and long-term effectiveness. These strategies are not completely effective in the long run because maintenance of systemic disinfection agents at levels that would prevent recolonization and biofilm elaboration is difficult and because biofilm is known to protect microbes against systemic disinfection strategies. With this in mind, point use filtration is recommended as an additional barrier to waterborne pathogen exposure (Cervia, Ortolano, & Canonica, 2008).

Legal Liability, Code Violations & Loss of Public Trust

In countries around the world that have their traditional source in English common law, including Australia, New Zealand, most of Canada, the United States, England, Wales, most of India and a host of other countries, the law and the rights of aggrieved parties have evolved through the doctrine of *stare decisis*. That is, legal liability has been confirmed through precedent of past cases otherwise similar in legal issues and facts. In common law jurisdictions, an injured party or parties (also known as plaintiffs) may bring a legal action against a defendant as a result of failure(s) of some sort by the defendant/wrongdoer. Negligence on the part of a professional is referred to as malpractice, and thus there have been many cases filed over the years related to medical malpractice, nursing malpractice, legal malpractice, and so forth.

Hospitals, nursing homes and medical clinics over the years have been found liable for various forms of negligence. Healthcare facilities have a general duty to keep premises safe and free from dangerous conditions. When a facility fails in this duty, a lawsuit can be brought against it.

Four elements are usually needed to prove negligence in common law jurisdictions: duty of care (requiring all organizations and persons to behave in a reasonably prudent manner, as would reasonable organizations and persons under like circumstances); breach of duty (failure of the defendant to follow the prescribed standard of care); causation (where a plaintiff proves through evidence that an injury occurred as a result of the defendant's negligence); and damages (a demonstration of loss by the plaintiff related to things such as personal injury, permanent physical disability, physical and mental pain and suffering, loss of enjoyment of life, and so forth) (Pozgar, 2012).

In common law jurisdictions, just adhering to local building and hygiene codes may not be enough to exonerate a defendant sued by injured parties, particularly when related to the issue of facility water tainted by a bio-pathogen. For example, in Melbourne, Australia, a plaintiff's bar attorney who specializes in deadly *Legionella* bacteria lawsuits, indicated that just adhering to governmental guidelines has not been enough to protect defendants for not taking all steps necessary to ensure clean cooling towers. In rather graphic language, attorney Eugene Arrocca made the following comments about defendant Royal Melbourne Hospital:

Well at the moment there are tests - they're required to do monthly testing for a total bacteria count, but not for *Legionella*. And we would have thought that given that *Legionella* is the prime killer in these sort of cooling tower mishaps, for the sake of an extra \$50 or even \$100 a month, to conduct a test on *Legionella* to ensure that it's not in the system is money which I think pales into insignificance when you compare it to five months of intensive care for (client) Mr Riali. I mean, my estimate of what it costs to keep a patient in intensive care per day is about \$1,500. You multiply that by five months, and they could have enough tests for the next 50 years (Baggio, 2001).

In countries that follow civil codes (and not common law), strict monetary and licensure penalties can exist for failure of healthcare facilities to maintain safe and clean environments. Further, all healthcare organizations eschew the loss of public trust and patient business when it becomes known that water within the health milieu is compromised. In recent years, the Medicare system and other payers in the United States have refused to provide additional payment for treatment of patients that have incurred a nosocomial infection (infection acquired while in the facility), even if the ensuing medical treatments are lengthy and extensive. This is a trend that may well expand to other countries around the world. Clearly, no healthcare facility can afford to gain notoriety as a source of tainted water and human infection.

The 2010 United States Hospitals Water Monitoring Study

A groundbreaking survey of hospitals in the United States in 2010 revealed important gaps in the monitoring and correcting of sporadic episodes of water contamination by waterborne pathogens, including bacterial, viral, fungal and protozoan parasitic infiltrates (Kozicki et al., 2012).

The research problem centered on the determination as to whether the water supply of community hospitals in the United States was being tested by those facilities for waterborne pathogens. In 2010, no reliable measure existed regarding what percentage of community hospitals in the United States were testing for waterborne pathogens, even as these facilities provided acute care service to various kinds of at-risk patients. Approximately 85% of all U.S. hospitals are classified as community hospitals. By definition a community hospital is a nonfederal, short-stay hospital which is usually available to the general public (Shi & Singh, 2012).

A phone survey was conducted in July of 2010 using a structured sample of American Hospital Association (AHA) community hospitals. Hospital facility management was contacted by phone operators from the Central Michigan University Center for Applied Research and Rural Studies (CARRS). The survey for practical purposes was directed to community hospitals that employed facility management in the AHA registry. At the time of the phone survey, this made up of 970 of the 4,897 AHA member facilities. The identity of the hospitals and facility subject matter experts was not made available to the public or to the researchers, in order to protect hospital identity and the persons providing information.

Initial contact with each AHA facility management person was by letter in June 2010. Once the

pilot study was complete, the subject matter expert (SME) at these selected hospitals was contacted by telephone between July 7 to July 29 of 2010 and asked to participate in the survey. When a SME did agree to participate in the survey, this person was interviewed by the CARRS telephone researcher. A structured questionnaire was used to maintain uniformity in the survey process and to eliminate bias and to increase reliability. Confidentiality was maintained by use of a proven system in which the data file with identifying information was kept separately from the data file with interview data. The use of a written questionnaire and trained interviewers increased face validity by making the interview of SMEs systematic. The questions used in the survey had construct validity as they were developed based on literature reviews of waterborne pathogen testing in U.S. hospitals. The conclusions of this study have external validity because the sample in this study is made up of U.S. hospital facility managers.

All 970 AHA hospitals that had a SME were contacted and 393 or 40.52% of the possible SME respondents provided the data for this study. It took, on average, 13 phone calls before the SME was contacted and interviewed by the CARRS surveyor. All hospital SMEs in this study were read the IRB statement before the survey questions were started. Hospitals from all four U.S. regions: West, Midwest, South and North were included in this survey. All participants were informed that the survey was voluntary and that their identity and that of their facility would not be disclosed in the results. All participants agreed to take the survey after the IRB statement was read to them. The responses of these subject matter experts were immediately keyed into a word and data processing computer by the phone interviewer to capture the responses. The collected responses from the national survey were tabulated using SPSS descriptive statistics. The survey provided qualitative and quantitative information. Responses by region can be found in Table 2. The frequency of water testing in U.S. hospital facilities varies with 9.9% conducting daily tests, 8.4% weekly, 1% every other week, 27.5% monthly and 15.8% yearly (see Table 3).

Hospitals from all four regions of the United States were included in this survey (Table 2).

Table 2. Hospital Response by Region – Coded from States

Region	Frequency	Percent
West	69	17.6

n= 393 Adapted from “Waterborne Pathogen Risk Assessment at U.S. Hospitals,” by Z. A. Kozicki, 2011, (Doctoral dissertation, Central Michigan University, 2011), p. 157.

The testing for specific pathogens in water at the surveyed U.S. hospitals can be found in Table 4.

Table 4: Percentage of U.S. Hospitals Conducting Water Testing for Pathogens

Bacteria	Amoeba & Protozoa	Viruses	Fungi
55.5%	21.6%	18.6%	23.4%

n= 393 U.S. Community Hospitals. Adapted from “Waterborne Pathogens: A Public Health Risk in US Hospitals,” by Z. A. Kozicki et al., 2012, *Journal – American Water Works Association*, 104(1), p. 54.

The further breakdown of the 393 hospitals was as follows: rural (46.1%), urban (52.1%), not-for-profit (87.3%) and for-profit (12.7%). Only 57.3% of the hospitals provided additional treatment to water after it was in the facility, and most facilities (89.1%) relied on municipal water treatment. While only 3.1% of the respondents secured water from ground wells, it was this group that was most likely to provide additional treatment of water once it was in the facility (91.7%). A majority of the hospitals (57.3%) provided additional treatment to water after it was in the facility, but treatment modalities varied. A majority (66.2%) of the facilities indicated that they had a written waterborne pathogen plan and 50.1% had a waterborne infection team in place. A follow-up survey using SurveyMonkey took place from November 1 through December 10, 2010 involving 28 facility managers or 7% of SMEs is summarized in Table 5 Facility Water Treatment Method and Table 6 Facility Water Screening Sites.

Table 5: Facility Water Treatment Method (Follow up survey)

Facility Waterborne Treatment Method	Percentage Utilizing This Method
Chlorine Booster	14.3%
Chlorine Dioxide	14.3%
Copper Silver Ionization	19.2%
Hyper Chlorination	7.1%
Super Heating and Flushing	18.5%
Point of Use Water Filters	51%
Ultraviolet	35.7%
Ozonation	3.7%
Sterile Water	42%

n= 28. With 92 %, using municipal Adapted from “Waterborne Pathogen Risk Assessment at U.S. Hospitals,” by Z. A. Kozicki, 2011, (Doctoral dissertation, Central Michigan University, 2011), p. 165.

Table 6: Facility Water Screening Sites (Follow up survey)

Facility Waterborne Screening Sites	Percentage Screening These Sites
Patient Rooms	48.1%
Surgical Suites	53.6%

n = 28. Adapted from “Waterborne Pathogen Risk Assessment at U.S. Hospitals,” by Z. A. Kozicki, 2011, (Doctoral dissertation, Central Michigan University, 2011), p. 165.

All significant findings are by chi square (X^2) at $p < 0.05$; $n = 393$.

- Municipal water is the likely choice of both rural and urban facilities in this U.S. national study.
- Facilities that have municipal water are less likely to test for bacteria, amoeba, protozoa, virus and fungi and have a waterborne infection team than facilities that have ground water.
- Facilities that provide additional disinfection for water used in the surgical department are more likely to have a waterborne pathogen infection team
- If a facility provides additional treatment for ground water it is also more likely to test for bacteria, amoeba, protozoa, virus, fungi, pharmaceuticals and have a waterborne infection team.
- Facilities are more apt to conduct daily, weekly, every other week, monthly, and yearly water testing if they have a written plan to do so.
- Facilities are more apt to conduct daily, weekly, every other week, monthly, and yearly water testing if they have a waterborne pathogen team.

- Facilities in the Midwest and Northeast are more likely to conduct waterborne pathogen testing than facilities in the South or Western region of the United States.
- Facilities that provide training for clinical and/or non-clinical staff regarding waterborne pathogen management are more likely to test for bacteria, amoeba & protozoa, viruses, fungi and pharmaceuticals.
- Facilities that are more likely to train clinical and nonclinical staff regarding waterborne pathogens have a written plan for managing waterborne pathogens.
- Facilities that are more likely to train clinical and non-clinical staff regarding waterborne pathogens have a waterborne infection team.
- Training of clinical and/or non-clinical staff about waterborne pathogen management is more likely to happen in urban versus rural facilities.

It is recognized that human enteric pathogens are known to cause widespread waterborne disease in the United States. The cost is estimated to be \$20 billion a year in lost productivity. Worldwide waterborne disease is estimated to account for nearly 6,000 deaths per day, mostly in children (WHO/UNICEF, 2000). Even though there is an understanding of the microbes in the environment and their association with disease, much progress has yet to be made in actually ending the threat of waterborne pathogens to human health (Reynolds, 2003, October).

It is indeed unfortunate that there is no accurate “national record-keeping” in the United States of how many illnesses are caused by contaminated water. It is even more tragic that this situation is endemic worldwide. Hospital acquired infections (HAIs) are a problem for all hospitals, everywhere, and it is generally unknown how many HAIs are caused by tainted water in drinking water sources, air conditioning units, cooling towers, showers, sinks, baths, water decorations, potted plants and so forth. The resultant cost to hospitals around the world is increased patient co-morbidities and mortalities, and compromised clinical outcomes. See Table 7 for information about common opportunistic pathogens found in United States drinking water.

Table 7: Some Common Opportunistic Pathogens Found in United States Drinking Water

Organism	Prevalence in drinking water	Disease manifestation/infection route	Other comments
<i>Pseudomonas aeruginosa</i>	Up to 24%	Urinary tract, wound and skin infections, burn victims, pneumonia, respiratory tract infections in cystic fibrosis patients	Estimated to account for 10-20% of nosocomial infections – Highly resistant to disinfectants.
<i>Aeromonas hydrophila</i>	Up to 27%	Wound infections, septicemia, and diarrhea	Widely distributed in the environment.
<i>Mycobacterium</i> spp.	Up to 70%	Respiratory, intestinal and generalized infection in HIV patients. Rarely documented pulmonary disease in immunocompetent hosts	2nd most common cause of death in HIV-positive patients
<i>Acinetobacter calcoaceticus</i>	Up to 38%	Bloodstream infections, pneumonia, bacteremia	
<i>Flavobacterium meningosepticum</i>	Traced to water sources	Neonatal meningitis, adult septicemia	
<i>Legionella</i> spp.	Up to 33%	Pontiac fever, Legionnaire’s Disease, respiratory infection	Aerosol route – Isolated in drinking water samples. Frequently colonize in water distribution systems

RECOMMENDATIONS

In the absence of clear standards around the world, the authors recommend the following as proper protocol for healthcare facilities policy makers to consider for medical standards within their jurisdictions everywhere:

- 1) A regimen of at least weekly internal surveillance of all water usage within all healthcare facilities;
- 2) The antiseptic treatment internally within the healthcare facility of all drinking water systems and surgery and dialysis water;
- 3) The development of a written plan of water surveillance and water quality maintenance in each healthcare facility; and
- 4) The development of a waterborne pathogen team in each hospital and major clinical setting.

Further, it is recommended that the World Health Organization and all major governmental public health and nongovernmental organizations (NGOs) dedicated to international health develop a set of guidelines that would be recommended to all healthcare facilities around the world. The authors believe that the four protocols stated above would serve as a rational framework in which to open the discussion in all healthcare facilities about preventing waterborne nosocomial infections. Whenever possible, healthcare organizations should be leaders in the advancement of regional standards for monitoring aquifer water quality, as underground water reserves often overlap various political and geographical boundaries.

CONCLUSIONS

There are sound moral and business reasons for hospitals and healthcare facilities in all countries to strive to eliminate any and all sources of waterborne pathogens as they arise. Further, it is time for international consensus to be reached on this issue so that the detection of pathogens in healthcare facility water sources are regular events, and the treatment of issues are immediately and effectively handled. The cost savings to healthcare facilities will be tremendous, as will the mitigation of avoidable human misery, illness and death. At minimum, all healthcare facilities must begin to test regularly the water they provide in their facilities and take appropriate action to reduce nosocomial infection.

LEADERSHIP, COMMITMENT AND TEAMWORK: A CASE STUDY OF THE BRAZILIAN MILITARY ORGANIZATION

Paolo Rosi d'Ávila and Fátima Bayma de Oliveira
Fundação Getúlio Vargas, Brazil
Anderson de Souza Sant'anna, Fundação Dom Cabral, Brazil

ABSTRACT

The present study aimed to investigate leadership, organizational commitment, and teamwork in a military organization of the Brazilian Army. This may result in the offer of opportunities for perfecting selection, training programs and human resources preparation to peace missions for the United Nations. Firstly, theories regarding leadership, organizational commitment, and teamwork were revised. Later, face-to-face interviews were carried out from November 1st to 5th, 2012, and information was collected in a specific military organization of the Brazilian Army. Research tool was submitted to a panel of nine judges (n=9) and later applied to a group of 70 participants (n=70). Data was collected over the internet, and content analysis was carried out by means of Sphinx Software. Leadership, Organizational Commitment and teamwork were categorized on the grounds of the dimensions discussed in the theoretical review section of this study. The results show that a quantitative investigation via multivariate analysis involving the studied constructs would be promising, thus being of scientific research interest.

INTRODUCTION

The literature on leadership comprises a wide range of works involving its effects on organizations. However, few of them concern investigations over the relationship between leadership, teamwork and organizational commitment. This study aims to delve into the theoretical foundations of leadership, commitment and teamwork and the complex interrelations amongst these variables, since clarifying them may provide support to improve the organizational environment and work performance. As regards leadership approaches, the following aspects were investigated: situational leadership (Hersey and Blanchard, 1982), transformational transactional model proposed by Bass and Avolio (1990) and Leader-Member Exchange-LMX approaches (Graen & Cashman, 1975; Graen, Cashman, Ginsburgh & Schiemann, 1977; Scandura & Graen, 1984). As far as teamwork is concerned, theoretical approaches to substantiate the characterization of working teams and Team-Member Exchange-TMX (1995) were emphasized. The approach to organizational commitment applied the model proposed by Allen and Meyer (1991), specifically when it comes to affective, normative and instrumental categories in order to understand how related it is to the leadership process. A survey was conducted in the Brazilian Army, with the participation of 70 volunteer respondents (n=70) who were serving in a Brazilian military organization, and it aimed to analyze respondents' perception regarding the above-mentioned theoretical contributions.

THEORETICAL FRAMEWORK

Leadership

Studies regarding leadership have put forward many advances elsewhere, which may be proven by the increasing production of quality publications in other countries as opposed to what happens in Brazil. Carrying out theoretical-empirical research in the scope of leadership processes is perhaps an excellent opportunity for producing subsidies to educators, researchers, administrators and professionals who need a well-founded theoretical framework to this topic, as well as the scientific language per se. Fiedler (apud Hersey and Blanchard, 1986, p.118) also carried out investigations over this theme and proposed the

leadership contingency model, wherein consideration structures would swap with initiation structures. Upon comparing these two approaches, the former may be regarded as more individual-centered and fosterer of social relations, whereas the latter seems to take into consideration relationship factors and empowering situations, thus being more task-oriented. Although these references put forward important contributions to understanding leadership, it is also worth exploiting other theoretical approaches in order to have a broader view and theoretical consistency on this subject. The knowledge of approaches based on behavioral, contingency, transactional and transformational traces may contribute to the discussion of the general research problem. According to Tannenbaum *et al.* (1961, p.44), and in an analysis of leadership literature on situation, those term have been used in several ways to denote an activity, or a determined series of activities to which the group is committed; group characteristics, including interpersonal relationships; goals or group needs; and the cultural context. Tannenbaum *et al.* (1961) also define leadership as something that comprises the aspects of objective contexts that would consciously or unconsciously impact attitude or behavior over individuals as regards influence relations. The author recognizes that leader's and follower's situation may differ in many aspects. The situational approach gathered expressive notoriety by the time the trace-based and the behavioral leadership approaches proved to be insufficient to provide a theoretical framework that would be suitable for explaining the leadership phenomenon. Tannenbaum *et al.* (ibidem1, p.42) suggest that any Global Leadership theory may take three aspects into consideration: 1) the leader and their psychological attributes; 2) the follower, with their problems, attitudes and needs; and 3) the group situation, wherein followers and leaders relate to each other. According to the definition proposed by Tannenbaum *et al.* (op.cit. p.42), leadership would be defined as the interpersonal influence applied in a situation, by means of the communication processes in order that a goal or specified goals are met. It is possible to observe that a specific behavioral style should be adapted to a so-called target situation in order to become effective. The adoption of a task-oriented style, together with a specific orientation towards the individual, could be effective in a given situation, but not in another. This observation is endorsed by a study carried out in Nigeria (apud Hersey & Blanchard, 1986, p.106), which observed that task-oriented supervisors tended to reach high productivity by means of strict supervision. One possible conclusion is that there is no telling whether leaders' behavioral styles will be effective, for it depends on different elements involved in a situation. For Tannenbaum (1961), the situation may be regarded as an activity or a series of activities to which a determined group is committed; also as the characteristics of the group, including interpersonal relations, goals and needs, as well as cultural context. Hersey and Blanchard (1986, p.165) point out that the style and expectations of the leaders, followers, supervisors, co-workers and the organization are environmental variables capable of influencing the appropriate choice of leadership style, let alone the demands the position entails. By turn, Schein (1982) proposes a diagnostic referential scheme in order to analyze leadership, by taking into consideration the characteristics of leaded individuals and real work situation. Hence, the diagnostic of the leadership situation to be carried out by the leader would involve the leader's perceptions, the leaded individuals' characteristics and the task/situation. Based on this diagnostic, the leader would be able to exhibit behaviors that may or may not obtain the expected results.

Each one of the contingency theories to be discussed in the present paper will highlight a situational aspect deemed relevant according to each approach: 1) Fiedler's theory emphasizes the leader figure; 2) House's Path-Goal Theory presents the way subordinates may attain high levels of performance and rewards; 3) Vroom-Yetton's theory takes into consideration the limits of subordinates' participation in the decision process; 4) Hersey and Blanchard's model highlights the importance of subordinates' level of maturity; and 5) Argyris's model emphasizes leader's behavior. Fiedler (1995) developed a theory according to which the leader's effectiveness would depend upon two pillar aspects: the leader's personality and the level at which the situations are under leader's control. Such situational control would include three dimensions: leader-subordinate relationship quality, formal power position, and degree of task structure. Fiedler (1993) carried out many other studies regarding leadership and is considered to be one of the most prominent researchers in this field. The methodology used by Fiedler (1993, p.4) involved the application of a simple scale that would indicate the level at which an individual describes their last preferable co-worker (CTMP, or LPC) as favorable or unfavorable, i.e., the employee an individual would have most difficulty to work with. After analyzing the research results, Fiedler concluded that someone who accounts favorably for the last preferred co-worker (i.e., granting a high CTMP or LPC mark) would tend to be more human-relations oriented, whereas the case otherwise (i.e., granting a low CTMP or LPC mark) would tend to be regarded as more task-oriented and least concerned with human relation aspects at work. The results in Fiedler's studies (1993) lean towards the contingency hypothesis, according to which task oriented leaders are more effective in situations involving highly favorable or unfavorable teamwork tasks (task-oriented leadership), whereas human-relations-oriented leaders are more effective in average favorability levels (relationship-oriented leadership). Martin G. Evans and Robert J. House (apud Stoner, p.354) developed the Path-Goal model based on an expectation model, in which human's motivation would depend upon the

expectation of reward or its attractiveness. House and associates identified two variables that helped determine the most effective leadership style: subordinates' personal characteristics, and environmental pressures and demands at work place. According to Stoner (1999, p.354), the Path-Goal Theory consists in a leadership theory that focuses on the role of the leader at clarifying how subordinates may achieve high levels of performance and associated rewards. The leader may excel at clarifying the objectives and offering conditions for subordinates to attain them motivated by increasing rewards. This theory focuses on the leader's possibility to interfere in their followers' motivation by means of the availability, the level of reward attractiveness, and the empowerment of expectations, in such a way that it evidences that an effort may result in rewardable performance. The effect of leadership in motivation depends upon environmental characteristics, task and subordinates. The theory at stake relates explicitly to subordinate's characteristics. In this respect, two aspects are worth highlighting: the one related to subordinates' "locus of control", and the perception of the very capacity to accomplish a task.

Accordingly, people who regard themselves as effective agents of their own destiny would have an internal locus of control, whereas those who ascribe the causes of their behavior to external factors would have an external locus of control. Research on leadership and degrees of satisfaction with people from different loci of control suggest that a participative-people-focused leadership tend to appeal more to people with internal locus of control, whereas a counseling-task-focused leadership tends to appeal to people with external locus of control.

Observing the characteristics of tasks and subordinates to better define ongoing situation and leadership developments is significant for performing an effective leadership. Therefore, taking into consideration the level of orientation to be given may depend both upon the degree of task structuring, the level of self-reliance and the locus of control that characterize subordinates.

Concerning the environmental factors that would affect subordinates' preferred leadership styles, the following stands out: 1) subordinates' task nature; 2) the organization formal authority; 3) subordinates' work groups. Vroom-Yetton's model raises an important issue regarding whether the head of an organization assumes a guiding or a participative position with the subordinate before a problem-solving situation. Vroom & Yetton's model (apud Stoner, 355) was developed to help administrators decide how far subordinates should be involved in solutions to specific problems. Hence, a set of norms has been identified in order to guide leaders to adapt their leading style according to circumstance demands. These norms were investigated on the grounds of the effects of participation over satisfaction and performance, as well as of its practical application before the need to decide over the limits of subordinates' participation in a decision making process. In this respect, Vroom & Yetton would help managers decide the extent to which subordinates would be able to take part. Vroom & Yetton's leadership and decision models could be organized within three categories: autocratic, consultative and group. The choice between three alternative levels of participation would be oriented by three results of decision, based on: 1) quality or rationality; 2) acceptance or subordinate commitment to implement the decision; 3) required time for taking a decision. Hersey and Blanchard (1986) proposed a contingency approach wherein the most effective leadership style ranges according subordinate "maturity". This maturity is understood as accomplishment desire, willingness to accept responsibilities, and the capacity and experience related to the task. Therefore, followers' goals and knowledge are seen as important variables when it comes to defining the most effective leadership style. In sum, Hershey and Blanchard believe that the leader ought to know how to adapt the leading style to subordinates' maturity. Hence, four developmental stages with four corresponding leadership styles would be proposed. On the initial stage, when subordinates are inexperienced in the tasks required by the organization, the most appropriate style would be the guiding one, for subordinates would be oriented towards their tasks and would become familiar with the organization rules and procedures. On the second stage of subordinates' development, the leader would adopt a training style, characterized by being task oriented, but with a relative increase in trust and support towards subordinates. On the third stage of subordinates' maturity development, the participation style would be more effective. On this stage, task orientation would decrease, but the support behavior would remain so that subordinates start to assume greater responsibilities. On the fourth stage of development, when subordinates become more self-confident, self-directed and experienced, the leader may reduce task support and orientation, and, thus, adopt a delegation style. In order to perform an effective leadership, the leader must be able to diagnose subordinates' levels of development and be flexible to adopt an appropriate style according to the level of subordinates' maturity. In contrast, Argyris is concerned about the good psychological functioning within organizations, and suggested that several benefits in the work environment could be attained if directors and subordinates behaved more psychologically mature. According to Argyris (apud Schein, 1982), directors and leaders acts are guided by two different theories: 1) a theory characterized by objectives, values and hypotheses that a person claims to guide their behavior; and 2) a theory in use, characterized by implicit

hypotheses that most probably guide individual's behavior. Even though the adopted theories varied considerably, from autocratic approaches to more participative ones, the theories in use could reflect what Argyris called Model I (apud Schein, 1982, p.100), which is grounded on four main hypotheses or, pursuant to Argyris, on four "guiding variables": 1) the hypothesis that an individual should meet their own goals as they see it; 2) the hypothesis that an individual should win instead of losing; 3) the hypothesis that an individual should reduce the emergence of negative feelings in relationships to the minimum; and 4) the hypothesis that an individual should be rational and reduce any emotionalism to the minimum. Argyris (apud Schein, 1982, p.100) affirms that these guiding variables lead to a behavior that aims at the control of one person over the others, which rises self-security to a maximum and produces minimum confrontation regarding any subject coated with emotional load. Hence, some factors came to be regarded in terms of the situation analyses in which leadership could be detected. These factors, investigated by Stoner (1999), and called environmental variables by Hersey & Blanchard (1986), would be: 1) the personality, leader's previous experiences and expectations; 2) superior's expectation and behavior; 3) task demands; 4) peers' expectations and behaviors; 5) subordinates' expectations and behavior; and 6) organizational culture and politics. The situation will be more thoroughly discussed in the leadership contingency approach, regarded as one of the main theoretical perspective of leadership. Bass and Avolio's approach (1993) puts forward two leadership behavioral types: transactional and transformational. Big enterprises, such as IBM, AT&T and GM, have been facing the need to count on transformational leaders when endeavoring to implement short-term changing programs. Burns has been influenced by Bass (1985, apud Smith & Peterson, 1994, p.130), who developed a measuring survey from the so-called transformational and transforming leadership. The transactional leadership would be assessed by two scales called contingency reward and management by exception; whereas the transformational leadership would be assessed by four scales known as charisma (reference power), inspirational motivation (communication, goals and path), intellectual stimulation and individualized consideration. As regards transformational leadership, leaders are able to change target key collaborators' work orientations, in order to foster commitment to the organization.

One of the theorists of this style of leadership is Warren Bennis. The leaders he studied have four competences: management of attention, meaning, trust and self. By managing attention, the leader knows what they want and where they aim to arrive at; they have clear goals and objectives. Meaning management refers to communication and idea transmission, producing a meaning in the environment to any available information. Managing trust takes place via constancy. Bennis (1996, p.82) shows a recent study revealing that people prefer following individuals who they can trust, even bearing different viewpoints, to people who they agree with, but change opinion at any time. By managing the self, the leader knows oneself and attempts to develop their virtues, let alone accepting risks.

Bennis (1997) affirms that the bureaucratic organizational model was ideal for the industrial era, and that the new leadership paradigm is comprised of alignment, which consists in creating shared goals at human resources level; creation, in the sense of being adaptive and creative, experimenting solutions and learning with own mistakes; empowerment, which is based on trust and credibility to individuals, systemic communication, and collective engagement, since collaborators should feel the importance of their participation and contribution to something meaningful that involves commitment.

In particular, military leadership is studied by authors like Janowitz (1967), Sepúlveda (1996) and Souza (1996), who attempted to explore more thoroughly the organizational culture, the specificities of military leadership, and the leader's profile. William (1983) pinpoints four influential aspects associated with military leadership: organization authority, moral authority, technical capacity, and charisma. Although the contributions put forward by these authors are highly pertinent, especially Bennis's (1997), lifting foreign leadership models to apply in our culture is not enough. Questions should be raised over the leadership paradigm to be implemented in the Military Forces to date, in particular in Brazil, taking into account members' cultures, characteristics, objectives and beliefs, let alone the trends in the world today. With regard to the approaches, Situational Leadership by Hersey & Blanchard (1969), Bass transformational approach (1985) and approaches of Leader-Member Exchange LMX (Graen & Cashman, 1975; Graen, Cashman, Ginsburgh, & Schiemann, 1977; Scandura & Graen, 1984) were investigated. Rejecting the linear approach to leadership ("one best style"), Hersey & Blanchard present their own "tri-dimensional leadership effectiveness model" which adds an effectiveness dimension that shows how leadership style is related to the environment and situation to achieve maximum effectiveness. (S. Novit, 1971) The Situational Leadership approach discusses the dimensions of Situational Leadership (task behavior and relationship behavior) in terms of observed behavior. According to these researches, it would be appropriate for leaders to adopt differing styles of leadership depending upon the specific problem or circumstance. Thus, leaders should analyze subordinates' emotional maturity and chose the most adequate

style of leadership considering the circumstances, sometimes providing socio-emotional support or delegating when necessary. (Hersey & Blanchard, 1982, Hersey and Blanchard, 1993). Situational leadership is a contingency theory. It focuses on the followers and hypothesizes that successful leadership is achieved when leaders select the right leadership style and consider the followers' readiness. Readiness is defined by Hersey & Blanchard (2000) as the extent to which people have the ability and willingness to accomplish a specific task. Situational leadership uses two dimensions identified as task and relationship behaviors, but takes a step further by considering each one as either high or low, and combining them into four specific leader behaviors: telling, selling, participating, and delegating. The final component in Hersey and Blanchard's theory is defining four stages of follower readiness: R1 (unable and unwilling/insecure); R2 (unable and willing); R3 (able and unwilling/apprehensive) e R4 (able and willing). (Hersey & Blanchard, 2000)

Newman faces emotional labor as the component of dynamic relationships between two people (worker and citizen, or worker and worker) and states that Alice Rivlin outlined emotional labor as one of requirements of successful leadership in a 2003 conference of the American Society for Public Administration. The situational approach to leadership (Hersey and Blanchard, 1969) reflects these skills. This leadership model requires leaders to adapt and fit their styles into subordinates' competence and commitment (Newman, Guy, & Mastracci, 2009).

The robustness and pragmatic utility of Situational Leadership proposed by Hersey & Blanchard was criticized by Graef (1993) because of its challenges, logical and internal inconsistencies, conceptual ambiguity, incompleteness, and confusion associated with multiple versions of the model.

Despite these criticisms, Yukl (1989) makes reference to the value of Hersey and Blanchard's theory in the sense of treating individual subordinates differently as the situation changes and of being aware of opportunities to build subordinate confidence and skills. According to Castro & Benatui (2007), the transformational leadership presented by Bass (1985) describes the effects that the leader produces over their followers. Leaders with transformational characteristics cause changes in their followers, being aware of the importance and value that outline the results obtained after performing the assigned tasks. Leaders encourage followers to transcend their personal interests under the objectives of the organization. When transformational leadership occurs, it would be possible to build an environment of trust and respect amongst the members of the group, who become motivated to achieve more than what was originally expected. This is why it is usually thought to be more comprehensive and effective than the transactional type. However, leaders can use both types of leadership according to different situations. CELID Questionnaire (Leadership Styles Questionnaire-Castro Solano, Nader & Casullo, 2004) is a 34-item questionnaire that synthesizes the theory of leadership Transformational / Transactional Bass (1985) and requires the respondents to read the behaviors and attitudes listed in it. The hypothesis to be verified in the study developed by Castro & Benatui, 2007 suggests that young people with transformational leadership profiles, combined with transactional aspects are those who have a high academic and military performance. The study counted on 412 participants (n=412) cadets undertaking graduation in a military institution that belongs to the Argentine armed forces.

The dimensions evaluated in the instrument are Transformational Leadership, Transactional Leadership and Laissez Faire. The Transformational Leadership has four sub domains: 1) charisma or idealized influence, being the respect for the leader who wants to be imitated and instills high levels of expectation in their followers; 2) Inspiration, being the degree to which the leader energizes fans providing a future vision, objectives and purpose; 3) intellectual stimulation, being the leader's actions related to intellectual stimulation for fans to solve problems creatively to new challenges and obstacles; 4) individualized consideration, being the support that is provided to the follower, paying attention to their personal developmental needs.

The Transactional Leadership has two sub domains: 1) contingency reward is an interaction between leader and follower guided reciprocally. The leader identifies followers' needs and makes a compromise between group needs and individual, by rewarding or sanctioning in terms of objective fulfillment; 2) Management by exception: the leader intervenes only when they have to make corrections or changes in followers' behavior. In general, interventions that are negative and critical to the objectives are not diverted from their course.

The Laissez Faire dimension represents the absence of any kind of transaction. The leader avoids making decisions, is not responsible and does not use their authority. It is considered to be the most ineffective leadership. Three distinct groups could be verified in the results found by Castro & Benatui

(2007): 1) the profiles of more complete spectrum are related mostly to high academic, high practical intelligence and high abstract reasoning; 2) the predominantly transactional leadership profiles are mostly related to low academic performance, average military performance, low practical intelligence and lower abstract reasoning; 3) The predominantly transformational leadership styles have average academic and high military performance. Future studies should evaluate the relationship between leadership styles and successful performance in the real-life situation of professional officers. Solano (2009) intended to test two hypothesis in civil and military contexts about the personal and collectivist influence on the style of transformational leadership. The first hypothesis is that the transformational organizational culture, personal and organizational values, which can be seen as collectivist, affects the transformational leadership style. The second hypothesis is that the transactional organizational culture, personal and organizational values that can be characterized as individualistic affects the transactional leadership style. The results of the work oriented by Solano (2009) showed that transformational civic leaders are influenced by culture, while transformational military leaders are influenced by personal and organizational values. Finally, transactional civilian leaders report to be influenced by the organizational culture while their co-military colleagues report to be influenced by organizational values.

It is important to mention the notion of values because they can be related to different styles of leadership, effectiveness and value system. In the field of Leadership, it is possible to consider the importance of values in the context of the studies developed by Burns (1978), who stated that when you refer to leadership you also refer to values. Solano (2009) has used the above-mentioned CELID Questionnaire (Leadership Styles Questionnaire-Castro Solano, Nader & Casullo, 2004), but has also applied the Portrait Values Questionnaire (Schwartz, 1987, 1992, 1994, 2000, 2001; Castro Solano & Nader, 2006) and Organizational Description Questionnaire (ODQ) (Bass & Avolio, 1992; Nader, Lupano Perugini & Castro Solano, 2006). The Portrait Values Questionnaire (Schwartz, 1987, 1992, 1994, 2000, 2001; Castro Solano & Nader, 2006) is a scale to measure human values consisting of 40 phrases that describe certain attitudes or ways of interacting with different people by means of a wide range of topics (money, pleasure, traditions, etc.), and it can be evaluated in two different dimensions. The first one contrasts the importance of personal interests to achieve collective goals (Self-Transcendence) to behaviors against those who seek to prioritize their own interests (self-promotion). The second dimension includes behaviors that focus on safety and order (Conservation) against others which value the independence of actions and thoughts (Openness to change). Collectivist interests (the values that prevail in a society have to do with serving the interests of the entire community) can be defined as individualistic (aspects related to personal development and success) or mixed.

Organizational Description Questionnaire (ODQ) (Bass & Avolio, 1992; Nader, Lupano Perugini & Castro Solano, 2006) is designed to evaluate the type of organizational culture, modeled on Bass and Riggio (2006) and consisting of 28 items (n=28) that are answered true or false. The leadership approach on the Leader-Member Exchange consider *role making* (Graen, 1976) to be the dynamic of process that create social structures (Weick, 1969) amongst persons in hierarchical organizations. In the research developed by Scandura & Graen (1984), *role making* involves leader-member exchanges that have been observed as a consistent pattern characterized by leader-member transactions. Depending on the exchange for positional resources from a leader, the member commits oneself to higher degrees of involvement in the function of the unit. The source of influence can involve highly valued outcomes for both superior and member. The superior can offer outcomes of increased job attitude, influence decision making, open communications, and support member's actions, confidence and consideration (Scandura & Graen, 1984).

Scandura & Graen (1984) studied LMX status in dyads on the effectiveness of a dyadic leadership intervention in a study that designed the leadership training which enables and encourages supervisors to improve the dyadic exchange relations with their members through the use of a normative and behavioral model of dyadic exchange.

Three hypotheses were considered:

- "Hypothesis 1. Members having initially low-quality LMX will show more positive effects on overall job satisfaction due to the leadership intervention than their initially higher quality cohorts.
 - Hypothesis 2. Members having initially low-quality LMX will show more positive effects on supervision satisfaction due to the leadership intervention than their initially higher quality cohorts.
 - Hypothesis 3. Members having initially low-quality LMX will experience more positive effects on productivity due to the leadership intervention than their initially higher quality cohorts."
- Scandura & Graen (1984, p.429)

As a result, the effects of leadership intervention were perceptive and indicated that employees having initial poor-quality exchanges were mostly affected by the intervention, increasing productivity and

satisfaction in response to the improved LMX. Scandura, T.A. & Schriesheim, (1994) developed a scale which has items for leaders and subordinates in order to evaluate Leader-Member Exchange and this scale was translated into Portuguese and applied in Brazilian military organizations.

Cogliser, Schriesheim, Scandura, & Gardner (2009) used a sample of 285 matched pairs of employees (n=285) and supervisors, explored the extent to which congruence in leader and follower ratings of LMX quality was related to follower job performance and work attitudes. The researchers observed that balanced/low (high) LMX relationships were associated with relatively low (high) levels of follower job performance, organizational commitment, and job satisfaction, while the incongruent combinations generally yielded intermediate levels of follower outcomes.

The organizational culture is defined as the values and beliefs shared by members of a particular organization and can be identified two types of organizational culture: transactional and transformational. The relations that prevail in transactional organizations are usually contractual, based on bureaucratic structures and communication systems where is predictable verify that the interests of the organization are more important than the interests of the employees. In transactional organizations the commitment is usually short term; work motivation is driven by personal interests; cooperation depends upon the negotiation and the employees work alone in order to attend regulations and rules. The Transformational Culture in organizations generally present structures that are more flexible, informal and dynamic, encouraging teamwork and personal growth, and favoring long-term goals and the commitment of the members. Leaders and followers generally share mutual interests and visions of the organization (Bass and Avolio, 1992, apud Solano, 2009).

Solano (2009) concludes that future research should firstly delve into culture at all levels for the purpose of generating more knowledge on this variable and measurement tools. The research instrument that was employed in the present study may detect types of values, as well as intellectual, emotional and behavioral skills that can be associated with the dimensions studied by Solano Castro & Benatuil (2007) and Solano (2009) in the specific context of peacekeeping forces. It may also be useful for workout programs in leadership skills and allow for enhancing efficacy in military contexts. Oliveira, Sant'Anna & Vaz (2010) have carried out a study in the states of Minas Gerais and Rio de Janeiro (Brazil), whose main goal was to investigate themes, issues and challenges that emerge from key position holders in the public sector of both Minas Gerais and Rio de Janeiro governments. The research employed NVivo 8 software to analyze the qualitative data collected therein, and concluded that it was possible to group the main issues and identifiable challenges according to the relations between public administration and new leadership. The study also allowed for identifying a list of competency attributes required from the manager and leader of the public sector.

Organizational Commitment

The work carried out by Mowday, Porter and Steers (1979) sought to develop and validate a commitment scale that could be used as a tool to measure worker's commitment in organizations. The tool developed by Porter and associates, known as *Organization Commitment Questionnaire (OCQ)* relied on a study involving 2563 employees (n=2563) within nine different organizations (n=9), whose results were regarded as satisfactory in terms of tool reliability and internal consistency. The levels of predictive validity, convergent validity and discriminant validity were deemed acceptable.

In this study, Attitudinal Commitment would represent a state in which the individual would identify oneself with a given organization and its objectives, thus evidencing ones' intention to remain connected to the organization so as to facilitate attaining one's goals. For the purposes to which the tool was developed, commitment was defined as the identifying forces of an individual with a determined organization, which could be characterized at least by three factors: 1) a strong belief in accepting the organization objectives and values; 2) an inclination to exert considerable effort in the name of the organization; and 3) a strong desire to remain in the organization as a member (Mowday, Porter e Steers, 1979, p. 226).

Meyer, Irvin & Allen (1998) tested the hypothesis that the influence of precocious experiences at work to organizational commitment would be moderated by the value assigned to these employee experiences. The values assigned to work were measured in two groups of university graduates before entering the organization, wherein work experience measures were taken into consideration as well as three

compromising forms (affective, continuity and normative, according to Allen and Meyer, 1990), let alone other types of measuring after entering the organization. Regression analysis showed that personal values and experiences interact in the affective commitment prediction and in the normative commitment, but the nature of interaction is diverse for different combination of values / work experience. The research made advances regarding the applied methods, inasmuch as it resorted to a set of alternative procedures that enabled a clearer assessment of joint influences of work values (person) and work experiences over commitment. The results support the hypothesis that there was greater affective commitment amongst those who had positive initial work experiences, and also evidence the effects of interaction between value versus experience. Values and work experiences interact by influencing employees' commitment to the organization.

Bastos (2004) highlights that several studies were developed in order to clarify the reasons for the bonds the employee creates to the organization they work, called Organizational Commitment. The research carried out by Mascon, Bastos and Souza (2012) investigated the standpoint that managers bear the characteristics of a worker who is committed to the organization, and explored the relevance of treating the affective and instrumental dimensions as integrating the same construct, as proposed by Meyer and Allen (1991). On the ground of the organizational commitment theoretical approach, and supported by the cognitive schema concept, the authors characterized the schematic elements that comprise the concept of committed worker from a group of managers, besides exploring the weight of the affective and instrumental elements that integrate this schema.

Research results indicated that the commitment concept is related to its affective basis, the commitment instrumental basis may be regarded as the commitment antithesis, and suggested that extra effort and additional contribution could be regarded as relevant characteristics so that a worker could be deemed committed within the universe of the interviewed managers. The research adopted a qualitative analysis, by means of data content analysis and cognitive mapping to display the results. The authors recognize as research gaps the studies that investigate the commitment concept in the light of cognitive structures, and also point out to the need of widening knowledge over the theme via qualitative studies from the standpoint of Brazilian managers (Mascon et al, 2012).

Teamwork

When it comes to teamwork, theoretical approaches that support the characterization of work groups, as well as the Team-Member Exchange – TMX (Seers, 1989), were highlighted. The construct of team-member exchange quality (TMX) was proposed as a way to assess the reciprocity between a member and the peer group. It should measure the member's perception of their willingness to assist other members, share ideas and feedback and, by turn, define how readily information, assistance and recognition are received from other members. The quality of the team-member exchange relationship indicates the effectiveness of the member's work relationship to the peer group. Team-member exchange would also be related to the leader-member exchange (LMX) construct developed by Graen and his associates (Graen & Cashman, 1975; Graen, Cashman, Ginsburgh, & Schiemann, 1977). The two constructs are similar in that they may be assessed by asking the occupant of a focal role to describe the reciprocal quality of a role exchange relationship (Seers, 1989)

Scandura, T.A. & Schriesheim (1994) developed a scale which has items for employees in order to evaluate Team-Member Exchange and this scale was translated into Portuguese and applied in Brazilian military unit. Zaccaro, Rittman, & Marks (2001) focus on leader-team dynamics of "functional leadership" which asserts that the leader's main job is to do, or get done, whatever functions are not being handled appropriately in terms of group needs. The relationships between members of a team involve reciprocal influence, whereby both leadership and team processes influence each other. The functional leadership approach in terms of 4 superordinate and 13 subordinate leadership dimensions and relate these terms to team effectiveness and a range of team processes. The leader dimensions are: information search and structuring, information use in problem solving, managing personnel resources and managing material resources. The subordinate dimensions are: 1) Acquiring information; 2) Organizing and evaluating information; 3) Feedback and control; 4) Identifying needs and requirements; 5) Planning and coordinating; 6) Communicating information; 7) Obtaining and allocating personnel resources; 8) Developing personnel resources; 9) Motivating personnel resources; 10) Utilizing and monitoring personnel resources; 11) Obtaining and allocating material resources; 12) Maintaining material resources and 13) Utilizing and monitoring material resources.

Ford & Seers (2006) perceived an increasing interest in within-group and adopted a model of study that suggests that within-group agreement on environment is predicted by the quality of exchange relationships, specifically team-member exchange (TMX), leader-member exchange (LMX), social interaction and work interdependence. Results suggest that average high quality LMX and TMX relationships are both predictive of within-group agreement on some measures of environment. The results also support the notion that differentiation in TMX relationships within a team is deleterious to within-group agreement on environment.

Tse, Dasborough, & Ashkanasy (2008) sought to advance research on interpersonal exchange relationships between supervisors, subordinates, and coworkers at work by integrating social exchange, workplace friendship, and climate research to develop a multi-level model. The researchers tested the model using hierarchical linear modeling (HLM) with data obtained from a sample of 215 manager-employee dyads working in 36 teams. At the individual level, leader-member exchange (LMX) was found to be related to workplace friendship. Workplace friendship was positively related to team-member exchange (TMX) and mediated the LMX-TMX relationship. At the team level, HLM results indicated that the relationship between LMX and workplace friendship was moderated by affective climate. These findings suggest that high-quality LMX relationships are associated with enhanced workplace friendship between employees, especially when the affective environment is strong.

METHODOLOGY

The present study consists in investigating the constructs of Leadership Organizational Commitment and Teamwork, and it aims to orient future studies involving eventual existing relations amongst different work group members in organizations. Therefore, this is an exploratory study which aims to discuss the theme inserted in the context of military organizations.

A Company of Marines employed by the Brazilian Army, heretofore named “Alpha”, was involved in data collection. Both the commandment of the military organization and all participants freely agreed to take part. Sample choice took into consideration that the military organization has been employed over two years in support operations to homeless after Rio de Janeiro Região Serrana on January 12th, 2011, as well as Pacification Operations at Complexo do Alemão, a favela located in Rio de Janeiro in 2011 and 2012. In all, 143 invitations (n=143) to take part in the research were sent to militaries of the chosen organization, characterizing the volunteering nature of their participation. 75 male participants (n=75) agreed to take part, resulting in an answer rate of 52,44%. The reason why 100% participants were male is explained by the fact that no woman was selected to engage in operational combat in the studied subunit.

The questionnaire was submitted to a panel of nine judges (n=9), who assessed how participant-friendly was the research tool. The surveys were made available to respondents over the internet. Sphinx software was employed in order to identify military's beliefs regarding Leadership, Team Work, Commitment, Human Relations and tasks that contribute to effectiveness in job.

The applied measures were obtained via data collection found in the research tool, which guided the answers to the following open questions:

1. What does the position of team leader entail?
2. In your current activity, what does teamwork entail?
3. In your opinion, what is a person committed to ones' own work team like?
4. In your current activity, what tasks would you consider most important to your team success?
5. What do you regard as important to interpersonal relationship in your work team?

A content analysis was carried out in order to investigate leadership constructs, teamwork, and organizational commitment, the results of which are displayed on Table 1. Table 1 displays the results of content analysis with respect to leadership construct analysis in terms of the dimensions of Leader-Member Exchange-LMX model (Scandura & Graen, 1984).

Liderança_LMX_AC				
Mutual Trust	28	28,9%		28,9%
Respect	28	28,9%		28,9%
Obligation	41	42,3%		42,3%
Total	97	100,0%		

Table 1. Leader-Member Exchange-LMX (Scandura & Graen, 1984).

The results disclosed on Table 1 provide evidence that all dimensions discussed in the scientific literature were contemplated, which refers to the Leader-Member Exchange-LMX model (Scandura & Graen, 1984). Table 2 displays the results of content analysis related to Organizational Commitment.

Comprometimento				
Affective attachment	59	72,8%		72,8%
Normative Commitment	22	27,2%		27,2%
Continuance Commitment	0	0,0%		0,0%
Total	81	100,0%		

Table 2. Commitment (Allen & Meyer, 1990)

The results disclosed on Table 2 provide support to the proposition that normative and affective dimensions were contemplated; however, no answer related to continuance dimension was ascertained. Table 3 displays the results of content analysis related to the analysis of Teamwork construct dimensions within Team-Member Exchange approach investigated by Seers (1989), Scandura, T.A. & Schriesheim (1994), and Seers, Petty, & Cashman (1995). The results disclosed on Table 3 provide support to the proposition that there is a strong appreciation regarding member's contribution of ideas, assistance to other members and recognition to other members, and a low concern towards feedback and member's receipt of information.

RESULTS

The results show that Obligation was regarded as the most relevant dimension to quality change of a leader-member in work teams. The organizational commitment was analyzed in terms of affective, continuance and normative components. No answers that contemplate continuance dimension were ascertained, which may denote a strong intention to be acknowledged as part of the selected group. Concerning teamwork, the most appreciated dimensions were member's contribution of ideas, assistance and recognition to other members, whereas the least appreciated dimensions concerned feedback and member's receipt of information. The results of this exploratory study constitute the basis of a qualitative study that will be complemented by a further quantitative analysis in a second moment. In such, the results obtained by applying the leadership scales Leader-Member Exchange-LMX (Scandura & Graen, 1984), Commitment scales (Allen & Meyer, 1990) and Team-Member Exchange (Seers, Petty & Cashman, 1995) will be analyzed and discussed. The present study will be replicated with the same participants in June, 2013. The objective is to identify possible changes in the shared vision of military members regarding the investigated constructs. The present study should be replicated with other military members of Brazilian military units using the Sphinx software, in order to enhance the comprehension about the investigated constructs.

Trabalho_Equipe_AC_2				
member's contribution of ideas	29	33,0%		33,0%
feedback	4	4,5%		4,5%
assistance to other members	23	26,1%		26,1%
member's receipt of information	6	6,8%		6,8%
recognition to the other members	26	29,5%		29,5%
Total	88	100,0%		

Table 3. Team-Member Exchange (Seers, Petty, & Cashman, 1995)

IMPACT OF ALLIANCE NETWORKS ON FIRM'S INTERNATIONALIZATION

Gilberto F. da Silva and T. Diana L. van Aduard de Macedo-Soares
Pontifical Catholic University of Rio de Janeiro, Brasil

ABSTRACT

Based on previous research into firm's internationalization and the role of alliances or networks in internationalization processes, it is proposed that there are clear motives for firm's engagement in an international alliance network. After a review of the existing literature regarding the influence of networks and alliances in the internationalization process, this paper's aim is to suggest some propositions and a conceptual framework to help analyze the influences of drivers that can explain the engagement of a firm in international alliance networks and positively impact firm's international expansion. Some conclusions and suggestions made for future research are also presented.

INTRODUCTION

Global business has witnessed a growth in alliances as a result of technological development and the globalization of competition (Das and Teng, 2002). Firms are more and more connected to a greater number of partners. Consequently, competition has moved from traditional firm versus firm contests to intergroup competition (Goerzen, 2005; Hitt *et al.*, 2012). In addition, markets are increasingly becoming international networks of relationships (Johanson and Vahlne, 2009), especially of alliances. Indeed, it is believed that participation in international alliance networks influences the speed of an international venture's development and, thus, contributes to its success (Coviello and Munro, 1995, 1997).

A significant number of studies have investigated the reasons for establishing alliances and their role in the internationalization process of the firm. Cases in point are investigations focused on international new ventures (Oviatt and McDougall, 1994), entrepreneurial high-technology firms (Coviello and Munro, 1995), SMEs (Small and Medium Enterprises), manufacturing industries (Musteen *et al.*, 2010), small advertising agencies (Boojihawon, 2007), biotech firms (Al-Laham and Souitaris, 2008; Yu *et al.*, 2011), firms in fashion supply chains (Guercini and Runfola, 2010), and software SMEs (Ojala, 2009). Recently, as more and more firms tend to compete internationally not merely by way of alliances but, also, through alliance networks, including so-called portfolios of alliances (Ozcan and Eisenhardt, 2009), the role and impact of these networks is being increasingly scrutinized.

The objective of this article is to share the results of a bibliographical research that aimed at contributing to these investigations by addressing the following two questions: (1) What are the main drivers that account for a firm's engagement in international alliance networks; (2) How do these drivers influence a firm's international expansion? Specifically, it intends to present some propositions regarding these two questions as well as a framework to help analyze whether these drivers positively influence a firm's international expansion.

The remainder of this article is divided into four parts. First, we give a brief description of the method used to carry out the bibliographical investigation. The main results of the latter are presented in the second part and are followed by propositions pertinent to the research questions. Next, we introduce an analytical framework. In the last part, we make some concluding remarks as well as suggestions for future research.

BIBLIOGRAPHICAL RESEARCH METHOD

The selection of 48 articles from the literature review was performed following the bibliographical research method developed by Villas, Macedo-Soares and Russo (2008). Firstly, two combinations of two key words – alliance \cap internationalization, and network \cap internationalization – were used to perform a journal

– alliance \cap internationalization, and network \cap internationalization – were used to perform a journal articles’ search into the following online sources of academic content: www.jstor.org, www.sciencedirect.com, ehis.ebscohost.com and www.emeraldinsight.com. Two other parameters were added to the literature review criteria: (1) papers published from September 2007 to August 2012 (i.e. a five-year time frame), and (2) the key words could be found either in the title, abstract or key word section of the published paper. From an initial total of 274 papers selected, after analyzing title, key words and abstract, only 15 papers were selected for reading. Eight papers were added to this initial selection due to the authors’ prior knowledge regarding their relevance to the theme investigated.

After analyzing the results of this first search, it was found that the Journal of International Business Studies and the Strategic Management Journal accounted for slightly more than a third of the total articles initially selected. Since these two journals are in the Top 10 business academic journals according to the ISI Impact Factor ranking, it was decided to undertake another bibliographical search specifically in these two journals, but expanding the time frame by five years. This resulted in an additional 41 papers. Also, as a consequence of the analysis of authors’ citations in the papers’ selected, another set of 37 papers were chosen for analysis. After reading these 101 articles some of them were discarded as they were judged not to be in keeping with the objective of the research. As a result, a total of 48 manuscripts, as well as several business strategy books, effectively contributed to the literature review. After describing the process applied to select the relevant papers from the existing literature, we proceeded with the construction of the theoretical basis of this paper.

RESEARCH RESULTS AND PROPOSITIONS

In this section we present the main results of the literature review that led to the formulation of pertinent propositions.

Definitions

First of all, it is important to clarify what definitions were adopted for the research’s central concepts. A firm’s international alliance networks were defined, in accordance with Gulati, Nohria and Zaheer (2000), as *a firm’s set of relationships, both horizontal and vertical, with other organizations — be they suppliers, customers, competitors, or other entities, — including relationships across industries and countries. (It is) Composed of inter-organizational ties that are enduring, [...] of strategic significance for the firms entering them, and include strategic alliances (p.203)*. It is important to note that networks are sometimes called portfolios of alliances. Ozcan and Eisenhardt (2009) define portfolio as the set of direct ties (or linkages) of a focal firm (Das and Teng, 2002), observing that it can also be considered an egocentric network. Alliances were defined in keeping with Gulati (1998) as “voluntary arrangements” (p.293) among two or more independent firms, involving the exchange, sharing or joint development or provision of technologies, products or services. Drawing partly on Stonehouse, Campbell, Hamill and Purdie (2004) a firm’s alliance networks were considered international when it is operating across its national boundaries by way of alliance networks. It is important to mention that international alliance networks include global alliances, or “constellations”, a concept proposed by Gomes-Casseres (1994, 1996) to refer to networks of alliances between multiple rival partners that form the basis of new units of competition. The global alliances in the airline industry, e.g. Sky Team, Star Alliance, are eloquent examples of this type of network. Indeed, in this article, the term ‘international alliance networks’ includes both international alliance portfolios and global alliances or international constellations.

Drivers of Engagement in International Alliance Networks

In this section we present six drivers of a firm’s engagement in international alliance networks that may positively impact its international expansion. Inspired by Patton (1990), we use metaphors to represent these drivers since “metaphors can be powerful and clever ways of communicating findings. As Patton (1990) put it: “some of the classification systems have relied on metaphors as a way of communicating the connotative meaning of analytic categories” (p.400). Pertinent findings in the literature were organized around perceived communalities, resulting in the drivers. For each one, we assigned a metaphorical phrase with the intention of capturing their essence in a hopefully powerful and synthetic manner, as shown in Table 1.

Table 1: Drivers that account for a Firm’s Engagement in International Alliance Networks

-

In the following six sub-sections of this paper we present the results of our bibliographical research that led to the formulation of the six metaphorically phrased drivers, as well as associated propositions.

Bridges to International Markets

When conducting business in a foreign country, a firm has disadvantages vis-à-vis local firms that may undermine its performance and internationalization process. Cases in point are existing governmentally instituted barriers to trade, insufficient understanding of laws, of foreign language, or business practices in foreign countries (Oviatt and McDougall, 1994). On the other hand, when engaging in multi-country alliances, a firm may gain simultaneous access to several foreign markets (García-Canal *et al.*, 2002).

This is even more important in the case of Small and Medium Enterprises – SMEs –, since they tend to have limited (or no) international experience and they do not have the prominence of Multinational Enterprises – MNEs – that usually attract foreign partners (Lin and Chaney, 2007). However, in the case of SMEs, despite their lack of sufficient resources to venture overseas, there is evidence of an increasing trend of internationalization (Al-Laham and Souitaris, 2008; Boojihawon, 2007; Coviello and Munro, 1997; Coviello, 2006; Johanson and Vahlne, 2009; Kontinen and Ojala, 2011a, 2011b; Lin and Chaney, 2007; Manolova *et al.*, 2010; Musteen *et al.*, 2010; Ojala, 2009; Yu *et al.*, 2011), taking advantage of their alliance networks' resources.

At the same time, there is a growing number of International New Ventures (INVs) (Coviello and Cox, 2006; McDougall *et al.*, 1994; Oviatt and McDougall, 1994), defined as business that from their inception seek to derive significant competitive advantage from the use of resources not owned by the firm, but from strategic alliances, to produce sales of outputs in multiple countries (Oviatt and McDougall, 1994).

In summary, be it a SME or not, a firm that apparently would not have the resources needed to undertake an internationalization process, is able to take advantage of its inter-firm alliance networks (Lin and Chaney, 2007) and partnerships to partially compensate this resource disadvantage (Sharma and Blomstermo, 2003). Since networks are considered to be borderless a firm, by engaging in an international alliance network, will ease its expansion into foreign markets (Johanson and Vahlne, 2003). Additionally, business relationships help identify international opportunities, impact on market choice and decrease the importance of the traditional view of having to overcome various barriers when entering a foreign country (Johanson and Vahlne, 2009). Therefore, in the case of firms participating in alliance networks, international expansion would be influenced less by countries' borders and more by the establishment and development of relationships (Johanson and Vahlne, 2003). As a result, firms that are engaged in multilateral network relationships would easily achieve significant international growth (Sasi and Arenius, 2008).

Alliance networks can also trigger initial international expansion in cases where firms that are already internationalized seek out other firms that are not yet internationalized to accompany them abroad (Chandra *et al.*, 2012; Johanson and Vahlne, 2003), extending their business relationships from the domestic market into foreign markets (Johanson and Vahlne, 2003). The existing relationships of the alliance networks generate international opportunities and, moreover, expose firms to other international network ties (Chandra *et al.*, 2012).

Also, the existing social ties may alert the firm regarding existing foreign market opportunities (Ellis, 2000). However, it is worth mentioning that weak ties are considered to be more versatile and diversified than strong ties, generating a larger variety of cues into foreign markets (Sharma and Blomstermo, 2003). The weak tie may be an outsider, or an “unseen” part of the firm's network (Welch and Welch, 1996) that provides access to unforeseen international opportunities.

As a result, new ventures with limited resources would also be able to successfully compete in the international environment (Oviatt and McDougall, 1994). Moreover, even though some parts of the broader network connections may not be visible, they would still be part of the company's capability for international growth (Welch and Welch, 1996). We consequently argue that alliance networks thus function as bridges to cross previously perceived gaps when planning to enter foreign markets. In Table 2, we summarize the most

important findings of the literature review that contributed to the perception of international alliance networks as “Bridges to International Markets”, and that may produce a positive impact on a firm’s internationalization processes.

Table 2: Findings regarding alliance networks as Bridges to International Markets

Alliance networks grant simultaneous access to several foreign markets.	García-Canal, López-Duarte, Rialp-Criado and Valdés-Llaneza (2002)
A firm that would not have the resources to undertake an international expansion would take advantage of its alliance networks to partially compensate this resource disadvantage.	Lin and Chaney (2007) Sharma and Blomstermo (2003)
Alliance networks may alert a firm to existing foreign market opportunities and trigger the initial international expansion.	Ellis (2000) Chandra, Styles and Wilkinson (2012) Johanson and Vahlne (2003)
Existing social ties may alert a firm to existing foreign market opportunities. Weak ties are considered to generate a larger variety of cues into foreign markets than strong ties.	Ellis (2000) Sharma and Blomstermo (2003) Welch and Welch (1996)

It is thus argued that international alliance networks can be perceived as bridges to international markets, notwithstanding which country is referenced as a foreign country, and whether the member is already internationalized or a domestic firm just beginning its internationalization process. When there is such a perception, it is expected that there will be a positive impact on the firm’s internationalization processes. Thus, the following propositions were formulated:

- Proposition 1a: An international alliance network is perceived by a firm as a bridge to the international market.
- Proposition 1b: An international alliance network that is perceived by a firm as a bridge to the international market positively impacts its international expansion.

Smoothers of Constraints

As previously mentioned, a firm that is internationalizing faces constraints such as existing governmentally instituted barriers to trade, or insufficient understanding of laws, of foreign languages, or business practices in the foreign countries (Oviatt and McDougall, 1994). Moreover, a firm can be at a disadvantage because it has limited (or no) international experience, limited resources, and lacks an attractive profile to foreign partners (Lin and Chaney, 2007). Additionally, there are other constraints that influence international expansion such as the lack of necessary investment (Coviello and Munro, 1995; Macedo-Soares and Mendonça, 2010), risks associated to this investment, and time demanded for integration of foreign operations (Coviello and Munro, 1995; Lin and Chaney, 2007).

Managers perceive that international alliance networks may be a source of value creation to the firm, derived from the pool of resources and capabilities generated by the network’s members (Goerzen, 2005). Alliances in the foreign market that may be formed with local firms, industrial partners, or financial partners (García-Canal *et al.*, 2002) may also help overcome the lack of knowledge of local culture and institutional norms (Hitt *et al.*, 2012), supplying knowledge on foreign markets and clients (Sharma and Blomstermo, 2003), solving unexpected problems (Lin and Chaney, 2007) faced when investing in unfamiliar foreign environments, and reducing the risk involved in going abroad (Sharma and Blomstermo, 2003). In summary, these are some of the reasons why a firm attributes its competitive advantage to international alliance networks (Lin and Chaney, 2007).

Participation in networks not only drives internationalization (Coviello and Munro, 1997; Goerzen, 2005), but may also contribute to obtaining political and financial support (García-Canal *et al.*, 2002), help mitigate and diversify risk (Coviello and Munro, 1997; García-Canal *et al.*, 2002; Lin and Chaney, 2007), contribute to lower necessary investments (Lin and Chaney, 2007; Macedo-Soares and Mendonça, 2010), entry costs (Coviello and Munro, 1995) and organizational costs (Goerzen, 2005), as it can also reduce the time needed for integration of international operations (Lin and Chaney, 2007). Therefore, alliance networks may contribute to the firm’s ability to overcome foreign country market barriers and help enter the foreign market (Johanson and Vahlne, 2003). In Table 3 we summarize the findings of our literature review regarding the perception of alliance networks as “Smoothers of Constraints”, and that also suggest a positive impact on firms’ internationalization processes.

Table 3: Findings regarding alliance networks as Smoothers of Constraints

Participation in an alliance network helps a firm overcome its lack of knowledge of a foreign country's culture and institutional norms and provides knowledge of foreign markets and customers.	Hitt <i>et al.</i> (2012) Sharma and Blomstermo (2003)
Participation in an alliance network contributes to reducing overall entry costs and the investments needed to undertake international expansion.	Coviello and Munro (1995) Lin and Chaney (2007) Macedo-Soares and Mendonça (2010)
Participation in an alliance network contributes to reducing the time needed for integration of international operations.	Lin and Chaney (2007)
Participation in an alliance network contributes to reducing and diversifying the risk associated with an international venture.	Coviello and Munro (1997) García-Canal <i>et al.</i> (2002) Lin and Chaney (2007) Sharma and Blomstermo (2003)

Therefore, it is contended that participation in alliance networks can be perceived as smoothing the prior perceived constraints to firms' internationalization, notwithstanding which country is referred to as a foreign country, and whether the firm is already internationalized or just a domestic firm beginning its internationalization process. Moreover, this perception is expected to positively impact the firm's internationalization process. Thus, we formulated the following propositions:

Proposition 2a: An international alliance network is perceived by a firm as a smoother of constraints related regarding its internationalization process.

Proposition 2b: An international alliance network that is perceived by a firm as a smoother of constraints to its internationalization process, positively impacts that firm's international expansion.

Accelerators of Initial Expansion

The involvement in international alliance networks also promotes rapid international growth (Coviello and Munro, 1995, 1997). One of the ways in which international expansion is accelerated is through the establishment of alliances with local partners (local alliances) to enter into new markets (García-Canal *et al.*, 2002).

According to the literature, this network effect that promotes rapid international expansion is influenced by several factors. Generally, higher network cohesion was found to inhibit the internationalization of certain ventures based on technological alliances, although, in the case of marketing alliance networks cohesion has promoted the initiation of foreign sales (Yu *et al.*, 2011). On the other hand, no relationship was found between geographical dispersion of ties and internationalization speed (Musteen *et al.*, 2010). Also, language congruency was found to play an important role within the international alliance networks. As intuitively expected, linguistic congruency, for example, between SMEs' top executives and the partners of their international ties accelerated firm's internationalization (Musteen *et al.*, 2010).

Whether the internationalization was client-led or market-driven, network relations influenced the patterns of international growth (Boojihawon, 2007). However, this network influence was moderated by some factors. Firms owned by families that presented a low degree of family involvement in their strategy used strategic alliances networks to speed up their internationalization process. This was not observed in the case of firms presenting a strong involvement of the family member (Fuentes-Lombardo and Fernández-Ortiz, 2010). On the other hand, in the case of EMNEs (Emerging Country's Multinational Enterprise), rapid internationalization was a reflection of an exogenous factor: the recent changes in the global business environment (Ramamurti, 2012).

Table 4 summarizes the main findings of our bibliographical research regarding the perception of alliance networks as "Accelerators of Initial Expansion" and suggest they may produce a positive impact on a firm's internationalization processes.

Table 4: Findings regarding alliance networks as Accelerators of Initial Expansion

The involvement in international alliance networks promotes rapid international growth through establishment of alliances with local partners.	Coviello and Munro (1995, 1997) García-Canal <i>et al.</i> (2002)
The involvement in international alliance networks promotes the initiation of foreign sales.	Yu <i>et al.</i> (2011)
Linguistic congruency with international ties accelerated firm's internationalization.	Musteen <i>et al.</i> (2010)

Therefore, it is claimed that the participation in alliance networks can be perceived to increase the speed of the initial international expansion into a foreign country, independently of which country is referenced as a foreign country, and despite the fact that the firm is already internationalized or a domestic operating firm

starting its internationalization process. It is also expected that this perception positively impacts the internationalization process. We, thus, formulated the following propositions:

Proposition 3a: An international alliance network is perceived by a firm as a factor that accelerates the initial expansion into the foreign country.

Proposition 3b: An international alliance network that is perceived by a firm as a factor that accelerates the initial expansion into the foreign country positively impacts a firm's international expansion.

Providers of Valuable Membership

Since foreign country alliance networks are not comprised of firms that are not participants (Johanson and Vahlne, 2003) and because markets are considered to be networks of relationships (Johanson and Vahlne, 2009), insidership in an important international network is necessary for successful internationalization (Johanson and Vahlne, 2009, 2011). Therefore, a firm that does not belong to a certain network is called an outsider of the network and faces the "liability of outsidership" (Johanson and Vahlne, 2009, 2011), due to the fact that it cannot take advantage of the resources provided by the network and does not have access to markets created by network members.

This insidership advantage is even more fundamental because participants of a network perceive that the developed relationships are not easily replaceable (i.e. high switching costs) (Larson and Starr, 1993), and also because it takes time to develop the dense network of socioeconomic ties (Johanson and Vahlne, 2003; Larson and Starr, 1993) that are characteristic of international alliance networks. Specifically, firms that are INVs (International New Ventures) face other types of liabilities: the liabilities of newness and smallness, since they very often do not have the necessary means to acquire all resources required for internationalization (Coviello and Cox, 2006). However, it was observed that firms overcame such liabilities by engaging in alliance networks that enhanced their resource and knowledge base (Loane and Bell, 2006). Moreover, firms that form a cross-border strategic alliance with local partners may benefit from their knowledge of foreign country's idiosyncrasies such as local market knowledge, sources of local capital funding, legal procedures and politics (Hitt *et al.*, 2012). Therefore, firms that are members of alliance networks do not have to go to great lengths to collect country specific institutional knowledge (Sharma and Blomstermo, 2003). Moreover, these network ties are even more useful in cases when firms face greater variation or diversity in their international operations (Lindstrand *et al.*, 2009).

Similarly, SMEs usually face greater competition in the host market than larger firms due to a lack of local knowledge and lack of resources (Lin and Chaney, 2007) needed to properly promote the expansion in the foreign country. Therefore, to be a member of an international alliance network should always be a key concern for a firm aiming to expand its local operations to foreign markets or to further expand its international operations. Every internationalized firm has a certain level of dependency on resources controlled by other firms (Johanson and Mattsson, 1987), that influence the internationalization process. Moreover, to be a member of an alliance network is also a way of accessing unforeseen foreign markets opportunities, since the firm "can be found by other firms that have already identified international opportunities" (Chandra *et al.*, 2012, p.95) and because "each foreign client is a source of new ties and new knowledge" (Sharma and Blomstermo, 2003, p.750). An interesting example of this insidership paradigm was given by Hatani (2009): a group of Toyota's suppliers decided to establish subsidiaries in Tianjin (China) after they discovered Toyota's intention to build an assembly plant in the area. By the time Toyota had come to an agreement with the local government, there were already 18 units of Toyota's traditional suppliers in the area pre-clustering around the "virtual assembly plant". These firms aimed to be prepared to supply Toyota in its foreign venture and to concede no opportunity to local competitors, building industrial facilities that seemed over scaled for local demand, but adequate for Toyota's forecast future demand. Table 5 presents a summary of the findings of our literature review regarding the perception of alliance networks as "Providers of Valuable Membership", and that may produce a positive impact on firms' internationalization process.

Table 5: Findings regarding alliance networks as Providers of Valuable Membership

Firms perceive that there is an insidership advantage necessary for successful international expansion.	Johanson and Vahlne (2009, 2011)
Firms overcome liabilities of newness and foreignness by engaging in alliance networks that enhance their resource and knowledge base.	Loane and Bell (2006)
A firm that forms a cross-border strategic alliance with local partners may benefit from their knowledge of foreign country's idiosyncrasies such as local market knowledge.	Hitt <i>et al.</i> (2012)

sources of local capital funding, legal procedures and politics.	
Alliance network ties are even more useful in cases when a firm faces greater variation or diversity in their international operations.	Lindstrand, Eriksson and Sharma (2009)
Participation in an alliance network grants access to unforeseen foreign markets opportunities.	Chandra <i>et al.</i> (2012)

Hence, it is argued that to be a member of an international alliance network can be perceived to be a key concern for successful international expansion into a foreign country, notwithstanding which country is referenced as a foreign country, and whether the firm is already internationalized or a domestic firm just starting its internationalization process. Also, as the firm is engaged in an international network (i.e. it is an *insider*), a positive impact is to be expected on its international expansion. The following propositions were thus formulated:

- Proposition 4a: A firm's participation in an international alliance network is perceived to provide valuable membership advantages.
- Proposition 4b: The Valuable Membership provided by an alliance network is perceived by a firm as having a positive impact on its international expansion.

Safer and Guided Paths

The internationalization process that involves the use of alliances or networks is said to differ significantly from the traditional one (García-Canal *et al.*, 2002). The business contacts within the network provide the initial trigger for internationalization (Coviello and Munro, 1997), influence foreign market selection, entry mode decision (Coviello and Munro, 1995, 1997; Coviello, 2006) and may either facilitate or constrain new product developments and market diversification (Coviello and Munro, 1997). Chandra *et al.* (2012) noticed that domestic and international networks also shape cross-border venturing activities, opportunity identification and development, configuring a path-dependent process.

Firms tend to adopt a similar international entry mode to their other network partners (Lin and Chaney, 2007). However, this does not prevent some SMEs from choosing a market as a result of product strategy or of requirements for implementation of after-sales support for local customers, without any influence of the network (Ojala, 2009). Nevertheless, firms tend to use their existing network relationships to promote initial expansion in the early phase of internationalization (Ojala, 2009; Sasi and Arenius, 2008), to find new partners, to increase their attractiveness (Sasi and Arenius, 2008) or to build new relationships in order to achieve further international expansion (Ojala, 2009).

With respect to the identification of potential linkages to be established in the local market to promote internationalization into the foreign country, general business contacts were perceived as the most relevant, followed by local customers, the sales force of local customers and existing partners (Coviello and Munro, 1995). Besides, it was noted that participation in alliance networks increased firms' survival rate (Lee *et al.*, 2012) and that some customers provided firms with a secure step into an uncertain foreign market, supporting their international expansion (Boojihawon, 2007). Moreover, suppliers may also provide safe steps to an international expansion by enhancing opportunities to exploit identified local market trends, and by supporting firms in the provision of follow-up services by the co-development of customized local solutions (Macedo-Soares and Mendonça, 2010).

Finally, the literature suggested that firms may also take advantage of their membership in multi-country alliances by using alliances to improve their international competitiveness in multiple countries (García-Canal *et al.*, 2002). However, the process is "co-evolutionary, gradual and based on feedback" (Sharma and Blomstermo, 2003, p.705), with the stock of resources and knowledge provided by current ties allowing the firm to further expand its network ties and broaden the international expansion of its activities. The findings of the literature review regarding the perception of alliance networks as "Safer and Guided Paths", and that also suggest a positive impact on a firm's internationalization processes are summarized in Table 6.

Table 6: Findings regarding alliance networks as a Safer and Guided Paths

Business contacts within the network influence foreign market selection.	Coviello (2006) Coviello and Munro (1995, 1997)
Domestic and international networks shape cross-border venturing activities.	Chandra <i>et al.</i> (2012)
Domestic and international networks shape opportunity identification and development.	Chandra <i>et al.</i> (2012)

A firm tends to take a similar international entry mode to its other network partners.	Lin and Chaney (2007)
A firm tends to use its existing network relationships to find new partners.	Sasi and Arenius (2008)
A firm tends to use its existing network relationships to increase their attractiveness.	Sasi and Arenius (2008)
A firm tends to use its existing network relationships to build new relationships in order to achieve further international expansion.	Ojala (2009)

Thus, it is contended that firms that are members of an international alliance network tend to follow an internationalization path that is guided by the internationalization profile of the network members, regardless of the fact that the firm is already internationalized or a domestic firm starting its internationalization process, ensuring a safer path and positively impacting international expansion. Consequently, we formulated the following propositions:

- Proposition 5a: A firm that is a member of an international alliance network tends to follow an internationalization path guided by the alliance network.
- Proposition 5b: A firm that is a member of an international alliance network and follows an internationalization path guided by the alliance network, perceives this path to be safe.
- Proposition 5c: A firm that is a member of an international alliance network and follows a guided internationalization path that is perceived to be safe, has a more successful international expansion.

Circle of Trusted Relationships

The firm's participation in alliance networks offers a potential for building relationships based on trust and commitment. Both these attributes are required in the process of building joint assets (Johanson and Vahlne, 2011) and are considered preconditions for internationalization (Johanson and Vahlne, 2009), especially because the existing relationships are perceived to be very important for obtaining initial credibility when entering into foreign countries (Coviello and Munro, 1995).

This process of developing a relationship based on mutual trust and commitment is evolutionary and characterized by the fact that it does not imply formal agreements, merely a common history of joint business experiences (Johanson and Vahlne, 2009). It is, however, a very delicate process, since it may be jeopardized by any decision a partner takes without considering the other partners' interests. This possibility is even more critical in the case of international alliance networks due to the diversity and worldwide scope of the latter's relationships (García-Canal *et al.*, 2002), which could lead to partner misconduct that is complicate to manage.

Nevertheless, firms continue to establish alliance networks based on mutual trust and commitment that act as important drivers of international expansion. This is also the case of SMEs (Boojihawon, 2007), family firms (Kontinen and Ojala, 2011a) and INVs (Coviello, 2006), where trusted relationships act as a the main reason to internationalize, providing a firm with a secure step into an uncertain foreign market (Boojihawon, 2007) and acting as a strategic resource for dealing with local market idiosyncrasies, especially in cases where the market is perceived as "distant" from the firm's traditional markets (Guercini and Runfola, 2010). Alliances with local firms may also legitimate the firm in the foreign market and stimulate third-party referrals, acting as a driver for growth and internationalization (Coviello, 2006). Table 7 summarize the findings of our literature review regarding the perception of an alliance network as a "Circle of Trusted Relationships", and that also suggest a positive impact on a firm's internationalization processes.

Table 7: Findings regarding alliance networks as Circle of Trusted Relationships

Trust on the part of alliance network partners is required in the process of building joint assets.	Johanson and Vahlne (2011)
Trust on the part of alliance network partners is a precondition for internationalization.	Johanson and Vahlne (2009)
Trust on the part of alliance network partners is a prime reason to internationalize.	Boojihawon (2007)
Trusted local alliance network partners provide a firm with secure steps into uncertain foreign markets.	Boojihawon (2007)
Trust on the part of local alliance network partners acts as a strategic resource for dealing with local market idiosyncrasies, especially in cases where the market is perceived as "distant" from the firm's traditional markets.	Guercini and Runfola (2010)
Trust on the part of local alliance network partners stimulates third-party referrals, acting as a driver for growth and internationalization	Coviello (2006)

Therefore, it is contended that trust on the part of alliance networks partners is a necessary driver for a firm's internationalization, independently of which country is referred to as a foreign country, and despite the fact that the firm is already internationalized or a domestic firm starting its internationalization process. Furthermore, this trusted local alliance network is expected to positively impact firm's internationalization process. Thus, we formulated the following propositions:

Proposition 6a: An international alliance network is perceived by a firm as a circle of trusted relationships.

Proposition 6b: The firm's participation in an alliance network that is perceived as a circle of trusted relationships ensures a positive impact on its international expansion.

On the basis of the results of our bibliographical research, and with a view to identifying the main drivers that account for a firm's engagement in international alliances, we propose a draft framework to help analyze whether these drivers positively influence its international expansion.

ANALYTICAL FRAMEWORK

As mentioned in the previous section, we identified six drivers in the literature that supposedly account for firms' engagement in international alliance networks:

- (1) Bridges to International Markets,
- (2) Smoothers of Constraints,
- (3) Accelerators of Initial Expansion,
- (4) Providers of Valuable Membership,
- (5) Safer and Guided Paths, and
- (6) Circle of Trusted Relationships.

It was also argued that if alliance networks are perceived as representing either one, or more, of these drivers, they will independently contribute to a positive impact on firms' international expansion. Therefore, as a result of the analysis presented above and inspired by some International Business (IB) studies that have discussed frameworks (Javalgi and Martin, 2007; Malhotra and Hinings, 2010; Welch and Welch, 1996), we tentatively drafted the conceptual framework presented in Figure 1. The objective was not only to assess whether the different drivers influenced firms' international expansion, but also the relative impact of these drivers on the latter.

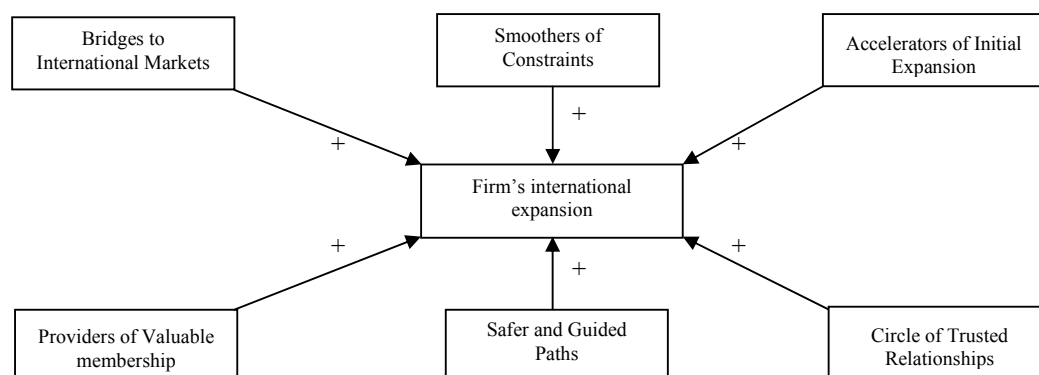

Figure 1: Drivers that account for firms' engagement in international alliance networks and impact firms' international expansion.

As shown in the framework by the positive signs, each driver is expected to have a positive impact on firms' international expansion. The overall results of these impacts are graphically represented by the arrows and the positive signs. On the other hand, if an empirical study discovers that a driver does not influence international expansion in a specific context, this box and the respective arrow should be withdrawn from the framework. It should be highlighted that we are not proposing any of the five existing alternatives to measure the level of a firm's international expansion, as mentioned by Hennart (2011). The objective of our theoretical framework is primarily to analyze if the driver is perceived as having a positive impact on a

firm's international expansion, but not the extent of this impact. In the next section we present some final considerations and suggestions for further research.

CONCLUSION

By reviewing the literature on the internationalization of the firm and on the role of alliance networks in internationalization processes, we hope to have contributed to highlighting some important drivers that might account for a firm's engagement in international alliance networks and positive impact on the performance of its/their international expansion. We also formulated some propositions regarding these drivers that could be tested in the scope of future empirical research. Despite the fact that some studies have already investigated the impact of alliance networks on the internationalization process (Al-Laham and Souitaris, 2008; Boojihawon, 2007; Coviello and Munro, 1995; Guercini and Runfola, 2010; Musteen *et al.*, 2010; Ojala, 2009; Oviatt and McDougall, 1994; Yu *et al.*, 2011), we did not find any analytical framework that contemplated all the different drivers proposed. Therefore, it is hoped that after testing and refining it, this framework could be a useful tool for managers and researchers to enhance their international alliance network management.

We believe that such a tool can be all the more valuable in the case of a firm from emerging countries, where there is still a great lack of understanding of the impact of alliance networks on the internationalization process (Kiss *et al.*, 2012), as well as regarding the motives that drive managers to engage firms in cross-border alliance networks (Ellis, 2011). Since this study was mainly based on the literature of international networks and alliances, there was no intention of comparing findings from this field of knowledge with that of international entrepreneurship. This could constitute an opportunity for important future investigations. Another suggestion for further research would be to focus on firms that are considered outliers, in order to verify the significance and impact of the above mentioned drivers in the case of such firms.

SOCIAL RESPONSIBILITY IN TECHNOLOGY-BASED ENTERPRISES: A CASE STUDY ON INCUBATED SMEs

Maria Fatima Ludovico de Almeida and Catia Araujo Jourdan
Pontifical Catholic University of Rio de Janeiro, Brazil

ABSTRACT

The objective of this paper is two-fold: (i) to introduce a conceptual model to assess incubated technology-based small and medium enterprises (SMEs) concerning the adoption of ISO 26000 guidelines; and (ii) to demonstrate its applicability through a multiple-case study on selected incubated technology-based SMEs. We believe that the conceptual generic model, due to its flexible, dynamic and systemic characteristics, can be useful not only for incubated SMEs, but also for managers of technology-based incubators, and for business associations, regional and national networks, within the wide context of business incubators. Managers of SMEs, public managers in general and academic specialists can also take advantage of the knowledge generated during this research to improve their strategies towards sustainable development, by adopting in next future the ISO 26000 guidelines.

INTRODUCTION

From the historical and economic perspectives, the growing use of the technology business incubator strategies stems from evidences that industrial innovation has had demonstrable positive effects on regional economic growth. They have been considered a fundamental instrument for supporting entrepreneurship and as the birthplace of some of the most prominent techno poles. The success achieved by these initiatives attracted the attention of government officials, academy and industry representatives, which started to see the technology business incubators' model as a reference for business incubators in general. They attempted to enlarge the previous scopes of incubation policies and programs, going beyond the support to spin-off entrepreneurs.

Within this broader perspective, the support for technology-based start-ups has also encompassed entrepreneurship and young enterprises from the most different segments of economic activity. Following this new path, technology business incubators began to act as supportive instrument of local development policies, by creating new enterprises and strengthening small ones that already existed. Incubators can be classified as mixed use, technology, manufacturing, service, and other (which include community-revitalization incubators and incubators for web-related businesses).

The present work focuses on technology business incubators, here defined as those that nurture young firms whose products, processes or services are generated from the results of applied research, and in which technology represents high aggregated value. Once economic sustainability is an inherent principle to the very conception of the technology business incubators, the challenge is how to improve incubated businesses performance by embedding social and environmental criteria and objectives into strategic and operational processes of incubators and incubated firms.

In Brazilian university incubators, it has been observed that the strategies and procedures for selecting candidates for incubation have been almost exclusively based on technical and economic requirements (including those concerning market prospects). There is a lack of data, studies, and systematic investigation about effective and potential contributions of business incubators for the incorporation of environmental and social dimensions into business strategies of incubated technology-based enterprises.

We assumed that the perception and reality of incubated technology-based enterprises' performance on social responsibility can influence: (i) the creation of new sustainable competitive advantages; (ii) enterprise's reputation; (iii) organizational capacity to attract and retain workers and fulfill their stakeholders' expectations; (iv) maintenance of employees' morale, commitment and productivity; and (v) relationship with companies, governments, the media, their stakeholders and communities in which they operate.

From this perspective, the objective of this paper is two-fold: (i) to introduce a new conceptual generic model to assess incubated technology-based small and medium enterprises (SMEs) concerning the adoption of ISO 26000 guidelines; and (ii) to demonstrate its applicability through a multiple-case study on selected incubated technology-based SMEs.

Initially, we present the theoretical background addressing central themes of the research – small and medium enterprises, social corporate responsibility and performance assessment, with a focus on the balanced scorecard tool. Afterwards, we describe the methodology adopted during the research, and discuss the results and implications for public policies and guidelines for future research.

Aiming to improve the global performance of technology-based incubators and to widen the reach of support to small and medium enterprises generated in these innovation environments innovation and that want to act in a social and environmentally responsible way, the problem to be investigated comes from the following question: “How can one evaluate the adoption of ISO 26000 Standard guidelines by technology-based enterprises nurtured in a university incubator, in Brazil, with the perspective of defining new criteria for selection processes of candidates and performance indicators of incubated enterprises?”

Once the research problem has been defined, the general objective was identified as: “to propose and validate a conceptual model for evaluating how technology-based enterprises nurtured in a university incubator in Brazil have implemented SR guidelines according to ISO 26000 Standard framework, within the perspective of defining new criteria for selecting candidates and assessing incubated enterprises performance”.

THEORETICAL BACKGROUND

As illustrated in Figure 1 below, the theoretical background discussed in this section consists of core and specific themes that support the design of a conceptual framework for assessing corporate social responsibility (CSR) in incubated technology-based small and medium enterprises (SMEs).

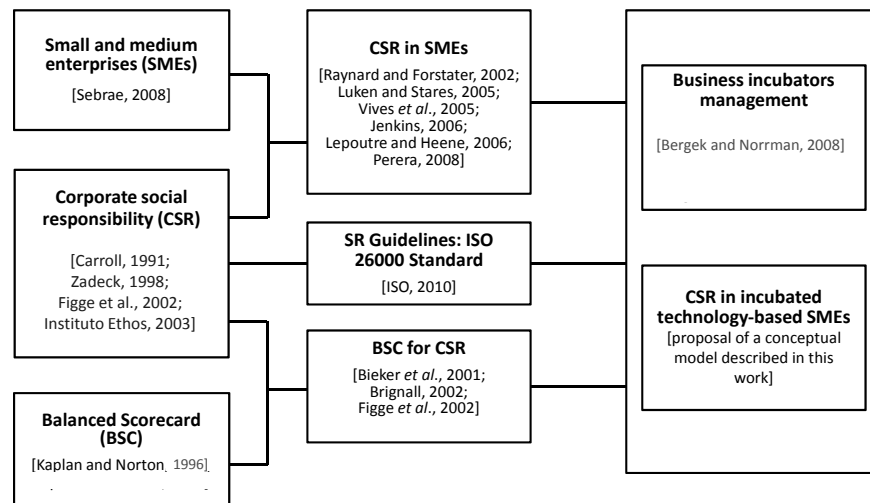

Figure 1: A schematic illustration of the theoretical background components

The basis for the current concept of social corporate responsibility – CSR – were launched by representatives of the World Business Council for Sustainable Development, in 1998, in Holland. Instituto Ethos de Empresas e Responsabilidade Social (Instituto Ethos, 2003) refers to CSR as:

[...] the way of management that defines itself by the ethical and transparent relation of the enterprise as a whole with all of the audiences in which it has a relationship and by the establishment of corporate goals compatible with the sustainable development of society, preserving environmental and cultural resources for future generations, respecting diversity and promoting the reduction of social inequities (p.12).

The concept of CSR was associated to the engagement of the stakeholders and to the corporate sustainability in its economic, social and environmental dimensions, as a resultant of sustainable development from the business perspective. Indeed, this concept has been consolidating itself in a systematic and multidimensional way, with a focus on interdependence and interconnectivity between different stakeholders connected directly or indirectly to the enterprise business. As a matter of fact, corporate social responsibility (CSR) has been pointed as a phenomenon that has led enterprises to rethink their role, their obligations, and, even more, the way they manage their businesses. It can be also defined as a holistic, socially responsible and ethical attitude of enterprises in their relationships, namely with shareholders, employees, communities, suppliers, clients, governments and the environment (Carroll, 1991; Figge et al., 2002, Zadek, 1998; Instituto Ethos, 2003).

The most general and accepted concept of SR refers to four categories defined by Carroll (1991). The Carroll's model includes economic, legal, ethical and voluntary responsibilities. These categories are not mutually exclusive, having on one side economic interests and on the other social interests. The relevance of Carroll's model stems from the basic assumption that social responsibility should not be assessed separately from the economic performance, thus being part of the global responsibility of the enterprise. In this work, we emphasize that enterprises should integrate social and environmental criteria at the normative level of strategic management of their businesses, translating these criteria into objectives and goals, whose results and performance can be measured in a systemic view.

For the definition of small and medium enterprises, we used the classification adopted by Serviço Brasileiro de Apoio às Micro e Pequenas Empresas (Sebrae, 2008): (i) micro enterprise: in the industry, up to 19 people workers; on trade and services, up to 09 workers; (ii) small enterprise: in the industry, from 20 to 99 workers; on trade and services, from 10 to 49 workers; (iii) medium enterprise: in the industry, from 100 to 499 workers; on trade and services, from 50 to 99 workers; and (iv) large enterprise: in the industry, over 500 workers; on trade and services, over 100 workers.

From the literature review, we could find studies arguing that SMEs are better positioned and equipped to support socially responsible behavior than large enterprises. On the other hand, several researchers have argued that, in practice, SMEs present themselves as an obstacle to the implementation of a SR philosophy, comparatively to large enterprises. SMEs' managers point out that they don't have enough time or resources to devote to SR, even the attendance of legal requirements constitutes, at times, a difficulty. The previous empirical works carried out by Raynard and Forstarter (2002); Vives et al. (2005); Lepoutre and Heene (2006); and Perera (2008) reinforced those difficulties and proposed recommendations to future studies, which were considered and discussed during the second phase of this work (multiple-case study).

Balanced Scorecard or BSC is a tool of strategic planning and global performance assessment that became commonly recognized as a system of strategic management, communication and performance evaluation by various organizations all over the world: enterprises, governmental agencies, and institutions of Science, Technology and Innovation (S,T&I). As defined by Kaplan and Norton (1996), the BSC model translates an organization's mission and strategy into a comprehensive set of performance measures that provides the framework for a strategic measurement and management system". This strategic management system measures global performance in four 'balanced' perspectives: (i) 'financial', that summarizes "the readily measurable economic consequences of actions already taken"; (ii) 'market', that contains measures that identify the customer and market segments in which the organization will compete and the measures of the organization's performance in these targeted segments; (iii) 'internal process' that measures the critical internal processes in which the organization must excel; and (iv) 'learning and growth' that measures the infrastructure that the organization must build to create long-term growth and improvement.

With an attempt to apply the BSC model in incubated technology-based SMEs within the perspective of CSR, we will discuss in the next section the potential of the BSC model as an assessment tool for 'measuring' in this particular context the adoption of SR guidelines posed by ISO 26000 Standard (ISO, 2010).

Despite the success experienced by Kaplan and Norton regarding the acceptance of BSC model, since 1996, when their book titled “The Balanced Scorecard: translating strategy into action” was launched, authors as Bieker et al. (2001), Figge et al. (2002) and Brignall (2002) have argued that the use of financial and human resources did not figure anymore as the only determinant factors for promoting competitive advantages. From this perspective, Bieker et al. (2001), Brignall (2002) and Figge et al. (2002) launched a different perspective concerning BSC tool, with an attempt to determine how enterprises can benefit from a ‘Sustainable Strategic Map’, incorporating adaptations to the original concept formulated by Kaplan and Norton (1996). The lack of integration between the three dimensions (economic, social and environmental) on the usual BSC tool still represents an obstacle for organizations incorporating SR objectives and initiatives into their strategies in an effective way.

The creation of a ‘Sustainable Strategic Map’, based upon BSC model, allows organizations to evaluate and implement environmental and social initiatives within a strategic view, at all levels of the corporation. The ‘Sustainable Strategic Map’ also contributes to communicate and transform CSR into a constant, planned and well-measured business issue.

To integrate the social and environmental aspects to conventional BSC, Figge et al. (2002) suggested three alternatives: (i) incorporation of the social and environmental dimensions in three of the original perspectives of the BSC; (ii) creation of a fifth perspective exclusive to the environmental and social dimensions; and (iii) creation of an exclusive BSC for the environmental and social sustainability, but dependent of one of the previous alternatives.

The conceptualization of each alternative reflects the fundamental difference between the three proposals. While the first two integrate the environmental and social aspects to the conventional BSC (with the creation or not of a fifth dimension), the third comprises of a variant that is a derivative of the previous ones. The third proposal is configured as a step before the adoption of a first sustainable BSC, almost as a refinement of this first solution.

Concerning the two first alternatives, Figge et al. (2002) argued that they are not mutually exclusives, and can be used simultaneously, in accordance with the characteristics of strategic environmental and social objectives defined by the organization. Thus, it can be concluded that the choice by an organization among the three alternatives here presented will depend on the social-productive context in which it operates; on relationships with its stakeholders and on its organizational maturity level.

Considering that the context of technology-based SMEs have been generated is a university incubator and also the objectives of the present work, we adopted the first alternative as a basis for designing a conceptual generic model to assess incubated technology-based small and medium enterprises (SMEs), considering ‘Social Responsibility’ perspective. It was assumed, in practical terms, that this alternative was the most simple and easy-to-apply and could effectively help incubated technology-based small and medium enterprises (SMEs) to adopt SR guidelines and to embed SR good practices in their operations, products and services.

In regards to social responsibility guidelines for SMEs, the ISO 26000 standard includes a text directly addressed to SMEs (ISO, 2010 - Section 3.3.4 – Box 3). Although it doesn’t intend to establish any specific orientations to SMEs, this text highlights and articulates aspects of the ISO 26000 standard that can facilitate its interpretation and application by these enterprises and also by technology business incubators. As mentioned before, ISO 26000 Standard was conceived for all kinds of organizations, including micro, small and medium enterprises. Although their individual social and environmental impacts are small, the cumulative impacts of SMEs are highly significant, offering the potential for significant progress towards sustainable development if the SR Agenda can be made more relevant and appropriate for SMEs (International Institute for Sustainable Development, 2004). However, in general, it is reinforced in several works that SMEs can be at the margins of the Social Responsibility Agenda. The existing SR discussion, both in terms of the business case and the tools, is often not conducive to the engagement of SMEs (Raynard and Forstater, 2002; International Institute for Sustainable Development, 2004; Luken and Stares, 2005; Vives et al., 2005; Lepoutre and Heene, 2006; and Perera, 2008).

We assumed in this research that technology business incubators can serve as facilitators for the insertion of effective SR practices on the reality of SMEs nurtured by them, reversing the undesirable signals above mentioned. Since technology business incubators adopt management tools for integrating SR practices

in SMEs nurtured by them, they will be effectively fulfilling their role, as catalyzing agents for developing entrepreneurs within SR perspective.

METHODOLOGY

The methodology adopted during the research project encompasses three main phases, as follows: (i) exploratory phase, comprising bibliographical and documentary review on research central themes, and designing of the conceptual framework; (ii) applied research, focusing on the development of a multiple-case study, involving six technology-based SMEs, incubated in Instituto Genesis (PUC-Rio, Brazil); and (iii) the conclusive-reflexive phase.

In addition, for supporting the multiple-case study development the exploratory phase included a particular documentary research concerning business contexts and profiles of the SMEs selected for the multiple-case study. In this phase, a conceptual model was designed as a basis for the applied research phase. It was an innovative model for assessing how technology-based SMEs incubated in a university incubator have implemented SR practices and initiatives according to ISO 26000 framework (ISO, 2010).

In the subsequent phase – applied research – this model was validated empirically by selected enterprises incubated at Instituto Genesis da PUC-Rio, adopting a multiple-case study protocol, as presented by Yin (2005). Based on Yin's typology, we selected a holistic multiple-case study, considering groups of enterprises that are suppliers of products and services for the followings sectors: (i) energy, oil and gas; (ii) telecommunications; and (iii) environmental area.

The development of the multiple-case study comprised six steps, as follows: (i) selection of the type of case study and delimitation of units of analysis; (ii) elaboration and pre-test of the instrument of field research (descriptive material related to the conceptual model in a didactic format for an easy application by the selected SMEs, through semistructured interviews); (iii) data collection by interviews with the directors of six selected SMEs, data treatment and analysis; (iv) presentation and discussion of results; (v) empirical validation of the conceptual model by the directors of SMEs and the incubator managers; and (vi) conclusions of the multiple-case study, including a set of recommendations and suggestions for future works.

CONCEPTUAL MODEL FOR ASSESSING SOCIAL RESPONSIBILITY IN INCUBATED TECHNOLOGY-BASED SMEs

The conceptual model aims to assess how incubated technology-based small and medium enterprises (SMEs) can be aware of SR importance for creating value for their business and adopt guidelines posed by ISO 26000 Standard. We decided to adopt the ISO 26000 standard as a reference framework for the inclusion of SR business issues into strategic planning and performance assessment of these SMEs for two reasons: (i) the ISO 26000 standard is guidance for all types of organization, regardless of their size or location; and (ii) it may offer supply chain opportunities to SMEs.

Figure 2 represents the general schema of conceptual model for assessing social responsibility in incubated technology-based SMEs.

According to the general view showed in Figure 2, the conceptual model encompasses a sequence of four modules: (i) Module 1 – 'Definition of business model and value propositions'; (ii) Module 2 – 'Selection of SR issues from ISO 26000 framework'; (iii) Module 3 – 'Prioritization of SR initiatives and practices'; and Module 4 – 'Building the Sustainable Strategic Map for incubated technology-based SMEs'.

MAIN FINDINGS

The conceptual model was empirically validated by six selected SMEs incubated at Instituto Genesis (PUC-Rio, Brazil). By means of a multiple-case study protocol, as presented by Yin (2005), managers from the selected enterprises were interviewed for this case study. The SMEs integrate supply chains of relevant sectors in Brazil, as follows: (i) energy, oil and gas; (ii) telecommunications; and (iii) environmental area. In

this section, we present and discuss the multiple-case study findings, with an attempt to answer the following questions:

- What are the most relevant CSR issues that potentially contribute to value creation for firms in the long-run?;
- What are the core themes and subthemes of CRS related to these issues, within ISO 26000 framework?;
- Which strategic SR objectives, initiatives and business performance indicators should be in respective sustainable strategic maps of the selected incubated enterprises, based on guidelines set out in the ISO 26000 framework?.

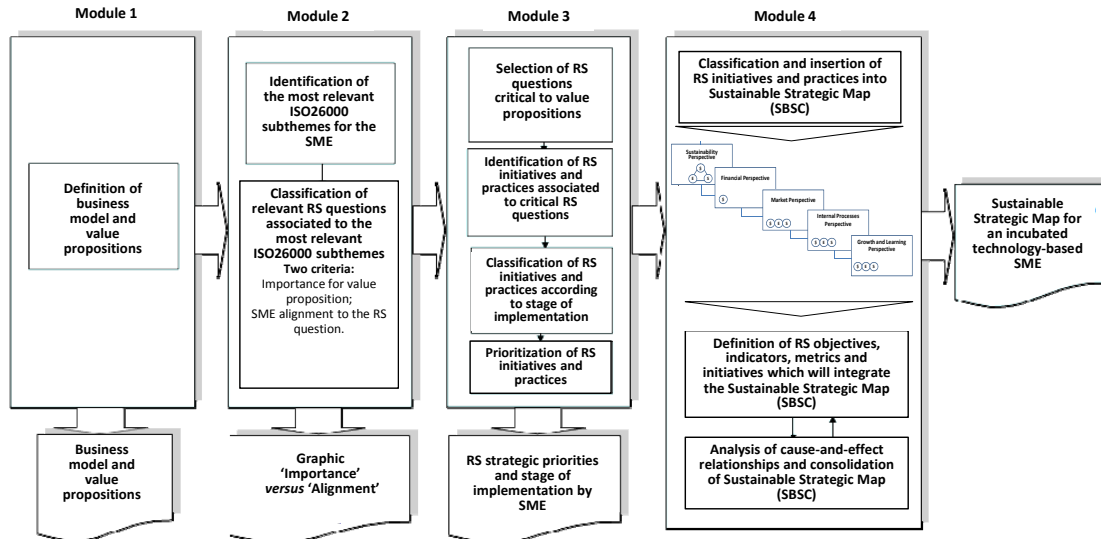

Figure 2: General Representation of Conceptual Model for Assessing SR in Incubated Technology-Based SMEs

Concerning the first question, this multiple-case study allows the identification of CSR issues that most affect strategically the performance of SMEs within SR perspective. Among the SR 345 questions associated to the 36 SR issues that integrate ISO 26000 framework, 45 were considered the most important and strategic for the six incubated technology-based SMEs. From them, 8 questions were indicated as priority by at least 3 SMEs interviewed.

In relation to the second question, the subthemes of CRS related to most important SR Issues for SMEs interviewed are: (i) 'Labor practices', with 16 SR questions considered as priorities; (ii) 'Community involvement and development, with 8 SR questions; (iii) 'Consumer issues', with 7 SR questions; (iv) 'Organizational governance', with 6 SR questions; (v) 'The environment', with 4 SR questions; and (vi) 'Fair operating practices, with 4 SR questions.

The last question refers to CSR strategic goals, initiatives and business performance indicators that should be in respective sustainable strategic maps of the selected incubated enterprises. We came up with a set of 22 CSR strategic goals, 41 initiatives and 57 indicators associated with these initiatives (by computing the common elements only once). From the set of 22 CSR strategic goals, 9 are associated with the 'Learning and Growth' dimension; 11 with the 'Internal Processes' dimension and only two with the 'Market' dimension. These findings indicate a well-balanced distribution between 'Learning and Growth' and 'Internal Processes' dimensions. According to the sustainable BSC rational, it was expected a very few strategic goals and initiatives within the 'Market' dimension. This assumption was confirmed during the interviews.

Focusing on the set of 57 SR indicators directly related to the 41 SR initiatives, 51 are process indicators and only six can be considered outcome indicators. Due to space limitations, the empirical results focusing on the six incubated technology-based SMEs will be not presented in this paper. They were in-depth reported by Jourdan (2011), in her MSc dissertation, and are available for public access and downloading in the following address: <http://www.maxwell.lambda.ele.puc-rio.br>.

CONCLUSIONS

This work aimed to present a new conceptual model to assess social responsibility of incubated technology-based small and medium enterprises (SMEs) aligned to ISO 26000 guidelines. Its applicability was demonstrated by means of a multiple-case study on selected graduated technology-based SMEs which were nurtured in Instituto Genesis (PUC-Rio, Brazil).

It is believed that this model, due to its flexible, dynamic and systemic characteristics, can be useful not only for incubated SMEs, but also for managers of technology-based incubators, and for associations, regional and national networks, within the wide context of business incubators. Managers of SMEs, public managers in general and academic specialists can also take advantage of the knowledge here generated to improve their SR strategies, by adopting in next future ISO 26000 guidelines.

Based on the results here presented, we recommend:

- to apply the conceptual model and support material (templates, graphs etc.) on incubated enterprises in Instituto Genesis (PUC-Rio, Brazil), within the perspective of review its current selection process of candidates and performance assessment of the incubated enterprises;
- to define a national strategy together with the Associação Brasileira de Incubadoras de Empresas e Parques Tecnológicos (Anprotec), Serviço Brasileiro de Apoio a Micro e Pequenas Empresas (Sebrae), Instituto Ethos and Associação Brasileira de Normas Técnicas (ABNT), institutions with potential interest in its application at national level;
- to develop an IT application that allows the diffusion and implementation of this assessment tool to other incubated enterprises (in Brazil and other countries);
- to create a database with the results generated by incubated enterprises from Instituto Genesis, after applying the assessment tool, and utilize non-parametrical statistical analysis for the treatment and analysis of the collected data.

We believe that the conceptual model presented in this work, illustrated by a multiple-case study in Brazil, can contribute to a critical reflection on the ongoing methods used by incubators and incubated firms and, more important, on the real possibilities of applying SR principles and practices within the organizational contexts of university incubators and their incubated technology-based enterprises.

Due to its flexible, dynamic and systemic characteristics, the conceptual model can be useful not only for incubated SMEs, but also for managers of technology-based incubators, and for associations, regional and national networks, within the wide context of business incubators. Managers of SMEs, public managers in general and academic specialists can also take advantage of the knowledge generated during this research to improve their strategies towards sustainable development, by adopting in next future the ISO 26000 guidelines. This is the vision preconized by those who participated in the ISO 26000 standardization process, as follows: “maximization of the contribution of the organization for sustainable development” (ISO, 2010).

APPROPRIATING THE ECONOMIC RETURNS FROM R&D RESULTS AND TECHNICAL INNOVATIONS IN THE BRAZILIAN ELECTRICITY SECTOR

Maria Fatima Ludovico de Almeida and Maurício Nogueira Frota
Pontifical Catholic University of Rio de Janeiro, Brazil

José Tenório Barreto Jr.
Light Electricity Services, Brazil

ABSTRACT

The objective of this paper is to describe a conceptual model for value appropriation of R&D results and technical innovations implemented by electric power distribution, generation and transmission concessionaires in Brazil, within the perspective of contributing to the advancement of empirical knowledge on this subject. An empirical validation of this model was conducted in one of these concessionaires, namely Light Electric Services, in 2011. Specifically, the study sought to: (i) evaluate the appropriability regime and use of value appropriation mechanisms, focusing on four successful R&D projects carried out by Light Electricity Services; (ii) build business models and alternative scenarios for appropriating the economic returns from the referred R&D projects, (iii) formulate appropriation strategies for each R&D project; and (iv) identify associated problems and inadequacies to determine how best to implement the proposed strategies.

INTRODUCTION

Over the past few years, the electric power distribution, generation and transmission concessionaires in Brazil have made substantial investment in R&D, which has demanded improvements in strategies, processes, organizational structures of these firms. More than just meet the requirements of the National Agency of Electrical Energy (ANEEL), concerning R&D activities, it is expected that concessionaires are able to create new knowledge, to innovate more effectively and adapt to changing environmental conditions more quickly and efficiently (Fernandino and Oliveira, 2010).

From the regulatory perspective, the electric power distribution, generation and transmission concessionaires and permissionaires should apply a minimum percent of their net operating income every year in R&D activities, within the 'Research and Development Program for the Brazilian Electric Power Sector'. The obligatory application of these funds is foreseen by law and in the concession contracts. It is up to the Agency to regulate investment in the Program, evaluate and approve the conditions for carrying out research and following up on its results. ANEEL established guidelines and instructions that regulate the elaboration of R&D projects, through the 'Manual for Research and Development Program for the Brazilian Electric Sector'.

According to ANEEL (2012), the quality of a R&D project can be evaluated by two basic criteria: (i) the nature of products developed in relation to scientific creativity and innovative features; and (ii) its potential market application. The second criterion is closely related to appropriability regimes concerning the knowledge generated and also to methods and mechanisms for economic appropriation of R&D results, which will be discussed here.

In this paper, we assumed that new knowledge and technological solutions generated by projects carried within ANEEL's Research and Development Program should bring economic and social benefits for the electricity sector value chain, as a whole, and for the society, in general, justifying utilization of public funds.

Based on this assumption, this paper aims to describe a conceptual model for value appropriation of the results from R&D projects implemented by electric power distribution, generation and transmission concessionaires in Brazil, within the perspective of contributing to the advancement of empirical knowledge about economic appropriation of R&D results. An empirical validation of this model was conducted in one of these concessionaires, namely Light Electric Services, in 2011.

Specifically, the study sought to: (i) evaluate the appropriability regime and use of value appropriation mechanisms, focusing on four successful R&D projects carried out by Light Electricity Services; (ii) build business models and alternative scenarios for appropriating the economic returns from the referred R&D projects, (iii) formulate appropriation strategies for each R&D project; and (iv) identify associated problems and inadequacies to determine how best to implement the proposed strategies. The research, from which this paper was originated, included: (i) development of theoretical background; (ii) survey and discussion of empirical studies on appropriability of results of R&D at the international level, (iii) conceptual modeling of value appropriation of R&D results, considering an environment of open innovation; and (iv) proposal and demonstration of three operational tools, validated within four R & D projects of Light selected for this purpose.

Firstly, we present the theoretical framework and a very synthetic view of empirical literature on this subject, which were of particular interest for the modeling phase, as already mentioned. Afterwards, we describe the proposed conceptual model for value appropriation of R&D results, detailing three tools that integrate it. Then, we discuss the results of implementing these operational tools in the context of four Light/ANEEL R&D projects, and also the benefits and implications for Light Electrical Services, the universities which collaborate with Light, and also for the Brazilian Regulatory Agency.

THEORETICAL BACKGROUND

The theoretical background encompasses the following themes: (i) R&D value appropriation, appropriability regime and mechanisms; (ii) business modeling for innovation and value appropriation scenarios; and (iii) value appropriation strategies concerning R&D results.

A theoretical framework for analyzing the relation between innovation and appropriability was introduced by Teece in 1986. One year later, Levin et al. (1987) studied how firms used a variety of different appropriability strategies including, but not limited to patents (López, 2009). One of Teece's core contributions was to link the question of who can benefit from innovation to the contractual conditions surrounding the innovation, as well as the nature of the relationships between the innovator and others, vertically related asset holders.

In this paper, we define 'value appropriation' as the individual share of the value that a firm can capture from R&D efforts and generated innovations. In addition, to find ways of creating different innovations (and creating value), firms need to focus on the best strategies to generate new knowledge and also to appropriate the value of their R&D efforts and results. In the case of joint innovation among non-competitors (firms and academic institutions, for instance), both value creation and appropriation may be inherently collaborative and collective. By way of illustration, innovations are typically created jointly, and when they are commercialized (possibly also jointly), the results are allocated in accordance with whatever formal or informal contract is in existence. But even, in these circumstances, firms must identify and use proper appropriability mechanisms to protect both the innovation itself and the increased rents due to R&D.

According to Hurmelinna and Puumalainen (2005), the appropriability regime of a firm has been defined as the extent to which knowledge and innovations can be protected from imitators. It consists of appropriability mechanisms – the means to protect both the innovation itself and the increased returns due to R&D (Cohen et al, 2000; 2001). The mechanisms of appropriability of knowledge are diverse and include patents, trademarks, trade secrets and even the time of development and launch of a new product to market (time-to-market). These mechanisms can be grouped according to their legal or strategic nature. Its effectiveness can be verified, both from the standpoint of preventing copying by competitors (replicability), and by consolidating or improving the company's competitive position in the market, by innovation. From

this perspective, these mechanisms will be used by companies to a greater or lesser degree, depending on various external and internal factors, including innovation model adopted by the company, whether open or closed.

Neoschumpeterian authors, as Dosi, Pavitt and Soete (1990), argue that conditions and methods of appropriability vary markedly across countries, industries and sectors. From this perspective, intellectual property rights (IPRs) are considered one of the main mechanisms of appropriability for new knowledge assets, but once they interact with other mechanisms, their importance should be relativized. The appropriability regime represents a combination of effective available means of intangibles and innovations protection, their profitability, and the R&D increased returns (Hurmelinna-Laukkanen and Puumalainen, 2007).

According to Hurmelinna-Laukkanen and Puumalainen's framework, we define the five main mechanisms of appropriability, as follows (Table 1).

Table 1: Appropriability mechanisms

Mechanism	Description
Nature of knowledge	The nature of knowledge has a major role given the availability of other mechanisms. The more tacit the knowledge is, the more difficult is its replication. It may confer greater protection against copying. However, the same feature can also difficult the transfer of that knowledge, or allow to be lost to competitors. On the other hand, for codified knowledge, a certain amount of disclosure is required in writing an enforceable contract or a patent application. Disclosing information may not be possible if the core knowledge is very tacit in nature, however. Similarly, copyright or model-right protection covers only the expression, not the underlying ideas, and therefore the codified, explicit form is critical in terms of the scope and usefulness of the protection.
Institutional protection	Institutional protection includes legal mechanisms of protection such as patents, design registrations, trademarks and copyrights, trade secrets and confidentiality agreements; beyond labor legislation (next item).
Human resource management	The terms of confidentiality between employers and employees, the clauses for avoid knowledge transfer to competitors, and even strategic human resource retention policies constitute ways to protect knowledge. Labor legislation has been also classified into this category.
Practical and technical means	The practical and technical means are those mechanisms used to protect direct access to knowledge and strategic information such as passwords, encryption systems or areas with restricted access. They are effective in protecting the codified knowledge.
Lead time to market	Lead time to market refers to the length of time it takes from a product being conceived until its being available for sale. Lead time is important in industries where products are outmoded quickly.

Given the linkages between the above mechanisms, the appropriability regime may take different forms. According to Teece (1986), a previously diagnosis of the appropriability regime concerning a given knowledge asset may indicate for the firm if the regime is weak, moderate or strong, according to two criteria: (i) legal protection, and (ii) replicability of knowledge, if tacit or codified.

Depending on this initial diagnosis, different appropriability strategies can be implemented, in order to ensure return on investments made during the development of new products or processes. Teece (1986) points out that, in situations where the protection by intellectual property rights (IPRs) is considered strong, the innovator, even not dominating and controlling complementary assets required, will be in an advantageous position to acquire them. Even in situations when the innovator recognized the need for co-specialization of these assets, mechanisms such as licensing and technical assistance contracts allow the formation of supplier networks. Thus, appropriability mechanisms should be seen under a systemic view: patenting with industrial secrets or licensing, transfer of technology and "know-how" from others in order to enable the economic exploitation of innovation. Appropriability can occur mediated by the intellectual property, without establishing restrictions on the innovation process, and may even promote cooperation between the actors in this process, while maintaining its continuity. On the other hand, when the protection by IPRs is considered weak, the competitive strategies should enable innovators to position themselves in favorable conditions in relation to imitators.

The second part of the theoretical framework refers to the concepts of business model and value appropriation scenarios. There is no inherent value to a technology by itself. Its value is determined by the

business model adopted by the firm to introduce the innovation into market. The same technology brought to market by different business models result in different value appropriations. An inferior technology with a better business model will always be better paid than a top technology with an inferior business model.

Based on Zott and Amit (2010), Osterwalder and Pigneur (2010), Teece (2010), Chesbrough and Rosenbloom (2002), business model can be defined as a conceptual framework that depicts the way a company does business with its customers, partners and vendors. The business model framework outlined in this paper is the generic model proposed by Osterwalder and Pigneur (2010). This framework is composed of a set of nine building blocks that relate to each other and that can be classified among four categories, as follows: infrastructure operation; customer relationship; product or process innovation; and financial aspects.

Chesbrough and Rosenbloom (2002) linked this business model framework to the technology management literature and define it as the “heuristic logic that connects technical potential with the realization of economic value,” emphasizing its role in linking technology to market outcomes. To extract value from an innovation, a start-up (or any new venture firm) needs an appropriate business model. Business models convert new technology to economic value. For some start-ups, familiar business models cannot be applied, so a new model must be devised. Not only is the business model important, in some cases the innovation rests not in the product or service but in the business model itself.

Aligned to this perspective, Casadesus-Masanell and Ricart (2010) stress that one important component of business models are the choices in how the organization operates, such as compensation practices, procurement contracts, location of facilities, or assets employed. Regarding the formation of strategic partnerships for innovation, the phenomenon of globalization has been providing firms to better identify partners with complementary assets anywhere in the world and commercialize their technologies in several markets at the same time.

The third and last part of this theoretical background focuses on value appropriation strategies within the context of the adoption of open innovation model by innovative firms.

Open innovation has been considered by Chesbrough (2003) and its followers as a paradigm that assumes that firms can and should use external ideas as well as internal ideas, and internal and external paths to market, as the firms look to advance their technology.

The boundaries between a firm and its environment have become more permeable and innovations can be easily transferred inward and outward. The central idea behind open innovation is that firms cannot afford to rely entirely on their own research in a world of widely distributed knowledge. Instead, they should buy or license processes or inventions (i.e. patents) from other organizations. In addition, internal inventions which were not being used by the owner should be taken outside the firm (e.g. through licensing, joint ventures or spin-offs).

According to Chesbrough (2003), a firm can capture value from an innovation in the following three ways: (i) using the technology in its existing business; (ii) licensing the technology to other firms; and (iii) launching a new venture that uses the technology.

METHODOLOGY

We adopted a methodology based on an action-research approach, due to the nature of the socio-technical problem and the variety of knowledge and skills involved (multidisciplinary). The research methodology comprises: (i) bibliographical and documental review on central themes, namely, appropriability regimes; value appropriation of R&D results; and open innovation; (ii) survey of the empirical literature on the use of appropriability strategies, including the determinants of the propensity to patent, with a view to highlighting the main findings for the modeling phase of the action-research; (iii) design of a conceptual model aiming at effective value appropriation of R&D results, considering an environment of open innovation; and (iv) proposal and demonstration of three operational tools, validated within the context of four Light/ANEEL R&D projects.

As mentioned before, the research method used to guide the conceptual modeling phase was action-research that is an interventionist approach to the acquisition of scientific knowledge (Baskerville and Wood-Harper, 1996).

Action research can also be considered as a kind of transformative methodology (Gobo, 2008), meaning a way of interfering with the state of the object. Thus, an important aspect of the conceptual model

was the participation of those who directly or indirectly contributed to the generation, application and exploitation of knowledge coming from the selected R&D projects. This means that this research also reached Light partners (universities, enterprises and S&T institutions) that have been involved in the development of the four selected R&D projects. This aspect was particularly important during the demonstration phase of the operational tools for effective R&D value appropriation.

CONCEPTUAL MODEL FOR LIGHT ELECTRICITY SERVICES (LIGHT)

Figure 2 represents the conceptual model proposed for Light concerning R&D value appropriation.

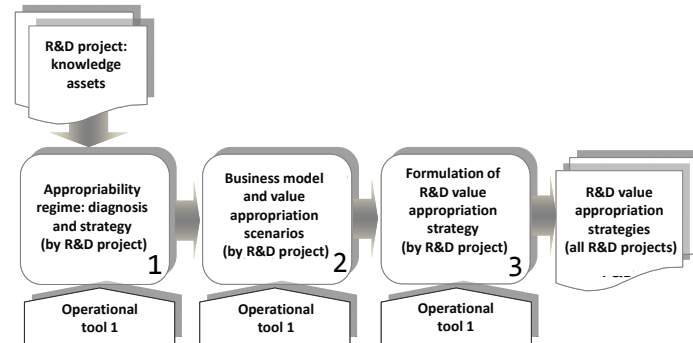

Figure 2: Conceptual Model proposed for Light: R&D Value Appropriation

As the conceptual basis for the proposition of these tools has already been addressed in this paper, we present for each operational tool: (i) their objectives; (ii) schematic representation; and (iii) support questions for their application. Thus, the “Operational tool 1” has the following objectives: (i) to evaluate the appropriability regime and the corporative use of protection mechanisms regarding knowledge assets generated by the selected R&D projects; and (ii) to establish the best appropriability strategy for each R&D project (on a case-by-case basis).

Figure 3 shows schematically the sub modules of the ‘Operational tool 1’ and their interrelationships.

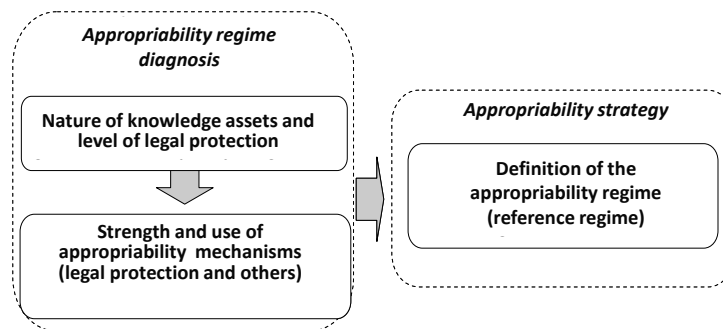

Figure 3: Schematic Representation of ‘Operational Tool 1’

Regarding the 'Operational tool 2', its objectives are: (i) to design the innovation business model, according to the concepts described in previous section; (ii) to generate alternative value appropriation scenarios under the open innovation framework; and (iii) to establish the reference scenario for better defining the value appropriation strategies for Light (on a case-by-case basis).

Figure 4 shows schematically the modules 'Operational Tool 2', their interrelationships and connections with the results obtained from the application of the 'Operational Tool 1'.

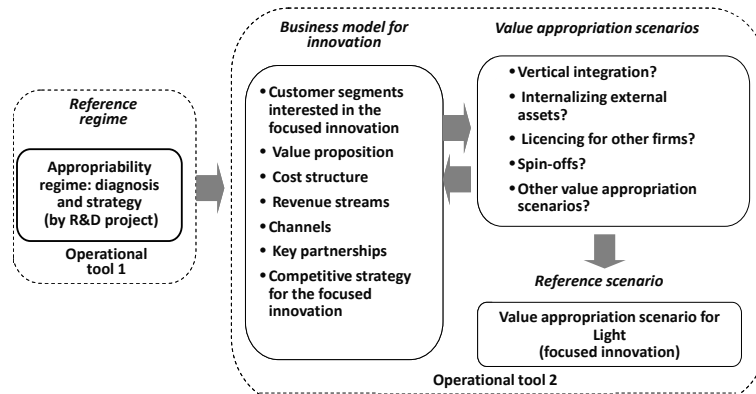

Figure 4: Schematic Representation of ‘Operational Tool 2’

Finally, the third tool refers to the formulation of R&D value appropriation strategies and analysis of critical success factors regarding implementation phase.

Figure 5 shows a schematic representation 'operating tool 3', its components and their interrelationships and connections with the results generated by previous tools application.

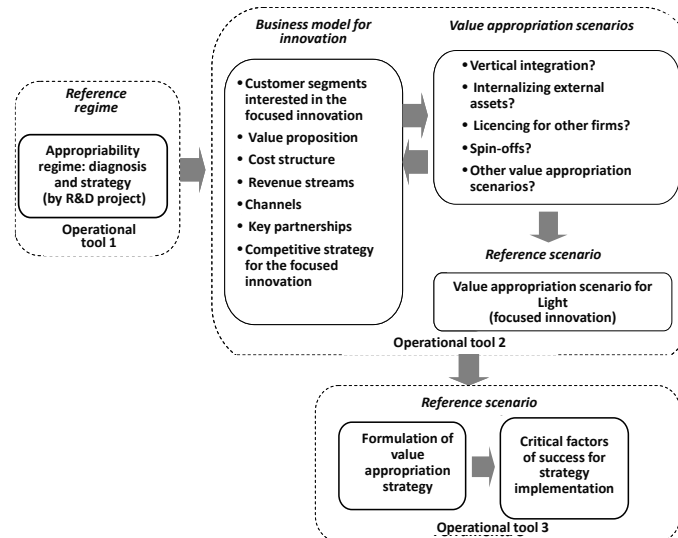

Figure 5: Schematic representation of ‘Operational Tool 3’ integrated to previous tools

MAIN FINDINGS

The model shown in Figure 2 was validated in the context of the four R&D projects, selected according to the following criteria: (i) stage in the innovation chain: R&D successfully completed. Final stages of the innovation chain; (ii) alignment to the ANEEL’s strategic themes and research lines of Light: strong aligned; and (iii) potential market entry: high potential.

Among the Light/ANEEL R&D projects eligible for demonstrating the effectiveness of operational tools proposed, we selected the most promising projects from the perspective of time-to-market of innovations. During the validation stage, two workshops were organized by Light with support of PUC-Rio, bringing together effectively a group of about 20 participants, including Light managers directly involved in the selected R&D projects; and experts from the areas of R&D, Planning and IT of the company. Engineers from external institutions participating in these projects and a representative of the Patent Office that provides support to Light in this area also participated in the two workshops.

During the first workshop, two operational tools were proposed and validated: (i) diagnosis of the appropriability regime and formulation of appropriability strategy for each selected R&D project

(‘Operational tool 1’); and (ii) design of innovation business model and value appropriation scenarios, according to the respective open innovation contexts of selected R&D projects (‘Operational tool 2’).

In the second workshop, it was discussed and validated a tool for formulating value appropriation strategies (VAS) regarding all selected R&D projects (‘Operational tool 3’).

Finally, in the conclusive phase of this research, we formulated recommendations for improving the current Light/ANEEL R&D management process, focusing on issues of appropriability regime and economic value appropriation of knowledge assets generated by its R&D projects.

Regarding the main bottlenecks and challenges concerning value appropriation of R&D results (identified by action-research method during workshops and interviews with Light R&D managers), we pointed out critical success factors around five dimensions of analysis: (i) Light organizational culture for value appropriation of knowledge assets (particularly, R&D results); (ii) use of practices and tools of competitive and technological intelligence; (iii) effective management of intellectual property portfolio; (iv) knowledge management and information systems; and (vii) contracting, licensing and intellectual property issues.

CONCLUSIONS

This research contributed to the advancement of empirical knowledge about appropriability regimes and value appropriation of R&D efforts and results (knowledge assets). Through the validation by managers and experts involved in four Light/ANEEL R&D projects, it was possible to evaluate – in practice – a conceptual model for better appropriation of economic value of these knowledge. With support of three operational tools created especially for Light and ANEEL purposes, the appropriability regime and the use of mechanisms for protecting knowledge assets were assessed, focusing on the mentioned R&D projects.

Concerned with the strength of appropriability regimes – analyzed on a case-by-case basis – it can be concluded that the use, by Light, of legal protection mechanisms may represent a guarantee of exclusive exploitation of new knowledge. However, the economic returns of R&D may be related not only to legal protection of knowledge asset, but also with other strategies that may favor the capture of its value. This can be confirmed by the results of the application of ‘Operational tool 1’ in the context of the four R&D projects.

As mentioned before, the evaluation of different value appropriation strategies necessarily involves the definition of the innovation business model (potential innovation derived from R&D efforts and results). In the cases we analyzed, it was possible to define the respective innovation business models and value appropriation scenarios, using the graphical schema of open innovation funnel (Figures 4 and 9). Therefore, the ‘Operating tool 2’ was validated by Light. After application of ‘operational tool 3’, the best value appropriate strategies regarding the four Light/ANEEL R&D projects could be revealed. Additionally, the main bottlenecks and challenges concerning value appropriation of R&D results could be identified by action-research method during workshops and interviews with Light R&D managers). It was possible to point out critical success factors around five dimensions of analysis: (i) Light organizational culture for value appropriation of knowledge assets (particularly, R&D results); (ii) use of practices and tools of competitive and technological intelligence; (iii) effective management of intellectual property portfolio; (iv) knowledge management and information systems; and (vii) contracting, licensing and intellectual property issues.

The empirical results obtained from the research that originated this paper validated advanced tools for assessing appropriability regime and formulating value appropriation strategies, within the context of open innovation. Albeit limited to four R&D projects, it is believed that the use of such tools can help Light and other concessionaires to define the best strategies of value appropriation of knowledge assets, especially for future projects.

PRODUCT INVOLVEMENT AND ONLINE WORD-OF-MOUTH IN THE SOUTH AFRICAN FAST FOOD INDUSTRY

Christine De Meyer, University of Johannesburg, South Africa
Daniel Petzer, North-West University, South Africa

ABSTRACT

Word-of-mouth (WOM) impacts on satisfaction, loyalty and profitability, while the level of product involvement influences the extent to which consumers engage in WOM. The Internet furthermore allows for the rapid diffusion of WOM. This study investigates product involvement and online WOM in the South African fast food restaurant industry. Data was collected through questionnaires distributed through convenience sampling (n = 264). Results indicate respondents exhibit high levels of product involvement and spread positive WOM to others about their favourite fast food restaurant, but they do not tend to engage in online WOM. Positive correlations exist between product involvement and WOM.

INTRODUCTION

WOM is seen as one of the most effective and credible marketing tools a marketer can use to influence consumer attitude, perception and their purchasing behaviour (Yang, Hu, Winer, Assael & Chen, 2012, p. 952). According to Berger and Schwartz (2011, p. 870) this is especially true in the fast food restaurant industry - the focus of this study. It has been established that consumers exhibit different levels of product involvement depending on the product or service involved. Those who exhibit high levels of product involvement seek continuous information, have high levels of experience and interest in the product, and have the ability to influence other consumers' purchasing behaviour (Wu & Wang, 2011, p. 449). According to Riegner (2007, p. 443), consumers' levels of product involvement influence their levels of word-of-mouth (WOM) engagement. Xue and Zhou (2011, p. 45) explain that due to the increased use of social networking sites on the Internet, increased opportunities for expanding WOM communications through an online forum exist, especially on a global platform. This has led to consumers to share more experiences and opinions based on their purchasing behaviour and engaging in online WOM (Chen, 2011, p. 1). Marketers therefore cannot ignore the role of the Internet in spreading WOM. This study focuses on investigating product involvement, WOM and online WOM. It determines the relationship between these constructs in the fast food restaurant industry of South Africa. The paper provides insight into the industry concerned and reviews the constructs and the relationships between them. After the research methodology and results have been discussed, managerial implications and recommendations are presented.

LITERATURE REVIEW

South Africa's food and beverage industry (which includes the fast food and restaurant sectors) has seen increased sales in the last five years with a 9% increase from 2011 to 2012 (Statistics South Africa, 2012, p. 2, Ntloedibe, 2011). Maumbe (2012, p. 149-150) adds that fast food outlets contributed 30% and employed 24.1% people in the industry. Despite economic woes, the demand for fast food has increased with 25.3 million people purchasing fast food at least once a month (Vallie, 2012). The fast food and restaurant sectors in South Africa can attribute this growth to its adaptation to new market trends (such as healthier food options), technological innovations, demographic changes and increased levels of food safety (Maumbe, 2012, p. 147).

According to Samson (2010, p. 61) "product involvement is the degree of interest of a consumer in a product category on an on-going basis". Xue and Zhou (2011, p. 8) add that it is based on the relevance that a product or service has in consumers' minds based on their needs and interests. Wu and Wang (2011,

p. 449) explain that consumers can experience either high (e.g. risky purchase) or low levels (e.g. low-risk purchase) of product involvement. Consumers who exhibit high levels of product involvement, seek continuous information on the product and have high levels of experience and interest in the product, and will easily influence other consumers' purchasing behaviour (Wu & Wang, 2011, p. 449). Xue and Zhou (2011, p. 52) explain that consumers' level of product involvement will be influenced by WOM communications spread by others. Riegner (2007, p. 443) supports this by stating that WOM will influence consumers who have higher levels of product involvement (such as in the purchase of technology), but is less likely to influence purchases of low involvement products (such as apparel).

According to Ahmad (2012), "WOM may be defined as an informal type of communication between private parties concerning the evaluation of goods and services" (p. 104). WOM includes any form of communication such as, face-to-face, phone or email, and can be expressed as either positive or negative (Xue & Zhou, 2011, p. 47, Goyette, Ricard, Bergeron & Marticotte, 2010, p. 8). WOM is seen as being one of the most effective marketing tools when influencing consumers and their purchasing behaviour (Yang *et al.*, 2012:952) where at least 70% of consumers' purchasing decisions (especially in industries such as food and beverage, banking and technology) are influenced by WOM (Berger & Schwartz, 2011:870). Chen, Wang and Xie (2011, p. 239-240) explain that WOM is characterised by two dimensions, namely intensity and valence. These authors clarify that WOM intensity refers to the volume of messages expressed by consumers (i.e. how often and the amount of information expressed). WOM valence refers to the type of message expressed (i.e. whether the message is positive or negative). WOM intensity and valence are influenced by the type of product as well as the type of consumer – such as a consumer's personality, social class and culture – and will influence other consumers' attention to messages and their purchase behaviour (Nekmat & Gower, 2012, p. 88, Lam, Lee & Mizerksi, 2009, p. 56).

Xue and Zhou (2011, p. 45) explain that due to the increase of people using social networking sites on the Internet, the opportunities for expanding WOM communications through an online forum have increased, especially on a global platform. Chen (2011, p. 2) defines online WOM as when consumers or potential consumers research a product or service online, and then share their experiences and opinions about the products and services with others through an online platform. According to Nekmat and Gower (2012, p. 85), online WOM is influenced more greatly by WOM valence and intensity than traditional WOM. This is since online WOM is more permanent in nature, can easily be spread by other online users, and can reach a large number of consumers at once, although online WOM could be seen as less credible if the reader does not know the source (Wu & Wang, 2011, p. 449). As with traditional WOM, online WOM has also been found to have an influence on customer loyalty and satisfaction (Wu & Wang, 2011, p. 448).

PROBLEM STATEMENT, OBJECTIVES AND HYPOTHESES

Berger and Schwartz (2011, p. 870) explain that the food and beverage industry is influenced by WOM messages spread by other consumers. Chen *et al.* (2011, p. 240) state that WOM intensity and valence play an important role as they enable product information to be entered into the market place and can increase the level of consumer awareness. Trusov, Bucklin and Pauwels (2009, p. 90) mention that understanding WOM is becoming more important due to the changes in consumers' behaviour and the influence of social media. The authors reiterate that traditional methods of communication are losing their effectiveness placing more pressure on understanding the influence of online WOM through social media. The need for researching online WOM in cultures outside the US and other Western cultures has become vital due to the lack of studies in other cultures except Western cultures (Xue & Zhou, 2011, p. 46). From the information presented above, the importance of researching product involvement and online WOM cannot be disputed, especially in the food and beverage industry and in South Africa due to its variety of cultures. Additionally, the authors are unaware of such a study having been undertaken from a South African perspective. The primary objective of this study is therefore to investigate the relationship between product involvement and online WOM in the fast food industry of South Africa.

Based on the primary objective stated previously, the following secondary objectives have been formulated for this study:

- Develop a demographic profile of respondents taking part in the study.
- Determine the fast food restaurant and online patronage habits of respondents.
- Determine the level of product involvement respondents exhibit towards fast food restaurants.
- Determine the extent of WOM generated by respondents with respect to the fast food restaurants.

- To measure how online WOM is spread with respect to fast food restaurants.

The following hypotheses have been formulated for the study:

- H1_a: Respondents exhibiting different demographic characteristics (gender, race and age) differ significantly in the level of product involvement they exhibit towards fast food restaurants.
- H2_a: Respondents exhibiting different fast food restaurant patronage habits (length of time and patronage frequency) differ significantly in the level of product involvement they exhibit towards fast food restaurants.
- H3_a: Respondents exhibiting different demographic characteristics (gender, race and age) differ significantly in the extent of WOM they generate with respect to the fast food restaurant they buy from.
- H4_a: Respondents exhibiting different fast food restaurant patronage habits (length of time and patronage frequency) differ significantly in the extent of WOM they generate with respect to the fast food restaurant they buy from.
- H5_a: There is a significant and positive correlation between the level of product involvement respondents exhibit towards fast food restaurants and the extent (intensity and valence) to which they generate WOM in the fast food restaurant industry.
- H6_a: There are significant and positive correlations between the level of product involvement respondents exhibit towards fast food restaurants and how they spread online WOM, Table 7 provides the results.

RESEARCH METHODOLOGY

The research design followed in this study is descriptive and quantitative in nature. The target population of the study included people 50 years and younger, who reside in the Gauteng Province of South Africa, who have patronised a fast food restaurant during the six months prior to the study being conducted, and those who go online to send messages, share content, thoughts and opinions. Convenience sampling was used to select respondents and a paper-based self-administered questionnaire was designed to collect data from respondents. Section A gathered information regarding respondents demographic as well as fast food restaurant and online patronage habits. Section B included multi-item scales measuring the level of product involvement as well as the extent of WOM (intensity and valence) with respect to the fast food restaurant respondents purchased from. Finally, another scale measured how respondents spread online WOM. The measurement scales measuring the extent of WOM (intensity and valence) were adapted from the work of Goyette *et al.* (2010, p. 12). The measurement scale measuring product involvement was adopted from the work of Wu and Wang (2011, p. 471). The items measuring how online WOM is spread were adapted from the work of Riegner (2007, p. 446). The researchers ensured face validity before including these items in the questionnaire. The internal consistency reliability of the measurement scales was assessed by calculating Cronbach's alpha coefficients. The four measurement scales realised Cronbach's alpha coefficients between 0.849 and 0.932, which indicate that the scales are reliable and an overall mean score could be calculated for each (Pallant, 2010, p. 6).

Trained fieldworkers fielded the questionnaires. The completed questionnaires were checked for completeness, consistency of answers and whether they were free of interviewer cheating. Data obtained from the questionnaires was analysed using SPSS version 20. The researchers relied on a confidence level of 95% and subsequent significance level of 5% ($p\text{-value} = 0.05$) when testing hypotheses. The independent sample t-test or the Mann-Whitney U test was used to compare the means of two groups where appropriate (Pallant, 2010, p. 214). The one-way Anova or the Kruskal-Wallis test was used to compare the means of more than two groups where appropriate (Pallant, 2010, p. 214). The Pearson product moment correlation determined whether significant relationships exist between the normally distributed continuous variables. The correlation coefficient (r) indicates the direction and strength of the correlation.

RESULTS

In terms of the demographic profile of respondents it was observed that the majority of respondents are female (55.3%), white (57%) followed by African (21.0%) and between the ages of 18 to 25 years (41.8%). In terms of the fast food restaurant and online patronage habits of respondents most respondents indicated Nando's (21.9%) as their favourite fast food restaurant followed by KFC (20.7%) and McDonald's (17.6%). Just over a quarter of the respondents (25.5%) have been supporting their favourite fast food restaurant for 3 years or longer but less than 5 years, followed by those who have been supporting their favourite fast food

restaurant for longer than 10 years (22.1%). The majority of respondents buy from their favourite fast food restaurant at least once a month (29.9%), followed by those buying from their favourite fast food restaurant at least once every two weeks (27.3%). Most respondents access the internet through their cellphone (39.2%), followed by those using a notebook or laptop computer (17.7%).

Table 1 presents the standard deviation and mean for each item measuring respondents' level of product involvement on a seven-point semantic differential scale. The Table also provides an overall mean score for respondents' level of product involvement with fast food restaurants. It can be seen from Table 1 that respondents rated their level of product involvement when it comes to fast food restaurants fairly high (mean = 4.47). Respondents assigned the most positive ratings to fast food restaurants being needed (mean = 4.80), relevant (mean = 4.69) and valuable (4.51). The lowest ratings were assigned to fast food restaurant being involving (mean = 4.08) and fast food restaurants being fascinating (mean = 4.18).

Table 1: Respondents' level of product involvement

Item	SD	Mean
Unimportant; important	1.640	4.48
Boring; interesting	1.442	4.43
Irrelevant; relevant	1.477	4.69
Unexciting; exciting	1.484	4.45
Means nothing to me; means a lot to me	1.536	4.24
Unappealing; appealing	1.467	4.84
Dull; fascinating	1.389	4.18
Worthless; valuable	1.430	4.51
Uninvolving; involving	1.577	4.08
Not needed; needed	1.708	4.80
Overall mean score	1.137	4.47

Table 2 indicates the level of agreement respondents expressed with respect to items measuring the extent of their WOM (intensity and valence) towards their current fast food restaurant on a scale where 1 = 'strongly disagree' and 5 is 'strongly agree'. The standard deviation and mean for each item as well as the overall mean score for the scale are reported. It is evident from Table 3 that items measuring WOM intensity obtained means above the mid-point of the scale of 2.50 with 'I speak of my brand of fast food restaurant much more frequently than about any other brand of fast food restaurant' realising a mean of 2.98. 'I speak of my brand of fast food restaurant much more frequently than about brands of any other type', and 'I speak of my brand of fast food restaurant to many individuals' both realised a mean of 2.59, just above the mid-point of the scale. The overall mean score for WOM intensity is therefore also above the mid-point of the scale (mean = 2.72). With respect to WOM valence, all items realised a mean above 3.00 with the item 'I mostly say positive things to others' realising the highest mean of 3.31, followed by 'I speak favourably of my brand of fast food restaurant to others' (mean = 3.29). The item 'I speak of the good side of my brand of fast food restaurant' (mean = 3.15) realised the lowest mean which is, however, well above the midpoint of the scale. A paired samples t-test confirms that the overall mean score for WOM valence (mean = 3.23) is significantly higher than the overall mean score for WOM intensity (mean = 2.72). An overall mean score for the extent of WOM of 3.06 has been realised.

Table 2: Respondents' extent of WOM

Item	SD	Mean
WOM intensity		
I speak of my brand of fast food restaurant much more frequently than about any other brand of fast food restaurant.	1.122	2.98
I speak of my brand of fast food restaurant much more frequently than about brands of any other type.	1.119	2.59
I speak of my brand of fast food restaurant to many individuals.	1.091	2.59
Overall mean score	0.974	2.72
WOM valence		
I recommended my brand of fast food restaurant.	1.162	3.20
I speak of the good side of my brand of fast food restaurant.	1.064	3.15
I am proud to say to others that I am a customer of this fast food restaurant brand.	1.168	3.20
I strongly recommend people buy products from my brand of fast food restaurant.	1.163	3.20

I mostly say positive things to others.	1.052	3.31
I speak favourably of my brand of fast food restaurant to others.	1.091	3.29
Overall mean score	0.962	3.23
Overall mean score for extent of WOM (intensity and valence)	0.888	3.06

Table 3 presents the standard deviation and mean for each item measuring how online WOM is spread by respondents regarding fast food restaurants. Each item is measured on a scale where 1 is 'never' and 5 = 'always'. From Table 3 it can be seen that all items realised means well below the mid-point of the scale of 2.50 with 'I talk to friends online about fast food restaurants' (mean = 1.91) obtaining the highest mean, and 'I write reviews/stories or rate fast food restaurants online' (mean = 1.52) the lowest mean.

Table 3: How respondents spread WOM online

Item	SD	Mean
I talk to friends online about fast food restaurants.	1.118	1.91
I send/forward emails about fast food restaurants.	1.117	1.79
I talk about fast food restaurants in a chat room/forum.	0.920	1.54
I meet other people online who like fast food restaurants.	0.934	1.56
I write about fast food restaurants on a personal page, blog or website.	0.973	1.57
I write reviews/stories or rate fast food restaurants online.	0.913	1.52
I post messages on Facebook/MySpace/Twitter about fast food restaurants.	1.132	1.85
I share content related to fast food restaurants online.	1.043	1.74

With regard to H1_a that respondents exhibiting different demographic characteristics (gender, race and age) differ significantly in the level of product involvement they exhibit towards fast food restaurants, the independent sample t-test indicate that blacks and whites differ significantly in the level of product involvement they exhibit towards fast food restaurants (p-value = 0.000). Blacks (mean = 4.89) exhibit significantly higher levels of product involvement than whites (mean = 4.18). H1_a can therefore only be supported in terms of race, since blacks exhibit significantly higher levels of product involvement than whites towards fast food restaurants.

With regard to H2_a that respondents exhibiting different fast food restaurant patronage habits (length of time and patronage frequency) differ significantly in the level of product involvement they exhibit towards fast food restaurants, the following findings were made:

- The results of the Mann-Whitney U test indicate that groups of respondents who have been supporting their favourite fast food restaurant for different lengths of time differ significantly in the level of product involvement they exhibit towards fast food restaurants (p-value = 0.047). Those supporting their favourite fast food restaurant for 3 years or longer (mean rank = 132.90) exhibit significantly higher levels of product involvement than those supporting their favourite fast food restaurant for less than 3 years (mean rank = 113.46).
- The results of the Mann-Whitney U test indicate that groups of respondents who buy from their favourite fast food restaurant at different frequencies differ significantly in the level of product involvement they exhibit towards fast food restaurants (p-value = 0.001). Those who buy once a week or more (mean rank = 150.51) exhibit significantly higher levels of product involvement than those buying less than once a week (mean rank = 117.46).

H2_a can therefore be supported. Those supporting their favourite fast food restaurant for 3 years or longer and those who buy once a week or more from their favourite fast food restaurant exhibit significantly higher levels of product involvement.

H3_a (respondents exhibiting different demographic characteristics (gender, race and age) differ significantly in the extent of WOM they generate with respect to the fast food restaurant they buy from), tested through an independent samples t-test indicate that blacks (mean = 2.90) exhibit significantly higher WOM intensity than whites (mean 2.58; p-value = 0.008). H3_a can therefore only be supported in terms of race, since blacks exhibit significantly higher levels of WOM intensity than whites towards fast food restaurants they buy from.

With regard to H4_a that respondents exhibiting different fast food restaurant patronage habits (length of time and patronage frequency) differ significantly in the extent of WOM they generate with respect to the

fast food restaurant they buy from results of the Mann-Whitney U test indicate that those who buy once a week or more (mean rank = 157.56), however, exhibit significantly higher levels of WOM intensity than those buying less than once a week (mean rank = 121.05; p -value = 0.000). $H4_a$ can therefore only be supported in terms of those who buy once a week or more who exhibit significantly higher levels of WOM intensity than those buying less than once a week.

$H5_a$ (there is a significant and positive correlation between the level of product involvement respondents exhibit towards fast food restaurants and the extent (intensity and valence) to which they generate WOM in the fast food restaurant industry), the Pearson product moment correlation indicates a significant and positive (p -value = 0.000 and $r = 0.508$) correlation with a large effect between the level of product involvement respondents exhibit towards fast food restaurants and the extent (intensity and valence) to which they generate WOM in the fast food restaurant industry. $H5_a$ can therefore be supported. There is a large significant and positive correlation between the level of product involvement respondents exhibit towards fast food restaurants and the extent (intensity and valence) to which they generate WOM in the fast food restaurant industry.

With regard to $H6_a$ that there are significant and positive correlations between the level of product involvement respondents exhibit towards fast food restaurants and how they spread online WOM, it was observed that there are significant and positive correlations between all items measuring how WOM is spread (online WOM) and the level of product involvement. Only two items exhibit a medium effect namely, 'I talk to friends online about fast food restaurants' ($r = 0.359$) and 'I share content related to fast food restaurants online' ($r = 0.316$) while the other items had small effects. $H6_a$ can therefore be supported.

MANAGERIAL IMPLICATIONS AND RECOMMENDATIONS

The results indicate that the majority of respondents access the Internet through their cellphone. This makes a mobile site and developing relevant mobile application indispensable for marketers who wish to increase traffic to the site and subsequently encourage product involvement. The results of the study indicate furthermore that respondents exhibit fairly high levels of product involvement pertaining to the fast food restaurant they patronise most frequently. Respondents indicated that they view fast food restaurants as something that is needed, relevant and valuable. In order to increase product involvement, marketers of fast food restaurants could capitalise on these sentiments of their customers. Black respondents also exhibit significantly higher levels of product involvement than white respondents. Those respondents who have been patronising the fast food restaurant for three years or longer and purchase from the fast food restaurant once a week or more, exhibit higher levels of product involvement. These findings can guide marketers in identifying those groups of customers who tend to be significantly more involved with their products than others.

It was furthermore found that respondents spread WOM about their favourite fast food restaurants. The results indicate significantly higher levels of WOM valence than WOM intensity. Respondents are thus positive about their favourite fast food restaurant, but not equally willing to speak about it. Marketers of fast food restaurants therefore have to work on strategies to encourage their customers to voice the positive feelings they have towards the particular fast food restaurant. Black respondents exhibited significantly higher levels of WOM intensity than white respondents. Marketers can capitalise on the sentiments of their black customers to convert a large untapped segment of the market. In addition, research should be undertaken to uncover the significantly lower levels of WOM intensity amongst white customers. The challenge is, however, to get customers to voice their positivity (WOM intensity) to the same extent that they experience it (WOM valence). From the results it is evident that those who patronise fast food restaurants once a week or more, exhibited higher levels of WOM intensity than those who patronise the fast food restaurant less than once a week. It is thus evident that regular customers are more willing to spread positive WOM.

With respect to the levels of online WOM respondents participate in the following was found: The study showed that respondents do not really engage in online WOM. Of those respondents that do engage in online WOM, they mainly do so by posting messages about their fast food restaurant on a social networking site such as Facebook or mySpace. This could be attributed to cultural aspects, where South Africans are known to engage in higher levels of traditional WOM (i.e. talking directly to friends and family) than online WOM. As most online WOM messages are spread via a social networking site, fast food restaurants need to

ensure that they are active on social networking sites (i.e. have their own Facebook page which consumers can “friend”) and create opportunities for consumers to “like” the restaurant or send a link to others.

Overall, it was found that significant and positive correlations exist between the level of product involvement respondents exhibit towards fast food restaurants and the characteristics of WOM (namely intensity and valence) as well as online WOM. This suggests that fast food restaurants should aim to increase the level of product involvement consumers have towards the brand and service in order to increase the intensity and valence of the WOM spread about the fast food restaurant. This once again could be done by engaging with consumers about the products and services they require from the fast food restaurant and perhaps allow consumers the ability to customise their own fast food meal to increase the level of product involvement. By engaging with consumers on social media, fast food restaurants could increase the level of product involvement and encourage the spreading of WOM both in the traditional sense and online.

CONCLUSION

Researching the relationship between product involvement, WOM intensity and valence and online WOM is necessary for organisations aiming to increase the levels of customer satisfaction and loyalty. This is also true for South Africa with its numerous cultures, and especially in the fast food industry which is dealing with changing consumer demands and tighter budgets. The results of the study confirm previous studies that the level of product involvement influences WOM intensity and valence. From the results it was found that from a South African perspective, culture influences the level of product involvement and that respondents do not really engage in online WOM. This indicates that traditional WOM is still prevalent in this market.

A PRELIMINARY STUDY OF AUSTRALIAN TAX PRACTITIONERS' ETHICS

Ken Devos
Monash University, Australia

ABSTRACT

The tax compliance literature indicates that limited Australian empirical research has been conducted into the ethics of tax practitioners. This preliminary study seeks to address this gap and investigate the views of tax practitioners' regarding the Code of Professional Conduct and general ethical and moral issues faced in their work. The study adopted a mixed method research methodology drawing data from both a survey instrument and interviews. It is suggested that the results provide useful information for the Australian tax authority and has implications for tax policy development.

INTRODUCTION AND BACKGROUND

This study investigates the views of tax practitioners with regards to various ethical issues they potentially face in their work. An examination of the tax compliance literature reveals there is a lack of recent empirical research in Australia regarding the influence of tax practitioners who act as intermediaries, between the Australian Taxation Office (ATO) and the majority of Australian individual taxpayers (Richardson and Sawyer, 2001). As tax practitioners are viewed as representatives of both the taxpayer and the revenue agency it is important to ascertain where their allegiances lie when faced with vexed ethical situations.

The tax practitioner represents a significant third category of actor together with the taxpayers and the ATO in a tax system of voluntary compliance Marshall et al (1998). This is particularly so in situations where the tax law is ambiguous and the tax owed depends on the interpretation of the complex provisions of the law Ayers et al. (1989). As tax practitioners carry the responsibility for accurate tax filing for the majority of Australian tax payers (Baldry, and K McKinstry, 1995) as approximately 75% of Australian individual taxpayers lodge through a tax agent or accountant, they are also in a position to exert a strong and direct influence on the compliance and tax administration process Erard, (1993).

The importance of tax practitioner ethics, with respect to tax administration, enforcement policies and the distribution of equity in the tax system was initially recognized in Australia in the early 1990's. A draft project relating to tax agents professional standards and regulatory arrangements was submitted to the Commissioner of Taxation's National Tax Liaison Group in 1992. An agreement between the ATO and the professional bodies consequently endorsed a National Review of Standards for the Tax Profession. In particular, the then Commissioner Boucher, (1993) emphasized the ethical component of tax advice:

"Ethics is an intrinsic aspect of providing tax advice. Tax advisers play a role in shaping our tax morality. Whether in-house or external they become involved in the decision- making processes of the enterprises they advise." (p.52)

At an international level, the influence of tax advisers on the ethical standards of their clients has also been identified by Gordon (1988):

Their advice communicates by implication many political judgments about the legitimacy of legal norms and regulations and about the normative value of complying with them, whether they want it to or not. They can't choose not to be influential; they can only decide not to care or think about their influence and whether they should exercise it differently. (p.30)

Since the early 1990's major developments in the regulation of tax practitioners and their accountability with respect to the advice they provide was evidenced in the release of exposure draft legislation in 2007. Further draft transitional provisions and consequential amendments resulted in the introduction of the *Tax Agents Services Bill* in 2008. Finally, after nearly fifteen years in the making the recently established Tax Practitioners Board, introduced the *Tax Agents Services Regulations* and the *Tax*

Agents Services Act (2009), including a Code of Professional Conduct which became operational from 1 March 2010.

However, despite the increased attention directed towards tax practitioner standards and professional conduct and the impact it might have on tax compliance, there has been little empirical research as to the influence tax practitioners' ethics may have had on compliance levels in Australia. It is submitted that this research will give an indication of the effectiveness of these recent measures upon tax practitioners' ethics, and whether this ultimately may have influenced the ethical behavior of taxpayers themselves.

Consequently, the results of this study contribute to the literature by revealing how and why the views of tax practitioners, either directly or indirectly, influence the ethical climate and level of compliance amongst Australian individual taxpayers. Ultimately the research has the potential to further elicit the reasons on how tax practitioners impact the compliance landscape and improve the ATO's collections thereby improving the provision of goods and services to members of the community.

The remainder of this article is organized as follows. The next section provides the relevant research questions for this study and briefly describes the research methodology. The third section presents a discussion and analysis of both quantitative and qualitative research findings. Finally, a brief summary of the key findings/implications, along with some tax policy considerations, and limitations are given in the conclusion.

RESEARCH METHODOLOGY

Based on the forgoing discussion, the following research questions were posed to gauge the views of tax practitioners on various ethical and related issues.

Research Questions

1. What are the views of tax practitioners' with regards to the professional and ethical standards stipulated in the Code of Professional Conduct?
2. What are the views of tax practitioners with regards to various ethical issues faced in their work?

In order to address the research questions posed above, an electronic survey instrument was developed and distributed to tax practitioners via a web link. (The software version used was Qualtrics). In particular the web site of the Australian CPA's (Certified Practising Accountants) and the Association of Tax and Management Accountants (ATMA) in Australia allowed members to participate in the anonymous survey and to provide further information by way of a telephone interview if desired.

Survey Instrument

The entire survey instrument comprised 18 questions with Q19 calling for additional comments, if any. In Section A of the survey Q1 to Q9 obtained specific demographic data and this was followed by Section B which addressed particular ethical and related issues. A five point likert scale ranging from strongly agree to strongly disagree for Q10-11 was provided. Following this Q12-18 required a yes or no response with space provided for additional comments in some questions. Some of the questions were adopted from a tax ethics study on New Zealand Tax practitioners, conducted by (Attwell and Sawyer, 2001).

Survey Sample

The survey remained open for a period of 4 weeks during May –June 2012. Potentially, the exposure to CPA tax practitioners and tax and management accountants was to approximately some 11,000 members. A total of n= 283 survey responses were received giving a response rate of 2.6%. However it was envisaged that the total number received would be sufficient in terms of a basic statistical analysis and provided a snap shot of the preliminary results. In addition, 11 tax practitioners were happy to express their views further in a telephone interview.

DISCUSSION AND ANALYSIS OF RESEARCH

FINDINGS

**Table 1 Descriptive Statistics – Demographic Profile of the Tax Practitioner
Sample Survey Q1-9**

<i>Survey Question</i>	<i>Frequency</i>	<i>Percent</i>
1. Tax Practitioner Office		
Sole Practitioner	87	31%
2-5 partners	21	7%
6 or more partners	18	6%
Directors, if a company	50	18%
Industry	57	20%
Tax Consultant/Agent	47	17%
Other (please state)	3	1%
Total	283	100%
2. Legal Structure		
Limited Liability Company	38	13%
Partnership	38	13%
Sole Trader	165	58%
Other (please specify)	42	15%
Total	283	100%
3. Tax Related Work time		
100%	48	17%
75-99%	75	27%
50-74%	87	31%
25-49%	61	22%
0-24%	10	4%
Total	281	100%
4. Type of Client Base		
Salary and Wage Earners	30	11%
Self Employed Persons	28	10%
Small Medium Business (SME)	177	63%
Large Business	36	13%
Other (please state)	11	4%

CPA Australia (CPA)	157	56%
Institute of Chartered Accountants (ICA)	24	9%
Association of Taxation and Management Accountants (ATMA)	86	30%
Other (please state)	15	5%
Total	282	100%

The results in Table 1 above indicate that the majority of tax practitioners were sole practitioners 87(31%) with large numbers also working in industry (20%) or in the capacity of a company director (18%). This was expected to some extent as the majority of registered tax agents are sole practitioners or consultants. The results also indicate that the preferred legal structure amongst this sample of practitioners was a sole practitioner with (58%). All other entity structures were less preferred although it is noted that there were in fact a variety of structures employed with various trust structures being used (See other 15%) indicating that it is still one of the most popular, particularly unit trust with a corporate trustee.

The results indicate that the majority 75% of practitioners sampled spent 50% or more of their time on tax related work while 17% spent 100% of their time in tax related work. This was expected to some degree as other financial or accounting services provided are usually limited and do not attract the same remuneration. Many tax practitioners may specialize in a tax area and also have generalist tax knowledge to service a range of clients.

Further to the type of client serviced in Table 1 above, it is noted that the most popular is the small medium enterprises (SMEs) at (63%). This result was not unexpected as the average practitioner finds these clients the most lucrative given the expertise required. That is, the practitioner would arguably not generally have the skills and knowledge to deal with the more complex large businesses and would find salary and wage earners and the self-employed being less profitable. The SME also brings various GST and FBT obligations that must also be dealt with.

The figures in Table 1 reveal that the majority of tax practitioners were between the age of 40 and 60 years (61%). This is not surprising given that very few younger graduates are taking up tax practices illustrated by only 5% in the 20-29 age bracket. It also suggests that the number of accountants that will be practising tax in the future will continue to decline and only the larger firms will be left to service clients. Further the majority (65%) of practitioners had between 11 and 25 years of tax experience with only 9% of practitioners indicating less than 10 years. This is a reflection of the current state of the tax profession generally in that it is aging and not as many younger graduates are entering the profession. This could have implications for the future availability of advice being offered by Australian practitioners and arguably tax services may need to be derived offshore in the future.

As expected the majority of the practitioners came from the more populated states in that of Victoria and NSW and also Queensland (84%) and also as expected 73% of tax practitioners were males and 27% females. It confirms that tax practice continues to be heavily male dominated. Finally, the majority of practitioners were CPAs (56%) with 30% coming from the Association of Taxation and Management Accountants. This was also expected given that the survey instrument was placed on the web site of both these accounting bodies and members were attracted directly by the on-line invitation. It is noted however, that many practitioners were also members of two or more associations including the Tax Institute, the Law

Society and the Institute of Practicing Accountants. In this regard it will be important to distinguish the type of advice provided by practitioners of different affiliations. The following analysis only focuses on the professional code of conduct and issues of general tax ethics.

Table 2 Core Statistics –Code of Professional Conduct Survey Q14

14. In your view, to protect the integrity of, and public confidence in tax practitioners, do you believe all practitioners should be registered and comply with the professional and ethical standards as set out in the Code of Professional Conduct in the Tax Agent Services Act 2009. Please make any comments you have on this issue below.				
#	Answer		Response	%
1	Yes		243	86%
2	No		39	14%
	Total		282	100%
No				
Generally yes				
The real issue for public confidence is do I act for the client not the Tax Office. If I act for				
Financial Planners should not be exempted				
Self- ethics				

The results in Table 2 above indicate strong support (86%) for compliance by tax practitioners with the Code of Professional Conduct as stipulated in the *Tax Agents Services Act 2009*. The introduction of the code appears to have been well received and supported by the majority of this sample of tax practitioners and has the force of law. This finding has been supported by previous studies where respondents who had defined themselves most inclusively, and identified with their nation as a whole, possessed the most favorable tax ethics and attitudes (Wenzel 2007, p 44).

However, there was a small amount (14%) who indicated that tax practitioners need not comply with the code in order to protect integrity or improve public confidence in tax practitioners. Rather as stated it was self-ethics which actually regulated a tax practitioners' behavior, with regards to personal morals as opposed to society norms. Certainly preventative campaigns fighting tax evasion acceptance could be more successful if they are informative and oriented toward better explaining the benefits of public policies than when they are educational and oriented to directly increasing the sense of duty and solidarity of taxpayers (Molero, and Pujol, 2012, p 159) as would be the case of tax practitioners here.

Interestingly the results in Table 3 indicate that the majority (62%) of practitioners surveyed did not face any ethical or moral problems in their work. Given the nature of the work and advice provided on particularly contentious issues, this was surprising. Of the (38%) who did confront problems, there was a variety of issues, including tax avoidance schemes, false claims, misrepresentation and difficult professional positions taken. As indicated by one practitioner, other than tax avoidance measures the other issues are a daily occurrence in this job which emphasizes the importance of monitoring and improving tax practitioner ethics. Further general comments in this regard can be viewed below in Table 4 below.

Some of the comments in Table 4 above illustrate the difficulty some tax agents are faced with and the conflict of interest they potentially endure. One important feature is the ability to distinguish between tax evasion and tax avoidance, and that as tax agents' tax avoidance will generally be the aim. Those who go against that principle whether agent or client need to be dealt with by tax authorities.

SUMMARY AND CONCLUSIONS

Summary

The findings with regards to the two main research questions posed, based on both the quantitative and qualitative research components are as follows. While the survey results generally supported the need for a Code of Professional Conduct there were mixed results in the interviews. Some agents indicated that they were self-regulated and that the Tax Agents Board would be adequate in maintaining tax agent integrity. However, most acknowledged that the Code was appropriate and now provided penalties according to the

degree of seriousness. It was noted that additional deterrent measures could still be put in place to support the Code in the tax agents' view.

With an emphasis in this research upon the ethical and moral issues confronting tax agents, some interesting views were gathered in this regard. For instance approximately half of the tax agents were happy to act for taxpayers who had been prosecuted or had late lodgment imposed, had penalty tax imposed or inadvertently understated private use of a motor vehicle. However, it was clear that the majority would be uncomfortable in acting for clients who had promoted tax avoidance schemes. Although there was evidence of an allegiance to clients first, tax agents felt compelled to either educate or discard clients who refused to comply. When faced with ambiguous or contentious situations tax agents would generally adopt a cautious approach in advising their clients.

Table 3: General Ethics – Survey Q18

18. In your job situation, have you personally faced any difficult ethical or moral problems?

#	Answer	Response	%
1	Yes	107	38%
2	No	175	62%
	Total	282	100%
retaining client confidentiality with previous accountant - it was maintained but it was under difficult circumstances; non-disclosure to ATO & relations-spouse, partners etc			
Watching senior personnel behave unethically and not being able to do / say anything			
Clients desire to over claim expenses and also not declare all cash sales			
A client who I discovered had used my name as being the auditor of self- managed super funds when I had not been involved with those Funds. A client who wanted advice on how to set up his employment affairs in order to reduce his child support payments.			
1, Wife working in a massage parlour without her husband's knowledge, wanted to lodge amended return without husband knowing. 2. Client had an obvious "ghost" payroll expense for subcontractors. We parted company.			
discovered good client was a drug dealer. had to resign engagement			
Ethical problems are an everyday occurrence in this industry. I face all of the above listed scenarios except tax avoidance schemes one on a daily basis.			

Tax Policy Implications

Clearly tax professional representation is high in Australia and is accepted largely due to issues of tax complexity and the strong desire to minimize high rates of tax payable. However, this heavy reliance on tax professionals can be unhealthy and puts pressure on the tax profession. In this sense it is important that tax simplification continues and that tax loopholes are closed so that the potential workload on tax professionals may be alleviated. The integrity of overarching principles which aim to bring about compliance with the spirit of the law as opposed to the letter of the law needs to be defended (Hite and McGill, 1992) so as to not compromise tax agents' ethics.

It is also apparent that the code of professional conduct although a step in the right direction needs to be supported by strong enforcement and the Tax Agents Board. Harsh deterrent measures in terms of penalties need to be maintained in order to continue the decline in exploitation schemes. Industry benchmarking while having some impact also requires other active compliance measures and further sophisticated methods in order to improve creditability. Overall, based on the evidence herein, it appears that tax agents' ethics are generally of a good order, while there is still plenty of room for improvement. When compared to the results of Attwell and Sawyer's study of NZ tax agents in 2001 of barely passing at 60%, this is encouraging.

Limitations

First, as with most behavioral studies, the sample of tax practitioners was not totally representative of the wider Australian tax practitioner population which makes it difficult to extrapolate the results. Second, as this study was only exploratory in nature the data was not subjected to more rigorous statistical analysis which would have been undertaken in a wider study. However, the fact that there was a reasonable number

(n=283) in the sample to conduct some meaningful analysis maintained the validity of the results and allows some comparability with previous studies. Third as this study only focused on selected ethical, compliance and demographic variables, not all variances were explored, thereby limiting overall results. Finally, problems of honesty and misinterpretation in tax surveys are always present and hard to erase (Hite 1988), particularly in the case of sensitive ethical issues.

Table 4 Other Ethical Issues/comments Survey Q 19

19. Do you have any additional comments that you wish to make on tax ethics in general or on this survey?
Text Response
Ethics is a personal thing I am unsure how you will monitor this.
IF IT IS NOT PROHIBITED BY LAW AND HELPS CLIENTS REDUCE TAX PAYABLE ITS OK WITH ME. IN THIS SENSE ETHICAL BOUNDARY IS DEFINED BY CONSIDERATION TO LAW ONLY. I DON'T THINK ANY TAX AGENT SHOULD HAVE TO EVEN THINK ABOUT ADVISING A CLIENT NOT TO DO SOMETHING WHICH IS PERMITTED UNDER LAW DUE TO SOME KIND OF HIGHER ETHICAL BOUNDARY. MANY OF OUR CLIENTS OPERATE IN INDUSTRIES WHERE ATO HAS PUBLISHED BENCHMARKS. SO NOW WE COMPARE CLIENTS TO BENCHMARKS AND IS THEY ARE WITHIN ATO RANGES I FEEL I HAVE MADE ENOUGH ENQUIRY WITH REGARDS TO FIGURES CLIENT HAS SUPPLIED ITS ONLY IF THEY FALL OUTSIDE BENCHMARKS THAT I WILL ENQUIRE WITH CLIENT AND THEM ITS ONLY TO ADVISE THEM IF WE LODGE FIGURES AS IT THEY MAY STAND OUT ON ATO RADAR FOR AUDIT PURPOSES
For as long as tax law is perceived to be unfair and unreasonably applied (vide TR2010/3) people will see anything they can do to minimize tax as a fair and reasonable response.
I can only explain the tax laws and if I feel clients are not being truthful - I no longer act as their tax agent
All practitioners are there to apply the law. By aiding or abetting evasion they become lawbreakers. There is absolutely no way that an intelligent well trained professional accountant can confuse avoidance with evasion and there is absolutely nothing immoral or unethical about a practitioner assisting a taxpayer to legally avoid tax.
Q 18 Wholesale abuse of DGR funds: School Blgd and PBI and abuse of Exempt Benefits by supposed religious practioners I appreciated the good strong questions and will look forward to read the results of this survey
Question 10 very confusing not sure if answered correctly.
The TPB needs to apply consistent standards and penalties to rogue tax agents and it needs to do it often. The ATO needs to be more proactive in hunting out shonky and illegal agents and prosecute the people who use them. Once it is known that you will be prosecuted for using a shonky or illegal agent taxpayers will change their behavior
A good survey good luck!
Whilst the tax office treats we agents as the 'Tax agents' and not as part of the team - clients expect us to avoid as much as possible - by nature alone we will battle to ethically do the right thing and the internal conflict of interest will plague us to 'not lose a client' The issue falls back to a simple conclusion - the law is the law
The problem is that it against professional body and accounting standards to disclose details to the ATO without the authority of the taxpayer.
It's very easy to be ethical as an accountant. It's a very clear choice & everybody gets the reputation they deserve
Q16 - Though an assumed correlation exists, it does not make the statement true Q18, My comments I wish to add are as follows: Clients always want to pay less tax, and want to rush their Forms>Returns quickly in order to avoid paying more in Agent fees (in relation to time & \$) and also for speedy refunds if applicable, therefore most people don't care for the accuracy of the Tax system.
Regarding a lot of the questions - it really is impossible for me to comment on. Regarding some of the questions above in relation to strongly agreeing - It is of course ethical for a tax agent to advise someone in those situations - the advice might very well be correct advice such as, you have to declare your income. To say it is unethical is ridiculous

A STUDY OF UNETHICAL BEHAVIOUR CONCERNING LEGAL FEES IN CIVIL LITIGATION FROM A SOUTH AFRICAN PERSPECTIVE

Ora Dippenaar
Tshwane University of Technology, South Africa

ABSTRACT

During the last two years many lawyers and counsel had to answer to the court regarding fees they charged in civil litigation. Apart from legal practitioners that charge fees on an hourly basis, there are three main fee structures namely party and party fees, attorney and client fees and contingency fee agreements. Even though the Contingency Fee Act 66 of 1997 has clear stipulations and states that a legal practitioner may only claim a maximum of 25 % of the amount awarded to the client or double the practitioner's usual fees, whichever is the lower, contingency fee agreements are still open to the most severe forms of client exploitation. Legal practitioners claim to enter into common law contingency fee agreements with their clients on the basis that common law contingency fee agreements do not resort under the Contingency Fee Act. Law societies are not in agreement as to whether or not contingency fee agreements could still be concluded in terms of the common law. The aim of this paper is to explain the fee structures available to attorneys and to discuss examples of unethical behaviour by legal practitioners in this regard. This paper is a literature study.

INTRODUCTION

C J Langenhoven, a renowned early twentieth century South African writer and poet said: "If a person litigates for a jacket, he should keep his trousers ready for the legal fees". In similar vein, Lord Brougham remarked as follows: "A lawyer is a gentleman who rescues your estate from your enemy and keeps it for himself". And then there is the following saying, of unknown origin: "A man is innocent until proven broke". It is also said that in order to get a group of lawyers to smile for a picture they must just be asked to say "Fees". Although these quips are usually made with tongue in cheek, they undoubtedly reflect the views of many a litigant faced with an excessively high legal bill.

In South Africa, the years 2011 and 2012 were particularly notorious in so far as publicity of legal practitioners' exploitation of clients was concerned. Especially attorneys representing clients in Road Accident Fund (RAF) claims provided for in terms of the Road Accident Fund Act 56 of 1996 came under barrage. On 4 June 2012 the Daily Dispatch reported the case of Ngubuzayo Dumse who was disabled in an accident in 2003. In 2010 the firm of attorneys concerned paid Dumse R200 000.00 out of the R787 610 they received from the RAF. However, the firm instructed him to repay R105 323 of this amount for outstanding legal fees. This left Dumse with 16 % of the initial amount awarded. Dumse consulted another lawyer (Cole) who referred to the fee in question as unconscionable, unfair, injurious to the administration of justice, contrary to the Cape Law Society's guidelines and contrary to the good morals of society. Cole pointed out that Dumse's first lawyers' fee was 1100 % more than party and party fees. The legislation pertaining to the RAF has since been amended by restricting the amounts payable for injuries. Furthermore, the RAF does not make any contribution towards claimants' legal costs if the claimant has settled the matter with the RAF, a step obviously aimed at avoiding any payment of legal costs to a claimant's attorney. After the abovementioned amendment to the Road Accident Fund Act few potential clients qualify for worthwhile claims. There are therefore fewer claims on which fees can be charged. Many attorneys who previously built their practices on RAF cases are now obliged to explore other fields for an income. To this end the focus is currently shifting to medical malpractice claims.

As regards the determination of professional fees, attorneys have the following alternative fee systems at their disposal: they may bill on an hourly fee basis; on an attorney and client fee basis; or on a contingency

fee basis. The attorney should, during the first consultation, explain the applicable fee structure so as to enable the client to make an informed decision on the question whether, from a costing point of view, it would be a worthwhile effort to proceed with the matter.

FEE STRUCTURES FOR LEGAL FEES IN CIVIL LITIGATION

Apart from legal costs based on an hourly fee, the three main categories of legal costs are those which will now be discussed.

(i) Party and party fees

Party and party tariffs are prescribed by legislation. In order to keep up with inflation they are adapted from time to time by publication in the Government Gazette. There are separate fee scales for party and party fees in the Magistrate Court and in the High Court, respectively. Party and party fees are the most conservative fee structure. When judgment is given in civil litigation, the magistrate or judge also deals with the legal cost issue, in other words a determination must be made as to which party would be liable for the legal fees. Usually the unsuccessful party has to pay the successful party's legal fees. Unless otherwise stated by the court, this is party and party costs which means that the unfortunate litigant must contribute to his opponent's legal fees.

(ii) Attorney and client/attorney and own client fees

Attorney and client fees are more extensive fees which an attorney is entitled to recover from his own client for professional services rendered. While party and party costs are limited to necessary costs, attorney and client costs are all costs incurred by the litigant's attorney, for example costs pertaining to regular progress reports sent to the client. The losing party is not responsible for such expenses. Where, for example, plaintiff was the successful litigant and defendant has to pay plaintiff's party and party costs, these costs are deducted from the attorney and client costs and the plaintiff remains liable for payment of the balance to his legal representative.

There are attorneys who refer to attorney and own client costs which according to them, are costs on an even higher scale than attorney and client costs. This is not a valid distinction because attorney and own client fees are non-existent

Experience and expertise play an important role in the determination of an attorney's fee. The Law Societies of most provinces publish guidelines on what they regard as reasonable fees. Attorneys that are admitted to appear in the High Court may charge the same higher fee as counsel.

(iii) Contingency fee agreements

Contingency fee agreements (also called *pacta de quota litis*) were forbidden in terms the common law but were legalised in 1997. They are often referred to as "keys to the courthouse" or "no win, no fee" agreements. In terms of such an agreement any person with a strong case, but without sufficient funds to bear the initial costs occasioned by the legal proceedings can have such proceedings instituted. Should the attorney as party to such agreement, be successful with the claim, the attorney receives a percentage of the amount awarded to the client. In the event of an unsuccessful claim no remuneration is due. Contingency fee agreements are regulated by the Contingency Fee Act 66 of 1997.

normal attorney's fee, whichever is lower. According to a newspaper article published in "Beeld" on 26 October 2012, an increasing number of attorneys are of the view that 25 % is not a realistic percentage as they have to pay all expenses from this 25 %, including counsel's and expert witnesses' fees. Section 3(1)(a) of the Act requires a contingency fee agreement to be in writing. In terms of section 3(3)(h) the agreement shall allow the client 14 days, calculated from the date of the agreement, to withdraw from the agreement after written notice to the legal practitioner. In the event of withdrawal the legal practitioner shall be entitled to fees and disbursements in respect of necessary work done calculated on an

attorney and client basis. Section 4 requires a copy of the agreement to be delivered to the client upon the date on which the agreement is signed.

An obvious advantage of fee agreements is that where an attorney is of the opinion that a client has a reasonable prospect of success in court, such client is given access to the court notwithstanding insufficient funds to institute legal proceedings. A contingent fee agreement serves as incentive for the lawyer to utilise his time as efficiently as possible because the remuneration does not depend on the quantity of time spent to complete the task but on the extent of the amount eventually awarded to the client. On the other hand, an hourly fee structure serves as incentive to work slowly in order to use as much time as possible. By entering into a contingency fee agreement the client of course runs the risk of being liable for payment of the taxed party and party costs of the successful opponent.

Contingency fee agreements may not be entered into in criminal law and family law matters.

(iv) Common Law Contingency Fee Agreements

The fee provided for in terms of this agreement is higher than the fee prescribed in the Contingency Fee Act. It is respectfully submitted that this agreement creates the ideal opportunity for overreaching. Law societies in the different provinces are not in agreement as to whether common law contingency fee agreements should still be recognised. In some provinces legal practitioners may charge common law contingency fees and in other provinces they may not. Cloete and Nagel (424) have doubts about the power of law societies to declare common law contingency fees illegal and they raise the question whether that decision should not rather be made by a court of law.

Common law contingency fee agreements were discussed in *Thulo v Road Accident Fund* 2011 5 SA 446 (GSJ). This case dealt with compensation in terms of the Road Accident Fund Act 56 of 1996 for injuries suffered in a motor vehicle accident. The court held that the RAF was liable for 70 % of the plaintiff's damages due to injuries. Plaintiff's attorney worked on a contingency fee basis. Counsel for the plaintiff handed into court a draft order in terms of which the RAF would be required to make payment directly into the trust account of the plaintiff's attorney to ensure that funds would be available to pay the fees of counsel and experts. However the court intimated that the money had to be paid to the client directly. Morison AJ held that the practitioner's fees were limited to (i) 25 % of the amount awarded in the judgment or (ii) double the normal fee of that practitioner, whichever was lower. According to the court the purpose of the Contingency Fees Act was to ensure that the client was paid at least 75% of the amount obtained through successful litigation. The court denied the existence of any common law contingency fees, and pointed out that if, for example, the defendant should fail to pay the taxed costs to plaintiff's attorney, the latter would not be entitled to recover those costs from his/her client if that would result in the client receiving less than 75 % of the amount awarded to him/her.

ETHICAL CONCERNS OVER CONTINGENCY FEE AGREEMENTS

According to the American Bar Association Standing Committee on Ethics and Professional Responsibility, all contingent fee agreements carry risks: the risk that the case would require more work than the lawyer anticipated; the risk that the law might change; the risk that the client could dismiss the lawyer; the risk that the client could reject a proposed settlement which the lawyer might consider to be an acceptable one; or the risk that the client might require the proceedings to be continued when the lawyer considers it unjustified.

What does the generally accepted requirement that an attorney's fee must be "reasonable" mean? Is a standard fixed-percentage contingent fee always proper, or is a dynamic fee that reflects the degree of risk inherent in the matter, preferable. There are strong views among some academics that lawyers who charge a standard contingency fee in a case which does not entail meaningful risk, is charging both an illegal and an unethical fee. This fee is said to be unethical because it violates the lawyer's fiduciary duty to deal fairly with clients. The charging of a contingency fee which is grossly disproportionate to a realistic risk of non-recovery amounts to charging a "clearly excessive" fee. Former Harvard president and law school dean, Derek Bok, stated that there is little room for bargaining over the terms of the contingent fee. He pointed out that most plaintiffs do not know whether they have a strong case and that very few lawyers will inform their clients if that is the case and agree to a fee which is lower than the fee calculated according to the standard rate. Good faith is a central principle of the South African law of contract. Conflicting ethical precepts often

reflect the tension between the view of an attorney as a fiduciary and public servant, and the view of an attorney as a businessperson.

ETHICAL CONCERNS OVER COUNSEL FEES

On 29 September 2011 the North Gauteng High Court made a strong standing against unethical behaviour by legal practitioners in the case of *The Pretoria Society of Advocates and General Council of the Bar of South Africa vs Geach, Güldenpfennig, Pillay and others*. The case deals with disciplinary action taken by the Pretoria Society of Advocates against 13 members of the bar. The general charges were double briefing and overreaching. All 13 respondents were experts in their particular fields of litigation, namely claims against the RAF for damages arising from personal injuries. They all had been at the Bar for decades and were all regarded as men of good standing. Disciplinary proceedings were first instituted by the Pretoria Bar Council against 13 counsel concerned. Each was sentenced to a fine and a period of suspension except for one counsel that was struck off the roll, but members of the Bar were split. Some thought the sentences to be too harsh and others regarded them as too lenient. Some thought the matter should rest and others felt the transgressions should be referred to the court. The latter view prevailed when, at the insistence of the General Council of the Bar of South Africa (GCB), the umbrella body representing all constituent South African bars, the matter was referred to the North Gauteng High Court. The acting judges were Van Dijkhorst AJ, Combrink AJ and De Villiers AJ. They lamented the loss of integrity and reputation caused by the relevant 13 members of the Pretoria Bar and the inevitable damage caused to the

The court referred to the matter of *Kekana V Society of Advocates of SA 1998(4) SA 649 (SCA) 656* where it was said that when a person decides to practise as an advocate, he subjects himself to scrutiny of his professional conduct. The Supreme Court of Appeal formulated the principle as follows: “The preservation of a high standard of professional ethics is left almost entirely in the hands of the individual practitioner. Therefore absolute personal integrity and scrupulous honesty are demanded of each practitioner...”

In the above matter against Geach, Pillay and others, the court stated that in order to remove an advocate’s name from the roll the court must, amongst other things, decide if the person is a fit and proper person to continue to practise. This is done on a preponderance of probabilities.

(i) A Fit and Proper Person

It was also mentioned in the above matter that the court’s discretion in the decision if a person is fit and proper, is not bound by rules and precedents. An analysis of decided cases has shown that the following are to be taken into account to decide whether any particular conduct would render a person not fit and proper:

- (a) The seriousness of the transgressions. Where a court finds dishonesty, removal from the roll can be avoided only in exceptional circumstances.)
- (b) Systematic contravention of the uniform rules to which an advocate subscribes upon becoming a member of the Bar, may indicate a lack of responsibility and integrity required from an advocate.
- (c) Persistent violation of the Bar Rules and a contemptuous attitude thereto are factors to be taken into account as aggravating circumstances.
- (d) Where the affected clients are especially vulnerable to abuse.
- (e) The period over which the transgressions occurred.
- (f) The extent to which clients have been prejudiced by counsel’s conduct.

The court will take the following mitigating factors into account:

- (a) If the court is of the view that a period of suspension will be sufficiently corrective to avoid a recurrence.
- (b) If the respondent has shown remorse.
- (c) If the respondent’s private life has been affected.
- (d) If the respondent has repaid amounts overcharged, but such repayments should not be overemphasised.

The salient facts pertaining to the case against Pillay referred to above could serve as illustration of the application of some of the abovementioned factors. The court held that Pillay was not a fit and proper person to practice as advocate because he did not work the hours he recorded and therefore falsely presented to clients that he had consulted for the recorded number of hours; in consequence he charged for work he did

not do. This conduct constituted fraud. This finding together with the fact that he also lied to the court, motivated the court to have Pillay removed from the roll of advocates.

(ii) Double briefing

According to the Uniform Rules of the General Council of the Bar of South Africa:

“An earlier brief, once accepted, takes precedence over a later brief. A member wishing to surrender an earlier brief in favour of a later brief shall do so only with the consent of both instructing attorneys.”

On 1 November 2006 the Pretoria Bar Council issued the following circular:

“It has come to the attention of the Bar Council that some members appear at the roll call of civil trials in several matters set down for the same day. What is further most alarming is that such counsel probably charge full fees in respect of preparation and appearance in each of these matters. Such conduct is viewed in a serious light as it amounts to double (even multiple) briefing and overreaching.”

Many a counsel has been removed from the role because of double briefing. Not only is it a transgression of the uniform rules of the general council of the Bar, but it almost always goes hand in hand with overreaching.

(iii) Overreaching and determining a fee

According to the Uniform Rules of the General Council of the Bar of South Africa:

“Counsel is entitled to a reasonable fee for all services. In fixing fees, counsel should avoid charges which over-estimate the value of their advice and services as well as those which undervalue them. A client’s ability to pay cannot justify a charge in excess of the value of the service, though his lack of means may require a lower charge or even none at all.”

“In determining the amount of the fee, the following should be considered:

- (a) The time and labour required, the novelty and difficulty of the questions involved and the skill required to properly handle the case;
- (b) The customary charges by counsel of comparable standing for similar services; and
- (c) The amount involved and importance to the client.”

Overreaching implies a level of dishonesty as a practitioner is obtaining a greater reward than that which he is entitled to, misleading those responsible for payment of the fee.

The representative of the GCB presented the following definition of the word overreach: “to circumvent, outwit, cheat in dealing, taking unfair commercial advantage of another, deceive, exceed and mislead”.

CONCLUSION

Legal practitioners have a duty to act in the best interest of their clients. This implies a moral obligation not to overcharge a client. Legal practitioners should explain their fees in detail to a potential client during the first consultation. The client must be clear on what the proceedings are going to cost him. He/she must understand, agree to and sign the fee agreement and be furnished with a copy of the agreement. The client should also be given time to consider if the legal costs justifies proceeding with the matter. Writer believes it is crucial to inform a potential client on how the fees will be calculated, but to give the client an exact amount in advance on how much litigation is going to cost is a tall order for the legal practitioner to comply with. It is seldom possible to know beforehand how much proceedings are going to cost, for example where expert witnesses could be involved.

Although the court has recently dealt thoroughly with attorneys and advocates that exploited their clients, it is alarming that these malpractices had been in progress for years before being dealt with. Surely many colleagues were aware of these malpractices but remained silent leading writer to the conclusion that an example were made of only a few of the culprits

Be it as it may, writer will be unfair not to break a lance for legal practitioners in general. There is a saying among legal practitioners: “You are a good lawyer until you send a bill”. Legal practitioners are business men and their practises are theirs and their employees’ bread and butter. They are professionals that studied many years and also completed in house training with little or no income. Surely they are entitled to a reasonable fee for work done. They have huge overhead expenses such as office rent, salaries, computers, office equipment and telephone bills to mention but a few. Surely they are entitled to a reasonable fee for work done. Unfortunately many a client in need of a lawyer is in a financial predicament, but the public

should bear in mind that the legal profession is very demanding and requires continuous study and long working hours from practitioners.

The contingency fee cap has been 25 % since the enactment of the Contingency Fee Act in 1997. Maybe it is time to be revised. It is debatable that money recovered on behalf of the client should be paid directly to client as many attorneys may now have to litigate to get the agreed 25 % from the client. As attorneys should be men and women of good character their clients should not have a problem receiving the agreed 75 % from his/her attorney. It is not fair to treat all legal practitioners as unethical and untrustworthy because of the greed of a few.

The precepts of the law are these: to live honestly, to injure no one, and to give every man his due.

THE ROLES, GOALS AND ACTIVITIES OF EMPLOYERS AND HR PRACTITIONERS IN NEW ZEALAND FOR ORGANISATIONS TO BE SUCCESSFUL AND COMPETITIVE: EMPIRICAL EVIDENCE FROM A LONGITUDINAL STUDY

Andries J Du Plessis, Leon De Wet Fourie and Pieter S. Nel
Unitec Institute of Technology, New Zealand

ABSTRACT

This research considers the role, activities and contribution of HR and managers in six closely related themes that should be addressed to maintain high workplace productivity in a complex business environment in which there are many competing interests. Previously a reward approach was simple with two main streams pay and benefits. In New Zealand HR practitioners have been exposed to global competition creating the need for their roles, goals and activities to be recognised in adding value in organisations to be successful. The outcomes of this research shed light on when is an employer an employer of choice, employee empowerment, employee engagement, rewards based on individual and the whole organisation's performance including the remuneration component that is a reward system classifiable into monetary- and in-kind payments. Recommendations and the conclusion form the last two sections.

INTRODUCTION

In today's global economy Human Resource (HR) practitioners must be prepared to meet the considerable challenges and expectations posed by the continuing evolution of their roles, goals and activities to confirm how their function is creating and adding value to the organisation. An organisation is formed in order to fulfill a specific mission or purpose. This mission or purpose cannot be achieved unless the organisation searches for and selects the best potential employee with the right skills, knowledge and aptitudes (KSAs) for each identified job or position. It is imperative, therefore, that an organisation would design and implement an appropriate reward system in order to attract the best suitable employees in order to achieve its desired goals and objectives (Nel, Werner, Du Plessis, Fazey, Erwee, Pillay, MacKinnon, Millet and Wordsworth, 2012).

In the past, a reward (remuneration) approach was actually very simple: pay and benefits. Labour was a lot less mobile but by taking their skills offshore was really uncommon up to the stage that politicians realised what was happening especially in New Zealand. They began to refer to it as the brain drain from New Zealand. Jobs today are more of a balloon than a box; they shift as economies change and company structures morph. Individual efforts are far more valued and recognised with job security coming more from employability rather than paternal protection (Youngman 2011; Boxall 1995).

Designing and managing a reward system that includes benefits, services, and even empowerment with employee engagement as the next step is rather a complex task. It must not only ensure that the organisation is attractive to potential employees, that is the employer of choice, but it must also ensure that the employees, when placed, are as productive as possible with optimum levels of job satisfaction.

The global economic climate has become increasingly turbulent, businesses seek to keep ahead of the competition by working faster and smarter; by raising productivity levels per employee while, at the same time, increasing innovation and minimising costs (Chavan, 2009). Employment security is no longer

guaranteed, and loyalty from employees is no longer a given. Companies have always faced many challenges, but at no other time have the business challenges become more pronounced, with rapid and volatile change, as in the 21st century (Du Plessis, 2009; Jørgensen, Owen, & Neus, 2009).

At the heart of the business are managers who must deliver required services to increasingly demanding customers, through employees having differing levels of understanding, personalities, backgrounds and abilities (Drucker, 2006). Managers face complex business environments in which there are many competing interests. Working out how to make the best use of the intellectual capital they have at their disposal in the form of existing productivity tools and employee knowledge to drive productivity can be a major challenge for many of them. This research considers the role, activities and contribution of HR that can be used to drive high workplace productivity in such an environment.

Organisations must be able to attract a sufficient number of job candidates who have the abilities and aptitudes needed to add value to the company. In other words they have to become an employer of choice to ensure that they have a pool of suitable applicants who can enter the selection process when they have vacancies. A company's workforce is the lifeblood of organisations and they represent one of its most potent and valuable resources according to Du Plessis & Frederick (2010).

HR practitioners in New Zealand have been exposed to global competition creating the need for their roles, goals and activities to be recognised in adding value in organisations to be successful. The emergence of globalisation, development in technology and telecommunications; the shift towards a knowledge-based workforce; labour legislation and intensifying competition for skilled labour create new competitive realities for organisations. Employers are now looking to the HR practitioner to go beyond the delivery of cost effective administrative services and provide expertise on how to leverage human capital (Du Plessis, 2010). The roles and activities of both the employers and HR practitioners have changed over the years and this study endeavours to shed more light on these roles, activities and goals. In this paper six closely related themes are analysed and discussed: Employee engagement, rewards based individual performance, rewards based on organisational performance, an employer of choice, benefits and services, and employee participation and empowerment.

PROBLEM STATEMENT

From the research problem, taking into account the broader focus on key HR roles, goals and activities, one realises that there is a need to consider to what extent HR practitioners in NZ organisations contribute to the success and competitiveness of organisations in the current situation; but how prepared are they for the future in NZ?

OBJECTIVES OF THIS STUDY

Over the past decades several studies were done in NZ among HR practitioners' roles, goals, and activities including their competencies, future capabilities, and challenges. The ultimate objective of this study is to determine the extent to which the current contribution of the roles they play, goals they set and achieve and activities of HR practitioners in New Zealand organisations match their current competencies as well as the previous studies' predictions by HR practitioners. By comparing this study of NZ organisations with previous studies add more value and it informs the reader of how changes have taken place over the past almost twenty years in NZ.

METHODOLOGY

Background

A very comprehensive HRM questionnaire covering 358 items to identify HRM and management trends was jointly compiled in New Zealand and Australia in 1994: (IPMNZ, 1994). The same questionnaire was used with permission for a survey to identify the future competencies and roles of HR in those countries for the year 2000 by the Human Resource Institute of New Zealand. The same questionnaire was modified and refined and used again in 2000 by Burchell (2001) in association with the Human Resource Institute of New Zealand (HRINZ) to determine a future perspective on human resources in 2010 in New Zealand. The final section of the said questionnaire sought to obtain demographic information from respondents. The same questionnaire was used with permission after minor editorial modifications for an identical survey in South

Africa in the last quarter of 2002. The topics covered in the questionnaire included human resource goals, roles and activities, and so forth. Due to the magnitude of the survey only a small section is analysed and reported upon in this paper.

The quantitative methodology adopted was an e-survey; a questionnaire containing structured closed questions. This involved the selection of a sample of people from the HR practitioner population in NZ to ascertain how factors differ, and to make inferences about the population, or in other words generalising from sample to population. Reliability of this study was seen as high (15.4% responded) as previous leading HRM studies conducted in NZ were successful with a response rate of 41 %, 11% and 34 % respectively.

Sample selection

The study focused on HR practitioners in NZ organisations who are registered as members of the Human Resources Institute of New Zealand (HRINZ). HRINZ have 3600+ individual members who are involved in the management and development of HR in private and public sector organisations throughout NZ. The target population was limited to HRINZ members that had registered to participate in HR research requests that HRINZ provided links to; the total number of HRINZ members in this category was 635. A total of 119 members responded but 98 questionnaires were fully completed and usable resulting in a 15.4% response rate.

Data collection

The data was collected via the e-survey, which was a repeat of previous studies and therefore a very important longitudinal study. The invitation to participate went to 635 members of HRINZ.

Questionnaire

The questionnaire consisted of questions to adequately explore each of the HR themes researched in this study. All the questions in the questionnaire were closed questions. Only six closely related themes are covered in this paper but due to the size of the study and length limitation for this paper not all the information could be discussed. The Tables reflect the research questions used in this paper, and the rationale for using the six specific themes is discussed later.

LITERATURE REVIEW

Background

A reward system includes anything that an employee may value and desire and that the employer is able or willing to offer in exchange for employee contributions (Marsden, 2011:16). Du Plessis (as cited in Nel et al, 2012) explains that the reward system is composed of two components: the remuneration component and the non-remuneration component see Figure 1, below.

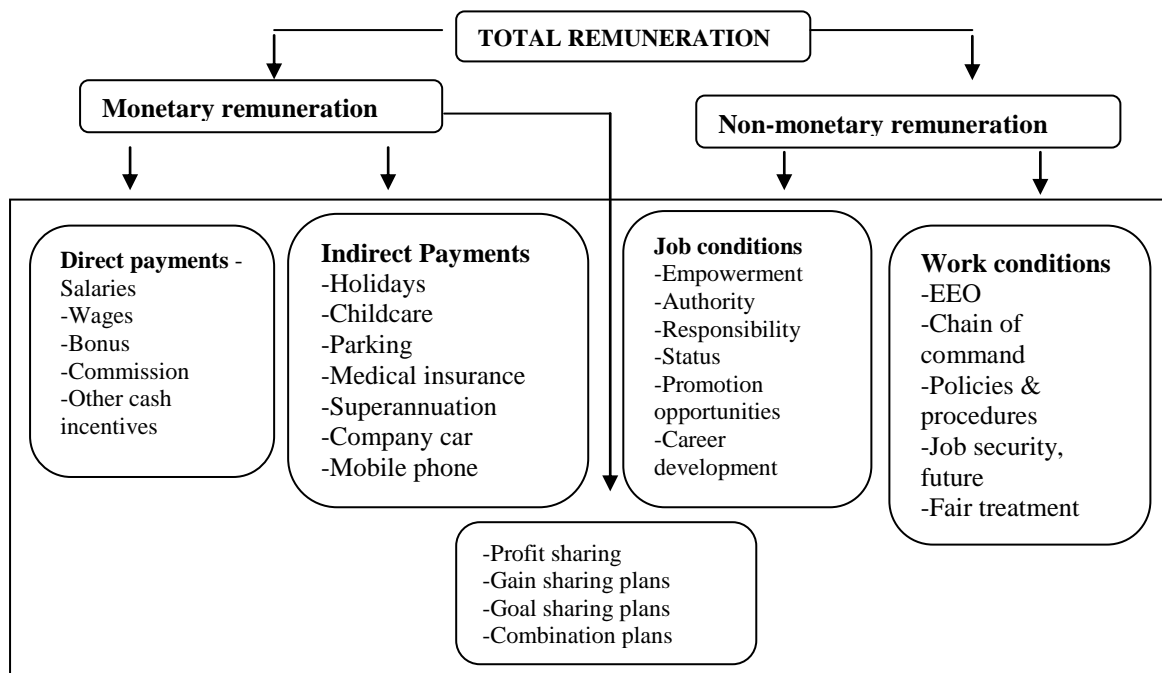

Source: A J du Plessis as cited in Nel et al (2012, p267)

This paper confines itself to when are employers an employer of choice, employee empowerment, employee engagement, rewards based on individual and the whole organisation's performance including the remuneration component that is a reward system classifiable into (a) monetary payments and (b) in-kind payments. Organisations all have different remuneration policies which is what gives the organisations or companies their competitive advantage. This paper also shed light on employee participation and empowerment that could contribute for an organisation to be regarded as an employer of choice. Therefore, remuneration management is a human resources management activity aligned with the organisational strategy that deals with every type of reward individuals receive in exchange for performing organisational tasks. It includes pay and benefits (total remuneration) or just pay (cash remuneration) (Nel et al, 2012).

Monetary claims on benefits and services are wages or salaries paid to an employee in the form of money or a form that is quickly and easily transferable to money at the discretion of the employee. Whereas in-kind claims are claims on goods and services made available and paid for either totally or in some percentage by the employer (Nel et al, 2012). Many organisations, especially in the United States, have shifted from administering salaries to administering total remuneration. There are indeed new remuneration trends. There

are several approaches to remuneration management in the modern age with all its pressures and changes, such as broadbanding, skills-competency-based pay, variable pay approaches and others (Wood et al, 2013).

Figure 1: Total Remuneration Management System

The pay debate that is, the argument regarding the best way of rewarding people for their services, has always been important because relating employee compensation to company profits (and thus to its survival) is unavoidable. This pay debate is far from settled precisely because the relationship of productivity, profitability, and personal gain in firms is critical, intractable, and permanent. The benefits could be linked with empowerment of employees and the services they get from their employers. These services and benefits could be the reason why people regard certain organisations as an employer of choice (Du Plessis & Frederick, 2012).

Stone (2011) supports the fact that the objective of a remuneration package is to influence employee motivation in a positive manner so it leads to improved organisational performance and strategy. If rewards are to be useful in stimulating desired behaviours, they must meet the demands of the employees whose behaviours they are intended to influence. People gain satisfaction from their work, but for various reasons. The degree of job satisfaction that employees enjoy has not only been difficult to identify and define, but also to measure with any degree of certainty.

There has to be a clear link between remuneration and performance (Rudman 2010). In other words, both employer and employee have to be satisfied in the exchange relationship. Marsden (2011) points out that organisations should have a more holistic view of the whole employment relationship and its value. High levels of employee engagement could enhance individual as well as organisational performance. Value-added remuneration is one in which components of the remuneration package (benefits, base pay, incentives and so on) create value for the organisation and its employees (Nel et al, 2012).

Employee benefits may be defined as rewards that are allocated to employees for being members of the organisation and for their positions or job-levels within the organisation (Paine, 2008). These benefits will include some of the following: benefits for death, accident, sickness, retirement or unemployment. Factors influencing the growth of employee benefits are industrialisation, trade unions, wage controls, cost advantages, tax advantages, inflation, and legislation. Perquisites, or perks, are a special category of benefits and are available only to employees with some special status, such as upper-level managers.

As employees acquire more skills, they become more flexible resources, developing a broader understanding of the work processes and of their contribution to the organisation. In terms of employee-related outcomes, skills-based pay results in higher pay rates, increasing satisfaction, higher skills growth, commitment, and capacity for self-management or problem solving. There is greater teamwork among

On the other hand Du Plessis and Frederick (2012) argue that there is pay for competencies which are the sets of skills, knowledge, abilities, behavioural characteristics, and other attributes that predict superior performance. True competencies are those that add value and help predict success – these are the ones that should be rewarded, which involves identifying those competencies that are needed to support an organisation's strategy. Many organisations are discovering that they want to reward more than just the skills or knowledge necessary for a role. Employees are needed who are not only skilled, but also energetic, service-conscious, and problem solvers. The answer lies in the development of less obvious competencies – the ability to work in teams, to accomplish specific goals, to solve problems rapidly, and to understand the customer's perspectives and meet their needs in a way that really adds value. Nel et al (2012) postulate that certification of competence in skills necessary to perform well in the job is required to get a pay rise. The actual selection of competencies depends on the nature of the business, and the nature of the job – competencies could include leadership, flexibility, initiative, and so on.

A reward strategy is a long-term plan designed by an organisation that aims to attract the best talent to it whilst ensuring that its present employees are operating at optimum levels of job satisfaction so that its strategic goals are achieved. Human capital gives a company its sustainable competitive advantage. In Nel et al (2012) Du Plessis has designed a model for organisations to follow should they find it necessary to design and implement a new remuneration system. Such a system has many advantages amongst others a satisfied workforce, be regarded as an employer of choice, employee engagement and so on. The first step requires a thorough analysis of the present remuneration structure, current remuneration policies, pay procedures, and salary problems. Thereafter, the remuneration system designer formulates new salary policies based on the business strategy of the organisation and incorporating the value chain.

Source: A J du Plessis as cited in Nel et al (2012 p275)

The next step is to develop the implementation plan, working closely with remuneration experts, consulting with trade unions, and communicating with all employees. Once the new system is in place, evaluation and monitoring should be carried out on an on-going basis; feedback should be given and if necessary more changes should be made. The nature of the business and its strategic plans will influence the design of the new remuneration system. The new system could be skills- or knowledge-based, competency-based, performance related, variable-based incorporating incentives, and broadbanding could be used as a pay base.

Companies should keep up with the global trends where employees have more skills and are in the position to demand better benefits or even engagement in decision making (Härtel & Fujimoto, 2010). Individual as well as organisational performance could be a good indicator for the necessity of a new system. The research results in this project shed more light on this aspect later in this paper. In many organisations, individuals have not changed as rapidly as the cultures in which they are expected to work. Many employees cling to the belief that they are entitled to ever increasing salaries, punctual and substantial raises, and luxurious benefits packages. But old habits can be broken, old behaviours changed, old expectations replaced with more attractive new ones. The knowledge of new cultures and compensation strategies must not be the sole property of the compensation professional. Line managers must have a clear understanding of pay strategies, and the rewards process must be made clear to both supervisors and employees. To be successful, reward strategies must add value to the organisation, but one must understand how they work, what values and behaviours they support, how they must be administered and communicated, and what their limitations are (Du Plessis, Paine, Botha, 2012).

ANALYSIS OF THE RESULTS

Comparison of the profile of the respondents with previous studies in NZ

A study was executed in 2000 by Burchell (2001) in association with HRINZ to determine a future perspective on HR in 2010 in NZ. Using five related themes a study was executed in 2008 by Paine (2008) and a repeat of the 2000 study was executed in 2010 by Nel and Du Plessis (Nel & Du Plessis, 2011). Some of the comparisons are depicted in Table 1, 2 and 3 below. Paine used themes not discussed in this paper therefore her comparisons are not reflected in the Tables below.

The profile of the respondents is important to add value to their opinions. In the current (being 2010) study in NZ, the most frequent title was HR Manager (46.7%), and the next most common title was HR non-management (16.7%). Those two titles accounted for 63.4% of the reported titles. There was a huge and unexpected increase in the consultants' category from 14% in 2000 to 21.7% in 2010. There was a sharp

decline in the line managers with HR functions who responded in 2000 from 10 % to only 1.7% in 2010. It can be deduced that more organisations make use of consultants than allowing their line managers to execute HR functions and activities, see Table 1, below.

Figure 2: A model for designing and implementing a new remuneration system

Table 1: Profile of respondents by profession in New Zealand in 2000 and 2010

Profession	NZ profile 2000	NZ profile 2010
HR (officer to director)	72.0%	63.4%
Business (line managers to CEO)	10.0%	1.7%
Consultants	14.0%	21.7%
Academic (all tertiary institutions)	4.0%	8.2%
Other	0%	5%
TOTAL	100%	100%

In New Zealand most organisations (83%) have fewer than 10 employees. In this study, the participants are from different sized organisations (see Table 2 below); the following groupings were compiled for analysis: small organisations with fewer than 100 employees (0-99); medium 100 to 499 employees, large is 500 or more employees. It should be noted that New Zealand is predominantly a country of small businesses, with 93.3% of enterprises employing 19 or fewer people ("SMEs in NZ: Structure and Dynamics," 2006)

Table 2: Profile of respondents by organisation size in NZ in 2000 and 2010

Number of employees in organisation	NZ profile 2000	NZ profile 2010
Fewer than 10	1.0%	11.7%
10 – 49	4.0%	8.3%
50 – 99	9.0%	5.0%
100 – 499	40.0%	28.3%
500 or more	46.0%	46.7%
TOTAL	100%	100%

In Table 2 above, the profile of the respondent's organisation size employing 500 or more employees for 2000 is almost identical to the 2010 and the group 50 to 99 employees is close with only 4% less in 2010.

Table 3 below compares the six themes used in this paper as it was current in 2000 and predicted for 2010 and current in 2010 and predicted for 2020 by the respondents. None of the themes were closely predicted and none in reality are close as per the responses from the respondents.

Table 3: Six closely related themes - two categories: very important to critical for success

Closely related Themes	NZ 2000 actual	NZ predict for 2010	NZ 2010 actual	NZ predict for 2020
Employee engagement	27.3%	61.1%	68.4%	81.6%
Rewards – individual performance	11.0%	1.0%	30.0%	51.6%
Rewards – organisational performance	8.5%	14.5%	18.3%	41.6%
Reputation – employer of choice	32.4%	48.5%	38.4%	65.0%
Benefits and services	8.2%	8.2%	16.7%	43.3%
Employee participation and empowerment	3.0%	45%	35.0%	71.7%

Employee engagement

Employee engagement in the day-to-day activities of organisations seems to get momentum. The actual for 2000 was 27.3% and the respondents predicted that it will increase to 61.1% in 2010. The actual figure for 2010 was 68.4% and therefore it was actually more important as what the respondents predicted in 2000. Interestingly the figure increased with another 12.9% as predicted for the future (being 2020). It confirms the earlier statement that employee engagement gets momentum and it can be said that employers regard employee inputs more and more valuable for the success of their businesses. For 81.6% of the respondents, it is very important to critical for success in 2020. At the other end of the spectrum, only 13.2% of the respondents regarded it more important in 2020 than the actual figure of 2010 whereas in 2000 a huge increase of 33.8% was reported to 2010.

Rewards based on individual performance

The respondents were asked to state how important rewards is for individual performance now (being 2010) and for the future (being 2020). The 2000 respondents forecasted a decrease of 10% to 2010. They were totally off the mark because the actual figure for 2010 was 30% of the respondents that regarded individual performance currently (being 2010) and a further 21.6% on top of this figure regarded it important and critical for success in 2020. In comparison there is a 19% difference between 2000 and 2010 actual figures and a very close 21% between 2010 (actual) and 2020 predicted figure. Employees have changing needs and therefore a performance difference between individuals and organisations are required to respond to these differences. Many employees are now looking for more than just remuneration and organisations need to understand this quest in order to assist their staff to have a better balance.

Rewards based on organisational performance

Due to increasing diverse workforces in NZ, their opinion was related to the area of organisational performance. Between 2000 (actual) and 2010 (predicted) there was an increase of only 6% compared to the actual in 2010 (18.3%) and the predicted percentage for 2020 (41.6%) resulting in a 23.3% increase in importance, according to the respondents. The respondents of 2000 predicted very closely the importance of organisational performance. There is less than 4% difference in what they predicted for 2010 and what the actual figure was for 2010. It can be deduced that employers and also HR practitioners do not really understand the importance of rewards based on organisational performance. Their prediction for 2020 is less than 50% of the respondents (only 41.6%) regard this as important or critical for success. It is really alarming and HR practitioners and managers should take note of this careless attitude towards success of the business or otherwise it is a matter of them discarding the importance of teamwork, loyalty, employee engagement and empowerment of employees in the workplace. Organisations' responses to employees' needs may range from providing rewards other than monetary such as work arrangements to addressing employees' growing desire to have more family-friendly working environments.

Establishing a reputation as an employer of choice

Respondents were asked to give a response whether their organisation is an employer of choice. There was a 10% lower figure given for the actual figure in 2010 as what was predicted (48.5%) for 2010. It seems that organisations would establish themselves as an employer of choice for the future (65%) as they experience the lack of skills attributes and knowledge among their employees if they are not the employer of choice. Employees only have to visit the organisation's website to determine if their organisation is offering the

equivalent as other employers. It is always good if employees compare their rewards with similar organisations. Employees leaving an organisation now place their negative experiences or positive experience on the social media, Facebook and others, and employers / organisations are compared or measured by the public opinion of ex-employees or current employees. It is one thing to recognise the need to be the employer of choice, however it is quite another thing to have the rewards on the table for the employees and what they really experience working for an organisation.

Benefits and services

This question was designed to establish the extent to which organisations, in other words employers and managers provide benefits and services to their employees. Organisations in New Zealand are behind most organisations in the rest of the world providing medical assistance, retirement benefits and so on (Marsden, 2011; Nel et al, 2012). The research outcomes for this question confirm that in 2000 only 8% of the respondents regarded this as important and even the prediction to 2010 was a mere 8%. The actual figure for 2010 was double (16.7%) but they realise that employees will be more demanding in the future and predicted almost a three-fold increase to 43.3% to 2020. The increasing global nature of competition requires that organisations use all of their available resources to survive and to succeed (Sheehan, 2005). The emphasis on human resources and their value add in an organisation is of the utmost importance for success.

Employee participation and empowerment

This question was put to the respondents to determine what the involvement of their organisation's employees are in the decision making process and to what extent are they empowered and do they participate in the running of the business. In a study done by the SHL Workers and Good Management (Hopkins, 2012) it was found that 36% of managers regard their participation and involvement in the strategic direction of the organisation as part of their job. The study further revealed that it is not just monetary rewards but include responsibility, more control (empowerment) and more of a say in their work they are doing. Professional development, recognition for doing a good job is not everything and 67% of their respondents expect more money as rewards for being part of decision making and more responsibilities.

The respondents in our research project responded in 2000 with a mere 3% that acknowledged participation and empowerment and a huge increase to 45% was predicted for 2010. The actual figure for 2010 was 10% lower than predicted (35%) and for the future (2020) the figure is up by 36.7 % to 71.7%. It can be deduced that HR practitioners and employers know that it is important for employees to participate but they just don't want to "share" control (empowerment) with their employees as yet.

RECOMMENDATIONS FOR HR PRACTITIONERS AND EMPLOYERS

Concrete recommendations are proposed in this section, even though a very high level of employee participation and empowerment (71.7%) are evident in the results, the second highest prediction for any of the six themes, for 2020, used in this paper along with employee engagement (81.6%).

- They will have to be the change agents and leaders with the development and implementation of a new rewards system.
- Individual performance is important for the respondents therefore a definite reward system for individual performance should be developed and implemented.
- Employer of choice was rated at 65%. HR practitioners should assist employers to ensure that the needs of employees are met as far as possible and that feedback received from employees is taken seriously and something positive gets done about it.
- Employers and HR practitioners should use the talents of people from various backgrounds, experiences and cultures and engage them in decision making on certain levels and to successfully take part in aligning organisational strategies and performance with individual performance.

CONCLUSIONS

Findings indicate that the engagement and empowerment of employees has gained great momentum in NZ. In 2000 the actual figure was 27.3% compared to the actual figure in 2010 of 68.4%. A further 13.2% was predicted to 2020 to a total of 81.6%. Individual performance plays a significant role in the success of a business with a 19% increase since the 2000 study to the actual of 2010 while organisational performance increased with less than 10% in the actual responses for the two periods when the studies were executed. The employer of choice increased with only 6% for the same period while benefits and services doubled. Therefore it can be deduced that benefits and services for employees are critical for success. Employee participation and empowerment is up by the biggest margin of 32% and it confirms that employees want to be more involved in the day-to-day running of the organisation and that they would love to have more responsibilities even if there is no increase in pay but other rewards or benefits.

The six themes show similar increases for roles, goals and activities for employers and HR practitioners in New Zealand. The most significant result is employee participation and engagement, and recommendations were made in the previous section. A new kind of HR practitioner as well as a business manager and employee can be expected in successful organisations in the future adding sustainable value.

A very useful remuneration system was developed for use by employers and HR practitioners (Figure 1). Similarly a model for designing and implementing a reward system (Figure 2) was developed depicting the steps to be followed for successful implementation of a remuneration system.

A STUDY ON THE INTERNATIONAL POSITION, AND OCCURRENCE, OF BRIDE ABDUCTION

**Louise du Preez and Antoinette Marais
Tshwane University of Technology**

ABSTRACT

In modern day society it is difficult to comprehend that a phenomenon such as bride abduction, or bridenapping, still exists. In a time where human rights are shouted from the rooftops, young women, from as young as twelve years old, are forcefully taken from their homes and forced to marry a man whom they often have never seen before in their lives. This is an introductory paper discussing this phenomenon as an international practice based on literature studies to compare the various bridenapping practices and procedures. The aim of the paper is to raise awareness of the existence of bridenapping in modern society, and to use a comparative approach to find solutions that will lead to the eradication of bride abduction.

INTRODUCTION

Bride abduction, otherwise known as bride-kidnapping or bridenapping, is when a woman, usually a virgin under the age of 25, is abducted with the intention to force her into marriage with a man she would not consent to under normal circumstances. Victims of bride-kidnapping can be as young as 12 years old. The abduction is carried out by an individual, or a group of men organised by the intended groom. The girl is then kept against her will at the house of the groom, or his family.

Oftentimes the girl is raped repeatedly by the man who wishes to marry her, ruining the girl's reputation and making her prospects of marrying someone else at a later stage impossible. Because of the forcible rape, and the loss of virginity, the victim's family often agrees to the forced marriage to save the family's honour and the girl's reputation. Even if the girl is not actually raped, and remains a virgin, the mere possibility that she is not a virgin anymore is sufficient to destroy her chances of ever marrying someone else.

REASONS FOR THE OCCURRENCE OF BRIDE ABDUCTION

Various circumstances might lead to bride-kidnapping. These circumstances differ from region to region. Many groups which take part in this phenomenon do so as part of their culture and traditions. Other perpetrators do so on religious grounds, whilst still others do so because of a mistaken believe in the mythical healing powers of having intercourse with a virgin.

Bride abduction primarily takes place in poverty stricken communities where the abductor does not have the money to pay a dowry to the woman's family. The abductor may also not be socially acceptable as a suitable husband in the eyes of the woman's family due to a variety of reasons, such as lower social standing, poverty, disease or previous criminal behavior.

The majority of regions where bridenapping is practiced are patriarchal societies where women have very few, or no rights as individuals at all. In these societies there are oftentimes a strong social stigma surrounding extra marital sex, pregnancy and births. In these patriarchal societies women and children work for the family as free laborers. By abducting the woman the man also does not have to pay economic compensation to the woman's family in order to marry her.

CONSEQUENCES OF BRIDE ABDUCTION

Once a girl has been kidnapped to force her into marriage there are various consequences of this abduction and consequent forced marriage which has an effect on the victim's life. In many cases the victim is not only the victim of kidnapping and a forced marriage, but also the victim of domestic violence and spousal rape throughout the marriage. The victim is not only subjected to assault by her husband, but also her family-in-law.

For girls who planned to qualify themselves on a professional level, these dreams are destroyed by the bridenapping, as the woman is now forced to work for the husband and his family without any compensation. The woman also does not usually have a say in whether she wants children, when or even how many. These decisions are made by the husband, as the head of the household. If the husband tires of her, he can force her to leave the house, and her reputation is once again tarnished, as she did not meet the requirements of a good wife.

Bridenapping also increase female impoverishment, which makes it very difficult for the victim of the abduction to leave the abductor and the marital home, as she has no means of supporting herself and her children, even if she is in a position to take them from her 'husband'.

Once a woman has been abducted and forced into marriage this usually leads to the deprivation of other fundamental human rights as well, such as the right to freedom of movement, the right to fair labor practices and the right to own property.

THE INTERNATIONAL POSITION ON BRIDE ABDUCTION

Bride abduction is not an internationally accepted ritual. Various international treaties and conventions attempt to protect girls and young women against this phenomenon. The United Nations Universal Declaration of Human Rights states in Article 16: "*marriage shall be entered into only with the free and full consent of the intending spouses*".

In 1979 the UN General Assembly adopted the Convention on the Elimination of All Forms of Discrimination against Women. Bride abduction was again declared unacceptable in Article 16, which states: "*states parties shall take all appropriate measures to eliminate discrimination against women in all matters relating to marriage and family relations and in particular shall ensure, on a basis of equality of men and women: a) The same right to enter into a marriage, and b) The same right freely to choose a spouse and to enter into marriage only with their free and full consent*".

The Declaration on the Elimination of Violence against Women recognised the urgent need for the universal application of rights and principles with regard to equality, security, liberty, integrity and dignity to women. Article 1 reads as follows:

"For the purposes of this Declaration, the term 'violence against women' means any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or suffering to women, including threats of such acts, coercion or arbitrary deprivation of liberty, whether occurring in public or in private life."

Article 21 of the African Charter on the Rights and Welfare of the Child protects children, under the age of 18, in African countries against the practice of bride abduction, by stating:

"1. States Parties to the present Charter shall take all appropriate measures to eliminate harmful social and cultural practices affecting the welfare, dignity, normal growth and development of the child and in particular:

- (a) those customs and practices prejudicial to the health or life of the child; and*
- (b) those customs and practices discriminatory to the child on the grounds of sex or other status.*

2. Child marriage and the betrothal of girls and boys shall be prohibited and effective action, including legislation, shall be taken to specify the minimum age of marriage to be 18 years and make registration of all marriages in an official registry compulsory."

The rights of women in Africa are protected through the Protocol to the African Charter on Human and Peoples' Rights on the Rights of Women in Africa (The Maputo Protocol). Article 5 of the Maputo Protocol protects African women against any harmful practises. This includes internationally unacceptable practises. Article 5 states:

" States Parties shall prohibit and condemn all forms of harmful practices which negatively affect the human rights of women and which are contrary to recognised international standards. States Parties shall take all necessary legislative and other measures to eliminate such practices ... "

Women in Africa are further protected against actions amounting to bridenapping by Article 6 of the Protocol:

" States Parties shall ensure that women and men enjoy equal rights and are regarded as equal partners in marriage. They shall enact appropriate national legislative measures to guarantee that no marriage shall take place without the free and full consent of both parties. "

INTERNATIONAL OCCURRENCE OF BRIDE ABDUCTION

Unfortunately all these treaties, conventions and protocols do not prevent the phenomenon of bridenapping to continue internationally. The majority of communities where bridenapping occur on a regular basis are minority tribes in remote rural areas, but it also occurs in developed countries, such as the United States and across Europe, albeit in exceptional cases.

United States of America

In recent years there were two reported cases of bridenapping in the USA, those of Elizabeth Smart and Jaycee Dugard. The 14 year-old Smart was abducted from her home in Salt Lake City, Utah, on 05 June 2002 by

Brian Mitchell. After being abducted by Mitchell, his wife and accomplice, Wanda Ileen Barzee, prepared Smart for a 'marriage ceremony'. Over the course of the next 9 months, Elizabeth Smart was repeatedly raped by Mitchell as his 'second wife'. Barzee was convicted of her role in the abduction and sentenced to 15 years imprisonment in November 2009. Mitchell was convicted of federal kidnapping and sentences to life imprisonment in 2011.

Jaycee Lee Dugard was kidnapped whilst walking to the school bus stop on 10 June 1991, at the age of 11 in South Lake Tahoe, California. Dugard was abducted by Phillip Garrido and his wife Nancy Garrido. The kidnappers kept Dugard in a concealed area behind their house where she was the victim of repeated rape and sexual assault. Jaycee Dugard bore two daughters during this time, fathered by Phillip Garrido. On 26 August 2009 Dugard was identified after an investigation into suspicious behaviour of a man accompanied by two women on the campus of the UC Berkeley campus. A staff member of the university alerted Garrido's parole officer, which lead to Garrido's interrogation where he admitted kidnapping Dugard. During questioning Dugard displayed signature signs of Stockholm syndrome. She formed a close bond with Phillip Garrido during her period of captivity. After more than 18 years Jaycee Lee Dugard and her two daughters were reunited with her family. Both her kidnappers pleaded guilty to the kidnapping of Dugard as well as sexual assault. In June 2011 Phillip Craig Garrido was sentenced to 431 years imprisonment, and his wife, Nancy, to 36 years to life imprisonment. At the sentencing hearing Dugard's mother read the following statement written by Jaycee Lee Dugard:

"I chose not to be here today because I refuse to waste another second of my life in your presence. I've chosen to have my mom read this for me. Phillip Garrido, you are wrong. I could never say that to you before, but I have the freedom now and I am saying you are a liar and all of your so-called theories are wrong. Everything you have ever done to me has been wrong and someday I hope you can see that. What you and Nancy did was reprehensible. You always justified everything to suit yourself but the reality is and always has been that to make someone else suffer for your inability to control yourself and for you, Nancy, to facilitate his behavior and trick young girls for his pleasure is evil. There is no God in the universe that would condone your actions. To you, Phillip, I say that I have always been a thing for your own amusement. I hated every second of every day of 18 years because of you and the sexual perversion you forced on me. To you, Nancy, I have nothing to say. Both of you can save your apologies and empty words. For all the crimes you

have both committed I hope you have as many sleepless nights as I did. Yes, as I think of all of those years I am angry because you stole my life and that of my family. Thankfully I am doing well now and no longer live in a nightmare. I have wonderful friends and family around me. Something you can never take from me again. You do not matter anymore." —Jaycee Lee Dugard, June 2, 2011

Kyrgyz Republic (Kyrgyzstan)

The Kyrgyz Republic is a former Soviet Republic situated in Central Asia. The country has a population of approximately 4.7 million people. 58% of the population are ethnic Kyrgyz, living in the mountainous rural areas of the country. Bridenapping most often occurs under the ethnic Kyrgyz people, although it is not unheard of under the other ethnic groups. Under Soviet rule the phenomenon of bride abduction decreased dramatically, but after independence it increased again, possibly as a way of re-introducing previous traditions lost under the Soviet regime. There is however no consensus under the people of the Kyrgyz Republic on whether bridenapping is a tradition, or not. The claim that bridenapping is a Kyrgyz tradition are mostly made by men.

Although Article 155 of the Kyrgyz Criminal Code states that '*forcing a woman to marry or to continue a marriage or kidnapping her in order to marry her without her consent*' is punishable by a fine or imprisonment of up to 10 years, it is estimated that as many as 50% of ethnic Kyrgyz women are married through the process of *ala kachuu*, of which about two thirds took place without the woman's consent. *Ala kachuu* is defined as the process of bridenapping (directly translated: to take and run away), or getting married by means of abducting the woman. Islam also prohibits marriage without the consent of the parties involved, but even this religious law does not stop some men in this mainly Muslim country from following the practice of bridenapping.

Unfortunately the legislation prohibiting bride abduction and non-consensual marriage are poorly enforced. According to the Women's Support Centre (WSC) in Bishkek, Kyrgyz Republic, only 1 in 700 cases is pursued by the justice sector, and only 1 in 1 500 cases of abduction results in a judicial sentence. Some victims actually obtain protection orders against their abductors from the police, but in practice these orders offer very little protection, as the police do not enforce the protection orders, thereby discouraging women to do something about the infringement of their fundamental human rights. Victims of bridenapping have the best chance of being assisted by NGO's, who largely depend on donations to effectively provide support to these women. For as long as bridenapping and the domestic violence and sexual assault that follows this phenomenon goes unpunished in the Kyrgyz Republic, it will continue to occur.

Zabila Matayeva joined the WSC after her sister, Cholpon, was stabbed to death by her husband. Cholpon was the victim of bride abduction at the age of 19. After staying in this 'marriage' for 10 years Cholpon demanded a divorce from her husband as a result of regular physical assault. This is when he killed her. Matayeva explains why her sister stayed in this situation for such a long time:

"She was lost. Cholpon thought her life would end if she left the [groom's] house. This would bring shame on her and the family. She would need to leave the village. So she stayed." - Zabila Matayeva Sister of bride-kidnapping victim

Georgia

In Georgia bridenapping occurs mostly in ethnic minority communities such as the Samtskhe-Javakheti. Bridenapping is a custom that occurs either voluntary or involuntary. Voluntary bridenapping takes place where there is consent prior to the kidnapping and marriage. Involuntary bridenapping takes place where the bride is abducted by the groom, often with the help of his friends and family. This may result in a hostage situation, detention, assaults and even rape.

Most bridenapping cases are part of an elaborate courtship process where the brides agree in advance to the so-called kidnapping to avoid parental opposition to the marriage. In this case no crime has been committed and it is only seen as a cultural ritual. It is estimated that approximately 20% of the kidnapping cases are real and committed against the wishes of the women.

Bridenapping has been practised in Georgia for centuries, but international and national laws in Georgia now prohibit this practice. Although bridenapping is clearly a case of human rights violations against women depriving them of their freedom and right to choose their partners in marriage, it is still

permitted in society. Bridenapping is still seen by society as part of tradition and therefor many cases go unreported. Despite both national and international legislation being in place it seems as if this is insufficient as the concepts of honour and shame and the tradition are still regarded by society as being paramount.

Georgia has joined all the UN human rights instruments that underline the principle of equality and the rights of women. Georgia also signed the human rights protection documents of the Council of Europe in 1999.

The Constitution of Georgia (1995) in Chapter 2, protects human rights and freedom. Article 17.2 prohibits cruel, inhuman or degrading treatment of a human being. Article 18.2 prohibits the restriction of personal liberty without a court order.

The Criminal Code of Georgia (2000) also criminalises acts that violate human rights and liberties such as assault and battery, torture, coercion and threatening. It also criminalises sexual crimes such as rape, sexual abuse and coercion into sexual intercourse or other acts of a sexual nature.

Previously under the Soviet Union the Criminal Code of Georgia also dealt specifically with bridenapping. After the fall of the Soviet regime this provision was again enacted in the Criminal Code of Georgia. Article 143 thereof describes bridenapping as illegal imprisonment but there is no legislation presently that criminalises the act of bridenapping.

The reality is that there is a discrepancy between the law on paper and the actual enforcement thereof in real life. In Georgia family units and their standing in society is paramount. If a woman admits or reports sexual violence against her during the process of bridenapping she risks losing the support of kinship and damaging her honour and that of her family and their social status. The majority of victims who are raped or are victims of attempted rape therefore don't report these sexual abuses and crimes for fear of bringing shame on their families.

In Georgia, a deeply patriarchal society, women are treated as a commodity. Some male head figures of the family even claim ownership of a woman and her body. In contemporary Georgian society, public discussions of bridenapping are prohibited. It is seen as an age old practice rather than a "problem".

AFRICA

There are numerous countries in Africa that still practice bride abductions even though there have been human rights groups trying to eradicate this age-old custom. The countries in Africa most affected by this practice are Rwanda, Ethiopia, Kenya, Somalia and South Africa. The consequences that these women face after being abducted to be a bride are marital rape, unwanted pregnancies, domestic and verbal abuse as well as sexually transmitted diseases. Bride abduction is a symptom of an underlying problem, gender based inequality. Inequality between men and women are found in all parts of life in many African countries.

South Africa

Ukuthwala (translated: to carry) is a custom originally used by the Xhosa tribe, although various other groups such as the Sotho and Mpondo clan have also adopted this practice. The (original) main aim of *ukuthwala* is to force the girl's family to enter into negotiations for the conclusion of a customary marriage. The custom of *ukuthwala* is generally the same as bridenapping in other countries. It will appear that the girl is resisting the abduction, but usually it is in fact not the case. The girl is normally a willing participant. If the parents of the girl do not go after her to bring her back, it is a sign that they agree with the customary marriage that will follow. The family will accept lobola (an amount of money or live stock) from the groom in exchange for their daughter. It is not part of the custom to seduce the girl, if the man seduces the girl he will have to pay a seduction beast over and above the consented lobola.

When *ukuthwala* happens with the consent of the girl, it is the proper use of a traditional custom as opposed to when it happens against her will. Then it will be abduction and therefore a crime. It has also been suggested that if the parents consented to the abduction it will not be a crime.

The reasons for *ukuthwala* vary from avoiding the expense of a wedding to forcing the father to consent to the marriage between the couple. Another reason for using this practice by older men is the belief

that you can be cured of HIV/AIDS if you have sex with a virgin, usually a young girl. These young girls become child brides. Sometimes these bride abductions happen with the consent of the parents or guardians.

Ukuthwala is still being practiced in remote villages in the Eastern Cape, Kwa-Zulu-Natal and the Western Cape. In 2009 reports of 20 Eastern Cape school girls who had to leave school to be part of the traditional custom, *ukuthwala* were met with outrage. Traditional leaders had rules in terms of which this custom was practiced. Presently the regulation of this custom has changed for the worse. The traditional leaders have raised concerns that abducting a girl of 12 is not part of the cultural practice they know. It was also stressed that *ukuthwala* was an old custom that was now being wrongly practised in several parts of South Africa.

South Africa ratified various international human rights instruments. Bridenapping (a man taking an adolescent girl for marriage without consent) for any reason is a crime. If a person exploits a child sexually he will face a fine and imprisonment of up to 20 years. South Africa unfortunately has a low conviction rate for rape and child abuse.

The “TOGETHER WE ARE THE SOLUTION”-campaign was launched in May 2009. The traditional leaders of these affected areas, as well as the government, joined forces to get the campaign of the ground. The aim of the campaign is to eradicate the practice of bridenapping with girls under the age of 18.

Somalia

Somalia has a very bad reputation when it comes to child labour and child abduction. Bridenapping is being practised by various ethnic groups and is maintained by cultural and religious beliefs. One of the main reasons for child/bride abduction is to marry a virgin because of the belief that she will be free from diseases.

When a girl is abducted, she is considered to be the property of the husband and she must obey his wishes. Even after the husband dies, she will remain the property of his family. She can even be forced to marry another man who is part of her husband's family. The family's oldest living male will have the right to decide her fate.

Girls as young as 10 years of age are being kidnapped to be married. Some girls are being kept as slaves, should they try to escape it will only lead to more abuse and rejection from the community. As in some of the other countries where bridenapping occur the family of the girl often consent to the kidnapping as they will then receive an amount of money. They will consent without considering the girl's future. They will expect the girl to stay with her husband, even though she is treated badly.

The war in Somalia exacerbated the situation. Tribal chiefs and war soldiers would kidnap women and girls and they would be forced to be wives for the whole group of men. This practice hinders social progress. These women do not learn to speak for themselves, or make their own decisions.

The United Nations Entity for Women states that “*All governments are obligated under the international law to undertake action to end harmful practices*”. The Somali Family Code does not protect the victims of bridenapping. According to the Social Institutes and Gender Index, traditional practices are being used, even though it leads to human rights violations instead of using the Somalian law.

Research shows that Rwanda, Kenya and Ethiopia have similar challenges where bridenapping is concerned.

RECOMMENDATIONS AND CONCLUSION

Bridenapping is a vicious cycle of poverty, powerlessness and suffering. The international community agrees on the need to address bride kidnapping, but not a lot of progress have been made. The main problem is the beliefs of these communities when it comes to their traditions. Tradition and culture are very important to a healthy and happy society, but if that same tradition undermines the basic rights of the most vulnerable members of that society, the question must be asked whether that tradition has real value and for whom.

It is clear that legislation is currently not the most effective way to combat bridenapping. The government needs to set the example of what is acceptable behaviour, by formulating policies to eradicate this practice. If the government neglect to protect women and children, it should be held accountable by the international community. If the government is serious about changing the fate of these women, it should reconsider its treatment of women in general and not just when it comes to bridenapping. The respective governments should attempt to address the woman and child abuse that is taking place through the practice of bridenapping. Specific funding should be dedicated to combat woman and child abuse in general and bridenapping, specifically. The authorities should apply the law applicable to human rights and punish the perpetrators accordingly. Building relationships with other countries also affected by bridenapping is highly recommended. The different countries could benefit from sharing each other's programmes and policies for best practices. A network between the victimised women can be created.

Awareness campaigns specifically targeting these communities engaging in bridenapping are crucial to successfully eradicate this practice. These campaigns should highlight the human rights of women and children. The conditions in which bridenapping is flourishing should be changed from the ground up. Community leaders should be educated in human rights and the violation thereof. Programmes should be implemented in schools, on how to treat women, the younger generation should be educated to demand change for their future. The "TOGETHER WE ARE THE SOLUTION" campaign launched in South Africa only focuses on girls under the age of 18, this campaign should be broadened to include all women forced into marriage, irrespective of their age. The only way that bridenapping can be dealt with effectively would be when non-governmental organisations, human rights groups and the governments work together with the communities where bridenapping is still practiced. These women and children do not have a voice. If their government, their community and their family are not prepared to protect them, who will?

DEVELOPING APPROACHES TO COMBAT CYBER BULLYING THROUGH A COMPARATIVE STUDY BETWEEN THE UNITED KINGDOM, AUSTRALIA AND SOUTH AFRICA

Louise du Preez
Tshwane University of Technology, South Africa

ABSTRACT

Information and communication technology has changed our modern day lifestyle forever. Information technology has impacted on education, more especially the almost immeasurable quantity of information available on the internet. Cyber bullying is a multidimensional phenomenon and as such poses a challenge for different international role players to develop an approach which will address all aspects of cyber bullying. All countries should implement legislation preventing and eradicating cyber bullying. This paper will take the form of a comparative study of the different aspects of cyber bullying in the United Kingdom, Australia and South Africa to determine the approach of these countries and the success of the various approaches. In conclusion the author will make recommendations regarding the South African situation.

INTRODUCTION

The term “cyber bullying” was initially defined by Bill Belsey, a Canadian author and anti-bullying activist, as “*the use of information and communication technologies to support deliberate, repeated and hostile behaviour by an individual or group, that is intended to harm others.*”

There are various other definitions of cyber bullying most of which include acts involving bullying and harassment through the use of information and communication technologies. Cyber bullying is committed in various ways for example through text messages, picture or video clips, mobile phone calls, emails, chat forums, instant messages, social networking sites such as Facebook and Twitter.

Cyber bullying came into being as a result of the evolution of electronic communication. It is a new and insidious form of bullying that has slowly poisoned the internet and electronic media. In 2007 there were already 900 000 reports of cyber bullying that were reported by secondary students as was reported by the US Department of Education in 2010. The technology and electronic communication has allowed bullies to be cunning and act from a distance, outside of schools and sometimes under the protection of anonymity.

It is true that children have been bullying each other for generations but the present generation are empowered by technology to expand their reach and the extent of their bullying. This phenomenon is called and is defined amongst others as “wilful and repeated harm inflicted through the use of computers, cell phones and other electronic devices. An enhanced communication social network has impacted greatly in schools and in the workplace. There has been an increase of homicides and suicides which can be related to cyber bullying.

What is more is that online victimisation has also extended to adults and is no longer limited to minors only. The development of online interaction has brought about new forms of offending where offences such as harassment and “stalking” are a daily occurrence on the internet.

Cyber bullying causes emotional and physical damage and requires that society take legal action. Bullying has taken on a whole new dimension where a few hurtful remarks communicated in person can now be communicated to multimedia interaction via multiple electronic sources.

INTERNATIONAL POSITION

There can be no doubt that cyber bullying is a burning issue in many countries across the globe. Countries affected by cyber bullying will have to develop legislation and amend legislation and measures to combat this rising evil and to keep abreast of the ever evolving electronic communication. Failure to do so will result in a gross intrusion of, and violation of human rights.

Internationally cyber bullying is recognised as a serious threat to human rights. The Convention on the Rights of the Child (UNCRC) 1989 is the first legally binding international instrument to incorporate and protect human rights. Human rights are fully recorded in 54 articles of the Convention and two optional Protocols.

The Convention protects the rights of children. It guarantees basic rights such as health care, education, legal, civil and social services. Governments that uphold the obligations of the Convention have committed themselves to the protection of children's rights and are accountable for this commitment before the international community. All state parties to the Convention must develop policies and take actions to implement same in the best interests of the child.

Article 19.1 of the UNCRC states that "*State Parties shall take all appropriate legislature, administrative, social and educational measures to protect the child from all forms of physical or mental violence, injury or abuse, neglect or negligent treatment, maltreatment or exploitation, including sexual abuse, while in the care of parents, legal guardians or any other person who has the care of the child.*"

In 2011 the UNCRC expanded Article 19 to include acts committed via information technologies, such as cellular phones and social networking sites such as Facebook and Twitter. Also included is psychological bullying. A number of countries have introduced legislation to criminalise and punish acts of cyber bullying.

The (UNCRC) has acknowledged the seriousness of cyber bullying and the children are the perpetrators thereof. The UNCRC therefor requires that the response to such incidents be proportionate to the circumstances and nature of the acts of cyber bullying by the child. A retaliating approach towards the children should be avoided at all cost.

On November 2003 the Convention on Cybercrime was signed by the Council of Europe and non-member states Canada, South Africa and the United States. In terms of this agreement all participating parties must enact legislation that facilitates investigation and prosecution of crimes committed through the internet.

There are also non-profit organisations that combat cyber bullying and cyber stalking. They advise victims, provide awareness through campaigns and report offences to the police. In 2008 Wired Safety's International Stop Cyber Bullying Conference took place. Some of the issues that were discussed were parent's legal responsibilities, the need for more legislation and the difference between free speech and hate speech. Adult behaviour was classified as stalking harassment and that of children as bullying harassment.

Cyber bullying can be combatted through intervention, counselling and education of teachers and parents. Students should also be thought how to avoid becoming victims of cyber bullying and cyber stalking.

THE UNITED KINGDOM

In terms of UK law cyber bullying, as in South Africa and Australia, is not a specific criminal offence. There are however criminal legislation that applies in cases of harassment and threatening behaviour, in particular threatening and menacing communications.

Cyber bullying activities can be criminal offences under a range of different laws including the Protection from Harassment Act 1997 which contains both criminal and civil provisions, the Malicious Communications Act 1988, Section 127 of the Communications Act 2003, The Education and Inspections

Act 2006 (EIA 2006), The Crime and Disorder Act 1998 and the Public Order Act 1986. The age of criminal responsibility in the UK starts at 10 years.

The Protection from Harassment Act 1997 is applicable where there are repeated incidents of harassment. Section 1 thereof prohibits behaviour, amounting to harassment of another. Section 2 creates a criminal offence and Section 3 provides a civil remedy for breach of the prohibition on harassment referred to in Section 1. Section 4 creates a more serious offence of someone causing another person to fear that violence will be used against them on at least two occasions. A civil court may grant an injunction to restrain a person from conduct which amounts to harassment. Upon conviction of an offence in sections 2 or 4, the court may also issue restraining orders to protect the victim of the offence.

The Communications Act 2003 covers all forms of public communications. Section 127(1) defines an offence of sending a “grossly offensive, obscene, indecent or menacing” communication. Section 127(2) creates an offence where a person sends a message which that person knows to be false (or causes it to be sent) or persistently makes use of a public communications system, for the purpose of causing annoyance, inconvenience or needless anxiety.

The Education and Inspections Act 2006 contains provisions that deal directly with cyber bullying and empower teachers. Head teachers now have the power “to such extent as is reasonable” to regulate the conduct of pupils. This power can be exercised when the pupils are off-site or not under the control or charge of a staff member. This is very significant as cyber bullying often takes place out of school but can impact strongly on the school life of those pupils involved.

In terms of the Crime and Disorder Act 1998 an anti-social behaviour order can be obtained for cyber bullying. This is a civil order which prohibits a person from engaging in specific anti-social acts. Such an order can be made against any person above the age of 10 years where there is evidence that their behaviour caused, or is likely to cause one of the following acts to others: 1) harassment 2) alarm or 3) distress. If such evidence is placed before the court an order will be granted to protect a person(s) from further anti-social acts. To determine whether the conduct is anti-social in nature, the consequences and the effect thereof, or likely effect thereof, on a member or members of the community within which such acts take place, are measured and considered.

The order should be precise to prohibit the specific behaviour complained of, and also be proportionate to the legitimate aim of protecting the community from further abuse. Should such an order be breached it is a criminal offence and criminal penalties are then applicable.

The Public Order Act 1986 in Section 5 thereof makes it an offence to use threatening, abusive or insulting words, behaviour, writing, signs or other visual representation with the intent to cause harassment, alarm or distress.

The Obscene Publications Act 1959 makes it an offence to publish an obscene article. An article is obscene when the effect is such as to tend to deprave and corrupt persons who are likely to read, see or hear the matter contained or embodied in it.

Defamation is a civil remedy under the common law where the defendant commits a delict against the claimant/plaintiff. The Defamation Acts of 1952 and 1996 provide certain defences. Any published material that damages the reputation of an individual or an organisation inclusive of material published on the internet, will fall within the ambit of the Defamation Acts and would constitute a tort/delict.

A civil action for defamation can be brought by an individual or a company, but not by a public authority. The claimant will bear the onus to show that the material is defamatory. It is not necessary for the claimant to prove that the material is false. The burden of proof instead, lies with the defendant being the author/publisher to prove that what they have written is true.

It is now possible for an Internet Service Provider (ISP) to be liable for the content of sites which it hosts. This means that should an ISP receive a notice of complaint it should take such notice seriously and investigate it immediately.

Prevention strategies and activities are designed to support the whole-school community. The ‘whole-school community’ refers to learners, teachers, support staff, parents, school leaders, governors and

all the people providing support, including teaching assistants , break and lunchtime supervisors and extended school provision staff.

Pro-active measures can be taken by schools to help prevent cyber bullying and to reduce the impact should there be any such incidents. Schools are now required to have a clear policy on tackling all forms of bullying, which is owned, understood and implemented by the whole-school community. This can be used as a building block for prevention of cyber bullying and to review and update policies to ensure and maintain a safe and welcoming environment as a responsibility and function of the whole-school community.

An Anti-Cyberbullying Code was introduced which gives one seven important tips to protect oneself and friends from getting caught up in cyber bullying. The Code also gives advice on how to report cyber bullying when it happens. In short the 7 important tips are the following: Always respect others, think before you send, treat your password like your toothbrush, block the bully, don't retaliate or reply, save the evidence, and make sure you tell.

AUSTRALIA

In Australia the need to develop new laws dealing with cyber bullying intensified following the first criminal prosecution for cyber bullying in the Wilson case in 2011. This followed after two youths committed suicide in 2009 that were both the result of cyber bullying.

Studies in Australia to determine the prevalence of cyber bullying have revealed alarming statistics. A survey of 400 students in Victoria revealed that 30% of students have been a victim of cyber bullying. A study by Galaxy Research in 2008 on 300 children aged between 10 and 17 years found that 25% of the children were victims of cyber bullying. Another study of over 7000 young children revealed that the rates of cyber bullying ranged between 4.9%for year 4 students to 7.8% for year 9 students. The study further found that the prevalence rate was 2% higher for females as opposed to males.

Another study found that cyber bullying took place, primarily through instant messaging, mobile phones and social networking sites. From the studies conducted in Australia and the inconsistencies therein it has become clear that it is very difficult to measure the prevalence of cyber bullying in a community. Studies in Australia have shown that cyber bullying has the potential to become a major problem affecting young children in Australia. As a result of the ubiquity of mobile phones amongst young children in Australia, cyber bullying is mostly committed through the use of mobile phones. Another study revealed that an astonishing 94% of senior high school students indicated that they had experienced bullying using a mobile phone.

As far as criminal sanctions are concerned, Australia, like South Africa, has no specific criminal offences for cyber bullying but relies on a patchwork of generic offences to combat and prosecute these offences. As far as criminal liability is concerned in Australia, there have been arguments put forward that cyber bullying should be addressed through legislation that specifically criminalises the conduct.

Presently most jurisdictions have legislation proscribing conduct such as assault and harassment that may be relevant in relation to cyber bullying. Only the Commonwealth Criminal Code contains a number of serious criminal offences for engaging in conduct involving the use of telecommunication services that would satisfy any reasonable definition of "cyber bullying".

Some of the offences include the use of a "carriage service" which includes fixed or mobile phones, internet or intranet services with the intention to commit a serious offence. It is also an offence for a person to use a carriage service in such a manner that reasonable person would regard as being menacing, harassing or offensive. Furthermore it is an offence to use a carriage service to transmit, make available, publish or otherwise distribute material that directly or indirectly incites suicide.

The Commonwealth legislation is the best model available to prosecute cyber bullies. The States and Territories are content to use existing criminal laws rather than follow the US and draft specific anti-cyberbullying laws. The failure to draft anti-cyberbullying laws, can be attributed to the fact that there is a wide spread feeling that cyber bullying is a behavioural problem that should be dealt with by families and schools.

Amendments to Acts creating offences such as the amendment to the Crimes Act 1900 (NSW) where “a person, who assaults, stalks, harasses or intimidates any school student or member of staff of a school while the student or member of staff is attending a school, although no actual bodily harm is occasioned, is liable to imprisonment for 5 years “, does not address cyber bullying outside the school.

Australia has however designed a national cyber safety and cyber security education program, called Cybersmart. This program is managed by the Australian Communication and Media Authority (ACMA), as part of the Australian Government’s commitment to cyber safety.

The program provides information and education which empowers children to be safe online and was designed to meet the needs of children, young people, parents, teachers and library staff. It furthermore funds the “Outreach program” which offers free Internet Safety Awareness presentations to parents, students and teachers to encourage a consistent approach to cyber safety education between school and home.

SOUTH AFRICA

Very little is known about the true extent of cyber bullying in South Africa. What is alarming however is the fact that along with increased access to and usage of electronic communication technology, cyber bullying has increased dramatically.

This has resulted in the criminal abuse of the internet which in turn has created legal uncertainty as the criminal, civil and procedural laws in South Africa are inadequate to combat, investigate and successfully prosecute the commission of crimes involving the use of the internet. South Africa presently does not have specific legislation for cyber bullying to eradicate this offence and protect victims against cyber bullying.

Only in 2002 did South Africa promulgate legislation prohibiting certain conduct in cyberspace by means of the Electronic Communications and Transactions Act 25 of 2002. In South Africa very little research has been done on cyber bullying. As a result it is unclear how many children are victims of cyber bullying. The reality of cyber bullying was illustrated when in 2009 the Centre for Justice and Crime Prevention (CJCP) conducted a study amongst 1726 young people aged between 12 and 24 years. The study revealed that almost half of the respondents had experienced some form of cyber bullying. An interesting finding was that 69.7% of the respondents who commit cyber bullying had themselves been bullied indicating that there appear to be a correlation between bullies and victims of cyber bullying.

Cyber bullying is generally dealt with as harassment resulting in victims having to rely on remedies in the criminal and or civil law. The common law, criminal and civil law are applicable to both perpetrators and victims irrespective of their age and no distinction is made between cyber bullying (children) and cyber stalking (adults) as is the case in other countries.

Depending on the nature of the acts of cyber bullying the perpetrator may be criminally charged with common law offences such as extortion, assault, criminal defamation and crimen iniuria.

Extortion is committed when a person unlawfully and intentionally threatens to electronically distribute compromising images or information about another person unless the victim furnishes the perpetrator with an advantage of some sort.

Assault is committed when the perpetrator threatens the victim with the personal violence through use of the internet or other form of technology and the conduct inspires fear or belief in the victim that such personal violence is to take place to determine whether the conduct falls within the definition of assault the following subjective test is applied: Did the victim believe that the perpetrator intended to, and was able to carry out the threat?

Criminal defamation is committed both verbally and in writing when the publication of a matter seriously injures the victim’s reputation. It is a requirement that the defamatory conduct or words must have come to the knowledge of the victim. Defamatory remarks on social networking sites, in chat rooms, text messages, e-mails or instant messages to third parties amount to cyber bullying and will be prosecuted as criminal defamation.

Crimen iniuria is committed when a perpetrator unlawfully and intentionally violates the dignity or privacy of the victim. The test is both subjective and objective to determine if the victim's dignity has been violated. It is a prerequisite that the victim must be aware of the perpetrator's offensive behaviour and feel degraded or humiliated by it. It is however not required that the perpetrator's words or conduct should have come to the attention of people other than the victim.

The crime is also committed by communicating to somebody else a message containing, expressly or implicitly, an invitation to or a suggestion of sexual immorality or impropriety, or by sending indecent photos. The civil law also provides remedies to the victims of cyber bullying, the first being a peace order issued by a magistrate in terms of section 384(1) of the Criminal Procedure Act 56 of 1955. If a person has been the victim of threats of violence or use of abusive language, the victim may approach a magistrate on application. The magistrate may order that the perpetrator appear before him, and may also order that the perpetrator be arrested to ensure appearance before the magistrate.

After the enquiry, the magistrate may order the perpetrator to give recognisances with or without sureties to the amount of R2000 for a period not exceeding six months to keep the peace towards the victim and refrain from doing so again. The magistrate could order the perpetrator to pay the costs of the inquiry.

The second remedy provided for in the civil law is an application for an interdict in the Regional Civil Court or High Court restraining the perpetrator from committing or continuing a wrongful act. The complainant can also institute a civil claim for defamation and claim damages where he/she suffered injury to his/her dignity and/or good name. Such claim can be instituted in the District, Regional Civil or High Court depending on the claim amount.

The Child Justice Act 75 of 2008 which came into effect on 1 April 2010 deals exclusively with children. The purpose of the act is to create a criminal justice system for children who are in conflict with the law and are accused of committing offences. Furthermore the act determines the minimum age of criminal capacity of children (10-14) and also makes provision for securing the attendance of the child as well as the release or detention and placement of children.

In terms of cyber bullying the act seeks to divert matters away from the formal criminal justice system and to encourage the use of restorative justice in respect of children in the criminal justice system. It ensures children's accountability without necessarily criminalising them.

Electronic communication technology combined with poor impulse control make children particularly vulnerable to cyber bullying and therefore less harsh reactions to child offenders are required. One of the main objectives of the Act is diversion where the children are dealt with outside the formal criminal justice system and are encouraged to acknowledge accountability. In such cases the specific needs of the child are his or her reintegration into his or her family and community are considered. The possibility of re-offending is reduced and it prevents the child from having a criminal record if he complies successfully with the diversion order.

In 2003 the South African Law Reform Commission started an investigation into stalking. In 2010 the Protection from Harassment Act of 2010 was tabled before Parliament. The Act was published in the Government Gazette no 34818 dated 5 December 2011 as the Protection from Harassment Act 17 of 2011. The act came into effect on 13 April 2013. The Act does not define cyber bullying but the definition of harassment is wide enough to include acts of cyber bullying.

The aim of the Act is to provide for the issuing of protection orders against harassment. Upon application the magistrate may issue an interim protection order against the respondent who on the return date can show cause why the protection order must not be made final. If the interim order is confirmed and the respondent fails to comply with the order he can be arrested. The victim is still entitled to lay criminal charges against the perpetrator even though an order was obtained in terms of the Act.

RECOMMENDATIONS AND CONCLUSION

It was, from a South African point of view, very important to promulgate and implement the Protection from Harassment Bill 1 of 2010, which came into effect on 13 April 2013. As far as criminal sanctions are concerned, Australia, the United Kingdom and South Africa, has no specific criminal offences for cyber bullying but relies on a patchwork of generic offences to combat and prosecute these offences. All schools

should have specific policies on how to deal with cyber bullying, South Africa may also benefit from investigating the cyber security education program Cybersmart, in Australia for best practices. Finally, South Africa could also learn from the United Kingdom's anti-bullying guidance. Although there is no single solution, the crime can be prevented, through, updating existing policies, making reporting cyber bullying easier, promoting the positive use of technology and evaluating the impact of prevention activities. It is essential that all countries should introduce cyber bullying legislation in order to effectively eradicate this phenomenon.

ASSESSING THE LONDON STOCK EXCHANGE'S INITIAL PATH-DEPENDENCY. A NEW INSTITUTIONALISM ANALYSIS

Zenzo Lusaba Dube

National University of Science and Technology, Zimbabwe

ABSTRACT

This paper addresses, from the new institutionalism, why the London Stock Exchange (LSE) resisted the takeover bids from Macquarie Bank of Australia and NASDAQ. To answer this, the paper draws upon the three schools of new institutionalism. New institutionalism is used as the means concept through which an understanding of LSE can be reached primarily through the historical institutionalism's path-dependency. The year March 1801 created the foundations of a regulated securities market in England through the LSE's first ever subscription room. It is through a study of the LSE's past one can understand its present circumstances and its future.

INTRODUCTION

The London Stock Exchange (LSE) is steeped in history, dating back as far as 1762, when one hundred and fifty brokers formed a club and rented premises at Jonathan's Coffee Houses. The rent payable to the proprietor of the premises was £12,000 per annum, which was raised through the £8 charge per head in the form of subscription (Morgan and Thomas, 1969). However, this arrangement was to be short lived. One broker, who had been denied access to the premises, brought an action against the proprietors of Jonathan's. It was held that Jonathan's place had been a place for dealers in stocks and shares since time immemorial, and the plaintiff's right to access was therefore upheld. After this ruling, having been denied the exclusive use of Jonathan's place, the brokers acquired a building of their own along Threadneedle Street, and called it the "Stock Exchange" (ibid; p69). Strangely though, admission was not restricted and was open to all at a daily charge of 6d (ibid). It was not until March 1801 that the LSE was officially regulated, when it was converted into a subscription room. From its humble beginnings at Jonathan's, the LSE has grown into the largest stock exchange currently in Europe and subsequently, one of largest in the world. It is this global dominance that has attracted, from the turn of the twenty-first century, would be 'suitors' in the form of takeover bids from other international exchanges. Unimpressed by its courtiers, LSE has brushed off the advances of the Macquarie Bank of Australia (2005), Euro Next (2005), Deutsche Bourse (2005), NYSE (2006) and NASDAQ (2007). The LSE was of the view that NASDAQ's £12.43 per share offer was not even close on price.

On the 12th of February 2007, having seen off the NASDAQ hostile bid, the LSE posted a record £327 billion value in equities traded in the month of January the same year¹. In July 2007 the LSE sought to issue new shares in order to purchase Borsa Italiana for 1.6 billion Euros. NASDAQ opposed this move as it would water down its 30 percent stake in the Exchange to 22 percent². Furthermore Chris Gibson-Smith (LSE's chairman 1976-1988) reiterated to the shareholders that the LSE's strong performance and consistent growth supported the view that NASDAQ's previous bids undervalued the LSE. The takeover of Borsa Italiana was designed to fight off NASDAQ. In 2007 the LSE merged with Borsa Italiana to become the London Stock Exchange Group. The paper argues that in order to understand why it preferred a merger and fought off the bids from Macquarie and NASDAQ one must critically analyze the original ideas and values behind the LSE's creation. The London Stock Exchange Group's (LSE Group) total income and total revenue rose by 10% and 7% during the six months interim ending 30 September 2012³. This evidences its continuing growth. The LSE Group has also acquired in LCH.Clearnet and in July 2012 signed a Memorandum of Understanding (MoU) with the Singapore Stock Exchange (SGX). The MoU will facilitate

the largest and most actively traded stocks on the respective exchanges to be traded by their respective member firms (ibid).

THEORY: NEW INSTITUTIONALISM

Hall and Taylor (1996) defined institutions as “formal rules, compliance procedures and standard operating procedures which structure relationships between people in various units of the polity or the economy” (p.7). New institutionalist approaches come from a variety of disciplinary roots but share a common element of skepticism about atomistic accounts focusing on the individual (Baldwin and Cave, 1999). Despite sharing this common element of skepticism, new institutionalists do not share a unified body of thought (Hall and Taylor, 1999). There are three different schools of thought under new institutionalism, namely Rational Choice, Historical and the Sociological. All three seeking to elucidate the role that institutions play in the determination of social and political outcomes (ibid). Howell (2007) held that each of the three institutionalist schools of thought has a different perspective regarding agents and institutions. Howell (2007) identified that amongst its weaknesses, rational choice institutionalism had a simplistic understanding of agents, and because of this simplicity it fails to explain changes in institutional structures. The Achilles’ heel with sociological institutionalism is that unlike historical institutionalism it fails to deal with different choices and interpretations and the power struggle between different agents in specific settings. Sociological institutionalism rests its emphasis on cultural settings. Sociological institutionalism argues that cultural factors play an important part in institutional analysis (ibid). Rational choice explains the persistence of an institution through the effects that those institutional value functions have on the actors (Hall and Taylor, 1996). Institutions are created as a result of voluntary agreements by the relevant actors. It is the view of Hall and Taylor (1996) that institutions survive competition due to the fact that they provide more benefits to the relevant actors than alternate institutional reforms. New institutionalism seeks to explain the persistence of institutions. It is possible to find a mix of cultural and calculus behaviour within the individual actors. Calculus and cultural approaches also provide different explanations for why institutions display continuity over time. Hall and Taylor (1996) further posited that the calculus perspective argues that individuals adhere to patterns of behaviour because deviation will make them worse off, and the more these contribute to problem resolution the more robust the institution will be.

Historical institutionalism begins by insisting that new institutions are created or adopted in a world already replete with institutions (ibid). With historical institutions, culture plays an important role in their study. The original 150 members who created the LSE no longer actually exist. However their cultural values, norms, behaviour and initial policies are immortally embedded in the structural walls of the LSE’s history. It is their initial policies, their cultural values and norms which subsequently shaped the LSE’s future and behavior (path-dependency). Path-dependency according to Brendstrup (2002) is a ‘reproduction of the effects of a particular institutional configuration of the past into the present and what is needed to be identified are the mechanisms that sustain the reproduction’ (p8). Howell (2007) posited that historical institutionalism uses both calculus and cultural perspectives to identify the relationship between institutions and actors. It is these calculus and cultural behaviours within the LSE that this article also identifies. Howell (2007) noted that “...*historical institutionalism analyses institutions by taking into consideration path-dependency. This is where ideas incorporated in the formation of an institution are endogenous to present and future decisions. Institutions can only change in relation to past decisions*” (p. 6).

METHODOLOGY

The original LSE manuscripts held by the City Guildhall Library, London, served as primary data. The records are not available for consultation until they are thirty years old. The records were not in the public domain. The manuscripts that the researcher found invaluable were the General Purposes Committee minutes which dated from 1798. These manuscripts were all originals. The March 1802 Deed of Settlement was original. It was a two-way dialogic process⁴. The research process was qualitative in nature and meaning was therefore drawn from the data. The researcher reviewed the volumes in their chronological order, noting down elements of new institutionalism. Indeed history is selective and is the study of causes (Carr, 2001). It is a selection of events that are of historical significance. Selective or informative as it is, history must have meaning. Indeed path-dependency became the central focus of the Minutes; it meant identifying those decisions taken by the Committee for General Purposes and the Council which could be seen either as part of the formation of its path-dependency or were strengthening it. New institutionalism was used as a means of an interpretative tool of analysis of the LSE from its historical perspective into the new institutionalism perspective.

RESULTS AND DISCUSSIONS

All the three schools of thought that fall under new institutionalism seek an understanding of the existence and the perpetuation of an institution. Whilst each of these three schools of thought have their strengths and weakness, it is historical institutionalism that bridges them into one platform, as it draws upon the strengths of the calculus approach along with those of the sociological approach. The dialogic nature of historical institutionalism makes it unique in the sense that it is a dual interaction between the researcher and the researched. This allows themes to emerge as the dialogue continues. The past lives in the present through the means of path-dependency. The initial values, decisions, policies and ideas influence subsequent future policies of an institution. The following section covers the empirical analysis of the LSE. The analysis begins by tracing the origins of the LSE. This is necessitated by path-dependence methodology of historical institutionalism. Historical institutionalism dominates the analysis as it uses the calculus perspective of the rational choice and the cultural approach of the sociological institutionalism. The analysis is in three parts. The first covers the empirical analysis from the historical institutionalism perspective. The second is from the rational choice and the third is from the sociological institutionalism perspective.

Historical Institutionalism

Duguid (1901) argued that the Royal Exchange was the first Stock Exchange at the end of the seventeenth century when shares and stocks were first transacted. The Royal Exchange was burned down in the 1666 Great Fire of London. Thereafter the newly rebuilt Royal Exchange was not to everyone's satisfaction, as complaints were made that it was too crowded (Long, 1978). Subsequently the merchants involved in the trading of shares and stocks moved to the coffee houses of Change Alley at the beginning of the eighteenth century, and stayed there for the next hundred years before emigrating again to the Capel Court at the turn of the nineteenth century (ibid). From the years 1739-1815, Britain was either preparing for war or was engaged in wars every two to three years (Roberts, 2004). This in turn led to a great strain on the public debt, which increased from £44 million to £820million by the time of the battle of Waterloo (1815) (ibid). This led to birth of the secondary market which inevitably led to the creation of the LSE (ibid). In 1760 one hundred and fifty brokers were kicked out of the Royal Exchange for rowdiness and formed a club at Jonathan's Coffee House to buy and sell shares (Hobson, 1966). In 1773, this group of merchants acquired a building of their own along Threadneedle Street and on the 4th of July 1773 the title "The Stock Exchange" was adopted (ibid). The 1795 French occupation of Amsterdam and the blockade of Hamburg from 1803 had a devastating effect on the trade and financial activities of these then major financial institutions to such an extent that it led to the migration of merchants and capital to London (Roberts and Kynaston, 1995). It was against this backdrop and as well as the numerous French wars that London and the LSE's position as the world's primary trading and financial centre grew (Roberts, 2004). Furthermore, Britain financed the Napoleonic wars through what was known as a Sinking Fund under the National Debt, which brought a lot of business to the Exchange, bringing it further to national importance and international prominence (Jenkins, 1973). Expensive Napoleonic wars caused the Bank of England to suspend specie payments and the financial world was involved in panic (Duguid, 1901, Acres, 1931). In spite of this, the LSE grew from strength to strength, and flourished to a certain extent such that by the end of the eighteenth century. According to Acres (1931), "It was decided to rise to higher things; to secure land in Capel Court opposite, to erect a building, and to make the Stock Exchange a closed market' (p. 70).

On the 12th of January 1801 the Committee appointed for the General Purposes met at the behest of the Committee of Proprietors with the chief purpose of converting the LSE into a subscription room⁵. Amongst its Resolutions were (a) that in order to protect the interests of the Proprietors, it was felt necessary to secure in advance 200 to 250 base Subscribers before the conversion into a subscription room, and (b) the introduction of an annual fee of 10 Guineas paid yearly by each Subscriber and an annual sum of 5 Guineas to be paid by each clerk introduced by the Subscriber with the first fees being due on 2nd of March 1801⁶. Furthermore it was also resolved that the rules and the regulations to be abided by the Subscriber would be formed by the Committee appointed for the General Purposes and the Committee of Proprietors⁷. According to Hall (1996) institutions are defined as "The formal rules, compliance procedures that structure the relationship between people in various units of the polity and economy" (p. 7). These rules and regulations bound the LSE's Subscribers together into one common cultural, norms, values and procedural identity. These bound the LSE's Subscribers' behaviour in terms of either the cultural or calculus approach under new institutionalism. The rules and regulations also determined how the institution mediated with the economic and political forces of the outside world. The rules and regulations chartered the LSE initial path-dependency. This is largely due to the fact that the Committee of Proprietors represented the original nine

founders of the LSE who had created the Deed of Settlement. This meant that the owners of the LSE were also involved in the making of the rules and regulations and as such the rules and regulations were bound not to be divorced from the Deed of Settlement. Within the historical institutionalism framework, individuals make the institutional decisions that then persist throughout the life of the institution (Peters, 2001). Indeed as such, the Deed of Settlement “lived” for over another hundred and eighty-four years.

Historical institutionalism holds that institutional formation occurs when an idea has been accepted and embodied into a structural form (Peters, 2001). Proponents of this school of thought would inductively argue that the birth of LSE as an institution was in March 1801 when it was formally officiated. With new institutionalism, to be more precise with historical institutionalism, it is the initial policies set at the beginning that subsequently shapes the future policies of an institution (path-dependency). It follows as such with the LSE as its initial policies, path-dependency that is the closed-door policies, restrictive practices; elitist tendencies were implanted in March 1801. Michie (2001) defined a stock exchange as “a market where specialized intermediaries buy and sell securities under a common set of rules and regulations through a closed system dedicated to that purpose” (p. 3). On this definition in 1801 the LSE was the first modern Stock Exchange when it was officially regulated. The official regulation meant that the LSE became an institution not in 1773 when the one hundred and fifty members formed a club, but in March 1801 when it was officially regulated. The emphasis on the date of creation is further re-iterated by Peters’ (2001) argument that “It is important to know when creation occurs because the choice is crucial to future developments based on initial ideas. Initial patterns will persist and shape subsequent policies” (p73). It is these initial policies that created the path-dependency. In the LSE’s case these initial policies of March 1801 were further translated into the first Rule Book of 1812. From its very birth the LSE was still a very private institution closed to the public. The nine founders had pulled down the old houses purchased by them and on the site erected what was to be called the Stock Exchange. They had deemed the old houses in Threadneedle Street⁸ inconvenient and thus had them pulled down:

Upon the site thereof and the Ground belonging thereto caused to be erected a spacious Building for the transacting of buying and selling the public stocks or Funds of this Kingdom and the same is now nearly finished and is called The Stock Exchange and is intended to go under appellation⁹.

However grand, ambitious or bold this intention was, it eventually became reality, for the ‘spacious Building’ was to become the LSE, an exclusive club which by the eve of the Great War was the dominant institution of its kind in the world (Hennessy, 2001). Under the Deed of Settlement the nine founders of the LSE were to hold the office of Trustees or Managers for life, subject to resignation or disqualification¹⁰. The founders (the Trustees) had the powers of trusteeship and the management of the LSE building. They had powers to take leases for the purposes of the undertaking, and to declare dividends for the Proprietors:

The Trustees {first entering into a Resolution for that purpose at one of their Monthly Meetings} are to be at liberty to purchase any Freehold or Leasehold Mefsuauges {sic} for the purpose of the undertaking and to pay for the same and enter into any agreements for the better accommodation of the Proprietors and Subscribers frequenting the Stock Exchange and as a majority of them see fit¹¹.

The Committee for General Purposes was in charge of the management and regulation of affairs:

The Committee for the General purposes (of whom 7 to be a Quorum) to have the sole management regulation and direction of all the concerns of the Undertaking- (Except the Treasureship thereof and the management and direction of the Buildings which are to be under the sole direction of the Trustees and Managers and except those particular concerns put under their direction)¹².

The Committee for General Purposes consisted of thirty members or subscribers who were chosen annually by ballot upon the 25th of March. The regulation of the Committee Room was under the direction of the Managers and Trustees¹³. The Managers and Committee for General Purposes were entitled to the use of the Committee Room. The Trustees had the sole power to annually fix the price at which subscribers could be admitted to attend and transact business at the LSE¹⁴ and also held the sole rights to declare dividends which they appropriated amongst themselves: “Trustees to make Dividends of profits yearly within 30 days after setting the accounts on the 25th of March in each year amongst the Proprietors according to their Shares and interests in the Undertaking”¹⁵. Historical institutionalism pays particular cognisance on how institutions distribute power unevenly across social groups and how some groups gain power at the expense of other groups (Hall and Taylor, 1996). In essence, what the 1802 Deed of Settlement did was to give greater powers to the Trustees or Managers and lesser ones to the Committee for General Purposes (representing the subscribers/members). Power is taken in the sense of control and ownership of the LSE. The next section covers the analysis of the LSE from the rational choice perspective. The rational choice assumes that actors in institutions are rational in their decision making process. This decision making and behaviour is analysed through the calculus perspective.

Rational Choice Institutionalism

The rational choice school of thought, in their deductive approach, would on the other hand, argue that the birth of LSE as an institution was not in March 1801 but in 1773 when a building was acquired along Threadneedle Street. Under this model institutions are chosen as instruments for satisfying individual interests and resolving collective dilemmas. Weyland (2002), noted that “As products of individual-level behaviour, institutions are not actors in their own right ...but merely ‘the rules of the game’ governing individual choice and strategic calculation” (p. 60). From a deductive point of view, it then follows that there was a logical need for the one hundred and fifty merchants to form “The Exchange” in 1773 after having been evicted from the Royal Exchange. They needed a place of their own to conduct trade and realise institutional gains. The subscription room set the LSE’s path-dependency to that of a self-regulatory, elitist and monopolistic institution. It is these attributes of the LSE’s path-dependency that anchored the rationalist perspective. Self-regulation and elitism ensured that the LSE solidified its monopoly over the London market. The LSE gave its Members a fixed set of preferences with penalties for defection. The most capital of punishments was expulsion from the LSE as a Member. This meant one could not practice in London as it had the monopoly. From a rationalist perspective the LSE thus became an ideal framework of understanding why institutions persist over time. The rationalists’ calculus argues that institutions persist over time as they offer actors a set of strategic preferences with penalties for defection. The seeds had been sown, the path-dependency, the self-regulatory aspect, the independence with minimum State interference. The seeds are still evident in 2007 as it has fought off numerous takeover bids. History is repeating itself. The next section analyses the LSE from the sociological institutionalism approach. Under this approach actors are assumed to take account such factors as cultures, values and norms when faced with decision making. The sociological approach uses the cultural approach in analyzing human behaviour.

Sociological Institutionalism

As early as in 1773, when the LSE was simply known as the “Stock Exchange”, in order to discourage what the established professionals called the “riff-raff, the tinkers and other parasites”, a sum of six pence was charged as entrance fee a day (Chapman, 1998, p. 19). This can be viewed as signs of its elitist tendencies, whose membership was preserved for the gentleman whose word was taken in good faith and not the “riff raff, the tinkers and other parasites of the day”. As such “the established routines or familiar patterns of behavior” were the gentlemanly behaviour and virtues that were expected to be upheld by the members. For the gentility behaviour upholds Hall and Taylor’s (1996) argument that under the cultural approach “Institutions provide moral or cognitive templates for interpretation and action” (p. 939). In the early days of the LSE, membership was limited to 500. This, according to Gibson-Jarvie (1979), “Was in order to curtail the risk of affording new facilities to the criminal designs of notorious and unprincipled gamblers” (p. 110). As such the subscription room was created in order to restore order in the markets and instill the public’s trust in the LSE. The markets were largely unprincipled and as such persons of devious means could profit, at the market’s expense. The need to restore and instill gentlemanly values led to the creation of the subscription room. There was little or no regulation governing human conduct and the only recourse for the LSE was to admit membership to those whom it perceived were trustworthy and whose word could be taken in good faith. Inevitably this led to segregation, where membership to the LSE was preserved for the elite. Cultural factors have an important part in determining the actors’ preferences. The culture, norms and values of the LSE bound it into an elitist closed at heart institution. Membership to the LSE was for the bourgeois

CONCLUSIONS

It can be argued that the LSE’s initial path-dependency still exists today. It is still in sense a self-regulatory institution with minimum State interference and is still dominant over the London market. The LSE will fight any takeover bids; preserve its self-regulatory aspect. It will as a last resort, opt for a merger of equals or acquire another Exchange. From the analysis, one can deduce the future behavioural outcomes of the LSE. It has been and still is a self-regulatory institution and independent and free from the legislature since its creation. In order to remain competitive in the long run, or should such a need arise, it will either choose a merger of equals or acquire another exchange. This helps in understanding why NASDAQ, Euro-next and the Macquarie takeover bids failed because these were hostile takeover. Within the realms of new institutionalism, the LSE’s behaviour is viewed as the path-dependency which was shaped into being by the means of the Deed of Settlement and the first ever subscription room. The initial policies of the past are affecting the present and to certain extent its future policies. The merger with Borsa Italiana is the LSE’s

calculus means of attaining and realizing institutional gains without being bought off. New institutionalism offers deeper insights into the workings of institutions. It is a strategic theory which brings the histories of the past unto those of the present. Indeed new institutionalism enables one to harness future opportunities through that element of predictability of future behavioral outcomes.

HELPING TWO DEVELOPING COUNTRIES TO GLOBALIZE BY IMPLEMENTING COMPETITIVE INTELLIGENCE

A.S.A Du Toit And N. Sewdass
University of Pretoria, South Africa

ABSTRACT

This paper compares competitive intelligence (CI) activities in South Africa with CI activities in Brazil to determine how these countries can use CI to increase competitiveness. A questionnaire survey was sent to CI professionals. The majority of organizations cope above average with changes in the business environment and the CI function is more mature in South Africa than in Brazil. It is recommended that both countries should develop a CI culture by creating CI awareness among employees.

INTRODUCTION

The economic success of a country depends on its capacity to apply activities which create a competitive advantage, its ability to create an environment of transformation and progress, and its capacity to innovate (Canongia, 2006: 58). Competitive intelligence (CI) has long been recognized as a strategic management tool that could enhance competitiveness. This perception of CI as a strategic tool is not exclusive to developed countries. CI is expected to play a key developmental role in developing countries as well. The need to enhance companies' and by extension, countries' competitiveness has grown rapidly. CI is essential, and will increasingly be a challenge in the years to come, especially for emerging economies (Canongia, 2006: 58).

This paper will compare CI activities in South Africa with CI activities in Brazil. Companies in these two countries have faced increased environmental uncertainty and increasingly there is a need to compete in the global economy and to monitor and understand their environment more accurately for survival and success. Little research (Dou; Dou, Dou & Manullang, 2005; Du Toit, 2003) has been done on the application of CI in developing countries and the purpose of this paper is to examine the current situation with regard to CI activities in South Africa and Brazil. The business environment is highly complex in South Africa because of factors such as the country's unique history, diversity, geography, political and institutional landscape. Companies tend to be less dynamic and more resistant to change, compared to companies in industrialized countries. Within a short period of time after the democratic elections in South Africa in April 1994, the international market opened up. South Africa as a net exporter of strategic minerals and the 'gateway' to Africa has an internal environment ideally suited to the use of CI by companies to gain the competitive edge in a developing domestic economy and a challenging external environment. CI is therefore enjoying increased prominence in South Africa.

Substantial political changes in Brazil since 1990 have also led to greater information exchange and the Brazilian society has been evolving into a knowledge society dealing with political changes, globalization, new technologies, hyper competition and new global competitors, such as China. The Brazilian government and Brazilian companies have realized competing in a global economy requires a strong vision of what exists outside the country's borders. The objectives of this paper are: to determine the state of CI in South Africa and Brazil and to determine how these countries can use CI to improve competitiveness.

COMPETITIVENESS IN THE GLOBAL ECONOMY

Competitiveness is a multifaceted concept and according to Garelli (2003: 702) the competitiveness of nations “focuses on the policies implemented by nations to shape the environment around enterprises” and economic value is only created within the context of an enterprise. According to Waheeduzzaman (2002:13) the ultimate goal of competitiveness is to improve the standard of living or real income of the citizens of a country. Since companies actually compete in the global economy, many authors are of the opinion that when studying competitiveness, the focus should be on companies since they are the main engines of a country’s competitiveness (Garelli, 2003: 704). Organizations like the World Economic Forum (WEF) and International Institute of Management Development (IMD) rate countries annually on the basis of various competitiveness indicators. The WEF publishes the Global Competitiveness Report annually and the IMD the World Competitiveness Yearbook. A country like Brazil manages its competitive environment by relying on assets (land, people and natural resources) but is not necessarily competitive (Garelli, 2003: 706). Technology has an impact on the competitiveness of nations and South Africa is leapfrogging technological infrastructures by focusing on mobile rather than fixed phones (Garelli, 2003: 708). As a country becomes more competitive, the standard of living or per capita income increases and this helps the reduction of inequality within the country (Waheeduzzaman, 2002: 16).

COMPETITIVE INTELLIGENCE

With the increased volatility of the business environment, countries and companies rely on early detection of environmental changes so that they may respond with appropriate counter measures. Since they require time to adapt to the changing environment they should have the ability to anticipate changes and imagine the consequences of alternative responses to those changes and they use CI to facilitate the identification of potential opportunities and threats. Because CI improves decision-making, it helps a company to meet or exceed its objectives and business goals. Companies in developing countries who are familiar with CI practices in their local regional markets may find the requirement to extend CI practices globally very difficult to accomplish in a structured way (James, 2000: 44). Executives usually have to read through several reports and proposals before making decisions, and it is often found that they are overwhelmed with information and lack intelligence that will enable them to make more efficient decisions. Therefore, it can be said that the companies that are able to turn information into intelligence will succeed (Sewdass, 2012:24).

There are many definitions of CI. CI is the process of developing actionable foresight regarding competitive dynamics and non-market factors that can be used to enhance competitive advantage. CI is concerned with the techniques used to select and filter information from a variety of sources, to interpret and analyze it, to communicate it to the right people and to use it effectively (Dou, Dou & Manullang, 2005).. Competitive dynamics refers to the evolution of a company’s industry and the moves and countermoves of competitors, suppliers, customers, alliance partners and potential competitors. Non-market factors such as government regulations, tariffs and the culture of a country impact competitive dynamics but are not suppliers of products or services to the industry (Prescott, 1999:42-43). CI uses legally and ethically available public sources to assess the strengths and weaknesses of its competitors.

CI in developing countries

Kahaner (1996, p. 25) states that CI has become the 'latest weapon in the world war of economics', in which many emerging economies view CI as a way to win economic wars against larger, more industrialized countries. According to Calof and Skinner (1999:1) a country will under-perform without an appropriate CI infrastructure and they quotes Prescott and Gibbons by stating that “the key question is not whether governments should play a role in a company’s CI efforts but what should be the purposes and methods used by government.” Hawkins (2004:51) emphasizes that companies in developing countries should use formal processes of collecting, analyzing and disseminating intelligence to successfully compete in the global economy. Managers in developing countries continue to be surprised by undesirable changes in the environment and it appears that the advances in managing intelligence are as yet largely unknown in these countries. Currently most developing countries are weakly integrated with the global economy. Utilizing CI will enable companies in developing countries to gain a greater market share and to compete successfully against international competitors (Pellissier & Kruger, 2011). Ifan, Dou, Manullang and Dou (2004:995) state that “after a period of recession and inflation, most developing countries have to face the necessity of improving their capacities to innovate and increase the competitiveness of their industries”. Furthermore, in developing countries, the creation of new products from their natural resources is important

as it has the ability to contribute to the country's foreign direct investment (FDI) (Dou, Dou & Manullang, 2005). In order to achieve this, the implementation of CI will be the answer.

South African situation with regard to competitiveness

Before 1994 South Africa was isolated from the rest of the world as a result of the apartheid regime and this inhibited competitiveness (Viviers & Muller, 2004:54). After 1994 the economy became more open and, along with export markets, domestic markets became increasingly larger and more competitive with increased globalization of markets. Many industries were deregulated and privatized and there was a large construction boom due to the 2010 Soccer World Cup. To survive many South African companies needed to extensively globalize their business activities to exploit country differences and worldwide markets. This prompted companies to become more sensitive to external environments which includes monitoring political/legal, economic, technological, socio-cultural and industry forces such as competitors, customers and suppliers.

According to the Global Competitiveness Report (Schwab, 2011: 39) South Africa has moved up by four places to attain the 50th position in terms of competitiveness among 142 countries and it remains the highest ranked country in sub-Saharan Africa and second-places among the BRICS economies. By regional standards, South Africa also benefits from the size of its economy and it ranked 25th in the market size. The country's financial market development is ranked 4th and this indicates that there is a very high level of confidence and trust in South Africa's financial markets in other parts of the world. South Africa also does reasonable well in areas such as business sophistication (38th) and innovation (41st). These are a few examples that indicate that South Africa is the most competitive economy in the region but in order to further enhance its competitiveness, the country will need to address the most problematic factors for doing business. Inefficient government bureaucracy, inadequately educated workforce, restrictive labour regulations and corruption in South Africa are the most critical areas that pose problems for other countries doing business with South Africa.

Brazilian situation with regard to competitiveness

According to the Global Competitiveness Report 2011-2012 (Schwab, 2011:126), Brazil has improved its competitive position by five places and is ranked 53rd out of 142 countries. Brazil has also benefited from several competitive strengths. These strengths include its internal market size (10th), a sophisticated business environment (31st) and innovation (44th). The country also has an efficient financial market that is ranked 40th and the rate of technology adoption is relatively high at 47th compared to other countries in its region. However, there are several problematic areas that hinder countries from doing business with Brazil for example factors such as tax rates, tax regulations, inadequate supply of infrastructure and restrictive labour regulations, and these factors also impacts Brazil's capacity to fulfil and sustain its competitive potential.

RESEARCH METHODOLOGY

Since CI is a relatively new activity in developing countries, this study is mainly exploratory in nature. It attempts to provide a comparison of the implementation of CI in two developing countries, namely South Africa and Brazil. A questionnaire survey methodology was used where questionnaires were administered to CI experts in organizations in South Africa and Brazil. A combination of convenience sampling and snowball sampling were used to identify the experts in CI. Convenience sampling refers to the procedure of obtaining respondents (units or people) who are most conveniently available (Zikmund, 1994:367). Snowball sampling, on the other hand, refers to procedures in which additional respondents are obtained from information provided by initial respondents. This technique is used to locate members of rare populations by referrals (Cooper & Schindler, 2007:425). CI practices in South Africa and Brazil are still in the early phase of development and when CI is practiced by individuals in organizations, it is still a matter of sensitivity (Strauss & Du Toit, 2010: 311; Decaup & Domingues, 2009: 25). Furthermore, in South Africa there is no recognized list of practicing CI professionals available (Viviers & Muller, 2004:56) and in Brazil a similar situation exists where networking takes on an important role in the development of CI (Libis, 2005:249). Thus the researchers had to rely on their personal contact and networks in industries to identify the experts in CI. These experts were assumed to have a sound knowledge of CI, its implementation and benefits for organizations. This is perhaps a limitation of this study as some important experts practicing CI could possibly be left out of the survey. The questionnaire was structured as follows: Section A: Background and demographic information; Section B: Competitive situation in organizations; Section C: Competitive intelligence implementation in organizations. The questionnaire was sent as an attachment via email and it was accompanied by a cover letter to all identified respondents. The completed questionnaires had to be

returned to the email of the researchers. In South Africa the questionnaires were email to 40 CI experts and 24 questionnaires were completed which represents a response rate of 60%. In Brazil 33 questionnaires were emailed and 13 questionnaires were completed representing a response rate of 39.3%.

FINDINGS AND ANALYSIS

Credibility of the research is measured by the Cronbach Alpha Coefficient and a higher scale than 0,7 is considered as being reliable. With regard to the questionnaire for Section A the Cronbach Alpha was 0,751, for Section B 0,802 and for Section C 0,787. An overall coefficient of 0,778 was calculated for the results obtained and this is considered to be in the range of scores considered as being reliable.

Biographical data

In South Africa the gender of the respondents was mostly male (70%) while in Brazil the gender was almost equal (53.8% male and 46.2% female). In Brazil 84.6% of the respondents were younger than 50 years while in South Africa 50% of the respondents were younger than 50 years. The majority of respondents in South Africa had postgraduate degrees and was either top management or senior/middle management level of their organizations' (85%), while the majority of respondents in Brazil has bachelor's degrees and were either in top management or senior/middle management level of their organization's (69.2%). The South African findings here correlate with the findings of Du Toit and Strauss (2010:24). In Brazil the majority of the respondents (76.9%) were employed by companies with more than 500 employees compared to South Africa where only 50% of the respondents were employed by companies with more than 500 employees. It is interesting to note that in South Africa four companies with less than 50 companies also use CI as a strategic tool. With regard to industries the majority of companies in Brazil were in the manufacturing industry (30.7%) while in South Africa the majority of companies were in financial, insurance, real estate and business services (25%).

Competitive situation

In South Africa 55% of the organizations are of the opinion that they cope above average with changes in the business environment. This is an indication that organizations in SA should pay more attention to CI as a strategic business tool. In Brazil only 46.1% of the organizations indicated that they cope above average. This is an indication that currently CI practitioners in Brazil do not realize the importance of scanning the environment as an early-warning tool to adapt strategies. The majority of South African organizations indicated that competition in their business environment is very intense (65%) compared to the organizations in Brazil where only 23% of the organizations indicated that competition is very intense.

Competitive intelligence function/unit

According to the majority of respondents in South Africa (60%), a formal CI function does exist in their organization while in Brazil a formal CI function exists at only 15.4% of the organizations. In South Africa the CI function has been in existence for more than five years in 65% of the companies while in Brazil none of the companies had a CI function for more than five years. This indicates that the CI function is more mature in South Africa than in Brazil.

CI activities

With regard to the five most important CI activities implemented by organizations, 85% of the respondents strongly agreed that they evaluate the reliability and accuracy of information while 61.5% of the respondents in Brazil strongly agreed that the CI function assists to quantify/qualify strategic choices. The majority of the organizations (84.6%) agreed that their staff members always report back on competitor actions and that they evaluate the reliability and accuracy of information (see Figure 1). With regard to the situation in South Africa, 25% of the respondents strongly agreed that their organizations use CI for decision-making while 58% agreed that they interview managers to verify intelligence products and evaluate the reliability and accuracy of information. Fifty per cent of the respondents strongly agreed that the most important CI activity in their organization is to use CI to remain cognisant with government legislative trends Twenty-one per cent of the respondents use CI to assist in the quantification/qualification of strategic choices. This is also an indication of the maturity level of CI in South Africa (see Figure 2).

Figure 1: Brazil: five most important CI activities

Figure 2: South Africa: five most important CI activities

Use of secondary sources

In Brazil, respondents identified promotional material, information on regulatory bodies and sales forecasts as the most important secondary sources used by them (see Figure 3). Interesting 31% of the respondents never use corporate annual reports or survey summaries (38%). The most important secondary sources used by South African organizations are information on regulatory bodies (see Figure 4). The fact that information on regulatory bodies is so important, is an indication that restrictive regulations (enacted by the government) often contribute to a decline in competitiveness. This is in contrast with developed countries where deregulation enhances competitiveness. Promotional material, internal financial information and corporate websites are also important sources.

Use of primary sources

The most important primary sources used by organizations in Brazil are direct customer feedback, suppliers and analysis of competitor's feedback (see Figure 5). This finding correlates with the findings of Libis (2005:241) that there is abundant access to primary research but that credibility of the sources is questionable. Organizations therefore prefer to collect their own information directly from customers. The most important primary sources used by organizations in South Africa are industry experts, direct customer feedback and company employees. Staff who attend conferences and seminars are also important information sources. This indicates that South African organizations sensitize and train their employees to collect information on the competitive environment (see Figure 6).

Analytical methods or models used

The majority of organizations in Brazil (61.5%) used competitor analysis and 46.2% of them use SWOT analysis and Customer Segmentation Analysis to a great extent while only 30.7% of the organizations used Financial Ratio and Statement Analysis to a very great extent (see Figure 7). This indicates that organizations in Brazil do not use sophisticated analysis techniques. With regard to the use of CI analytical methods or models in South Africa, 50% of the respondents used industry analysis to a great extent while 40% of the organizations used SWOT analysis to a great extent and 10% of the organizations used it to a very great extent (see Figure 13). Benchmarking, competitor analysis and GAP analysis is used to a great extent by 35% of the organizations and 15% used it to a very great extent (see Figure 8). This collaborates with the findings of Viviers and Muller (2004:64) that South African organizations do not use sophisticated analysis techniques.

Figure 3: Brazil: use of secondary sources

Figure 4: South Africa: use of secondary sources

Methods used to distribute and present CI findings

The majority of organizations in Brazil (46.2%) used email and customer//competitor/supplier profiles to a great extent to distribute CI findings. Reports and market and industry audits are used by 38.5% of the organizations to a great extent. Presentations are used by 23% of the organizations to a great extent while 30.8% of the organizations used it to a very great extent (see Figure 9). The most popular method to distribute CI findings in South Africa is presentations which are used by 41% of the organizations to a great extent and by 27% of the organizations to a very great extent. Briefings are used by 55% of the organizations to a great extent and by 14% of the organizations to a very great extent. This is also an indication that CI is practiced on a mature level in South Africa. Email is used by 27% of the organizations to a very great extent, personal delivery by 23% of the organizations to a very great extent and reports are used by 45% of the organizations to a great extent (see Figure 10).

RECOMMENDATIONS AND CONCLUSIONS

As Brazil and South Africa become more integrated into the global economy it stands to reason that the global economy will have more of an impact on the countries' economy. To this end it has become more crucial to monitor global events and trends and it is very important for both countries to develop a CI culture. CI analyses not just the environment but competitors and markets as well. Therefore understanding the direction that competitors are moving to in the future is key to be able to counteract them timeously. Keeping abreast of domestic and international market trends and their potential impact on organizations in both countries is vital. Trend tracking needs to monitor the impact of not only product changes but also organizational changes such as future mergers and dissolutions. It is also recommended that organizations in both countries should enhance a CI culture by creating CI awareness among employees and provide CI training sessions for new employees. CI could enhance the competitiveness of South African organizations in the global economy. There is clear recognition that the world will become more competitive and will increasingly do so.

Figure 5: Brazil: use of primary sources

Figure 6: South Africa: use of primary sources

Whether South African managers will meet these challenges is not clear and according to the empirical survey conducted, few have actual plans to improve their ability to keep track of competitors and to enhance their competitiveness. There appears to be a degree of complacency and self-deception that is inhibiting managers from instigating effective planning to improve CI and few conduct CI in a formal systematic manner. CI should assist senior management to develop and review a set of key intelligence needs (KINs). Only a limited number of organizations in Brazil recognize the importance of a CI unit and did not indicate the use of CI for decision-making as one of the five most important CI activities. CI should assist senior management to develop and review a set of key intelligence needs (KINs). In order to provide direction to the CI function in these organizations, it is important that they should interview management on a regular basis. According to the survey organizations in Brazil do not use sophisticated techniques such as blind-spot analysis and scenario analysis to analyze CI data. The use of these techniques as early warning signals is very important to get a head-start on competitive organizations in the global economy. The CI function in organizations in Brazil should thus evolve from ‘providing just the facts’ (reactive) to being ‘a key component of company strategy’ (proactive).

It is recommended that organizations in Brazil should seek to engage proactively with the global environment by revising their strategic priorities. It is therefore evident that organizations in Brazil need to redress some critical competitiveness issues, most notably the establishment of the CI function as a strategic tool. Without a CI strategy, organizations will find it difficult to position themselves in the global marketplace. A limitation of this research is that a small sample was used and further research which includes a larger sample will have to be conducted. In the light of the world-wide interest in CI in developing countries and the desire to understand how South Africa and Brazil can improve its competitiveness, the hope is expressed that the South African and Brazilian governments and industries will in future create an environment which will facilitate the competitiveness of organizations and encourage long-term sustainability.

CONSUMER TRUST DETERMINANTS IN TUNISIAN BANKS: AN EXPLORATORY STUDY

Nabila El Jed
Manouba University, Tunisia

ABSTRACT

The global economic crisis and the intensification of the competition in the Tunisian banking sector especially with the entry of Foreign Banks. These circumstances make the commitment of the customers a necessity for the survival of the banks. The study of the impact of trust on long-term relationships orientation with the banks should allow the managers of these latter to anticipate the risk of escape of their customers and to imagine actions that promote the continuity of the commitment. The purpose of this paper is to identify consumer trust determinants in Tunisian Banks. In this respect, an exploratory qualitative study was conducted. In fact 13 semi direct interview were conducted. The results identified two facets of trust: institutional and interpersonal. Three dimensions of trust were also determined: competence, honesty and benevolence.

INTRODUCTION

Trust is essential for any Exchange relationships. Many researchers have attempted to understand and grasp this concept. Even there is a large development in marketing researches on this issue yet ambiguity still remains. Ben Miled 2012 states that Trust is a multidisciplinary concept and it was treated in: economy (Schmidt 2001), sociology (Granvotter 1985), socio psychology (Rempel and Homes 2001), marketing (Sirieix and Dubois1999), That explains the diversity of definitions.

This work fits into the general framework for a better understanding of consumer trust, using Tunisian Banks as a case study, conducting a qualitative exploratory study. The theoretical implications of this research can be seen at three levels. First, despite a theoretical potential powerful enough to work on trust in marketing, little research has been conducted in the study of trust in consumer behavior. In fact, according to the literature, it is clear that it is the inter-company relationships that have been the preferred field of application for searching. However, since Filser's remark in 1998 on the rarity of the consideration of the trust as predictor of consumer behavior, few studies have begun to develop. This work was particularly interested in the study of trust towards brand (eg, Gurviez 1999; Sirieix and Dubois, 1999). On the managerial level, any exchange relationships mainly in business long term orientation must be concerned with the question of establishing and maintaining trust. In the first part of this article, we'll briefly discuss the notion of confidence as it has been studied in marketing. Then we will present results of the qualitative research. In conclusion, several lines of research will be outlined.

THE CONCEPT OF TRUST IN MARKETING

Many researchers have high lightened the profusion of definitions of trust. Defined as presumption, expectancy, belief, desire or as behavior, trust appears as a concept polymorphic diversity of definitions hinders development of research in this area (Guibert, 1999). Based on the first reflections Dwyer and Lagace (1986), Barclay and Smith (1997) have identified two conceptions dominant faith in the literature. In the first one, trust is treated as cognitive expectancy or emotional feeling, while in the second; it appears as a risk-taking behavior or as a willingness to engage in such behavior. Based on these considerations, we could distinguish two approaches predominant in the literature: firstly, trust is identified as a psychological state upon the behavioral intention (presumption, expectancy, belief); secondly, it is seen as an intention or behavior (willingness to rely on partner behaviors confident).

Trust as a psychological variable

A first current research captures the trust as a psychological state which excludes behavioral dimensions of order. Indeed, for some authors, it is necessary to eliminate from the definition of the concept of trust the behavioral intention. Their argument is based on the fact that for behavior is a result and not an integral part of the conceptualization of notion of trust (Morgan and Hunt, 1994). In this context, trust is understood as a psychological state upstream of the intention of behavior that could result in a presumption (Gurvies and Korchia, 2002; Bidault and Jarillo, 1995), an expectation (Sirdeshmukh, Singh and Sabol, 2002 Perrien et al, 1999) or by a belief vis-à-vis partner exchange (Sirieix and Dubois, 1999; Ganesan, 1994, Anderson and Narus, 1990 Anaderson and Weitz, 1989).

Despite this diversity of conceptualizations of the notion of trust, the authors agree, beyond their differences, that is based on cognitive elements but also emotional. Indeed, since the questioning of the primacy of cognitive paradigm and the appreciation of the emotional in understanding behavior, work on confidence was freed from a purely rational concept long suggested by economic theory. Therefore, more and more researchers recognize that the trust does not obey only purely cognitive processes; it also involves mechanisms of emotional (emotions). Character emotional trust is evidenced by benevolence, which represents the dimension emotional. The latter refers to the attention can manifest some interest and well-being of the other (Ganesan, 1994).

Trust as a behavioral variable

The second stream of research advocates a design exclusively the behavioral concept. It captures the trust or as actions (Deutsch, 1962) and in which case the second stream of research advocates a design exclusively the behavioral concept. It captures the trust or as actions (Deutsch, 1962) and in which case speak confident behavior (Smith and Barclay, 1997) or as an intention behavior resulting willingness to be vulnerable (Mayer, Davis and Schoorman, 1995) or by the willingness to rely on an exchange partner (Moorman, Deshpande and Zaltman, 1992; Andaleeb, 1995; Chaudhuri and Holbrook, 2001).

What emerges from the different conceptualizations of trust evoked by these authors is probably the recurring reference to the notion of vulnerability in proposed definitions. For example, for some authors, trust is understood as "the willingness of a party to be vulnerable to the actions of the other party (Mayer, Davis and Schoorman, 1995, p.712), for others, trust goes beyond the simple intention (willingness) to translate in behavior, but the vulnerability remains pervasive in the definitions. The concept of trust is then treated as actions that increase its vulnerability to another (Deutsch, 1962) or to" actions reflect the willingness to accept vulnerability in an uncertain situation "(Smith and Barclay, 1997, p.6).

DETERMINANTS OF TRUST TOWARDS TUNISIAN BANKS: A QUALITATIVE EXPLORATORY STUDY

Few academic researches on the subject have been conducted in Tunisian Bank sector (Ochi 2008), therefore it is important to undertake an exploratory research. The ultimate goal is to achieve a better understanding of concept of consumer confidence and its determinants in Tunisian Banks.

Objectives, methodology and sample qualitative study

Objectives

The objectives of the study are qualitative at three levels:

- At the level of the concept of trust: Exploring the Concept of trust in the perspective of the Consumer, check the relevance of the emotional component of trust in the context of Marketing services and finally validate the previously proposed definition.
- At the conceptual framework: Submit a preliminary model of the determinants of trust.
- At the later stages of the research: Generating items to build a scale of trust toward Tunisian Bank.

Methodology

In the context of this exploratory study, individual interviews and semi-mix interviews were conducted. Indeed, the interview technique allows for a level of depth and friability of information that is lacking in other more quantitative methods . It is particularly suitable when the purpose of the study is essentially heuristic.

The interview guide was designed according to the method of the funnel. It revolves around three topics:

1. General attitude in relation with Tunisian Bank faced with a choice of investment
2. Financial institutions and their presentation by the respondent
3. The respondent bank and its relationship with it

Sample

Since this is an exploratory qualitative study, representation was not an important issue when gathering our sample (Evrard et al., 2003). The goal is not extrapolate a set of results, but to capture the variety of cases or possible situations. Thus, a reduced size is not an issue since it reflects the diversity possible responses by the interviewees. We conducted our interviews with 13 people. It is a convenience sample consisting mainly of teachers in university. The profile of the interviewees is presented as follows: 50% female and 50% male. The average of age is 41 years. These interviews lasted on average 30 minutes .the saturation criterion was chosen to determine the sample size.

This criterion was defined by Mucchielli (1991, p 114) as "the phenomenon that appears after some time in qualitative research when the data is collected only are new." This test well theoretically clear that is empirically difficult to implement a perfectly rigorous manner. But from the 13th interview, we felt that there was no enrichment of verbal material exists, we have decided to stop.

RESULTS OF THE QUALITATIVE STUDY

Verbal material collected was subjected to thematic content analysis. After having cut the speech units of meaning, we performed a horizontal analysis. This allowed us to identify patterns and to see how the different themes been addressed by the interviewees. But as pointed Giannelloni and Vernet (1995), the results of the qualitative analysis should be interpreted with caution because of the non-representativeness of the sample. In what follows, we will proceed first to examine the notion of trust as perceived by the consumer. The objective is to assess the validity of the proposed definition of trust in Tunisian Bank. Then we will discuss the factors that have been identified as likely to influence consumer confidence to Tunisian bank. This step will allow us to establish a preliminary version of a conceptual framework. At the end of the thematic analysis, we were able to discern six meta-categories relating to competence, integrity and benevolence of the bank and the banker, which predicts a two-and three-dimensional aspects of trust in the Tunisian banks-customer relationship. The interviewees have indeed expressed different dimensions of trust depending on whether referring to the bank or to the banker. This structure may be finally validated in the quantitative phase of the research.

The interviews show, moreover, that the area studied has meaningful specificities when compared to its similar French and North American. These features are on the one hand, cultural, related to the nature of the relationship, marked by a strong impregnation of interpersonal relationships. They are on the other hand, from a collection of the bank distinctive compared to private service.

Cultural characteristics are related to the entanglement and economic social spheres. They support the role of the banker in maintaining customer loyalty. In Tunisian banks, the banker's knowledge gives, in fact, entitled to relational benefits (quality hospitality, a personalized, accelerated procedures ...). It reinforces the customer's choice, develops their confidence and strengthens its attachment to the institution. This context is also marked by the existence of trends regional influence the choice of the bank and determines the nature of the relationship with it. Unlike European cultures and Anglo-Saxon aspects interpersonal relationships seem to be decisive in the context of Tunisian bank.

The Tunisian banking sector is also characterized by a different perception of public and private banks. The later are considered more competent and more active in communication, they are also thought to dispose of a qualified and better trained staff than public banks. The interviews show, however, skepticism about the morality of private banking and its pricing policy, the interviewed appear, indeed, dissatisfied with excessive, tariffs charged in the private sector. The specific context Tunisian banking endow customer commitment in his relationships with his bank. In fact, verbal material collected evidence, shows, the

importance of institutional reasons in the choice of private banking and continuity of relationship with her. It also reveals the predominance of interpersonal aspects of relationship in public banks. We wish, finally, to say that the teachings of this qualitative phase were not intended to be extrapolated to the entire population, but predict structure of the trust and to discover its characteristics in a cultural context other Westerner. They form the foundation for the subsequent quantitative phase. Finally, a conceptual framework from the results of the exploratory phase may occur as follows:

figure1: framework of trust and his consequence commitment

CONCLUSION

This qualitative study aims to test a multi-faceted conceptualization and dimensions of trust in a context other than European and North American. It seeks to explore the specifics of a new cultural context in confidence. To achieve the above objectives, the semi-structured interviews, lasting an average of 30 minutes, have been made with thirteen people with various profiles in age and gender. The number of interviews was determined according to the principle of saturation (Mucchielli 1991), . The verbal material collected has been a thematic level.

At the end of the thematic analysis, we were able to discern three dimensions of trust relating to: competence, integrity and benevolence of the bank and the banker. We distinguish two facets of trust: interpersonal and institutional in the Tunisian bank customer relationships.

The specific context of the Tunisian banking endow customer commitment in his relationship with his bank. The verbal material collected, shows the evidence, of the importance of institutional patterns in the choice of the private bank and its continuity relationship with her. It also reveals the primacy of interpersonal aspects of relationship in public banks.

We want finally to say that the teachings of this qualitative phase were not intended to be extrapolated to the general population, but predict structure of the trust and to discover its characteristics in a cultural context other than the occidental one. In fact it's an exploratory study to be a foundation for a quantitative study.

NEW VENTURE PLANNING SKILLS INCORPORATE ETHICS FOR INDUSTRY: A STUDY OF CURRICULUM FOR ENGINEERING STUDENTS

Jane English
University of Cape Town, South Africa

ABSTRACT

Recent changes in policy at UCT have focussed on 'graduateness' for students as they prepare for the challenges of professional life. Ethics is a key area of 'graduateness' and one that has, until recently, not had its own focus. In response to changing South African legislation which has increased focus on ethics, ECSA (Engineering Council of South Africa), responsible for setting standards for the qualification of engineers, requested emphasis on ethics.

At the University of Cape Town, courses offered by Professional Communication Studies (PCS) equip students for their professional careers; in particular a course which supports New Business Planning. Ethics is an important area that forms part of this course and this paper explores innovations in the teaching of ethics to engineers in the PCS department in 2011/2012. The innovations are a response to changes in the assessment requirements of ECSA and to the challenges of UCT's focus on 'graduateness'.

INTRODUCTION

Professional Communication Studies' (PCS) of the University of Cape Town, South Africa, was requested by the Engineering Council of South Africa (ECSA) to include a component on professional ethics. ECSA meets the international requirements of the Washington Accord. Ethics was deemed as an essential component of the non-technical skills' and knowledge base in the accreditation process for undergraduate engineers and as an essential component in the New Venture Planning (NVP) courses.

Institutionally, PCS operates within the Faculty of Engineering at the University of Cape Town (UCT). UCT has a reputation as a leading university for teaching and research both in Africa and globally (CHED 2010:48). At a professional level, PCS, together with the rest of the Engineering Faculty, is accountable to the Engineering Council of South Africa (ECSA) which accredits the particular curriculums of the different Engineering Departments. ECSA has developed a set of Exit Level Outcomes (ELOs) independent of the UCT conception of graduateness (CHED 2010:75) and which require detailed analysis and response in each accredited course as to where these ELOs are demonstrated and how they are assessed.

The teaching strategy of PCS is a combination of lecturer input, practical engagement and written (reports; business proposals; executive summaries, posters and theses), oral (presentation skills for individual and group skills and creation and use of appropriate visual aids) and managerial skills (leadership, negotiation, conflict skills, meetings, debate around NVP) which include ethics. Courses are experiential, dynamic and inter-active. This small group (approximately 25 students) has the appropriate dynamic for facilitating the debate of professional ethics.

Aim

The paper reviews the ECSA accreditation process which is approved by the internationally recognised Washington Accord; it evaluates the needs of the Faculty of Engineering and the Built Environment and, in particular, the curriculum renewal initiatives coming from the Faculty. The paper examines the role of ethics and the New Venture Planning component. It looks at the motivators for and management of the NVP programmes and their inclusion of professional ethics in the teaching of related professional skills and support offered by the PCS modules.

Background

PCS runs courses that supplement the technical engineering courses with skills aimed at equipping students for their academic future as regards thesis writing and their professional careers (Sulcus and English, 2010) as regards report writing, business correspondence, or business proposal writing and presentation skills. These professional skills courses are often offered in conjunction with project work in core engineering course and their recognitions comes out of research across academia (Moreale and Pearson, 2008; Hondonga, 2011); industry (Rhodes, 2002; Costlow, 2002) and national requisites (National Planning Commission Report, 2011). In addition, PCS runs workshops on those skills required by those who will be graduating into professions (Conradie *et al.*, 2010). Skills covered include problem-solving techniques, business communication skills, and negotiation and team-work. Professional ethics is a core factor in all these areas.

Professional Communication Studies' is increasingly challenged to consider the value of the skills and principles it teaches and the context in which these skills are taught (see Tables 1-3). At an inter-departmental level, PCS courses are closely linked with NVP project work in the different engineering departments, for example, the business proposal development project that falls in 4th year for both the electrical and chemical engineers and the group presentation of 4th year Civil Engineers road integration project or the 4th year Architecture project. These projects require a high level of collaboration and collegial respect between the departments.

In the NVP module and its project, students learn how to prepare a business plan for launching a potential new business offering a product or service. A business plan is a carefully thought-out description of where the business is now, where it wishes to be at some defined time in the future, and how it proposes to get there (Fui-Hoon Nah, Lee-Shang Lau and Kuang, J. 2001). The plan acts as a roadmap to measure progress. It states what the aims of the business are, how it will make money and who will make it work. It is a working document to address challenges encountered in the process - it is not a guarantee for success. While the eventual business model will possibly look different from the original idea, a thorough plan will ensure that the business is viable (Von Blottnitz, 2012). Learning outcomes are that students:

- Understand the various aspects of starting and operating a business.
- Are able to describe a product or service in investor's terms.
- Understand and apply risk analysis models such as SWOT.
- Differentiate and expand on the needs and benefits of a product/service
- Are able to determine with a reasonable degree of certainty whether or not a business or innovation is viable.
- Acquire the ability to know why and when you need to write a business plan and be able to produce a document which demonstrates to business associates – such as bankers and investors, and
- understand the importance of the process of team formation and management in a multi-disciplinary project team.

Topics are drawn from projects in engineering departments with which students are engaged in main stream courses; for example, global warming; water scarcity; low cost housing; electrical and electronic systems. The NVP courses have theoretical support in Action Learning. The following definition was used in a memorandum Action Learning and the Developing Countries, prepared in 1974 for The Council for Technical Education and Training in Overseas Countries (TETOC):

“Action Learning is a means of development, intellectual, emotional or physical, that requires its subjects, through responsible involvement in some real, complex and stressful problem, to achieve intended change sufficient to improve his observable behaviour henceforth in the problem field. Learning-by-Doing may be, perhaps, a simpler description of this process, although action learning programs presume a design and organization unnecessaryAction learning particularly obliges subjects to become aware of their own value systems, by demanding that the real problems tackled carry some risk of personal failure, so that the subjects can truly help each other to evaluate in what they may genuinely believe. Action learning demands real-time and hence observable activity on the subject's parts and thus tests whether the subjects are committed to what they can, in other conditions, merely asseverate.” (Revans, 1982, p. 627)

The course also serves to acquaint students with national drives such as the King 111 report and ECSA's rules. The aim of recent changes in corporate governance worldwide is to promote greater corporate accountability, transparency and stakeholder confidence (Leclercq, 2011). The original King Report on Corporate Governance (King 1: 2009; Harris *et al.* 2009) incorporated a Code of Corporate Practices and Conduct that was aimed at promoting the highest standards of corporate governance in South Africa. It was the first of its kind in the country and was intended as a code of good practice that emphasised

responsibilities of company directors. King 111 has developed to emphasise social transformation through black economic empowerment and by moving away from goals being for the ‘bottom line’, i.e. profits for the company, to making the ‘triple bottom line’ the objective for all companies: financial, social and environmental corporate reporting. This is a reinforcement of the agreement of trust between professionals and society (Leclercq, 2011). King III — released in July 2010 — includes an increased focus on sustainability, risk management, information technology and internal auditing, remuneration, alternative dispute resolution and business rescue – all inherent to ethical practice.

Methodology

This paper is a desktop study of the processes of including the teaching of professional ethics in an engineering curriculum. It examines the effectiveness of the learning experience, materials, assignments and outcomes (Biggs, 2003; Boud, 2009; Black and McCormich, 2010). Part of the review considers the manner of improving practices (Jawitz, 2009) and assessment tools (Dreyer, 2008) to measure this.

ASSESSMENT OF ETHICS COMPONENT IN NVP

Previous research at PCS has concentrated much of its efforts on the communication side of Professional Communication (Sulcas and English, 2010; English *et al.*, 2011; English *et al.* 2012). Consequently, it is important to give substance to a conceptual understanding of what the ‘professional’ side entails and its relevance for NVP and ethics.

The measure of the tag ‘professional’ is that arises from both a technical and a legal base, which enables skills to be translated into outcomes (Larson, 1979). This conception of professionalism does not address the challenges of recognising professional behaviour – including knowledge, organisation and the ethics of professional service’ – as central in defining a professional (Lawson, 2004, p. 26). Professionalism thus engages dynamically with aspirations of best corporate practice as a complex combination of characteristics rather than a particular definition. Being a professional is defined, in ideal terms, as a benchmark to inspire performance rather than as an attribute belonging to a particular class of people. Initially, the inclusion of ethics in the NVP module was evaluated by Duly Performed assessment only, but the importance of these skills have been emphasised by ECSA. Thus, marks are now allocated to this section as can be seen from Table 1.

Table 1: Comparison of proportion of marks for the three distinct categories of the 3rd and 4th Year Chemical Engineering PCS Courses 2009-2012

Course accredited	Written Communication	Oral Communication	Professional skills
Elec/Chem/Mech Eng 3 rd Year 2009	60%	30%	10%
Elec/Chem/Mech Eng 3 rd Year 2010	62.5%	31.2 5%	6.25%
Elec/Chem/Mech Eng 3 rd Year 2011	57.5%	32.5%	10%
Elec/Chem/Mech Eng 3 rd Year 2012	62.5%	37.5%	Shift to be assessed in 4 th year
Elec/Chem/Mech Eng 4 th Year 2009	50%	50%	0
Elec/Chem/Mech Eng 4 th Year 2010	50%	50%	0
Elec/Chem/Mech Eng 4 th Year 2011	50%	50%	0
Elec/Chem/MechEng 4 th Year 2012	40%	40%	20%

Previous research at PCS has concentrated much of its efforts on the communication side of Professional Communication (Sulcas and English 2010; Newton *et al.*, 2011). In Table 1 it is evident that written skills were given the major emphasis but, previously no marks were given to professional skills which included ethics. Yet, in practice, professional ethics are a major part of the role of the professional engineer in relation to other roles (English *et al.*, 2012). Time and financial constraints put pressure on the

global engineer resulting in pressure to cut corners, to work within narrow limits at risk of loss of ethics (Bowen et al., 2007).

ECSA Requirements for accrediting Professional Communication Studies' courses

Engineering Council of South Africa certifies and ensures the professional competence of individuals through registering them. It also ensures the quality of engineering education through accrediting institutions and regulating professional conduct, and thus, it is concerned with professional ethics. ECSA specifies certain requirements of the engineering courses at UCT. The individual courses are correlated against a set of ECSA requirements to see that the course effectively achieves these outcomes. (ECSA, 2011)

A significant reason for this shift in PCS's emphasis from communication skills to include professional skills - and professional ethics - is the drive by the Engineering Council of South Africa (ECSA) to clarify and interpret required learning outcomes in the accreditation of engineering courses in the different institutes of higher education. These institutions are historically focused on delivering the hard skills such as mathematics and sciences. ECSA's recognition of the value of the soft skills to the graduate engineer created a space for Professional Communication Studies to provide learning opportunities to support learning outcomes in the NVP modules and through teaching ethics. Van der Vost (2004) emphasises how ethical decision-making lies at the heart of engineering design. It touches on technical competency, but reaches out to include a deeper understanding of how design affects individuals, society, and the natural environment (Van der Vost, 2004). Engineers are seen to play a key role in the 'development, production and operation of technology, (where) they are, at least in part, responsible for the consequences of technology.... Explicitly or implicitly, it is expected that engineers perform their work in ethically and socially responsible ways (Zandvoort *et al.*, 2000, p. 371).

It is apparent that it is more and more important to ensure ethics is 'embedded in the engineering curriculum' (Fleishman 2004:371). Engineering students need to see extended engagement with issues such as social transformation, sustainability and whistle blowing over the course of their degree. Students also need to be encouraged to use technology to store and collate their work as a portfolio over the full length of their degree, demonstrating not only the development of technical proficiency in expressing and communicating over time, but a sustained engagement with ethical issues incorporated in their project work (www.wix.com).

The role of Exit Level Learning Outcomes (ELOs)

The engineering degree courses cover six major knowledge areas, namely: mathematics; basic sciences; engineering sciences; design and synthesis; computing and IT and, what is termed, complementary studies. These knowledge areas are assessed in a series of Exit Level Learning Outcomes (ELOs) from 1-10 and course content is deemed satisfactory, or not, in terms of the specified competencies taught. Professional Communication is identified as an area of complementary studies and is seen to contribute extensively to Exit Level Learning Outcomes (ELOs) 6, 8 and 10, namely Professional and Technical Communication, Individual, Team and Multidisciplinary working, and Engineering Professionalism. It is in terms of the requirements of these areas that the PCS courses for the 3rd and 4th year Electrical and Chemical Engineering programme are assessed. See Tables 2 - 4 for definitions of the ELOs pertaining to PCS.

ECSA requires documentation requiring proof of assessment of the outcomes. Each outcome needs to be re-assessed if competence is not clearly demonstrated (in the case of PCS, outcomes for Levels 6, 8 and 10 as per Tables 2-4). Consequently, the student is given an additional opportunity to improve on non-satisfactory performance. The material is required to be presented in an academic or simulated professional context to a non-specialist professional audience.

Another change to the assessment was the addition and inclusion of peer review as part of the assessment of the ethics' module. This allowed groups to identify and acknowledge those who had worked exceptionally hard and supported the rest of the group; to identify those who had worked as individuals on their own or alternatively; to identify those who had not pulled their weight in contributing to group work on the poster, the business concept or the preparation for the presentation. The peer review forms used in level 8 provide good material for further analysis of the professional learning experiences of students (Table 3).

Table 2: Level 6 of ECSA Exit Level Outcome (ELO) definitions

Professional and Technical Communication: Learning outcome: demonstrate competence to communicate effectively, both orally and in writing, with engineering audiences and the community at large.	The candidate executes effective written communication as evidenced by: Uses appropriate structure, style and language for purpose and audience; Uses effective graphical support; Applies methods of providing information for use by others involved in engineering activity; Meets the requirements of the intended audience. The candidate executes effective oral communication as evidenced by: Uses appropriate structure, style and language; Uses appropriate visual materials; Delivers fluently; Meets the requirements of the intended audience.

Source: ECSA, 2011, p. 6

Table 3: Level 8 of ECSA Exit Level Outcome (ELO) definitions

Individual, Team and Multidisciplinary working teams: Learning outcome: demonstrate competence to work effectively as part of a team.	The candidate exhibits team and multidisciplinary working by: Making an individual contribution to team activity Performing critical functions Enhancing the work of fellow team members Benefits from support of team members Communicating effectively with team members Delivering completed work on time.

Source: ECSA, 2011, p. 6

The assessment of Engineering Professionalism for level 10 (see Table 4) includes a multiple choice test based on detailed engagement with the ECSA Code of Conduct. This test is intended to ensure that each student engages personally and with full attention to the detail of the ECSA documents. The test format is designed to ensure attention to the detail of the ECSA Code of Conduct so that the student is alerted to areas which require their professional attention. An ethics' essay requires each student to present his/her own response to a specific practical scenario which required ethical engagement and action. Group discussion is recommended prior to embarking on the writing and research stage of the task in order to ensure that students expand their conception of the challenges involved through discussion with a diverse group. Each student then prepared an individual response, supported by reference to policy documents and relevant literature. Issues of style and discourse built on what was had been learnt over the third and fourth year.

Table 4: Level 10 of ECSA Exit Level Outcome (ELO) definitions

Professional and Technical Communication: Learning outcome: demonstrate critical awareness of the need to act professionally and ethically and to exercise judgement and take responsibility within own limits of competence.	The candidate exhibits professionalism by the following: Being aware of requirements to maintain continued competence and to keep abreast of up-to-date tools and techniques; Displays understanding of the system of professional development; Accepts responsibility for own actions. Displays judgement in decision-making during problem solving and design; Limits decision-making to area of current competence; Reason about and make judgement on ethical aspects in case study context; Discerns boundaries of competence in problem-solving and design.
---	---

Source: ECSA, 2011, p. 7

The ECSA team in their review of the curricula in 2010 requested that the students also understand that the 10 required outcomes taken together express the “hallmarks of an engineer” (ECSA 2010, p. 3), recognising ‘what they do’ as well as ‘what they know’. (Accreditation Visit Team Report to the EPAC,

UCT, p. 2). The ability to allow students to reflect and engage with what they do is on a different level from the usual assessment of what the student knows and requires different assessment techniques.

The critique resulted in various changes being made to the PCS curriculum. Ethics has been positioned as a skill to be developed and practised alongside other professional skills rather than being considered as intuitive or an innate value. The written assignment has been expanded – students are given scenarios (see Table 5) to research. In their discussion, the concept of ethics must be seen to be supported by the professional codes, where ethics is rightly or wrongly identified as a skill alongside other professional skills. This assignment is supported by the literature that describes ethics as existing in knowing how to make decisions and knowing what are appropriate behaviours (Newberry, 2004; Benetar, 2011) and how to carry them into design (Van der Vost, 2004).

Table 5: Scenarios to be researched in relation to professional codes

1. It is usual to distinguish between professional and general ethics because of differences in audience, content and method. Give an example of a way in which the following concerns are relevant to us generally and to the specific profession [yours]. That is, give an example of a way in which the following concerns are relevant to us generally and to your specific profession: that is, the way in which justice is a concern to everyone (general ethics) and then how justice is a concern in your profession. Discuss justice relative to audience, content and methodology (professional ethics).
2. Analyse three professional codes of conduct / ethics of your choice (At least one must be for the quantity surveying fraternity in South Africa). List three values that they all share. In arriving at these values, be sure to define them in such a way that would be compatible with all three codes. Can you identify and describe any values left out of the primary six that are normally described in the literature? If so, what are they and what do they add to the discussion?
3. Robert is a third year engineering student whose DP is at risk, even though he knows he is doing the best work he can. A friend offers to help him by sitting next to him and “sharing” his answers during the next exam. Robert has never cheated in an exam before, but this time he is desperate. Should he accept his friend’s offer?

CONCLUSION AND FUTURE RESEARCH

Teaching ethics is a skill to continue to be identified, valued and practised. Professional Communication Studies (PCS) is a department well positioned to expand its role within the Engineering Faculty at UCT as regards teaching and demonstrating principles of professional practice and effective communication. At a most basic level, the teaching of ethics can be seen to relate to communicating facts about the ECSA Code of Conduct, responsibilities and policy documents that regulate the practice of the engineer. Teaching in this area would be aimed at establishing competence – a key concern of ECSA. For final year students the weighting of marks for oral, written and professional skills in 2012 with those of previous years shows far better recognition of professional skills now being given. Peer review is included with the ethics assessment as part of professional skills. The essay topic has extended the opportunity of applying the details of the ECSA Code of Conduct and the reinforcement of these in a multiple choice test on the ECSA Code of Practice emphasises its importance for students.

Further research may be conducted into creating learning opportunities for students to apply and develop their ethical reasoning and decision-making skills in conjunction with the application of their technical engineering skills. Such research would strengthen the role that PCS plays in teaching and assessing ethics as part of its focus on professionalism. PCS will continue to work with the different departments in the Engineering Faculty and to engage with current debates into teaching and learning theory and ways to encourage students to engage with the practice of engineering in ethically sound ways.

MENTORING AND COACHING IN A PUBLIC SECTOR DEPARTMENT IN SOUTH AFRICA

Lesley Erasmus and Geoff A Goldman
University of Johannesburg, South Africa

ABSTRACT

Literature purports that mentoring and coaching are useful tools to develop and retain staff, but they are not without their challenges. Of crucial importance is the relationship between mentor/coach and protégé. Anything that negatively affects this relationship puts the entire mentoring/coaching initiative at risk. By means of a cross sectional survey utilising a customised measuring instrument, ten null hypotheses were tested at a South African Public Sector department concerning aspects surrounding mentoring and coaching. Findings reveal that gender had no influence on the mentoring or coaching relationship and that coaching was not seen as contributing to staff development. These findings are in contrast with contemporary literature on mentoring and coaching

INTRODUCTION

In the public sector, service delivery is of cardinal importance. Public sector institutions often need to invent solutions in order to appease their constituents. Allio (2009) states that leaders are often challenged “to do the right thing” as opposed to “doing things right”, which implies integrity and ethical behaviour. With on-going corruption scandals, this is an area that warrants close scrutiny in the public sector. Many organisations are experiencing “organisational flattening”, as continual restructuring and change results in wider spans of control. This could result in increasing unfilled leadership positions and a shrinking pool of leaders (Lawrence, 2008). A return to more traditional staff training and development methods – mentoring and coaching in particular – could contribute to incubating competent managers and leaders. In the wake of the global financial crisis, organisations have been forced to cut costs, resulting in training and development budgets being slashed. Mentoring and coaching (M&C) provide an opportunity to develop and train potential leaders inexpensively. Furthermore, M&C provides development opportunities tailored to the individual and specific context of work, something that more “formal” training and development interventions are not capable of.

AN OVERVIEW OF RELEVANT LITERATURE

Terblanche (2009) highlights some issues contributing to the labour challenge in South Africa. These include, *inter alia*, a large pool of unskilled labour, a shortage of a skilled labour, and the emigration of skilled employees; resulting in a skills deficit of skilled human capital. This necessitates the HR function in organisations to become more involved in training and development of human capital (White, 2008). From a macro perspective, the skills deficit has been a contributing factor in the development of the Skills Development Act of 1998, the Skills Development Levies Act of 1999, the National Skills Development Strategy of 2001, the Human Resource Development Strategy of 2001 and the Joint Initiative for Priority Skills Acquisition. In 2008 South Africa ranked 118th out of 130 countries proclaiming to be actively investing in talent management (Grobler & Diedericks, 2009). This is alarming and demonstrates that there is much debate but little action on this issue. There are calls to include leadership development in MBA and other formal education programmes globally (Hay & Hodgkinson, 2005). However, calling for the formal education sector to resolve the issue could be seen as ‘passing the buck’, as organisations need to take the lead to help address the situation. According to Zauszniewski (2009), M&C are important tools to help recruit, develop and retain employees. Calo (2008) also emphasises the importance of skills transfer and development for a new generation of employees, especially in the light of the aging baby boomer generation, who are nearing retirement age and taking with them knowledge and experience which could be lost if contingencies are not put in place. Calo (2008) purports that it is not surprising that M&C are probably

the most effective ways of transferring explicit and tacit work-related knowledge from one person to another, as it helps foster close personal relationships between colleagues and it also helps in creating a positive organisational culture. Although often used interchangeably, there are fundamental differences between the acts of mentoring and coaching. This shall now be elaborated upon.

Mentoring

Parker, Hall, and Kram (2008) purport that mentoring has become a popular term when career development is discussed in organisations. To enhance skills at managerial level in organisations, executive mentoring programs have gained popularity, despite organisations not investing enough energy in designing such programs properly (Allen, Eby & Lentz, 2006). Bhatta and Washington (2003) are of the opinion that mentoring is a key tool in helping employees experience career growth, in all sectors and industries. Noe, Hollenbeck, Gerhart and Wright (2006) concur, purporting that mentoring can be rewarding for both the mentor and the protégé in terms of career development. In a study conducted by Thomas and Cheese (2005), General Electric intentionally mentored employees to inculcate change throughout the organisation. Landale (2005) corroborates this, stating that executive mentoring has improved leadership qualities in multinational corporations globally. Moberg (2008) defines mentoring as the relationship between a senior, more experienced person who assumes the responsibility to develop a junior person. Gesme, Towle, and Wiseman, (2010) take a similar stance, stating that mentoring entails providing guidance, assisting in self-discovery and career development. Finding the right mentor-mentee combination is critical, as both mentor and mentee have expectations (Bluckert, 2006; Zauszniewski, 2009). Furthermore, these expectations should be formalised in the form of written agreements. Pokora and Connor (2007) concur with this notion of formalisation, as the 'return on investment' should be visible and agreed upon by those involved in the mentoring initiative. Formalising the process also gives direction and provides deliverable to the process, thus making it more measurable (Pokora & Connor, 2007). However, formalising the process could distract from the actual mentoring experience, especially if the mentor or the mentee is too focused on the framework devised. Waddell and Warnock (2006) also stress that the mentor-mentee relationship should be take care of career development needs of the mentee, while also taking into account and giving credit to the time consumed by the mentor.

Hansford and Ehrich (2005) state that the advantages associated with M&C outweigh the disadvantages. For the mentee these advantages include support from more experienced staff, freedom to share ideas and professional development, while for mentors, networking, professional development, the opportunity to reflect, exposure to new ideas and the opportunity to give back to the profession are advantages (Hansford & Elrich, 2005). As for the organisation, improved employee retention, management continuity, improved communication and productivity are definite positive outcomes of mentoring (Hansford & Elrich, 2005). Mentoring does have drawbacks for the mentor, mentee and ultimately the organisation. Meyer and Fourie (2006) specify possible disadvantages which could stem from the mentor-mentee relationship, these include over-protection by mentor; ego drives of mentor and mentee; mentor trying to "clone" the mentee; workload; inflexibility of mentor; manipulation by mentee, and mentee over dependence. In addition to this, Hansford and Elrich (2005) warn that mentoring can become superficial, especially when people assigned as mentors are not suitable mentors. These pitfalls can negate the advantages of mentoring highlighted above.

Coaching

In contrast to mentoring, coaching is concerned with facilitating professional change and human development (Scamano & Harden, 2007). Wright (2005) purports that coaching provides support to enhance skills, resources, and creativity that people already possess. Coaching has transcended sport and life coaching; it has become an important facet of staff development (Lloyd & Rosinski, 2005). Coaching also requires a trust relationship to be built between coach and protégé (Zauszniewski, 2009; Stead, 2005). The fundamental difference between mentoring and coaching, however, is that coaching focusses on helping the protégé to learn how to achieve more, whereas the aim of mentoring is to act as a resource at the disposal of the mentee (Wright, 2005). Baron and Morin (2009) purport that coaching aims to increase employees' work performance, whereas mentoring addresses a larger set of issues related to the protégé's life inside and outside the organisation. Coaching seems to focus on optimal and efficient achievement of work related performance targets, thus narrowly focussed on performance whereas mentoring seems to be a more holistic approach focussing more on the attitudinal and behavioural level. The advantages and drawbacks of coaching are similar to the advantages and drawbacks of mentoring discussed in the previous section.

Challenges facing successful mentoring and coaching

According to De Vries, Webb and Eveline (2006), M&C of female employees can contribute to transforming a workplace often characterised by male dominance and discrimination. In most industries, senior management is still a male dominated environment, and thus very often the coach would be male and the protégé female, creating tension in a sexualised work environment; something that should not be ignored or downplayed (Morgan & Davidson, 2008). The situation is not unique to gender. Moore, Miller, Pitchford and Jeng (2007) purport that often it is difficult to find willing coaches from previously disadvantaged groups and that protégés would often choose coaches who they can relate to in terms of race, background and cultural belief. Moore et al. (2007) further state that there are fewer previously disadvantaged role models as opposed to their white counterparts, and that racial and ethnic lines should not be undermined in the coach-protégé relationship.

THE RESEARCH SETTING

This study was done in the Gauteng Department of Economic Development (GDED), a department of the Gauteng Provincial Government. The GDED was established following the decision in 2007 to split the Gauteng Department of Finance and Economic Affairs (GDFA) into two separate departments: the Gauteng Treasury and GDED. Most of the old GDFA was absorbed into the Gauteng Treasury and therefore the establishment of the new, autonomous GDED within the Gauteng Government did not progress without challenges in terms of attraction, development and retention of staff. GDED is in the process of attracting new skills, especially on leadership level, which is an expensive endeavour and efficient performance of new staff is not guaranteed.

RATIONALE AND METHODOLOGY EMPLOYED

The GDED has prioritised the attraction, development and retention of skills. Literature purports that mentoring and coaching (M&C) could be useful mechanisms in the development and retention of staff. However, literature also suggests that M&C is not without its' pitfalls. Amongst others, cultural differences, gender differences, ethnic differences and preparedness of the mentor or coach could negatively affect the mentor-mentee (or coach-protégé) relationship. Furthermore, the commitment of top management to M&C initiatives is crucial for results to be forthcoming from M&C initiatives. M&C initiatives are often undertaken haphazardly and without the necessary planning of a workable M&C process. Based on this research problem, the objectives of this study are:

- To ascertain if the GDED ascribes importance to M&C as tools to develop and retain staff [O1].
- To determine whether differences between mentor/coach and protégé has a detrimental effect on the mentor-mentee or coach-protégé relationship [O2].

In order to achieve O1, the following research question is posed:

How does the GDED view mentoring and coaching as mechanisms to help develop and retain staff?

To address O2, the following null-hypotheses were constructed to be tested at the GDED:

H_{0.1}	<i>There is an association between ethnicity of the mentor and the mentor-mentee relationship</i>
H_{0.2}	<i>There is an association between ethnicity of the coach and the coach-protégé relationship</i>
H_{0.3}	<i>There is an association between gender of the mentor and the mentor-mentee relationship</i>
H_{0.4}	<i>There is an association between gender of the coach and the coach-protégé relationship</i>
H_{0.5}	<i>There is an association between cultural differences and the mentor-mentee relationship</i>
H_{0.6}	<i>There is an association between cultural differences and the coach-protégé relationship</i>
H_{0.7}	<i>There is an association between the learning experience and differences that exist between mentor and mentee in terms of gender, ethnicity or culture</i>
H_{0.8}	<i>There is an association between the learning experience and differences that exist between coach and protégé in terms of gender, ethnicity or culture</i>
H_{0.9}	<i>There is an association between mentoring and staff development</i>
H_{0.10}	<i>There is an association between coaching and staff development</i>

The study employed a quantitative approach. As quantitative research tests hypotheses derived from a theoretical background (Lancaster, 2005), it was deemed appropriate for this study. The study furthermore employed a cross sectional, survey design, where primary data was gathered by means of a structured

questionnaire. The research population was managerial staff within GDED. As the likelihood is greater that people on managerial level have a greater understanding of, and experience with, M&C, this group of GDED employees was deemed most appropriate. The entire management population (128 people in total) in GDED was targeted, thus no sample was selected. A customised measuring instrument was developed derived from literature. The questionnaire consisted of three sections. Section 1 gathered demographic data, Section 2 solicited both nominal and continuous data, to ascertain whether importance is attached to mentoring and coaching at GDED, in line with O1. Section 3 consisted of 12 items to assess whether demographic differences impact on the mentor/coach-protégé relationship at the GDED, in line with O2. These items solicited continuous data.

The questionnaire was distributed by the researcher, who personally followed up outstanding questionnaires and collected all completed questionnaires. SPSS was used to analyse the data. As Section 2 and Section 3 employed different levels of measurement, the analysis thereof will be discussed separately:

Section 2: Analysis for this section involved:

- The internal reliability of the Likert-scale items was assessed by means of the Cronbach's-Alpha coefficient to ensure that the same constructs yield consistent results over time (Black, 2002).
- Frequency distributions to illustrate the importance the GDED ascribes to M&C

Section 3: This section addressed O2 (to determine whether demographic differences between mentor/coach and protégé had a detrimental effect on the mentor-mentee or coach-protégé relationship); which entails testing the ten stated null-hypotheses. This section consisted of 12 items measured nominally. Chi-squared analysis was employed to test the stated null-hypotheses at a 95% confidence level.

PRESENTATION AND DISCUSSION OF FINDINGS

The survey realised 106 usable questionnaires (82.8% response rate). The majority of the respondents were African Males between 30 and 39, with a post graduate qualification in the employ of GDED for 5 years or less (79%, showing high staff turnover). Gender distribution is more male dominated and ethnicity is more or less reflective of the distribution in the country. .

O1, addressed in Section 2 of the questionnaire, endeavoured to ascertain if the GDED ascribes any importance to mentoring and coaching as tools to develop and retain staff. However, Section 1 also contained some questions pertaining to respondents' views on mentoring and coaching. This information is insightful as it shows respondents opinion of and experience with mentoring and coaching, as reflected in Table 1.

TABLE 1: Evidence of and importance attached to mentoring and coaching

Item	Yes	No		
Has the respondent ever been mentored?	53%	47%		
Has the respondent ever been coached?	51%	49%		
Has the respondent ever acted as a mentor?	47%	53%		
Has the respondent ever acted as a coach?	56%	44%		
Item	Extremely important	Important	Of little importance	Don't know
Mentoring as staff developmental tool is...	70%	20%	0%	10%
Coaching as staff developmental tool is...	62.3%	31.1%	1%	3.8%

Approximately half of the respondents have been mentored or coached at some stage of their careers. Similarly, just over half of the respondents have acted as mentors or coaches at some stage of their careers. The questionnaire was not designed to measure how many of those who had received mentoring/coaching themselves became mentors/coaches, so one has to assume that some of the people who have mentored or coached never received any mentoring or coaching themselves. Rather unsurprisingly, respondents are of the opinion that mentoring and coaching is of vital importance for the development of staff. As far as the importance of mentoring and coaching for the GDED is concerned, Table 2 presents the relevant data.

TABLE 2: The importance attached to mentoring and coaching at the GDED

Item	Yes	No
Do staff development programs exist?	34%	66%

Are succession strategies in place?	8%	92%			
Item	Strongly agree	Agree	Don't know	Disagree	Strongly disagree
Staff development can be improved	49%	49%	0%	2%	0%
Mentoring and coaching, could help retain staff.	25%	42%	5%	22%	6%
Senior managers view mentoring as important	2%	15%	37%	31%	15%
Senior managers view coaching as important	0%	15%	37%	29%	21%

The Cronbach's-Alpha coefficient was calculated for the items in this construct measuring continuous data. Thus, for the four items in this construct employing a Likert-scale, the Cronbach's-Alpha was 0.804, indicating a high level of internal reliability between these items. One third of the respondents were of the opinion that staff development initiatives exist in the GDED. Upon closer scrutiny, those respondents that answered "yes" came from the ranks of top management. One can deduce that what top management intend as staff development initiatives are not perceived as such by middle and supervisory level management. As for succession planning, 8% respondents were of the opinion that succession strategies exist. This is alarming, as it can hinder continuity within the GDED, especially against the backdrop of high staff turnover. 98% of the respondents felt there is room for improvement in terms of staff development at the GDED. Furthermore, although 67% of respondents feel M&C can be used as tools to retain staff, 17% of respondents feel that the GDED top management ascribes value to M&C, which seems to suggest that some of the respondents that occupy top management positions at GDED are of the opinion that little value is ascribed to M&C.

Even though it could be argued that this finding is offset by the 37% of respondents who were indifferent to the importance top management places on mentoring and coaching at the GDED, there is still enough evidence to suggest that the GDED does not attach much value to M&C as tools to develop and retain staff. However, the findings do show that many respondents, who themselves occupy management positions within the GDED, are of the opinion that M&C could potentially be useful developmental tools. This could indicate a personal appreciation of the value of M&C, but on a systemic level the GDED does not attach much value to these mechanisms. O2 tried to determine whether demographic differences between mentor/coach and protégé had a detrimental effect on the mentor-mentee or coach-protégé relationship.

Findings pertaining to ethnicity: 87% of respondents do not feel that it is necessary to be mentored by a person of the same race. $\chi^2 = 0.006$ and $p = 0.938$, thus the association between mentoring and ethnicity is not statistically significant. In terms of coaching, the findings also show that 87% of respondents deem it unnecessary to be coached by a person of the same race. $\chi^2 = 0.006$ and $p = 0.938$, thus the association between coaching and ethnicity of the coach is not statistically significant.

Findings pertaining to gender: 93% of respondents felt that the gender of the mentor had no effect on the mentor-mentee relationship. $\chi^2 = 6.096$ and $p = 0.000$, implying a statistically significant association between mentoring and gender of the mentor. $\phi_c = 0.059$, however, signifies that this association is a slight one. In this study, therefore, gender does impact on the mentor-mentee relationship. As far as coaching and gender of the coach is concerned. 91% of respondents believe that gender does not play a role in coaching. $\chi^2 = 7.779$ and $p = 0.005$, indicative of a statistically significant association between coaching and gender of the coach exists. $\phi_c = 0.246$, denoting that the association between mentoring and the gender of the coach is low.

Findings pertaining to the learning experience gained: 89% of respondents felt that learning had nothing to do with the ethnicity of the mentor. $\chi^2 = 0.186$ and $p = 0.666$, thus the association is not statistically significant. 91% of respondents, similarly felt that the ethnicity of the coach had no effect on learning. $\chi^2 = 0.005$ and $p = 0.943$, indicating no statistically significant association between these variables.

Findings pertaining to cultural differences: 54% of respondents felt that cultural differences had no effect on the mentor-mentee relationship. $\chi^2 = 3.153$ and $p = 0.076$, therefore no statistical significance exists for this association. 58% of respondents felt that the coach-protégé relationship is not effected by cultural differences. With $\chi^2 = 3.532$ and $p = 0.060$, this association bears no statistical significance.

Findings pertaining to leadership development: 94% of respondents were of the opinion that mentoring could foster staff development. $\chi^2 = 2.257$ and $p = 0.133$, thus this association has no statistical significance. 90% of respondents were of the opinion that coaching could develop staff. $\chi^2 = 4.057$ and $p = 0.044$, thus this association does exhibit statistical significance. Furthermore, $\phi_c = 0.279$, denoting a low association between coaching and staff development.

CONCLUSIONS RESULTANT FROM THE STUDY

O1 set out to ascertain if GDED ascribes any importance to mentoring and coaching as tools to develop and retain staff. The data leads one to conclude that the GDED does not seem to attach much value to M&C as mechanisms to help develop and retain staff, although individual respondents tend to exhibit a personal belief that M&C has the potential to be beneficial to GDED. O2 endeavoured to determine whether demographic differences between mentor/coach and protégé have a detrimental effect on the mentor-mentee or coach-protégé relationship. Table 4 presents a summary of the main conclusions pertaining to the stated null-hypotheses.

TABLE 4: Summary of main findings

Ho	Main finding	Outcome
$H_{0.1}$	$\chi^2 = 0.006$, $p = 0.938$. Not statistically significant	Cannot reject null-hypothesis
$H_{0.2}$	$\chi^2 = 0.006$, $p = 0.938$. Not statistically significant	Cannot reject null-hypothesis
$H_{0.3}$	$\chi^2 = 6.096$, critical value = 1.66, $p = 0.000$ Statistically significant. $\phi_c = 0.059$; little association	$\chi^2 > \text{critical value}$, Reject null-hypothesis
$H_{0.4}$	$\chi^2 = 7.779$, critical value = 2.08, $p = 0.005$ Statistically significant. $\phi_c = 0.246$; low association	$\chi^2 > \text{critical value}$, Reject null-hypothesis
$H_{0.5}$	$\chi^2 = 3.153$, $p = 0.076$. Not statistically significant	Cannot reject null-hypothesis
$H_{0.6}$	$\chi^2 = 3.532$, $p = 0.060$. Not statistically significant	Cannot reject null-hypothesis
$H_{0.7}$	$\chi^2 = 0.186$, $p = 0.666$. Not statistically significant	Cannot reject null-hypothesis
$H_{0.8}$	$\chi^2 = 0.005$, $p = 0.943$. Not statistically significant	Cannot reject null-hypothesis
$H_{0.9}$	$\chi^2 = 2.257$, $p = 0.133$. Not statistically significant	Cannot reject null-hypothesis
$H_{0.10}$	$\chi^2 = 4.057$, critical value = 2.12, $p = 0.044$ Statistically significant, $\phi_c = 0.279$; low association	$\chi^2 > \text{critical value}$ Reject null-hypothesis

Therefore, $H_{0.3}$, $H_{0.4}$, and $H_{0.10}$ can be rejected. All the other stated null-hypotheses cannot be rejected as the associations were not statistically significant as $p > 0.05$. This study affirms that:

- Gender of the mentor has no influence on the mentor-mentee relationship
- Gender of the coach has no influence on the coach-protégé relationship
- Coaching does not seem to develop staff

This seems to contradict literature on the topic, that states that gender can a sensitive issue as far as M&C is concerned. Also, although respondents viewed coaching as a mechanism that has potential in terms of staff development, the data reveals that they do not think it actually lives up to this potential. Although data pertaining to seven of the stated null-hypotheses turned out not to be statistically significant, one should always bear in mind that statistical significance means that there is not enough evidence to suggest that the stated null-hypothesis can or cannot be rejected. However, the distribution tables suggest that ethnicity and cultural differences might not play a role in the mentor-mentee and coach-protégé relationship.

MANAGERIAL IMPLICATIONS AND FUTURE RESEARCH

From the perspective of GDED, this study underscores the sentiment that too much debate surrounds M&C as mechanisms to facilitate staff retention and staff development. Especially seen against the backdrop of high staff turnover at GDED (as 79% of respondents had been employed at GDED for 5 years or less), the Department needs to prioritise measures to develop and retain staff. This issue is even more cardinal, given as GDED is in the process of trying to attract new, skilled staff. It would be futile to staff if GDED has no strategies in place to make sure incumbents do not leave after a short tenure. This obviously has associated hidden costs which any Government Department (provincial or otherwise) can ill afford. This study has proven that for managers of GDED, gender has no bearing on coach-protégé or mentor-mentee relationship. Furthermore the study also suggests (although not conclusively) that ethnicity and cultural differences might not play a role in the mentor-mentee or the coach-protégé relationship. This is insightful, as literature purports the opposite. Therefore, this implies that M&C endeavours do not need to be designed with careful consideration to matching mentor and mentee (or coach and protégé) in terms of gender, ethnicity and cultural differences. What seems to be more important would be a match between the two personalities involved and the learning the mentee/protégé stands to gain from the relationship. This is even more important in the over-politicised, South African environment, where things are often done to seem politically correct, rather than to achieve a common goal. The findings of this study seem to call for a digression from this course of action.

As this study has produced findings that seem to contradict literature, the measuring instrument can be reconsidered to measure more dimensions of M&C. This measuring instrument should be applied to a larger sample in order to reach conclusive findings on the issue of mentoring and coaching. As a case, the importance attached to M&C at GDED acts as supporting evidence of how M&C are overlooked as valuable tools to help develop and retain staff. Gaining insights into multiple contexts would illuminate this issue even more.

ECONOMIC CAPITAL FORMATION WITHIN AN ENTREPRENEURSHIP VENTURE

**Corrie Ferreira, Jan Grundling and Lizl Steynberg
Tshwane University of Technology, South Africa**

ABSTRACT

This study was motivated by the priority placed by the South African Government on the development of small enterprises, the rapid business growth, and the need to provide information to entrepreneurs in a developing country. The purpose was to determine the sufficiency of the economic capital formation process in a selected dental laboratory to support growth and sustainability. The research design aimed to collect economic longitudinal data on one dental laboratory over the period 2001 to 2011. The results revealed that the dental laboratory has adapted well and positioned itself to survive and grow financially.

INTRODUCTION

The relevance of this study derived firstly, from the priority placed by Government on the development of small, medium and micro-sized enterprises (SMME) in South Africa. Ipso facto this implies a need for available information that can be accessed by other SMMEs to learn from, adopt or apply in their own business endeavors. Secondly, this case is of particular interest because of the dental laboratory's (DL) rapid business expansion and growth over a relatively short time-span of 16 years. It transformed itself from a stable, but small, DL to one of the biggest DLs in the Tshwane Metropolitan area, positioning itself as an interesting case study of a successful business venture. Thirdly, this case is able to provide valuable information for prospective entrepreneurs in a developing country such as South Africa. The business venture was launched from a financial constraint basis and the entrepreneur did not come from a renowned entrepreneurial background.

PROBLEM STATEMENT

The research problem was formulated as "Does the DL optimize its resources sufficiently, as reflected in economic capital formation, to support the sustainability and growth of the business?"

PURPOSE

The purpose of this research was to determine the sufficiency of the economic capital formation process in a selected DL to support growth and sustainability. Economic capital formation was evaluated in terms of investment, allocation of economic resources and economic health as part of a bigger investigation to determine the adequacy and configuration of four critical capitals (social, cultural, economic and strategic capital) in the Entrepreneurship-in-network model that influences the adaptability and growth potential of the selected DL.

SCOPE

The research was conducted as a sub-division of a greater study in which the adaptation and fixation of the DL was investigated over its total lifespan using the Entrepreneurship-in-network model as theoretical framework. This paper will only focus on the financial capital formation process that occurred during this period. The economic capital was evaluated in terms of the real financial performance of the DL and compared with what was considered to be a financially healthy business. All financial variables were measured at ex post facto level.

THE ENTREPRENEURSHIP-IN-NETWORK THEORETICAL FRAMEWORK

An adapted Entrepreneurship-in-network model was adopted as framework based upon a synthesis derived from studying four clusters of entrepreneurship models:

- Cluster 1: The process models include the pursue-opportunity models of Baron and Shane (2008), Van der Veen and Wakkee (2004), and Deakins and Whittam (2000) respectively, the life cycle models of Granlund and Taipaleenmäki (2005), Kuratko and Hodgetts (2004), Robbins (1994), Victor and Boynton (1998), Miller and Friensen (1984), and Quinn and Cameron (1983), the entrepreneurs events model of Bygrave (1989), and the resource-based cumulative model of Harber and Reichel (2007). These models emphasised key activities that need to be performed in pursuit of new user-value by an entrepreneur in discrete defined phases of a business. However, the models ignore the dynamic nature of a changing environment, challenges and tasks that may unfold in multiple ways. The models are also not able to accommodate periods of non-growth or reversal of growth as an option for survival;
- Cluster 2: The interaction or relationship models including the structural network models of Groen (2005), Van der Veen and Wakkee (2004), Håkansson and Snehota (1995), and Håkansson (1989), the social identity models of Highhouse, Thornbury and Little (2007), Korte (2007), Van Knippenberg and Hogg (2003); and Tajfel (1972), the social systems models described by Bjerke (2007), Parsons (1964) and Parsons, Shils and Tolman (1951), and the regulatory focus model described by Brockner, Higgins and Low (2004). Interaction or Relationship models recognize that inter-business relationships are intrinsic to business success. A relationship is considered as a *mutually oriented interaction between two reciprocally committed parties implying mutual orientation and commitment over time* (Håkansson & Snehota, 1995, p. 25). These relationships and their effects to other important business constructs such as business opportunity recognition, opportunity preparation, opportunity exploitation and the utilization of the various types of capital are important; and
- Cluster 3: The economic models including the transactional cost models described by Hogg (2007), Michael (2007), and Coase (1937), and the Heterodox emerging model described by Minniti and Lévesque (2008). These models evaluate the economic performance of a business within a macro-economic environment and within bounded rationality.

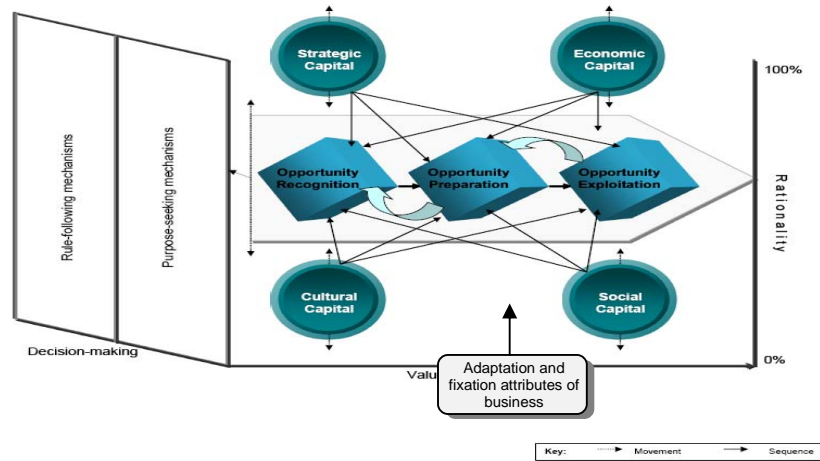

The adapted Entrepreneurship-in-network framework adopted in this research (Figure 1) gives an indication of its stochastic nature as all components (actions to be conducted, resources, the behaviour of the actors, the interactions between the actors and the situation) are dynamic, heuristic and biased. Everything that occurs within the model is based on bounded rationality - a decision-making mode that varies between rule-following behaviour and purpose-seeking behaviour - and within a timeframe. It accommodates reverse processes that may influence the outcome of opportunity-seeking behaviour. The adapted model is highly complex as it displays a probability nature and not a deterministic nature. Furthermore, a possibility of greater variation and multidirectional development, as well as adaptation paths, can be followed. The possibility of multi-directional paths is supported by Achtenhagen, Melin and Naldi (2010) who stated that, unlike the suggestion of many models of organisational growth, even growing firms do not display unidirectional development paths.

Implicit in this model is that entrepreneurship is by its nature a social act within a specific type of social structure which creates value for the market place. As such entrepreneurship is on the one hand an order-creating (creating a new equilibrium) act, and on the other hand an act that results in creating new contingencies. While the entrepreneur remains the main driver of the entrepreneurial process, careful consideration of the influence of interacting actors and institutions influences the entrepreneur in his decision on what the business ought to be (identity) or ought to do (acceptable value to produce). In this regard, Hoang and Antoncic (2003) identify three critical elements, namely: the nature of the content that is exchanged between actors; governance mechanisms in relationships; and the network structure created by the cross-cutting relationships between actors to explain entrepreneurial outcomes.

In the Entrepreneurship-in-network approach as put forward by Van der Sijde (2007), interaction of actors takes place with regard to opportunity recognition, opportunity preparation and opportunity exploitation, all of which subsequently lead to value creation. This model does not represent a linear process, because changing circumstances may require the entrepreneur to re-evaluate decisions made in earlier stages. Mechanisms contained in the definition by Parsons, Shils and Tolman (1951) and Fry, Stoner and Hattwick (1998), showed that interaction between actors striving for goal attainment, optimization of processes, maintenance of patterns and institutionalization of shared symbols produce their own specific

types of capital needed in the business. Each of these mechanisms is related to specific types of capital: interaction between actors is linked to a social capital; goal attainment is linked to strategic capital; optimization of processes is linked to economic capital; and maintenance of patterns and institutionalization of shared symbols is linked to cultural capital.

FIGURE 1: Adapted Entrepreneurship-in-network model

An assumption is made that a business needs sufficient *capital* to be sustainable over time and that a business has to be in possession of sufficient *capital* in all four areas (social, strategic, economic and cultural) to be viable and successful. Further, for a business to be sustainable and to grow an entrepreneur needs to achieve value-creation continually. This is the reason for adding a value-creation-over-time dimension to the Entrepreneurship-in-network model.

Economic capital refers to one of four domains. These domains are economic conditions, investment, allocation of funds or economic resources and the state of health of the financial capital in a business (Du Toit, 1979; Lambrechts, Reynders & Scheurkogel, 1979). The first domain relates to the general conditions of the macro-economy that include amongst others interest rates, inflation rates and general business conditions that exist in the economy and may influence business decisions. The second domain relates to the investment component which refers to the actual utilization of funds for productive purposes to procure economic objects such as fixed assets and technology. The purpose of investment is to achieve a higher turn-over and/or lower cost structure, and secure higher profit margins through the procurement of fixed and floating assets. The third domain refers to the allocation of economic resources. This includes how profits or savings are deployed to create income for the business. The fourth domain refers to the economic health of a business in terms of its market value, solvency, liquidity and owner control.

RESEARCH DESIGN AND METHODS

The research design aimed to collect economic longitudinal data on one DL over a period of 16 years divided into two discrete periods. The DL was selected as most suitable to justify the research using a criterion-based benchmark approach of state-of-the-art technology employed; spectrum of dental speciality services provided; the four critical types of capital relevant to the study; and the lifespan of the business. All economic variables were measured at ex post facto level. The concept “Economic capital” included the three domains defined by Lambrechts, Reynders and Scheurkogel (1979), and Du Toit (1979) as general economic conditions, investment, allocation of funds or economic resources and the state of health of the financial capital in a business. The first domain relates to the investment component that is the actual utilization of DL funds for productive purposes to procure fixed assets and technology. To analyze the investment profile of the DL five (5) components were investigated namely, cash in hand; overdraft facilities utilized; loans; outstanding debtors; and investment capital. In addition to cash in hand, the researcher will also determine how many days’ worth of cash PDL has available to cover its monthly operational costs. This will be done according to the following formula:

Days to deplete cash = (Cash in hand at the end of period/monthly operational expenses) x 30 days.

The second domain refers to Performance indicators concerned with turnover, gross profit, profit before tax and profit margins. This domain focused on financial achievement. The third domain refers to the economic health of the DL in a particular phase in terms of the indicators solvency, liquidity and owner control.

In order to protect the intellectual property of the DL all data was be transformed according to a standardized formula that treated all data in a similar fashion. This made it impossible for the public to calculate the investment data of the DL. The purpose of an analysis of the investment profile of the DL was to form a picture of the turnover, cost structure and profit margins by procuring fixed and floating assets.

FINDINGS AND RECOMMENDATIONS

For this research the phases 2001 to 2005 and 2006 to 2011 were analyzed. The year 2001 was taken as base year and received an indicator value of one (1). The only exception is cash in hand where 2009 was chosen as base year.

Investment Profile

In this section the actual utilization of DL funds for productive purposes are presented (Table 1). The five (5) components analyzed in the investment profile are summarized in Table 1 under the same headings.

- **Cash in Hand**

Data was not available for the period 2001 to 2008. Since 2009 the cash in hand of the DL has increased significantly. For the period 2009 to 2010 the cash in hand increased by 77% while the cash flow for the period 2010 to 2011 increased by 508% over a year-on-year basis. The implication is that the DL is well positioned to manage immediate business risks and to exploit new business opportunities. Further analysis to determine how much cash the DL needed to pay current invoices, using the average number of days it would take to deplete the cash was calculated by dividing the total cash available at the end of the period by the average cash expenses per day. In 2009 the DL had 33.9 days available to deplete its cash in hand. In 2010 the DL had 29.5 days available and for 2011, 96.5 days. Since 2009 the number of days has increased by 284.7%. The result implies that the DL was in a reasonable position to fulfill its short-term commitments (Table 1).

- **Overdraft Facilities Utilized**

An overdraft facility refers to a source of short-term working capital funding for business expenses and is particularly useful to give a business greater financial freedom and flexibility. It is created when a borrower draws money against a previously established line of credit. The basic cost to the borrower is the interest levied on the daily overdraft balance. For short term working capital funding, the figures in the overdraft facility provide an indication of whether cash flow in a business is in good health or whether a cash flow problem exists (Overdraft, 2010). An overdraft facility closely relate to debtors, creditors, turnover, growth rate of the business and changes in the market. The researchers therefore analyzed overdraft facilities utilized in terms of the factors mentioned.

Table 1 indicates that the DL shows a decline in its dependency on overdraft facilities. In the period 2009 to 2011 it did not use overdraft facilities. This is an indication of a healthy cash flow. In 2001 to 2005 the business was partially dependent on overdraft facilities although over a year-on-year basis, the dependency declined indicating that the business was moving steadily towards a stronger cash flow. Also in 2006 to 2008 the business owner made use of overdraft facilities. The advantage of the overdraft position as experienced by the DL was that the business would not experience immediate cash flow problems and would not be refused credit by financial institutions. In the case of the DL the initial dependence on an overdraft facility could be attributed to its being a new business. A shortcoming of this analysis is its lack of predictive ability with regard to the cash doubt or cash security position of the DL. Due to limited data available further statistical analysis on predictions was not possible.

Table 1: Investment profile of Pretoria Dental Laboratory

PHASE	Year	Cash in hand	Overdraft facilities	Loans	Outstanding Debtors	Investment Capital
-------	------	--------------	----------------------	-------	---------------------	--------------------

			utilized			
PHASE 1	2001	-	1	1	1	1
	2002	-	0.64	3	1.25	1.13
	2003	-	0.53	3	1.30	1.18
	2004	-	0.49	3.66	1.35	1.26
	2005	-	0.13	5.66	1.38	1.08
	Average	-	0.54	3.27	1.26	1.13
PHASE 2	2006	-	0.02	5.66	1.44	1.26
	2007	-	0.64	5.66	1.69	1.18
	2008	-	0.19	5.66	1.82	1.58
	2009	1	0	5.66	2.08	3.75
	2010	1.77	0	0	2.36	5.66
	2011	11.54	0	0	2.96	9.62
	Average	2.39	0.14	3.78	2.06	3.84

From 2001 the overdraft facilities gradually decreased from 9.3% to less than 1% in 2005 as a percentage of turnover and over the period, 2009 to 2011 no overdraft facilities were called upon to cover operational costs. The increase in the overdraft in 2007 and 2008 was done in preparation for the acquisition of two laboratories that were bought in 2008 and 2009 respectively. The management of the overdraft as a percentage of turnover illustrates a controlled and responsible approach to utilization of external funding. The same trend is reflected in the overdraft as a percentage of gross profit. Even at its peak of 16.2%, overdraft facilities did not put a severe strain on the gross profit of the DL. Except for two years the gross profit percentage exceeded 30%, during which time the DL was able to achieve a growth rate of more than 20% per annum. This illustrates that overdraft facilities were used for expansion or for improvement and not for bail-out purposes.

- **Loans**

From 2001 to 2005 the DL gradually increased the loan base from 1% to 5.66%. The latter percentage was maintained until 2009. Since 2010 the DL did not depend on loans for production purposes (Table 1). At no stage did loans as a percentage of turnover exceeded 9% or a percentage of gross profit exceeded 12.5%, which reflects the approach of the business owner to finance the activities and expansion of the DL from self-generated funds.

- **Outstanding Debtors**

The number of outstanding debtors has shown an exponential increase since 2001. However, the research revealed that the number of outstanding debtors is well under control and that debtors managed as a percentage of turnover, as a percentage of gross profit, and as a percentage of profit before tax showed a steady decline. By 2011 debtors as a percentage of turnover had decreased from a high of 34.58% to a low of 15.02%. The improvement is more impressive when the number of debtors, as a percentage of profit before tax, is calculated. Debtors as a percentage of profit before tax decreased from 31% in 2001 to 7% in 2011.

- **Investment Capital**

Investment capital refers to money used by the DL to procure fixed assets. The data revealed too little was spent on the procurement of fixed assets over the period 2001 to 2008. However, since 2009 a strong increase in the procurement of fixed assets occurred (Table 1). The increased expenses can be explained in terms of the expansion of the DL when the dental service-base was enlarged. Another reason for the

relatively low investment in fixed assets can be explained in terms of the longevity of technologies utilized in a dental laboratory. Very little demand is made on replacement of existing technologies. Only moderate financial stress was exerted on the DL as the investment capital as a percentage of turnover ranged from 33.34% to 40.51% between 2009 and 2011. Investment as a percentage of gross profit in the same period ranged from 39.64% to 47.28%.

Generic Economic Health Profile

In this section the return on investment including return on equity, nett asset turnover and fixed asset turnover, as well as performance indicators including turnover, gross profit, profit before tax, and profit margin, and lastly the economic health indicators including solvency and liquidity of the DL will be discussed.

• Return on Investment

The return on equity (ROE) indicates that the DL has been an asset creator and that a healthy state of cash has been created from existing assets. Since 2001 to 2005 an average of 59.2 cents was generated for every one rand invested in the DL. From 2006 to 2011 the ROE increased as 80.72 cents were generated for every one rand invested. This indicated a relatively high efficiency rate in the DL that continued to grow as the DL matured. The exceptionally high ROE values in 2007 and 2008 were attributed to the procurement of new business acquisitions that were highly efficient at the time of acquisition. The same trend is reflected in the net asset turnover (NATO) and the fixed asset turnover for 2007 and 2008 (Table 2).

The NATO showed that the speed with which investments have translated into cash flow for the period 2001-2005 and 2006-2011 were high with an average of 300.97% in Phase 1 and an average of 300.98% in Phase 2 indicating a stable cash flow situation in the lifespan of the DL. These figures also showed that sales were active and that minimal cash was tied up in the DL to keep the business operational. According to these figures the DL should find it relatively easy to expand if it so desires. A disadvantage is that these high percentages may be indicative of inadequate investment in expansion or in modernization. However, on the positive side the fixed asset turnover supported the statement that sales generated by fixed asset investment were buoyant in phases 1 and 2 (Table 2).

Table 2: Return on investments

PHASE	YEAR	RETURN ON EQUITY (PROFIT BEFORE TAX/TOTAL EQUITY)	NETT ASSET TURNOVER	FIXED ASSET TURNOVER
PHASE 1	2001	46.05%	330.27%	2101.48%
	2002	51.35%	271.85%	2366.68%
	2003	52.31%	262.07%	2901.45%
	2004	62.77%	326.65%	4588.59%
	2005	83.50%	314.02%	4208.33%
	Average	59.20%	300.97%	3233.31%
PHASE 2	2006	92.20%	316.32%	4078.97%
	2007	138.96%	370.89%	6878.30%
	2008	113.85%	383.93%	7790.46%
	2009	61.41%	199.43%	1928.52%
	2010	58.72%	289.99%	5009.00%
	2011	61.17%	245.32%	718.59%
	Average	87.72%	300.98%	4400.64%

Table 3: Performance indicators

PHASE	YEAR	TURNOVER	GROSS PROFIT	PROFIT BEFORE TAX	PROFIT MARGIN %
PHASE 1	2001	1	1	1	8.17%
	2002	0.98	1.03	1.26	10.47%
	2003	0.95	1.06	1.34	11.48%
	2004	1.21	1.37	1.71	11.60%
	2005	1.20	1.48	1.96	13.36%
	Average	1.07	1.48	1.45	11.02%
PHASE 2	2006	1.26	1.19	2.53	16.37%
	2007	1.70	2.18	3.56	17.14%
	2008	1.87	2.38	3.90	16.98%
	2009	1.64	2.45	5.00	24.88%
	2010	3.01	4.41	7.21	19.58%
	2011	5.01	7.06	12.78	20.86%
	Average	3.48	4.52	7.28	30.32%

- Performance Indicators**

Using 2001 as a base year Table 3 revealed that with the exception of 2002 and 2003 the DL was able to maintain a positive growth in turnover, with an accelerated growth rate in phase 2.

Table 4: Economic health indicators

PHASE	YEAR	SOLVENCY (TOTAL DEBT/ TOTAL EQUITY)	LIQUIDITY (CURRENT ASSETS/ CURRENT LIABILITIES)	
		DEBT RATIO	CURRENT RATIO	ACID TEST RATIO
PHASE 1	2001	0.60 : 1	2.40 : 1	No inventory
	2002	0.52 : 1	3.08 : 1	
	2003	0.47 : 1	3.40 : 1	
	2004	0.34 : 1	4.48 : 1	
	2005	0.42 : 1	4.34 : 1	
	Average	0.47 : 1	3.54 : 1	
PHASE 2	2006	0.30 : 1	5.52 : 1	
	2007	0.67 : 1	3.08 : 1	
	2008	0.36 : 1	4.62 : 1	
	2009	0.24 : 1	11.07 : 1	
	2010	0.03 : 1	18.71 : 1	
	2011	0.10 : 1	33.49 : 1	
	Average	0.28 : 1	12.75 : 1	

- Economic Health Indicators**

Despite a decline in turnover in 2002 and 2003, the DL was able to increase its gross profit, profit before tax and its profit margins. While in the first phase the average profit margin was 11.02%, profit before tax was 45%, and gross profit was 48%, these figures increased on average by 30.32%, 628% and 352% respectively, using 2001 as base year. These figures provided evidence that the DL was a financially sound, growing business. The economic health indicators in Table 4 indicated that the solvency and liquidity status of the DL improved on a year to year basis as it relates to its debt situation as well as to its cash flow situation. As the DL did not carry an inventory the acid test ratio could not be calculated.

CONCLUSION AND RECOMMENDATIONS

The status of the economic capital of the DL was extensively analyzed for the period 2001 to 2011 as data for the first 5 years was not available. To complete the picture on the health status of the DL a perspective was provided on investment, allocation of funds and the health of the financial capital to provide an indication of the utilization of funds for productive purposes and how profits and savings have been used to create income for the business. The results revealed that the DL over time has adapted well and positioned itself to survive and grow financially. Its cash flow in each time period investigated increased to such an extent that it could take immediate business risks and exploit new business opportunities. It was also well positioned to pay current debt and has in the last time period under consideration 96.5 days available to deplete its cash reserves. In recent times it did not access any overdraft facilities or loans.

It can be concluded that the DL was in a reasonable position not only to fulfill its short-term obligations, but also its medium-term obligations. Although it was stated that technologies employed in a DL have a relative long lifespan, the researchers are still of the opinion and recommended that a larger proportion of surplus funds needs to be re-invested in the business for expansion purposes and replacement of technologies. Currently surplus funds are primarily channeled into investment portfolios such as property that do not relate to the core business of the DL.

While the DL had a healthy investment profile, questions can be raised on whether the business owner should access overdraft facilities as a mechanism to expand the business. An overdraft give a business greater financial freedom and flexibility, and it may also serve as an instrument to protect the cash security of a business. Given the fact that the DL is a family business and the possibility that one or more of the offsprings may take over the business in the next five to ten years with the probability of joint ownership, it may be advisable to increase the number of days of cash depletion to about 120 days and to venture into business expansion thereby creating a further platform for growth.

While the findings revealed that outstanding debt was well under control, the exponential increase in outstanding debts sent out signals that the business owner should develop an early warning system for risk management. This is particularly relevant at present because businesses are under severe stress due to the global economic crises of 2007 to 2011. The return on investments indicated that, since its inception the DL had been an asset creator and 80.72 cents was generated for every rand invested. This indicated that the business owner was highly efficient in the way the finances were managed and in the way acquisitions had been made. Investments had translated into cash very rapidly. A criticism against the DL is that given the ease with which cash was generated too little was invested in the expansion and modernization of the DL. This comment is borne out by the performance indicators that the DL showed a sustained positive turnover growth with liquidity and solvency throughout its lifespan.

INTERACTION AND BONDING AS SOCIAL CAPITAL INDICATORS IN A SMALL BUSINESS

Corrie Ferreira, Jan Grundling and Lizl Steynberg
Tshwane University of Technology, South Africa

ABSTRACT

Social capital encompasses the quality and quantity of associational life. It is assumed that high levels of social capital result in improved business performance. For this reason the purpose of this research was to evaluate the status of social capital in a dental laboratory (DL) in South Africa using interaction and bonding (trustworthiness and reputation) as indicators. Based upon a cohort-survey research design using employees, customers and suppliers as research respondents, findings revealed that the social capital in the DL was in a healthy state despite an autocratic decision-making style based upon the principle of sole decision-making by the business owner.

INTRODUCTION AND THEORETICAL BACKGROUND

Entrepreneurship is by nature a social act within a specific type of social structure which creates value for a society or the market place. As such entrepreneurship is on the one hand an order-creating (creating a new equilibrium) act, and on the other hand an act that results in creating new contingencies. While the entrepreneur remains the main driver of the entrepreneurial process, careful consideration of the influence of interacting actors and institutions influences the entrepreneur in his decision on what the business ought to be (identity) or ought to do (acceptable value to produce). Hoang and Antoncic (2003) in this regard identified three critical elements, namely: the nature of the content that is exchanged between actors; governance mechanisms in relationships; and the network structure created by the cross-cutting relationships between actors to explain entrepreneurial outcomes. In essence, interaction between actors represents social capital in a business.

Social capital represents features of social organization such as networks, norms, bonding, trust, and reputation that encourage co-ordination and co-operation for mutual benefit. This encompasses the quality and quantity of associational life. The quality and quantity of associational life can be separated into the sources of social capital (primarily social networks) and its consequences. These can be either positive or negative depending on the circumstances. Social capital accumulates stock from which spawns certain benefits because of social network management. Network management represents the management of a set of social enhancement by raising the productivity of other resources, such as human and physical capital. The creation and accumulation of social capital requires the involvement of at least two people. The productive outcome of social capital formation is not only dependent solely on the intentions and actions of the entrepreneur, but also on the collective internalization of the externalities inherent in its formation. In other words, social capital should benefit all those who are part of the social capital formation structure (Chou, 2006).

In a social exchange, one individual typically provides a benefit (information, advice, resource access or other services) invoking an obligation in the receiving party to reciprocate, by providing some benefit in return (Ulhøi, 2005). The provider however, cannot be assured that the benefits will necessarily be reciprocated. Therefore, one can conclude that trust is the moderating variable that influences social exchange. The stronger the trust levels between the provider and the receiver, the stronger will be the bonding ties and the social capital built.

Groen, De Weerd-Nederhof, Kerssens-Van Drogen, Badoux and Olthuis (2002) explained social capital as a community of people in which diverse members of employees are tied together and their ability to interact with others. Chewar, McCrikard and Carrol (2005) extended this viewpoint by viewing social capital as managing real and virtual elements of social identities in a business, including social rhythms for

interaction, membership, conventions, trust, productive outcomes, collective efficacy and the accomplishment of goals. Blanchard and Markus (2002) as quoted by Chewar, McCrikard and Carrol (2005, p. 262) defined social capital as feelings of membership, feelings of influence, integration and fulfillment of needs and shared emotional connections. It can be concluded that social capital formation is a function of bonding, interaction, management of identities and feelings inside and between business members. It is an asset available to individuals or collective actors as it provides an opportunity to access information and resources within a social network (Maurer & Ebers, 2006). Hu and Kronelliussen (1997) as quoted by Ulhøi (2005, p. 942) reported that high levels of social capital result in improved business performance. Research showed that bonding social capital impacts on the economic growth of a business by assisting in the accumulation of human capital. Findings revealed that social capital impacts on financial development through its effects on collective trust and social norms by participation in associational activities (Chou, 2006).

PROBLEM STATEMENT

To a large extent, workers in the DL had to adhere to self-prescribed rule-following behaviour instilled in employees over a period of 16 years. This rule-following behaviour has become fixated or ingrained in the employees' work practices derived from the group culture that established the following norms: work according to own schedule, but finish work on time, every time; take full responsibility for your position in the supply chain team; and produce products of high quality to the best of your ability. All business decisions were made solely by the business owner. This is an autocratic approach that has been the norm since the inception of the DL in 1996. The researchers were therefore interested in determining the perceived status of social capital in the DL in the presence of an autocratic leadership style of the business owner.

PURPOSE

The purpose of this research was to evaluate the status of social capital in a dental laboratory (DL) in South Africa using interaction and bonding (trustworthiness and reputation) as indicators.

RESEARCH DESIGN AND METHODS

Research Design

This was an idiographic research design focusing on a DL single research subject. The research environment was an oral dental research environment within the health sector of the Tshwane Metropolitan Region of South Africa. After careful evaluation of other dental laboratories in the Tshwane Metropolitan area, the DL was selected as business most suitable to justify the research project using a criterion-based benchmark approach based upon: state-of-the-art technology employed; spectrum of dental speciality services provided; the social capital relevant to the study; and the lifespan of the business that allows for longitudinal data collection.

The empirical part of the research was based upon a cohort-survey research design. Alasuutari, Bickman and Brannen (2009, p. 230) defined a cohort as an aggregate of individuals who experience the same events at the same time intervals. In this research longitudinal data was compiled from cohorts spanning a timeframe of 16 years stretching from 1996 to 2011. The researchers drew on the memory of research respondents to obtain longitudinal data. For this reason a fixed panel of respondents was selected with no additions to the sample or emigration from the samples permitted. The cohort thus remained stable during the execution of the research.

To eliminate historical effects due to differences in experiences and memories of respondents, the researchers opted for a standardized measuring instrument to minimize variance. This is in accordance with recommendations made by Creasey (2006) on how to minimize historical effects. To conduct a cohort-survey research Dixon, Bouman and Atkinson (1987) proposed the following procedure: select variables relevant to the concepts to be studied; devise a way of measuring those variables; develop a data recording device; and measure the same variables in the same way in the groups.

Population

The population was defined as all staff members employed, customers and suppliers of the DL over a period of 16 years. The staff members constituted 13 members with fewer than five years experience, 2 members with fewer than 10 years, and 4 staff members with fewer than 16 years in the DL. The customer base was presented by 69 customers with a relationship of fewer than five years, 8 customers with fewer than 10 years and 11 customers with fewer than 16 years with the DL. The supplier base was presented by 7 suppliers with a relationship of fewer than five years, 8 suppliers with fewer than 10 years and 2 suppliers with fewer than 16 years with the DL.

Sampling

The researchers employed a criterion-based sampling technique, a special kind of purposeful sampling. Babbie (2007) described purposeful sampling as an approach in which a researcher uses his/her own judgment about which respondents to choose depending on the purpose of the investigation. The biggest advantage of this approach is that the researcher is able to use his/her own research skills and prior knowledge of the research subject to select respondents (Babbie, Mouton, Vorster & Prozesky, 2006). For the purpose of this research the following criteria were chosen to select respondents:

- Respondents should have had a working business relationship with the business owner for at least one year and respondents would be classified into one of the following categories based on the length of the relationship: more than 10 years; 5 – 10 years; or more than 1 year, but fewer than 5 years;
- The respondents in the abovementioned categories were proportionally selected, by applying the stratified random sampling principles. The rationale behind this was that more weight was given to respondents that had a long working relationship with the owner;
- For suppliers and customers an additional criterion, namely, the monetary value of business with the laboratory was added. In the case of customers, only customers that contributed more than 2% to the total revenue of the DL, and grouped with others, more than 60% to the total revenue was included. The decision of 2% was decided upon due to the fact that the customer base was relatively broad and the contributing size of customers was of approximately the same order. In the case of suppliers the sample was loaded (88:17) proportionately to ensure greater equality and balance in perceptions of both the customers and suppliers;
- Staff members – Self-administered questionnaires were used to compile data on social capital. From a total of 19 staff members with an employment history of more than one year, 12 employees were selected to participate, whilst 7 were excluded. The 12 participating employees represented 63.16% of the workforce. The decision to load the weight of the employees to 63.16% of the workforce was firstly due to the small sample available and secondly, because these 12 employees had a very close relationship with the business owner and the daily operations of the laboratory; and
- Customers and suppliers – In this study the term customer represented all dentists, hospitals and dental laboratories that had a work relationship with the DL over the period of 16 years. The term supplier referred to all suppliers of materials, equipment, and services of any kind, over the period. Self-administered questionnaires were used for both customers and suppliers to determine the trustworthiness and reputation of the DL that has spelt success in a highly competitive DL laboratory market place.

Measuring Instruments

A structured self-administered questionnaire, entitled “Management of Social Capital Questionnaire” was designed to evaluate the management of social capital in the DL. Statements were formulated to evaluate two dimensions: employee’s interpretation of how the business owner would evaluate a particular statement in terms of his priority, and employee’s personal priority evaluation of a particular statement. Participants were instructed to rank all statements from most important to least important. The highest priority received the lowest numerical number i.e. one (1) while the lowest priority received the highest numerical number. The advantage of this construction type is that the researchers were able to determine to what extent the employees’ perceptions, *what they think is expected of them*, corresponded with what they *inherently believe* to be the right response. The researchers assumed that the closer to agreement between what is expected and what employees regarded as priority, the higher the social capital.

This self-administered questionnaire entitled “Bonding with Customers and Suppliers Questionnaire” was designed to evaluate the DL’s relationships with its customer and supplier base. Firstly bonding ties, indicative of social capital, will be evaluated. The two specific bonding ties to be evaluated will be trustworthiness and the reputation of the DL. Items were constructed using a five-point Likert Scale.

An evaluation of one (1) would be indicative of total disagreement on a statement while an evaluation of five (5) would be indicative of total agreement. Trustworthiness contained six (6) statements to measure business honesty, fulfillment of commitments, consistency in behaviour, business integrity, responsible conduct and reliability in business. Reputation comprised five (5) statements used to measure the business image, standing, contribution and role, as well as the quality of relationships with its customers and suppliers.

Hypothesis

In the quantitative paradigm the following hypothesis was tested:

H₁₀: There exists no association between the perceived social capital in the DL and the observed social capital reported by employees, customers and suppliers.

H_{1a}: There exists a significant association between the perceived social capital in the DL and the observed social capital reported by employees, customers and suppliers.

Data Analysis

Due to the small employee sample size (n=12) non-parametric data analysis methods were used. The relationship between the expected rank order and what the employees believed the rank order should be, was determined according to the Spearman Rank Order Correlation coefficient. Strong and significant relationships would be indicative of congruence in perceptions and thus contributing to social capital. This analysis does not provide an indication of how good or how bad the profile is.

Two types of bonding were analyzed namely trustworthiness and the reputation of the DL. Customers and suppliers were analyzed as one group representing the external business relationships of the DL. Due to data skewness to the negative tail, raw data was transformed into two categories which indicated the presence of high social capital in the DL. Therefore the bi-nominal test instead of the Chi square test was performed. The neutral value on the scale, that is the three (3) value on the scale, was transformed to the next lower score in the Likert scale.

The Spearman's Rho correlation represents a numerical index of the degree of relationship between two ordinal scale variables when each variable is expressed by rankings from highest to lowest score. The correlation may vary between -1 to 0 to +1. Spearman Rho correlation therefore assesses agreement between respondents' rank-orders on the variables. The Spearman Rho correlation was computed according to the following formula (Diekhoff, 1996; Aron & Aron, 1997; Fraenkel, Wallen & Sawein, 1999):

$$R_s = 1 - 6 \sum D^2 / N(N^2 - 1)$$

where:

R_s = the Spearman rank-order correlation

D = difference between corresponding ranks on X and Y

N = the number of cases in the analysis

The binomial test represents the probability of an outcome of any particular response that is not influenced by the outcome of any other variable. To determine whether the observed probability differs significantly from the test probability, the following formula was used (Ott & Longnecker, 2004):

$$P(y) = n! / y!(n - y)! \times \pi^y (1 - \pi)^{n-y}$$

where:

n = number of trials

π = probability of success on a single trial

1 - π = probability of failure on a single trial

Y = number of successes in n trials

$$n! = n(n - 1)(n - 2) \dots (3)(2)(1)$$

FINDINGS

A total of 12 employees participated in the research. Of these 75% (n=9) were of the male gender while 25% (n=3) belonged to the female gender. The sample revealed that the employees working at the DL were middle-aged and older, as 66.7% (n=8) were between the ages of 46 and 71 years while 33.3% (n=4) were younger than 45 years. 41.6% (n=5) of the employees were in possession of a professional qualification, while 33.3% (n=4) had a secondary school qualification. The rest of the respondents, namely 25% (n=3) had a primary school education implying a semi-literacy level.

A total of 28 customers and suppliers participated in the research, of which 57.14% (n=16) were customers and 42.86% (n=12) were suppliers. Of the 16 customer participants 5 have had a business relationship with the DL of fewer than 5 years, 5 have had a business relationship of fewer than 10 years, while 6 have had a business relationship of fewer than 16 years. Of the customers 12 businesses were registered as private ownerships, 1 was registered as a partnership, 2 as companies while 1 was registered as a state-owned enterprise. The majority of customers receiving a service from the DL were dentists (n=15), while one hospital received dental technical services. Of the suppliers 5 had a business relationship of fewer than 5 years, 5 had a business relationship of fewer than 10 years, while 2 had a business relationship of fewer than 16 years. The supplier composition consisted of 2 private ownerships, 6 close corporations and 4 were registered companies. All the suppliers were suppliers of material and equipment.

In this section the researchers analyzed the correlation between what employees believed the DL considered being the priorities, and what the employees thought the priorities should be, to optimize social capital in the DL. Social capital was analyzed in terms of two concepts, namely bonding ties and interaction.

The data in Table 1 revealed that a high correlation existed between what the employees think the DL considered to be important to establish bonding ties in the business and what they themselves considered to be important. The correlations were positive ($r_s > 0$) implying that strong positive agreement existed between the rank order of statements. This implies that a high level of congruence existed between the employer's expectations and their own belief system. The highest level of congruence was to demonstrate respect for each other. Respect for the dignity of the other is followed by trust in each other.

It can therefore be concluded that the bonding ties component of social capital was high. H_0 should therefore be rejected in favor of H_a which stated that a high correlation exists between what the DL considered important to establish bonding ties and what employees themselves considered being important.

Table 1: Spearman's rho correlations for bonding ties

ITEM	CORRELATION	p-value	N
Employees should respect one another	0.695**	0.006	12
Employees should understand the business's aspirations	0.513*	0.044	12
Employees should feel they are valuable members of the business	0.549*	0.032	12
Employees should be able to trust one another	0.638*	0.013	12

The data in Table 2 reveal that a good relationship or association existed between what the employees think the DL considered being important for healthy interaction in the business and what they themselves considered to be important. This implies that a high level of congruence existed between expectations and their own belief system. The highest level of congruence implied that employees felt free to interact with customers and suppliers, and that employees should be kept informed. The only aspect that had a negative influence on the interaction component of social capital was the disagreement that existed because employees were unable to influence decisions on work outputs in the DL. This view was confirmed in the interview with the business owner who clearly stated that all decisions on work outputs and DL-related decisions are autonomously made by the business owner. The H_0 should therefore be partially rejected in favor of H_a which stated that there is a high correlation between what the DL considered to be important for meaningful interaction in the business and what employees considered to be important.

It can be concluded that a high level of social capital in the DL existed due to the high level of association that existed between the social capital priorities of the DL and the perceived priorities of employees. The only area of concern was the absence of influence by employees on decision-making regarding work outputs.

Table 2: Spearman's rho correlations for interaction

ITEM	CORRELATION	p-value	N
Employees should be kept informed	0.608*	0.018	12

Employees should feel free to interact with customers and suppliers	0.745**	0.003	12
Employees should feel free to influence decisions on work outputs	0.273	0.196	12

For customers and suppliers the two options under evaluation namely the respondents agree to some extent and the respondents totally agree were tested on an assumed probability proportion of 0.5 each. These evaluations tested only whether respondents differ significantly or whether they totally agree or agree to some extent on the “trustworthiness” and “reputation” statements of the DL. In the case of trustworthiness (Table 3), five of the six statements provided evidence for the acceptance of H_a namely that the DL was a totally trustworthy business.

Table 3: Binomial test on trustworthiness of Dental Laboratory

Social Capital: Trust-worthiness	Group	Category	N	Observed Prop.	Test Prop.	Asymp. Sig (2- tailed)	Average
I regard the Dental Laboratory as an honest business	Group 1 Group 2 Total	5.0000 4.0000	22 6 28	0.79 0.21 1.00	0.50	0.004**	4.7857
I can always rely on the Dental Laboratory to fulfill its commitments on time	Group 1 Group 2 Total	5.0000 4.0000	19 9 28	0.68 0.32 1.00	0.50	0.087	4.6786
The Dental Laboratory always behaves in a consistent manner	Group 1 Group 2 Total	5.0000 4.0000	21 7 28	0.75 0.25 1.00	0.50	0.013*	4.7500
The Dental Laboratory always conducts business with integrity	Group 1 Group 2 Total	5.0000 4.0000	4 24 28	0.14 0.86 1.00	0.50	0.000**	4.8571
The Dental Laboratory conducts business in a responsible manner	Group 1 Group 2 Total	5.0000 4.0000	6 22 28	0.21 0.79 1.00	0.50	0.004**	4.7857
The Dental Laboratory is a reliable organization to do business with	Group 1 Group 2 Total	5.0000 4.0000	5 23 28	0.18 0.82 1.00	0.50	0.001**	4.8214

The five statements were: DL is an honest business; PDL always behaves in a consistent manner; DL always conducts business with integrity; DL conducts business in a responsible manner; and DL is a reliable organization to do business with. The only statement on which respondents agreed to some extent was the statement: “DL always behaves in a consistent manner”.

In the case of reputation (Table 4) only two of the five statements provided evidence for the acceptance of H_a on the reputation of the DL as a business organization. These two statements were: The DL has a good name in the dental environment; and the DL maintains quality relationships with its customers and suppliers.

Table 4: Binomial test on the reputation of Dental Laboratory

Social Capital: Reputation	Group	Category	N	Observed Prop.	Test Prop.	Asymp. Sig (2-	Average
-------------------------------	-------	----------	---	-------------------	---------------	-------------------	---------

						<u>tailed)</u>	
The Dental Laboratory has a good name in the dental environment	Group 1 Group 2 Total	5.0000 4.0000	25 3 28	0.89 0.11 1.00	0.50	0.000**	4.8928
The Dental Laboratory is one of the best dental laboratories in the business	Group 1 Group 2 Total	5.0000 4.0000	13 15 28	0.46 0.54 1.00	0.50	0.851	4.5357
The Dental Laboratory is a significant contributor to the dental profession	Group 1 Group 2 Total	5.0000 4.0000	10 18 28	0.36 0.64 1.00	0.50	0.185	4.6428
The Dental Laboratory plays an important role in my business success	Group 1 Group 2 Total	5.0000 4.0000	14 14 28	0.50 0.50 1.00	0.50	1.000	4.5000
The Dental Laboratory maintains quality relationships with its customers and suppliers	Group 1 Group 2 Total	5.0000 4.0000	7 21 28	0.25 0.75 1.00	0.50	0.013*	4.7500

The other three statements on which respondents agreed to some extent were: DL is one of the best laboratories in the business; DL is a significant contributor to the dental profession; and DL plays an important role in my business success. It can therefore be concluded that the bonding ties as a component of social capital with customers and suppliers were good. However, to obtain conclusive absolute agreement more needs to be done by the business owner of the DL to improve the positional standing of the DL in the industry in terms of its reputation.

CONCLUSION AND RECOMMENDATIONS

Blanchard and Markus (2002) as quoted by Chewar, McCrikard and Caroll (2005, p. 262), defined social capital as feelings of membership, feelings of influence and integration as well as fulfillment of needs and mutual emotional connection. Social capital represents features of a social organization such as networks, norms and trust that facilitate co-ordination and co-operation for mutual benefit and as such encompasses the quality and quantity of associational life (Chou, 2006). In this study the aspects in the definition are classified as bonding ties (trustworthiness and reputation) and interaction.

The research findings revealed that the social capital in the DL was in a healthy state. Bonding between employees in the DL was high and employees also felt free to interact with customers and suppliers. Employees also felt well informed. The only negative aspect experienced by employees was the fact that they had no influence over decisions regarding work output at the DL. This result was not surprising as the business owner had an autocratic decision-making style based upon the principle of sole decision-making. At this stage no change is recommended as the current positive business results do not provide any evidence to support a change in management style.

The business owner's relationships and networking with customers and suppliers of the DL have been evaluated as trustworthy. Business is conducted honestly, consistently, responsibly and reliably. It has also been rated as a business with high integrity. Although the reputation of the DL in the market place has been rated as good it is recommended that the business owner of the DL develop a strategy to enhance the

rating of the DL as one of the best dental laboratories, as a significant contributor to the dental profession and as an important role player in the business success of its customers and suppliers.

ORGANISING THE HUMAN RESOURCES FUNCTION TO HARNESS FUTURE OPPORTUNITIES: SURVEY RESULTS OF 2010 FORECASTED FOR 2020

Leon de Wet Fourie and Pieter Nel
Unitec Institute of Technology, New Zealand

ABSTRACT

Some contemporary approaches for HR practitioners are identified in this paper in order to make use of human resources (HR) functions as a source of competitive advantage to add value to organisations. A survey was executed via an e-questionnaire using Survey Monkey in 2010 with forecasts for 2020 to obtain longitudinal results. Responses totalled 119 from members of the Human Resource Institute of New Zealand, representing 15.4%. The most important results are: HR should exhibit leadership in the functioning and organising of HR. Conclusions are that HR has a strategic function and practitioners are aware of how to increase HR effectiveness to add value to create future business opportunities.

INTRODUCTION

HR functions of contributing to the bottom line as well as becoming a strategic partner and change champion are only some of the pressures on the human resource (HR) profession in recent years (Ulrich et al 2012). Human resource management (HRM) has also been compelled to justify its existence and contributions by demonstrating how the function adds value and, consequently, the success of organisations in the globalised current business environment. It is also acknowledged that increased competition globally and regionally often serves as a catalyst for some organisations to adapt and then to profited from these changes (Bryson & Ryan 2012; Nel et al 2012).

This research paper is aimed at providing valuable insights into current HRM practices, particularly HR functioning and staffing related to issues in New Zealand. The main value stems from the longitudinal survey results that reveal the emerging trends and priorities of HRM due to the forecasts up to the year 2020, based on the 2010 survey. The overall results of the research results are of assistance to HR practitioners to enhance effectiveness and thereby add value to the bottom-line of organisations.

The paper reviews relevant literature and this is followed by the research focus and methodology. The findings of the 2010 survey and forecasts for 2020 are then discussed, followed by conclusions and recommendations.

LITERATURE REVIEW

The literature review takes cognizance of the work of various researchers, (Härtel & Fujimoto 2010; Nel et al. 2012; Strack et al., 2008; Ulrich et al. 2012., Wilson 2010) to identify HR functions. The value of their research could, for instance, provide indications for the future regarding New Zealand HR managers' organising of the HR function and staffing to be effective, add value, and harness future opportunities for organisations.

The general functions of HR managers are not dissimilar in most market driven economies around the world (Pretorius 2010; Rudman 2010). The communication of HR's strategic vision for the future is a critical contemporary HR function. Furthermore, the functions of HR managers in particular are

interdependent with those of line management regarding activities such as strategy formulation. Attempts to either practise only HR or line management would result in organisations being in danger of becoming dysfunctional. HR personnel, particularly HR managers, should therefore utilise their expertise to benefit organisations and enable it to remain competitive in the current and future business world. Snell & Bohlander (2013) state that “Successful organizations combine the experience of line managers with the expertise of HR managers to develop and utilize the talents of employees to their greatest potential” (p.30). Ignoring the particular relationships between various HR and business functions can, therefore, result in serious negative consequences for an organisation.

HR practitioners in New Zealand (NZ) have been exposed to increasing global competition pressures on the organisations they work for. These include: globalisation; developments in technology and telecommunications; the shift towards a knowledge-based workforce; changed employment legislation; and intensifying competition for skilled labour. The HR function, therefore, needs to go beyond the delivery of cost effective administrative services and provide expertise on how to leverage human capital and be strategic in the execution of the functions they provide to the organisation. HR also needs to demonstrate the financial impact of HR activities on the organisation. The role of HR practitioners as strategic business partners and leaders of change has also received considerable attention globally by various researchers (du Plessis, Beaver & Nel, 2006; Strack et al 2008; Ulrich et al 2012; Wilson 2010). HR practitioners must also expect to meet the raft of new challenges posed by the continuing evolution of their role and function. According to Ulrich and Brockbank (2005:134), HR should, therefore, not be defined by ‘what it does’ but by ‘it’s contribution to achieve organisational excellence’. In the post Global Financial Crisis (GFC) environment, businesses in all parts of the world are facing more challenges than ever before to stay in business. These challenges require diligent HR and general management.

HR practitioners are compelled to play an increasingly vital role in maximising the efficiency of an organisation’s human resources, because HR practices support the employee behaviour that is critical for accomplishing key organisational processes and adding to the bottom line (Bryson and Ryan, 2012; Hawkins 2010; McDonnell, Stanton and Burgess, 2011). It is evident that individual HR practitioners must execute appropriate HR functions and be equipped with distinct competencies that enable them to execute the functions that would support organisations appropriately to achieve their objectives to remain competitive (Rasmussen, Haworth, and Andersen 2010).

METHODOLOGY

Background to the Collection of the Empirical Data

The main research question is: To what extent have human resources functions in organisations as well as staffing changed to add value to the bottom line between 2010 and forecast for 2020 in New Zealand, and to what extent are these changes significant for the practice of HRM?

A very comprehensive questionnaire covering 358 items to identify HRM and management trends was jointly compiled in New Zealand (NZ) and Australia in 1994. The questionnaire was used in a survey to identify the possible future competencies and roles of HRM in those countries for the year 2000 and was used by the then Institute of Personnel Management, now known as the Human Resource Institute of New Zealand (IPMNZ 1994). The results of that study formed the basis for subsequent research study in 2001 with forecasts for 2010 in NZ (Burchell, 2001; Burchell, 2002). Minor modifications involved updating and reducing the questionnaire, which at that time was paper based, and refining the questions for clarity. The final section of the said questionnaire sought to obtain demographic information from respondents. The 2001 survey covered all registered HRINZ members and the response rate was 10%.

Study Covering HR Practice in New Zealand in 2010 and Forecasted for 2020

The NZ study of 2001 was again used with minor modifications in 2010 to obtain responses from NZ HR practitioners. For the 2010 repeat study, the questionnaire was shortened, although some sections were expanded to include contemporary aspects such as social media in the HRIS section. The reporting format was also changed to an e-survey using Survey Monkey. A 5-point Likert scale was also used which ranged from 1 = “unimportant” to 5 = “critical to success”. The target population was again limited to HRINZ

members, and to those who had registered to participate in HR research requests. The HRINZ provided links to the total number of HRINZ members in this category which totalled 635. A total of 119 members responded but only 98 questionnaires were fully completed and usable, resulting in a 15.4% response rate. As pointed out earlier in the methodology, the 2010 survey participants obtained from the HRINZ database only included members who were registered and who had requested to participate in HR research from HRINZ. The overall positive implication is perhaps a higher quality and more focused response from participants in 2010.

The results of the e-survey were subject to verification first and a SPSS analysis was undertaken. Parametric and non-parametric tests were applied using the Wilcoxon Signed Ranks Test as well. Significance testing at the $p < 0.01$ level was undertaken and the results were recorded. This approach enhances the 2010 comparisons with the 2020 forecasts for analysis purposes, and identifies significant differences between the two sets of data as well. It must be noted that due to the magnitude of the research projects and their longitudinal nature, only the 2010 study with forecasts for 2010 are addressed in this paper. As a further narrowing down to analyse the results, only those results focusing on HR organisation and staffing are reported on. Consequently only a very small section of the overall survey is reported on and presented in this paper.

DEMOGRAPHIC PROFILE OF RESPONDENTS

In this section the various demographic responses are presented. These include the profession, gender, organisation size and industry sector.

Profession Representativeness

The response is a representative sample of the HRINZ members who participated in sharing the research data, and this provides confidence in the responses which were provided. In the current study in NZ (2010), the most frequent title was HR Manager (46.7%), and the next most common title was HR non-management (16.7%). Those two titles accounted for 63.4% of the reported titles.

Organisation Size

It should be noted that NZ is predominantly a country of small businesses, with 93.3% of enterprises employing 19 or fewer people (Ministry of Economic Development, 2006). The study results consisted of participants from different sized organisations. For the purposes of analysis, however, small organisations were grouped as organisations with less than a 100 employees (0-99 with a result of 25%); medium organisations consisted of 100 to 499 (with a result of 28.3%); employees, large organizations consisted of 500 or more employees.(with a result of 46.7 %).

Industry Sector

Table 1 outlines the types of organisations and the size of the respondents' organisation for the various industry sectors which are represented in the survey. This result is also a representative sample of NZ Industry which provides confidence in the survey responses.

FINDINGS

This paper highlights the results of the 2010 survey together with the respondents' forecasts for 2020. A discussion and comparison of aspects of each category for 2010 as well as forecasts for 2020 is undertaken.

The rationale for the research was, via the interpretation of the data to identify those characteristics of the HR function that would make it effective in providing HR practitioners with the necessary knowledge to enable management's efforts to become or remain competitive in the business environment. The research is executed within the context of a longitudinal study to identify trends for management practice.

As previously outlined, the findings and discussions are only focused on the HR organisation and staffing that adds value to the bottom line, representing data from section 4 of the 2010 survey only. Section

4 of the HR survey comprised 18 questions and only those which returned predetermined high results are reported on.

Table 1: Profile of the respondents by industry sector 2010

Sector	NZ profile 2010
Agriculture, hunting, forestry and fishing	4.3%
Mining and quarrying	1.5%
Manufacturing	6.9%
Electricity, gas and water	8.3%
Wholesale and retail trade, restaurants and hotels	6.2%
Transport, storage and communication	4.1%
Business, insurance and financial services	12.5%
Community, social and personal service	11.1%
Education	20.8%
Other	24.3%
TOTAL	100%

Respondents were required to apply the 5-point Likert Scale ranging from 1 being “unimportant” to 5 being “critical to success” for both 2010 and 2020 to provide their responses. This analysis, however, only focuses on the last 2 combined responses of respondents, namely, “Very Important” and “Critical to Success”. Furthermore only the results of the 18 Questions which attracted a combined response of more than 50% are discussed. Lastly, as a further refinement, parametric and non-parametric tests were applied, in particular the Wilcoxon Signed Ranks Test to obtain a focussed picture of the results. The results which attracted a response of more than 50% are shown in Table 2 and are listed from the highest response to the lowest. Results below 50 % are not listed or analysed, although their possible applicability to the functions of HR are noted.

Table 2: Paired responses by question for 2010 and 2020 above 50%

No.	Question detail	Position of re- sponse	Response by year
14	Exhibits leadership for the functioning and organisation of HR	1 3*	2010 – 1.3% 2020 – 0.0%
13	Focuses on the quality of HR services	2 2	2010 – 2.6% 2020 – 0.0%
11	Anticipates the effect of internal and external changes on the organisation	3 1	2010 – 0.0% 2020 – 0.0%
9	Educates and influences line managers on HR issues	4 4	2010 – 1.3% 2020 – 0.0%
10	Defines and communicates HR vision of the future	5 5	2010 – 1.3% 2020 – 1.3%

***It must be noted that the result of the 2020 forecast is also listed in rank order from highest to lowest**

In Table 3, responses are ranked for 2020 which were not part of the 50% plus threshold for both 2010 and 2020 questions, but singularly above the threshold. Results are again listed from Highest to Lowest. From the responses it is clear that the perception of respondents regarding 2020 has shifted measurably as to what is regarded as “Very Important” and “Critical to Success” since 2010. These results are noteworthy and need to be explored in more detail. It must furthermore be noted that all other responses which did not attract a response above 50% for either 2010 or 2020 are not addressed for the rest of the analysis in this paper. No further discussion is undertaken of these issues as they are either unimportant or of no concern, as they are not on the radar screen in organisations in NZ as far as the respondents are concerned in their efforts to become or remain competitive. The questions which are not further discussed are the following:

Table 3 Single results by question for 2020 which attracted more than a 50% response in descending order

Q No.	Question detail	Response by year
-------	-----------------	---------------------

12	Demonstrates the financial impact of all HR activities	2020 – 79.5%
16	Managing knowledge and intellectual capital	2020 – 65.0%
5	Broad knowledge of most HR Functions	2020 - 62.8 %
2	Knowledge and use of HR information systems	2020 – 61.5%
18	Knowledge of the impact of globalisation on HR practices	2020 – 56.4%
17	Knowledge of e-Commerce and HR implications thereof	2020 – 53.8%

A further refinement of the results are presented in Table 4 where the questions for either 2010 or/and 2020 which attracted more than 50% responses are listed after further statistical analysis. It is indicated in Table 4 under the heading “Question and year” in terms of the applicable categories and in brackets reflecting the year.

Table 4: Paired comparisons and significance of results

Paired Q number	Question and year	Mean 2010	Mean 2020	Significance
2	Knowledge and use of HR information systems (only 2020 above threshold)	2.88	3.70	.000* /.000**
5	Broad knowledge of most HR functions (only 2020 above threshold)	3.37	3.77	.000* /.000**
9	Educates and influences line managers on HR issues. (2010 & 2020 above threshold)	3.67	4.20	.000* /.000**
10	Defines and communicates HR vision of the future. (2010 & 2020 above threshold)	3.55	4.07	.000* /.000**
11	Anticipates the effect of internal and external changes on the organisation. (2010 & 2020 above threshold)	3.75	4.45	.000* /.000**
12	Demonstrates the financial impact of all HR activities. (2020 above threshold).	3.30	4.15	.000* /.000**
13	Focuses on the quality of HR services. (2010 & 2020 above threshold)	3.52	4.05	.000* /.000**
14	Exhibits leadership for the functioning and organisation of HR. (2010 & 2020 above threshold)	3.78	4.07	.000* /.001**
16	Managing knowledge and intellectual capital (only 2020 above threshold).	3.22	3.82	.000* /.000**
17	Knowledge of e-Commerce and HR implications thereof (only 2020 above threshold)	2.60	3.53	.000* /.000**
18	Knowledge of the impact of globalisation on HR practices(only 2020 above threshold)	2.65	3.63	.000* /.000**

*p<0.01 (Note: Scale used was: 1-Unimportant, 5- Critical to success)

** Wilcoxon Signed Ranks Test

In the next section the results are analysed, bearing in mind the significance of each as shown in Table 4 as well as the literature survey which was undertaken to determine the context of the results. The analysis is initiated for both 2010 and 2020 results of the same question above the threshold of 50% and proceeds from highest to lowest. The discussion of the 2020 only results which were above the threshold and were significant as well, as shown in Table 4, are analysed and discussed.

ANALYSIS OF THE RESULTS

The results are discussed from highest to lowest while observing the statistical significance for the relevant questions for both 2010 and 2020 as being shown in Table 2 and significance shown in Table 4.

Question 14: Exhibits Leadership for the Functioning and Organisation of HR

For 2010 this was the highest response (66.3%), but it slipped to 3rd position (81.6%) in the 2020 response. It can be deduced that the need for leadership capabilities with regard to HR’s functioning and organising has

exceeded the previous importance measurably, but must be viewed in the context of the 2020 results. The result is also identified as being significant. The reasons for the increase of this question is perhaps that current and future HR practitioners in New Zealand need to focus more on their abilities, skills and attributes to become outstanding leaders. It is also increasingly vital for the HR practitioners in New Zealand to exhibit leadership skills within the organisation, as was pointed out in the literature review (Ulrich et al. 2012; Rudman, 2010).

It is noteworthy that Q 11 - "Anticipates the effect of internal and external changes on the organisation" (86.4%) became a top priority and Q13 - "Focuses on the quality of HR services" (83.3%) was a second priority for 2020. These were preferred above leadership of the function, as was shown in the 2020 priority list. This result may perhaps be ascribed to the notion that by 2020 the leadership function of HR will have been consolidated and accepted by line management and those new issues such as effect of change and quality of service may then take centre stage.

Question 13: Focuses on the Quality of HR Services

For 2010 this was the second highest response (60.3%) and maintained the same position for the 2020 response (83.3%). This could perhaps be explained in the context of comments made by Macky & Johnson (2007) who state that only half of New Zealand organizations report assessing what they do and much of this is likely to be informal, ad hoc and piecemeal. Marchington and Wilkinson (2012) also state that HR specialists are often critical of their actual contribution to HR goals and the quality of the service being provided. The reasons for this could be that firstly, HR often finds itself in an ambiguous position, and its presence is being questioned on cost grounds, and secondly, that the contribution of HR is hard to quantify as practitioners work closely with line managers and depend on them to put policies into effect. Also, while it may be possible to identify the impact of HR decisions, one cannot always be sure that the HR specialists contributed to them. (Snell & Bohlander, 2013). The concerns identified in the literature may perhaps be the reasons for the heightened focus on service as second priority by the respondents for both 2010 and 2020.

Question 11: Anticipates the Effect of Internal and External Changes on the Organisation

For 2010 this was the third highest response, (57.7 %) albeit being on par with Q 9 regarding "education and influence on line managers on HR issues". It gained first position (86.4%) in the 2020 response. It is clear that respondents ascribe high importance to internal and external changes in the years to come, which is in line with the literature survey (Strack et al 2008; Ulrich et al 2012; Wilson 2010). Change is expected to become a way of life as New Zealand business organizations strive to keep pace in an increasingly competitive world market place, according to Bryson and Ryan (2012). Respondents certainly regard the nature and impact of change on organisations and the HR function and staffing as critically important for the next decade in NZ. It may also be that the fallout from the GFC is still fresh in terms of the changes that had to be made to survive in the minds of the respondents. The results were also supported by being significant at $p < 0.01$ and being 0.000 level as well, as was shown in Table 4.

Question 9: Educates and Influences Line Managers on HR Issues

For 2010 this was the fourth highest response (57.7%) although it was on par with Q 11 regarding change. It did maintain the same position for the 2020 response (being 80.7 %). Educating and influencing line managers regarding HR issues thus saw a significant increase for 2020 which was significant at $p < 0.01$ and 0.000 level as well, as was shown in Table 4.

This result could perhaps be justified by various researchers stating that line departments are those that are directly involved in activities that are central to the organisation. Furthermore, as the traditional work of HR managers diminishes, line managers are stepping up and performing some duties that are typically done by human resource professionals, ably assisted in the process by modern automation (Erasmus et al 2013). Furthermore Macky (2008) claims that in New Zealand, the majority of the businesses are small and as such, HR issues are dealt with by line managers who play a critical role in HRD efforts. They act as a link with employees and support the successful implementation of systems and processes in their management areas in the organisation. Line managers therefore need education assistance in identifying areas of need to managing HR interventions. Such education could of course also be executed by HR

consultants where organisations do not employ HR personnel or managers. It is clear from the results that education is viewed as becoming increasingly important as part of the function of HR and for staffing the organisation to add value to the bottom-line.

Question 10: Defines and Communicates HR Vision of the Future

For 2010 this was the fifth highest response (52.5%) and maintained the same position for the 2020 response (74.3%). whilst significant at $p < 0.01$, and at the 0.000 level. This could perhaps be ascribed to views such as Marchington and Wilkinson's (2012), that "strategy is about winning." An organisation's chosen strategic vision has clear implications for HR policy and practice, as well as for the workforce, and it should be clearly communicated to all relevant stakeholders in the organisation.

According to Bratton and Gold (2012), the organisation's commitment to its HR processes forms a part of its evolving value system and lies at the heart of the organisational framework, which should be communicated to all stake holders. The HR vision is also a determinant of the principles on which management decisions are based, and it should be embedded in corporate culture as well (Nel et al. 2009). HR practitioners thus act as a middle person for communication between employee and management.

Discussion of Singular Questions which Attracted Responses above 50% only in 2020

The discussion is based on the results shown in Table 4 and are summarised below. It must be noted that all results are significant at $p < 0.01$ and are at the 0.000 level as well for the Wilcoxon Signed Ranks Test. New opportunities or realities for 2020 which were not high on the HR agenda in 2010 (below the 50% threshold) have now come to the forefront. These are addressed below and possible reasons for these results are suggested.

Question 12: "Demonstrates the financial impact of all HR activities" (79.5%). The result is the most important and is perhaps due to the close proximity of the GFC global effect when the respondents completed the survey. Their perception of the future is therefore acute regarding the consequences and effects of financial issues on HR activities and businesses.

Question 16: "Managing knowledge and intellectual capital" (65.4%). It has been a key feature of the modern world that the knowledge revolution has become exponential. It is therefore not surprising that respondents regard the management of knowledge and intellectual capital (also known as human capital) as a primary HR source to manage in future (Erasmus et.al 2013). The respondents anticipate it to be far more important by the end of this decade than the current value ascribed to it. Many researchers have focused on the knowledge wave and the intellectual capital of human resources as a major competitive advantage for organisations in future, and this includes appropriate talent management (Snell & Bohlander, 2013).

Question 5: "Broad knowledge of most HR functions" (62.8%). It is often the case in organisations that HR practitioners are accused of being over specialised or not knowledgeable enough about the business. This result can perhaps be viewed in the New Zealand context and ascribed to the characteristic of being mainly small sized enterprises, according to the Ministry of Economic Development (2006). Many organisations avoid employing full time high level HR practitioners due to their small size. HR clerks or officers often have to shoulder the burden of the work and it is implied that they should have a broad knowledge of HR functions (Nel et al, 2012). This situation is regarded as becoming more acute for the future and has therefore increased in the estimation of the respondents for the 2020 forecast.

Question 2: "Knowledge and use of HR information systems" (61.5%). The evolutionary process of the electronic age has increased exponentially since the start of the new millennium. A simultaneous development is the knowledge about and the use of human resource information systems (HRIS) in organisations at all levels on a global scale (Snell and Bohlander, 2013). Organisations are increasingly aware of the issue that "information is power" and that it provides a competitive edge which is critical for survival and being successful in the future. It also creates opportunities for the future. It is therefore not surprising that respondents have highlighted their opinion of the future in terms of the ever increasing importance of HRIS to HR practitioners in particular and the need to be knowledgeable about them.

Question 18: “Knowledge of the impact of globalisation on HR practices” (56.4%). Although New Zealand is a small country and at the bottom of the world, it does not escape the globalisation of businesses, and this will only escalate during the next century. Multi-national companies (MNC) also operate in and from New Zealand, one of the most noteworthy being a home-grown MNC, namely Fonterra. The role of HR practitioners is critical to operate as an innovator and integrator and to be a strategic positioner in order to cope with the global impact on organisations (Ulrich et al. 2012). In 2020 this facet of HR organising and staffing is regarded as critical to accommodate the ever increasing globalisation of businesses and to develop contemporary approaches to harness future opportunities.

Question 17: “Knowledge of e-Commerce and HR implications thereof” (53.8%). Developments such as the internet and e-commerce has revolutionised business globally and are an inescapable reality. More and more organisations are therefore conducting their business on-line and also have to adapt to the ever increasing competitive demands of this channel of doing business (Bryson & Ryan, 2012). It is not surprising that it has raised awareness and has become a priority above the 50% threshold as well. This will increase in importance in future and HR need to provide the appropriate service to management to cope with this contemporary demand (Erasmus et.al. 2013).

An overall deduction regarding the results of the 2020 singular questions only, as identified by the respondents, is as follows: It is abundantly clear that issues relating to the electronic era and use thereof are of paramount importance to the organising and staffing of the HR function to provide optimal service to organisations. Equally important is the issue of knowledge management and the use of intellectual capital by organisations, since this would enhance being competitive and enable the harnessing of opportunities for organisations in the next century.

CONCLUSIONS AND RECOMMENDATIONS

In the research that was executed in 2010 and forecasted for 2020 a comparison of the highest and lowest results above the 50% threshold revealed significant changes in some HR functions and staffing.

The most significant result is the leadership function of the HR practitioner, to take cognizance of the effect of change by the aligning of HR strategies with business strategies in order to organize the HR function better both internally and externally. A new kind of HR practitioner can be expected to organize the HR function in future successful organisations in order to add value to the bottom line for the 21st century.

Concrete recommendations are that the organisation of the functions of HR practitioners needs to be intensively reassessed to cope with future demands on them. Furthermore, organisations need to link human resources goals to business strategy, attract and retain highly skilled staff, and enhance productivity, quality and customer satisfaction to serve organisations effectively and to harness future business opportunities.

It is acknowledged that it is perhaps a limitation of the study that it was executed in 2010 while New Zealand was still in the grips of the economic downturn due to the global financial crisis. Respondents' responses could perhaps have been more conservative for 2010 as well as their forecasts for 2020, which may have an impact on the overall results.

It is concluded that although HR may be a key management role, the answer to achieving this lies to an extent in each individual human resource managers' functions. HR practitioners should be a strategic business partner, advisor and assistant to the front line manager as well as a people manager, which in turn is influenced by the organization's perception of the nature and scope of HR staffing. This is particularly important, as the organisation and staffing of the HR function continues to shift from that of a functional expert to that of a business partner to harness future opportunities for an organisation. Lastly business organisations clearly need to take note of the impact of, for example, financial decisions on the HR function which in turn would impact on the leadership of HR regarding the overall competitiveness of an organisation for the next century in the aftermath of the global financial crisis.

REGENERATION STRATEGY OF JAPANESE-STYLE BRAND

Hisao Fujimoto
Osaka University of Economics, Japan

ABSTRACT

This paper focuses on the issue whether the Japanese-style brand strategy will decline or can seek the way of regeneration under the recent global competition. Describing the past and present situation of Japanese-style brand strategy, it is argued that the Japanese-style brand strategy can be seen as an outside-in path comparing to the Euro-American's inside-out path. Based on the review of four elements of brand, an exploratory study of brand image has been conducted. Authors discuss on the possible development of Japanese-style brand for connecting "past" and "present" brand strategies and groping for the hybrid brand identity through two paths. It will also suggest a strategy for Japanese brands in the global competition.

INTRODUCTION

There have been many reasons to regard the Japanese-style brand strategy as a different model from the Euro-American one. However, the Japanese-style brand strategy is confronting with many problems now and is becoming more and more complicated. Many Japanese leading companies have realized the importance of their brands last ten years. For competing in the global hyper competitive circumstances, Japanese companies have developed their brand strategies. This paper describes several issues on the future of the Japanese-style brand strategy based on the brief review of the past and present condition of the brand strategy in Japan. The scenario for the regeneration of Japanese-style brand strategy is discussed based on the brand image research.

PAST AND PRESENT OF JAPANESE-STYLE BRAND STRATEGY

In Japanese-style brand strategy, it is adequate only to manage individual brands separately. Much of the attention has been paid to the reliability and image of the company with its brands. Consequently, the "double brand" has frequently been used, where a corporate brand name and a product brand name are integrated.

While the product management has been carried out continuously, there has been an absence of the product design based on the style and claim of the brand. In other words, little has been done to clarify or differentiate brand concepts. A product name is rarely advertised or promoted separated from a corporate name, even in the case of new products. It seems that the improvement of the reliability and/or image of corporation is substantially important for Japanese company. This is very contrastive to the Euro-American-style brand strategy, which is very product-oriented.

Several factors can be mentioned for explaining the background of the corporate brand-oriented brand strategy in Japan (Ogawa, 1994a, Kido 1994, and Tanaka 1996). They are (1) cultural factors, (2) corporate behavior factors, and (3) consumer behavior factors.

The Japanese-style marketing has been formulated under the background of Japanese-style consumers, companies, distribution channels and transactions. Japanese consumers are lack of judging ability, though they have homogenous needs and cultural backgrounds with high context. That is called "immature but highly interesting consumers" (Ikeo, 1999). It brings that Japanese consumers tend to avoid risk and use corporate brand as an umbrella brand in order to reduce uneasiness in their purchases.

The Japanese style of distribution channels and transactions can also be emphasized. The small scale and large number of retailers, the many steps of wholesaling as well as the complicated and many transaction steps are often mentioned as features of the Japanese-style distribution system. It is noticeable that, in such distribution system, manufacturers have oriented to the distribution system, where the building and maintenance of business relationships have been regarded as most important. As Takashima (2000) noted, the enrichment of product lines and the frequent development of homogeneous new products have been supported by the advertising, which has been emphasizing the corporate image emotionally rather than technological differences of individual products. It has brought to enhance the reliability of the corporation and its product lines. Such a situation is also connected with the appreciation of the corporate brand.

The understanding of Japanese-style brand strategy has also been confronted with “counterevidence”. For instance, there are many cases where corporate names are used in Europe and America such as Mercedes-Benz, BMW, Xerox, IBM, Coca-Cola (Katahira, 1994). It is also a question whether any corporate brand strategy has been existed in Japan (Suyama and Umemoto, 2000).

“TWO PATHS” OF BRAND EVOLUTION

The brand evolution is considered to take two different paths. The first path is called the “outside-in path” which reorganizes and integrates brand systems correspondingly to the corporate environments. The identity of product brands is verified through the total management of the corporation or corporate group. Furthermore, the identity has been fused into a hyper-corporate brand through strategic alliances and M&A in the global scale. The identity needs its consistency with the taste of existing goods and services as well as the corporate strategy and mission.

For instance, the brand strategy of Toyota Motors Co., which was centered on brands by vehicle type in the past, has recently been changing under the keyword of “making complex”. It includes (1) the extension and clarification of brand identity of individual vehicle types, (2) the development of distribution brand strategy, (3) the active corporate brand communication, and (4) the hyper-corporate brands and beyond-corporate brands

The second path is called the “inside-out path”, from the viewpoint of the discrimination and relation between the core portion and extended portion of identity. It is an important problem how the brand DNA on each organization levels should be succeeded and evolved. In order to enlarge the scope of management into the total management of identity, the management of individual brand identity has to be carefully performed.

For instance, Duskin, which has been engaged in dust control business by a franchise system since its establishment, has been regarding the franchise system, not products nor business, as its core identity. However, some confusion has been found in the evolution process of Duskin's identity, when it has entered to the food service business (Mister Doughnuts) and the rental service business (United All), and expanded its business to Taiwan. This identity gap came from the lack of uniformity in the development of various products and shops in Mister Doughnuts, and in the franchise rental business.

The Japanese-style brand strategy mainly follows the former of “two paths” of brand evolution and the Euro-American-style brand strategy the latter. However, both paths are only different routes toward the same goal. There may be differences between these two approaches. One is from the whole to the individual and the other is from the individual to the whole.

BRAND IMAGE ANALYSIS

This image survey was performed by the interview requesting reserve method for the adult (age 20-59) of both male and female who drink beer and live in the Kansai district in 2010. The number of effective respondents was 374. Fig. 1 depicts each beer brand's positioning based on product assessment score on the horizontal axis and organization assessment on the vertical axis. The product assessment is expressed by the distance from the origin in supposing the total points of moments of each of functional benefit, emotional benefit and self-expressive benefit respectively as x, y, and coordinates. The organization assessment is expressed by the value of moment. These data express intensity of respondents' impression, i.e. product or brand image.

All brands can be classified into three groups. The first group includes Super Hops, Lager, Super Dry and Kirin Tanrei, which are situated on the diagonal line or its neighborhood. The second group includes Malts and Ichiban-Shibori (first squeeze) which are situated a little detached from the line. The third group includes Yebisu, Black Label and Brau, which are situated at the right bottom detached from the line. Clearly, brands of the first group are on the good balance in product image and organization image. Considering the sales and market share of each brand, this brand group should belong to the power brand. In addition, Super Hops and Malts are relatively high score for organizational assessment. These two brand are belong to Suntory. It means that the corporate name and brand of Suntory has the strong effect on the brand image for their products.

Fig.1 Brand images of beers

On the contrary, Yebisu among three Sapporo's brands, which are considerably detached from the line, keeps a certain royalty thanks to its exceptionally high product assessment. However, one reason why Black Label and Brau are forced to bear a hard fight would be that the low organization assessment to Sapporo leads to a negative effect on the mind share, although their product assessment is on the same level as Super Dry.

Table 1 shows the results of the relationship between the royalty level and the brand selection elements. The appreciation has been divided into three segments of "positive royal" (always one specific brand), "multiple royal" (a few changeable brands) and "non-royal" (no specific brand). On the other hand, factors of brand selection have been specified as symbol (reliability feeling), personality (friendship), organization (corporate image) and products (taste and price).

Table 1: Royalty level and brand selection factors

	(%)			
	Product	Organization	Personality	Symbol
Positive Royal	29.9	15.8	27.6	26.7
Multiple Royal	38.4	14.9	21.6	25.0
Non-Royal	44.0	2.3	23.1	30.8

In the "positive royal" group, the weight of the symbol, personality and product element among the four elements is almost equal, a bit less than 30 percent. It is obvious that upper phase in the pyramid structure of identity plays an important role for enhancing the relationship between brands and customers. In the "multiple royal" group, the weight of the product element is 38.4 percent and a little higher than that of "positive royal" while the weight of the personality element is 21.6 percent and lower than that of "positive royal". This indicates that the "brand as products" is the important assessment factor in selecting brands. On the other hand, the weight of the organization element is sharply increased than the "non-royal" group. Therefore, the assessment of the "brand as organization" is decisive on the occasion of forming the evoked set and selecting each brand.

In the "non-royal" group, the weight of the product element among the four elements is most prominent, which is much higher than the "positive royal" and "multiple royal". This element includes the price element and so-called cost performance orientation. At the same time, it cannot be ignored that the weight of symbol and personality is respectively 30.8 percent and 23.1 percent. It should be considered that these two elements always play a constant role, while the weight of the organization element is extremely low.

In the "first path" of brand evolution, it becomes issues how four elements (products, organization, personality and symbol) of identity should be combined at organization level. The royalty level of target consumers provides a reliable clue for the brand evolution.

DISCUSSION AND MANAGERIAL IMPLICATION

The Japanese-style brand strategy is on the course of regeneration. For an effective regeneration, it is necessary to reconsider the past and present of the Japanese-style brand. It also needs to elucidate the relationship between the Japanese feature and factors such as the market conditions, competitive environment, and internal marketing resources. When Japanese company extends its business globally on the first "outside-in brand evolution path", it have to reorganize the company's structure (Holt et al 2004, Strizhakova2008, and Melnyk 2012). It may build the "hub and spoke" structure and/or "network" structure with the alliance companies.

At the same time, the more important thing is to analyze the dynamic development process of brand from the viewpoint of life cycle. In this way, the past of the Japanese-style brand would be connected with its present. In this sense, it will be important decision that which factors of Japanese style will be maintained or changed in the global setting.

Generally, Japanese brand strategy still has its weight to the organization-oriented principle and the first path. However, consumers' royalty and their brand selection behavior are bringing to the situation that the intermediate strategy will be more favorable for enhancing brand power than a strategy inclined toward either Japanese-style or Euro-American style. Even if the first path and corporate brand strategy was adopted, the second path and product brand strategy had to be considered for all levels of consumer royalty. It is sought to make the brand evolution in Japan more reliable on the "two paths" and the hybrid brand identity of four brand elements.

UNCOMMON PARTNERS: LEVERAGING E-GOVERNMENT INITIATIVES TO SPUR ECONOMIC ACTIVITY

James W. Gabberty
Pace University, USA

ABSTRACT

The nascent field of e-government, which can be broadly defined as servicing the needs of citizens by federal, state and local governments using ICT (a.k.a. C2G), has been expanding since its launch over the past decade or so. This paper will examine the current role played by e-government, highlighting those nations which are extracting maximum benefit from e-government initiatives and why they are achieving such robust gains. It will attempt to locate the nexuses for possible collaboration with for-profit businesses to demonstrate how companies in search of increasing their respective market shares may be well advised to consider governmental collaboration.

INTRODUCTION

Over the past twelve months, equity markets – mostly led by the U.S. – have rebounded substantially from the depressed levels of the past five years, indicating positive momentum buttressed by boosts in corporate profits. As labor participation rates and stubbornly high unemployment rates seem to contradict the economic expansion that points to positive growth, high unemployment levels remain flat, begging the question: what are the factors that could be responsible for raising corporate profits while concomitantly keeping inflation low and unemployment levels high? Like the dismal science itself, economists have not been able to explain this phenomenon while equity purists point to the monthly expenditure by the U.S. Treasury of \$81 billion per month to stabilize the financial markets.

Expansionary fiscal policy by governments typically vary in their outcomes, depending how the dollars are allocated and spent; oftentimes government programs may cause a temporary increase in economic activity, but, as was evidenced in 2009, that activity may disappear one or two quarters after the money is spent. In other instances however, government spending can have unimaginable positive consequences for the economy, as witnessed by the payoff in investing in research and development during the 1960s and early 1970s that produced the now famous TCP/IP protocol suite of communication technologies that are the lynchpins of the modern Internet, which has essentially reshaped every society on earth, making it possible for smaller-sized firms to compete globally and for larger-sized firms to capture an even wider market share; for governments, meanwhile, communication technologies has enabled the efficient and effective exploration of space, bringing into question the likelihood of the colonization of the planets and beyond.

While both for-profit and not-for-profit entities have benefitted greatly from the tremendous strides made possible by technologies such as the Internet, countless billions of citizens living in nations throughout the world have similarly been positively affected by the advancement of information and communication technologies and, for most, this has become manifest in the quick adoption of smartphone technologies that provide all the advantages of portable communication and interoperability with the Internet. However, usage patterns of handheld devices indicate that many end users are passively benefitting from their telecommunication devices – reading and responding to email, browsing the web and keeping up with the social affairs of friends. Internet web sites such as Facebook (> 600 million daily users) and RenRen (the Chinese equivalent of Facebook, having > 1.8 million daily users), Twitter (> 6.6 million daily users), Weibo (Chinese version of Twitter, with approximately 46 million active daily users) and WhatsApp (> 6.7

million daily users with 8 billion Inbound and 12B outbound messages daily) have essentially interconnected people with one another such as never before in the history of mankind, yet the daily contact that people have with their governments – historically the one single entity that touches every citizen of every nation – remains at levels that more or less precede the advent of social media.

The 10 years of evolution that e-government, broadly defined as servicing the needs of citizens by federal, state and local governments using ICT (a.k.a. C2G), has indeed been expanding since its launch over the past decade, but at rates that are disappointing. The costs are substantial and, like the various economic models that have been redefined as a result of leveraging infrastructure programs like the Internet for innovative commercial use, so too has e-government begun to redefine how people interact with their leaders and governmental agencies, some nations extracting higher performance levels than others. In much the same way that e-business and e-commerce models continue to redefine corporate value chain and strategic supply chain management strategies, e-government and its interaction with the for-profit sector offers unbounded economic expansion opportunities that could virtually redefine how many societies interact with domestic and international companies around the world.

This paper will provide an overview of the current role played by e-government, highlighting those nations which are extracting maximum benefit from e-government initiatives and why they are achieving such robust gains. It will also attempt to locate the nexuses for possible collaboration with for-profit business to demonstrate how companies in search of increasing their respective market shares may be well advised to consider governmental collaboration.

E-Government

Most governments view e-government favorably, since implementing technology at national levels ultimately benefits the total welfare of society through providing a mechanism by which they could interact with one another (Agre, 2001). Among the many effects of new and expanding information and communication technologies and the digital revolution is the reality and potential of ICT to increase the efficiency and effectiveness of government, and making governments more responsive to the needs of their citizens (Yong, 2005). This is e-government – the use of ICT transform government to make more efficient, effective, transparent and accountable (West, 2005). A broader definition looks at e-government as the use of ICT to strengthen government performance in areas such as more effective and more efficient provision of government services, opening new methods for people to access government and official information, and making government more accountable to its citizens of the country. This broad definition of e-government centers on tools and applications that can transform the ways government is practiced and the ways public administration reform and good governance goals can be met. In general, a broader view of e-government refers to the overall strengthening of government-citizen relationships, in making internal government processes more efficient and effective, improving the quality of public services, and expanding processes for democratic accountability and control, citizen participation, and collective decision-making. Government often is seen as inefficient and unresponsive in meeting citizen expectations; and citizens do not have an alternative to government. Increasingly, governments are working to overcome such circumstances through the application of e-government.

e-Government Goals

By applying ICT processes and tools, e-government addresses some specific points that improve access to information and services and make government more accountable to citizens. Some of the goals of e-government are as follows:

- Effective delivery of public goods and services to citizens without the interventions and inconveniences of traditional bureaucratic and administrative systems.
- Providing improved access to information and to the systems and structures that constitute government, particularly for marginalized and disadvantaged segments of a citizenry that most need the benefits and protections government provides.
- Government also works with and provides services to business; benefits of e-governance for the private sector include streamlined bureaucracy and administration, more immediate and efficient delivery of benefits and services, and better performance of government as a customer.

- Expanded and more accessible opportunities for the direct participation of all citizens, from all segments of the population, for them to be more actively involved in the policy and decision making processes of government, again, particularly the marginalized and disadvantaged segments of a citizenry, which most often have the fewest opportunities to participate.

Value Potential of e-Government

E-Government provides many opportunities to improve the quality service to the citizen. Given the advancement of technologies such as tablets and smartphones, citizens should be able to get service or information from their respective city, state, and/or federal government in minutes or hours, versus pre-Internet delivery norms of days or more typically, weeks.

Citizens and businesses ought to be able to file required reports without having to hire accountants, lawyers and other representatives. Government employees should be able to do their work just as efficiently, timely and in many cases remotely as their counterparts in the commercial world.

E-government can be divided into four citizen-centered groups, each providing opportunities to transform delivery of services.

- **Individuals & Citizens: Government-to-Citizens (G2C):** Build easy to find, easy to use, one-stop points-of-service that make it easy for citizens to access high-quality government services.
- **Businesses: Government-to-Business (G2B):** Reduce government's burden on businesses by eliminating redundant collection of data and better leveraging E-business technologies for communication. More importantly, steer business opportunities towards the private sector that can provide better assistance and potentially better pricing for particular items typically consumed by citizens (pharmaceutical, eyewear, medical items, consumer electronics, online education, etc.).
- **Intergovernmental: Government-to-Government (G2G):** Make it easier for states and localities to meet reporting requirements and participate as full partners with the federal government in citizen services, while enabling better performance measurement, especially for grants. Other levels of government will see significant administrative savings and will be able to improve program delivery because more accurate data is available in a timely fashion.
- **Intra-governmental: Internal Efficiency and Effectiveness (IEE):** Make better use of modern technology to reduce costs and improve quality of federal government agency administration, by using industry best practices in areas such as supply-chain management, financial management and knowledge management. Agencies will be able to improve effectiveness and efficiency, eliminating delays in processing and improving employee satisfaction and retention.

The 'Typical' Four Dimensions of e-Government

The success of e-government initiatives depends in part on the ability for public administration, as well as the political will of key stakeholders. While the government and its administration play a fundamental role, the e-government environment is shaped also by other stakeholders, including citizens, businesses, civil servants, local, national and international institutions and civil society organizations. Analytically, the e-government environment can be structured in several ways, according to different aspects. But we will focus on the main 4 dimensions on the e-government environment, as indicated below:

- **Infrastructure:** Infrastructure is probably the most obvious and tangible dimension of e government. Since e-government is characterized by procedures and services taking place between administrations on the one side and citizens or businesses (or other administrative entities) on the other, technical infrastructure is needed to carry information and services.
- **Policy:** Different types of policies shape the e-government environment. Trade regulations control the import and export of ICT goods, affecting the provision of services. Policies protecting local ICT industries, including tariff barriers, alter the movement and price of goods in a market. Similarly, antitrust regulations and market liberalization strategies, enforced by telecommunication regulatory

authorities, have created the conditions for greater competition in the sector, the introduction of new technologies and services, and better prices for consumers. Likewise, the inclusion of universal service obligations in the licenses of telecommunication incumbents or Internet providers has promoted access to ICT infrastructure in least served areas, such as rural and low income communities.

- **Governance:** Governance, that is, the performance of public administration, is an important factor for the success of e-government initiatives. The World Bank defines governance as the exercise of political authority and the use of institutional resources to manage society's problems and affairs. The optimum performance an administration can strive for is to produce a “worthwhile pattern of good results, while avoiding an undesirable pattern of bad circumstances”. Therefore, to achieve good governance, different factors need to be balanced, including costs, freedom of the individual vs. the common good, local, national or global interests, as well as short and long term gains vs. losses. The negotiation of these factors may lead to different results and performances, as places and times change.
- **Outreach:** The dimension of e-government most prominently perceived and experienced by end users, namely companies and citizens. Often referred to as the “horizontal integration” of public services, this dimension brings together various service offerings to the end-users.

An Overview of U.S. e-Government Services

In the FY 2008 Report to Congress regarding the implementation of the e-Government Act of 2002, several developments and improvements to the U.S. e-government system are noted. Specifically mentioned is the website USA.gov, which serves as the central portal for citizens seeking government information, benefits, and services. The report explains that “new search tools and technologies have been added to USA.gov to aggregate and present information on jobs, weather, congressional contact information, federal forms and FAQs from over 40 Federal agencies” (USA E-Government Task Force, 2009). Furthermore, the OMB emphasizes the importance of the National Contact Center, which provides information about government services over the phone in English and Spanish, as well as an online chat forum providing instant answers to FAQs from citizens.

An agency-specific example of improvements in the U.S. e-government system would be disaster assistance services through FEMA. This system, which was completed in December 2008, streamlines the process that disaster victims must take to apply for and receive benefits from multiple government agencies (USA E-Government Task Force, 2009).

From a casual observer, one may wonder how valuable the E-Government Act of 2002 has been in providing citizens with more efficient and accessible information, resources, and services online. According to a report published by the Brookings Institution (2008), the U.S. e-government initiative has been successful, but still has room for improvement. For example, the good news is that 89% of U.S. e-government websites have services that are fully executable online, and 40% offer some type of foreign language translation. However, the bad news is that only 3% of U.S. government websites are available from a PDA or handheld device, although that number has changed somewhat in recent years, and only 25% of federal websites are accessible to the disabled (West, 2008). So while the Office of Information made a lot of progress in making services more accessible to citizens during the period 2002 - 2008, there are issues that still remain. For example, the ascent of portable devices has resulted in more people viewing the Internet through handhelds than through laptop or personal computers, yet while the for-profit sector is pushing ahead to retrofit screen redesigns to match the changing consumer devices, e-government programs have yet to move at a pace that is anywhere near the rate of technological advancement that is exhibit in the for-profit industry. Given President Obama’s IT-intensive campaign and trademark skillful use of information technology and the Internet in spreading information and encouraging participation, one could predict that his administration would ensure greater improvements in the U.S. e-government system, although that remains to be seen.

The Costs of e-Government

It is not difficult to imagine that streamlining governmental services by incorporating easy-to-use web interfaces can very costly. According to the Congressional Budget Office (CBO), the early cost estimates for implementing the E-Government Act of 2002 were \$60 million for 2003 and \$600 million over the period of 2003-2007 (CBO, 2002). These estimates were based on: the cost of developing, implementing, and

maintaining a federal portal, funding interagency projects, creating an office for information security, technology training and education, and studying national disparities in Internet access. A major justification for federal e-government funding was that it would help to reduce long-term costs. In other words, the more information and services that can be provided electronically, the less expensive and bureaucratic it will be for the government to provide these programs in a traditional fashion. As captured in a phrase made popular during the 1990s and attributed to Al Gore famously at the time, the ultimate goal is a government that “works better and costs less.” In 2007, that same CBO office stated that the legislation would authorize appropriations for programs to improve the coordination, deployment, and access to government information and services, and centralize many Internet-related activities currently underway throughout the US government at an average cost of about \$6 billion per year during the period 2008 – 2012 (CBO, 2007).

The Challenges of e-Government

One very important challenge to discuss is the lack of Internet access that still exists for citizens of the U.S. Estimates place the number of Internet active users at about 227,719,000 in the U.S., which translates into 74.1% of the population that has reliable Internet access, and leaves 25.9%, or approximately 80,000,000 members of the population still without. This is an alarming number of American people without consistent access to the Internet, and more specifically, without e-government services and information. As with many disparities in the U.S., there are correlations between Internet access, education level, and household income. Additionally, Hispanic and African-American households and those who reside in rural areas are disproportionately less likely to have Internet access in their homes. The above statistics present a large challenge for the U.S. e-government system. It is quite possible that the government did not conduct a needs assessment or survey before deciding to implement an e-government system, especially since the lower echelon of citizens would most likely comprise the greatest potential users of e-Government. As previously stated though, the number of individuals actively interacting with the Internet through their cell phones is rising at astonishing rates, so the metrics are not as dire as they first appear to be; however, the rate at which the massive e-government program in the U.S. is adopting to the smaller screen sizes attributed to this rising tide is somewhat disappointing.

Comparative E-Government

In March 2013 The Waseda University Institute of e-Government for the ninth consecutive year published the rankings for the development of e-Government worldwide (55 countries). The research was conducted by Waseda University in cooperation with International Academy of CIO with partner universities to organize the workshops and meetings. Key facts follow, highlighted in Tables 1 & 2:

Table 1: Historical Rankings of e-Government, by Nation

No	Final Rankings	Score
1	Singapore	94.00
2	Finland	93.18
3	USA	93.12
4	Korea	92.29
5	UK	88.76
6	Japan	88.30
7	Sweden	87.80
8	Denmark	83.52
8	Taiwan	83.52
10	Netherlands	82.54

2008	2009	2010	2011	2012	2013
1 USA	1 Singapore	1 Singapore	1 Singapore	1 USA	1 Singapore
2 Singapore	2 USA	2 UK	2 USA	1 Singapore	2 Finland
3 Canada	3 Sweden	2 USA	3 Sweden	3 Korea	3 USA
4 Korea	4 UK	4 Canada	4 Korea	4 Finland	4 Korea

Case Study 1) E-Government in Finland

Finland declared broadband Internet access as a legal right for its citizens in October 2009, the first nation in the world to do so. The legislation requires that telecom companies be required to provide Internet access to the entire population of Finland. A spokesperson cited the country's reason being that the Internet is "something you cannot live without in modern society" and related it to common utilities such as water and electricity. Ironically, Finland was already one of the most connected countries in the world, and this mandate was intended to bring access to rural areas and increase connectivity speeds for the population as a whole. This is the key reason of success for the Finland in implementing e-government in their country. After Finland's mandate was passed, other countries such as Estonia, France, and Greece followed suit with similar legislation. This initiative helps to shed light on the U.S.'s low Internet access rates and begs the question of if and when a similar policy will be enacted in the U.S., although the size of the nation, degree of remoteness of specific towns, adoption of computing devices, ability to speak English, etc., amplifies the complexity of this potential undertaking.

Case Study 2) E-Government in Dubai

One major threat that has recently become an even bigger priority for the U.S. government than widespread broadband distribution for the U.S. e-government infrastructure is cyber security. While online security and the privacy of information is a major concern for any country with an e-government system, Dubai officials believe that they have found the best practice and are seeking certification through the ISO 17799 standard. The ISO (International Organization for Standardization) is the world's most recognized developer and publisher of international standards. Their ISO 17799 standard provides guidelines and principles for maintaining and enhancing information security management within an organization. Dubai recognizes the ISO 17799 as the best way to ensure that their e-government services are safe and trustworthy for citizens. For each government agency that wishes to provide services online, Dubai requires that they undergo a risk assessment by a team of specialists who examine the safety and reliability of the current security system. After a thorough inspection, recommendations are made as to how the organization can better improve its security system and comply with the standards provided in ISO 17799. The security standard is achieved by,

“implementing a suitable set of controls, including policies, processes, procedures, organizational structures and software and hardware functions”. This standard provides a good measure of internal security awareness and preparation, as well as outlining objectives for information management.

New trend in e-Government

Use of Cloud computing: Cloud computing permits to uniformly cover the whole country with e-government solutions, independently of divergence of local administrative units that may be better or worse prepared to provide e-services. Service-oriented architecture facilitates provision of compound services covering whole customer processes.

M-government and Social Media: Mobile government, sometimes referred to as m-Government, is the extension of e-Government to mobile platforms. Governments can use social media to connect with citizens or businesses to exchange information interactively. Social media has substantially changed the way that organizations, communities, and individuals communicate.

Open Government/Big Data: The OECD defines [open government] as “the transparency of government actions, the accessibility of government services and information and the responsiveness of government to new ideas, demands and needs”. Together, these three building blocks are seen to support a number of benefits for government and societies. Big data which can handle large amount of data will be the key success of e-Government which needs to handle large data of entire population.

CONCLUSION

Electronic government in the U.S. has come a long way since it declared it a national objective in 2002. But e-Government also faces some of the challenges, notably information assurance, security and broadband deployment. Many developing nations have also successfully and efficiently implemented e-government and have come a long way, using the U.S. as a reference model. Also, with the emergence of mobile technology and cloud technology, the future success of the e-government will largely depend on implementing these new technologies to serve citizens of these nations. A follow-up that must be addressed is the role that private enterprise can and will play in future versions of electronic government.

ENTERPRISE DIAGNOSIS AND THE STOILMo

**María J. García and Gilberto J. Hernández,
Minimax Consultores C. A., Venezuela**

José G. Hernández, Universidad Metropolitana, Venezuela

ABSTRACT

The enterprise logistics, for its close relation with all the aspects of an organization, it is an ideal tool to achieve the diagnosis of the functioning of an enterprise. In the academy four qualitative-quantitative models have been created to facilitate the teaching of logistics and it has been proved that these models can be used in the organizations to realize diagnoses of its functioning. One of these models is the Logistic, Strategic, Tactical, Operational with Inverse Logistics Model (STOILMo [MoLETOI]), which analyzes the logistics through the administrative pyramid, following strategic, tactical and operative stages. For this model its stages and its phases have been worked, and different questions have been used for the diagnosis, but an analysis of these questions has not been performed. The objective of this work is to show how the STOILMo (MoLETOI) functions, how can it be used to perform enterprise diagnosis, explaining mainly the standardization of its questions. To achieve this general objective and its specific objectives, the Integrated-Adaptable Methodology for the development of Decision Support System (IAMDSS) will be used.

INTRODUCTION

The enterprise logistics covers many knowledge fields: Supply-Procurement (Cachon & Swinney, 2009; Puschmann & Alt, 2005); Production (Ivanov, 2009; Karageorgos et al., 2003); Flows (Rice & Hoppe, 2002); Distribution (Coe et al., 2008; Hesse & Rodrigue, 2006) including there the transport (Lemoigne & Dagnaes, 2003); Reverse logistics (Gungor & Gupta, 1999), just to mention some of the most relevant, this confluence of so many knowledge fields in enterprise logistics makes its study very complex. Nevertheless this difficulty for its teaching it is an advantage, when wanting to do diagnoses. Being involved with virtually all areas of an organization, with a focus centered in the logistics, makes easier to produce a diagnosis of the good or bad performance of an organization.

On the other hand, to minimize the difficulty of teaching logistics four qualitative-quantitative models have been created (Hernández et al., 2013), which try to cover all these aspects that have relation with enterprise logistics. These models and his respective approaches are: A) The Supply, Production, Distribution and Inverse Logistic model (LSPDI, in Spanish el modelo Logístico, Abastecimiento, Producción, Distribución e Inversa [LAPDI]), centered in flows; B) The Logistic Model Based on Positions (LoMoBaP, in Spanish Modelo Logístico Basado en Cargos [MoLoBaC]), studies logistics through the functions performed by the managers in logistic positions in an organization; C) The Logistic Model Based on Indicators for Positions (LoMoBaIPo, in Spanish Modelo Logístico Basado en Indicadores de Cargos [MoLoBaCa]), which overcomes MoLoBaC and measures enterprise logistics through indicators and D) The Logistic, Strategic, Tactical, Operational with Inverse Logistics Model (STOILMo, in Spanish Modelo Logístico, Estratégico, Táctico, Operativo con logística Inversa [MoLETOI]), which analyzes logistics through normal stages of administrative analysis: Strategic, Tacit and Operative and which will be object of study in this work.

The MoLETOI (STOILMo) is represented by four stages of four phases each (See figure 1) and in it is advanced from the Strategic stage up to the Operative one, passing previously by the Strategic-Tactic and Tactic-Operational. MoLETOI, through its sixteen phases, as the other three qualitative-quantitative models mentioned, it is of great utility on performing managerial diagnoses, especially when asking the right questions, from this the objective of this work arises: to show how the STOILMo (MoLETOI) functions, how can it be used to perform an enterprise diagnosis, explaining mainly the standardization of its questions.

This general objective involves three specific objectives:

- To present, the stages and phases of MoLETOI.
- To describe the different questions those are used in MoLETOI.
- Indicate how it can make the diagnosis of a company using MoLETOI.

To reach the raised objectives it will follow the Integrated-Adaptable Methodology for the development of Decision Support System (IAMDSS, in Spanish, Metodología Integradora-Adaptable para desarrollar Sistemas de Apoyo a las Decisiones [MIASAD]) (García, et al., 2011), which because its flexibility and ability to adapt to different types of research, as indicated Hernández, et al. (2013), the steps considered important could be applied, therefore as done in other researches (Hernández, et al., 2013) only the following steps will follow:

a) To define the problem that, as is indicated in the objectives is to show how the MoLETOI works and how it can be used to realize a managerial diagnosis;

b) To prepare the first prototype, where the users of the final product will be identified, the main readers of this article which will be all the studios of the enterprise logistics interested in the diagnoses of organizations and those who think about how to have new approaches and concerned with the application of quantitative-qualitative tools. Also, there was established the structure of the article, which in addition to the introduction will consist of two central chapters, in the first one of them, that is the main one of the work, the stages and the phases are detailed and the questions of the MoLETOI are standardized, in the last one a brief indications will be given of as is used MoLETOI to complete a business diagnosis;

c) Obtaining data, in this case on logistics models, diagnosis and the organizational pyramid of management science;

d) Establishing alternatives, which will be the different questions that MoLETOI could use to realize enterprise diagnoses;

e) Evaluate alternatives, according to possibilities for a precise enterprise diagnostics;

f) Selecting the alternative, according to the previous evaluation and considering the secondary objectives, whether they are tacit or explicit;

g) Implementing the best alternative, illustrating, as MoLETOI with these questions can make a proper enterprise diagnostics;

h) Establishing controls, the mechanisms, that allows to recognize if the solution obtained, continues being valid in the course of the time.

With regard to limitations and reaches, especially by reasons of space, no field work will be made, but they will be shown a great number of the questions that uses the MoLETOI and will be discussed as they apply for an enterprise diagnostics.

QUESTIONS OF MoLETOI (STOILMo)

Just as it is indicated in Hernández & García (2009), MoLETOI origins date back to the 2006 and its fundamental bases are in Dornier et al. (1998) and Díaz et al. (2004). The phases of the MoLETOI go beyond than their simple statement; they describe a series of aspects that are expected to be known upon having concluded. To be able to know all the necessary aspects in every phase there is a set of questions that must be asked. Subsequently they will be presented with certain detail the phases of the MoLETOI, and some of the questions that must be made to determine the performance of an organization, in accordance with the respective phase. For space reasons, not all questions may be submitted, nevertheless it will try to include as many as possible, trying that the ones no present could be inferred from the others. This should not present greater difficulty, since part of what is expected as product of this work is the standardization of the questions of the MoLETOI. As for the details of each phase, they were already commented in Hernández & García (2009) and other works there cited, but the majority of these are only available in Spanish.

The first stage, Strategic allows, through the four phases, measuring the initial bases of the organization in study. For the phases of this phase has:

01. To define: Vision, Mission and Principles of the organization.- In addition to verifying that the company has clearly stated and is applying its Mission, Vision and Principles, it is necessary to recognize the reason of being of the enterprise, especially distinguishing its product lines and services, and market sectors and goals which are directed. The seven questions to ask at this stage are:

01.01. The company with respect to its Mission, does it fulfill it?:

Very bad (1 to 12); Bad (13 to 26); Regular (27 to 40); Less than good (41 to 55);
Good (56 to 70); Very good (71 to 85); Excellent (86 to 100).

The first 01 of the identification 01.01 it corresponds to the phase 01 and the second 01 to the first question of the phase, this identification will be constant for all the phases and all the questions. As well as the scale shown among parenthesis for each one of the seven possible answers it will also be constant. According to the question the Very bad can signify total non-existence or a total bad performance, while Excellent or could signify that has always been present or has an excellent performance in every moment and by all aspects involved. For the intermediate scales, similar reasoning will be had where the requisite could had been defined, or the resource had but not in the adequate conditions, or not applied correctly at all levels of the organization. In any case, the one responsible for carry out the diagnosis should be able to explain this in every sense. Additionally for the questions of the first two stages, especially the Strategic stage, one should be very careful and remember that it is only measuring what is strategic or if there is a long-term planning and if it has been successful, and if possible to measure its applicability over time.

Before initiating the group of questions it should be agreed with the diagnosed organization leader, if it prefers to give its answer with a qualitative qualification or if directly prefers to do a numerical qualification. Anyway it should be warned that in the end the answer should be expressed with a number, whereby after qualifying the situation, equal to, and within a closer range, giving a final value. In general it is necessary to allow that the enterprise would prefer some questions in qualitative form and others in quantitative form. If it decides to give his response in numerical form directly, the question should be formulated in a way such that the answer is a value. The question 01.01 previously discussed, it was possible to present: In a scale 1 to 100, with which value does it qualify the Mission of the enterprise?.

The questions 01.02 and 01.03 will be very similar to the question 01.01, in which it will only change Mission by Vision and Principles, respectively. Also at this stage 01 the following questions must be asked:

01.04. Since the beginning was it clear in the enterprise which needs could satisfy its products or services. (In a scale 1 to 100, with which value does it qualify the knowledge that the company has had from his origins, with respect to the needs that can satisfy his services and products?).

01.05. For all the members of the organization, how well-known are the lines of products. (In a scale 1 to 100, with which value does it qualify the knowledge that there have all the members of the organization of his lines of products?).

The questions 01.06 and 01.07, will be very similar to the question 01.05, but referred instead of product lines, market targets and market sectors respectively. The advantage of the Strategic stage is that if a fault is detected corrections can be established immediately. That is to say if an organization has failures in the definition of its Mission, Vision or Principles, at once they must be defined or corrected; if an organization did not know well the needs that satisfied its products and services, their product lines, goal markets or their market sectors to which they are directed, it is necessary, at once, to establish a program so that this information comes to the whole personnel involved.

Similarly to what was done for the stage 01, it will be done or all the different phases, only that by reasons of space they will be presented in a more summarized manner. Table 1, will show the rest of the questions in the Strategic stage, for the remaining stages there will be done a combination of the steps followed for table 1, with what was performed in phase 01.

In the questions of the phases 02, 03 and 04 as indicated for the questions of phase 01, any deviation should be corrected immediately. For the next three stages, the political environmental and the levels of service defined in this fourth phase must serve as measurement and orientation.

The second stage, Strategic-Tactics, help measure aspects of the transition between the strategic and tactical. For four phases of this stage it is had:

05. To analyze the supply sources.- It should be measured if it has suppliers for all the supplies and if these are the most suitable as well as which continuous improvement programs can be established with them, at the same time it should revise the programs of selection, evaluation and monitoring of suppliers and of the technologies that should be acquired for the reception and management of all the supplies.

For this phase nine questions will be asked in a similar manner to the showed for the Strategic stage, covering the following aspects: 05.01 Analysis of the suppliers of all the possible supplies; 05.02 Suitability of the suppliers; 05.03 Continuous improvement programs; 05.04, 05 and 06 Selection programs,

of evaluation and monitoring of the suppliers; 05.07, 08 and 09 Selection programs, of evaluation and monitoring of technologies for the reception and management of all the supplies.

Table 1. Remaining questions of the Strategic stage.

Phase 02. To visualize the integration of the supply chain.- It should verify what level of integration with the supply chain is needed in the market in which it operates or expects to operate the organization, who would be its members and levels of commitment in front of them, also it is necessary to verify if the proposed integration has been obtained to plenitude.	
Question	Aspects that covers the question
02.01	Level of integration to the supply chain need in the market where it operates.
02.02	Members of the supply chain in the market where it operates.
02.03	Level of commitment front the members of the supply chain.
02.04	Level of integration achieved with supply chain.
Phase 03. To visualize the information system.- Check if there was a clear vision of how communications would be not only in the area of logistics but throughout the enterprise, and even with the rest of the chain, ensuring smooth communication in all directions, making use of the suitable technologies of the communication.	
Question	Aspects that covers the question
03.01	Knowledge of how would be the communications in the area of logistics.
03.02	Knowledge of how would be the communications in the company.
03.03	Knowledge of how would be the communications in the supply chain.
03.04	Information flow in all directions.
03.05	Use of the suitable technologies of the communication.
Phase 04. To define the environmental and the customer service politics.- Check whether the policies of respect and care for the environment and the customer service are being achieved and if they respond to an appropriate service costs. These established levels of service must be the fundamental base for the development of the remaining stages of the model in the organization.	
Question	Aspects that covers the question
04.01	Politics for the respect and care of the environment.
04.02	Politics of customer service.
04.03	Achievements reached with the politics for the respect and care of the environment.
04.04	Achievements reached with the politics of customer service.
04.05	Costs benefits ratio of the environmental politics.
04.06	Costs benefits ratio of the politics of customer service.

06. To analyze the inverse logistics politics.- Evaluating reverse logistics policies, verifying, among others aspects, if the technological tools used to apply them are the adequate and measuring, for these politics its impact, in the environmental, market and especially in the economic.

Similar to the previous phase, for the phase 06 there are five questions to cover: 06.01 Politics of inverse logistics (IL); 06.02 Technological tools used in the IL; 06.03, 04 and 05 Impact in the environmental, in the market and in the economic-financier of the politics of IL.

07. To select the technologies of the productive processes and to establish the logistical flows (LAPDI).- To check that the selected technology of the productive processes is adapted for the organization, while simultaneously check all the flows, particularly of information, of control and especially of materials, as much in the direct process of formation and commercialization of the final products, as in the inverse flows, of those materials that return to the organization through the inverse logistics. If failures are failures, it should be applied a deeper analysis through the model LAPDI.

The questions for this phase are nine, which have their reach on: 07.01 The technologies of the productive processes; 07.02, 03, 04, 05, 06, 07 and 08 The adequate management of the flows of: information, direct materials, inverse materials, control, monetary, energy and persons; 07.09 The situation of the management of the flows and the complete application of the model LAPDI. For the response of the latter question it is necessary to understand that Very bad it is slightly necessary and Excellent as very necessary, so the higher these values would be worse for the organization, for which, on having expressed it

along with other values of the remaining questions, it is necessary to register 100 minus assigned value, so that, on having realized the average, the sense of the diagnosis is supported.

08. To establish the distribution strategies.- According to established supply chain, in terms of customer service and according to the flows found in the previous phase, is revised if properly established distribution strategies are followed, measuring the technologies of storage and transportation to be utilized and especially its feasibility of application in the market where it is or is going to play the organization.

The set of questions of this phase are six: 08.01, 02 and 03 Adequacy of: the strategies of distribution, the technologies of storage, strategies and technologies of transportation, established to follow; 08.04, 05 and 06 Feasibility to apply the strategies of: distribution, of storage and of the transportations.

Although not immediately as in the Strategic stage, it is necessary to rectify, as soon as possible, any bad functioning found as a response to the questions asked in this Strategic-Tactical stage.

The Third stage, Tactical-Operative, must verify tactical principles and its transition to the operational stage, for this task the following phases apply:

09. To establish the politics of quality management.- According to customer service and being this a fundamental aspect of any modern organization, it should be verified that the politics of quality management established are the adequate and if they actually can be implemented, remembering that this is not only to have total control of the quality of the materials, but also the processes, equipment and even human performance, is to say operators can work with the required standards.

Its six questions: 09.01 The adequacy of the policies established for the quality management; 09.02 The implementation of the politics 09.03, 04, 05 and 06 Management, of the total control: quality of materials, processes, equipment and human performance.

10. To establish the maintenance politics.- To ensure a high customer service, politics of maintenance should be established, that guarantee a high operability of the machines and process, by which should be verified that the quantity of maintenance based on forecasts, the preventive and corrective are in adequate dose and particularly the relation among them is the best for the organization.

For this phase will have seven questions: 10.01, 02, 03 and 04 The adequacy of the policies established for maintenance: general, predictive, preventive and corrective, according to the process and the time of operability of the machines; 10.05, 06 and 07 Taking into account the costs and the time machine operability, the relation among maintenance: predictive to corrective, predictive to preventive, preventive to corrective.

11. To establish plans and operational controls and the integration of the information systems.- It should be verified, that the productive levels and the systems of control to guarantee the same, are working in accordance with the established plans and that simultaneously are perfectly integrated to the systems of information, permitting a system of prediction and of early alarm, that function with a high efficiency.

Here are four questions: 11.01 Production levels, according to established plans; 11.02 Control systems to ensure production levels; 11.03 Integration of control systems and information systems and 11.04 The system of prediction and early alarm of the productive levels.

12. To establish the organization and the functions of the positions (MoLoBaC).- To verify that the flow chart established for the organization is implemented in a suitable way and that the established positions redeem the functions that it corresponds to them, minimizing the duplicities and dispersion in the performance. If major faults are noted, one should resort to an application of the MoLoBaC, used as model to measure the dispersion in the positions.

The six questions of this phase will be: 12.01 Implementation of the established flow chart; 12.02 The functionality of the flow chart; 12.03 For all positions, globally, as for the performance of the functions that it is up to them to execute in accordance with the established flow chart; 12.04 and 05 For all positions, globally, in terms of: the duplicity, dispersion of the functions that corresponds them to execute; 12.06 Considering the situation of the duplicity and dispersion of functions, the complete application of the MoLoBaC. The qualification of 12.06 is done similarly to the 07.09.

In this stage, Tactical-Operative and in the Operative stage, which will be analyzed next, detected faults usually require a deeper analysis for correction, since they have greater impact in the performance of the organization.

Last stage, Operative, is the closing of the model and with it should be verified that the strategies and tactics established are being performing adequately to reach the objectives established in the Vision and Mission of the organization. These last four phases are:

13. To implement resource handling politics.- It should verify that what was planned in regard to resource management: financial, material, of technology and any other, but especially the human resources, is being carried out properly, especially the latter, where it is necessary to verify that the systems of remuneration and incentives are adapted for the organization and his members.

Thirteen questions of this phase: 13.01, 02, 03, 04, 05 and 06. The implementation of resource handling: financial, material, of technology, human, energy and other are in accordance with the enterprise planning; 13.07, 08, 09, 10, 11 and 12 The plan of the handling of the resources: financial, material, of technology, human, energy and other with respect to the current situation; 13.13 The adequate systems of remuneration and incentive for the organization and its employees.

14. To implement the quality, maintenance and inverse logistics management.- Separately and integrated, it is necessary to verify that the measurements and quality controls, of the different types of maintenance and of reverse logistics (IL) policies are being implemented in accordance with the provisions and if they are given the expected results, thereby achieving customer services that were prescribed.

Fourteen questions are: 14.01, 02 and 03 The implementation of management of: quality, maintenance and the IL in accordance with the enterprise planning; 14.04, 05 and 06 The integration of the implementation of: the quality management with maintenance management, quality management with the IL and maintenance with the IL; 14.07, 08, 09, 10 and 11 The measurements and controls of: quality, maintenance: predictive, preventive and corrective and IL and its application, in accordance with the enterprise planning; 14.12, 13 and 14 Excellent customer service and management programs: quality, maintenance and IL that they are applying.

15. To implement the management of transports, inventories and warehouses.- To verify that with the necessary frequency, it is taking the control of the inventories, as well as the management of the stores and above all the management of the transportations, with special attention to the handling of the fleet, the routes and the deliveries, analyzing if a constant review is realized that allows to detect any possibility of improvement in the handling of these three fundamental aspects in the distribution stage of the logistics and Supply Chain: inventories, store and transport, which is usually the major monetary expenses.

Here are thirteen questions: 15.01, 02 and 03 The implementation of the managing of: transport, inventories and stores in accordance with the plan; 15.04, 05 and 06 The program of handling managing: transport, inventories and stores in accordance with the current situation of the environment; 15.07 The quality of the deliveries; 15.08, 09, 10, 11, 12 and 13 As for offering opportunities of improvements, the frequency with which reviews the management of: the inventories, the stores, the transports, the fleet, the routes and the quality of the deliveries.

16. To implement the politics of management control (MoLoBaICa).- To determine the existence and good use of management indicators. If it is detected that the potentialities are not exploited, or there are clear failures, the application of MoLoBaICa is recommended to: verifying if the standards of adequate performance are achieved, to identify potential and to detect real flaws, to invest there the resources that will allow improving them.

The six questions of this phase will be: 16.01 The implementation of the management control politics, in accordance with the planned; 16.02 The management control politics, in accordance with the current situation of the environment and of the organization itself; 16.03, 04 and 05 The: quantity, quality and potentiality of the management indicators implemented in the different areas of the organization; 16.06 The complete application of the MoLoBaICa, in accordance with the management indicators implemented in the different areas of the organization. The qualification of 16.06, it will be done similarly to 12.06 and 07.09. Of the hundred twenty (120) questions to ask, the stage with the greater number is Operative with forty six (46). This number of questions in the last stage was to be expected, since it represents the present time and offers the greatest potential for improving performance, for which it is necessary to study and to value its performance in major detail. Subsequently some very brief comments about the application of these questions, to do diagnoses across the MoLETOI will be done.

BRIEF COMMENTS OF THE DIAGNOSIS WITH MoLETOI

For reasons of space and because it escapes the objectives of this work, only some very brief comments about how it complete the diagnosis through MoLETOI will be made. Already with each one of the 120 questions it is had an evolution of the most important aspects of the organization, but they can also offer an evaluation of each of the phases. As for all the answers yielded a numerical value between 1 and 100 and given that the importance of each question is similar to the remaining ones of the phase, a simple average of the values obtained in each of the responses is done. This average will allow qualifying as it is the performance in each of the phases. For the first stages, Strategic and Strategic-Tactical, it is recommended to realize the corrections immediately as it was indicated while preparing the questions. For the Tactical-Operative and Operative stages, it is necessary to perform a more careful analysis of the corrections to implement, but in any case, in accordance with the evaluation obtained in every question, it is necessary to do a recommendation of the actions to take in the same way that is done for each phase, although in general it is a compendium of the actions performed to solve the possible problems detected in every question.

For the evaluation of each of the stages are applied weights table 2 and a normalization is done, dividing by the entire weight of the stage, indicated for each stage in the last line of table 2. Finally to have the finished evaluation of the organization the weighted average of the evaluation of four stages is calculated. Again according to the result there are a series of recommendations that the organization can take.

Table 2. Weighing of the phases and stages of the MoLETOI.

Stages							
Strategic		Strategic-Tactical		Tactical-Operative		Operative	
Phase	Weight	Phase	Weight	Phase	Weight	Phase	Weight
01	01	05	02	09	06	13	10
02	01	06	03	10	07	14	12
03	02	07	04	11	08	15	13
04	02	08	05	12	09	16	15
Weight (stage): 06		14		30		50	

In summary, it has 120 individual assessments, an evaluation for each phase, an evaluation for each stage and a general evaluation of the organization, being each of these evaluations accompanied of one or a set of recommendations. Presented in global form as MoLETOI works, subsequently some conclusions and future investigations are presented.

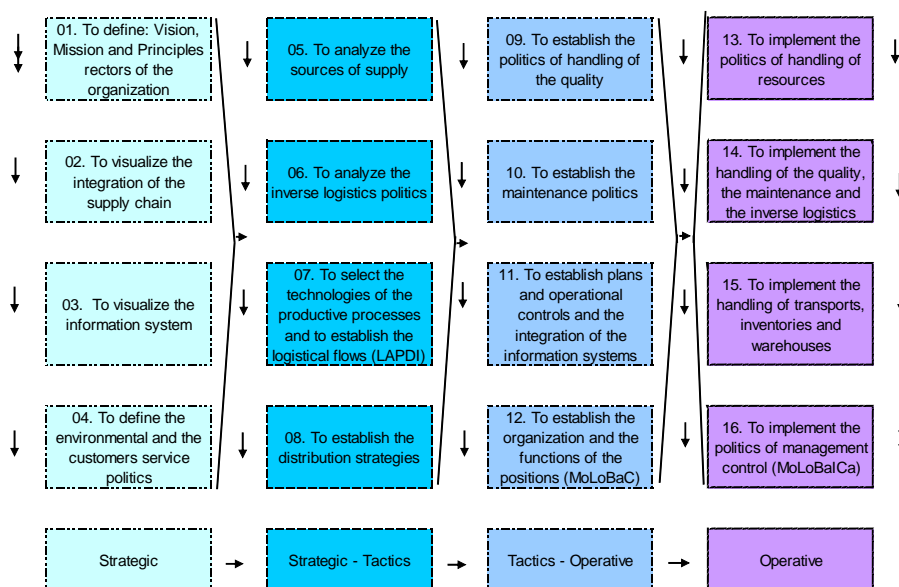

Figure 1: The Logistic, Strategic, Tactical, Operational with Inverse Logistics Model (STOILMo)

CONCLUSIONS AND FUTURE INVESTIGATIONS

In this work besides presenting the different phases and to briefly explain how they can be weighed, the 120 questions necessary to realize a diagnosis of an organization were presented, following the Logistic, Strategic, Tactical, Operational with Inverse Logistics Model (STOILMo [MoLETOI]), complying thus with the objective proposed. The 120 questions of the MoLETOI, undoubtedly allow performing a good diagnosis of the performance of an organization. But additional to having a clear vision of these aspects, it is possible to make a diagnosis of each of the phases, averaging the questions asked for each of them, that go from 4, in the phases 02 and 11, until 14 in the phase 14. Known the value of each phase will allow knowing the value of each stage, simply by averaging the weight of the evaluations of each of the phases that compose it and finally by making the weighted average of the stages, a general evaluation for the organization will be had. To continue deepening the study of the MoLETOI, it is recommended to prepare a set of recommendations that must be given to an organization, according to the scoring reached in each question, each phase, each stage and the organization as a whole. Another recommendation is to analyze the possibility to work MoLETOI through a system of indicators, which allows tracking the results of the different diagnoses that it can provide for an organization.

MATERIAL AND NON – MATERIAL DETERMINANTS OF EUROPEAN YOUTH’S LIFE QUALITY

Remigiusz Gawlik
Cracow University of Economics, Poland

ABSTRACT

The paper confronts chosen approaches to quality of life studies with recent changes in post-crisis socio-economic environment. The focus is on European Youth at verge of entry into adult life. Presented research is a preliminary study for “The Application of Artificial Intelligence Methods for Analyzing Material and Non-material Determinants of Life Satisfaction between Young People from Developing Countries” project. Identifying and grouping the determinants of their life satisfaction could result in elaborating an innovative approach, providing European Youth with a new perspective on their personal and professional development options and allowing them to achieve a decent level of life satisfaction.

INTRODUCTION

Developed Western economies have been recently witnessing the evolution of social tensions into mass movements. Anti – ACTA law demonstrations, Spanish *Indignados*, North American *Occupy Wall Street* or Polish *Oburzeni* proved that a growing number of young people often referred to as NEETs (*Not in Education, Employment or Training*) can destabilize existing economic models significantly. At the same time an important number of Youth from all over industrialized Western World cannot – or do not want – to discount the development opportunities offered them by former generations and existing education systems. Observers of this process adopt different perspectives on the issue, varying from judging Young People as spoiled, lazy or unproductive, towards presenting them as innocent victims of the almighty international financial crisis. Whatever the truth is, the author assumes that changing attitudes of European Youth already became a visible feature of Western countries’ reality. Together with the fact that mentioned groups of Youth became in their mass a noticeable force on the socio-economic scene, the entire problem of attitudes of young people in post-crisis economies seem to be worth studying.

Human life quality studies can occur in two dimensions. Researchers can search for determinants, measuring levels of quality of life of groups of people or even entire societies or those of individuals. Due to the immensity of the subject, author’s interests bend towards studying the quality of life of individuals, especially of European Youth. To be more precise, the research target group will be composed of young people from developing European countries at the verge of entry into their adult lives, facing decisions that will most possibly help them to achieve a satisfactory level of life or just the opposite – become obstacles on their path to happiness.

Another few words of explanation are due to define the *satisfactory level of life* notion. One could ask why not *optimal*? This choice results from author’s research on the sense of constant hunt for happiness. Bauman (2012) analyzes Rustin’s (2007) thoughts about this issue and finds out that “*On the track leading to happiness, there is no finish line*”. At the same time we can observe a constant pressure effectuated on young people by numerous environmental factors to be the most effective in every field of their activity, often without paying attention to material and non – material costs of these commitments. Meanwhile, there is no clear evidence that such an attitude results in achieving higher standards of quality of life, which is backed by Bauman’s (2012) findings. We could even tempt a slightly provocative, counterbalance statement, saying that instead of losing energy on endless enhancement of some future happiness, focusing on living the actual moment here and now would be way more rational. This somehow reflects basic economic logic of obtaining highest possible results at possibly lowest costs. Kołakowski (2009) supports this thesis by

summarizing his findings on the issue when discussing the idea that “*Happiness is just lack of misfortune*”, which – in its turn – could be accepted as a negative definition of happiness.

But how does the issue of human life quality contribute to International Economics or International Business science? Well, it seems rational to assume that any durable change in consumers’ minds should result in companies adapting their strategies, behaviors and products to actual tastes of their customers. The growing popularity of Corporate Social Responsibility practices in the strategies of companies could be a direct proof for the thesis that including non-material values into economic functioning of societies is a natural path of development for those already highly developed ones.

The presented paper reflects author’s search for a deeper understanding of mentioned socio-economic processes. It also tempts to search for a universal set of quality of life determinants that could form a complex model allowing each individual to choose from a specific set of material and non-material determinants those that will contribute to the highest possible level to his or her needs in personal development. In author’s opinion, to contribute to the service of humanity and society, the science of economics needs to refocus on individuals and their human values, incorporating material and non-material ones into one general scope.

CHOSEN APPROACHES TO HUMAN LIFE QUALITY

The concept of Quality of Human Life is usually perceived as an interesting field for research for scientists with medical background. An important number of publications about enhancing human life quality by curing maladies or lowering physical pain can be found. Although today it seems to be obvious, Thorwald (1957) observes that this belief is not older than 200 years. Past century of scientific research broadened Quality of Life (QoL) studies by psychological contexts. Economists seem started researching this issue even earlier. Already Smith’s Theory of Moral Sentiments, dating from 1759, included his rhetorical question “*What can be added to the happiness of a man who is in health, out of debt, and has a clear conscience?*” (Smith, 1759, p. 45). In past decades other dominants joined, just to mention sociology, ecology, sport sciences, biology, engineering or chemistry. At the same time, although the humanity seems to have a large toolbox necessary to improve the quality of life of individuals, it hardly ever uses the entity of available means.

Though, a question arises: if quality of life and happiness has been discussed and researched from so many different angles, why Western societies witness the dictate of happiness model based on money – related values? Aren’t there any other values? Do the existent models describe the reality precisely enough? Are they possible to be applied by non-professionals?

Traditionalist economic approaches to measuring quality of life often tend to put an equality symbol between income and human life quality. Incomprehensively, they have dominated the public discourse to the point, where one of the most important economic data when talking about country’s development level – and mentioned in first instance – is Gross Domestic Product or GDP per capita. Taken into account the vast amount of literature discussing the utility of GDP for QoL studies, there is no need of repeating well known arguments, although it is important to underline a purely economic, therefore limited character of this index. In their widely discussed report Stiglitz, Sen, Fitoussi (2009) recommend to adopt a different perspective on the issue by saying “*When evaluating material well – being, [one should] look at income and consumption rather than production*” (p. 12). Whereas material determinants of human life quality seem to bear an important influence on the matter in question, past global occurrences, namely the global financial crisis proved a growing need for more complex approaches.

The concept of widening categories of factors contributing to the quality of human life by non – material ones is not new. Stiglitz, Sen, Fitoussi (2009) mention that “[...] *the time is ripe for our measurement system to shift emphasis from measuring economic production to measuring people’s well-being*” (p. 12). When discussing the notion of happiness Alkire (2008) says that “*data on [people’s] emotional states are not limited to material means*” (p. 3). An important part of researchers until now active in purely economic areas became more favorable towards including non – material data into their studies, which became possible partly thanks to development of methods allowing to include empirical qualitative factors into statistical data sets by transforming them into quantitative ones. Methodology in question includes *inter alia* AHP and ANP methods (Analytic Hierarchy Process, Analytic Network Process), fuzzy logic, neural networks and other instruments based on Artificial Intelligence.

Şerban – Oprescu (2012) goes even further by stating that *“The complexity and dynamics of current social and economic phenomena determined a growing body of economists to ask for a renewal of economics methods and a repositioning to the current society problems. The defining element of this new theoretical approach should probably be its multi and interdisciplinary character. By accepting and using assumptions and explanations beyond the accepted limits of purely traditional economics, quality of life studies could open a path to the new social sciences”* (p. 79).

Taking into account an important number of approaches to QoL studies, some sort of classification into more general groups is necessary. Şerban – Oprescu (2012) proposes to divide them into three groups:

- 1) Purely economic approach inspired by consumer theory which is trying to provide some viable economic explanation to non – material aspects of life.
- 2) Utilitarian approach, where subjective well-being is derived from the utilitarian theory which aims to explain specific phenomena through individual subjectivity.
- 3) The capabilities approach inspired by Sen's theory that aims to assess the quality of life through objective indirect observations on the actions and status of a person (p. 86).

First of these approaches is based on the assumption that quality of life is directly linked with purchasing possibilities of an individual, who is rather referred to as a consumer. Alkire (2008) supports this thesis by saying that *“The most common resource measures by far are monetary indicators of income or consumption”* although *“Non-monetary resources may include a range of assets, as well as access to certain public services such as health, education, water, electricity, and roads”* (p. 2). Therefore a hypothesis, that our quality of life is a derivative from our economic status and consumption opportunities resulting from it can be formulated in frames of the purely economic approach. This attitude was predominant for Western QoL studies during most of the post-war period of prosperity and growth. It has highly influenced indexes used to measure the development level of societies – and therefore state policies. Accordingly to this logic, non-material determinants of human life quality are often graded as less relevant in relation to the material ones. In effect, there is a general belief that maximizing consumption is a logical way towards a happier life. Whereas it seems to be too much of a simplification, the purely economic, consumption-based approach provides some space for other than economic values in life, namely consumer's freedom of choice, but limits them to goods and resources only. Sen (1989) summarizes this debate by saying that *“The value of the living standard lies in the living, and not in the possessing of commodities, which has derivative and varying relevance”* (p. 34).

The utilitarian approach can be generally understood as an evolution of the purely economic one by introducing the notion of “utility” as a predominant feature of goods and resources to be consumed. One can notice that the preferences and satisfaction of individuals and societies gain some importance here. Nevertheless they are still perceived just as a mean towards achieving a higher goal – maximizing consumption levels by pushing the income, technological or productive constraints upwards and therefore being able to increase the amounts of purchased sets of goods. An aware consumer would also tend to maximize the utility of resource allocation, money included, and focus his or her efforts on lowering the losses and lost opportunity costs coming from non-optimal or faulty consumer decisions. A higher level of quality of life is believed to be achieved by maximizing consumer's individual utility. Recent studies point at broadening the utilitarian approach by other factors, such as social responsibility or business ethics (Burnes & By, 2012; Boboc, Dumitru & Stancu, 2009), but the overall idea of maximizing the utility of resources and therefore minimizing the externalities in their allocation remains the crucial goal of individual and institutional consumers in frames of the utilitarian approach to quality of life. Though, the problem of researching it by analyzing only the economic measures still remains. Stiglitz, Sen & Fitoussi (2009) call it the *subjective well-being* concept, which assumes that *“individuals [are] the best judges of their own conditions”* (p. 42). By adopting this point of view on the utilitarian approach, cited authors provide individuals with the right to pursue satisfaction and happiness as the ultimate goal of their existence.

In relation to both approaches presented above, the capabilities methodology provides a different view on the factors that determine the quality of human life. Sen (2008) describes it by introducing the notion of “capabilities”, which exhibit human freedom of choosing between various “functionings”, that – in their turn – are a combination of different sets of “doings” and “beings”. Saito (2003) explains the capabilities approach by saying that *“The capability approach makes two basis assertions: “(1) that the right perspective from which to judge a person's well-being is functionings, and not necessarily mental attitudes such as utilities; (2) that, in judging from the perspective of functionings, we should not merely look at*

whether a person is enjoying the preferred alternative but whether a person actually has the choice of an alternative: freedom to choose“ (p. 26). Stiglitz, Sen & Fitoussi (2009) state that *“The foundations of the capability approach, which has strong roots in philosophical notions of social justice, reflect a focus on human ends and on respecting the individual’s ability to pursue and realize the goals that he or she values; a rejection of the economic model of individuals acting to maximize their self-interest heedless of relationships and emotions; an emphasis on the complementarities between various capabilities; and a recognition of human diversity, which draws attention to the role played by ethical principles in the design of the “good” society”* (p. 42). Therefore the capabilities approach is perceived as the first to expand the material determinants of quality of life by non-material factors, i.e. education accessibility, social status, personal needs and activities, health, freedom, active and passive political rights, relations with other people, environment’s quality, security and others (Nussbaum & Sen, 1993).

In author’s opinion all of the above approaches exhibit a limitation, which does not allow to see them as complex methods for enhancing the quality of life of individuals. This constraint comes from the fact, that they are implying the use of normative and objective evaluations of attitudes of concerned people. What could be seen as an advantage in case of research on the quality of life of the society, cannot be applied to individuals, because the only person who can judge the usefulness of a given attitude or approach is the individual in question. Therefore there is a need for a more complex approach, including all three above, enriching them by some extra values, too, but above all – providing space for individual assessment of relevance of particular factors, accordingly to the needs and preferences of the concerned person.

Measures and indicators applied to quality of life research are numerous and evolving in time. The first stage of this process was based on material factors. Non-material determinants have been taken into account in its second stage. Already Nissel (1970) noticed that *“economic progress must be measured, in part at least, in terms of social benefits and the fact that it is just as important to have good statistics on various aspects of social policy [than it is economic statistics]”* (after Hicks, 2012, p. 1). The presentation of the capabilities approach (Nussbaum & Sen, 1993) and their following developments pushed this process further on, but at the same time included mainly external factors, independent from and not directly related to the person in question. Alkire’s (2008) quote, saying that *“Although resources are [...] not an adequate space for assessing quality of life, indicators of resources – of time, of money, or of particular resources such as drinking water, electricity, and housing – are still highly relevant to quality of life measures”* (p. 3) shows her interest in non-material determinants external to the individual, but at the same time proves that second stage approaches do not cover a vast set of factors determining the individual life satisfaction. It would be unjust not to mention that the quoted author does notice most recent changes in QoL research.

Analyzing the subjective reception of well – being of individuals as a contribution to human life quality is not a brand new concept, but only recently started to attire growing researchers’ attention. Layard (2005) says that *“If we want to measure the quality of life, it must be based on how people feel”* (p. 113). Similar views can be found in the works of Blanchflower & Oswald (2004) and Frey & Stutzer (2002). Stiglitz, Sen & Fitoussi (2009) also follow this logic by dividing the quality of life measures into subjective (*“dimensions of quality of life and the objective factors shaping these dimensions; cognitive evaluations, positive affects and negative affects”*) and objective (*health, education, personal activities, political voice and governance, social connections, environmental conditions, personal insecurity and economic insecurity*). These authors give their attention to the importance of some cross – cutting issues in frames of adopted division (p. 43 – 59). Kahneman & Krüger (2006) propose a reverse approach by calculating their U – index, which *“measures the proportion of time an individual spends in an unpleasant state”* (p. 19). At the same time Diener & Suh (1997) are suggesting to analyze economic, social and subjective QoL measures altogether, which can be understood as opting for a complex approach to quality of life studies.

Taking the above into account, it is highly possible that QoL research recently entered its third phase which will focus on researching on people’s subjective reception of happiness. It would be useful to tempt to combine the findings of the three stages of research into one complex model, including all the factors relevant to the quality of life, together with their subjective ranking and generalization on larger groups of individuals and societies.

MEASURING THE QUALITY OF LIFE OF YOUNG EUROPEANS

The infinite choice of subjective measures and indicators used in QoL research can provide scientists with serious headache. Nevertheless, attempts of downsizing their number to a smaller scale do happen. The question arises which are those to be omitted or what grades should be attributed to remaining ones. For the needs of the presented research the author will adopt Alkire's (2008) concept: *"Any approach to quality of life may wish to select the space in which to measure quality of life. Of course indicators may be used from different spaces, but a conceptually coherent approach should be able to explain why particular indicators have been chosen"* (p. 2). In authors opinion this coherence can be reached by understanding the nature of the quality of life.

Modern approaches show that measuring the quality of human life is directly linked to subjective reception of individual level of happiness. After studying classical thinkers Tatarkiewicz (1962) proposes four definitions of happiness:

- a propitious coincidence;
- a positive experience;
- maximization of amount of owned goods;
- overall life satisfaction expressed at its dusk.

The philosopher also underlines that because of its complexity, the real nature of happiness can be fully expressed only by the last definition. It is important to add that in Tatarkiewicz's opinion the notion of *owned goods* relates not only to material possessions, but also to non-material values, such as emotional states allowing to deal with stress and difficulties and to enjoy everyday life. (p. 15 – 29). Last, but not least, even this renowned philosopher does not attempt to provide the readers with a comprehensive definition of happiness, because of its individualized nature. He only states that *"Happiness is an abiding, full and justified contentment of life. Or: it is a life providing with an abiding, full and justified contentment. There are two definitions, because happiness is a reversible phenomenon"* (ibidem, p. 40).

Author's research lead in frames of the *"Socio – Economic Implications of Global Financial Crisis for European Youth"* project (Gawlik et al., 2012) between 31 Croatian, German, Polish and Slovak students, who with no doubt belong to the "European Youth" target group, showed that young people at the verge of their entry into adult life and professional careers experience a series of difficulties coming both from material and non-material determinants of their future effectiveness and awaited life success. The following paragraphs will present findings from this study. At the same time relevant QoL determinants will be extracted and allocated in one of mentioned factor groups.

The respondents mentioned a broad set of factors determining young people's life quality. The questions have been answered in open form (written essays, discussions and direct interviews). The respondents' concerns have been divided into material and non-material factors that have influence on their life quality. Material factors countered following issues:

- low expectation of future salary level;
- burden of student's loans – they have to be paid back even if there is no work after studies;
- investment risk that follows self – employment;
- rising costs of living accompanied by decreasing salaries;
- incertitude of financial investments – coming from low level of trust to the financial sector caused by its attitude and condition during and after the crisis;
- trouble with saving money for the future;
- low level of retirement pensions (if available).

Non – material factors could be divided into:

- Fears resulting from:
 - little availability of jobs;
 - low stability of jobs;
 - underqualified posts;
 - not being able to combine private and professional life;
 - general fear of the future.
- Inconvenience resulting from:
 - need for constant mobility;
 - need for networking (to know "the right people");
 - separation with family and friends;
 - working at uninteresting positions;
 - working for inadequate salaries;

- information overload;
 - uncertainty about the relevance of one's occupation to the society.
- Disappointments coming from:
 - low importance of students' University performance;
 - incompatibility between education and labor market;
 - escapist attitudes - maintain educational fiction in order to push away the moment of entry into adult life to the limit (Gawlik & Kopeć, 2012).

Although the material factors do not seem to be a very innovative discovery, the set of non-material ones provides food for thought. What attracts attention at first glance is that many of them are related with emotions – fear, inconvenience or disappointment. Another point is that even if the respondents mentioned them only after the material ones, they still did rank them as relevant or even crucial, when it comes to their influence on the quality of their lives. The presented study shows preliminary findings of research based on European Youth's experience and definitely has to become a subject for further, deeper and wider data collection and analysis.

CONCLUSION – DIRECTIONS OF FURTHER RESEARCH

As the nature of an important part of European Youth's concerns about their future quality of life consists of emotional factors that are subjective to each individual and therefore cannot be easily generalized, the application of artificial intelligence methods seems to be promising for further research. The reason for such a try is the need for combining the actually used descriptive measures and available indexes into one complex model that should include both qualitative and quantitative determinants. Because of their nature, based on human – type reasoning, neural networks and / or fuzzy logic processes could become a proper tool for such research, due to their similarity with human decision making – the core of the process itself is less important than the interrelations between various input and output data sets.

The main thesis of future research could possibly state that “A satisfactory level of life quality can be achieved by finding a proper balance between material and non – material determinants of life satisfaction.” Additional sub – theses should be checked. They could be formulated in the following way:

1. The choice of possible life patterns is a limited number.
2. A proper balance between private and professional life results in lower general costs of achieving higher levels of life satisfaction.
3. A higher level of decision making consciousness at the beginning of professional development results in a higher probability of final success.
4. Artificial intelligence methods, in example neural networks and fuzzy logic are a proper tool for proposed research, analysis and elaboration of scientifically aided decision – making models to enhance success when undertaking important life choices.

The research should also provide action strategies for young people that are interested in enhancing their life satisfaction in a longer scope. Findings from mentioned initial research showed at least four possible options:

1. Direct adaptation to the actual socio – economic system – full acceptance of the actual state of arts and efforts to fit into it to the highest degree.
2. Focusing on professional development – through education, experience and training.
3. Focusing on individual personal development – enhancing self – awareness and consciousness.
4. Alienation – living aside the society, without taking part in its mainstream (Gawlik & Kopeć, 2012).

Of course plenty of questions arise. Is this set a closed one? Which of these strategies provide European Youth with most possibilities of succeeding to have a decent quality of life? Or may it be a combination of all of them? At which proportions?

Although gaining the general ability of adapting to turbulent environment seems to be the proper answer to these questions, the real problem is how to do it? As it appears to be highly biased by individual preferences, further research should concentrate on providing young people with help when making strategic decisions about themselves. Tatarkiewicz's (1962) “*full and justified contentment of life*” can be achieved

only by a conscious choice of paths leading towards wanted happiness. At the verge of Youth's entry into professional and adult lives every mistake would highly influence their future performance and therefore contribute to their final success or failure when fighting for an acceptable quality of life.

SOCIAL MEDIA ENGAGEMENT AND EFFECTIVENESS ON BRANDING: A THEORETICAL ORIENTATION

**Ekaterina Glazyrina, London School of Business and Finance, UK
Wilson Ozuem, University of Gloucestershire, UK**

ABSTRACT

The internet has undoubtedly revolutionized not only the way brands communicate with consumers, but also the way consumers share brand-related information with others: providing new opportunities and representing new threats. The swiftness of modern communication has made it possible to connect in real-time with anyone, regardless of geographic location. A combination of newly achieved instant connectivity and evolving social media platforms, has allowed information to be delivered much faster than through traditional marketing channels, such as television, radio and press, affecting business processes and increasing consumers share of voice. Brand development and reputation are perceived to be one of the most influenced business areas, since many branding activities and brand-related conversations have been transferred on-line through use of social media tools and applications. Based on such observations, this paper investigates the impact of social media on brand perceptions.

INTRODUCTION

Social media (SM) has become an inalienable part of modern life. Geographic location is no longer an obstacle to global connectivity and the communicational time-frame has shifted towards real-time, providing an opportunity for instant information sharing. Consequently, business rules in a new shared-experience world have changed, as attempts to adapt to emerging opportunities and threats increase. Companies today need to integrate their webpresences with the rest of their brand attributes as part of an overall positioning strategy and at the same time control brand reputation, today's consumers have impact on brand equity like never before (Ozuem et al 2008; Booth and Matic 2011; Dann and Dann, 2011). This can be challenging considering the lack of social media expertise in many organisations and the lightning speed of technological development that does not allow for the same marketing techniques to be used twice, but requires continual transformation of such techniques. Thus, the rapid speed of social media development makes any assessment of its influence on various branding areas tricky, as new SM tools appear before old ones have been evaluated. These issues are particularly relevant for small organisations that have limited marketing budgets and cannot afford on-going employee education (Clow and Baack, 2012). At the same time these organisations can benefit from the web revolution the most. Not only can they survive without off-line shopping but they can survive without the use of advertising agencies by using SM channels to reach targeted customers direct. Therefore, understanding how SM influences the process of brand development is crucial for any business today and specifically for small e-commerce companies.

What lies within social media?

The volume of research devoted to SM growth and place in modern life is significant. However branding-related academic literature is dominated by theoretical frameworks that seldom consider SM phenomenon and web 2.0 maturities. One of the main issues faced by scholars is the absence of a recognised unified definition of what SM is. According to Bradley (2010) "SM is a set of technologies and channels targeted at forming and enabling a potentially massive community of participants to productively collaborate". Corresponding with this opinion is work by Scott and Peter (2010) where they define SM as "a set of web-based broadcast technologies that enable the democratization of content, giving people the ability to achieve massive scalability in real time, these technologies empower people to connect with each other to create value through online conversation and collaboration" (Scott and Peter, 2010, p.5).

The definition provided by Kaplan and Haenlein (2010) is a useful attempt to identify and integrate all SM components. They believe that SM is “a group of internet-based applications that build on the ideological and technological foundations of web 2.0, and that allow the creation and exchange of user generated content” (Kaplan and Haenlein, 2010, p.60). Another important aspect of Kaplan’s and Haenlein’s (2010) work is the development classification of SM types. These include social networking sites (Facebook and LinkedIn), collaborative projects (Wikipedia), blogs, content communities (YouTube and Daily Motion), virtual game worlds (Habbo Hotel), and virtual social worlds (Second life and World of Warcraft). Micro-blogging social network Twitter has not been classified in any of the highlighted groups since it is a single example of a merger between two SM types. However due to the rapid growth of 500,000 new members daily, Twitter is one of the most important and promising channels of SM (Raby, 2010).

According to Chaffey and Smith (2008) one of the main reasons that SM has been largely incorporated into modern life and, as a result, into business practices is that the web 2.0 concept has increased in prominence due to the evolution of technologies and communication techniques that have become somewhat of a “mainstream marketing approach”. The acceptance of SM by consumers has complimented the basis for the SM spread (Chaffey and Smith, 2008). Although new SM types are emerging with ever-increasing speed SM marketing has not yet matured. Data overload and lack of insightful SM web metrics are the biggest limitations of SM adoption by organisations. In terms of SM, marketers are forced to stretch their imaginations to create new engaging ways to achieve organisational objectives. SM provides an effective social platform for any type of organisation, regardless of its size. Whereas not everyone can see SM as a marketing tool and an essential part of the integrated marketing mix, most companies which recognise where the future of the web lies embrace SM in their marketing strategies (Tsai, 2009). Successful brands use SM to battle global recession. The number of big brands that have successfully implemented SM, include: Starbucks and their “Starbucks idea” to gather customer suggestions that are subsequently voted for by other users and Sun Microsystems through company CEO Jonathan Schwartz’s blog on corporate strategy and NPD. Bill Marriott and the Marriott International hotel chain produce a blog authored by the company’s chairman and CEO to share stories and photos from his stays in Marriott hotels all over the world while on vacation (Kaplan and Haenlein, 2010).

Social networking sites (SNS) are the most popular SM type in the UK. Already in June 2010 UK internet users made more visits to social networks than to search engines and in the USA SNS account for 15% of all internet visits made last year (WebCertaIn, 2010; Giamanco and Gregoire, 2012). However, in the corporate world, SNS are surrounded by controversial conversations and articles that attempt to justify business value. Chaffey et al (2009) define SNS as “a site that facilitates peer-to-peer communication within a group or between individuals through providing facilities to develop user generated content and to exchange messages and comments between different users” (Chaffey et al., 2009, p.112). The impact of SNS on media consumption cannot be overestimated due to impressive growth rates combined with large growth potential.

The main player in the SNS arena in the UK is Facebook that is reaching the one billion mark globally, meaning that it includes 14% of the world’s population. In the UK alone according to the research conducted by UMPF (2011) Facebook has 37.4 million regular users. Other heavyweights in this category include Twitter that a year ago already had 200 million registered members and LinkedIn, the most professionally orientated of the major sites (Giamanco and Gregoire, 2012). Scott and Peter (2010) have defined LinkedIn as a social network that “enables professional colleagues to connect and collaborate together and in groups” (Scott and Peter, 2010, p.15). Although LinkedIn was created earlier than other major SNS sites it took a long time for this website to gain momentum. However, in 2010 it claimed to have more than 50 million users and in 2011 it had registered its 100 millionth member, adding a million new users each week. Other dominant SM websites in the UK market are YouTube, Google+ with its 90% market share, Wikipedia which contains over 14 million articles and Google+ that has passed 65 million last year (Hird, 2010; WebCertaIn, 2010; Giamanco and Gregoire, 2012).

Towards branding in social media

Branding is a research area that has been studied for centuries and its relationship to other disciplines has been discussed widely. A brand, in its widest sense helps to distinguish the products and services of one organisation from another. Kotler et al (1999) define the brand as “a name, term, sign, symbol or design, or a combination of these that identifies the goods or services of one seller or group of sellers and differentiates them from the competition.” However it is important to note that practitioners often think of a brand in

relation to the level of awareness created amongst the targeted customers. Brand perceptions and brand image are other associations that reflect a brand in the consumer minds. According to Blythe (2006) branding is a “culmination of a range of activities across the whole marketing mix leading to a brand image that conveys a whole set of messages to the consumer about quality, price expected performance and status” (p.89).

The most frequently-discussed question in academic literature is why it is important to develop a strong brand. For example, Keller (2003) suggests that one of the main reasons why brand development is essential for corporate existence is that the brand helps consumers to identify product sources and assigns responsibility to a specific producer or distributor. He also highlights that through different types of experiences with a brand customers learn what it represents. Consequently, they create attitudes and perceptions as to whether a specific brand can satisfy their needs. Once consumers are able to recognise the brand after some exposure to it, any additional need for information during the decision-making process is diminished. Brand development includes building customer-brand relationships to earn loyalty, if what a brand stands for is communicated with consistency (Keller, 2003).

Keller (2003) suggests that since a brand is something that “resides in the minds of consumers” it needs to be placed in these minds. A brand should be treated as a perceptual entity that has its roots in reality. To develop a brand involves teaching consumers and structuring their brand knowledge by using a set of brand elements including brand name and meaning, so that they can identify and differentiate the brand within the product category (Keller, 2003). To create a strong brand, an accompanying marketing strategy must be developed and implemented. The concept of brand equity is one of the leading brand-related marketing theories that sheds light on how intangible brand assets can outweigh tangible assets. An initial definition provided by Farquhar (1998) determines brand equity as “an added value to the firm, the trade, or the consumer with which a given brand endows a product”. Probably the most well-known definition is the one provided by Aaker (1991), who believes that brand equity is a set of brand assets and liabilities linked to a brand, its name and symbol that add to or subtract from the value provided by a product or service to a company and to that company’s customer. Understanding brand equity is essential when discussing the process of brand creation.

The factors that form brand equity are debated in academia and a number of researchers suggest that they include social image, value, performance, trustworthiness and attachment (Lassar et al., 1995). Brand loyalty, brand awareness, brand associations and perceived quality are among other concepts representing brand equity (Aaker and Joachimsthaler, 2000). Aaker (1996) emphasises that brand identity includes a unique set of associations to characterise a brand promise and is of particular importance when building brand equity. He defines brand identity as number of dimensions organized around brand-as-product, brand-as-organisation, brand-as-person and brand-as-symbol.

Perhaps one of the best models that can be used to understand brand equity from a consumer’s point of view is Keller’s customer-based brand equity (CBBE) model (2003). It helps to identify how the consumer’s brand knowledge influences the way they react to marketing activity. The CBBE model is based on the belief that “the power of a brand lies in what resides in the minds of customers” (Keller, 2003, p.59). Customers build a network of brand associations as a result of brand experiences. The aim of the marketer is to ensure that customers develop desired brand attitudes, perceptions and beliefs. Keller (2003) defines CBBE as a difference in the impact that the identification of a specific brand by the customer has on their acceptance of branded products and marketing activities. A brand is believed to have a positive CBBE if consumers respond better to its offerings and marketing communications once a brand is defined. A negative CBBE means that brand identification results in a less favourable consumer response towards brand activities (Keller, 2003). Thus, by changing unfavourable brand attitudes and perceptions towards desirable ones, CBBE can be increased.

Social media and brand relationships

The volume of academic literature that looks into relationships between SM and branding is considerably less than the volume of overall materials about SM. Additionally, scholars that have pointed this out have expressed different opinions. Since the growth of SM has shifted power into the hands of consumers, the opinion that branding has become irrelevant has grown in popularity (Barwise and Meehan, 2010). However, Barwise and Meehan (2010) highlight that rapid SM development has made it more important “to get the basics right”. The consistent delivery of brand promise and creation of a strong brand have proven to be

essential in modern times, when the wide coverage and speed of SM can transform small mistakes into disasters via a rapid snowballing of reputation loss. The estimation of risks related to social media use has become a necessary part of brand development, - because today brand ownership belongs to consumers as much to brands themselves. Therefore consumer brand perceptions have the ability to influence brand reputation and equity more than ever (Booth and Matic, 2011). Manwaring (2011) advocates that social media is evolving far beyond being “just a new marketing and branding tool” and is a driving force for large-scale global transformation, led by socially, politically, and religiously conscious consumers seeking to voice their opinions and use their purchasing power to halt unsustainable business practices. While social media can positively contribute to brand equity and revenue, in the short-term it might even be harmful (O’Brien, 2011). According to Barwise and Meehan (2010), social media imposes threats for brand development in terms of difficulties with keeping up with the pace of innovation and possibilities of getting distracted by SM leading to a lack of strategic direction. To avoid this, organisations need to create a new type of brand manager – ringmasters; integrated thinkers with good digital skills (Spencer, 2010). Another risk related to SM is the potential harm of brand image due to Internet attacks from dissatisfied SM users who have a large variety of tools to enable a multiplying effect and high level of reach. Gaines-Ross (2010) suggests that corporate reputation warfare (the ability to respond effectively to SM attacks) is crucial to a modern organisation. Such warfare is defined by SM training and the creation of networks consisting of independent third parties willing to support a brand in times of attacks (Gaines-Ross, 2010). Additionally, there are a number of less obvious risks that can be controlled via AM police applications. For instance, according to Deloitte’s Ethics and Workplace Survey (2009), employee self-expression through social networks is perceived to be a trigger of reputational risk by more than half of corporate executives (Scott and Peter, 2010). Many modern managers monitor SM behaviour of their employees for purposes of damage control. Inappropriate posts, false representations, unguarded disclosures, copywriting violations or simply grammar mistakes can negatively influence brand reputation. To reduce such risks online communication training should be provided (Giamanco and Gregoire, 2012).

The main opportunity that SM can bring to a brand is identified by Scott and Peter (2010) as the value of SM which lies in relationships built via an open dialogue, - rather than through a controlled monologue. Where before the main aim was simply to deliver message, now it is to initiate a conversation, since the starting point has shifted towards the consumer (Li and Bernoff, 2011). Consequently, SM provides an opportunity to connect in fundamentally different ways, which are beyond the control of manufacturers and retail stakeholders. This has created a new base for brand-consumer communication (Edelman, 2010). If in the nineteenth century a brand emerged as a way of identifying producers, in the twenty-first century it has become a symbol of the relationship between organisations and consumers (Leimeister et al., 2006). “Brand democratisation” means that organisations are becoming facilitators of conversations where consumers are brand’s storytellers, instead of controllers of these conversations (Booth and Matic, 2011). This has been catalysed by the Internet information exchange capability (Neisser, 2006). Online users have identified new possibilities for research, transmission and manipulation of any organisational messages. Members of online communities formed on social networks can share information and influence other members. Highly involved SM participants and contributors became “customer-infomediaries” and co-producers of brand information (Barnatt, 1998; Shao, 2009). Forum members have expert influence over the corporate brand (Baglieri and Consoli, 2009). In return, organisations must enhance the value of online users who originate on-line word-of-mouth via reward systems. Peer-recognition is a powerful motivational tool to be used as part of SM brand development process (Zeisser, 2010).

It has to be noted that the topic of online communities is one of the most discussed in the field of modern academic research. According to Leimeister, *et. al* (2006, p.281) “a virtual community consists of people who interact together socially on a technical platform”. Virtual communities positively influence brand development and brand loyalty amongst community members increases as a result of social and emotional bonds creation. An online community is unique, since it provides a comfortable environment for expressing opinions, learning brand information, building relationships and maintaining network of connections amongst participants (Leimeister et al., 2006). Morgan (cited in Sheth and Pervatiyar 2002) suggests that relationships formed in online communities are based on social bonds and not easily copied by competitors. Therefore they can become a sustainable competitive brand advantage. A sense of community can be strengthened when contributors receive positive reinforcements by receiving comments from other network participants leading to the establishment of concrete community relationships (Joyce and Kraut, 2006). As online communities grow in size, number, and character, marketers are becoming more aware of the value of on-line word-of-mouth and its importance for brand attitudes and perceptions (Bughin et al., 2010). Additionally, Leimeister et al., 2006, Nielsen, 2009 and Barwise and Meehan, 2010 suggest that relationships built on social networks can be a powerful tool of brand enhancement. Consequently, many

marketing and consumer-behaviour commentators believe that online communities enable collaboration between brands and their most loyal consumers to co-produce linking value for the brand, as over time an increasing number of people join online social conversations that can noticeably affect any brand's reputation and equity (Cova and Cova, 2002; Booth and Matic, 2011). This linking value represents a surplus that belongs to brands that have developed a community of enthusiast consumers, as opposed to those who have not (Cova and White, 2010). It is important to highlight that Web 2.0 technologies significantly empower consumers that belong to communities in their relationships with companies that manage their favourite brands (Uncles, 2008). This has led customers not only to collaborate with those companies, but also to produce their own interpretations of meaning and strategy associated with the brands that they prefer (Wipperfurth, 2005).

As Aaker and Smith (2010) suggest, SM characteristics can lead to a "Dragonfly Effect", based on a ripple effect that sees a single action leads to a major result, if the multiplier occurs as a result of emotion sharing. This can be used as an effective tool of brand-building activities that are aimed at raising brand awareness or changing brand attitudes. Transmitting emotions via particular brand messages on SM helps to reach a large number of people in a relatively short time and leads to an emotional contagion phenomenon. Consequently, it increases the spread of positive feelings towards the brand (Aaker and Smith, 2010). An opinion that SM has a strong impact on brand awareness, trial and sales is widely shared by researchers.

In terms of other SM-related business opportunities, Barwise and Meehan (2010) highlight the SM role as a very insightful consumer research tool. This underlines a shift in the marketplace which has resulted from the growth of the SM phenomenon. Emphasis has moved from traditional product-orientated market research towards ethnographic research to discover the role brands play in consumer lives. It has been evident that SM has significantly widened consumer research opportunities, - and therefore must be used in a process of brand development (Barwise and Meehan, 2010). Another SM-related opportunity is its impact on the innovation process. The involvement of product users into the product development process has transformed it (McAfee, 2009). Barwise and Meehan (2010) support this opinion by suggesting that SM tools can significantly enhance customer engagement and collaboration in a varied number of ways and product development is one of these. According to McAfee (2009) many companies nowadays allow everyone to bring different ideas from trademarks to engineering and also encourage consumers to participate by establishing rewarding systems. In addition, enterprise 2.0 tools are designed to help with these more open innovation processes and provide an opportunity to gather ideas on a global scale.

Aral and Walker (2011) noted that as everything goes viral, the products that have viral features closely related to the SM tools are likely to be subject to quicker market adoption. Integration with these tools improves interactivity of the company's offerings. By simply adding a "share" button, peer-to-peer influences over the product purchase can be increased by 400% (Aral and Walker, 2011). As a final part of this paper the "Long Tail Theory" deserves attention. According to Anderson (2004) there is a potential amongst products that are not big "hits" or "blockbusters". They can bring a significant profit if sold to the right audience since the internet allows for a reduction of storage costs leading to fewer cost constraints. The distribution costs of goods that can be sold in a digital format are much lower than for physical goods resulting in a longer "tail" (Anderson, 2004). In his article Anderson (2004) suggests that obscure products will erode a large part of the share that traditionally belonged to a relatively small number of popular products.

In her later article "Should you invest in Long Tail?" Elberse (2008) points out that even though it cannot be denied that wide-spread e-commerce has extended consumers access to product ranges, companies should not completely turn away from making profit on hits and focusing on demand for obscure products. Elberse (2008) highlights that it is not easy to make a profit from the tail and that companies still make most of their money from a relatively small number of hits that are in greater demand. Her research has also identified that the most frequent customers are buying hits and purchasing from the tail, therefore it makes sense to offer both types of products (Elberse, 2008).

CONCLUSION AND FURTHER RESEARCH

With dramatic increases of the intensity of SM use by consumers all over the globe no brand can afford not to be represented on various SM channels. Since SM tools are changing the way consumers view and relate to brands by organising large brand communities marketers must aim at creating a sense of belonging inside these communities. In spite of the fact that SM has shifted the boundaries and became a trigger and platform

for new marketing strategies, one of the main challenges faced today by marketers is the creation of the ideal mix between traditional marketing methods and newly discovered consumer touchpoints. Additionally, such a traditional part of the overall marketing strategy benefits from the possibility of appreciating new customer perspectives, for example through access to real-time data. Moreover, as customers are becoming more reachable and visible, customer profiling and targeting must become more precise and efficient.

It is worth mentioning that with consideration of the Long Tail Theory, business owners and marketers might want to reconsider their product range. Following this theory, products do not need to be popular amongst other customer segments if they satisfy needs of the chosen niche. Also it means that although some of the items are not major hits, they still attract some customers that would not be attracted otherwise and together they yield more profit than a small number of popular items. Consequently, such companies are advised to concentrate on the creation of less-popular items just as much as on the popular ones. To sum up, this paper has covered theoretical perspectives of the impact of SM on brand perception. Further research directions might include a deeper investigation of communities as specific networks within SM networks to research their characteristics and roles for both brands and consumers. Especially, influence of opinion leaders within these communities on brand perception must be investigated. A number of authors, for example, Cova and White (2010) and Leimeister *et al* (2006) had a look at the role of virtual communities. However, the perspective of communities as networks within networks and the importance of opinion leaders in the level of brand conversations remain to be investigated.

THE RELATIONSHIP BETWEEN INCOME AND DEMAND FOR ENERGY COMMODITIES IN MALAWI: THE CASE OF SOUTH LUNZU TOWNSHIP

Betchani H. M. Tchereni
North West University, South Africa

ABSTRACT

This study analysed the effect of household income on demand for electricity and fuel-wood in South Lunzu Township of Blantyre city, Malawi. Survey data was collected through a semi-structured questionnaire. Using Engel function analysis employed in ordinary least squares framework, the study found a negative relationship between fuel-wood and income and a positive relationship between income and electricity expenditure. This shows that fuel-wood is regarded as an inferior commodity and electricity is a preferred energy facility. Other factors that explain the behaviour of choice between fuel-wood and electricity included home size, perception on well-being, age of the head of household, education of the head of household, and total expenditure. Campaigns aimed at changing the mindset of people such as those regarding renewable energy as solutions for rural areas only need to be intensified.

INTRODUCTION

The energy ladder theory suggests that the consumption of energy commodities can be modelled as the ascent of an energy ladder (Barnes and Floor, 1996; Rajmohan and Weerahewa; 2007). The climb follows a transition from the utilization of traditional, dirty and depletable energy resources such as biomass to a mix of modern and cleaner energy resources. The transition from and/or to the inferior types of energy depend on a number of factors. For households, as income improves, the energy basket also changes from biomass to modern resources with superior properties such as electricity. The agricultural and industrial sectors also move to superior energy resources as levels of development and civilisation improves. Households decision on which energy facilities to use therefore is modelled as a function of income. Cleaner and efficient energy facilities are obtainable only if households have higher levels of income.

The concept however seem to suggest that income is the single most important factor that determines the transition through the levels of energy consumption. Generally, it is believed that those energy resources which are cleaner, efficient and effective at the same time are the most superior to those which are not. Choice of energy facility can be a function of many other factors such as age of the population, education level, availability of the resource and culture (Mekonnen and Köhlin, 2008).

The study reported in this article contributes to the understanding of energy usage patterns of households in a township of South Lunzu in Blantyre, Malawi. The main aim was to analyse the behaviour of households as they go about making decisions on which energy facility to choose for home use. Two major energy facilities, electricity and wood are analysed. The study puts the theory of the energy ladder to the test for the case of a Malawian Township.

The article is organised as follows, section 2 provides the methodology followed by section 3 which provides the empirical results and interpretation. Finally, section 4 provides the conclusion.

LITERATURE REVIEW

Some empirical studies have shown that the theory of the energy ladder is objectionable especially considering the model's disregard of commonly observed multiple fuel uses and the persevering adherence to established, traditional techniques even in the face of modern alternatives (Masera et al, 2000; Jingchao and Kotani 2010; Barnes and Floor, 1996). In recent times, there has been a realisation that households tend to use multiple energy resources for different purposes in urban poor areas (Jingchao and Kotani, 2010). This is called fuel stacking. Fuel stacking is regarded as a hedging mechanism against possible failures in the supply chain of other cleaner fuel types especially in richer households. The problem with poor communities is the additional cost associated with having a variety of energy choices. As an example, the supply of liquid fuels such as petrol and diesel depends on availability of foreign currency, which is usually scarce in poor countries. Households in transition tend to use electricity for simple and inexpensive functions which do not require high amounts of voltage such as lighting, fridge, radio, and television. Activities that are perceived to consume more electricity such as cooking, water heating and ironing of clothes are done using less efficient and relatively dirty energy resources such as fuel-wood and charcoal (Barnes and Floor, 1996; Modi et al, 2006; Mekonnen and Köhlin, 2008).

There is also energy resource switching among households in poor countries. However, previous research shows that for such switching to take place, one of the most important determinants is the availability of other cleaner and therefore superior fuels (Mekonnen and Köhlin, 2008). Nevertheless, the energy ladder approach serves to explain two dominant problems in the energy sectors of less developed countries. Firstly, there is a widespread production and use of traditional energy sources which poses economic, environmental and health problems. In developing countries most people are poor and this limits their access to modern energy resources. They still depend on the traditional non-renewable resources. Secondly, the access to modern energy sources, such as electricity, petroleum or gas products, is very disproportionately strewn. Rural areas sometimes use firewood because they are too far away from the grid and/or their means of getting money is through sale of subsistence agriculture products that is expected once in a year. Cleaner energy facilities therefore are deemed as more of a luxury than a necessity thereby rendering global efforts such as the Kyoto Protocol of less value.

It is therefore imperative that energy projects for developing countries would have to specifically find strategies that would have two objectives; first to make the production and use of traditional fuels more sustainable, and secondly to enhance a social transition to clean, modern fuels (Modi et al, 2006). With 37% of Malawians living below the poverty line defined by \$1 a day, access to and use of modern forms of energy remains low. Biomass which comprise of all organic and traditional energy resources such as firewood, charcoal, animal dung and crop residues, account for 97% of Malawi's total primary energy supply; of which 59% is used in its primary form as firewood (52%) and residues (7%), while the remaining 38% are converted into charcoal. In 2008, 43.4% of all households in urban areas used charcoal, 41.8% firewood and only 13.6% used electricity for cooking (Kambewa and Chiwaula, 2010).

In order to achieve a positive social and economic transition towards efforts of successful globalisation especially the inclusion of least developed countries, Barnes and Floor (1996) stress the roles of demand and local participation as driving forces. The successful delivery of energy services is thus strongly related to the knowledge and understanding of local needs. If only a rural leader is convinced that respiratory infections will be eliminated if people adopt cleaner energy, that there will be more water pumped and supplied to his/her people and that health services at the local clinic or health centre will improve, then value will have been

RESEARCH METHODOLOGY

The data for this study was collected at the household level in South Lunzu Township in the city of Blantyre, Malawi between December 2011 and January 2012. The sampling technique was multistage starting with a purposeful country selection of Malawi because of its economic position being one of the poorest countries in the world. In Malawi, Blantyre city was chosen because for a long time, it had the highest population compared to other cities. Further, Blantyre is the hub of economic and manufacturing activities implying that the demand for energy both at the household and industry level was expected to be higher.

A standard questionnaire which asked specific questions that addressed the energy sector with a particular attention to renewable energy, energy expenditure at the household level, types of energy facilities normally used and access to modern facilities, was administered. Using random sampling where one in every five households was visited, a total of 319 questionnaires were administered using face to face interviews to the head of household.

Empirical model

To estimate demand elasticities, many studies in the past have adopted a complete demand system approach where the quantity demanded of a particular type of commodity, typically dividing between food and non-food items, are regarded as composite goods. These are called one-step approaches in the literature (Mustapha et al 2001, Radam et al 2005). However following Yeong-Sheng et al (2008), one of the best approaches in econometrically estimating commodity demand functions is to consider a two-step approach which first of all divides the consumption decision between food and non-food commodities and then the second stage considers the specific commodity, in this case energy. Consequently this study follows Rajmohan and Weerahewa (2007) where it was assumed that households first make their decision on the allocation of the total budget on composite commodities broadly defined as food and non-food items. The non-food items are divided between energy and non-energy goods. Next is to decide on which energy items to allocate a share of their budget. Among the energy commodities, a decision is also made regarding the total energy expenditure and how much to allocate on individual resources within the energy budget.

In microeconomic theory, Engle curves explain the relationship between the quantity of a commodity demanded and the income of the household holding other factors such as prices at constant levels. Budget elasticities calculated using the coefficients estimated in the Engle function are free measures of responsiveness of quantities demanded to a change in the total budget. In our case, the use of Engel functions assisted us to categorise the energy facilities as inferior, necessity or luxury based on income levels. The first stage is an estimation of an Engel function which is used to derive income elasticities. Following Yeong-Sheng et al (2008) equation (1) below is specified.

$$S_i = \alpha_0 + \alpha_1 \ln X + \sum_k \gamma_k H_k + \varepsilon \quad (1)$$

For purposes of the present study, the terms in equation number (1) above are;

S_i ; Expenditure share of energy commodity for each household i ,

X ; total expenditure of both energy and non-energy consumer goods and services,

H_k is a set of dummy variables which are household specific capturing both structural and demographic attributes of the respondents in the survey,

ε is an econometric error term which is assumed to be normally distributed with a mean of zero and a constant variance.

A separate model for each of the energy resources under scrutiny was estimated. Thus an Engel function for Fuel-wood and Electricity were estimated separately from each other.

RESULTS

In table 1, Household size, which was represented by *hsize*, was used to measure the number of inhabitants in a dwelling unit. The respondents were asked to provide the number of permanent members of the household who were staying at the dwelling unit at the time of the interview. Permanent residence included those members of the household who were temporarily away such as students in boarding schools and patients admitted in hospitals. On average, each household had 5 people with a maximum of 14 and minimum of 1. A standard deviation of about 2 indicated that there were little disparities in the number of people in each of the households visited in the survey.

Source: Survey data collected in South Lunzu, Blantyre.

In terms of willingness to pay for a clean environment represented by *wtp_clean*, a standard deviation of 3516 indicated that there were large disparities in the amount of money respondents were willing to part with to have their environment clean. This is easily observed from the table where one respondent was willing to pay up to MK50,000 (about US\$310 with a foreign currency exchange rate of MK161 = US\$1 as of December 2011 and January 2012) and yet others had no willingness to pay at all. On average however, the willingness-to-pay for environment clean was MK880.00 (US\$5.5 or ZAR44). Related to willingness-to-pay for a clean environment, respondents were asked whether they were willing to pay for a smoke free environment. This was in regard to smoke from burning of wood and factories nearby. Willingness-to-pay for a smoke free environment was represented by *wtps_moke* and in table 1 the minimum was 0 and the maximum was MK10,000 (US\$71) with a standard deviation of 1123. The average willingness to pay for a smoke free environment was MK620 (US\$3.8).

Taking income earned by the head of household to proxy household earnings, the highest amount was MK570,000 (about US\$3519) per month with the lowest making nothing at all. The average income for the sample's households was MK41,630 (about US\$257) per month. There were noticed income inequalities among the households as evidenced by a large standard deviation of 61872. Such a disparity in income distribution does not come as a surprise as the affordability of plots and accommodation in general attracts dwellers from all income groups.

Education was measured by the number of years of formal schooling a head of household completed as of the time of the survey. It was represented by *educ*. Where it was reported that a head of household repeated a school year, it was recorded as one year. Therefore, the respondents were asked to state their level of education from which the number of years of formal schooling was inferred following Malawi's education system. An individual would have spent 8 years of formal schooling if they stated that they had a Primary School Leaving Certificate, 10 years if they had a Junior Certificate of Education, and 12 years if they had a Malawi Schools Certificate of Education (MSCE) which is equivalent to O-Levels in the British school system. The most educated head of household had finished 16 years of progressive schooling, leading to a first degree, while the least educated had only 1 year of schooling. On average, head of households had 11 years of formal schooling, basically implying the completion of, at least, Junior Secondary School level.

Table 2 shows the results of the Ordinary Least Squares regression for Engel function analysing the effect of total expenditure on energy resources; income; employment status; household size; home size; respondent's perception on their well-being; age of the head of household; gender; marital status of head of household and education level of the head of household and marital status on electricity expenditure. According to the energy ladder hypothesis, electricity is an energy resource that represents high quality in the sense that it is clean and efficient (Barnes & Floor, 1996: 467).

Compared to fuel-wood, electricity was found to be a normal energy commodity in the sense that higher income households used more electricity than lower income households. As table 8.3 shows, there was a positive relationship between *ebs_elec* and *eexp*. This relationship was also statistically significant at the 1 percent level of rejecting the null hypothesis that there was no influence and relationship between expenditure on electricity and total expenditure on energy basket. The slope coefficient was 0.0000336 with an income elasticity of demand for electricity estimated to be about 0.5346 indicating that on average, increasing household income by 1 percent would lead to a 0.53 percent rise in the demand for electricity as an energy commodity.

The relation between expenditure on electricity and income was also positive and statistically significant at the 1 percent level to reject the null hypothesis that there was no influence and relationship between the two variables. The income elasticity of demand for electricity was about 0.15 and positive also. This means that a rise in income by 1 percent was associated with a rise in the demand for electricity of 0.15 percent holding other factors constant. Although the relationship was inelastic, the positive relationship conforms that for South Lunzu Township in the city of Blantyre, the energy ladder hypothesis holds. The statistically positive relationship between income and expenditure on electricity could lead to a conclusion that electricity was a 'normal good' in the sense that increases in income were associated with more households using it. Those with lower incomes tend to use less electricity but as their incomes increase, they shift from traditionally inefficient resources such as firewood to cleaner ones to which hydro electric power belongs

Home size as represented by hmsize was statistically significant at the 1 percent level. It therefore implies that the bigger the house the more likely the household was demanding more electricity. The elasticity of demand for electricity due to changes in home size was estimated to be 0.372 with a slope coefficient of 0.0008. Electricity therefore was found to be inelastic with small changes in the size of a dwelling unit. A 1 percent increase of a dwelling unit was associated with a 0.372 percent rise in demand for electricity.

Source: Survey data collected in South Lunzu, Blantyre.

The perception on poverty represented by 'poor' was statistically significant at the 10 percent level of statistical significance to reject the null hypothesis that believing to be poor might lead to less demand for electricity. This relationship was negative meaning that the more an economic agent considers themselves to be poor the less electricity they would demand as a regular source of energy. The slope coefficient was -0.0434 with an elasticity of -0.1379.

There was a positive relationship between electricity demand and the level of education of the head of household which was also statistically significant at the 1 percent level of significance to reject the null hypothesis that education level does not influence expenditure on electricity. Education level of the head of household was also the only variable that had an elastic relationship with demand for electricity with an electricity value of about 1.69 and a slope coefficient of 0.025. This means that increasing the education level of the head of household by 1 percent could lead to a 1.6 percent increase in the demand for electricity in South Lunzu Township. Four variables namely gender, marital status, employment status and household size were statistically insignificant to reject the null hypothesis that they did not influenced the demand for electricity among the respondents even at the 10 percent level of significance.

As the results show the slope coefficient between lneexp and ebs_wood was -0.15535 meaning that increasing the total expenditure on energy facilities by 1 percent will lower demand on all wood energy commodities by MK0.0016. In elasticity terms, a 1 percentage increase in total expenditure on energy facilities will lead to 0.22 percent decrease in demand for fuel wood. In this case the demand for fuel wood is inelastic to changes in income for the people of South Lunzu in Malawi. Demand was responding by less than the amount of expenditure change. This means that although there is a negative relationship between energy expenditure and demand for fuel wood, it cannot be concluded outright that fuel wood is an inferior commodity. There is an element of it being a necessity to the people probably indicating the demanded commodity coming from fuel-wood which is energy. Energy is a necessity without which life can be impossible. In addition, the availability and pricing of the commodity favours those that are poor thereby making it more inelastic to any small changes in income.

However, there was a negative relationship between household total expenditure on energy on the one hand and fuel wood as an energy facility on the other hand. The implication of this result is that wood is an inferior energy commodity whose demand decreases as income level of a household improve. This gives hope that in true sense although most people in Blantyre use fire wood and charcoal for their cooking needs, it is not by choice but rather their level of income is low that they simply use biomass for purposes of survival. Given more income or indeed as microeconomic theory of price predicts, by putting in place a mechanism that will ensure that the price of other more superior energy facilities is lower enough through subsidies for instance, will influence a migration from biomass to cleaner fuels.

The model is generally reliable as an explanation in the variability of the demand for energy facilities. The F-statistic and the adjusted R-squared were all relatively good. Therefore the null hypothesis is rejected in favour of the alternative that collectively, the independent variables namely total expenditure on energy facilities, home size, employment status of head of household and income are important. This model can be relied upon to explain consumer behaviour of demand for fuel wood in Blantyre holding other factors constant

CONCLUSION

The major objective of this paper was to analyse the effect of income on the demand for wood and electricity facilities in Blantyre, Malawi. A cross section data set from a sample of 319 households was analysed using ordinary least squares. The results in this study indicate that contrarily to other hypothesis, respondents were willing to substitute cleaner energy facilities such as electricity and solar with higher levels of income. Firewood was found to be an inferior commodity in the sense that higher levels of income led to less of these commodities being opted.

For sustainable development to be achieved, the study recommends three main policy issues. First is the civic education programmes to be enhanced especially regarding the benefits of renewable energy and that it is not for the rural areas only but also for the urban communities. Secondly, deliberate trade and tax policies aimed at reducing the price of renewable energy are recommended. For instance, zero import duties on all renewable energy facilities must be adopted.

Research, including the current one, must understand that rural people do not require modern energy for cooking, television, communication purpose, but rather for the basic social amenities first such as agriculture, water, and health facilities. The other uses are secondary and more of luxuries. Consequently, energy's impact to development should be assessed in the capacity of a contributing factor. The implied yardstick of such assessment is the extent to which interventions contribute to meeting local needs.

VALUING THE IMPACT OF POLLUTION ON THE POOR: THE CASE OF BOPHELONG

WCJ Grobler
North-West University, South Africa

ABSTRACT

This paper reports on a comparative study of poverty and the social cost of pollution among poor households in Bophelong. The level of poverty was measured and compared with the cost of pollution as revealed by citizens of Bophelong through a household questionnaire. To do this, the level of poverty was determined by looking at the Household Subsistence Level (HSL), while the social cost of pollution was determined using Contingent Valuation methods. These methods are generally termed contingent valuation (CV) methods and are used to elicit from respondents what they would be willing to pay for a cleaner environment or what they would have to be paid to accept the pollution. Further, the study performed regression analysis to determine the effect of pollution on poverty levels. Pollution was found to be a problem in the area as reported by respondents. Respondents valued pollution higher in 2013 compared to 2003. It is important for policy makers to be aware of the cost of pollution to the poor as they are more vulnerable due to the inability to cushion themselves against any negative consequences.

INTRODUCTION

The environment can be viewed as a composite asset that provides a variety of services. Its importance lies in its ability to provide the life support systems that sustain humanity's very own existence, but it is an asset nonetheless (Tietenberg, 2000, Terblanche, et al, 1994). The advantages in having a clean environment can be seen through global efforts to have it remain clean. In many parts of the developing world, poverty combined with rapid population growth is leading to widespread environmental degradation - primarily forests, soils and water. People living in subsistence economies are faced with few alternatives to depleting their natural resources (Tietenberg, 2000; Terblanche et al, 1994). With the advent of industrialization come the negative consequences of pollution and environmental degradation. South Africa is no exception to the air pollution problems caused by increased industrialization. The effects of air pollution are felt throughout the country particularly in areas of heavy industrial development such as the South Durban Industrial Basin and the Vaal Triangle. This is also evident in areas where households rely on non-electric sources of energy such as kerosene, dung, and coal for household energy needs (Terblanche et al, 1994).

The problem of pollution in urban areas has been exacerbated by a global increase of people moving from rural areas to cities. Nearly half of all people in the world now live in cities; an increasing number of them travel enormous distances every year by private car and in aircraft. In the developed world, technology has transformed patterns of work and family life, communications, leisure activities, diet and health. Similar transformations are well under way in the more prosperous parts of the developing world (UNEP, 2000). Rapid urbanization in South Africa has resulted from migration of people from rural areas into cities in search of jobs and a better life.

The fact that air pollution causes ill health and death is well recognized. Air pollution has both acute and chronic effects on human health. Health effects range anywhere from minor irritation of eyes and the upper respiratory system to chronic respiratory disease, heart disease, lung cancer, and death. (Hamilton, 1995:108). Air pollution has been shown to cause acute respiratory infections in children and chronic bronchitis in adults. It has also been shown to worsen the condition of people with pre-existing heart or lung disease. Among asthmatics, air pollution has been shown to aggravate the frequency and severity of

attacks. Both short-term and long-term exposures have also been linked with premature mortality and reduced life expectancy.

The past two decades has seen a growth in studies attempting to value environmental goods such as pollution and water quality by calculating their social cost to society (Hanneman, 1994:19). Most of these studies are based on health economics, where it is rather common to use the cost-of-illness (COI) framework to quantify the costs of different health risk factors (e.g. air/noise pollution, smoking, drug/alcohol addiction etc) in monetary terms. This includes measuring and quantifying the probability of sickness and its associated cost amongst the affected. A study by the World Health Organisation (WHO,2000) estimated that indoor air pollution alone kill a million children annually in South Asia and Africa, inflicting a particular severe impact on poor families. Today although everyone might suffer from the effects of increased pollution, etc, poor people are especially vulnerable since they are closer to the margin of survival and can less afford to cushion themselves from the impacts of pollution.

Given the above synopsis of the consequences of pollution, it was necessary to understand the social cost of pollution amongst poor households. In this paper, the level of poverty in Bophelong and its associated environmental value is studied. The social cost of pollution as revealed by the residents of the area is studied against the backdrop of important issues, such as urbanization and environmental degradation. A general understanding of poverty is also provided as the basis for the understanding of the findings of this comparative study.

LITERATURE ON POLLUTION AND POVERTY

Poverty can mean different things to different people. In popular discourse, poverty is a concept that captures a range of meanings. Poverty has usually been conceptualized as a state of being, characterized by a lack of income that leads to an inability to provide an adequate level of basic necessities. While ultimately income is important, the critical underlying resources that produce income are the assets that the poor have access to and control over in pursuing their livelihood strategies (UNDP,1997).The 1980's and 1990's saw publication of studies indicating that low income communities were being affected disproportionately higher by environmental hazards(Jacobs, 2001; Kammen,1995; Kopp et al,1997). In the 1990's and 2000's there was an increase in studies highlighting the impact of pollution on the poor (Bullard ,1995). In most African countries atmospheric pollution has only emerged as a problem in the past few decades. Its severity and impact is still largely unknown (Berk &Schulman,1995).

For poor people especially, health is also a crucially important economic asset. Their livelihoods depend on it. When poor people become ill or injured, the entire household can become trapped in a downward spiral of lost income and high health care costs. Investment in health is increasingly recognized as an important means of economic development and a prerequisite for developing countries. This is a particularly important consideration for poor people due to the need to break out of the cycle of poverty. Good health contributes to development in a number of ways: it increases labour productivity, educational attainment and investment, and facilitates the demographic transition (OECD,2003). An important issue relates to valuing the health impacts of air pollution. The study reported in this article was aimed at measuring the social cost of pollution among poor households in a South African township. This valuation is usually done using 'willingness to pay' or 'cost of illness' approaches (Drummond et al, 2005). The methods used to determine the social cost of pollution are based on welfare economics and consumer behaviour. These methods are widely used and accepted as a scientific way to determine social cost of different commodities.

The approach used in this article is a survey-based stated preference technique, where respondents are asked to place a monetary value on a good presented in a hypothetical scenario. These methods are generally termed contingent valuation (CV) methods and are used to elicit from respondents what they would be willing to pay or what they would have to be paid to give it up. The contingent valuation method is referred to as a stated preference method, because it asks people to directly state their values, rather than inferring values from actual choices (Atkinson and Mourato, 2008; Bateman et al,2003). The contingent valuation method (CVM) is used to estimate economic values for all kinds of ecosystem and environmental services (Carson and Michell, 1993). This method involves asking people directly, in a survey, how much they would be willing to pay for specific environmental services. People can also be asked for the amount of compensation they would be willing to accept to give up specific environmental services (Carson,2000; Berk and Fovell,1999 417; Portney, 2007).

A survey questionnaire was used to determine the “willingness to pay” or “willingness to accept” of respondents with respect to pollution. In the study respondents were asked if they have had the money, what they would be willing to pay extra to avoid pollution etc. This data was then used to calculate the social cost of pollution.

BACKGROUND OF THE STUDY AREA

The study was conducted in Bophelong, semi-urban residential township in Southern Gauteng. Bophelong is a former black township on the outskirts of the industrial town of Vanderbijlpark. It was established in 1955. The area belongs to the Emfuleni Municipality, on the southern tip of the Gauteng Province in South Africa. In the late nineties, the area was extended with 10,000 new low cost (RDP) houses. Most of the people who settled in the new houses were poor – those who could not previously afford a house. The population in Bophelong is estimated at 37,779, and the number of households is estimated at 12,352. The average household size in Bophelong, calculated from Statistics SA data (2007) is three persons per household. The average household size for Emfuleni as a whole is 3.52.

The size of Bophelong is approximately 9 square kilometer with a shopping complex and informal shops and markets. A total of 3 primary Schools and 3 secondary schools can be found in Bophelong. There is however no recreational facilities in Bophelong. Several studies have found increased levels of poverty in Bophelong. Sekhampu (2004), in his study found 62 percent of the population to be living below the poverty line. A follow up study by Slabbert and Sekhampu (2009) revealed that 66.3 percent of the residents of Bophelong are poor and that the unemployment rate is 62.2 percent. Fifty four percent of the poor were found to be female. Dubihlela (2011) found a poverty gap index of 0.53 among female-headed households in Bophelong, meaning that on average, households have a shortfall of 53 percent of their income to be placed on their respective poverty line.

METHODOLOGY

The research was based on a quantitative survey method using questionnaire interviews. Maps were obtained for the different areas of Bophelong and a stratified sample was compiled by taking into account the geographical distribution and concentration of people in different areas of the township. Plots/sites at which field workers were supposed to complete questionnaires were identified individually from the map before the field workers went out. However, where people could not be obtained for an interview, or where it was impossible to trace the house, a next pre-selected household was interviewed. Respondents were under no obligation to participate in the survey if they wished not to do so. The questionnaire included information on demographics, participants’ income and expenditure patterns and their general view about their environment. The opinions of the residents on the following environmental issues were also tested. Questions related to the following were asked:

- the cleanliness of the environment and responsibilities to clean it
- air and dust pollution and responsibilities to reduce levels of this pollution
- noise pollution and responsibilities for reducing it, and
- the value attached by residents to different kinds of pollution

Participants

A total of 300 households were interviewed by four fieldworkers. All the households approached were willing to partake in the survey and 300 questionnaires were completed in September 2003 and again in May 2009. Experience in previous surveys conducted by the Employment Research Unit (ERU), Vaal Research Group (VRG) and other institutions (e.g. Bureau of Market Research) has shown that samples of this size with a low refusal rate supply statistically reliable data within reasonable limits.

Measuring poverty

Following the guidelines of the World Bank, a poor household is defined as a household of which the combined income of all its members is less than the Household subsistence Level (HSL) as determined for the specific household. If the combined income of a household is described by y_i and the poverty line (HSL) of the same household is described by z_i , the extent of poverty, P_i , of this household is described by $P_i(y_i;$

zi) (Slabbert,2004:47). The headcount index is defined as the fraction of the population below the poverty line. In this report the headcount index is adapted to indicate the fraction of households that fall below their individual poverty lines, and is described by means of the equation (Ravallion,1992).

Using the 2000 Income and Expenditure Survey data, Statistics South Africa estimated that when consuming the kinds of foodstuff commonly available to low income South Africans, it costs R 211(\$26.37) per person every month to satisfy a daily energy requirement of 2261 kilocalories. This means that R211 (\$26.37) is the amount necessary to purchase enough food to meet the basic daily food energy requirements for the average person over one month. Another consideration is the need by households for other goods and services beyond food in order to meet basic needs. This includes accommodation, electricity, clothing, and schooling for children, transport and medical services, amongst other things.

The cost of such essential non-food items were estimated at R111 (\$13.88) per capita per month. Adding these figures together (R 211 and R111) gives an estimate of the minimum cost of essential food and non-food consumption per capita per month. It gives a poverty line of R322 per capita per month in 2000 prices (Statistics South Africa, 2007). When increased with inflation, the threshold amount to R570 in 2010 prices (Statistics South Africa, 2011). For this study the poverty line was adjusted for inflation and calculated at R593 (\$74) per capita per month. Statistics South Africa suggests that expenses attributable to children and adults in poor households are of similar magnitude. By estimating the cost of an additional male/female of various ages when added to a baseline household of two adults, it can be shown that the cost of a child in South Africa is roughly the same as the additional cost of an adult. This suggests that the additional complexity of adult equivalence calculations may be unnecessary (Stats SA, 2007).

RESULTS

Characteristics of the sample group

The gender distribution of the sampled population showed that the majority (52.7 per cent) of the sampled population were female. Regarding the composition of households in terms of the status of members of the family, the survey results showed that 11.3 per cent of household members are fathers, compared with 20.8 per cent mothers. This indicates an increased likelihood of single parenting. The percentage of sons and daughters in the sample population was 26.3 per cent and 26.7 per cent, respectively. Further analysis shows that 11 per cent of the population falls into the category of “others”, which was used to account for grandchildren and other household inhabitants (related or not). Figure 1 shows an analysis of household composition. Considering the average length of stay of respondents, 38% of Bophelong’s residents moved into the Vaal Triangle in the last 10 years. Of the sampled population 76.5% were below the age of 40, which is the age where people in general are the most productive. The number of persons per household varied from 1 to 123 members. The average household had 5 members. There were greater variations in household income, with the lowest household income recorded at R100 (\$11) per month and the highest at R22 000 (\$2400). The average number of years of schooling of the respondents was 6.2 years, which equates to primary schooling education.

Poverty status of sampled households

Making use of the methodology as explained, the level of poverty in Bophelong was determined. The percentage of households below the poverty line in Bophelong was 66.3%. The closer proximity of the township to the industrial town of Vanderbijlpark allows for access to low-paid household jobs like gardeners and domestic servants. Although this allows for a lower unemployment rate, it does not reduce the level of poverty at all. Households in Bophelong are therefore just as poor as the average townships household in the Vaal Triangle.

Figure 1 portrays the distribution of poor households below the poverty line. If most households earn 90-100% of their own HSL (Household Subsistence Level – which is used as the poverty line), this would indicate that the poverty is not very severe. Figure 4, however, shows that 47.6% of all households in Bophelong have an income of less than 50% of their HSL, which indicates a high degree of poverty. Regarding the gender distribution of the poor, 55.8% of the poor population is female and 44.2% male. It seems that the female population is slightly more affected by poverty than the male population.

Figure 1: Distribution of the poor below the poverty line

Pollution and the social cost of pollution

Three areas of environmental issues were analysed; namely the extent households are affected by or view littering, air and dust pollution, and noise pollution. Figure 2 shows the opinion of the residents of Bophelong about the state of the environment in terms of littering. Of the surveyed population, 81% regarded the environment as polluted and dirty.

Figure 2: Opinions about the Environment

The greater majority of respondents (91%) were of the opinion that something should be done about cleaning the environment. On a question of who should be responsible and take the initiative to clean the environment; 40% regard the municipality as responsible, and 38% are of the opinion that a campaign involving the whole community should be organised. In measuring the social cost of pollution an average monthly Rand value of R236 per household was given. This is the average amount households were willing to pay to have a clean environment. Figure 3 shows the number of people affected by air pollution.

Figure 3: Opinion about Air Pollution

When considering dust pollution the number of households affected by dust pollution 11% survey indicated that they are not affected. Figure 4 shows responses to the impact of dust pollution in the area. The average monthly Rand value that an average household attaches to clean air is R56 and to a dust-free environment R52. According to Figure 5, 47% of the respondents indicated that they are affected by noise in

Bophelong. The average monthly Rand value that an average household attaches to a quiet environment is R31

Figure 4: Opinion about Dust Pollution (%)

Figure 5: Opinion about Noise (%)

As shown in figure 3, a clean environment is seen as being of a much higher priority than a smoke-free, dust-free or quiet environment. However, taking into account the percentage of households that are affected and the average amount they are willing to pay to live in a clean, non-polluted, dust-free and quiet environment, the monetary value (annual social cost) of pollution can be calculated. When looking at the social cost of pollution revealed by the households, it shows that respondents value air pollution more important than a clean environment, dust and noise pollution. Table 1 compares the revealed social costs in the various categories of interest

Table 1: A Comparison of the Social Cost of Pollution

Pollution	(millions)
Environmental pollution (littering)	R 7 700 000 (\$855 556)
Air pollution	R 8 900 000 (\$988 889)
Dust pollution	R 8 800 000 (\$977 778)
Noise pollution	R 3 700 000 (\$411 111)

CONCLUSIONS

The study reported in this article clearly shows that policy makers need to make sure that they understand that poorer communities cannot cushion themselves against the impact of different types of pollution. It is also important to note that poorer communities value the impact of pollution high and that even when poorer communities become even poorer, pollution may still be important to them. It was shown in this study that Bophelong residents are poor. In this regard 47.6% of all households in Bophelong had an income of less than 50% of their HSL. The poverty gap ratio was recorded at 0.49, indicating that on average poor household's lack 49% of the income to attain a level equal to their poverty line.

When considering the opinion of a clean environment more residents indicate that the environment is dirty and untidy. Policy makers need to take the urgent need of the poor in consideration and the case of Bophelong is again an example of a poor community with a need of a cleaner environment.

THE IMPACTS OF EMPLOYEE SERVICE ATTITUDE ON SERVICE QUALITY, CUSTOMER SATISFACTION AND CUSTOMER LOYALTY IN THE HOTEL INDUSTRY

Xin Guan and Jeong-Gil Choi
Kyung Hee University, Korea

ABSTRACT

This study investigates the effects of hotel employees' service attitude on service quality, while it also examines the relationships among hotel employees' service attitude, service quality, customer satisfaction, and loyalty. Data was obtained from international hotel employees in Tianjin, China. The findings of the study indicated that among the variables of employee service attitude, emotional intelligence and role clarity had significant impacts on service quality and customer satisfaction. However, job satisfaction was not supported to be the impact on them. Service quality was improved to be a significant impact on customer satisfaction and customer loyalty. And also it was found there is a positive relationship between customer satisfaction and customer loyalty. The study would be meaningful in offering useful information on the importance of employees' service attitude in the hotel industry.

INTRODUCTION

Service excellence is a key differentiation strategy of differentiation (Prince and Simon, 2009). For the hospitality industry in particular, it represents a primary source of competitive advantage (Pfeffer, 1998). The alignment of employee service values and behaviors with an organization's strategic service priorities and the service expectations of its customers are therefore critical to organizational success (Boxall and Purcell, 2003). In today's rapid development of service industries, many hotel companies are exploring how they'll win in the market competition. Since hotels as a business entity providing accommodation services, competition is the most important quality of service. As hotels provide services to customers in the hotel business, the direct participants of the staff, employees are the cornerstone of the enterprise's survival and development. The employees in a hotel can really alter the quality of service and the whole atmosphere of the hotel.

As three aspects of guest experience (service products, service setting, service delivery system) exist, the hotel business is also called experience business (Choi, 2011). Guests may have great experiences in a hotel, or they may not. The experiences are the crucial factors in a customer revisit. You may lose some of your guests when you do a wrong behavior when providing services to them. Therefore, it is wise to do the right things to please your guests and make them build a loyalty to your brand.

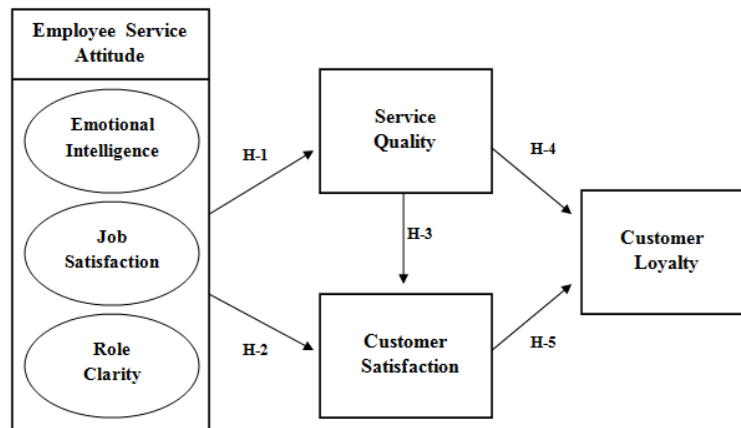

Having said the importance of services in the hotel industry and the need for qualified services in the international hotels in China, the study pursues an investigation of the relationship among employee service attitude, service quality, customer satisfaction and loyalty in the international hotels. Specifically, the study folds three objectives:

- 1) to explore the effects of employee service attitude on service quality in the international hotels;
- 2) to analyze the impact of service quality on customer loyalty;
- 3) to investigate the influence of customer satisfaction on customer loyalty.

METHODOLOGY

Based on the literature on employee's service attitude, service quality and customer loyalty, the model of the study has been developed (Figure 1).

Figure 1: Proposed research model

HYPOTHESES

It is claimed that emotional intelligence affects several work behaviors, including employee commitment, teamwork, and development of talent, innovation, and quality of service and customer loyalty (Zeidner et al., 2004, p. 386). Geller (1985) demonstrated that among nine key factors in successfully running hotels, employee service attitude is the most important. Chebat and colleagues (2002) indicated employees have become a critical one for the hospitality industry.

H1: Employee's service attitude has a positive impact on service quality.

H1-1: The employee's emotional intelligence has a positive impact on service quality.

H1-2: The employee's job satisfaction has a positive impact on service quality.

H1-3: The employee's role clarity has a positive impact on service quality.

Frichol (2009) explained employee service attitude is the primary reason of the customer satisfaction. When managers treat their employees well, employees in turn treat their customers well Gronross (1983). Numerous studies indicated that job satisfaction of employee is significantly related to customer satisfaction (Spinelli & Canavos, 2000). Tornow and Wiley (1991) showed the relationship that service attitude of employees is one of the factors in customer satisfaction.

H 2: Employee's service attitude has a positive impact on customer satisfaction.

H2-1: The employee's emotional intelligence has a positive impact on customer satisfaction.

H2-2: The employee's job satisfaction has a positive impact on customer satisfaction.

H2-3: The employee's role clarity has a positive impact on customer satisfaction.

Hypothesis 3: Service quality has a positive impact on customer satisfaction.

Service quality has become an important topic because of its relationship to customer satisfaction (Brady et al., 2002; Caruana, 2002) and consumer loyalty (Bowen & Chen, 2001; Caruana, 2002; Wong & Sohal, 2003).

Hypothesis 4: Service quality has a significant impact on customer loyalty.

Previous studies showed that customer satisfaction has a relationship with customer loyalty. Selnes (1993) found that an effect of customer satisfaction on customer loyalty appeared when customers are able to evaluate product quality through their experience with the service or products. Customer satisfaction is positively correlated to customer loyalty (Kandampully and Suhartanto, 2000).

Hypothesis 5: Customer satisfaction has a positive impact on customer loyalty.

The sample of the study is comprised of employees in the five-star international chain hotels in Tianjin (one of municipalities in China), China. Data has been collected from five luxury hotels in Tianjin. The hotel properties selected were based on the consideration of representatives of the luxury hotels which

can meet the standard in keeping balance between food & beverage, accommodation, leisure, convention, and business.

The surveys were conducted by the employees working in these five hotels to explore the relationships among employee service attitude, service quality, and customer loyalty. The survey was performed on October 20 to November 10, 2012. The total participants of the survey were 240 employees of the chosen hotels.

RESULTS

Table 1: Demographics of the survey respondents

Variables		Frequency	%
Gender	Male	98	44.5
	Female	122	55.5
Age	20-29	75	34.1
	30-39	92	41.8
	40-49	30	13.6

CONCLUSION

The purpose of this study is to explore the relationships between service attitude, service quality, customer satisfaction, and customer loyalty, and to explore the potential factors of employee service attitude affecting the service quality and customer satisfaction. This study examines five star hotels in Tianjin and surveyed hotel employees. The hypotheses were proposed to examine the relationships between the factors, and the findings suggested not all of them were supported. Emotional intelligence and role clarity were significant factors on service quality and customer satisfaction. On the other hand, job satisfaction was not supported to be a factor on service quality and customer satisfaction. It was found service quality and customer satisfaction both had positive effects on customer loyalty.

For the use of the hotel practitioners, the findings of the study may offer useful information when performing their jobs, or making work programs. This study might probably be a reminder to human resource managers the importance of hiring the right people to do the right work for the success of hotel operations. It is clear not only China's booming economy drives the promotion of hotel performance, but the employees bring the achievements. The study was conducted in one location in China, so the study may be expanded to other regional locations, which may offer some regional differences. In addition, the study was applied to the five star hotels. Comparison can also be made by collecting data from three and four star hotels, considering possible differences in the service attitude of employees by hotel ratings.

CONTEMPORARY PROGRAMMES OF GOOD GOVERNANCE, ECONOMIC RESTRUCTURING AND THE NEW PUBLIC MANAGEMENT TRAJECTORY IN SOUTH AFRICA: CHALLENGES AND ISSUES OF THE (NyGPyramid) MODEL

Nyawo Gumede and Sello P Mampane
Tshwane University of Technology, South Africa

ABSTRACT

In the last two decades an array of management techniques, practices and programmes have been adopted and implemented by most governments to ameliorate public administration. This was principally because most governments got ensnared in huge debts, operational inefficiency, and ineffectiveness in service delivery including lack of accountability from political elites and public servants. These problems emanated from the quaint methods of fiscal management that were implemented and practised resulting in rampant corruption and feeble public services. This led to widespread disgruntlement and demand for good governance hence the rise of the New Public Management (NPM). The (NyGPyramid) model argues that South Africa like most countries in the region has an endemic problem of poor governance owing to the existence of feeble corruption watch structures and enfeebled governance programmes in the country.

INTRODUCTION

Theories like public choice theory and principal-agent theory propelled the rise of the New Public Management (NPM) with its consonant reforms and practices of economic restructuring programmes. The colonial-independence-globalization theory also gave impetus to the emergence of the NPM theory for most former colonies like South Africa which had colonialism of a special type. Most African countries including South Africa have socio-political and economic conditions different from their Western counterparts because of decades of colonialism and apartheid and therefore experienced NPM uniquely. The programmes of good governance and economic restructuring pursued by South Africa in the post apartheid epoch reflect a particular uniqueness that emanates from its apartheid past. The public policy implications of the NPM are critical in terms of the (NyGPyramid) model critic. The government of South Africa, in the formulation and implementation of public policy must realize that the private sector approach to macro-economic state management has its shortcomings largely particularly because it has a Social Contract and not a Profit Contract with the citizenry. The high level of underdevelopment that is perpetuated and propelled by poor governance and systemic corruption militate against attainment of good governance. According to the (NyGPyramid) model good governance for most former colonies is imperative but the greatest challenge is that most African leaders feel entitled to lead for longer periods, have a greater propensity to illegally purge proponents of opposition politics and to influence creation of a flaccid governance policy frameworks and structures.

Public management has witnessed so many changes since the 1980s. Critical debates on good governance and its requirements have precipitated novel approaches to public sector management reforms. Governance failures and endemic corruption in most post-colonial African states propelled debates on new forms of governance. Most governments are personalized and are characterized by systemic corruption, nepotism, bureaucratic red tape and lack of proper delegation leading to one-man rule. Principles of good governance are totally and absolutely lacking. The World Bank recognizes the following four elements of good governance: a) Public sector management emphasizing the need for effective financial and human resource management through improved budgeting, accounting and reporting and rotting out inefficiency particularly in public enterprises (through restructuring); b) Accountability in public services, including effective accounting, auditing, and decentralization and generally making public officials responsible for

their actions and responsive to consumers; c) A predictable legal framework with rules known in advance (a reliable and independent judiciary and law enforcement mechanisms) and d) Availability of information and transparency in order to enhance policy analysis, promote public debate and reduce the risk of corruption (World Bank, 2002).

Governance emphasizes on ameliorating public sector management systems to enhance efficiency, effectiveness, productivity and competitiveness in service delivery. Thus, in good governance prescriptions public management reforms are a key aspect in the quest for market-based and private-domain-based paradigms to public sector management with a flavor called New Public Management (NPM). NPM has characteristics rooted in private sector frameworks of competitiveness, entrepreneurialism and customer satisfaction. In fact NPM is a label utilized to depict a managerial culture that emphasizes the centrality of the citizen or customer as well as accountability for results. It is a set of broadly similar administrative doctrines which were the focus of public administration agenda of most Organization for economic Cooperation and Development (OECD) countries from as far back as 1970 (Hood, 1991). The key components of the NPM may be put into two broad classes namely, those that emphasize managerial improvement and organizational restructuring, and those that emphasize markets and competition. Improved efficiency, greater competitiveness and accountability are the overriding aims of public sector reforms in South Africa since 1994. Strengthening anti-corruption mechanisms and institutions has been another important development in an attempt to reform. South Africa also made efforts to restructure most State Owned Enterprises (SOEs) to improve their financial and economic performance especially after 1997. It is significant to note that contemporary reforms have largely focused on the public sector with government aiming to introduce greater effectiveness, transparency, accountability and efficiency in the public service. Public sector restructuring and in particular restructuring of State Owned Enterprises has thus become not only a global phenomenon, but an integral part of the South African economic culture. This paper explores the programmes of governance, economic restructuring and the NPM against the backdrop of the (NyGPyramid) model in South Africa.

BACKGROUND

Governance is the practice and exercise of power in decision making in all spheres of government. Governance involves different stakeholders in the public policy arena ranging from the ruling political elites, the private sector, and supranational organizations like the World Bank, IMF, the WTO and the UN. In South Africa, government is comprised of three spheres, namely National, Provincial and Local government. South Africa has nine provincial governments and a plethora of local municipalities, which are both urban and rural. Municipalities govern on a four year term basis and run local affairs subject to national and provincial legislation but the latter may not compromise or impede a municipality's right to exercise its powers or perform its functions. In line with the principles of cooperative government, national and provincial government spheres are constitutionally mandated to strengthen municipalities' capacity to engage in local governance. However, metropolitan municipalities like Ekurhuleni Metro, EThekweni Metro and Tshwane Metro, Nelson Mandela Metro, Cape Town and Johannesburg Metro Municipalities have municipal executive and legislative authority in their juridical localities hence are at liberty to utilize the mayoral executive system or committee system.

After the restructuring of local government around 2005, South Africa had about 284 municipalities (Stats: SA, 2005). These municipalities play a key role in local government particularly in the delivery of public services. Nevertheless, weaknesses in services delivery manifest themselves easily at local level because local government has immediate responsibility to provide services that are mostly basic to local communities. Ineffectiveness and inefficiency in governance is felt at the local sphere of government than at the national, largely because the welfare of the citizens in these communities depends on the decisions made by local government.

UNDERSTANDING GOVERNANCE

The World Bank defines governance as the manner in which power is exercised in the management of a country's economic and social resources. The World Bank has thus identified three distinct aspects of governance namely: a) The form of political regime; b) The process by which authority is exercised in the management of the country's economic and social resources for development; and c) The capacity of government to design, formulate and implement policies and discharge functions (World Bank, 2002).

On the other hand, UNDP views governance as the exercise of economic, political and administrative authority to manage a country's affairs at all levels. UNDP posits that governance comprises mechanisms, processes, and institutions through which citizens and groups articulate their obligations and mediate their differences (UNDP, 1995). From the OECD perspective, governance denotes the use of political authority, and exercise of control in a society in relation to economic development (OECD, 1995). Thus, all these definitions encompass the role of public authorities in establishing an environment in which economic operators function and the nature of the relationship between the ruler and the ruled. For instance, in South Africa the tripartite Alliance of the African National Congress (ANC), South African Communist Party (SACP) and Congress of South African Trade Unions (COSATU) exercise considerable influence over policy issues even though at times they differ substantially as exemplified by the debate on nationalization of mineral resources.

Governance concepts mark a shift away from state control and state interventionist models of government to a minimalist state that is only concerned with provision of basic goods and services such as defense, education and health (Mothusi & Dipholo, 2008). It is significant to note that in most Third World countries like South Africa, the ruling elite tends to assume absolute power and authority in the governance process. Thus, dissenting views are often squashed. Domination by a single political party has led to political elites staying in the governance seats for a considerable length of time. For instance, in Angola the president has ruled for many decades in excess of generally accepted two terms of five years a term. In Namibia the former President extended his two terms by another term after amending the constitution. Most of these leaders see themselves as royals as opposed to elected officials and therefore want to govern for a lifetime resulting in failed states due to a combination of factors such as outright failure to govern, corruption, complacency and so forth.

Perspectives on the emergence of governance can be traced at the country level to a disgruntlement with state–domination models of economic and social development so prevalent throughout the socialist bloc and much of third world in the 1950s, 1960s and 1970s. At the international level, global governance, can be traced to a growing dissatisfaction among streams of international relations with the realist and liberal–institutionalist theories that dominated the study of international organization in the 1970s and 1980s (Weiss, 2000).

GOOD GOVERNANCE: SOUTH AFRICAN PERSPECTIVES

Good governance is expected to propel economic growth and development. From a critical perspective, South Africa is a middle income country with pockets of first world characteristics, such as infrastructure and some extremely opulent segments of the population. On the other hand, the majority of people constituting more than 85% of the country's population who live in the rural areas are extremely poor. This situation is not likely to change unless principles of good governance are practiced at all spheres of government and in all state institutions including its public enterprises. Good governance entails competent management of state resources be they natural, physical and financial as well as greater accountability by the government.

Through the Reconstruction and Development Programme (RDP), the government of South Africa has built and distributed many houses for the poor although the programme is dogged by institutional and systemic corruption in the actual construction as well as the allocation of the RDP houses. Nepotism is also rampant and has negatively affected the judicious allocation of RDP houses to the poor in provinces like Eastern Cape, Limpopo Mpumalanga and KwaZulu/Natal. The awarding of tenders for government projects in South Africa has been heavily criticized by scholars for being corrupted by a few political elites for personal benefits. South Africa has been criticized for corruption that is widely practiced in all spheres of government especially during the post–Mandela era. When corruption, either institutional or systemic, is left unchecked by a country, the result is poor governance.

KEY ELEMENTS OF GOOD GOVERNANCE

Political Principles

Good governance is based on the establishment of a) representative and an accountable form of government; b) Good governance requires a strong and pluralistic civil society, where there is freedom of expression and association; c) Good governance requires good institutions – sets of rules governing the actions of

individuals and organizations and the negotiation of differences between them; d) Good governance requires the primacy of the rule of law, maintained through an impartial and effective legal system; and e) Good governance requires a high degree of transparency and accountability in public and corporate processes (Downer, 2000).

Economic Principles

Good governance requires policies to promote broad-based economic growth, a dynamic private sector and social policies that will lead to poverty reduction. Economic growth is best achieved in an efficient, open, market based economy; b) Investment in people is high priority, through policies and institutions that improve access to quality education, health and other services that underpin a country's human resource base; c) Effective institutions and good corporate governance are needed to support the development of a competitive private sector. In particular, for markets to function, social norms are needed that respect contract and property rights; and d) Careful management of the national economy is vital in order to maximize economic and social advancement (Downer, 2000).

Good governance differs from one country to the other. In the same way, good governance issues and priorities differ from one political culture to the other.

THE NEW PUBLIC MANAGEMENT (NPM) CONCEPT

Globally NPM emerged in the 1980s as benevolent critic to the traditional public administration. Prior to prior the emergence of NPM paradigm, public administration was seen as the most rational avenue for managing the affairs of the public. However, Osborne and Gaebler (1992) argued that there was a need to reinvent government and harness the entrepreneurial spirit to transform the public sector and later “banish the bureaucracy”. This pointed clearly to the need to restructure government bureaucracy to promote productivity, competitiveness, and efficiency and effectiveness.

In South Africa, bureaucratic red tape is affecting most government departments. Since the early 1990s, South Africans across the political and professional divide have expressed grave concern about governmental efficiency, effectiveness and competitiveness in service delivery. With the creation of a single public service after 1994 that resulted from the merging of the four homelands of the Transkei, Bophuthatswana, Venda and Ciskei that were established by the apartheid regime for black people and the self-governing territories, government bureaucracy became too large and extra-ordinarily hierarchical. Public Administration became a source of poor service delivery.

It is worth noting that South Africa embraced the democratization process as an impetus for public sector reforms and liberalization of the markets. Thus, the process of decentralization was formalized with the constitutional establishment of local government and provincial governments. The rationale for decentralization is that local government is closer to local communities hence better placed to respond to their needs timely. However, between 1994 and 2010 the South African government has failed to take full advantage of the new wind of change thrust upon by the NPM vibe. Thus, South Africa still suffers from bureaucratic red tape, systemic corruption, inefficiency, ineffectiveness, poor service delivery, poor accountability and nepotism particularly in the award of government tenders to political dynasties of former liberation movements who claim their legitimacy from the liberation struggle. Due to this Liberation-Dynasty Syndrome(LDS), appointment of senior personnel especially at the level of Director-General, Deputy Director General and even at Chief Director is not based on merit. Thus, in most departments the whole operational stratum is politically corrupted leading to low productivity as a result of shortage of skills. This syndrome also affects the way procurement is done as exemplified by the recent police buildings saga which led to the withdrawal and removal of the Police Commissioner from the office and the former minister of public works in South Africa.

Essentially, NPM is a management culture that emphasizes the centrality of the ‘customer’, as well as accountability for results. The main objective of implementing NPM is to achieve more transparency, more efficiency and more quality as well as reduction of expenses. As a tool of public sector reform, NPM consists of several elements. Reformers from all parts of the world can avail all these elements as fundamental tools in transforming the public sector. These elements include the following:

- a.) Lean state – reduced tasks performed by state; b) Separation of decision making levels – separation of the strategic from the operative level: politics decides the what, administration the how; c) Lean

management – combination of management by objectives, flat hierarchy, projects management, performance related payments, modern methods of leadership; d) New services attitude – customer orientation: satisfaction in the center of all consideration, behavioral changes; e) New model of control – steering by clear targets, measurement of results, transparency of resources allocation; f) Decentralization – tasks ,responsibility, competence and budget in the hand of the projects manager / department manager; g) Quality management – ensure high service quality through qualification, competition, transparency; and h) Product approach – describing all administration services as “products” highlighting factors such as: features, cost, needed resources, and time to deliver (Teehankee, 2003).

Productivity, efficiency, effectiveness and competitiveness are not immediate priorities of the public servants in South Africa. Public choice theory contends that public administration is very slow and suffers from lack of greater responsiveness, allocative inefficiency, distributive incapability and weak re-distributive efficacy in South Africa. The principal-agent theory argues that the public (as principals), on whose behalf politicians and bureaucrats (as agents) are supposed to govern, is unable to hold the latter accountable because of insufficient information, (information asymmetry), incompleteness of the contracts of employment and the problems of monitoring behavior (Larbi, 2003). The public sector under performs because state officials pursue their narrow self-interests rather than the public interest. It is therefore difficult to demand accountability and good performance from the public servants (agents) because of the monopoly of public services, imperfect information about the services and about the interest of public employees and the huge transaction costs that would be involved in the efforts to write and monitor complete contracts (Larbi, 2003). It is critical to foster competition in the delivery of public services and reduce monopoly of the traditional government on public services. Larbi (2003) concedes that the result of the above drivers for change is that the role and institutional character of the state have been under increasing pressure to be more market-oriented and management-oriented with the emphasis on doing more with less (Larbi, 2003).

The traditional model of organization and delivery of public services based on the principles of bureaucratic hierarchy, planning, centralization, direct control and self sufficiency is being replaced by the NPM model (Larbi, 2003). The policy framework in South Africa is a graveyard that officials and people walk on without realizing it unless and until they fall on top of a skeleton. There are policies that are very contradictory and inconsistent with a developmental state trajectory with many being formulated in isolation with one another with particular regards to their objectives and implications. This is poor governance at its best. Many policies are not sustainable, not futuristic and environmentally insensitive largely because they are not based on realities on ground but rather on political expediency and convenience. Another conjecture which stimulated and propelled the rise of the NPM is what may be termed the colonial-independence-globalization phenomenon which traces the philosophy of public administration in South Africa from the colonial period through to the present day. This perspective contends that colonial apartheid public administration was very rigid, hugely- bloated, and acutely geared towards material exploitation and extraction of resources and creations of colonial markets, with very little interest on improving the quality of life for the colonized. This was achieved mainly through institutionalized autocratic administration. From Anglo-phone Africa, Franco-phone and to Luso-phone countries dictatorial administration of the proportions of a police state was common. In particular, apartheid South Africa practiced autocracy. Racial segregation did not permit equitable, transparent, effective and competitive allocation and management of public resources. Public administration served narrow and rigid interests.

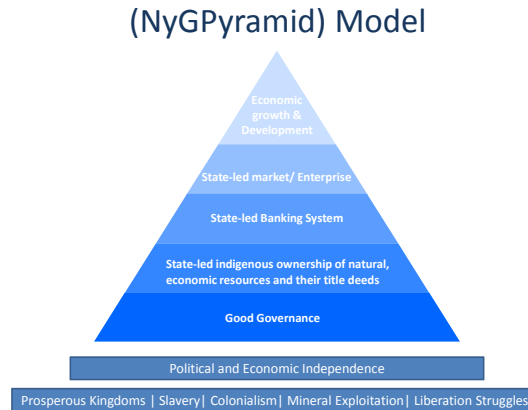

The urge to adopt NPM principles at independence was apparent with the adoption of the democratic and transparent constitution of South Africa. Thus, decentralized spheres of government were adopted to democratize public administration and give South Africa a renewed impetus for good governance. The new nine basic values and principles governing public administration were incorporated in the new constitution. The Public Finance Management Act of 1999, the Preferential Procurement Policy Framework Act of 2000, the Preferential Procurement Regulations of 2001 and the Municipal Finance Management Act of 2003 are all pieces of legislation which embrace the principles of the NPM trajectory. The wave of globalization also injected added impetus for the rise of NPM theory. From the colonial apartheid public servants to post independence civil servants, the need to globalize public services meant accepting the NPM. Global best practice became the brazen buzz word amongst government bureaucrats and consultants. The shift from Reconstruction and Development Program (RDP) to GEAR (Growth Employment and Redistribution) and New Growth Path is a clear sign of the victory of NPM principles in the new democratic South Africa. Given the foregoing it is clear that the colonial-independence-globalization phenomenon has taken the NPM paradigm to novel levels in the history of public administration. In a bid to ameliorate service delivery

efficiency, effectiveness, productivity and competitiveness the post independence bureaucrats have no choice except to adhere to global best practice which is NPM trajectory.

THE (NyGPyramid) MODEL

The (NyGPyramid) theory as depicted by the diagram below stipulates that within the African continent good governance programmes are difficult to conceptualize, implement, monitor and evaluate because of the nature of their erstwhile colonial and apartheid political economy and their pre-colonial political and administrative architecture. The biggest challenge to governance in South Africa and the continent is the mindset of the liberation leaders from ruling liberation parties themselves. The post-colonial and post-apartheid ruling oligarchy while they are elected through normal democratic channels, they are not inclined towards power sharing and multiparty democracy. Most post colonial post apartheid states are either de facto one party states or de jure un democratic. South Africa has proved to be a de facto one party state with the ruling ANC/SACP/COSATU alliance dominating the governance structures in the country and state organs. Having been supported by the Communist/Socialist Bloc during the liberation struggle the liberation party tends to adopt similar policies to the countries that sponsored the liberation struggle. Most Leaders in the alliance see themselves as Kings and the electorate as their subjects hence they stay in the governance seat for many years and ending up incurring serious public policy blunders. The model also argues that because South Africa is not yet politically completely liberated because of the Codesa compromises it is difficult for the post-apartheid government to fully practice democratic governance and even to conceptualize a good governance framework that is not enfeebled by the ruling political oligarchy (RPO), in pursuit of their gains and ambitions. The focus for the (RPO) in South Africa is on amassing political power across the whole country and to politically liberate all the provinces in the country which has proved futile for now because of the DA, Democratic Alliance, influence in Meyerton and the Western Cape. For now the focus is not on good governance but is on gaining political power. South Africa is not yet economically liberated. The ownership of the economy is in the hands of 6% the population leaving the majority extremely poor. In most cases the multinational companies which own the economy repatriate their profits and do very little in terms of financing good governance initiatives. The result is that the post-apartheid government has very little revenue to finance good governance initiative in the country.

With regards to the public enterprises restructuring the model argues that the state should own the public resources and generate employment and revenue for the state. This model believes that the Norway approach to macro-economic management can go a long way in economic growth in the country. The model believes in majority government share ownership in state businesses because governments have a public responsibility to the citizenry. The model suggests that government should not abdicate its responsibilities to the private sector. It argues that a government department is not a private company and therefore is not supposed to work in a similar fashion. The focus of government is not profit but welfarist. This model believes that while efficiency, effectiveness, productivity, profitability and competitiveness are critical values government has a social contract and not a profit –contract with the citizens. In fact during the liberation struggle the citizens were promised a democratic social contract and not a profit contract by the ANC, PAC, SACP and AZAPO. The manifestos of all these liberation movements and their armed wings were not profit-driven. The model concedes that the NPM theory has had mixed fortunes in its attempts to influence government to be run in a private sector way. Government has a welfare mandate that is why according to this theory the state must lead economic growth and development initiatives in South Africa. While the NPM believes in free market approach, the (NyGPyramid) believes in a state –driven paradigm that is goal –directed towards economic growth and development. South Africa is using a mixed economic system approach but with more free-market characteristics. (which is the reason why 94% of the population is in poverty and depending on government grants). In short the (NyGPyramid) model refutes the view that economic restructuring of state assets and the NPM trajectory are the only avenues of enhancing economic virility in a country. Apartheid legacy, corruption by the Black Economic Financial Aristocracy (BEFA), and the post-apartheid (RPO), make good governance impossible in South Africa. The state has a critical role to play in the affairs of the country as compared to the private sector. The pyramid is very clear which path the country should assume towards attainment of economic growth, development and good governance. (see the model below)

The (NyGPyramid) model has been articulated clearly in terms of its critic to good governance, restructuring and the NPM path in South Africa.

RESTRUCTURING OF STATE OWNED ENTERPRISES IN SOUTH AFRICA

The constitution of the Republic of South Africa requires the state to engage in pro-active action in the process of socio-economic growth and creation of social balance in South Africa. The constitution makes it clear that the state can make reforms as far as macro-economic growth is concerned. State Owned Enterprises (SOEs) in South Africa play a pivotal role in the process of economic development. Major state-owned-Enterprises in the transport, telecommunications, energy and defence must support the vision of the state towards global economic competitiveness, competency, competition and development. Success stories from countries that achieved unprecedented levels of economic growth such as the South East Asian Tigers have pushed the rest of the developing world into accepting the idea of state assets restructuring as a means of improving their efficiency (Naledi, 1999). From the forgoing it is clear that restructuring is a key feature of the NPM theory. Since 1994, the goals of restructuring have been embraced to address problems of inefficiency and ineffectiveness in the public sector, though government's objectives of economic development have been refined from time to time. The objectives for restructuring reform are inter alia;

- a) To facilitate economic growth; b) To fund the RDP (Reconstruction and Development Programme); c) To create wider ownership in the South African economy through black economic empowerment and boosting the small and medium enterprise sector; d) To mobilise private sector capital; e) To reduce state debt (proceeds may be used to reduce state debt from the apartheid era); f) To enhance the competitiveness of state enterprises (open up accessibility to global markets); g) To promote fair competition; and h) To finance growth and requirements for competitiveness (Policy Framework, 2000).

These objectives clearly show a commitment by the government to adhere to the principles of the NPM and good governance at enterprise level. The objectives are a mirror reflection of utmost commitment to improving the economic and public sector landscape. There is an inescapable demand for new financing through different forms of domestic and foreign partnerships to promote infusion of new equity capital and especially technology. It should be emphasized that growing enterprises are essential to ensure job security for the employed and to generate new employment opportunities for the unemployed (Policy Framework, 2000). It is important to note that economic growth and redistribution are central to the government objectives. The restructuring of state-owned enterprises (SOEs) is expected to lead to weakening of state control and authority over the provision of services, what may be called the thinning of the state (Terry, 2005). It is expected that the reform will capacitate markets and improve the delivery of services. Most state-owned enterprises in South Africa find themselves in huge debts hence the need to restructure to cushion them against further indebtedness while at the same time creating economically viable entities. Once the state asset is debt-free it is able to participate in economic development without restraint because its financial base would be healthy.

However, development cannot be measured only by financial criteria and restructuring is not a means of improving government finances and enterprise at the expense of the poor (ANC, 1994). Rather, the success of restructuring will be measured by its contribution to improving the standard of living of the South African citizens. The state has created an enabling framework such as regulatory reforms and institutions, which facilitates the process of the restructuring of state-owned enterprises and ultimately economic development. State Owned Enterprises (SOEs) play a crucial role in the current phase of economic restructuring where the focus shifts from macro-economic stability to the development of a sustainable growth trajectory.

Overall, restructuring of State-Owned Enterprises seeks to enhance greater accountability and transparency which is clearly a feature of the NPM approach (Naledi, 1999). On the social front, social imperatives include growth in employment, wider ownership and participation in the South African economy. Private public infrastructure partnerships in many sectors have already been manifested in the partial privatisation of Telkom, ACSA and South African Airways (SAA). Thus, State Owned Enterprises (SOEs) represent a critical element of the South African economy. Through the instrumentality of the restructuring programmes, the government of South Africa aims at creating a market-driven reform and economic milieu, largely supported by private, public and social capital (Policy Framework, 2000). This process attracts investors locally and hemispherically and competition forms a central element in the restructuring of State Owned Enterprises. Given the prevalence of residual natural monopolies in (SOE) sectors and the size of (SOEs) in relation to potential local competitors, the aim of government is to ensure that restructuring leads to greater competition with an appropriate degree of regulation. (New Agenda, 2002)

CONCLUSION

This paper has explored the concepts of governance, good governance, new public management, restructuring initiatives and the (NyGPyramid)model. However, the greatest irony of our times is that while the government of South Africa makes remarkable strides to embrace the principles of the New Public Management thus reforming the public sector, institutionalised and systemic corruption that is endemically entrenched in government defeats the purpose of reform. Many members of the PRO, BEFA and civil society elite collude in defrauding government and the general public. As a result and like in most emerging economies, South Africa has serious problems of lack of good governance. The rule of law should be observed if good governance is to be entrenched in the South African culture. The Liberation–Dynasty Syndrome (LDS), has negatively affected the theory and practise of public administration and management in South Africa because elite segments of the public service who come from the liberation background dominate the appointment process of senior managers in the post-apartheid epoch through the so called cadre deployment policy of the ruling party. In most cases these cadres are qualificationless but possess political credentials including having been in exile in countries like Zambia, Tanzania, Mozambique, Cuba, Germany, UK, USA, Botswana, Zimbabwe, Lesotho Swaziland, Lybia, Angola and former USSR. Thus, it is inherently difficult for qualified, competent and skilled people to work and contribute in the public service of South Africa. This challenge has to be tackled head-on in order to promote and sustain good governance in South Africa. The critic from the (NyGPyramid) gives some valuable insights into varying debates about NPM, restructuring and good governance in South Africa.

READING HOFSTEDE'S TAXONOMIES: UK VS FRANCE, PROFESSIONAL BUSINESS COMMUNICATION

Odile Haustant-Letaief
Birkbeck College, University of London, UK

ABSTRACT

This paper evaluates the extent to which Geert Hofstede's cultural values dimensions (or taxonomies) may contribute to effective relationships and minimise misunderstandings. In order to do so, examples of intercultural business interactions were used. Looking at two nations namely, UK and France, we have concluded that taxonomies may sometimes provide a practical vision for the way conflicts between people of different cultures may be prevented or understood, however, the application of these taxonomies have some limitations in relation to methodology used, national profiling, complexity of individual culture and non-cultural factors. Despite these limitations, Hofstede's taxonomies remain popular amongst intercultural communication researchers and consultants as it proposes a practical way to view and resolve culturally generated conflicts.

INTRODUCTION

Wearing hijab is heavily regulated by law in France as opposed to the UK where it is tolerated within a corporate environment. This may be explained through the understanding of cultural differences, as this paper sets out to demonstrate. Often this paper's author come across students attempting to use the work of Cultural dimensions pioneered by Geert Hofstede in a somewhat abusive way, often missing the subtlety of language needed when using such data resulting in the stereotyping of entire nations. This in no way implies Hofstede's work is difficult to read, but its obvious popularity amongst students explains the following paper. The author do not pretend to summarise the entire work, but instead aim to propose one way of understanding Hofstede, Hofstede and Minkov's cultural value dimensions (1980, 2001, 2010) (henceforth Hofstede and taxonomies), with practical examples from France and the UK.

Following a brief introduction of the theoretical metaphor "culture as an onion", the idea of cultural membership and Hofstede's taxonomies are then introduced. The problems raised in this paper aims to examine the extent to which Hofstede's taxonomies can be used to facilitate effective relationships and minimise misunderstandings in communication between people from different cultural backgrounds. This will be done, firstly with a demonstration of how these taxonomies help minimise misunderstandings as part of intercultural communication using observational evidence from UK and France. Moreover, outlining these examples will highlight cultural differences even in neighbouring countries, moving away from the West/East or North/South dichotomy often used to present Intercultural communication. An outline of some limitations occurring when using these taxonomies will follow.

Defining Culture

Hofstede's definition of culture (fig.1 onion metaphor) implies the existence of four different layers with implicit values at the core centre with rituals, heroes and symbols as more explicit representations of practices.

Fig.1. Onion Metaphor

Source: – Hofstede's Cultural Model (Hofstede, 2001: 11) ©Geert Hofstede B.V. quoted with permission

Hofstede's onion metaphor implies the notion that invisible and implicit values, as outlined in section one, have an influence on visible and explicit behaviors where norms are what we expect from a particular culture. This model denotes that cultures have two sides, one hidden and one seen, with the hidden model, core values, according to Hofstede's theory remaining unaffected by change. This static vision of the essence of culture is a theoretical construct that has been challenged, as we shall see in the second section of this paper. His theory of cultural taxonomies is based on the assumption that culture is learnt, as part of collective programming of minds, and no-one can escape it and consequently all aspects of our society including the workplace is affected. Cultural values are intrinsically the same but are often expressed differently. Culture is a complex concept that can be understood through memberships.

Cultural Memberships

According to Hofstede (2010), a person's culture comes with membership to various groups. These groups can be formed at national, regional and international level; they can further be defined by gender, age, social class, ethnicity, language and organisations with some smaller than others. Social networks membership such as Facebook, LinkedIn and Twitter are new types of cultural groups. As we shall later discuss, defining an employee's culture or culture profiling becomes very complex as membership to various groups can occur simultaneously but can also change with time so defining culture is increasingly difficult. Furthermore, his taxonomies are based on cultural membership at national level and if this is a practical choice, as we shall later argue, this does not take into account the complexity of cultures. The interaction between various cultures according to Hofstede (2010) leads to cultural shock. These cultural values therefore only become relevant when comparing the differences between two groups of culture, hence the significance of membership.

Hofstede's Taxonomies

Taxonomies frameworks include those by Hall, 1990; House et al., 1997, 2004; Kluckhohn & Strodtbeck 1961, 1973; Schwartz 1994, 1997; Trompenaars & Hampden Turner 1993, 1997; Nardon and Steers 2009. However, Hofstede (1980) Hofstede and Hofstede (2001) Hofstede, Hofstede and Minkov works (2010) (henceforth Hofstede) remain one of the most criticised and studied (Dickson et al. 2003, Jose et al. 2006, Fang 2010), hence the wide literature available and another reason for choosing these taxonomies in the following paper.

His paradigm with two extremes provides a general tendency for each nation, which shows national preferences. This empirical study provides a statistical national scores ranging from 1 to 120 of each taxonomy allowing comparison between nations. In his latest updated publication of *Cultures and Organisations* (2010) Hofstede's taxonomies, which will all be used in this paper, are:

5. Equality vs Inequality (Power distance);
6. Individualism vs Collectivism (Identity);
7. Masculinity vs Femininity (Gender);
8. Uncertainty Avoidance vs Tolerance (Truth);

9. Long-term vs Short-term (Virtue) and
10. Indulgence vs Restraint (Happiness).

Summary

As per Hofstede's onion model, with values at its centre defining behaviours within each culture, a "collective programming of mind that distinguishes the member of one group or category of people from others" (Hofstede, Hofstede, Minkov 2010: Kindle Locations 174-175) defines national tendencies. Using a set of business examples from two different national cultures, we shall now present Hofstede's taxonomies and then demonstrate how each may help with effective relationships and minimise misunderstandings in communication. Subsequently, we shall outline these taxonomy's limitations.

USING HOFSTEDE'S TAXONOMIES

Power distance (Hierarchy)

According to Hofstede *Power Distance* (PDI) refers to "the extent to which the less powerful members of institutions and organizations within a country expect and accept that power is distributed unequally" (2010: Kindle Locations 751-752). That is to say that within a culture the less powerful usually accept those in power.

Table 1. Comparison of Power Distance taxonomy between the UK, and France

Dimension/Nations	UK	France
Power distance	Inequalities should be minimised score 35	Inequality expected score 68

Source: Information extrapolated from Hofstede (2010) ©Geert Hofstede B.V. quoted with permission

For instance, as part of business interaction, a British company (with low score on power distance) with clients from France (with medium score on power distance), may want to factor differences in communication. In practical terms, that could be translated in the informal use of first name in email correspondence with clients in the UK (i.e. Dear John) which denote an effort to minimise inequality for no matter where you are in the hierarchy, your first name is used - although a more formal approach may be used when corresponding by letter. Whereas, when corresponding by email with French clients using the client's title and surname (i.e. Dear Mrs French) is generally the norm. Knowing and using these subtle differences may help facilitate effective communication with clients from difference cultures, as both cultures would feel the appropriate rules of communication are used.

Generally as France has a higher PDI score then the UK, communication style will tend to be more formal in France than in the UK. In France you would be expected to show respect to those in higher positions and consult them about decisions. Subordinates would expect clear information and direction whereas a more relaxed approach would be expected in the UK. Taking into account Hofstede's taxonomy of Power Distance, understanding the notion of (in)equality in France and in the UK may help facilitate effective relationships and minimise any misunderstanding as part of business communication.

Individualism – Collectivism (Identity)

According to Hofstede (2010) the paradigm of Individualism and Collectivism differs at national and individual level. At national level, the paradigm exists 'between' both whereas at an individual level the paradigm exists 'within' both. Here is the result of this taxonomy for France and for the UK.

Table 2. Comparison of Individualism vs. Collectivism taxonomy between the UK and France

Dimension/Nations	UK	France
Individualism (or IDV*)	High IDV* score 89	High IDV score 71

Source: Information extrapolated from Hofstede (2010) ©Geert Hofstede B.V. quoted with permission

*IDV = individualistic

For instance, as part of business interactions and although both IDV scores are high, France's score is lower than the UK. This subtle difference can be seen in the way decision making can take longer in France compared to the UK and the notion of hierarchy being more predominant in the former. In France, the emphasis would be on group effort rather than individual effort which is commonly predominant in the UK. This notion of "I" prevailing in the UK would move towards a "we" in France. For instance in a business meeting in the UK, unlike France, there would be no surprise if a participant stands out from the crowd. In France, an individual's promotion will generally relate to years of contribution to the team rather than individual achievements. The notion of 'group' is generally favoured in France compared to that of the 'individual' in the UK. When both countries have a general preference towards individualism, team work may become an issue to address and encouraged through individual incentives.

Masculinity vs. Femininity (Gender)

According to Hofstede (2010) the notion of Gender (Masculinity vs Femininity) differs from one culture to another and can be seen in the way assertive and modest behaviours are displayed and to which gender it is related. For men, masculinity at national level is when both genders have opposite behaviours i.e. the male being assertive and the female being modest whereas femininity at national level is when both genders display similarly modest behaviour.

Table 3. Comparison of Masculinity/Femininity taxonomy between the UK and France

Dimension/Nations	UK	France
Masculinity/Femininity	High Mas score – Masculinity score 66	Low Mas score- Femininity score 43

Source: Information extrapolated from Hofstede (2010) ©Geert Hofstede B.V. quoted with permission

In the UK, it is the opposite, being loud and competitive is not frowned upon even if it requires working longer hours and sacrificing family time when in France family time is generally valued. UK verbal communication would be direct as part of business interactions whereas small talks would be more appropriate in a French business setting, although direct questions are welcomed. Being modest as part of business interactions in France correlates with a low masculinity score.

Uncertainty Avoidance (UA) (Truth)

According to Hofstede's, UA refers to "the extent to which the members of a culture feel threatened by uncertainty or an unknown situation" (2010: Kindle Locations 2140-2141).

Table 4. Comparison of UA taxonomy between the UK and France

Dimension/Nations	UK	France
Uncertainty Avoidance	Low UAI* score 35	High UAI score 86

Source: Information extrapolated from Hofstede (2010) ©Geert Hofstede B.V. quoted with permission

*UAI = Uncertainty Avoidance Index

For instance, when attending a business meeting the degree of preparation will vary from the UK to France. In France, written communication, which is formal, is generally preferred as opposed to verbal communication. In the UK however, last minute preparations and sometimes little or no preparation is by and large unlikely to prevent a meeting from taking place, and loose instructions a deadlines are generally not an issue. Providing enough notice in France is widely seen as more of a requirement than in the UK, so is detailed instructions. This may also explain why wearing hijab is heavily regulated in France, as opposed to the UK. This could lead to decisions being made to standardise work processes in bureaucratic centralised French nation; whereas in the UK a decentralised system based on mutual agreement would be the preferred mechanism.

Long-term or Short-term (Virtue)

According to Hofstede “Long-term orientation stands for a society in which wide differences in economic and social conditions are considered undesirable. Short-term orientation stands for meritocracy, differentiation according to abilities” (2010: Kindle Locations 2690-2691). For him, this taxonomy derived from Eastern thinking, is more concerned by a search for *Virtue* rather than *UA*, which is concerned with *Truth*.

Table 5. Comparison of Long-term/Short-term taxonomy between the UK and France

Dimension/Nations	UK	France
Long-term (LTO)	Middle range score 51	High LTO score 63

Source: Information extrapolated from Hofstede (2010) ©Geert Hofstede B.V. quoted with permission

In both countries the above scores are very close; however France’s score for LTO is higher. Although, in both countries a wide difference in economic and social conditions are considered undesirable and in France this is generally even less desirable. Therefore, when doing business during a financial crisis UK is more likely to spend, invest and take risks compared to France where savings and delaying investment are more important. Signing a contract might take more time in France than in the UK, where more time would be spend in discussion. According to these scores, the *Virtue* of socialism is more prominent in France than in the UK which is more of a capitalist and risk taking nation.

Indulgence vs. Restraint (happiness)

According to Hofstede (2010) “Indulgence stands for a tendency to allow relatively free gratification of basic and natural human desires related to enjoying life and having fun. At the other end of the scale, restraint reflects a conviction that such gratification needs to be curbed and regulated by strict social norms” (Kindle Locations 3057-3058). This is concerned with the notion of happiness.

Table 6. Comparison of Indulgence/Restraint taxonomy between the UK and France

Dimension/Nations	UK	France
Indulgence/Restraint	High Indulgence score 68	Middle range score 48

Source: Information extrapolated from Hofstede (2010) ©Geert Hofstede B.V. quoted with permission

For instance, business interactions in non-verbal communication such as, smiling when greeting clients would be the norm for nations scoring high indulgence such as the UK; whereas this can seem odd in France as you would not expect to be too friendly. Roles are also loosely prescribed in nations scoring highly; this may be exemplified by the open ended UK job description, which generally states “and any other duties”. In nations with lower score like in France roles would be strictly prescribed. This also may explain the flexibility in the UK employment market, in comparison with France where there is generally less mobility. Understanding these national preferences may therefore help facilitate effective relationships and minimise misunderstandings when communicating.

Table 7. Summary of practical examples of how taxonomies can help facilitating communication

Country/ Communication	UK	France
Verbal	Speak your mind, be assertive and competitive but diplomatic. Any other business can be discussed outside the meeting agenda. Stand out in meetings.	Speak your mind and ask direct questions, courtesy and formality are key. Ask direct questions. Stick to meeting agenda. Try to blend but avoid being too friendly.
Non-verbal	Make eye contact but not too prolonged as this can make the other person feel uncomfortable, smile	Make eye contact as this is viewed as being polite and honest, showing a degree of interest
Written	Diplomacy is important. use formal language but may use first name when emailing with clients	Written communication is preferred to verbal. Use formal language and always use title when emailing clients. Use job title.

Source: author's own compilations

As summarised with practical examples in table 7, taking into account the differences between different cultures at national level by using Hofstede's taxonomies, this may generally help facilitate relationships and minimise miscommunication between people of different cultures.

LIMITATIONS OF HOSFSTEDE'S TAXONOMIES

Limitation due to Conceptual Framework

As set out in the introduction, Hofstede's taxonomies conceptual framework is based on a static definition of culture with unchangeable core values at its centre. This theoretical construct on the resilient nature of culture values to change has been challenged for not being based on any empirical data (Ailon 2008, 2009).

Additionally, according to Hofstede his theory is not a finished product (2001, 2010) and can be improved, explaining the subsequent addition of cultural dimensions. Although, non-western constructs such as Eastern Yin Yang can propose an alternative vision to Hofstede's bipolar paradigm (Meyer 2006, Fang 2010) there are no similar empirical academic studies providing a large enough data sampling concurring with that of Hofstede's. Consequently, Hofstede's taxonomies are based on a western theoretical construct of culture that has no empirical likeness, hence the resounding advice is to use them with caution (Ailon 2008, 2009). Furthermore, culture has not one single definition and Hofstede's proposed definition is not the only way to understand it.

Limitation of Taxonomies at National Level

Hofstede's theory is based upon data collected at national level and that gives the impression that all nations are culturally homogenous. This assumption of cultural uniformity at national level has been challenged (Dickson 2003, Tung R L, Verbeke 2010). Hofstede (2010) agrees with this and warns about the differences between societies and nations using the latest as a practical group rather than a true representation of one particular culturally defined society. In other words, although he admits that nations do not provide an accurate vision of cultures, it is a practical way to collect data and apply a theory. He also mentioned in a 2013 YouTube video that his theory was applied to the different regions of Brazil and the results show more similarities between regions than differences. These result needs replication within different nations to show stronger validities. Additionally, despite being practical this national data sampling can lead to erroneous generalisation limiting the application of the score at national level, hence the methodological limitation of his research. To sum up, these taxonomies can be erroneously used systematically and without taking into account the complexity of each nation. That is to say, if a large amount of members in one culture is likely to fall into these taxonomies, many would not. In other words these taxonomies show the probability or the

likeness at a nation level. It would therefore be wrong to state that all of France is the same, although they are likely to prefer the same.

Furthermore, according to Hofstede (2010) national scores cannot be used at an individual level for stereotyping as they are to be used at national level. His reasoning is that culture is group construct. However his scores provide a national tendency and are not representative of every single individual, the chance is that for a number of individuals (forming another group) the score will not be applicable. Therefore, using national tendencies as proposed by Hofstede's taxonomies may not always facilitate effective relationships and so minimise misunderstandings. That is, when not taking into consideration the complexity of culture within each nation.

Limitation due Methodology Employed

In reply to critics of McSweeney (2002), Hofstede (2002) actually agrees that his survey and the taxonomies generated from them are not the only way to measure cultural differences. Data has been collected using a questionnaire, which comes with its own limitations. For instance, respondents may not provide an accurate view of the situation, or may want to present themselves in a certain way, leading to an inaccurate set of data affecting the accuracy of national scores. If, when Hofstede's taxonomies are used and the survey fails to accurately represent a nation, this will lead to an inaccurate vision of this nation, hence their methodological limitation and their potential practical limitation in facilitating effective relationships and minimise misunderstandings.

Limitation due to Measurement, Time and Space

Hofstede (2002) states that his taxonomies are based on timeless values refuting that old data may compromise them. However, a study by Maseland and Hoorn (2009) demonstrates that Hofstede's taxonomies are based upon measurement of practices (or marginal preferences) rather than measurement of values within one culture. According to this study what people desire and what actually takes place may sometimes differ, hence a limitation of Hofstede taxonomies. Moreover, Ailon (2008) stated there are no empirical studies taken over a long enough period to ascertain whether cultural values remain the same over a long period.

Additionally, although comprehensive, his data does not represent all nations and is therefore limited. For his initial study Hofstede (1980) provided national scores for 40 countries based on IBM's Managers and employees answers. Although the number of nations considered increased in subsequent editions, his initial study does not take into account people from various organisations thus limiting the impact of measurement and questioning the relevance of generalising what takes place at an organisational level to a national level (McSweeney 2002). Hofstede claims (2010) that other studies confirmed his dimension, yet there is a danger of generalising his vision of national culture to all organisations within all nations. In response to this, Hofstede himself came up with organisational cultural dimensions different from cultural national dimensions. This complexity within culture challenges the usage of national taxonomies to facilitate effective relationships and minimising misunderstandings between nations.

Limitation due to Situational Factors

Breakdown of communication and conflict may also result due to other non-cultural factors such as situational factors (Gelfand et al. 2007). Ignoring the contribution of non-cultural factors such as miscommunication due to failure of equipment used and/or individual physical attributes (such as health related hearing issues), which are non-cultural factors and using only Hofstede's taxonomies may not help the understanding of conflict resolution. Moreover, changes in society such as the increasing use of new technology may also affect taxonomies (Shane 1993, Fang 2010) as this affects the way people communicate which may in turn affect cultural practices. Not factoring in these situations when using Hofstede's taxonomies will not always provide an accurate vision and thus will not necessarily help facilitate effective relationships and minimise misunderstandings.

CONCLUSION

If taxonomies may be used to support effective relationships and help minimise misunderstandings in communication, they also have some limitations. In fact, the application and validity of these western biased theoretical constructs can be challenged as they are based on data collected at a point in time, albeit over a period, and within a Multinational. They may also be based on a vision of culture at national level, where situational factors are not taken into account. Consequently, we may deduct that Hofstede's taxonomies as he also puts it, are just one way of understanding relationships amongst people from different cultures.

Despite their limitations, these taxonomies remain valuable practical tools when looking at conflict that may arise between members of different cultural groups. We may therefore conclude, that these taxonomies when used as a practical tool may serve to promote effective relationships and minimise misunderstandings amongst people from different cultures. It is almost an impossible task to monitor if fewer misunderstandings arise from cultural differences resulting from using Hofstede's taxonomies. If the effectiveness of his theory remain to be seen, his work for greater understanding of cultural differences remains surely key to conflict resolution, explaining the reasons why it is greatly used to prevent and minimise misunderstanding as part of professional business communication.

Advice for Global Managerial Application

Translating Hofstede's theory into practices should be done with caution, as outlined in the above paper. That is to say that Global Managers should not only rely on systematic and off-the-shelves (ready-made) country's profiling sometimes generalising and misguiding them. To sum up, a suggestion to assist Global Manager is that in addition to nurturing cultural awareness, openness to communication is generally a starting point in preventing and minimising culturally generated misunderstanding.

GLOBAL LEADERSHIP, CULTURAL INTELLIGENCE (CQ): HOW DOES NEUROSCIENCE FACILITATE OPPORTUNITIES TO IDENTIFY AND DEVELOP LEADERSHIP POTENTIAL?

James Hea, University of Liverpool, UK
Shaukat Ali, University of Wolverhampton, UK

ABSTRACT

Global leadership and cultural intelligence are new themes in the study of leadership and intelligence. This research investigated the relationship between them through the lens of neuroscience. Seven experts were interviewed from each of the fields of global leadership, cultural intelligence and neuroscience. Based on those interviews and additional research, a developmental framework is proposed to identify, select and develop cultural intelligence in global leadership talent. The proposed model draws upon the insights brought to light during the interviews together with research on the effects of specific meditation techniques and other studies that show growth in emotional and social intelligence mapped to specific domains of influence: global, national, regional and local. Additional avenues of research are suggested to validate the model with more empirical evidence.

INTRODUCTION

There is a convergence of academic disciplines underway to adequately address the complexity of the globalized economy. Organizations spend a considerable amount of money and time to develop their internal talent to gain a sustainable competitive advantage. However, to succeed as a global leader, according to Ireland and Hitt (1999), strategic competitive advantage will derive from leaders who can adapt and thrive on the global stage with a more sophisticated set of skills. Identifying and developing global leaders with the right global leadership skills can make a significant difference to sustainable economic, environmental, and social prosperity.

Neuroscience is providing a persuasive platform to identify and determine leadership traits in the domestic sphere but it is the contention of this paper that a similar platform for global leadership has not been fully developed but is desirable to do so. The insights of neuroscience provide a firmer scientific foundation to interpreting the current social science on leadership, particularly in terms of effective development interventions. Understanding what works in the development of global leadership skills, particularly as it transforms brain behaviors, provides a stable platform around a global leadership development strategy. By aligning development strategies with the desirable brain behaviors indicated for global leaders, more successful and effective global leadership can be predicted. This paper addresses that alignment as it is revealed through the convergence of global leadership and cultural intelligence with the findings in neuroscience.

The aims of this paper were to synthesize a workable definition of global leadership effectiveness; assess the role of cultural intelligence in global leader effectiveness; evaluate the findings of neuroscience in identifying and developing cultural intelligence in global leader candidates; and propose a developmental strategy of cultural intelligence in global leader talent based on these findings. To address these aims, the research used grounded theory approach to data gathering through interviews with experts from the three areas outlined above to meet the following objectives: distinguish global from domestic leadership by reviewing the academic literature and interviewing experts in leadership and management; determine the competencies that impact leader effectiveness by analyzing the research data; analyze which metrics from the field of intelligence theory are most effective in predicting leader performance based on cognitive,

emotional, social, and cultural intelligences; determine the competencies derived from cultural intelligence that contribute to overall global leader performance; identify the findings in neuroscience that support leader performance, development of intelligence, and the mastering of competencies; and analyze the psycho-physiological metrics used to identify and assess cultural intelligence in global leaders. The contention of this paper is to show that neuroscience may provide more effective identification of cultural intelligence within global leadership candidates as well as to better understand brain behaviors that support cultural intelligence.

LITERATURE REVIEW

Global Leadership

Global leadership is an emerging discipline seeking to distinguish itself from domestic leadership. Gundling, Hogan and Cvitkovich (2011, p. 11) identify emerging markets, population growth, and the urbanization of Asia and Africa as three of the trends that are accelerating the need for global leadership. To distinguish domestic leaders from global ones, Mendenhall et al. (2012, p. 4) provide three dimensions of the global context: complexity, flow and presence. Complexity is the single most distinguishing variable between domestic and global scope. Global leaders are expected to handle multiple cross-cultural, geographical, and socio-political contexts which make their role more complex. Flow refers to boundary spanning and the information flow that global leaders have coming from different departments and jurisdictions resulting in a qualitative 'richness' to the information that is lacking in the domestic environment. Presence refers to the amount of time a leader must be physically *present* across "geographical, cultural and national boundaries" (Mendenhall et al., p. 6). Therefore the domestic context tends to be less complex, requires less flow with respect to information and hierarchies, and requires less *presence*, since many of the cultural, national and organizational characteristics are familiar.

Florida (2005, p. 48) notes that globalization does not equate to homogeneity. Indeed there are many differences where the leverage of global reach has not balanced trade, financial flows, intellectual property or urban versus rural disparity. The sensitivity required to appreciate global diversity shifts the *competitive* mindset of a domestic perspective to a more *collaborative* mindset of the global perspective. Or as Robinson and Harvey (2008, p. 466) discuss, a psychological evolution is needed to address cultural and global issues. Is there, as Robinson and Harvey propose, a psychological evolution that can be used to gauge the maturity of a global leader? Robinson and Harvey outline clearly delineated and increasingly mature concepts of self and others that are required to engage in more culturally diverse contexts. Summarizing, global leaders exhibit more global thinking (broad perspective) as well as sensitivity to finely nuanced differences of each locality. They are aware of the heterogeneity of the world.

Javidan, Teagarden and Boween (2010, p. 111) list a set of 76 attributes that are desirable in a global leader from each of the following categories: intellectual capital, psychological capital, and social capital as part of a 'global mindset' inventory. (Javidan, Teagarden and Boween, 2010, p. 111) The attributes confirm that a global mindset is comprised of competencies not necessarily associated with domestic leadership. Discerning how domestic and global leadership is identified is critical for leader development. From the review of the literature on global leadership, it is apparent that the context of global leadership is distinctly different from domestic leadership.

The Intelligences

General Intelligence (IQ)

General intelligence or cognitive ability has been the foundation upon which intelligence has been measured. This includes standard IQ tests. Largely because of how leader effectiveness has been measured and how intelligence has been measured, leader success was deemed to be dependent upon a leader's cognitive ability. However, Judge, Colbert and Ilies (2004) reviewed the studies and how leaders were evaluated. The metrics were based on leader perception by their followers and not necessarily objective measures. In fact, Judge, Colbert and Ilies (2004) and Antonakis, Ashkanasy and Dasborough (2009) conclude that general intelligence (cognitive ability) can be a useful predictor of leader effectiveness when situations are not stressful and the leader is able to direct. However, in the real world of the demands of the 21st century, stress is a part of daily life and leaders must often *participate* in decision-making—not unilaterally *direct* it. Under

these conditions, research indicates that leaders with emotional and social intelligence are more effective in the perception of their followers as well as in objective measures.

Emotional Intelligence (EQ)

Support for multiple intelligences comes from Gardner's multiple intelligences model. This model is based upon empirical studies on the specific information each intelligence processes (Gardner and Moran, 2006, p. 228). Dependent on capability and perception, Gardner's model presents various intelligence types e.g. Linguistic (words and language), Logical-Mathematical (logic and numbers), Musical (music, sound, rhythm), Spatial-Visual (images and space), Bodily-Kinesthetic (body movement control), Naturalistic (natural environment), Interpersonal (other people's feelings), and Intrapersonal (self-awareness). For example, linguistic intelligence is based on language processing which is quite distinct from the logical-mathematical intelligence which processes mathematical problems. Gardner's *intrapersonal* intelligence, for instance, operates on the internal dynamics of the individual—including empathy, self-regulation, goal setting and perseverance (Moran, 2009, p. 144). These qualities are reminiscent of Goleman's (1998, p. 95) description of emotional intelligence (EI) which he says includes: self-awareness, self-regulation, motivation, empathy and social skill. He adds that EI serves as a differentiator between two similarly cognitively capable individuals. Indeed, Goleman asserts that EI leaders and their divisions perform better. Walter, Cole and Humphrey (2011, p. 55) confirm that despite "conflicting perspectives on the definition and measurement of EI, and in the midst of a continued debate on EI's construct validity, empirical research on emotional intelligence and leadership has produced notable findings." Based on the empirical results, identifying various intelligences can prove to be significant to improving leader performance.

Social Intelligence

So far, the literature has substantiated that multiple intelligences can be defined based on context and the type of information being processed and that there is empirical research to support the theoretical models. The premise of social intelligence is that there are social signals that are managed differently than cognitive or emotional ones. Gardner describes (1983, p. 164) *interpersonal* intelligence as the facility to "notice and make distinctions among other individuals." However, developing effective metrics for that description has proved difficult. The meta-analysis studies on social intelligence by Murphy and Hall (2011) confirm that social intelligence is difficult to assess. Wawra (2009, p. 165) argues that the construct suffers from an outmoded approach to measuring it; that the only way to understand social intelligence is to understand the neuroscience behind it. Some of the difficulties arise when attributing cognitive assessments to social phenomena. What neuroscience is revealing, according to Goleman (2006, p. 14, cited in Wawra, 2009, p. 165), is that certain brain behaviors start to mimic each other when people socially interact. If social intelligence is a non-verbal contagion of emotional energy as suggested by Goleman, then the intelligence aspect is not *what is cognitively perceived* but how the social situation *generates physiologic and affective responses*. Much of this, it turns out is subconsciously processed, making it that much more difficult to measure cognitively but easily identified physiologically (Wawra, 2009, 166). Similar to the problem faced by classical physicists when confronted with quantum phenomena, a new mindset and measuring tools were needed to forge ahead.

Cultural Intelligence(CQ)

Ang and Van Dyne (2008, p. 3-4) define cultural intelligence as the ability to "function and manage effectively in culturally diverse settings." Cultural intelligence (CQ), as defined by Van Dyne et al. (2012) is comprised of four factors: metacognitive CQ, cognitive CQ, motivational CQ and behavioral CQ. Metacognitive CQ refers to the ability of the individual to be cognizant of the fact that they are in a multicultural setting which allows them to be open to new experience, observant of cultural norms and question their own assumptions. Cognitive CQ is the degree to which an individual is already familiar with a culture's norms and values such as the culture's history, its systems including educational, political, legal and social, as well as understanding the fundamental religious or spiritual beliefs of a culture. Motivational CQ indicates the intrinsic interest an individual has in cross-cultural learning and adaptation. This is important as cultural intelligence relies upon interactions with others and being motivated is a key functional requirement. Behavioral CQ indicates that an individual is sensitive to and able to express the full range of acceptable behaviors required for successful social interaction. Rockstuhl et al. (2011, p. 826) note that global leadership requires adoption of a multicultural perspective, the ability to balance local and global needs and to be able to work with many cultures simultaneously. As such, cultural intelligence is distinguished from general and emotional intelligence because of the nature of the culturally diverse context. To be successful in intercultural settings, the individual needs to understand and work with different cultures.

Research on cultural intelligence as an empirically valid construct is supported by the meta-analysis of studies done by Groves and Feyerherm (2011, p. 539). Their review of empirical research has sufficiently separated EQ from CQ, noting that the cross-cultural context is not sufficiently addressed by emotional intelligence but requires the additional skills that cultural intelligence entails. Their own study examined “CQ as a leadership competency for managers charged with leading culturally diverse work teams” and provided empirical evidence that CQ and sensitivity to cultural nuances as perceived by the followers made a difference in both leader and team performance quite distinctly from emotional intelligence alone. The research investigated whether cultural intelligence is an extension of social intelligence or a context dependent version of it.

Neuroscience and Leadership

Neuroscience, the correlation of universal and specialized brain behaviors with cognitive, affective and behavioral patterns, is helping the biological sciences understand how we interact and adapt socially (Chiao, 2009, p. 288). Neuroscience is providing new tools of measurement and discovering new social phenomena within the confines of the brain. With respect to identifying potential leaders, for example, Balthazard et al. (2012, p. 252) studied whether there is a ‘brain signature’ for transformational leaders. Their research used quantitative EEG (qEEG) that resulted in correctly identifying 92.5% of the participants who scored high as transformational leaders. In addition, it is now possible to not just measure an individual’s response to a social question but to measure two or more people simultaneously as they interact. Goleman (2006, p. 12) reports that social interactions can physically alter the brain by sculpting its shape, changing its size and the number of neurons as well as modifying or creating new synaptic connections. It’s this interaction that distinguishes cognitive and intrapersonal intelligence from social and cultural intelligence. Social and cultural intelligence *can only be measured in context*. This is one indication that the findings in social science can be mapped to the findings in neuroscience.

Understanding culture from a neuroscience perspective facilitates the understanding of how culture is formed and how cultural traits are developed and transmitted from generation to generation. This also informs the neuroscience behind cultural intelligence. For example, Iacoboni (2008, p. 32) discusses how speech is learned through an imitative neural mechanism mediated through mirror neurons. This study supported the hypothesis that perception and motor function are linked and that stronger mirror neuron response supported learning. Rockstuhl et al. (2010, p. 26-30) outline the neural correlates of metacognitive CQ, cognitive CQ, motivational CQ and behavioral CQ. While this paper will not delve into the technical details of the neural substrates—the fact that there are neural substrates with empirical evidence supporting brain behavior and cognitive behavior correlations indicates that social science and the biological sciences in fact find a meeting ground to determine what is ‘plastic’ (i.e. changeable) and what is ‘hard-wired’ (i.e. stable and intrinsic).

An important discovery in the field of neuroscience and germane to this paper is, according to Garland and Howard (2009, p192), the discovery of neuro-genesis: the growth of new neurons in the brain—a phenomenon that previous to 1998 was considered impossible. The discovery that the brain can grow new neurons, new neural pathways and fundamentally adapt itself to repeated experience, opens new opportunities for development. Rock and Schwartz (2007, p.11) discuss how leaders and managers need to motivate their followers based on the findings in neuroscience. For instance, research indicates that behaviorism, the use of incentives and coercion (i.e. carrot and stick) as moderators of behavior don’t work because they reinforce “neural patterns associated with the...problem”. In other words, putting attention on the undesired behavior, in effect, reinforces it. Similarly, having individuals focus on goals they know they cannot achieve ultimately creates stress. Rather it’s important to provide employees with problems that are challenging but are still within their capabilities to solve. Using positive expectation, a manager can then pull the best from their people. When an individual feels that the problem is within their capability to solve and that the social environment is supportive, the brain opens up new neural pathways to determine solutions. When investigating leadership and neuroscience, understanding how intelligence and learning, observation and imitation interplay on a neural level can provide insight into developmental strategies. The research therefore consulted with experts in emotional and social intelligence, cultural intelligence and neuroscience to explore these relationships and uncover any developmental models that may contribute to intervention strategies.

METHODOLOGY

Grounded theory was used to collect data from a purposive sampling of experts in the areas of global leadership, cultural intelligence and neuroscience. Twenty-three experts were contacted and seven interviews were completed. Most experts were doctorates in their respective fields having an extensive academic or research background or both. In terms of experience, the respondents had a total of 186 years as researchers, professors, published academics and authors of popular books on the relevant topics. In addition, authors of popular, expert-endorsed publications relevant to the topic were also interviewed. Sets of questions specific to each area were developed to address the gaps revealed by the literature review. The experts were selected based on their notable contributions to one or more of the areas. Data collection was through written and verbal interviews with naturalistic questions allowing expansion and development of emerging themes. Data analysis was performed through the grounded theory method requiring coding, constant comparison, taking memos and finally building theory that the interviewees could confirm to be faithful to their contributions. The validity and reliability of this qualitative method, aside from ensuring that the original questions follow the stated aims and objectives of the paper, is embedded in its rigor, relying heavily on the researcher's diligence in capturing, recording, analyzing and co-constructing a saturated theory.

ANALYSIS AND DISCUSSION

Analysis

The interview instrument was composed of twelve questions, four from each of the following streams: global leadership, cultural intelligence, neuroscience and interventions. As the interviews progressed, results were compared and extensive memos were written. Future interviews were modified by inputs from the previous ones. In some cases, it was additional research of the constructs introduced during the interviews; in others it was the articles or direct references that the respondent suggested should be researched. In addition, by continually comparing responses and through coding the transcribed interviews, certain themes emerged. The themes were selected based on their import to the topic. The purpose of the analysis was to determine what gaps in the convergence of global leadership, cultural intelligence and the corresponding neuroscience and or interventions exist. The themes address these. The research analyzed the following five in detail:

1. Effectiveness and Performance
2. Competence versus Intelligence
3. Brain Integration and Ego Development
4. Systemic, Holistic and Global Thinking
5. Self-versus Object Referral

Theme 1 Effectiveness and Performance

This theme was based on the count of the number of times the words *effective(ness)* and *performance* were used. From the outset, Respondent B took issue with describing context (domestic versus global) before discussing effectiveness. Being effective, he ascertained, was more critical than context and would be the first antecedent to assuming a global position. Respondent G, as a researcher, insisted that assessment be based on performance. Both these perspectives, effectiveness and performance, were echoed by the others, and particularly the neuroscientists who argued that the research on brain performance correlates with leader effectiveness. One of the flaws with current research on leadership mentioned by respondent B and G was that self-reporting is often inaccurate and yet forms the basis of a lot of research. Effectiveness, they insisted, must be measured by more objective performance. Effectiveness, they maintained, must be measured by more objective performance. Indeed, the neuroscientists are used to collecting large datasets and having them analyzed through sophisticated computer software (i.e. fMRI, EEG, TCM, QEEG, etc.). As a result, neuroscience is able to provide more reliable and repeatable findings, which is why it has appeal in corroborating the findings in the social sciences.

Theme 2 Competence versus Intelligence

This theme was explored because it was mentioned by virtually all respondents and introduces the theoretical tension in the interviews. At the outset of the interviews, Respondent B challenged the validity of the cultural intelligence construct. The concern arose out of the tension between the intelligence and

competency constructs. Sternberg (2007, p. 16, cited in Emmerling and Boyatzis, 2012, p. 5) notes that intelligence tests relate more to academic proficiency than career development. Benjamin, Gulliya and Crispo (2012, p. 55-57) provide examples of various competencies that are derived from emotional intelligence and are applied in specific leadership contexts, making them eminently practical. It becomes easy to see the attractiveness of the competency model because it provides clearly measurable behaviors in specific context parameters. On the other hand, the multi-dimensional model of cultural intelligence is modeled after Sternberg and Detterman's (1986, cited in Ang and Van Dyne, 2008, p. 4) four loci of intelligence: metacognitive, cognitive, emotional and behavioral. The attraction of this model, according to respondent G, is that it limits research along four lines of investigation. The competencies, because they are performance based, can be mapped to specific brain performance. However, intelligence and competence are both based on the quality of brain functioning, something indicated by Respondents D, E, F and H but using the model of integrated functioning which is reviewed below.

TABLE 1. THE POSITION OF THE EGO DEVELOPMENT IN WILBER'S MODEL				
<i>K. Wilber</i>	% of US population	<i>Cook-Greuter</i> Ego Development Stages		<i>Torbert</i> ¹ Action logics
<i>SOUL</i> Transcendent	<u>Postpostconventional, Transpersonal, Ego-transcendent</u>			
Unitive view	<1%	6	Unitive	Ironist
<i>VISION LOGIC</i>	<2%	5/6	Construct-aware	Alchemist
<i>Postconventional</i> Systems view	~12%	5 4/5	Autonomous Individualist	Strategist Individualist
<i>MIND</i> Conventional	~75%	4 3/4 3	Conscientious Self-conscious Conformist	Achiever Expert/technician Diplomat
<i>BODY</i> Preconventional	~10%	2/3 (Δ) 2	Self-defensive Impulsive	Opportunist Impulsive

Figure 1 - Cook-Greuter Ego Development Stages

Theme 3 Brain Integration and Ego Development

The third theme was generated by the neuroscientists and included the additional research on the topic of ego- or self-development. Respondents F and H suggested that the author conduct additional research into ego or self-development to satisfy the question on stages of development of intelligence. Investigation into the ego development (maturity) works of Piaget, Loevinger, Rooke and Torbert, and Cook-Greuter provided plenty of food for thought, particularly when respondent H confirmed that "there are brain patterns associated with different stages of Piaget's cognitive development". This tied into Respondent D's focus on self-development, which will be addressed, in Theme 5.

Theme 4 Systemic, Holistic, and Global Thinking

The fourth theme was generated by the reflections on the nature of thinking expressed by the various respondents which has been summarized as systemic, holistic or global thinking. Thematically, the idea of systems thinking was brought up in slightly different ways by each of the respondents. Respondent B discussed the ability to be able to reconcile with those who have opposing points of view. In Cook-Greuter's (1985, p. 22) stage development, post-conventional stages are open to other points of view. Most notably, the post-conventional stages of cognitive development include systems and meta-systems thinking capability. These address the requirements that Respondent C stated regarding global leaders be systems thinkers in world full of 'multiplexities'. Indeed, stage 5 individuals have grown to the level of being able to "embrace some paradox and contradiction" including "toleration of ambiguity". Respondent H noted that global leaders need to be able to get out of their "concepts and categories", that is see outside of themselves. The post-conventional stages start taking on a "fourth person" perspective – which is a metacognitive state. Individuals at this stage are aware of their constructs and mental maps.

Theme 5 Self versus Object Referral

The last theme was explored because of its significance in summarizing the developmental opportunities for global leaders with cultural intelligence potential. Introducing the self-development stages of Cook-Greuter to the analysis provided a new framework for identifying, selecting and developing global leaders with cultural intelligence potential. The advantage of the framework is that it correlates to research on brain integration and performance. The underlying neurophysiology of the framework delves deeply into the perception-cognition-somatic markers and neural networks such as the default mode network.

Kohlberg's stages of moral development correspond to an increasingly sophisticated understanding of self and others. As Fiske (2009, p. 33) discusses when an individual perceives others as members of an out-group, it results in objectification and dehumanization. Neuroimaging shows that reduced functioning of the medial prefrontal cortex (mPFC) is correlated with objectification and dehumanization. Object referral therefore means that certain brain circuits and neural networks are 'wired' for dehumanization such as when the individual's amygdala is not fully developed and the pre-frontal cortex is not fully operational. Self-referral, therefore, would mean providing the amygdala with positivity (respondent H) and positive experiences (respondent B) and allowing the prefrontal cortex to naturally unfold its integrating and unifying capacities. Self-referral technologies, such as the Transcendental Meditation program, allow the neural circuitry to be reset by providing an experience of transcendence or what Maslow (1971, cited in Cook-Greuter, 1985, p. 30) called peak experiences. Peak experiences and brain integration have been correlated with post-conventional development.

DISCUSSION

Perhaps the most important discovery of this research are the relationships between the inner development of the global leader candidate being mapped to neurophysiological, ego-stage and moral development parameters together with research indicating that various intelligences cognitive, emotional, cultural and social and their loci – behavioral, cognitive, affect and metacognitive map to domains of influence: local, regional, national and global. The usefulness of this framework (see appendices) is in creating new theories of development and influencing new directions of research into identifying, assessing and developing global leaders with cultural intelligence.

During the interviews, leader/follower relationship was defined as the bilateral flow of intelligence between the leaders and followers. It was noted that if a leader does not get information from his followers he becomes ineffective. Another respondent called this resonant leadership – where emotional and social intelligence is activated - and leaders and followers have an effective, healthy relationship. Leader effectiveness in a domestic or national domain has been correlated with emotional intelligence while leader effectiveness in a cross-cultural domain has been correlated with cultural intelligence (Rockstuhl et al. 2011, p. 835). In this light, we can start to see how the various loci of intelligence: metacognitive, affect, cognitive and behavioral can be correlated to various domains of influence.

Metacognition, an important component of the cultural intelligence construct, is not isolated to intercultural interactions. Metacognitive function is a prefrontal cortex operation where information is integrated or as one respondent noted, "higher brain integration means that you're in touch with more inner resources". The more competent an individual is in their metacognitive skills, the more they are able to think systemically. A number of respondents felt this was a critical component of global leadership. Thinking systemically is available at the formal operations stage of ego development. In addition to ego development, moral development is associated with how we think about others. The post-conventional stages introduce the ability to consider other points of view and to view others as having valid points of view – i.e. contextually valid. Therefore, identifying global leader potential with cultural intelligence capability can be mapped to specific stages of ego development, moral development and brain integration.

By modifying the order to metacognitive, *affect*, cognitive and behavioral, it is possible to graphically illustrate the impact that Goleman (2006) and Goleman and Boyatzis (2008) propose that social and emotional intelligence make as predictors of leader effectiveness when cognitive skills are similar. This sequence also allows a graphic representation of domain of influence: metacognitive skills are needed at the global level; emotional skills predict success at the national or regional level; cognitive skills for lower levels of management or project level and those with a focus on behavioral competence would be at a local level working on tasks. The review of the various intelligences has provided insight into the fact that each provides a pathway for the ego to embrace *others* and *objects* in a more sophisticated and integrated way as it matures through its various stages. Brain integration research demonstrates that one has more access to

inner resources which when developed become competencies. The competencies – and the neural behaviors that support them – allow for the flow of intelligence socially, culturally, emotionally, cognitively and behaviorally and function as predictors of effectiveness.

CONCLUSIONS & RECOMMENDATIONS

Conclusions

Global Leadership

According to the findings, global leadership requires systemic, holistic thinking. It requires being open to others and to uncertain and ambiguous experiences. This, according to the findings, requires that the prefrontal cortex of the brain be ‘online’ and the amygdala to be ‘calm’. Initial analysis on ego stage development and post-conventional moral maturity provided a set of correlated competencies that matched many of those required for global leaders and cultural intelligence.

Cultural Intelligence(CQ)

Since a significant factor in global leadership is interacting with other cultures, being adept in intercultural situations plays a vital role. CQ requires metacognitive competence - the ability to assume a ‘fourth person’ perspective and the ability to think outside of one’s own cultural values. Being self-referral, that is comfortable with one’s self, proved to be one of the core competencies required for cultural intelligence and a vital tool for interacting in the global domain.

Neuroscience

Developmental interventions that activate the default mode network on a regular basis would provide the calm, social state of the prefrontal cortex required for developing global leadership thinking and the metacognitive competency required for cultural intelligence.

Developmental Strategies

The research on the Transcendental Meditation program reviewed in this study shows that the practice improves brain integration and post-conventional development, both appropriate for global leadership and cultural intelligence. The longitudinal study on intentional change theory by Boyatzis (2006, p. 612) speaks to significant improvements in emotional and social skills. A developmental strategy that maps ego maturity with neurophysiological signatures would provide a clear path to grooming global leadership talent.

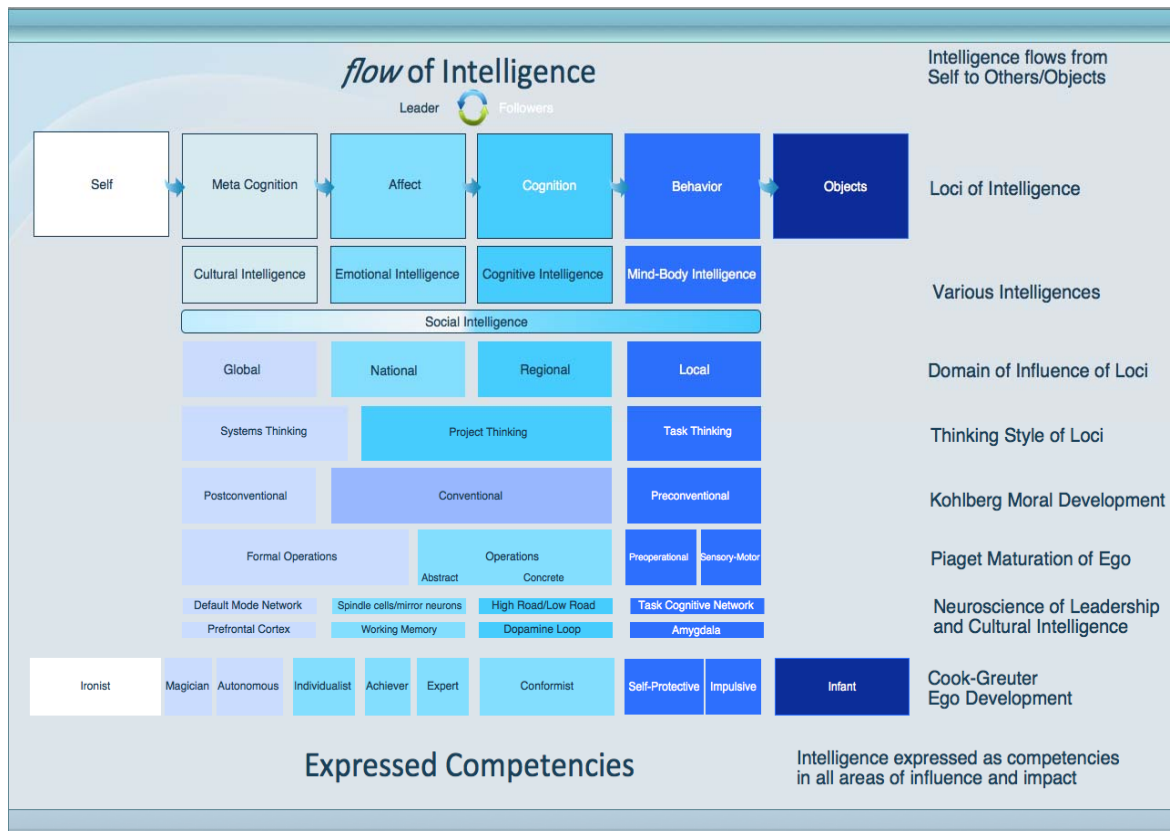

The Flow of Intelligence

The ‘flow of intelligence’ framework is proposed to investigate the various intelligences and their influence on the domains (global, national, regional, local) and the resultant competencies that are derived from them. An analysis of the competencies of the higher stages of development has mapped well to the skills and competencies required by global leaders with cultural intelligence. Similarly, an analysis of the underlying neurophysiology mapping to metacognitive, affect, cognitive and behavioral development provides a robust framework to inform future research and assist in the identification of global leadership and cultural intelligence candidates.

Implications

Global Organizations

The implication of this research to global organizations is that global leaders are distinct from domestic leaders largely by their thinking, their neurophysiology and their ego-stage development. Global, holistic, systemic, metacognitive thinking requires that the brain behave differently than at the domestic or national level. While many of the competencies needed to succeed at the global level can be demonstrated at the domestic level, these skills are essential at the global level for sustainable *cooperative* relationships with international partners. Similarly, moral maturity is based on ego stage and associated with higher brain integration. This maturity is the basis of increasing the flow of intelligence (social, emotional and cultural) and information from followers to leaders. It closes that gap. When organizations realize that assessment and development of their leadership candidates is cost effective, particularly in the global arena, then the suggested framework provides a more objective platform to identify and assess leaders who are ready for global responsibilities.

Academics, Practitioners and Researchers

Having a framework with a neurophysiological basis provides an effective gauge for an individual as they develop. One of the implications of the framework is that it also *disqualifies* candidates based on their stage development. This is an important finding. It means organizations can avoid costly mistakes by putting the inappropriate individual into a global position.

Recommendations

Global Organizations

The proposed 'flow of intelligence' framework provides several metrics both psychologically and physiologically. It is recommended that global organizations start the process of clearly identifying those candidates so that they can be put on the appropriate development track.

Academics, Practitioners and Researchers

For academics, practitioners, and researchers, it is recommended to continue correlating competencies needed for global leadership and cultural intelligence with higher ego state development, post-conventional moral maturity and specific brain behaviors such as integrated brain functioning.

Limitations & Further Research

This study was constrained by the number of interviews conducted and would be improved by having a wider number of participants. Ego and moral maturity need to be validated in cross-cultural contexts, which fell outside the scope of this study. The 'flow of intelligence' framework opens up a number of avenues of further study. Research correlating brain behavior or signatures with global leader performance and cultural intelligence competencies is needed. Similarly, ego stage and moral maturity need to be tested in different cultural contexts to assess their correlation across cultural boundaries.

MULTIATTRIBUTE MODELS WITH MULTIPLICATIVE FACTORS IN THE FANTASY SPORTS

Javier J. Hernández, María J. García and Gilberto J. Hernández
Minimax Consultores C. A., Venezuela
José G. Hernández , Universidad Metropolitana, Venezuela

ABSTRACT

The fantasy leagues are becoming every day more popular, this way of "live sports" has gained many followers and in 2012, in many countries and for the majority of the sports, are participating in fantasy leagues. In them, for every game, the participants receive points according to the real performance of the players that are on their team. At the end of the season, who accumulates more points is the winner. For this reason, having a good squad of players is essential to compete in fantasy leagues. The choice of the players to be included in the squad is, undoubtedly a multicriteria decision problem, for which it is possible to think in a Multiattribute Models with multiplicative factors (MMwMf) to help in the choice of the squad. In this work, it will be used the MMwMf, to conform a squad of a team of soccer fantasy, from there the objective: To construct a Multiattribute Models with multiplicative factors to help to conform the squad of a participant in one league of soccer fantasy. To achieve this general objective and its specific objectives, it will be used the Integrated-Adaptable Methodology for the development of Decision Support System (IAMDSS).

INTRODUCTION

The fantasy leagues, that were initiated like an entertainment among friends, have been popularized from the ends of the century XX and the starts of the century XXI (Davis & Duncan, 2006; Gillentine & Schulz, 2001; Holleman, 2006; Kwak et al., 2010; Otalvora, 2008) they have been converted for many in a new form of "live sports". This new form of life has won followers in the majority of the sports and in almost the whole world.

To win a fantasy league, the participant becomes player, coach and owner of his team and must compete against other league members, following all the same goal, to accumulate the biggest quantity of possible points, in each one of the days of play. This way, who achieves the best total score at the end of the season fantasy league is declared the winner of it.

The rules are adapted to the sport for which the league is created and simultaneously every league has his particular rules. It is common that at start of the league season there would be a draft or a selection system that allows each participant to build their team or squad. To complete a fantastic team, the participants choose players who are part of the different teams that shape the different affiliations or leagues that compete for a championship, in the respective sport in the real life. This first selection involves a process of decisions making, which ends up being one of the most important if aspires to win the league.

To conduct the decision making process, which allows to form the squad, respecting the particular rules of the respective league, it is necessary to attend on a large quantity of parameters, that converts the process into a multi-criteria decision making.

Among the large number of tools for multi-criteria decision making, there are two who stand out for its simplicity, so much to conceive the model, as for its implementation: the Matrixes Of Weighing (MOW) and the Multiattribute Models with multiplicative factors (MMwMf) (García & Hernández, 2011). It is for this reason that for this work they have been chosen the MMwMf, to conform the squad of a

participant in a fantasy. Particularly, this is going to work with soccer, which is usually one of the sports most difficult of estimating the performance of the players. According to the before said, the objective of this work will be: To construct a Multiattribute Models with multiplicative factors to help to conform the squad of a participant in one league of soccer fantasy.

This general objective involves three specific objectives:

- To explain how the soccer fantasy work, through one league of fantasy soccer in particular.
- Describing, what they are and how they function, the MMwMf.
- Construct a MMwMf, allowing form the initial squad of a participant in a league of soccer fantasy.

To reach the raised objectives it will follow the Integrated-Adaptable Methodology for the development of Decision Support System (IAMDSS, in Spanish, Metodología Integradora-Adaptable para desarrollar Sistemas de Apoyo a las Decisiones [MIASAD]) (García, et al., 2011), which, among their characteristics they emphasize their flexibility and adaptability to different types of investigation (Hernández, et al., 2013), by which they can be used of it, only the steps that be considered necessary, of there, similar to the realized in other works (Hernández, et al., 2012; 2013) only the following steps will follow:

a) To define the problem that, as is indicated in the objectives is to construct a MMwMf, to help to conform the squad of a participant in one a soccer fantasy league;

b) To prepare the first prototype, where first there identified the users of the final product, that is to say the principal readership of the article, that will be all those that usually take part in the fantasy, who will join studios of decision making and second the structure of the article is established, which in addition to the introduction will consist of three central chapters, in the first, will present the fantasy leagues, including fantasy soccer forward in this paper, in the second some general comments will be done of the MMwMf and in the third and main of all will be presented the MMwMf, that permits to select the players that will integrate the squad of a participant in a soccer fantasy;

c) Obtaining data, in this case on MMwMf and fantastic leagues, especially soccer fantasy;

d) Establishing the alternatives, that would be the different options of constructing a MMwMf for the selection of a squad of soccer fantasy;

e) Evaluate alternatives, according to the ability of different models to construct a squad that can be successful;

f) Selecting the alternative, according to the previous evaluation and considering the secondary objectives, whether they are tacit or explicit;

g) Implementing the best alternative, illustrating as the model chosen can be used to conform the initial squad of a participant in a soccer fantasy;

h) Establishing controls, the mechanisms, that permit to recognize if the solution obtained, continues being valid in the course of the time.

With regard to limitations and reaches, no field work will be made, but it will be shown the facilities that offers the model chosen to select a squad, through a simple and hypothetical example, to guarantee a major generality of the application of the same one.

FANTASY LEAGUES AND SOCCER FANTASY

As already it was commented the fantasy sports, have grown and they continue growing in recent years (Bolitho, 2006). As definition of fantasy sports has: "A fantasy sport is a game in which players (i.e., public individuals) compete against one another by maintaining rosters of actual professional athletes and using the real game statistics of those athletes to score points" (Massari, 2006, 444-445). And a definition of fantasy sports league: "Fantasy sports leagues are one way fans can enjoy their favorite sports away from the stadium or arena. A fantasy sports league is made up of a dozen or so participants who compete against each other based on statistics from real-world competitions" (Farquhar & Meeds, 2007, 1208). These same authors clarify that Fantasy leagues normally begin with a draft of some sort, where the participants (owners) either select their players or are randomly assigned players (Farquhar & Meeds, 2007).

This decision to conform its team is the first one and perhaps more important that a participant realizes in a fantasy. And although a large quantity of participants in the fantasy leagues, often lack training in quantitative and decision making, participating in one, it involves an a set of decisions makings, the majority of which are chained one with the other. Among the most important processes of decision making

to which a participant must resort in a fantasy, it is, the selection of its initial squad of players. It is in this aspect, the selection of the initial squad, in which this work will be centered. Although they try to make this selection so that it can adapt to the great generality of the leagues, it will be chosen La Liga (Spanish soccer), for the illustration.

As already it was indicated, each league has its own rules, in this article they will follow established in "Desafío la liga", although of it not greater details will be given, but only those that are indispensable to understand the criteria and attributes used in the final model, who have greater interest in these rules they can be revised in ESPN (2012).

To "Desafío la liga": They will be used to 15 players and cannot have more than three players from the same team. With regard to positions will not have more than 2 goalkeepers (GK), 5 defenders (Df), 5 midfield players (Mi) and 3 forward (Fo). For the formations in the field is established: Each participant should select, of his 15 players, 11 starters for each week of the fantasy. Among those 11 players can only have one GK and for the rest of the players some of these formations, orderly: Df-Mi-Fo: 4-4-2 (for default); 4-3-3; 3-4-3; 3-5-2; 5-3-2; 4-5-1 y 5-4-1.

The system of points of "Desafío la liga", it includes among others aspects: Matches = 1; 60 Minutes of play = 2; Goal of Df or GK = 6; Goal of Mi = 5; Goal of Fo = 4; Assistance = 3; Clean chart for Df or GK (minimum 60 minutes) = 4; Clean chart for Mi (minimum 60 minutes) = 1; Caught = 1 point by each 3 caught; Penal it Caught = 5; Penal Erroneous = -2; Goals Permitted by GK or Df = -1 point by each 2 goals; Yellow card = -1; Red card = -3; Goal against = -2.

Generally these rules seek to apply a multi-criteria approach, by which subsequently some details will be given of the Multiattribute Models with multiplicative factors (MMwMf).

BRIEF OF THE MULTIATTRIBUTE MODELS WITH MULTIPLICATIVE FACTORS

The comments on the Multiattribute Models with multiplicative factors (MMwMf) will take principally of García & Hernández (2011) and some of its quotes. There, based on the concepts of Ben-Mena (2000), Ehr Gott & Gandibleux, (2002) and of Roy & Vincke (1981), but mainly following Baucells & Sarin (2003), will be defined the Multiattribute Models (MM), as those that are designed to obtain the utility of alternatives through the valuable attributes, that they should be evaluated as components of the criteria. In every case the final result, as expressed in the equation (1), is an additive model (García & Hernández, 2011):

$$Pts = \sum_i pc_i * (\sum_j pa_{jc_i} * va_{jc_i}) \quad (1)$$

Where, for (1) and (2), which will be presented later, the subscript i represents the criterion and subscript j the attribute, therefore pc_i will be the weight assigned to criterion i, pa_{jc_i} will be the weight of attribute j of criterion i, va_{jc_i} will correspond to the value assigned to attribute j of criterion i, and Pts will be the total value reached about the variable in study. Thus under this definition and by its way to operate, for a MMwMf, it is only needed to define criteria, attributes and a valuation mechanism for such, which implies that the MMwMf is very useful when choosing between different alternatives, or when them must be valued or to made hierarchies. Nevertheless, which is its greater strength, the additively, that makes it simple to operate, becomes its main weakness.

This weakness, consequence of additively, that manifests when there are different scales from evaluation, or values in very distant ranks, it can be evaded, since it is seen in the equation (2) through the multiplicative factors (García & Hernández, 2011), which transform the model in:

$$Pts = \prod_k fg_k * (\sum_i \prod_h f_{ih} * pc_i * (\sum_j pa_{jc_i} * va_{jc_i})) \quad (2)$$

In (2) maintains all parameters of (1) and additionally using correction factors, that operate for the whole model, which will be called general factors, the fg_k and the f_{ih} that are the corrective factors of the criteria, from there that k represent the K general factors and h the H factors of the respective criterion i. Although there is not an analytic limit, for these multiplicative factors, so much general as of the criteria is recommended that never they be more than three. Having understood, what they are and in what they consist the MMwMf, it can be passed to construct the model, that permit to select the initial squad in a soccer fantasy.

A MULTIATTRIBUTE MODELS WITH MULTIPLICATIVE FACTORS FOR A SOCCER FANTASY

The Multiattribute Models with multiplicative factors (MMwMf) to be constructed, must take as principal criteria the value that the player has in the fantasy, the performance expected of the player, so much in the offense, as in the defense and a criterion, that despite not being very technical, has high importance in the fantasy, that is the affinity that the participant feels for a player or a team.

Just as it can be seen in the figures 1, 2 and 3, where not only the criteria and his attributes appear, but additionally have their respective weights and the general multiplicative factors, the criterion Player cost, has two attributes, one concerning what must be paid by the player, Reduction of capital and other Direct cost normalized, which is related to his value in the fantasy, since the higher cost, better performance is expected. Upon expressing the score of Reduction of capital, it will come given by 100 minus the player value, normalized. This normalization is made using as 100 the maximum quantity of money that the player is allowed to spend in the acquisition of players.

Criterion	P	Attributes	P	J01034	J01111	J02033	J02112	J01193					
Player cost	0,335	Reduction of capital	0,30	80	24,01	86	25,79	83	24,91	92	27,75	97	29,10
		Direct cost normalized	0,70	100	69,90	70	49,01	85	59,43	38	26,29	15	10,54
(f ₁)				1,00	31,46	1,00	25,06	1,00	28,25	1,00	18,10	1,00	13,28
Field performance	0,550	Offensive	0,55	100	55,00	46	25,30	43	23,65	38	20,90	41	22,55
		Defensive	0,45	100	45,00	46	20,70	43	19,35	38	17,10	41	18,45
(f ₂)				1,00	55,00	1,00	25,30	1,00	23,65	1,00	20,90	1,00	22,55
Affinity	0,115	With the player	0,90	100	90,00	100	90,00	100	90,00	100	90,00	100	90,00
		With the team	0,10	100	10,00	100	10,00	100	10,00	100	10,00	100	10,00
(f ₃)				1,00	11,50	1,00	11,50	1,00	11,50	1,00	11,50	1,00	11,50
Global (fg ₁)				1,00	97,96	1,00	61,86	1,00	63,40	1,00	50,50	1,00	47,33
Regularity (fg ₂)				1,00	97,96	1,00	61,86	1,00	63,40	1,00	50,50	1,00	47,33
Participation (fg ₃)				1,00	97,96	1,00	61,86	1,00	63,40	1,00	50,50	1,00	47,33
Pts. =					J01011 = 97,96	J02011 = 61,86	J03012 = 63,40	J04012 = 50,50	J05012 = 47,33				

Global = 0 if: jei > 3, jpo1 > 2, jpo2 > 5, jpo3 > 5, jpo4 > 3, C_{tji} > MD_{isp}; 1 for all other case.

Figure 1: The MMwMf constructed, showing the first 5 selections of the squad.

That is to say the value normalized of each player will be the cost that assigns him the league divided among the maximum total of investment of the league, multiplied by 100. For the attribute Direct cost normalized, it multiplies additionally this value normalized by 5, since the prices of the players upon being normalized will remain in values under 20, by which with the latter multiplication a value nearer to 100 is obtained, which simultaneously allows a major differentiation between the players.

The performances of each player are obtained from the experts in fantastic leagues, which are used to publishing these values, according to the performances of each player during the season. To the start of the season, when the squad is assembled, the values of the previous season should be used. In the case of players that were not in the league the previous season, whether for coming from teams that gain promotion or by coming from other leagues, his value is estimated in accordance with a player of similar price and that plays the same position. Since the prices of the players are a measurement of their performance expected in the league. Nevertheless, it is usually normal to have difficulties upon reckoning the defensive and offensive performance of a player, since the performance of each player is not normally present in such detail. In this case, the global performance of the player is used for both attributes. In every case the performances are normalized according to the player of greater score, to which is assigned the value of 100 and to the remainders they will be assigned proportional values. Also it should be emphasized, that for the majority of the scoring systems of the soccer fantasy, the Fo and GK, are used to having higher performances than the Mi and the Df.

For the third criterion Affinity, also two attributes were contemplated, with the player and with team and it was given greater value to the first one, since for the rules of this fantasy they cannot be included more than three players of the same team. No multiplicative factors of criteria were used, but instead three general multiplicative factors were used. The second of them Regularity, is 1 if it is expected that the player maintain a performance more or less constant during all the interim of duration of the league, otherwise assigned a value less than 1; Participation, for an athlete be given the value of 1 if expected to participate regularly in all league games, otherwise it will give a value less than 1, even becoming 0, if the player could be injured for a long time. The first general multiplicative factor, Global, is less direct and it is created to respect the rules of the fantasy, thus it will be maintained in 1, at the start, but will be 0 if the

player is available by surpassing its value the available money to invest, or if have exhausted the quota of players on their team or their position.

La Liga (Spanish soccer) will have 20 teams with an average of more than 20 players on their roster, at the start of the season, whereby the number of players to be evaluated are a little over 400, hence it is appropriate to make a list of players sorted in decreasing order by their performance and taking of this list in principle only the $n+1$ first players of each team, where n will be for this case equal to 3 and it corresponds to the maximum number of players by team that is permitted to select. The selection will begin from this list, in any case, of being necessary, it is possible to reduce this list of work to $2*m$ first players, being m the maximum number of total players permitted. As upon completing the quota of a position they should be eliminated of the list of work all the players of this position, they can be added to the list of start other players of the team, who play positions have not yet been taken over. An initial table of this list of work, is similar as the table 1. For this case this first list was prepared with $3*m$ that is to say 45 players and they took $3*n$ for each of the positions that is to say 6 GK, 9 Fo and 15 Df y Mi.

In the table 1, as in Figures 1, 2 and 3, players have been identified by the letter J followed by five digits, the first two identify the player, which have been ranked according to their performance in the last fantasy league, the third and fourth digits identify the team and fifth digit the position. The teams are ordered alphabetically, although generally they are ordered according to the number of points generated in the last fantasy league, as for player. This order does not have to coincide exactly with the final results of La Liga. For the last digit, which identifies the position that for the fantasy league the player redeems, as it was indicated previously the GK are 1, 2, the Df, 3 the Mi and 4 the Fo. In the table 1, in the column of performance (Perform), the points of the player are visualized already normalized on base 100, where 100 is for the player who has generated most points in the last league fantasy. Equally in the column of the cost (Cost) of the player the normalized value expresses itself already, although without multiplying for 5. In the table 1, not expressed values for attributes of the Affinity criterion, since they depend on each participant in the fantasy and sometimes the case is given that a player by being a fan to a club does not accept players of the rival team and it can give qualifications very low to a player for that reason, independent that the player in itself have had an excellent performance. Of the values of the table 1 there have been chosen the first five players who are those who appear in the figure 1, and later in figures 2 and 3 they are shown the remainder of the 15 players selected. In the table 1, it is possible to notice the high performance of Fo, where the first 8 players of the list are Fo, in particular the first player of the list it has an advantage of more of the double of the points with regard to the best players of the remaining positions. The same does not happen with the GK, that as it is possible to see in the table 1, except the best of them, the others do not occupy positions privileged in the table of the best 45.

For the selection of 15 players, which in the table 1 they appear in bold face, the followed strategy was to choose the first players for each of the positions and given that they spent much of the available budget, for the remainder of the selected, they tried to take players not exceed the budget unit that remained to complete the 15 places. On the way to work one can see that the last player chosen was more expensive than some of the players previously selected.

Trying to be neutral about the teams and players, in the attributes pertaining to the criterion Affinity the maximum punctuation was assigned to all the players. In 15 chosen players, since it is possible to observe in the figures 1, 2 and 3, none stayed neither with low regularity, nor with low participation and those players for whom the factor general Global became 0, of course they were not selected, therefore all the general multiplicative factors are seen equal to 1. Well as it is possible to see in the figures 1, 2 and 3 and in the table 1, selected two players from the teams: 03, 11, 16 and 19 and a player of each team: 01, 04, 06, 07, 10, 12 and 14, completing this way the authorized 15, that on the average they offer a performance expected of the 51,58% using the 97,97% of the available money, what shows a good use of the capital. Although by reasons of space not greater details are given of how went advancing in the use of the model some of the alternatives were discarded, with the values highlighted in the table 1 and the selections showed in the figures 1, 2 and 3, it is possible to understand easily how the MMwMf works, created to select the initial squad of a participant in a fantasy soccer. Hence, we present some conclusions and future investigations.

Table 1. The first 45 eligible players and 15 selected.

CONCLUSIONS AND FUTURE INVESTIGATIONS

More than showing the 15 players selected, the most relevant thing in this work is to have constructed the Multiattribute Models with multiplicative factors (MMwMf), that permits to do the selection of the players that will integrate the initial squad of the participants in a soccer fantasy, complying with the general objective pursued in this work. Also, it showed how a soccer fantasy works and it was illustrated what are and how do they work the MMwMf, complying in this manner with the specific objectives that had arisen.

It is interesting to note, that not necessarily the better players, of the most noticeable teams, are going to be the first selected, this happens for two reasons, a good player in its respective league, it is not necessarily so noticeable for the fantasy leagues and the prices of the big teams players sometimes can be very costly.

Here it was followed a general strategy, that began trying to recruit the best players in each position and then working with the available budget, but still can work with a strategy that does not allow investing in each player beyond a given amount. That is to say that the MMwMf are going to allow following different strategies, therefore it is recommended to try to analyze these different strategies to see which offers better results.

To prove what strategy offers better results, it is possible to initiate with one already finished league, in this case that of 2011 and doing the different trials of forming the squad and reviews at the end, that strategy generates the squad that produces the best results.

USE-ADOPTION GAPS IN FOOD RETAILING: HYPERMARKEYS, SUPERMARKETS AND TRADITIONAL FORMATS IN EMERGING ECONOMIES

Hayiel Hino
Ariel University, Israel

ABSTRACT

This research addresses the use adoption gaps in food retailing in the context of emerging economies. In particular, the study attempts to shed light on the intensity of use of hypermarkets by employing a new research approach. Thus, the study examines how various factors typically associated with food consumption, drive consumers to shop for food items across different food stores. The study employs data collected from a survey involving 433 households. The conceptual framework and hypothesis are tested using multiple regression analyses. The empirical results support our claim that the research approach applied in this study better explains the use-adoption gap in food retailing.

INTRODUCTION

Modern food retail formats are diffusing fast into emerging economies. To take the example of Jordan, in the early 1980s Jordan had no supermarkets. Since then supermarkets have diffused across main cities and are expanding into small towns and beyond, to the rural areas. Some foreign retailers, particularly Carrefour and Spinneys Group, as well as scores of local supermarket firms operate in Jordan. Jordanian consumers can choose from an array of supermarket formats including small, medium size, hypermarket and cash and carry. Supermarket adoption levels are relatively high. For example, a study by Hino (2010) finds over 68% of Jordanian households shop regularly at hypermarkets and/or supermarkets.

Supermarkets' market share in consumers' overall expenditures for food, grocery and FMCG is substantial but is lower than that found in the developed economies. Our consumer shopping behavior study, discussed in this paper, involving 433 Jordanian households finds hypermarkets and supermarkets capture 35% of consumers' weekly expenditures for these items. The important phenomenon, at the center of this research, is that the modern formats' share varies across product groups. It is high in the packaged, processed and non-food (60%) categories but is low in the fresh food categories (15%). Clearly, supermarket and hypermarket adoption does not entail a shift into a "one stop" shopping pattern where consumers buy there all their food, grocery and other FMCG needs. Adoption is often associated with partial and selective use of the modern formats. Many consumers shop regularly in the modern formats but they typically continue to buy important product categories in the traditional outlets. There is mounting evidence that these patterns are not unique to Jordan. They exist all over emerging economies. Moreover, not only in emerging markets but also in the non-Western developed economies, such as Hong Kong, Taiwan and Singapore (Goldman et al 2002; Coca Cola Retail research Council, 2005). The magnitude and nature of the gap between consumers' adoption of the modern formats and their use varies across product categories. It also varies across the different supermarket formats.

The study of this phenomenon is of major importance. A use-adoption gap signals a weakness of the modern format and acts as a barrier to supermarkets market share growth. Public policy makers and retail planners are interested in accelerating retail modernization: the process where the advanced supermarket technologies replace the outmoded and inefficient traditional formats and practices. The appearance of a use-adoption gap signals a break in the modernization process. An understanding of the reasons will help them fix the problem and lead to the continuation of the modernization process. For retail executives the gap indicates a failure in strategy or execution. An understanding of the reasons why supermarkets in general or

particular supermarket formats were unable to outperform the traditional outlets in some product areas is the first step in the process of rectifying the problem. Finally, for researchers studying the retail globalization process the use-adoption gap signals a failure of the replication strategy involving the as is transfer of advanced supermarket technologies into the emerging economies. The study of the reasons for the failure of these technologies will yield insights into the retail technology transfer issue and the process of retail globalization.

The idea that adoption does not tell the whole story and need to be complemented by examining how the innovation is used has received some recent research attention. Shih & Venkatesh (2004) have developed a use-diffusion model and tested it in the context of home computers. They looked at variety and rate of use and identified consumer segments displaying different use-diffusion patterns. We build on their work and especially on their use typology. However, the differences in research setting and research questions leads to a different conceptual framework, hypotheses and research design.

We study the use -adoption gap in the context of supermarket and hypermarket diffusion into emerging markets. The specific research issues we study are as follows: 1) Identification of the types of use-adoption gaps in supermarket retailing and an analysis of their nature; 2) The determinants of these gaps; 3) The implications for retail public policy, strategy and management and retail technology transfer.

The role of the use-adoption gap in supermarkets' diffusion process

The first step in the diffusion process involves supermarkets becoming accessible to consumers. Consumers enjoying accessibility may adopt or reject supermarket shopping. *Adoption* is defined as regular use of the supermarket formats. Consumers who adopt the supermarket formats can spend there a small or large proportion of their household's expenditures. This share of household expenditure component is a function of the supermarkets' usage pattern. Usage consists of two shopping behavior components. The "*intensity of use*" is the proportion of shopping trips out of the number of trips that a consumer directs to supermarkets. The "*category use*" is the proportion of product lines purchased by a consumer in the supermarket out of the total purchased. When only a small proportion of the shopping trips are directed to supermarket formats and/or consumers buy there only few of their product needs, the share will be low. The *use-adoption gap* may relate to the category use component and/or to the intensity of use. The gap occurs when consumers who adopted the supermarket shopping buy there only a small proportion of their needs and/or direct only a small proportion of their shopping trips to supermarkets. Supermarkets' overall market share will be high when diffusion is complete; most consumers adopt supermarket shopping and when the adopting consumers spend a high proportion of their budget for the relevant products in supermarkets. The use-adoption gap is important because it is a major determinant of the budget allocation construct.

Supermarket formats: use patterns and use-adoption gap scenarios

Our focus is the consumers who have adopted supermarket formats. We study their patterns of supermarket use. In this section we identify four supermarkets use patterns. These represent Hi and Lo positions on the two supermarket shopping behavior components: "*intensity of use*" and "*category use*". In the next section we discuss the determinants of each dimension and suggest hypotheses. We then discuss the conditions associated with each pattern and suggest hypotheses. Note that these patterns may relate to "supermarket formats" in general or to specific formats such as the hypermarket or the small supermarket. The first approach is relevant in the context of an economy where food retailing is at its earlier stages of development. This is at present the case in Vietnam and India and was the case in China in the early 1990s. The second approach is relevant in emerging economies, such as Jordan and Turkey, where supermarket diffusion is well advanced. In this study we focus on studying formats. Specifically, we study the use-adoption gap in the case of hypermarkets and small supermarkets.

The "*full*" supermarket use pattern describes a situation where consumers direct a high proportion of their shopping trips to supermarket formats and buy there a large proportion of their needs. This pattern represents the "one stop" supermarket shopping model. In this situation no use-adoption gap exists.

The "*selective*" supermarket use pattern describes a scenario where supermarket formats receive a large proportion of consumers' shopping trips but consumers buy there only a small proportion of their product needs. A use-adoption gap exists in this situation. It is caused by consumers' tendency to buy some product categories in the traditional outlets. This scenario indicates a failure of the modern supermarket

formats to compete in these product categories against the traditional formats. In emerging countries these are often the fresh food categories.

"Constrained" use pattern occurs when only a small proportion of consumers' shopping trips are directed to supermarket formats but at the occasions when they do shop there they purchase there most of their food needs. This situation is likely to reflect accessibility difficulties. Consumers' strategy in this condition is to combine a few major supermarket trips per month with frequent supplementary purchases of daily products in the traditional formats near home. Increased supermarket diffusion or change in consumers' mobility is likely to shift these consumers to the full use pattern. In this scenario no use-adoption problem exists.

The *"marginal"* use scenario relates to situations where only few of consumers' shopping trips are directed to supermarket formats and in these trips they buy there only a small proportion of their needs. The use-adoption gap here is severe. Supermarkets play a marginal role for these consumers. This scenario is most relevant when studying the strength and weaknesses of different supermarket sub formats. As will be discussed in the body of the paper we believe it is typical of the small local supermarket format which, in emerging markets, is much weaker than the hypermarkets.

The full use scenario characterizes supermarket retailing in the developed Western economies. It is the template for a successful transfer of the supermarket technology. Public policy makers, retail planners, retail executives and global retail researchers expect the full use scenario to eventually dominate. In this situation no use-adoption gap exists and supermarkets' market share growth is not constrained by a use problem. Deviations from a full use pattern signal a problem. It may involve a use-adoption issue as in the selective and marginal use cases or an accessibility-diffusion issue as in the constrained use scenario.

Our two dimensions of supermarket use and the classification of use patterns provide a starting point for an in depth study of the use issue and the circumstances associated with each dimension and use pattern. Each of the three use patterns signals a different type of supermarket weakness. Underlying the "full" use pattern is a situation where the two dimensions interact thus enhancing each other: buying all the needs in the format (category use) increases its attraction and thus the proportion of shopping trips directed towards it (intensity). On the other hand shopping frequently in the format increases the likelihood of buying there more product line (category use). However, in the situations underlying the three other use patterns the two dimensions are not correlated.

We study these patterns and their determinants. Specifically we develop and test hypotheses relating to the following types of factors: 1) The distance factor; 2) The household's socioeconomic and demographic factors; 3) The type and levels of outputs delivered by the format; 4) The format's performance across product categories; 5) Consumers' food culture and its impact on the demand for freshness;

Determinants

The likelihood of shopping at a format (store) is the typical dependent variable in the store and format choice literature. Our focus is different as we study both the intensity of format use and the category use. The intensity of format use can be viewed as corresponding to the likelihood of shopping variable. The category use adds the product category dimension to the model. This is a more realistic view of reality as the format's market share depends on both intensity and category use.

The determinants studied in the store and format choice literature are relevant for us. Some of the determinants impact both the intensity and category use dimensions similarly; others influence both but in an opposing manner and still other impact only one dimension. Following we discuss the determinants, explain how they impact each dimension and suggest hypotheses summarizing the impact. In the case of emerging markets such as Jordan, hypermarkets typically compete in the fresh categories with the traditional formats of traditional markets and local fresh food stores. They compete in the other categories with other supermarket formats. Our focus is mostly on hypermarkets vs. the traditional formats (fresh categories) and vs. the supermarkets (the non fresh categories).

Determinants of the intensity of use dimension

The proportion of shopping trips directed towards the supermarket or hypermarket over a certain time period is the relevant variable. It is a function of the utility it delivers to the consumer relative to the alternative formats. The store and format choice literatures identified consumer state variables that impact consumers'

utility and format choice. The relevant ones include travel costs, cost of time, the demand for freshness, variety and depth, storage constraints, household income and size. The format related variables studied include format attraction and image, the number of categories offered, the number of categories purchased (our category use dimension) and the format's price strategies and image. Finally, an increasing number of researchers study product perishability.

Travel costs/distance: This determinant relates to the spatial accessibility of the format and its impact on the use decision (Jones, Mothersbaugh, & Beatty, 2003). Low accessibility increases travel distance and costs and may lead to a smaller number of shopping trips (Bell, Ho, & Tang, 1998). Consumers no longer face "a supermarket" format. They typically face a number of formats. In a developing economy context the most relevant are the extremes of the local small supermarket and the hypermarket/cash and carry format. Local supermarkets and the traditional outlets are located nearer to consumers while hypermarkets further away. We expect therefore the distance factor to affect differently the intensity of use of supermarkets and hypermarkets.

H1A: (impact of the distance factor: hypermarkets vs. traditional formats). The greater the relative distance to hypermarkets (travel time/distance difference between the traditional format and the hypermarket) the greater is the proportion of shopping trips directed towards the traditional formats.

H1B: (hypermarkets vs. local supermarkets). The greater the relative distance to hypermarkets (travel time/distance difference between the small supermarket format and the hypermarket) the greater is the proportion of shopping trips directed towards the local supermarket.

Household's socioeconomic status: A large number of studies show that socioeconomic status variables such as income, education and size of apartment affect consumers' shopping propensity. The most relevant perspective is the household production approach (Becker, 1965; Betancourt & Gautschi, 1990; Messinger & Narasimhan, 1997; Goldman et al., 2002; Hoch et al., 1995). This framework suggests that a household's opportunity cost of time (time more or less valuable), storage costs and consumer ability to buy larger quantities influences consumers' tendency to shop in modern formats. Consumers high on these variables will conduct fewer shopping trip and buy larger amounts in each trip. In this case too we expect these variables to make a stronger impact in the case of hypermarket than on local formats.

H2A: (impact of income and education). A higher opportunity cost of time (income and education) is positively related to the propensity to direct shopping trips towards hypermarkets.

H2B: The ability to purchase in larger quantities (size of apartment and mobility) is positively related to the tendency to direct shopping trips towards hypermarkets.

Format outputs: In an emerging country context the modern formats are assumed to attract consumers away from the traditional formats because of their shopping environment advantages. These include a comfortable and interesting shopping atmosphere, order, easy to find items, cleanliness, tidiness, hygiene, trusted and helpful staff, and few stock outs. These reflect modern formats' use of advanced retail technologies and their ability to generate cost and scope economies (Briesch, Chintagunta, & Fox, 2009; Fox, Montgomery, & Lodish, 2004; Goldman, Ramaswami, & Krider, 2002; Hino, 2010). In reality the gap in outputs between the modern and traditional formats may be small. The modern formats may be viewed as similar or even inferior to traditional outlets. An additional and highly important output is price. Retail planners, experts and retail globalization researchers often assume that the superior technologies and systems transferred by supermarket firms will provide the modern formats with a substantial competitive advantage over the traditional format retailers using simple and outmoded retail technologies. However, modern formats often encounter conditions in emerging markets that make it difficult and costly to operate the transferred technologies. Consequently the modern formats are often forced to charge higher prices for marginally improved outputs. Similarly we may find cases where consumers put little value on many of the outputs associated with the modern formats focusing only on the price. The traditional formats employing low cost retail technologies enjoy an advantage in these situations. Finally, traditional markets' modernization programs may help traditional formats close these gaps with the modern formats. Hypermarkets are much larger than supermarkets and therefore can provide higher levels on these outputs at lower costs than local supermarkets. Local supermarkets find themselves especially vulnerable. They are unable to provide substantially improved outputs compared to the traditional formats but their cost structure forces them to charge higher prices. They, in effect, are squeezed between the hypermarkets and the traditional formats.

H3A: (Store outputs: hypermarkets vs. traditional formats). Consumers who view hypermarkets as similar to traditional formats in their store outputs are less likely to shop in hypermarkets.

H3B: (store outputs: hypermarkets vs. local supermarkets). Consumers who view hypermarkets as similar to local supermarkets in their store outputs are less likely to shop in hypermarkets.

H3C: (Price: hypermarkets vs. traditional formats). Consumers who view hypermarkets as being higher in price compared to the traditional formats are more likely to shop in traditional formats.

H3D: (Price: hypermarkets vs. local supermarkets). Consumers who view hypermarkets as being higher in price compared to local supermarkets are more likely to shop in local supermarkets.

The category use dimension: The typical category use pattern in the developed Western economies is that of "full use" (figure 1). In this situation consumers buy most of their product needs in the large supermarkets using other formats (convenience stores, local supermarkets) for supplementary purchases. The "selective" and "marginal" use patterns (figure 1) is mostly found in emerging economies and is mostly associated with fresh food (vegetables, meat, poultry, fruits, fish and bakery). This pattern was studied before (e.g. Goldman et al. 2002; Goldman & Hino 2005). This use-adoption gap was attributed to demand and supply side reasons. On the consumer side it reflects the nature of the demand for fresh ingredients. This demand is shaped by the society's food culture. This construct relates to the values and practices associated with food consumption and shopping. It consists of meal eating and preparation habits, the role of fresh ingredients in the cuisine and of food in the culture, the definition of freshness and the social context of eating and shopping (Hino, 2010; Sinha & Banerjee 2004; Veeck & Burns 2005). On the supply side it reflects supermarkets' inability to leverage their advanced supply arrangements in the conditions prevailing in emerging economies leading them to lag traditional formats in price and variety (Goldman et al. 1999; Hansen, 2003; Reardon et al. 2004).

Differences across formats: The nature and magnitude of the category use gap may vary across different supermarket formats: the larger hypermarkets are in a stronger position in the fresh categories than the small supermarkets. Supply side problems and size limitations limit the small supermarkets' ability to offer a selection matching the traditional formats in variety, freshness and price. They are in a much weaker position than hypermarkets. On the other hand the local supermarkets enjoy a proximity advantage over the more distant hypermarkets. This is an important consideration in situations where the demand for freshness and the daily cooking at home leads consumers to make frequent, often daily, shopping trips to buy the fresh categories.

Hypermarkets in emerging markets, especially in South Asia and the Middle East, increasingly copy traditional markets in their merchandising approach. They adapt to consumers' habits. Also, their size enables them to be supplied directly, not through a distribution center system. Thus, they can more easily adapt to the traditional supply arrangements. These considerations explain why, compared to the small supermarkets, they are better able to compete with the traditional formats in variety and freshness. They continue to suffer however from distance and price disadvantages.

Demand side causes of differences among fresh food items: The tendency not to buy fresh in the modern formats may vary across the fresh food categories, reflecting consumer and/or supply considerations. As to consumers, the position of some fresh food items in consumers' food culture may be less entrenched. In these cases consumers may choose to use non fresh forms of the products (e.g. frozen, chilled). For example, the regional cuisine variability in Arab food culture means that fresh items that are an important part of the cuisine in some regions are of marginal importance in others. Affluence, improved transportation and removal of cross regional trade barriers leads consumers to use fresh items from other regions that are not strongly anchored in their regional cuisine. Similarly, in the past seasonal scarcity of some food items increased the legitimacy of consuming these items in a frozen or preserved form. These types of products need not be purchased frequently and/or in a strictly fresh form. Hypermarkets and supermarkets are in an equal or even stronger position than traditional formats to offer these products.

Supply and distribution side causes of differences among fresh food items: Supply side factors were shown to be the major reason for supermarkets' weakness in the fresh categories in emerging economies (Goldman et al, 2002; Reardon et al, 2004). Studies show that supermarkets are unable effectively use their advanced fresh food supply and distribution technologies. These technologies and systems are largely ineffective in an environment where traditional agriculture production, distribution and supply arrangements persist. They are forced to use the same supply arrangements as the traditional formats. They end up offering consumers the same or lower levels of fresh outputs for higher prices. This gap between the modern technologies and supply conditions vary across different fresh food categories. The production and distribution conditions of some fresh products change faster towards conditions more favorable to the use of the advanced technologies. This happens in situations where production and distribution is handled by large units in a semi industrial manner. Research in a number of emerging countries (Reardon et al., 2004) finds this to be the case in two products: pork meat (large pork processing

facilities and cool chains) and fruits (large packing houses, often transported across regions or imported from foreign countries). In these cases the output and price gaps between the modern and traditional formats decreases fast.

Consumers' food culture: Consumers who mostly eat home cooked meals, use traditional preparation methods and eat traditional dishes often put high value on the use of fresh ingredients. They demand a large variety of fresh ingredients, are likely to shop frequently for fresh items and be highly sensitive to the level of outputs and services the store provides. Studies (Goldman et al. 1999; Coca Cola, 2005; Veeck & Burns 2005) and anecdotal evidence indicate that these "traditional" shoppers prefer buying in the traditional formats viewed as better able to supply them with outperform the variety, freshness, price and proximity outputs they require. The above means that consumers who do not follow these traditional food culture habits are less likely to shop for fresh in the traditional formats.

H4A: (hypermarkets vs. traditional formats). The probability of shopping for a given product in hypermarkets rather than in traditional formats is lower if the product is fresh.

H4B: (hypermarkets vs. small supermarkets). The probability of shopping for a given product in hypermarkets rather than small supermarkets is larger if the product is fresh.

H4C: (supermarkets vs. traditional formats). The probability of shopping for a given product in local supermarkets rather than in traditional formats is lower if the product is fresh.

H5: (meat and fruit vs. the other fresh food categories). The probability of shopping for meat and fruit in hypermarkets rather than in traditional formats is larger than the probability of shopping there for the other fresh food categories.

H6A: Consumers who show a stronger tendency to eat traditional meals are more likely to shop for fresh food in the traditional formats.

H6B: Consumers who emphasize the importance of using fresh ingredients in their meal are more likely to shop for fresh food in traditional formats.

APPLICATION

Jordan presents an ideal setting for conducting this research. Supermarket is relatively new in Jordan but in the short period since their appearance they have diffused fast. Two international supermarket companies operate in Jordan competing against scores of Jordanian supermarket firms. All supermarket formats, with the exception of the limited line discounters, operate in Jordan. 664 hypermarkets and supermarkets are estimated to operate in Jordan. Consumers can choose to buy in local supermarkets in hypermarkets or in large supermarkets. Data collected shows supermarkets and hypermarkets' adoption levels to be relatively high (68%). Yet, in spite the progress supermarkets' market share remains relatively low. The low market shares may reflect limited diffusion or the existence of a use-adoption gap. It is generally accepted that diffusion is almost complete. Our data shows that consumers in each of the three major cities we studied do indeed enjoy high accessibility to the various supermarket formats. Specifically, 65% of households report that supermarkets and hypermarkets are located, respectively, at a distance of 8 and 17 minutes from their homes. Some variations existed across the three cities in the accessibility of specific supermarket formats reflecting differences in retail structure. However, the general picture remains that of a relatively high level of diffusion of the supermarket formats. These modern formats operate along side a strong traditional retail system. Traditional formats are especially important in the retailing of fresh food dominated by traditional markets and local specialized fresh food stores.

The data clearly shows the existence of a strong user-adoption gap involving the fresh food categories. Specifically our study shows that the three modern formats (small, medium-large supermarkets and the hypermarkets) capture 60% of consumers' expenditures on packaged/processed food but they account only for 15.8% of the. This situation makes Jordan an ideal place to study the use-adoption problem.

RESEARCH DESIGN AND METHODOLOGY

For the purpose of data collection, we conducted a consumer shopping behavior study in Jordan. It included a stratified sample of 433 households selected from the three large governorates (Amman, Irbid, and Zarqa). The number of households selected in each residential area was proportional to its relative size. Also, the distribution of each sample among the geographical areas reflected the distribution of the three research populations, respectively. The person in each household responsible for most food and grocery shopping was interviewed. The field work was conducted by professional research company specializing in collecting data from representative samples. The interview process was closely supervised monitored by us. The questionnaire consisted of 35 questions and took about an hour to complete. The respondents were asked

about their adoption of the different modern supermarket formats, the formats (modern and traditional) in which they shopped for each of 15 product lines, their budget allocation among the formats, distances and travel time to each format, frequency of shopping and time of shopping. They were then asked about their evaluations of each of the formats in general and in reference to the particular product lines. In addition we collected detailed information about consumers' food culture: meal preparation and eating habits and the use of fresh, processed and frozen ingredients. Finally we collected demographic and socioeconomic data about the household as well as its structure. The product lines studied included packaged and processed food, non food items and six fresh food categories (vegetables, fruits, meat, poultry, fish and bakery). The questionnaire construction followed the procedures recommended in cross cultural research (e.g. Craig and Douglas, 2000; Hui and Triandis, 1985). The questions were first written in English translated into Arabic then again to English to identify problems. It was then pre tested in Jordan on 15 consumers, refined and translated again to English. A bilingual research assistant was closely involved at all stages identifying and resolving the cases where the Arabic concepts did not convey the original intentions.

DESCRIPTIVE STATISTICS

Demographics: 52% of respondents were females. The averages for age, education and income were, respectively, 38, 12.9 years of schooling and \$552 per month. The average home size was 3.54 rooms with an average density of 1.64 persons per room. In addition, over 42% of the respondents owned at least one car. Most respondents (98%) owned a refrigerator and 67% owned a cell phone.

Shopping patterns: We interviewed only consumers who regularly shopped in hypermarkets but adoption rates for the other supermarket formats varied: 65% adopted small supermarkets, 47% medium/large supermarkets and 46% hypermarkets. The average time to reach traditional markets, specialized food stores and the small supermarkets was 3.1, 7.5 and 9.8 minutes, respectively. These were clearly the local formats. The average time to the larger supermarkets and hypermarkets was almost double, 8.4 (SD 6.16) and 18 (SD 8.99) minutes, respectively. Consumers mostly (55%) walked to the three local formats: traditional markets, specialized stores and small supermarkets. Finally, respondents shopped an average of 3-4 times per month in the supermarket formats (2.1 in hypermarkets, 4.2 in medium/large supermarkets, and 1.2 in small supermarkets), 5.5 times (almost daily) in local specialized stores and 4.2 in traditional markets.

Food culture: Most respondents eat their main daily meal at home (5.8 times a week). These are cooked at home and mostly consist of freshly made traditional dishes (79%). The ingredients used in preparing these dishes are mostly fresh (on average 77.4% of the ingredients). Frozen, processed and precooked items play a much smaller role: average use of 11.7%, 3.9% and 11%, respectively.

Formats and product lines: Consumers shopped regularly in a number of formats: an average of between 1.7 formats to 2.55 for each of the product lines. Respondents designated traditional markets and the local specialty fresh food stores, rather than the hypermarkets and large supermarkets, as their main format for the fresh food categories: 86% for vegetables (6% hypermarkets and 5% large supermarkets) 69% for fruit (hypermarkets 20% and large supermarkets 10%), 56% for meat (30% hypermarkets, 12% large supermarkets), 65% for poultry (hypermarkets 21% and large supermarkets 10%), 69% for fish (hypermarkets 19%, large supermarkets 9%) and 43% bakery (hypermarkets 38%, large supermarkets, 14%). Hypermarkets and supermarkets are viewed as the most important formats for purchasing packaged food (60%), for pre-prepared, cooked and deli food (39%, 33%, respectively) and for non-food (65%, 41, respectively). Consumers spend an average of \$72.6 per week on food and daily necessities. A very high proportion of these expenditures, 55% is spent on the fresh food categories.

FINDINGS

We estimated the effect of the different variables in a nested fashion. We first included travel time, then socioeconomic variables, next the perceptions of store attributes, then the perishability variable and finally added the meal preparation variables. The hypotheses were evaluated in the general model. Also, the sign and significance level of the coefficients in all six types of variables and the differences in goodness of fit, as each variable set is incrementally added, indicate the relative contribution of each to the overall explanatory power of the model. We also included a constant to capture the residual preference for supermarkets after controlling for all six variable groups. Estimates for the models appear in Table 1 and Table 2.

Factors affecting Use-adoption gaps: Travel time distance

The travel time difference coefficient is significant ($p < 0.001$) and negative (-0.39). Also, the marginal contribution of this variable to the explanatory power of the model is relatively high; $R^2 = 0.15$, (see model 1, Table1). The negative sign for distance indicates that as the relative travel time to hypermarkets increases, the proportion of the shopping trips directed towards hypermarkets decreases, respectively. Accordingly, H1A is supported.

Travel distance: hypermarkets vs. supermarkets: Model 1 (Table2) tests the hypothesis relating to the expected negative impact of the relative travel distance difference between the supermarket format and the hypermarket on the likelihood of buying in hypermarkets. Our data supports H1B. The coefficient for travel distance is significant ($p < 0.001$) and negative (-0.25) thus decreasing the proportion of product lines consumers purchase at hypermarkets.

Socio economic variables: We use consumer cost of time, household mobility, and housing density (persons per room) as consumer economic characteristics. The regression model for these variables was found to be significant and with the expected coefficient signs, thus supporting H2A and H2B (see model 2, Table 1). These results indicate that consumers who enjoy a relatively high socio-economic status tend to conduct large purchases at large formats such as the hypermarket.

Format outputs: Model 3 (Table1) evaluates the impact of format outputs (store outputs and price) on the intensity of hypermarkets use. This is relatively high in the current study: R^2 increased by 5.5% (from 31.5% in model 2 to 37% in model 3). In addition, coefficients of the two variables were significant ($p < .01$) with the expected direction (Model3, Table2), thus supporting H3A and H3B. This means that consumers tend to shop at hypermarkets when these formats provide better outputs and low prices compared to traditional outlets.

The impact of store outputs differs across the modern food formats (hypermarket vs. supermarket). The regression model (model2, Table 2) points to the significant impact for this variable, which means that the hypermarket stores provide higher levels on these outputs. Accordingly, H3B is not supported. Research results regarding the price variable support H3D. The negative sign for price indicates that consumers view hypermarkets as being higher in price compared to local supermarkets (model2, Table 1). Hence, they are more likely to shop in local supermarkets.

The role of the perishable category: In model 4 (Table 1), the fresh food category is supported by a strong, negative coefficient for perishability showing that fresh food items are more likely to be purchased at traditional formats. Accordingly, H4A is supported. The impact of the perishable category differs across modern food formats (hypermarket vs. supermarket). The regression model (model3, Table 2) indicates no significant impact for this variable. This means that hypermarkets do not provide higher levels on the perishable products compared to supermarkets. Accordingly, H4B is not supported.

The use-adoption gap: Differences among fresh products (meat and fruits vs. other fresh items) have no significant impact on the intensity of use of hypermarkets, see model 4, Table 1. This means that consumers do not view hypermarkets as providing higher levels of freshness and quality in meat, vegetables and fruit products compared to traditional outlets. Therefore, H5 is not supported.

Table 1: Multiple regression models: hypermarkets vs. traditional stores (Parameter estimates¹)

R²		6.7%	21.9%	24.6%	28%

(1) Beta coefficients presented in Table 2 are standardized.

(*) $\alpha \leq .05$; (**) $\alpha \leq .01$

Food culture variables: Finally, model 5 (Table1) captures the added impact of the underlying cultural factors influencing food preparation and consumption habits. Hypotheses 6A and 6B are supported by the negative and significant coefficients of the two food preparation variables (type of meals and the use of fresh ingredients in food preparation). Furthermore, results point to a relatively high contribution to the explanatory power of the model: R² rose from 41.6% in model 4 to 50.7% in model 5.

DISCUSSION

The analyses demonstrate that the final model (model 5, Table 1) has a high explanatory power that matches the data. The model has F value of 38.17 which is significant at the 0.00 level. Moreover, the adjusted R² is relatively high: 49.4%. The findings also indicate that most of the explicative variables have significant effects and most hypotheses are supported by the data, thus providing empirical evidence in support of our theoretical framework. This also means that our model was able to capture most of the factors impacting the use-adoption gaps across the different food formats. We interpret the significant and positive constant (intercept) in the overall model (model 5, Table 1) as indicating that after controlling for all the variables included in the model there is a general underlying preference among the study population for the hypermarket format. This conclusion is supported by the perception of the hypermarket viewed as providing superior outputs compared to supermarkets traditional outlets.

values when they enjoy relatively low standards of living. If this is the case, economic and store output factors are expected to continue determining the intensity of use of the modern food formats.

SUMMARY AND CONCLUSIONS

Many earlier studies carried out in non-Western economies (e.g., Goldman et al., 2002; Goldman & Hino, 2005; Hino, 2010; Maruyama & Trung, 2007; Sinha & Banerjee, 2004) documented the tendency of consumers to display food shopping patterns that differ from those of consumers in Western developed countries. They shop frequently at traditional outlets for selected food categories rather than concentrating most of their food purchases in the mainstream modern supermarkets and hypermarkets.

Our focus in this paper is different as we study both the intensity of format use and the category use. The intensity of format use can be viewed as corresponding to the likelihood of shopping behavior. The category use adds the differences across the product category dimension to the model. This is a more realistic view of food shopping behavior as the format's market share depends on both intensity and category use.

The empirical results of the analysis lead to a number of conclusions. Firstly, our data found incomplete geographical diffusion of the prevailing hypermarket formats. Hence, travel time distance appears to constitute one of the major factors limiting the intensity of use of hypermarkets. If this the case, opening hypermarket stores in an increasing number of locations can positively affect hypermarkets' market share. Secondly, consumer socio-economic status and format outputs comprise additional barriers limiting hypermarket formats' use. In such cases significant improvements in consumer's economic abilities, as well as providing further improvements in format outputs, such as the offering of a wide variety of fresh and non-perishable product lines in relatively low prices are expected to increase the intensity of hypermarkets' use.

The study highlights the role of perishables. Perishable goods remain more likely to be purchased at traditional markets and specialized stores than either hypermarkets or conventional supermarkets with the latter a lesser choice for fresh products. Underlying the tendency to buy these products in traditional outlets are culturally determined food preparation and consumption patterns. Furthermore, cultural values provide within the context of food consumption, further insights regarding consumers' preferences for shopping for fresh food items. In our study, Jordanian families tend to prepare and eat family meals at home on a daily basis, in line with traditional directives. They look with suspicion on processed, frozen, and precooked foods, and view meals prepared from natural and fresh ingredients as healthier and safer. These findings pose a major strategic challenge for hypermarket executives. They need to develop new formats that will cater better than the present hypermarket formats to the particular needs of these consumers. The design of these formats should be based on the identification of the relevant attributes of the specialized traditional formats that make them so attractive to consumers.

LIMITATIONS AND FUTURE RESEARCH

We believe this study increases our understanding of the role of the use-adoption gap in hypermarkets' diffusion process; at the same time, it is subject to some limitations related to the generalization of the findings – but this, in turn, can provide avenues for future research.

The first limitation is that, because this study concentrates on relatively one country – extrapolation of the findings may be limited. Our approach, however, has been designed so that it can readily be applied to the study shopping patterns of consumers in other geographical areas as well, especially non-Western economies, thus testing the extent to which the conceptual framework can be generalized effectively.

The current study highlights the impact of the perishable product categories on modern formats diffusion in emerging economies. To address this issue, there is a need for further analysis of consumer behavior, supply infrastructure and public policy. Another avenue for future research refers to the different roles convenience supermarkets and hypermarkets play in food shopping. Future research could shed further light on the conditions for success of each format and its role in the retailing system.

Finally, in order to get better insights into the influence of consumers' food culture relatively to other cultures, a cross-cultural study that involves consumers from different ethnic and cultural affiliations is

recommended. Such a study would yield research results that are more comparable and would provide a better understanding of the role played by cultural values in shaping consumers' consumption systems.

PROTECTING RADICAL INNOVATIONS IN DOMESTIC AND INTERNATIONAL MARKETS

Pia Hurmelinna-Laukkanen, University of Oulu, Finland
Paavo Ritala and Liisa-Maija Sainio
Lappeenranta University of Technology, Finland

ABSTRACT

The increasingly tight connections between innovation and internationalization, and critical factors in this setting warrant more research. In this study, the focus is turned to protection different types of radical innovations in international and domestic markets. Our results based on literature review and empirical examination of data from 209 firms indicate that while protection mechanisms are typically stronger in internationalized firms than in domestic ones, there are differences with regard to the individual mechanisms that protect different types of innovations in both types of markets. Acknowledging this allows managers to prepare better for utilizing innovations and conducting innovation activities abroad, and helping their firms to grow internationally.

INTRODUCTION

An overview of recent literature shows that internationalization and innovation are linked to each other to an increasing extent (e.g., Dunning 1993, Frenz et al. 2005, Howells 1995, Kafourous et al. 2008, Pla-Barber and Alegre 2007, Salomon and Shaver 2005, Zahra and George 2002). Innovative products and services have the potential to promote growth and expansion of firms to new markets, and innovation activities are conducted increasingly in foreign locations in order to improve learning and allow utilizing valuable, yet dispersed knowledge more efficiently (Filippetti et al. 2011). In fact, prior studies have suggested that internationalization yields more radical innovations (Frenz et al. 2005), which can in turn generate new revenue streams. However, considering that competition is likely to intensify in international markets, preserving uniqueness and differentiation for the internationally operating innovator needs to be paid attention to as well. Therefore, protection and innovation appropriation issues become highlighted (Feinberg and Gupta 2004, Gassmann and Keupp 2007, Hurmelinna-Laukkanen et al. 2012, Oxley and Sampson 2004).

Research has been conducted on the relationship between internationalization and innovation (e.g. Cassiman et al. 2011, Golovko and Valentini 2011, Kafourous et al. 2008, Knigh and Cavusgil 2004), including also the types of innovation to some extent (e.g., Frenz et al. 2005). Likewise, the relationships between protection (or appropriation) of intellectual assets and internationalization (Baughn et al. 1997, Delerue and Lejeune 2011, Jain 1996, McGaughey et al. 2000, McGaughey 2002), and innovation protection (and appropriability) and innovation performance in general (e.g., Cohen 1995, Jantunen and Hurmelinna 2005) have been examined, and there are few studies that have considered the effects of protection on different types of innovations as well (e.g., Hurmelinna-Laukkanen et al. 2008, Levin et al. 1987). However, as internationalization, radical innovation, and protection issues have not been systematically researched in the same setting, there is a need for more research that would examine the interplay of types of radical innovation and innovation protection in international context.

In this study, we aim to address this gap in the extant research and examine *how different types of radical innovation can be effectively protected against imitation in domestic and international firms with certain protection mechanisms*. In exploring this issue, we focus on three types of radical innovations, i.e., technology, market, and business-model innovations, and seven different types of protection and innovation appropriation, i.e., intellectual property rights (IPRs), contracts, employment legislation, human resource management (HRM), secrecy, lead time, and tacitness of knowledge. We start our examination with theoretical discussion on international innovation environment. Following this, we move on to explore

empirically the strength of different appropriability mechanisms in firms that operate in domestic and international markets. This first stage of examination precedes examination of the match between the different forms of protection and different types of radical innovations. Discussion and conclusions with managerial implications, limitations of the study, and suggestions for future research close the paper.

INTERNATIONALIZATION OF INNOVATION ACTIVITIES

Aharoni (2011) notes that international business environment has recently faced relatively vast changes. Among these, R&D and innovation have become globally organized, with many innovations coming from multinational enterprises' subsidiaries located often in developing rather than developed countries (Govindarajan and Ramamurti 2011, Polzynski 2005, Quintas et al. 2008). Gassmann et al. (2010, p. 219) note that firms internationalize their R&D and innovation activities for two main reasons: "to be closer to their markets and lead users and to access the best talents worldwide by increasing their absorptive capacity." Being networked internationally facilitates learning that promotes innovation, and decreases the risks related to uncertainty that causes financial concerns and subsequently limits incentives for innovation (Nambisan 2005).

This also shows in the innovation outcomes. While it has been established that internationalization promotes innovativeness (e.g., Filippetti et al. 2011, Nieto and Rodriguez 2011), it also has been shown that it plays a role in terms of the type of innovation that is generated. Incremental innovation building on existing knowledge (Anderson and Tushman 1986, Darroch and McNaughton 2002) is likely to emerge irrespective of the markets in which the firm operates, but radical innovation may be somewhat different. Radicalness, that is, the degree of newness or novelty of a product or service (e.g., Amara et al. 2008) is not straightforward to define. Novelty can get different meanings and reach quite different levels depending on whether the perspective taken is on the technology or the user of the technology, for example. An innovation can be radical in the eyes of its creator, the firm, country, or to the world (Linton 2009, Li and Vanhaverbeke 2009, Darroch and McNaughton 2002). Nevertheless, issues related to high uncertainty and discontinuities with regard to markets and technology (Garcia and Calantone 2002), new market creation, cannibalization of current products and services, and the effects on a company's knowledge base are typically of concern (Hurmelinna-Laukkanen et al., 2008). Indeed, while the generation of incremental innovations can be explained in terms of responses to markets, dominant design, and other such issues, radical innovations are more likely explained in terms of chance or random scientific discoveries (Godoe 2000). In international markets, the firm gets in touch with more external sources of knowledge (Huston and Sakkab 2006), which means that there is higher likelihood of the new creations being notably different from earlier innovations (Frenz et al. 2005, Gassmann et al. 2010).

However, internationalization, and the related increase in connections to other actors, also means that the risk of unintended and unwanted knowledge leakages increases (Martin and Salomon 2003). Prior studies have suggested that using distinctive intangible knowledge-based assets is required for successful international activities (Dunning 1993, Martin and Salomon 2003, Zahra and George 2002). For preserving this uniqueness, firms need to pay attention to protection and appropriation issues. Different protection/appropriability mechanisms can be combined into an appropriability regime of a firm, that is, a structure that both allows deterring harmful imitation and improves the possibility to profit from innovations (Hurmelinna-Laukkanen et al. 2008). Intellectual property rights (IPRs) such as patents, copyrights and trademarks form the category of formal, institutional mechanisms together with contracts and employment legislation (Hurmelinna-Laukkanen et al. 2012). Informal mechanisms include e.g. tacitness of knowledge, practical/technical concealment and secrecy, lead time and human resource management (HRM) pursuing to prevent both knowledge leaving and leaking (Olander et al. 2011). The difference between the categories is that formal mechanisms build on institutionally established possibilities to enforce the rights, e.g., in courts (Neuhäusler, 2012). In international operating environment, it is likely that both types of mechanisms become relevant, and in fact, it has been shown previously that knowledge and innovation protection matters in relation to internationalization and that strength is needed from protection even more than in domestic markets (e.g., Gassmann and Keupp 2007, Hurmelinna-Laukkanen et al. 2012). Nowadays, the protection/appropriability mechanisms are needed not only to generate monopoly position for the firm through preventing copying, but also to enable knowledge exchange and transfer across borders through (cross-)licensing and other such mechanisms.

DIMENSIONS OF RADICAL INNOVATION IN DOMESTIC AND INTERNATIONAL MARKETS

Radical innovation is usually treated as a counterpart to incremental innovation, and different dimensions of radical innovations are addressed much less often. Regarding different dimensions of radicalness, technological *radicalness* is easiest to capture and define (see, e.g., Garcia and Calantone 2002, Therrien et al. 2011, Zhou et al. 2005). Such innovation exhibits a clear development in the state-of-the-art technology (Chandy and Tellis 2000), even to the extent of making prior technologies obsolete (Anderson and Tushman 1990). The benefits of the new technological innovation may come in the form of better functionality or performance. In international markets, technological radicalness is promoted by increased access to other technologies and learning opportunities (Frenz et al. 2005, Criscuolo et al 2010). Combining ideas and technologies in unique ways promotes such innovations that would not otherwise emerge.

Innovation may also be radical from the point-of-view of existing markets and customers (e.g., Garcia and Calantone 2002, Zhou et al. 2005). Innovations with high market uncertainty – i.e., high *market radicalness* provide new types of benefits and are typically designed for emerging or new customers and markets. Also, it is possible that the markets as such stay the same, but the benefits are radically different from previous ones, affecting the behavior of customers to a notable extent thus increasing market uncertainty (Benner and Tushman 2003, Zhou et al. 2005). Indeed, innovation can be perceived to be radical to different extents depending on how customers evaluate the innovation attributes, what kind of risk is associated to adopting the new innovation, and how much changes are needed in terms of using the innovative creation (Danneels and Kleinschmidt, 2001). In international markets, market radicalness could be seen to easily reach higher levels than in domestic markets as market knowledge may be lacking. In particular, the internationalized innovator needs to consider varying cultural and other such differences in addition to customer preferences in relatively well know domestic markets. This may produce surprising results, especially considering that the process is typically facilitated by learning from local markets (Pla-Barber and Alegre 2007).

In addition to technology and market dimensions, innovation radicalness may also be examined from the viewpoint of the firm's existing business practices (see Green et al. 1995, Linton 2009). It has been shown that it is difficult to appropriate value from new technology and innovations without adequate changes in the business model (Kodama, 2004; Björkdahl 2009). Thus, depending on the competitive landscape, new innovations may require or enable the firm to develop a radically new business model, suggesting a third dimension – *business model radicalness*. Business model construct, in general, can be defined as the design or architecture of firm's value creation, delivery, and capture mechanisms within its networks (Teece 2010). We suggest that business model itself may be the focus of innovation, and in these cases business model innovation itself may become a vehicle for corporate transformation and renewal (see e.g. Zott et al. 2011, Pynnönen et al. 2012). However, achieving business model innovations is challenging, as organizations may contain barriers in the form of configurations of assets and processes or the lack of capability of managers to fully realize the potential of a new business model (Chesbrough 2010). International context may provide opportunities and incentives for radical business model experimentation: new operating models may be piloted in markets that are geographically distant from the firm's main markets to reduce the risk. Secondly, international context as such may require changes in the value architecture and operating model as the firm develops from a domestic to an international player.

Summarizing the above discussion, it seems that internationalization and radicalness of innovation are linked to each other in each three dimensions of radicalness. Consequently, the following hypothesis is presented:

H1: Internationalized firms reach higher levels of innovation radicalness than domestic firms.

PROTECTION MECHANISMS FOR PRESERVING UNIQUENESS IN INTERNATIONAL ENVIRONMENT

As discussed earlier, the appropriability regime of the firm can be defined as a structure that both allows deterring harmful imitation and improves the possibility to profit from innovations. In fact, prior studies have suggested that the strength of the appropriability regime is positively related to the innovativeness of firms (Cohen 1995, Jantunen and Hurmelinna-Laukkanen 2005, Teece 1986). Surely, the framework itself

does not tell much about the final outcomes, as also appropriability strategies that determine how the mechanisms are used or if they are used at all may play a role - consider, e.g., appropriability strategies that build more on ownership of complementary assets than on strong appropriability (see, e.g., Milesi et al. 2013, Pisano 2006). Nevertheless, the appropriability regime and its strength provide the starting point for different strategic moves, and therefore, it is an important factor considering innovativeness. In particular, the strength of the appropriability regime both provides the possibilities to transfer and exchange knowledge safely, thereby directly contributing to innovation, and it also has incentive effects when the companies expect to profit from their innovation activities. This could be reflected to the firms' international activities and internationalization motivations as well.

Knowledge Protection/Appropriation and Internationalization

While examining appropriability regime as a whole is surely important, it also is relevant to acknowledge which specific mechanisms are most suitable in different situations. In particular, international settings can represent a challenge or an opportunity, depending on the individual mechanism that is under observation (e.g., Hurmelinna-Laukkanen et al. 2012, Martin and Salomon 2004, Polczynski 2005).

When discussing the relevant appropriability mechanisms in international settings, IPRs emerge frequently. For example, Sanyal (2004) notes that the scope of patent law is a key factor in multinational firm's decisions with regard R&D investments, but it is not always straightforward in which direction it takes the firm (see also Kumar 1996). Weak protection possibilities might limit the willingness to locate in a country, but on the other hand, the possibilities to utilize the resulting spillovers also are relevant (Kafourous et al. 2012). With regard IPRs, it has also been noticed that patent and other such decisions become much more complicated when multiple countries and jurisdictions are considered. It needs to be considered how the legal environment affects dependability and usability of protection, whether the cultural environment and attitudes towards protection of intellectual property is favorable, and if business environment exhibits a strong market for intellectual property and innovations. (Polczynski 2005). Nevertheless, IPRs are recognized as important tools in the international markets for innovation, especially considering that they are not only providing firms with temporary monopoly benefits, but also allow safer knowledge transfer and exchange, and enable avoiding harmful effects of infringement claims, litigations and the related limitations to freedom of operation (e.g., Atkins 1998, Cohen et al. 2002, Guellec et al. 2012, Megantz 2002). For example Hurmelinna-Laukkanen et al. (2012) found that IPRs are among the most decisive appropriability mechanisms in relation to internationalization likelihood. Contracting is also likely to be of relevance (Contractor 1981, Contractor and Ra 2002, Narula and Hagedoorn 1999), as it complements IPRs in many cases (for example, by blocking the potential holes in the IPR protection) or creates exclusive arrangements that are similar to the protection provided by IPRs. Also, contracting comes quite naturally as practically any form of entry and any type of business is typically conducted through legally binding contracts. However, there are also challenges in international markets as complexity arises, similarly to IPRs. Employment legislation can also be utilized to improve inimitability, but as an appropriability mechanism, it may be quite limited in terms of gaining other benefit than avoiding imitation, and it also suffers from the uncertainty related to legal differences in varying countries (Hurmelinna-Laukkanen et al. 2012).

Informal forms of protection and appropriability are could be as pronounced or even more relevant as the problems with legal environment and other such issues which require formal mechanisms. In fact, the international operations environment could strengthen many of these mechanisms, especially bearing in mind that informal mechanisms are often related to controlling knowledge flows for knowledge protection. Knowledge spillovers have been noticed to be geographically localized (e.g. Almeida and Kogut 1999, Jaffe et al. 1993), which means that the informal mechanisms can become quite relevant in relation to internationalization. For example, Almeida and Kogut (1993) have noticed that the flow of knowledge within a region depends on mobility of engineers. This means, that in order to preserve the core intellectual assets, attention needs to be paid to HRM as an appropriability mechanism (Olander et al. 2011). The challenge surely is that dealing with HRM issues across multiple cultures and nations is not straightforward (Briscoe 1995, Monks et al. 2001). Tacitness, lead time, and secrecy, if they are relied on as appropriability mechanisms, are inherently strengthened by international operations environment: cultural and language issues easily form additional barriers to transfer of knowledge and make it harder to overcome any causal ambiguities related to the innovation. This increases their value as protection mechanisms. Indeed, it has already been established in prior studies that strong lead time and tacitness are related to the likelihood of the firm to become internationalized (Hurmelinna-Laukkanen et al. 2012).

Based on the above discussion, it can be expected that internationalization and strength of protection/appropriability mechanisms are related to each other. In line with this, we hypothesize the following:

H2: Internationalized firms reach higher strength of appropriability mechanisms than domestic firms.

Knowledge Protection/Appropriation for Radical Innovation

Hurmelinna-Laukkanen et al. (2012) found in their study that different appropriability mechanisms relate differently to the tendency of firms to internationalize, to different entry modes, and to international performance. In this paper we examine a similar set of protection/appropriability mechanisms, but instead of considering different aspects of internationalization, we focus on different dimensions of radical innovations in domestic versus international markets. We expect that like in relation to internationalization, there are differences with regard to how individual protection mechanisms relate to radical innovation dimensions in domestic and international settings.

Prior research suggests that radical innovation may be easier to protect than incremental innovation and that the gained protection is typically stronger (Levin et al. 1987, Hurmelinna-Laukkanen et al. 2008): when the creation to be protected is notably different from earlier ones, lead time, secrecy, or tacitness, for instance, can become effective forms of protection since it takes more time for others to overcome causal ambiguities related to the innovation. Likewise, it is easier to meet the novelty requirements for gaining IPR protection, and in case of infringement claims, show how the innovation deviates from others (Levin et al. 1987, Hall 2005). Subsequently, following the earlier logic of innovation being facilitated and incentivized by strong appropriability, a positive connection can be found between the strength of knowledge protection and radicalness. This should show both in domestic and international markets.

However, as discussed above, there are different dimensions of innovation radicalness, and internationalization may both pose challenges and provide additional benefits with regard to innovation protection. This may have an effect on the found relationships. For instance, while IPRs are likely to be highly relevant with respect to technological radicalness (considering patent protection, for example), and they also may show significance with regard to market radicalness through trademark and trade name protection, they may not be as easily usable for covering new, radical business models. Lead time or tacitness might be much less 'selective' in the sense that they could be easily linked to different types of innovations both in domestic and international markets. Secrecy might pose some challenges, e.g., in relation to market or business-model dimensions of radical innovations of internationalized firms as not distributing enough information on these aspects might discourage their implementation in practice (see, e.g. Hannah 2005). Considering applying it in home markets where the risk of misunderstandings regarding the role of secrecy may be smaller it may be more useful – like in relation to technologically radical innovation, where secrecy may not be such an issue since not everyone in the firm needs (or even wants) to know about the technical specificities.

In line with the discussion thus far, the following hypothesis are put forward for closer examination of the interplay of internationalization, the dimensions of radical innovation, and different appropriability mechanisms:

H3: Both internationalized and domestic focused firms reach higher levels of innovation radicalness when the appropriability mechanisms are stronger.

EMPIRICAL STUDY

Data collection

The data for this study is acquired from a structured web-based survey, which was conducted in Finnish markets during 2008 and 2009. The sample involved firms operating in many types of industries, the inclusion criteria being having at least 100 employees, and an independent R&D/Innovation strategy. Initially, Finnish firms with at least 100 employees at the end of 2007 were included in the search, comprising a total of 1764 firms taken from the publicly available Amadeus database. After this screening process, 762 firms were qualified (a large part of the firms were disqualified at this point because they were

sub-branches or alternative brand names for the primary firms). Of these firms, 570 were reached after several contact attempts, and 455 of those were willing to participate, while 115 refused on the phone or after receiving the questionnaire. Finally, 213 responses were received, resulting in a response rate of 37.4 per cent. Four of the responses were subsequently dropped since these firms did not meet the 100 employee minimum criteria. In order to assess the possibility of non-response bias (e.g., Armstrong & Overton, 1977), an ANOVA (analysis of variance) test was conducted with several key variables of the survey to compare early and late respondents. The results of the test suggested that non-response bias is not a concern here.

Measures

Internationalization tendency was measured with a dummy variable, indicating whether or not the respondent firm was involved in internationalization activities. The question was formulated as “Does your company have international activities (e.g., sales, R&D and/or production abroad? “, and the respondent had to choose between “yes” (coded as 1) or “no” (coded as 0) alternatives.

In order to measure the strength of each firms’ *appropriability regime*, the survey included a broad range of knowledge protection and appropriability mechanisms – following the examples of the Yale (Levin et al., 1987) and Carnegie Mellon (Cohen et al., 2000) surveys, as well as more recent augmentations (e.g., Hurmelinna-Laukkanen and Puumalainen, 2007). In examining these mechanisms, we conducted a principal component analysis with Varimax rotation on the dataset. The items loaded on seven theoretically consistent factors, each representing different appropriability mechanisms (see Appendix 1). The Cronbach’s alpha (see, e.g., Nunnally, 1978) was above the level of 0.70 for each factor. In order to measure the strength of the overall appropriability regime of a firm, we then aggregated the mean scores of the seven factors into a single score for the measure. In addition, to enable additional analysis that distinguishes formal and informal appropriability mechanisms, two separate measures were calculated. The measure for formal mechanisms includes three factors: IPRs, contracts and labour legislation. The informal mechanisms include the remaining four factors: human resource management, secrecy, lead time, as well as tacitness of knowledge. Both sets of measures are also calculated as overall mean scores for the underlying factor means.

The three dimensions of innovation radicalness were measured with self-developed multi-item constructs. Respondents were asked to reflect the firm’s latest significant product or service launch while responding. We consider radicalness to be a continuous variable that is firm-specific and subjective by nature. The respondents in the firms were asked to make subjective interpretations regarding the degree of newness of innovations related to the company’s technological knowledge base, market offerings, and ways of operating. The goal was to capture *technological radicalness* on items related to technological difference, knowledge, and performance, with regard to competitors. The items related to this dimension were the following: “The performance of our product/service is technologically higher than that of other options in the market”, “we have more technological knowledge than our competitors” and “compared to our competitors, our product/service is based on a remarkably different technological solution. *Market radicalness* covered issues such as required amount of learning from customers, and the understandability of benefits of the developed concept. It was measured with three items, namely “Customers realize the benefits of the new product/service only over a longer period”, “ordinary customers may find it hard to understand all the features of the product or service” and “to use the product the customer needs to learn something new”. *Business model radicalness* was measured with respect to potential significant changes in production processes and company practices in general. Principal component analysis with Varimax rotation was applied in measure development. Three of the eleven original items were left out from the final constructs because of low factor loadings. The remaining eight items loaded onto three components, accounting for 69.5 percent of the variance. Based on this, composite measures for each dimension were computed. Considering the exploratory nature of the composite measures, the Cronbach’s alphas could be considered acceptable for newly developed scales. The measures and reliabilities for both appropriability mechanisms and innovation radicalness are listed in Appendix 1.

Results

We first compared the innovation radicalness measures (see Table 1), as well as strength of appropriability mechanisms (see Table 2) in domestically and internationally oriented firms with a series of independent samples’ t-tests.

Table 1. Internationalization and innovation radicalness

		Technological radicalness	Market radicalness	Business model radicalness
Domestic focused firms	Mean	3.54	4.46	3.43
	N	52	52	52
	Std. Deviation	1.35	1.41	1.40
Internationalized firms	Mean	4.62	4.40	3.79
	N	145	145	144
	Std. Deviation	1.41	1.55	1.49
	Mean difference	1.07	-.06	.36
	Sig. (2-tailed)	.00	.79	.14

With respect to innovation radicalness, there are notable differences between internationalized and domestic focused firms only with respect technological radicalness, with internationalized firms showing higher values. Market and business model radicalness do not show statistically significant differences (although business model radicalness is higher in internationalized firms, and comes close to being significant at 10 percent level).

Table 2. Internationalization and appropriability mechanisms

		IPRs	Contracts	Empl. Legislatio n	HRM	Secrecy	Lead time	Tacitness
Dom. firms	Mean	2.05	4.40	2.87	4.49	3.70	4.70	3.23
	N	49	49	49	48	49	49	49
	Std. Deviation	1.25	1.59	1.37	1.63	1.64	1.37	1.15
Int. firms	Mean	3.40	4.83	3.22	4.63	4.28	4.96	3.76
	N	134	137	133	139	132	136	139
	Std. Deviation	1.59	1.49	1.58	1.39	1.63	1.20	1.47
	Mean difference	1.35	.43	.35	.14	.58	.25	.53
	Sig. (2-tailed)	.000	.084	.175	.576	.036	.225	.012

In terms of Table 2, taking a look at the mean values of appropriability strength, internationalized companies are shown to exhibit higher values throughout the appropriability mechanisms. IPRs, secrecy and tacitness reach statistical significance, and also contracts are marginally significant. Other forms of protection also show higher means for internationalized firms even if they are not statistically significant.

We then moved on to examining the fit between type of radicalness and protection in domestic and internationalized firms, where equally divided sub-groups of high and low protection in terms of different appropriability mechanisms were compared with t-tests. Table 3 below summarizes the significant findings in terms of different types of radicalness for domestic-focused and internationalized firms (See tables A and B in the Appendix 2 for more detailed statistical information).

Table 3. Appropriability mechanisms that promote types of radicalness for domestic-focused and internationalized firms (based on Independent Samples T-tests)

	IPR	Contracts	Employment legislation	HRM	Secrecy	Lead time	Tacitness
Dom. firms	MarketRad	-	-	TechRad	TechRad	TechRad	TechRad
	-	-	-	(MarketRad)	MarketRad	MarketRad	BusModRad
	-	-	-	-	BusModRad	BusModRad	d
Int. firms	TechRad	TechRad	-	TechRad	TechRad	TechRad	MarketRad
	-	BusModRad	-	MarketRad	-	BusModRad	BusModRad
	-	d	-	-	-	-	d
		-					-

Intellectual property rights seem to be more relevant for technological radicalness in international markets, whereas in domestic markets, they are associated with market radicalness. Contracts may not play a relevant role for innovation radicalness in domestic markets, but in international environment strength of protection is related to both technological and business-model dimensions of radical innovations. Employment legislation and HRM are quite similar for both domestic and internationalized firms, and also lead time varies only with respect to market radicalness – the connection between protection and innovation being more visible in domestic markets. Secrecy seems to play a role in both markets with respect to technological radicalness, but it also is related to business and market radicalness in domestic markets. Tacitness also shows in both domestically and internationally oriented firms when business radicalness is of concern, but differences emerge also as tacitness is associated to technological radicalness in domestic firms and market radicalness in internationalized firms.

DISCUSSION AND CONCLUSIONS

During recent years, innovation and internationalization have been noticed to be tightly connected (e.g. Dunning 1993, Kafouros et al. 2012). Depending on a variety of factors, their interaction easily causes positive or negative cycles with unique intellectual assets promoting internationalization, and internationalization enhancing innovation, or problems in either area diminishing the chances to succeed in the other. This setting warrants more research, and in this study, the focus was turned to protection of different dimensions of innovation radicalness in international and domestic markets.

In order to grasp the most relevant connections, we examined first the relationship between *internationalization and dimensions of innovation radicalness*. Our findings indicate that in international markets, access to different types of knowledge and varying technologies enhances the chances that *radically new technologies* emerge (see Kafouros et al. 2012). Regarding *market radicalness*, internationalization does not seem to play a role, since this dimension is almost unchanged independent of domestic or international focus. In terms of *business model radicalness*, the internationalized firms seem to exhibit higher rates of newness (although this connection only close to being statistically significant). This result suggests that internationalized firms approach the business models differently or that international markets are utilized for trials and new operation modes, which increase the radicalness of business models for such firms. Overall, in the light of these findings, our hypothesis H1 is partially supported, as only one dimension of radicalness clearly shows higher levels in internationalized firms compared to domestic ones.

Second, we considered the linkages between *internationalization and protection/appropriability mechanisms*. We found that four out of seven mechanisms were clearly stronger in internationalized firms. This provides relatively strong support for the hypothesis H2. *IPRs* are highly important in international markets as they not only create obstacles to unwanted imitation, but also facilitate freedom of operation (through mitigating the risk of infringement claims and litigation) and enable safe knowledge transfer and exchange (Cohen 1995, Hurmelinna-Laukkanen and Puumalainen 2007). Likewise, *secrecy* is needed to preserve the competitive edge, and also, it can be stronger (and therefore more useful) in international markets due to cultural and language barriers, for example (Mäkelä et al. 2007). *Tacitness* is similar to secrecy in prevention of imitation and additional strength provided by international environment. *Contracts* are also more relevant in knowledge protection in internationalized markets. Especially, the challenges related to the complexity with regard the differences in legal, cultural, and business environments create uncertainty in terms of efficiency of protection (Polzynski 2005). Contracting can make up for some of the deficiencies of other forms of formal protection, and, in the best cases, improve the possibilities that the contracting parties are more willing to monitor and defend the rights of the firm for the common benefit. Other forms of protection are not statistically significant with respect to differences in domestic and internationalized firms. It may be that the complexity related to international operations environment comes into play, lowering slightly the *strength of employment legislation, HRM, and lead time*. This issue calls for future examination, however.

Finally, we combined all of the central factors of interest. Following our expectations, our study illustrates notable differences between internationalized and domestic firms in terms of the combinations of different types of radical innovations and the strength of protection. In general, it seems that in domestic markets, the informal mechanisms dominate the appropriability regime over formal ones, while in international markets there is a wider variety with respect to all different dimensions of radical innovations. There are differences regarding the strength of different mechanisms and dimensions of radical innovations in different markets, however.

As suggested above, *IPRs* may be more relevant for innovations containing high technological or market radicalness. Differences seem to emerge with respect to the firm orientation towards domestic or international markets, however: *IPRs* are associated with market radicalness in domestic markets and with technological radicalness in internationalized firms. Indeed, technological radicalness may be promoted in international markets when the firm can protect its existing technologies and transfer them more safely (see, e.g., Criscuolo et al 2010, Hurmelinna-Laukkanen et al. 2012), and technologically radical innovations may be easier, and important, to cover with *IPRs*. Regarding market radicalness, operating in domestic markets seems to be particularly prone to show connection to *IPRs* protection. It may be that in domestic markets, there are needs to differentiate the firm with respect to the competitors, and with the familiarity with the local *IPR* system, the protection mechanisms can be utilized in relation to innovation with high market radicalness. In international settings characterized by different legal systems, it may be harder to find the proper ways to cover these types of innovations. Surely, the differences may also indicate that the mechanisms are linked to each other within the appropriability regime: for example, it was shown that in international markets, *IPRs* and contracts may replace secrecy to an extent (see, e.g., Arundel 2001). Therefore, it pays off to have variety in the appropriability regime, as this enables strategic moves in different geographic areas and with respect different types of innovations, for example.

The importance of *contracts* in international setting (see Narula and Hagedoorn 1999) is confirmed as technological and business model radical innovations are associated with stronger contractual protection. The need for contractual protection to these dimensions of radicalness is quite understandable, since contractual protection is mostly needed when new technologies are developed with other organizations, and when business models incorporate new ways of distribution, for example. The need to build protection against customers' actions emerges rarely. Considering *employment legislation*, no statistical differences between domestic and international firms were found. As discussed above, this form of protection may be a double-edged sword, with complexity and uncertainty limiting its effects in international markets, and limited understanding of this mechanism as a relevant form of protection in domestic firms (see, e.g., Autio et al. 2000). On the other hand, *HRM practices* seem to be quite relevant for both domestically and internationally operating firms, especially with regard to technology and market radicalness. Paying attention to knowledge leaving and leaking (Olander et al. 2011) enhances the possibilities not to lose such knowledge in collaboration to the other parties that form the most distinctive advantage for the firm. After all, the contact persons in collaboration for technology exchange or market development are important gatekeepers and receptors of the knowledge (Baughn et al 1997). *Secrecy* and *lead time* behave in quite a similar manner in domestic markets, both of them promoting all dimensions of innovation radicalness.

Somewhat surprisingly, the connection between the strength of these mechanisms and radicalness of innovations disappears to an extent in international markets. Stronger secrecy is associated only with higher technology radicalness, whereas lead time relates to technology and business model radicalness. It may be, as suggested above, that in domestic markets it is easier to get the message of secrecy through without facing the adverse effects of organizations and individuals feeling themselves not trusted (Hannah 2005). In international markets, small nuances go unnoticed and misinterpretations are more typical (Mäkelä et al. 2007). Surely, it may be that while it is considered that the technological developments need to be kept secret also in international markets, the business model or market-related innovations are rather covered with *IPRs* and contracts requiring knowledge codification and 'publication', in which case secrecy cannot be utilized to a notable extent. Finally, *tacitness* also plays slightly different roles when comparing internationally and domestically operating firms, and with respect to different dimensions of innovation radicalness. While tacitness is associated with high business model radicalness in both domestic and international contexts, tacitness is further associated with technological radicalness in domestic markets and with market radicalness in international markets. This suggests that tacitness may be quite effective in protecting business model innovation compared to other mechanisms. Indeed, when an innovative business model is based on the complex social phenomenon and tacit knowledge within the firm, it is likely to be quite difficult to imitate.

It can be concluded that international markets, being innovative and having intellectual assets at the firm's disposal is a starting point for competitive advantage, but it may not be enough in a highly competitive environment. In addition, efforts have to be directed to preserving the distinctive intellectual assets and innovations. While these aspects have been recognized in previous studies (e.g., Autio et al. 2000, Frenz et al. 2005, Gassmann et al. 2010), our contribution lays in combining them into one study, and in a more detailed examination of relationships between different dimensions of radical innovations and varying protection/appropriability mechanisms in international and domestic markets.

The managerial implications of the study point to two issues: first, as it seems that different appropriability mechanisms are related to different dimensions of innovation radicalness especially with regard to operating in domestic or international markets, appropriability should be sought from multiple mechanisms. It is easier to execute or put aside existing protection according to the changes in company needs than to build protection from nothing while trying to internationalize or benefit from differently radical innovations at the same time. Resources might not suffice for such a task. Second, and related to this, it is important to get employees from different functions of the firm involved in knowledge protection for radical innovations. As radicalness comes in different forms, they may emerge in different parts of the firm, meaning also that benefits might be lost if personnel have no idea on the protection issues. In general, if a firm seeks radical innovations, access to multiple sources of knowledge from various markets seems to be an essential precondition.

There are limitations in this study that can be referred to when considering future research arenas. For example, we have delimited our study in that we have taken no definite position with regard causality issues, and we have not considered the international markets in terms of host country features, for example. Such issues could be considered in future studies. Furthermore, while we have tried to provide an overview of the above described connections, more detailed discussion on the reasons and contingencies related to the found linkages is still needed. For example, business model innovation and radicalness is still a relatively new area of research, and therefore calls for more examination.

APPENDIX 1

Appropriability mechanisms

During the last three years, how well have the following mechanisms protected your innovations (products, services, processes) from competitors' imitation? (1 = not applicable to our innovations, 2 = poorly, 7 = very well)

IPRs (reliability = .71)

- Patents
- Copyright
- Trademark

Contracts (reliability = .75)

- Long-term collaboration contracts
- Non-disclosure/confidentiality agreements

Labour legislation (reliability = .79)

- Inter-firm contracts on not recruiting personnel from each other
- Employees' non-competition agreements
- The legal loyalty obligation of employees

Human resource management (reliability = .76)

- Making personnel committed to the firm (e.g. by offering perks)
- Small personnel turnover/minimizing it

Secrecy (reliability = .72)

- Using passwords
- Restricting access to meetings and the firm's premises

Lead time (reliability = .80)

- Getting to the markets first with a new product or service
- Continuous improvements in products/services/processes
- Keeping ahead of competitors

Tacitness and complexity of knowledge (reliability = .89)

- Complexity of the product/service/process
- The fact that it's very hard to teach knowledge related to the product/service/process
- The fact that it's very hard to understand the features of the product/service/process by observing/examining it
- The fact that knowledge related to the product/service/process may not be usable in other environments
- The fact that it's not possible to document knowledge related to the product/service/process
- The fact that core knowledge related to the product/service/process is embedded in routines

Innovation radicalness

When considering the following statements, please reflect on your company's latest significant product/service launch.

(1 = totally disagree, 7 = totally agree)

Technology radicalness (reliability = 0.83)

- The performance of our product/service is technologically higher than that of other options in the market
- We have more technological knowledge than our competitors
- Compared to our competitors, our product/service is based on a remarkably different technological solution

Market radicalness (reliability = 0.61)

- Customers realize the benefits of the new product/service only over a longer period
 - Ordinary customers may find it hard to understand all the features of the product or service To use the product the customer needs to learn something new
- Business model radicalness* (reliability = 0.61)
- Introducing the product/service into our selection has clearly changed the practices of the entire company
Introducing the product/service has meant significant changes in our production process

APPENDIX 2

Results of empirical examination on strength of appropriability mechanisms of different types of innovations in domestic and internationalized firms

Table A. Appropriability mechanisms and innovation radicalness – domestic focused firms

ADEQUACY OF INTERNATIONAL FUNDING IN A LESS -DEVELOPED AFRICAN COUNTRY

Md Humayun Kabir
Tshwane University of Technology, South Africa

ABSTRACT

The main aim of this paper is to determine the adequacy of international funding in a less developing African country towards the Millennium Development Goals. The study analyses and evaluates the adequacy of international funding in Swaziland (a less-developed African economy). The findings show that only 25% of the respondents said that Swaziland is able to work towards achieving the Millennium Development Goals by the year 2015 with international funding while 40% of respondents indicated that the international funding help Swaziland to adequately finance her projects, that is, timely availability of funds and completion of funds. However, the study found that most of the projects financed by international funding in Swaziland are mainly road construction and upgrading urban development projects.

INTRODUCTION

International funding lies in the heart of developing countries financial resources because it helps in meeting the Millennium Development Goals (MDGs), sustainable economic development goals, improving or maintaining its current infrastructure, improving the level of employment, improving the welfare of the country's citizens, and improving the people's standard of living by designing and implementing Poverty Reduction and Growth Facility (PRGF) and Poverty Reduction Strategy Paper (PRSP). International funding, however, for developing countries especially in Africa is largely provided by the giant organisations such as International Monetary Fund (IMF), International Bank for Reconstruction and Development (IBRD), the World Bank, African Development Fund (ADB), Development Bank of South Africa (DBSA).

International funding is one of the essential sources of funding for governments and private sectors in developing countries. Its main purpose is to help developing countries in order to meet their sustainable economic development goals (Seiber, 1982) through the completion of major investment projects. Besides the developing countries, “some of the developed countries” still depend on international funding or external borrowing for their major projects (Adedeji, 1985, p. 53). The usefulness of international funding is determined by comparing the social benefit, or productivity, with the social cost of the transaction. Government accepts external loans in order to promote country's welfare. However, “many African states inherited huge amounts of foreign debt contracted by the colonial administrations, and have never emerged out of their indebtedness” (McMullen, N.J., 1979 cited in Adedeji, 1985, p. 53). With this respect, this study aims to determine the adequacy of international funding in a less developing African country towards the Millennium Development Goals and whether a less developing country can adequately manage its external debts in order to achieve country's sustainable economic development goals.

Considering Swaziland (a less developing African country) economy and social conditions, its economic growth rate is fallen to 2.4% in 2008 from 3.5 percent in 2007 [Central Bank of Swaziland (CBS), 2008/2009], has a budget deficit of 14.3% of GDP (Business Report, 2011; Vollgraaf, 2011), its 60% revenue come from South African Customs Union (SACU) receipts, unemployment rate is 40% (CBS, 2010/2011), more than 69% population live in the poverty (World Bank Development Indicator, 2011), and about 220,000 people are affected with HIV/AIDS [United Nations (UN), 2007:23]. Although there is a call for government to implement corrective measures in addressing these socio-economic challenges, somehow Swaziland facing difficulties by these socio-economic challenges to meet the MDGs by the year 2015.

On the other hand, according to the CBS (2004/2005), “public external debt continues to increase as government undertakes its development projects, which include upgrading of the country's road network and

maintaining its current infrastructure”. In order to keep the public debt at sustainable levels, the development of a proactive financing strategy is of utmost importance. Poor debt management policies can lead to debt crises which can adversely impact on the country's economy which can include being unable to meet its sustainable economic development goals, being unable to improve or maintain its current infrastructure and most importantly not being able to qualify for future loan advancements because of defaulting and being considered as a bad for debt by international lenders.

The study looks at whether the international funding is adequate in terms of helping Swaziland in working towards achieving MDGs. In this regard, this study will find out the criterion used by international financial institutions in selecting the countries to be funded and the adequacy of funding in helping developing countries in meeting their sustainable economic development goals.

The remainder of the paper is organised as follows: the first section provides a brief literature review on the subject matter. The second section describes the research methodology. The third section discusses the results of the analysis. Finally, the last section summaries the findings and provides concluding remarks with some recommendations.

LITERATURE REVIEW

External Debt

The policies of public external borrowing are generally thought to be guided by the simple objectives of the developing country's economic planners, e.g. promoting domestic output growth and increasing welfare of the populace. Further, various governments' objectives can include increasingly national income, improving the employment situation, and adjusting the balance of payments. However, external borrowing derives from the acceptance by a government or a government agency of real or financial resources from an external source with the obligation of repaying such resources in unspecified amount to that source at one or several specified future dates (Seiber, 1982). “External debt problems arise from the inability of a country to increase domestic savings, investment, and export earnings at a time when import bills, amortisation (repayments of the principal), and interest payments are increasing” (Adedeji, 1985, p. 53).

The major channel for external resource transfers to developing countries has been from offices sources, largely bilateral donor governments, international financial institutions such as World Bank, the United Nations Development Program (UNDP), IMF, or regional development banks, increasingly are providing a larger share of official loans. In addition, private commercial banks are taking a greater role in financial intermediation to developing countries (Seiber, 1982).

Developing Countries' Debt Relief and Sustainability

According to IMF (2005), “The IMF continues to work with other official creditors to support low-income countries' efforts to achieve and maintain robust debt sustainability”. The World Bank stated that “the debt burdens of a large number of the poorer countries remain unsustainably high” (The New York Times, 1991). Through the debt relief under the Heavily Indebted Poor Countries (HIPC) initiatives and improved tools for analysing and managing debt, the fund is playing an important role in supporting low-income member countries' efforts to achieve and maintain debt sustainability (IMF, 2005). The World Bank and IMF launched the HIPC initiative in 1996 and 1999 as a comprehensive effort to eliminate poorest and heavily indebted countries' unsustainable debt (IMF, 2005). O'Neill (1990, p. 22) pointed out that “by 1986 it had become clear that the debt problem of sub-Saharan Africa was serious, and more important, the special treatment was required, especially in the form of debt relief and new capital inflows on concessional terms”. With regard to the third-world debt crisis, the Secretary of the United States Treasury, James A. Baker III spelled out the following plan in 1985:

If the debt problem is going to be solved there must be a “Program for Sustained Growth”, incorporating... First and foremost, the adoption by principal debtor countries of comprehensive macroeconomic and structural policies, supported by the international financial institutions, to promote growth and balance of payments adjustment, and to reduce inflation (cited in Serkan and Peter, 2003, p. 16).

However, Adedeji (1985, p. 54) stated that “the African experience has shown that once a country is trapped in this situation, the tendency has been to borrow more in order to refinance maturing debt obligations”. Swaziland as an African country is no exception with that.

METHODOLOGY

The study analyses and evaluates the adequacy of international funding in Swaziland (a less-developed African economy). The adequacy of international funding was measured with the international fundings’ sufficiency in helping Swaziland towards the Millennium Development Goals and the timely availability of funds and completion of projects.

The instruments for collecting data were the questionnaires and documentary evidence (annual reports of Central Bank of Swaziland and other relevant documents). Questionnaires utilized close-ended questions with some of the questions requiring some explanations from the respondents in order to obtain more information on the relevant area and they were combination of a likert scale with five scales in which respondents expressed their opinions, perceptions, and attitudes and some of the questions being of multiple choice nature and lastly a simple category scale. Questionnaires were distributed to the economists and senior officials of the selected population.

The population of the study was made up of the Ministry of Finance Swaziland, Ministry of Economic Planning and Development Swaziland, and the Central Bank of Swaziland. The stated population is selected because the subject is highly technical in the sense that it requires respondents who are well knowledgeable about Swaziland's external funding and the latest developments in developing countries external debts. Researcher then randomly selected 25 respondents from each population. Total 100 respondents were selected based on simple random sampling technique from all selected population.

For reliability and validity of the questionnaire, a pilot study was undertaken. Questionnaires were delivered by mail and a self-addressed envelope was included for returning the questionnaire. The response rate was 76%. Ethical principles (confidentiality, anonymity, protection of privacy) were observed. An assurance was given to the respondents that all results will be kept confidential with a promise of anonymity.

FINDINGS

As indicated earlier that total hundred respondents were contacted from the selected four populations. Out of hundred respondents, 76 respondents (76% response rate) participated in this study of which 60 respondents are senior officers and 16 are economist. 70% of respondents had at least 10 years working experience.

Findings from Respondents

The respondents were asked about the adequacy of international funding in Swaziland. Adequacy was measured with the international funding’s sufficiency in helping Swaziland towards the Millennium Development Goals and the timely availability of funds and completion of projects.

- 40% of respondents agreed that the external funds help Swaziland to adequately finance her major projects, that is, timely availability of funds and completion of funds.
- 25% of the respondents said that Swaziland is able to work towards achieving the Millennium Development Goals which include amongst others, offering free education, and eliminating half of the existing poverty levels by the year 2015 with the external borrowing, donations, and grants she receives.

Next question was on how international funds should be allocated to the projects financed by international funds. The objective of the question was to ascertain the respondent's opinion on the allocation of international funds and the reasons for the allocation.

- 30% of the respondents felt that international funding should be channeled to projects relating to the improvement of agricultural facilities as the economy is agro-based.
- 22% of the respondents were backing the financing of health facilities, and most of respondents were highlighting the scourge of HIV / AIDS as an issue requiring urgent attention.

- Only 4% of the respondents felt that international funding should be channeled towards research and development.
- 5% of the respondents were backing the financing of other projects which included water facilities, energy facilities, and Small and Medium Enterprise (SME) funding.
- 16% felt that it should be channeled towards education facilities.

Next question was related to the preferences on the international creditors lending conditions on the different creditors which include the African Development Bank, DBSA, Government of Japan, The Italian Commercial Bank, Hambros Bank.

- 48% of the respondents preferred the African Development Bank Group. And most the respondents were sighting the fact that the ADB is mainly focused on financing development Projects in African Countries which include building earth dams, road infrastructure amongst others that is why it is most preferred. And not surprisingly the ADB is the largest multilateral creditor to the Swazi-Government.
- 42% of the respondents preferred bilateral creditors (Government to Government external debt) which comprises of the Government of Japan (23%) and the Italian Commercial Bank (19%). Most of the respondents were sighting low interest rates on the loans from bilateral creditors and also the fact that bilateral creditors usually offer technical expertise on the projects to be financed.
- Only 5% respondents preferred Hambros Bank.

In the follow up question, respondents were asked to give their opinion on how developing countries can efficiently manage their debt. The objective of the question was to determine the debt management strategies for efficient debt management.

- 35% of the respondents felt that the government can efficiently manage debt by having a legislative debt policy to guide government borrowing.
- 20% of the respondents felt that maintaining external debt at sustainable levels which include keeping debt at the acceptable IMF debt ratios (i.e. debt stock to GDP and debt stock to exports) can help the government to effectively and efficiently manage its debt.
- 15% of the respondents felt that implementing proactive debt management strategies which include timely repayment of debt to avoid rollover interest on overdue payments can help the government to efficiently manage her debt.

The next question aimed at finding out the views of the respondents on the criteria used by external lenders to lend money or otherwise to developing countries. The objective of the question was to determine the suitable criteria for international lending for developing countries.

- 45% of the population said that most of the International Funders consider the economic performance of the developing country before they lend money. A majority of the respondents chose economic performance, because they feel that it is more acceptable basis because it determines the country's ability to repay the loan.
- About 30% said that the political character of the developing country is also considered by the International Funders for lending money.
- 15% supported the consideration of past experiences.
- The need for technical skills was only supported by 10% of the respondents.

In the next question, respondents were also asked whether structural adjustments programs like meeting targets in fighting corruption, eliminating impediments to foreign investments, and reducing budgetary expenditures are acceptable basis to determine countries to qualify for debt relief.

- More than half of the respondents (55%) agreed to the above statement
- This was followed by 30% of the respondents who strongly agreed
- 9% respondents did not believe the statement
- 6% respondents strongly disagreed to it

CONCLUSIONS

Findings show that the projects financed by international funding in Swaziland from year 2001 to 2004 are mainly agricultural, road construction and urban development. The project with the largest share is the Lusip project, which is an agricultural project (see Figure I). 30% of the respondents felt that international funding should be channeled to projects relating to the improvement of agricultural facilities as the economy is agro-based, it mainly supported by agricultural projects like the sugar industry in the Lubombo region. However, financed by international funding from year 2001 to year 2004 shown in Figure I, no health project was financed by which is much against the 22% of the respondents' opinion. 22% of the respondents were highly concerned with the scourge of HIV / AIDS which requires urgent and undivided attention from the government. Further, the Figure I also shows that no educational related project was financed during that period. It is really surprising as the development of education and health should have been given more priority for sustainable economic development.

Only 25% of the respondents agreed that the external funding helps Swaziland in working towards the Millennium Development Goals (MDGs). It indicates that the international funding is not enough adequate in terms of helping Swaziland in working towards achieving MDGs. However, the MDGs, which include amongst others reducing the existing poverty level by half by the year 2015. Results show that 48% of the respondents preferred the African Development Bank (ADB) as most preferable lending conditions. The bank provides loans, equity and technical assistance to regional member countries at competitive market rates. The study found that, beside economic performance, 30% of the respondents think that the political character of the developing country is also important and needs to be considered in determining the suitable criteria for international lending for developing countries. They think that every sound external lender should concern about political risk. Other factors like past experiences and technical skills are also looked upon by the lenders.

The study mainly focuses on the issue of international funding and its adequacy within the context of Swaziland. As the overall findings indicate that international funding is not enough adequate in terms of helping Swaziland in working towards achieving Millennium Development Goals, a further research would be recommended to find out what Swaziland can do to complement the international funding to help the country in amongst other things to alleviate the high level of poverty and unemployment, improve the country's infrastructure, and economic performance. The study provides useful information on international funding towards achieving Millennium Development Goals with an emphasis on Swaziland which will be applicable to other less developing and developing countries especially in Africa.

REACTION TO DECEPTIVE ADVERTISING IN BRAZIL

Daniel Kamlot, Delane Botelho, and Fátima Bayma de Oliveira
EBAPE/FGV, Brazil

ABSTRACT

This paper examines the Brazilian consumers and their reaction to deceptive and non-deceptive advertisings. Two versions of the same ad – one without and another with deception – were exposed to 359 respondents and reactions compared using the Wells scale. It was found that consumers tend not to claim their rights in court when faced by deceptive advertisement. Also, the emotional quotient (EQ) of the deceptive advertisement exceeds that of the non-deceptive, indicating that consumers perceive greater appeal in a deceptive advertisement than in the non-deceptive. The deceptive advertisement is even perceived as more honest than the non-deceptive.

INTRODUCTION

Considering the strong competitiveness existing in current markets, companies strive to convince their target audience that they are the best option in the market to meet the requirements or wishes of the demand. However, very often such persuasion occurs in an anti-ethical, socially irresponsible manner, as when organizations seek to promote themselves and their products in detriment to the wellbeing of the society. For example, a manufacturer that convinces its clients about the value of its product will probably succeed in selling it; but if this manufacturer also causes pollution whose cost is higher than the benefit of the resulting product, the net outcome for the society will be a loss.

The most common tool that the marketing area provides for persuasion is advertising (Boone & Kurtz, 1999), although there are other elements of the marketing mix, such as other types of promotion, the product itself, some pricing techniques and distribution that convince the target-customers about the value of the offer. Adler and Rodman (2003, p.421) say that persuasion is considered ethical if “it is adapted to established standards”, although such standards vary from one situation to another. Advertising obviously shows the positive side of what is being advertised, but there may have advertising pieces that give only half-truths about the advertised product (or service).

Consumers are more prone of having a positive belief or perception about the advertised product or service in response to deceptive advertising (Olson & Dover, 1978). So consumers may perceive the product as more valuable than it really is, when it is communicated through deceptive advertisement. To prevent such situation, there are codes of ethics to be followed, drafted by different agencies, one of the best-known being the American Marketing Association (AMA) in the USA, but in most cases there is no evidence that they are adopted. This raises doubt about ethics in advertising.

In today's competitive environment there are many ways to attract customers, but few studies investigate whether the customer ceases to admire a firm that uses deceptive advertising. In principle, it may seem obvious that the public's perception toward such companies will be negatively affected, but it does not always happen in that way. Presumably, if deceived customers do not react to deception, its use will continue, since there is no negative counterpart or penalty for the company.

The purpose of this study is to identify how the Brazilian consumer reacts to companies that disseminate advertising with false or misleading information, announcing unrealistic benefits to the target audience. The contribution is to identify whether consumers' reaction to a company, once having felt harmed by its advertising or publicity, may influence or reinforce companies to promote even more harm to consumers.

LITERATURE REVIEW

Reaction To Advertising

Advertising is a communication tool closely related to persuasion (Pratkanis & Aronson, 2001), and the reaction to an advertisement is somewhat relevant when analyzing how the consumer perceives the dissemination of a product. A reaction can be understood as a response to some previous action, or stimulus. Thus, if advertisement is understood as a stimulus, reactions could result from exposure to it.

Khan (2006) believes that human behavior is affected by perception. This would be understood as a process consisting of five sub-processes – Stimulus, Registration, Interpretation, Feedback and Reaction. When an individual is exposed to some interesting stimulus, s/he will focus her/his attention on it. Interpretation occurs when meanings are attributed to the sensations felt, which are retained by memory and can lead to consumer behavior with positive or negative feedback for the individual. After interpreting the stimulus and the situation that is grasped by the person's memory, reaction follows in the form of buying or consuming.

Scales have been proposed to measure reactions from exposure to advertising. The best known is the Emotional Quotient Scale (EQ) by Wells (Wells, 1964; Mello, Fonseca, Neto, & Leao, 2006), starting with a list of expressions and words corresponding to consumer reactions to print advertising. From this list, items assessed empirically as having high or low emotional appeal were identified, consisting of three dimensions, as seen in Table 1. The scale “capture, from the consumer perspective, the immediate emotional reaction to print advertisements” and “measure how effective is the advertising” (Mello *et al.*, 2006). Vieira, Costa, Montaña, & Dill. (2010, p.95) explain that, from the Wells scale, it was possible to develop “a scale of the reaction profile for the ads”, built to identify the reactions of consumers to the advertising that targeted them.

Wells scale is suitable for differentiating the appeal perceived by the target audience of the advertising, so it would help identify between two advertisements which the consumers perceive as having more or less appeal. This could be applied when comparing two advertisements – for example, one misleading and one non misleading. In this case, Wells (1964) uses 12 phrases referring to the advertising or commercial transmitted, six favorably worded and six unfavorably worded, all rated on a 5-point scale varying from “Strongly disagree” to “Strongly agree”, (1- I find this advertising very attractive; 2- I would probably not pay attention to this advertisement if I saw it in a magazine; 3- This is a warm advertisement and affects the emotional; 4- This advertisement makes me want to buy the announced product; 5- I find this advertisement boring; 6- I don't like this advertisement; 7- This advertising makes me feel good; 8- This is a wonderful advertisement; 9- This kind of advertising is easy to forget; 10- This is an attractive advertisement; 11- I'm tired of this kind of advertising; 12- I'm indifferent to this advertising), where the favorably-worded phrases are numbers 1, 3, 4, 7, 8 and 10, and the rest unfavorable. The agreements with the favorable items are added to the disagreements of the unfavorable items and the total is divided by 12 and multiplied by 100, thereby producing a number between 0 and 100. Multiplying by 100 in this case is only to eliminate the decimal points. The rating of a certain advertisement would be obtained from the average of the total ratings of each respondent. Wells scale indicates how much the audience of the advertising is attracted to it: the higher the rating, the more attraction (Mello *et al.*, 2006)

In addition to Wells scale, with most relevant for this study, other scales were developed for similar purposes by Leavitt (1970) and Schlinger (1984), and Wells, Leavitt & McConville (1971), specifically for TV commercials. This shows that different authors have been interested in studying reaction to advertising, although the Wells scale is more appropriate for print advertising, which explains why it was used in the research. A summary of the dimensions assessed in each can be seen in Table 1:

Table 1 – Dimensions of prominent response profiles, according to the authors mentioned

Wells (1964)	Leavitt (1970)	Wells, Leavitt & McConville (1971)	Schlinger (1984)
Attractiveness; Meaningfulness; Vitality.	Energetic; Amusing; Personal relevance; Sensual; Authoritarian; Romantic; Familiar; Separated.	Humor; Vigor; Sensuality; Singularity; Personal relevance; Irritation; Familiar; Confident.	Entertainment; Confusion; Relevant news; Brand reinforcement; Empathy; Familiarity; Alienation.

Striving for Consumer Rights

Marketing professionals have for a long time used emotional and rational appeals to promote ideas, goods and services (Chaudhuri, 2006). The reaction to such appeals can determine a decision in favor or against what is being offered to the consumer. According to Petty & Cacioppo (1986), researchers in the advertising field are concerned with emotional and cognitive reactions to advertising. Two kinds of persuasion have been defended: central, which is analytical and cognitive, and peripheral, which is holistic, synthetic and of an emotional nature. Some companies mislead their customers, and even when they perceive such malevolence they remain loyal to them. Apparently, these customers are ignorant of their basic rights, with some variations across countries.

The first time basic consumer rights were strongly addressed was in 1962, when US President John F. Kennedy, in a speech in Congress, presented the four basic consumer rights (Consumers' Bill of Rights), which, although not definitive, were the basis for consumers to now feel that they had a certain protection in relation to their interests in the relationship with companies that wanted only to obtain advantages over customers and were not concerned with their satisfaction (Hawkins, Best, & Coney, 1995; Boone & Kurtz, 1999). These rights are originally: (i) the right to safety (refers to the protection against goods and services that may cause a hazard to health or life for the consumer, when used regularly); (ii) the right to be informed (means that the consumer must be given necessary – and enough – information to make intelligent and safe decisions, based on an informed choice, protected against misleading, cheating, illusory or fraudulent appeals displayed in advertisements, labeling, packaging and so on); (iii) the right to choose (this addresses guaranteed access to a wide range of goods and services at reasonable and competitive prices, with satisfactory quality); and (iv) the right to be heard (to have the assurance that consumer interests will be considered when formulating and putting in place government policies, and fair treatment will be provided, including consumer compensation when required).

In the USA, the consumer rights movement began in 1936 when the Consumers' Union was set up – today with millions of members, and whose focus is on performing tests on goods and services and providing information to consumers (*Instituto Brasileiro de Defesa do Consumidor* [IDEC], 2009). In Europe, the Consumer's Council, inaugurated in 1947 in Denmark, determined consumer consciousness, leading to the emergence of similar agencies in other countries (Dubeux & Kamlot, 2009). In developing countries this movement is more recent; in Brazil, for example, it only began in the 1970s with the creation of PROCON (Program for Consumer Guidance and Protection) and INMETRO (National Institute of Metrology, Standardization and Industrial Quality), with its focus on increasing safety of products offered on the market by industry. It was only in the 1980s with the rise of the National Consumer Protection Council that there was a more substantiated direction, which originated the Consumer Protection Code, including the rights addressed in the Brazilian Constitution (IDEC, 2009).

Proliferation of deceptive advertisements presumably occurs due to consumers failing to react against the contrivances created to deceive them. Broadbridge & Marshall (1995), when investigating the behavior complaints and protests of consumers, noticed that on several occasions they do not complain to the provider of the demanded product or service, in what is described as *Do-nothing* behavior. This occurs with customers of supermarkets (70% do not complain of anything that has been harmful to them), cosmetics (45%) or of durable goods (30%), generally because consumers think that "it is not worth spending time and effort" (Broadbridge & Marshall, 1995, p.10). Our study focuses on Brazilian consumers, bearing in mind that they have less experience with claiming their rights, since their consumer protection code is much recent than those in more developed countries, so the hypothesis to be tested is:

H1: Consumers tend not to claim their rights in court when faced by deceptive advertisement.

METHOD

The study was undertaken in the city of Rio de Janeiro, Brazil, between June and July 2012. The sample of 359 interviewees was made up of 49% men and 51% women. Their academic level shows a prevalence of people with complete high school and incomplete university education (44.6%), coherent with the predominant 18-24 age group (42.1% of the sample), 17.2% over 51 years old, 12.7% in the 25-31 age group, 11.4% between 32 and 38 years old, and 10.0% between 39 and 45 years old. The majority (59.3%)

of respondents were single.

We performed an experiment using two groups: one group was exposed to deceptive advertisements and the other to the same advertisements in their non-deceptive version. A test was also performed to check about differences between respondents of both groups, but no difference was found: the variables were tested for gender ($t=1.237$; $p\text{-value}=0.217$), age ($t=0.859$; $p\text{-value}=0.391$), marital status ($t=-0.617$; $p\text{-value}=0.538$), social class ($t=0.832$; $p\text{-value}=0.406$), education ($t=-0.634$; $p\text{-value}=0.527$) and occupation ($t=1.624$; $p\text{-value}=0.106$), and in none of these cases was the zero hypothesis of equality between the groups rejected, which indicates the homogeneity among the respondents.

To test the H1 hypothesis, respondents received a printed advertisement of tooth paste in the deceptive ($n = 190$) and non-deceptive ($n = 169$) versions, and answered a questionnaire. The deceptive version contained several contrivances against the codes regulating advertising in Brazil, while the non-deceptive was completely lawful, adopting all necessary details so as not to be misleading. The product was chosen because it is used by 98.4% of adults who brush their teeth (Figueiredo, Silva, & Bez, 2008), therefore it would not be a novelty for practically any respondent. The participants in the study answered whether they considered such advertising deceptive or not, and what they would do after looking at it. The idea, in this case, is to assess, among those who perceive deceptive advertising, their later behavior, noting whether they would take action with some specific agency, would tend to buy the product, would complain about it or would do nothing (this option would be the expected answer by whoever considered the advertisement non-deceptive, since it would make no sense to exercise their rights when they perceive nothing wrong with what was presented). We adapted the scales of Baker & Churchill (1977) and Bower (2001), using 5-point Likert to identify what the respondent would do based on the information received, and also used the Emotional Quotient Scale (EQ) (Wells, 1964).

RESULTS AND ANALYSIS

After selecting the respondents who considered the advertisement deceptive ($n=241$), we identified those who agreed (or strongly agreed) that would do nothing – that is, the consumers who would not exercise their rights – although they had felt harmed by the contents of the advertisement (regardless of being actually deceptive or not, since what was analyzed here is perception), as shown in Table 2.

Table 2 – Answers to “Have you already taken action against some company that you felt deceived you with some commercial or advertisement?”

No, although having been cheated by a company, I've never acted against it	36.7%
No, I've never felt cheated by a company	30.1%
Yes, I called the company's customer support and asked for compensation	16.5%
Yes, I took it to court	9.3%
Yes, I went to the consumer protection agency and filed a complaint	7.4%

Source: Field survey (2012)

Testing if the average in the case exceeds 4, the minimum value that represents agreement with the affirmative that they would do nothing, the result was: $n = 241$; $\bar{x} = 4.2407$; $\mu_0 = 4$; $s = 1.23835$; where: n : Size of sample; \bar{x} : Average of sample; μ_0 : Value used to compare with \bar{x} ; s : Sample standard deviation;

H1 was accepted ($t = 3.017$; $p = 0.00$), which leads to rejection of the null hypothesis of equality between the quantities of consumers that intend to claim their rights in the legal sector, and those who have no such intention. So, the quantity of consumers who would do nothing after feeling cheated by an advertisement exceeds those who would do something (such as complain to the relevant agencies or to the company that disseminated the advertisement), meaning that consumers tend not to claim their rights in court when faced by deceptive advertisement.

Wells scale (1964) was used to analyze the consumers' reaction to deceptive and non-deceptive advertising. First, the emotional quotient (EQ) was calculated for both advertising pieces to compare their values, which would consequently indicate the emotional appeal of each type of advertising, in the eyes of the public in the study. In practical terms, the higher the score, the greater the appeal of the advertisement.

In the present case, the field results are found in Table 3:

Table 3 – Field data for calculating the EQ

	Non-deceptive advertising					Deceptive advertising				
	SD	D	N	A	SA	SD	D	N	A	SA
I find this advertising very attractive	136	16	15	5	1	142	19	12	10	11
I would probably not pay attention to this advertising if I saw it in a magazine	25	33	21	24	70	48	25	12	38	71
This is warm advertising and affects the	127	20	17	8	1	162	12	8	1	11

Source: field study (2012)

Legend: SD=Strongly disagree; D=Disagree; N=Neutral; A=Agree; SA=Strongly agree.

Based on the data shown in Table 3, EQ was calculated, with the following results: $EQ_{\text{non-deceptive}} = 12.09$; $EQ_{\text{deceptive}} = 12.84$. Although there was little difference, it is found that the emotional quotient of the deceptive advertisement exceeds that of the non-deceptive. In other words, consumers perceive greater appeal in a deceptive advertisement than in the non-deceptive advertisement. This result makes sense, bearing in mind the reality of the markets; to call consumers' attention there is always an ethical limit to be followed, and if all companies bore in mind that such a limit has to be respected, they would all be restricted somehow to a specific threshold. When companies that use bait or contrivance attract the attention of potential customers, this limit would be exceeded, and attractions, which will never be delivered or respected, will call consumer attention. Deceptive advertising where the announced price is extremely low tends to attract more attention – and therefore more appeal – of those interested in the product in question. The later disappointment does not contribute for consumers to mistrust beforehand the commercial addressed to them.

Wells (1964) proposes yet another scale to compare the reaction of the interviewees to the displayed advertisements. Using a semantic differential scale (created by Wells (1964)), each group of respondents individually assessed each advertisement (deceptive or otherwise) to comprise the reaction profile for each. The scale consisted of adjectives shown in Table 4, which should be rated on a scale of seven (7), with the results shown in this table:

Table 4: Field results using the scale of semantic differential of Wells (1964) for deceptive and non-deceptive advertising

	In blue: non-deceptive	In red: deceptive	
Beautiful	5.90	5.67	Ugly
Pleasant	5.52	5.22	Unpleasant
Gentle	6.04	5.39	Harsh
Appealing	5.01	4.65	Unappealing
Attractive	4.99	4.68	Unattractive
In good taste	5.44	4.91	In poor taste
Exciting	5.53	5.05	Unexciting
Interesting	5.58	5.32	Uninteresting
Worth looking at	5.63	5.17	Not worth looking at
Comforting	4.68	4.42	Frightening
Colorful	4.09	4.01	Colorless
Fascinating	5.31	5.10	Boring
Meaningful	5.24	5.09	Meaningless
Convincing	5.71	5.24	Unconvincing
Important to me	6.07	5.56	Unimportant to me
Strong	5.86	5.34	Weak

Honest	4.93	4.48	Dishonest
Easy to remember	4.64	4.80	Hard to remember
Easy to understand	3.69	3.44	Hard to understand
Worth remembering	5.66	5.33	Not worth remembering
Simple	3.63	3.22	Complicated

Graph 1 – Semantic differential scale

Source: Field survey (2012)

It is found that bad adjectives predominated for both advertisements. Both the deceptive and non-deceptive version did not please the respondents, but there was a slight difference in favor of the deceptive, which had a general rating of 4.92 against 5.23 for the non-deceptive (higher ratings mean worse results). The non-deceptive advertising exceeded the deceptive only on the “easy to remember” item, as shown in the Graph 1, presented to ease the comparison of the results. Thus, it is apparent that the general reaction to deceptive advertising tends to exceed that in relation to the non-deceptive.

It cannot be said that there is a considerable difference between the averages (for $\alpha=0.05$, $p=0.225$ is obtained, and $t=-1.229$), but the slight difference observed demonstrates that the population proves to be no great admirer of non-deceptive advertising, nor perceives major differences between versions with and without bait advertising. This indicates that possible future stricter control by responsible agencies for the distribution of general advertising might be necessary to moderate the degree of contrivance released to the consumer market in advertising.

The deceptive advertisement is even perceived as more honest than the non-deceptive. This could turn into a future problem for the government, when trying to create public policies to advertising (which does not exist in Brazil presently). When consumers accept dishonest ads as a usual way to communicate with them, the whole society seems to be in danger, and the adequate entity to regulate the communication means is the government. So, aiming at the future wellbeing, this entity should be aware of what is happening in the market.

A factorial analysis was undertaken of the components in the reaction profile to deceptive and non-deceptive advertising. Starting with the reaction to non-deceptive advertising, three factors were obtained – just as also measured by Wells (1964), who called them Attractiveness, Meaningfulness and Vitality –, as shown in Table 5. Before performing such an analysis, KMO (Kaiser-Meyer-Olkin) statistics were calculated (using the SPSS v18 software), which is a measure of joint correlation that assesses the suitability

of the sample with regard to the partial correlation degree between the variables (Fávero, Belfiore, Silva, & Chan, 2009). For non-deceptive advertising, this value was 0.935, which means excellent suitability for using such analysis, since values close to 1 indicate close correlation between the variables. The first factor in this case, called Attractiveness, explains 52.4% of the accumulated percentage of the observed variance. The second factor, Meaningfulness, explains another 6.78%, and the third factor, Simplicity, another 6.0%.

In the case of deceptive advertising, the KMO value was 0.946, also indicating excellent suitability (Fávero *et al.*, 2009). When doing the factorial analysis, the factors obtained were shown in Table 6. In this case, the first factor (Attractiveness), explains 54.0% of the accumulated percentage of the observed variance. The second factor, Meaningfulness, on the other hand, explains 8.23% and the third factor, Simplicity, explains 5.9% of the variance. It is apparent that the component variables of the factors referring to deceptive and non-deceptive advertising are quite similar. The first factor (which explains a much higher percentage of the variance) in both cases indicates that the advertisements apparently emphasize aspects linked to the audience's emotions, since most of their component variables are of this nature.

Table 5 – Factors – non-deceptive advertising				Table 6 – Factors – deceptive advertising

FINAL REMARKS

This study investigated the reaction of consumers when exposed to deceptive advertisements, observing that most of them do not exercise their rights after encountering a situation in which they have been harmed by a deceptive advertisement. Only a few mentioned searching for legal entities to seek compensation for possibly suffering some damage. The results ratify the findings of Broadbridge & Marshall (1995), who mentioned the behavior called *Do-nothing*; that is, when consumers, even when feeling harmed by their purchase, fail to complain. For the Brazilian consumers in the study, this conduct prevails.

Using Wells scale (1964), the consumer reaction was analyzed in relation to deceptive and non-deceptive advertisings. The general reaction to deceptive advertising exceeded, although with little difference, the reaction to the non-deceptive. Thus, it can be said that the deceptive advertisements presented are more attractive than the non-deceptive. This is one more topic that deserves researchers' attention, since attractiveness has not yet been analyzed in the literature when comparing anti-ethical and ethical messages, in advertising or any other communication tool.

This study contributes to furthering the knowledge regarding consumer reaction to deceptive advertising: most respondents did not seek for their rights, even perceiving that they were exposed to deceptive ad. So, in weaker regulated markets advertising agents could create deceptive or anti-ethical commercials, without causing major commotion among those who would be the target of the disseminated messages. It is a hazardous situation for the society that strives to prevent the proliferation of such communication. The same results can also be felt as indicative of what occurs in TV commercials and the Internet – a suggestion that this could be a future subject of new studies. A typical example of such a situation would be the widespread spams to mislead the consumers targeted for these kinds of deceptive advertising. Public policy implications include the dilemma of strengthening the legislation in nations where the society is not affluent enough to regulate itself, leaving to the nation state the role of regulating the market.

Since the sample of this study consisted only of Brazilians, whose reality is different from that of consumers in other countries, the advancement of this study in other markets may be performed for comparative analysis. Another suggestion for future research would be to analyze the reaction to abusive advertising – commercials that incite violence, discrimination, environmental disrespect or that induce consumers to behave in detriment to their health or safety.

A JOINT REPLENISHMENT MODEL UNDER TRANSPORTATION BATCH AND QUANTITY DISCOUNTS

He-Yau Kang, National Chin-Yi, University of Technology, Taiwan
Amy H. I. Lee, Chung Hua, University, Taiwan
Cheng-Han Lee, National Chin-Yi, University of Technology, Taiwan

ABSTRACT

Under a global competitive market, improving competitive edges to meet rapidly changing technological innovations and dynamic customer needs is important for firms. How to provide products with a high quality, lower cost at the right time and place is important for manufacturers to maintain a competitive edge and to make a decent profit in a longer term. This paper considers a joint replenishment problem, and the objective is to minimize total costs, where the costs include major and minor ordering cost, purchase cost, holding cost and transportation cost. The joint replenishment problem is first formulated as a mixed integer programming model. Then, an efficient particle swarm optimization model is constructed for solving large-scale lot-sizing problems. An illustrative example in a high-tech manufacturer is used to illustrate the practicality of these models for determining the replenishment level from multiple suppliers for multi-periods.

INTRODUCTION

Joint replenishment problem has been a popular issue in both the academic field and in real practice. With the increasingly complicated manufacturing environment and fierce market competition, the joint replenishment problem is becoming more difficult to solve. The intention of this research is to construct a joint replenishment model with transportation batch and quantity discounts to minimize total cost over the planning horizon under the requirement that no inventory shortage is allowed in the system.

Quantity discounts is a common practice in purchasing activities. Two major types of quantity discounts are existed: all-units discount and incremental discount (Cha and Moon, 2005). Under the all-units discount, the discounted price, which is set by the purchased quantity belonging to a specified quantity range, is applied to all units beginning with the first unit. Under the incremental discount, the discounted price is applied only to those units inside the quantity range; therefore, different prices are applied to the units belonging to different price breaks.

Transportation cost is one of the major parts of the total operational cost. In most inventory models, however, the transportation cost is usually considered implicitly in fixed setup or ordering cost, and it is assumed to be independent of the size of the shipment (Ertogral *et al.*, 2007). Ertogral *et al.* (2007), by incorporating all-unit-discount transportation cost explicitly, developed integrated models to tackle a vendor-buyer lot-sizing problem under equal-size shipment policy.

PSO was proposed by Kennedy and Eberhart (1995) in the mid-1990s while simulating the choreographed, graceful motion of swarms of birds. As part of a sociocognitive study, the notion of “collective intelligence” in biological populations was investigated. PSO is inspired by the ability of flocks of birds, schools of fish, and herds of animals to adapt to their environment, by implementing an “information sharing” approaches to find rich sources of food and avoid predators (Taleizadeh *et al.*, 2009). PSO has been used to solve the joint replenishment problem with quantity discounts so that near-optimal solutions can be produced in a short period of computation time.

The remainder of this paper is organized as follows. In section 2, the problem under consideration and the assumptions are described. The constructions of the MIP model and the PSO model are presented in section 3. Case study is carried out in section 4. Some conclusion remarks are made in the last section.

ASSUMPTIONS AND NOTATIONS

This study is to construct a replenishment model for multiple periods under an environment with transportation batch and quantity discounts. Without loss of the generality, the notations are extended from those used in the models of Kang and Lee (2010), Lee and Kang (2011), Kang *et al.* (2012) and Lee *et al.* (2013). The environment is as follows:

- The replenishment lead time is of known duration, and the entire order quantity is delivered at once in the beginning of a period.
- The demand of each period is independent and known.
- At most one order can be placed in each period.
- The replenishment quantity is unconstrained.
- Replenishment is instantaneous.
- The total costs include major and minor ordering cost, holding cost, purchase cost and transportation cost.
- The initial inventory level is zero.
- No inventory shortage is allowed in the system.

All the required notations in this paper are defined as below.

Notations

Indices:

I	Part ($i = 1, 2, \dots, I$).
j	Supplier ($j = 1, 2, \dots, J$).
t	Planning period ($t = 1, 2, \dots, T$).
k	Price break ($k = 1, 2, \dots, K$).

Parameters:

d_{it}	Expected demand of part i in period t .
h	Inventory holding cost, per unit per period.
\hat{O}	Major ordering cost per replenishment.
o_j	Minor ordering cost per replenishment from supplier j .
r_j	Transportation cost per time from supplier j .
s_j	The maximum transportation batch size from supplier j .
p_{ijk}	Unit purchase cost of part i from supplier j with purchase quantity under price break k under incremental quantity discounts.
q_{ijk}	The upper bound quantity of part i from supplier j with price break k .
M	A large number.

Decision variables:

Q_{ijt}	Purchase quantity of part i from supplier j in period t .
$P(Q_{ijt})$	Purchase cost for one unit based on the discount schedule of part i from supplier j with order quantity Q_{ijt} in period t .
$\lceil Q_{ijt}/s_j \rceil$	The smallest integer greater than or equal to Q_{ijt}/s_j .
W_{jt}	Number of transportations from supplier j in period t .
I_{it}	The ending inventory level of part i in period t .
Z_{ijt}	A binary variable, set equal to 1 if a purchase is made, and 0 if no purchase is made, for part i from supplier j in period t .
X_{jt}	A binary variable, set equal to 1 if a purchase is made, and 0 if no purchase is made, from supplier j in period t .
Y_t	A binary variable, set equal to 1 if a purchase is made in period t , and 0 if no purchase is made in period t .

U_{ijk} A binary variable, set equal to 1 if a certain quantity is purchased, and 0 if no purchase is made, for part i from supplier i with price break k in period t .

MODEL FORMULATION

This paper develops a MIP model and a PSO model to solve the joint replenishment problem with transportation batch and quantity discounts in determining an appropriate replenishment policy for each period.

Costs of Materials

Equation (1) calculates the ordering cost for the system, where \hat{O} is the major ordering cost per time, Y_t represents whether a quantity is purchased in period t , o_j is the minor ordering cost per time and X_{jt} represents whether a quantity is purchased from supplier j in period t .

$$(1) \quad \text{Ordering cost} = O = \hat{O} \times \sum_{t=1}^T Y_t + \sum_{t=1}^T \sum_{j=1}^J o_j \times X_{jt}$$

The ending inventory in a period is equal to the ending inventory level in the previous period plus the purchase quantity in the period minus the demand in the period. The holding cost in period t is equal to the holding cost per unit times the ending inventory in period t . The total holding cost for a planning horizon is the summation of the holding cost for each period, as in equation (2).

$$(2) \quad \text{Holding cost} = H = \sum_{t=1}^T \sum_{i=1}^I h_i \times I_{it} = \sum_{t=1}^T \sum_{i=1}^I h_i \times (I_{it-1} + \sum_{j=1}^J Q_{ijt} \times Z_{ijt} - d_{it})$$

The purchase cost is obtained by equation (3), where $P(Q_{ijt})$ is the unit purchase cost based on the discount schedule with the order quantity Q_{ijt} , and Z_{ijt} represents whether a quantity is purchased for part i from supplier j in period t .

$$(3) \quad \text{Purchase cost} = P = \sum_{i=1}^I \sum_{j=1}^J \sum_{t=1}^T (P(Q_{ijt}) \times Q_{ijt} \times Z_{ijt})$$

Constraint (4) calculates the transportation cost of the system, where r_j is the transportation cost per time from supplier i per period, $\lceil Q_{ijt} / s_j \rceil$ is the smallest integer greater than or equal to Q_{ijt} / s_j , W_{jt} is number of transportations from supplier i and s_j is the maximum transportation batch size from supplier i .

$$(4) \quad \text{Transportation cost} = R = \sum_{j=1}^J \sum_{t=1}^T r_j \times \lceil Q_{ijt} / s_j \rceil = \sum_{j=1}^J \sum_{t=1}^T r_j \times W_{jt}$$

Mixed Integer Programming (MIP) Model

In this section, we proposed a mixed integer programming (MIP) model to solve the joint replenishment problem and to determine an appropriate replenishment policy for each period.

The MIP model is formulated as follows:

$$(5) \quad \text{Minimize } TC = \sum_{t=1}^T [\hat{O} \times Y_t + \sum_{j=1}^J o_j \times X_{jt} + \sum_{i=1}^I h_i \times I_{it} + \sum_{i=1}^I \sum_{j=1}^J P(Q_{ijt}) \times Q_{ijt} \times Z_{ijt} + \sum_{j=1}^J r_j \times W_{jt}]$$

$$\begin{aligned}
(6) \quad & \text{subject to} \quad I_{it} = I_{it-1} + \sum_{j=1}^J Q_{ijt} \times Z_{ijt} - d_{it} \quad , \text{for all } i, t \\
(7) \quad & \sum_{i=1}^I Z_{ijt} \leq M \times X_{jt} \quad , \text{for all } j, t \\
(8) \quad & \sum_{j=1}^J X_{jt} \leq M \times Y_t \quad , \text{for all } t \\
(9) \quad & Q_{ijt} \leq M \times Z_{ijt} \quad , \text{for all } i, j, t \\
(10) \quad & W_{jt} = \left\lceil Q_{ijt} / s_j \right\rceil \quad , \text{for all } j, t \\
(11) \quad & P(Q_{ijt}) = \sum_{k=1}^K p_{ijk} \times U_{ijk} \quad , \text{for all } i, j, t \\
(12) \quad & q_{ijk-1} + M \times (U_{ijk} - 1) \leq Q_{ijt} < q_{ijk} + M \times (1 - U_{ijk}) \quad , \text{for all } i, j, t, k \\
(13) \quad & \sum_{k=1}^K U_{ijk} = 1 \quad , \text{for all } i, j, t \\
(14) \quad & Y_t \in \{0, 1\} \quad , \text{for all } t \\
(15) \quad & X_{jt} \in \{0, 1\} \quad , \text{for all } j, t \\
(16) \quad & Z_{ijt} \in \{0, 1\} \quad , \text{for all } i, j, t \\
(17) \quad & U_{ijk} \in \{0, 1\} \quad , \text{for all } i, j, t, k
\end{aligned}$$

and all variables are nonnegative.

Particle Swarm Optimization (PSO) Model

In this research, PSO is used to solve the joint replenishment problem with transportation batch and quantity discounts, and some works related to this study are Dye and Hsieh (2010) and Dye and Ouyang (2011). The proposed procedures are as follows:

Step 1. Initialize particles with random positions and velocities on d -dimensions in the search space.

Step 2. Evaluate the fitness of all particles.

Step 3. Keep track of the locations where each individual has its highest fitness.

Step 4. Keep track of the position with the global best fitness.

Step 5. Update the velocity of each particle:

$$(18) \quad v_{k+1}^\pi = \chi \left[v_k^\pi + \varphi_1 \times rand \times (pbest_k^\pi - x_k^\pi) + \varphi_2 \times rand \times (gbest_k - x_k^\pi) \right]$$

where χ is the constriction factor, v_k^π is the velocity of π^{th} particle at the k^{th} iteration, φ_1 and φ_2 are acceleration constants, $rand$ is a random number between 0 and 1, x_k^π is the current position of the π^{th} particle, $pbest_k^\pi$ is the best searching experience of π^{th} particle so far at the k^{th} iteration, $gbest_k$ is the best result obtained at the k^{th} iteration, and

$$(19) \quad \chi = \frac{2}{\left| -\varphi_1 - \varphi_2 - \sqrt{(\varphi_1 + \varphi_2 - 4)(\varphi_1 + \varphi_2) + 2} \right|}$$

Step 6. Update the position of each particle:

$$(20) \quad x_{k+1}^{\theta} = x_k^{\theta} + v_{k+1}^{\theta}$$

Step 7. Terminate the process if the standard deviation of fitness is less than an error or the maximum number of iterations is reached; otherwise, go to *Step 2*.

CASE STUDY OF A HIGH-TECH MANUFACTURER

A joint replenishment problem with transportation batch and quantity discounts is solved here. An original design manufacturer in Taiwan purchases some electrical parts from China for assembling various products such as touch panels, smartphones and tablet computers, and then delivers the products to USA, Europe and Japan. In order to obtain the optimal stock replenishment strategy, the production management needs to consider ordering costs, transportation batch and quantity discounts. The objectives of the model are to minimize total cost of satisfying demand, and in turn, to determine the order quantity from each supplier in each period.

Based on an interview with the production manager, the following assumptions are made. Each planning horizon contains seven days, and each period is one day. Thus, each planning horizon contains seven periods. The major ordering cost per replenishment is set to be \$300. The minor ordering cost of supplier A (o_1) and supplier B (o_2) per time is set to be \$150 and \$145, respectively. The transportation cost of supplier A (s_1) and supplier B (s_2) per time per period is set to be \$150 and \$180, respectively. The maximum transportation batch size of supplier A (b_1) and supplier B (b_2) per time is set to be 80 and 100, respectively. The discount schedule for part 1, 2 and 3 are shown in Table 2, 3 and 4 respectively. In addition, we set unit holding cost per period (h), which includes rent for the required space, materials, insurance cost and security cost, to be \$5.

The initial population size is set as 150 in the proposed PSO model, which is implemented by the software MATLAB (2007). The algorithm is terminated after 1000 generations have elapsed. In this case, the best generation occurs at the 121th generations.

Table 1: Demand of each period in a planning horizon.

$t \backslash d_{it}$	1	2	3	4	5	6	7
d_{1t}	250	300	280	220	100	150	200
d_{2t}	300	290	330	270	310	450	280
d_{3t}	290	210	180	140	190	200	240

Table 2: Discount schedule for part i=1.

Supplier	Price break (k)	Purchase quantity (Q)	Price per unit ($P(Q)$)
A	1	0~150	\$250
	2	151~250	\$230
	3	251 or more	\$210
B	1	0~150	\$430
	2	151~250	\$425
	3	251 or more	\$405

Table 3: Discount schedule for part i=2.

Supplier	Price break (k)	Purchase quantity (Q)	Price per unit ($P(Q)$)
A	1	0~150	\$330
	2	151~250	\$325
	3	251 or more	\$305
B	1	0~150	\$220
	2	151~250	\$210
	3	251~	\$200

Table 4: Discount schedule for part i=3.

Supplier	Price break (k)	Purchase quantity (Q)	Price per unit ($P(Q)$)
A	1	0~150	\$350
	2	151~250	\$330
	3	251~	\$310

B	1	0~150	\$530
	2	151~250	\$525
	3	251~	\$505

The solution obtained by the MIP model is shown in Table 5. The replenishment strategy is to purchase 251, 299, 280, 320 and 360 units of part 1 in period 1, 2, 3, 4 and 6 from supplier A, respectively. The replenishment strategy is to purchase 300, 290, 330, 280, 300, 450 and 280 units of part 2 in period 1, 2, 3, 4, 5, 6 and 7 from supplier A, respectively. The replenishment strategy is to purchase 290, 251, 279, 260 and 370 units of part 3 in period 1, 2, 3, 5 and 6 from supplier A, respectively. The total cost is \$1,228,580.

The case is also solved by the PSO model. Table 6 shows that the replenishment policy is to purchase 250, 580, 320 and 350 units of part 1 in period 1, 2, 4 and 6 from supplier A, respectively. The total cost is \$1,268,620, with an error 3.259% from that of the MIP model.

CONCLUSIONS

A joint replenishment problem, which considers dynamic lot-sizing, quantity discount, major and minor order cost, holding cost, transportation cost and purchase cost, is studied. A mixed integer programming (MIP) model and a particle swarm optimization (PSO) model are proposed to devise good replenishment strategies. A MIP model is first constructed to determine the replenishment level of materials. An efficient PSO model is proposed next for solving large-scale problems. By calculating major and minor ordering cost, holding cost, purchase cost and transportation cost, replenishment level and system cost can be determined. In addition, the solution from the MIP model is an optimal solution and from the PSO model is a near-optimal solution.

FISHER HYPOTHESIS IN KAZAKHSTAN, RUSSIA AND KYRGYZSTAN

Maya Katenova, Kimep University, Kazakhstan

ABSTRACT

This paper examines whether the Fisher Hypothesis holds in three CIS countries – Kazakhstan, Kyrgyzstan and Russia – using quarterly data on three month interest rates on Treasury bills and consumer prices over the period 2002q1-2011q4 (40 observations in total). Before testing the validity of these hypotheses, tests were conducted based on the Dickey-Fuller and Phillips-Perron test statistics to determine the order of integration of the underlying time series. Results obtained show that nominal interest rates on Treasury bills and inflation rates were not integrated of the same order. However, nominal interests turned out to be stationary in all cases when assessed are based on Phillips-Perron tests only under the first difference. Results based on the ARDL test for cointegration show that the FH do not holds in the long run for all countries. The results obtained based on autoregressive model distributed lag model as well as error correction model strongly confirm these results.

One implication that emerges from these results is that Treasury bill markets in the CIS countries under investigation do not provide investors any hedge against inflation. Another important implication is that monetary policy cannot be conducted effectively to contain inflation by reducing interest rates. And the third implication is the probability of poor quality of the source data and not a sufficient length of time series.

INTRODUCTION

Irving Fisher (1930) described an environment where nominal rates respond one-for-one to changes in the expected decline in the purchasing power of money. This "Fisher equation" holds, for instance, in an economy without taxes in which the quantity of lending depends in equilibrium on the real rate of interest received by lenders. (Hanson, Stuart, 1986)

Fisher hypothesis (1930) was tested in different countries during different periods of time. Humphrey (1983) mentioned in his article that the real/nominal rate distinction is of 18th rather than 20th century vintage.

Since inflationary expectations influence nominal interest rate, the Fisher effect has far-reaching implications for debtors and creditors as well as for the effectiveness of monetary policy and efficiency in banking sector. (Hasan, 1999)

Typically, the nominal interest rate on Treasury bills or the expected return on risky stocks must rise by an amount equal to the increase in expected inflation, leaving the real return on these assets to be constant and independent of anticipated inflation over the holding period. (Bhatti et.al. 2011)

The objective of this paper is to examine whether the Fisher hypothesis holds in three CIS countries – Kazakhstan, Russia and Kyrgyzstan – using quarterly data on interest rates on Treasury bills and consumer prices over the period 2002 - 2012. The main objective of this paper is to test validity of Fisher effect in three CIS countries through investigation of long run relationship between interest rate and inflation rate.

LITERATURE REVIEW

Fisher hypothesis and stock market

The Fisherian assumption that real returns are independent of inflationary expectations is soundly rejected for each major stock market of the world. Solnik (1983). The author used interest rates as a proxy for expected inflation, the data provide consistent support for the Geske and Roll model whose basic hypothesis is that stock price movements signal (negative) revisions in inflationary expectations. Firth (1979) examined

the relationship between inflation and the rates of return on common stocks using British data. The result of the research show that stock market returns in Britain do provide some support for the Fisher effect. Additionally, there was no statistically significant evidence that publicly available information on rates of inflation could be used to earn superior stock market returns.

Fisher hypothesis and Treasury bill market

Hafer and Hein (1985) compare the relative forecasting accuracies of the interest-rate model, a univariate time-series model of inflation, and forecasts taken from the American Statistical Association-National Bureau of Economic Research (ASA-NBER). Hein and Koch (1988) compare inflation forecasts derived from tax-exempt yields to those from taxable Treasury bills.

Hafer and Hein (1990) used Fama and Gibbons's methodology to address the question of whether nominal rates in Belgium, Canada, England, France, and Germany provide accurate forecasts of their rates of inflation. Previous studies using this forecasting procedure have relied on U.S. Treasury bill data. In their article Hafer and Hein (1990) used 1-month Eurocurrency rates reported by the Harris Bank of Chicago.

Fisher effect in interest rate determination equations have been included and verified by such authors like Fama (1975), Graham (1988). Crowder (2003) tested Fisher hypothesis in nine industrialized countries and the results were supportive of Fisher hypothesis. The author used unit root test and panel cointegration tests in his paper.

Feldstein (1976) has explored the impact of inflation in a growing economy. The author mentioned that the presence of the corporate and personal income taxes substantially alters the effect of inflation on the capital intensity of production, the market rate of interest, and the real net return to savers. Hafer and Hein (1990) found that based on the evidence from Belgium, Canada, England, France, and Germany time-series forecasts of inflation have equal or lower forecast error and produce unbiased forecasts more often than the interest-rate model. The other important finding of authors is that the interest-rate model forecasts may provide marginally useful information that allows one to improve on the time-series inflation forecasts. Hasan (1999) proved acceptance of partial Fisher hypothesis in Pakistan suggesting that interest rate does not fully cover inflation. It means that bank deposits deteriorate over time so that investors will be looking for alternative investment opportunities such as equity, bonds, foreign currency etc. The author claims that the monetary policy may not be effective in such a situation. Also, results show that the market (banking sector) is inefficient. The failure of interest rate to perform its role as a hedge against inflation and as a predictor of inflation needs innovation and financial engineering for better alternatives in the banking sector.

Fisher hypothesis was criticized by such authors as Darby (1975). He argues that in an efficient capital market, in which taxes are imposed on interest income, the nominal interest rate in equilibrium must increase by more than the increase in expected inflation so as to compensate the lender not only for a loss of principal due to inflation but also for a loss of return due to tax on interest receipts from the principal. Feldstein (1976) incorporates taxes and shows that this alters effect of inflation on the capital intensity of production, the market rate of interest, and the real rate of return to savers, and that the nominal interest rate rises by more or less than twice the rate of inflation. Hansson and Stuart (1986) concluded that under plausible conditions, one should expect to observe that nominal interest rates move roughly one for one with the rate of inflation. Deviations from such a one-for-one relationship can occur if (i) different types of income are taxed at different rates or (ii) purchasing power parity does not hold exactly. In general, the relationship between interest rates and inflation predicted by the theory here appears to accord closely with most empirical findings. This agreement supports the view that open-economy considerations vis-a-vis capital are important for understanding aggregate economic behavior.

In general, Fisher Hypothesis is still a debatable issue. Although there is a positive relationship between the nominal interest and expected inflation rate, the nominal interest rate seems not to adjust fully to the inflation rate. Bhatti et.al. (2011) Moreover, there were findings that there is negative relationship between expected returns on common stocks and expected inflation rates. Carmichael and Stebbing (1983) present in their paper the fact that Fisher Hypothesis can be completely inverted. Using the data on Australia and United States, Carmichael and Stebbing (1983) presented the evidence which did not reject the inverted Fisher Hypothesis.

METHODOLOGY AND EMPIRICAL RESULTS

This study uses data which is collected from the National Statistics Agency of the Republic of Kazakhstan, KASE, and the statistics obtained from the World Bank. The absence of reliable data that goes back far enough is an obvious drawback for any empirical research of all CIS countries, and Kazakhstan is not an exception.

The data set consists of quarterly observations starting from January 2002 and ending in December 2011 (40 observations in total). Two sets of time series were collected: one on consumer price index (CPI) data and another one on three-month Treasury bills data for three CIS countries- Kazakhstan, Kyrgyzstan, and Russia. Each set of observed series consists of 40 numbers of observations.

The unit root test has been employed for each series. Both Dickey-Fuller (1979) and Philips-Perron tests for unit root were conducted before the test of the Fisher Hypothesis was implemented. The obtained results are presented in the table below:

Table 1: Testing for Unit Root

Variable	ADF		PP	
	Level	First Difference	Level	First Difference
Kyrgyzstan				
i_t	-3.151867	-8.765273*	-3.151867	-9.590367*
Δp_{t+1}	-4.560588		-4.537157	
r_{t+1}	-9.064853		-9.891744	
Kazakhstan				
i_t	-1.636020	-3.670773	-1.302156	-3.625449
Δp_{t+1}	-3.162238		-4.038910	
r_{t+1}	-4.399007		-4.507757	
Russia				
i_t	-2.312627	-7.320432	-2.292873	-7.346677
Δp_{t+1}	-3.909370		-3.909370	
r_{t+1}	-7.348771		-7.367202	

The critical values of ADF and PP test are presented in the table below.

Critical Value	
	ADF and PP
1%	-3.610453
5%	-2.938987
10%	-2.607932

According to the obtained results the nominal interest rates on Treasury bills of all three considerable countries have got a unit root problem in level and no unit root in the first difference, in other words they are integrated in I (1) order. On the other hand, expected inflation and real interest rate series have no unit root problem and are integrated in the I (0).

The basic regression model for testing FH has a following form:

$$i_t = \beta_0 + \beta_1 \Delta p_{t+1} + \varepsilon_{t+1} \quad (1)$$

where,

i_t – the one –period nominal interest rate,

Δp_{t+1} – the expected change in the logarithm of the domestic price index from time t to $t+1$,

ε_{t+1} – an error term.

Fisher Hypothesis itself requires to have two basic restrictions: first is the $(\beta_0, \beta_1) = (0,1)$; and the second is that the error term ε_{t+1} should be stationary.

ARDL Modeling Approach to Cointegration Analysis

Several methods are available for conducting the cointegration test. The most commonly used methods include the residual based Engle-Granger (1987) test, and the maximum likelihood based Johansen (1991;

1995) and Johansen-Juselius (1990) tests. Due to the low power and other problems associated with these test methods, the OLS based autoregressive distributed lag (ARDL) approach to cointegration has become popular in recent years. The main advantage of ARDL modelling lies in its flexibility that it can be applied when the variables are of different order of integration (Pesaran and Pesaran 1997). Another advantage of this approach is that the model takes sufficient numbers of lags to capture the data generating process in a general-to-specific modelling framework (Laurenceson and Chai 2003). Moreover, a dynamic error correction model (ECM) can be derived from ARDL through a simple linear transformation (Banerjee et al. 1993). The ECM integrates the short-run dynamics with the long-run equilibrium without losing long-run information. It is also argued that using the ARDL approach avoids problems resulting from non-stationary time series data (Laurenceson and Chai 2003). As mentioned earlier, the variables considered in this study are a mix of I (0) and I (1) series. The cointegration test methods based on Johansen (1991; 1995) and the Johansen-Juselius (1990) requires that all the variables have to be of equal degree of integration, i.e., I(1). Therefore, these methods of cointegration are not appropriate and cannot be employed. Hence, we adopt the ARDL modelling approach for cointegration analysis in this study.

The ARDL test for a long-run relationship between nominal interest and expected inflation rates is based on a dynamic conditional vector error correction model

$$\Delta i_t = \alpha_0 + \alpha_1 \Delta p_t + \alpha_2 i_{t-1} + \sum_{i=1}^m \beta_i \Delta i_{t-i} + \sum_{i=0}^m \gamma_i \Delta p_{t+1-i} + v_t \quad (2)$$

where the null hypothesis of no cointegration is represented by $\alpha_1 = \alpha_2 = 0$. The null hypothesis of no cointegration can be tested using the F-statistic. The lag length of the error-correction model can be determined, as suggested by Pesaran *et al* (2001), on the basis of three tests: (i) Akaike's Information criterion (AIC), (ii) Schwarz's Bayesian Information Criterion (SBC), and (iii) Lagrange multiplier (LM) statistic for testing the null hypothesis of no serial correlation in residuals. As the order of integration of the nominal interest rate and expected inflation was tested, the ARDL model, as represented by equation (2) for different lag levels and the values of SBC, AIC and the LM tests for different lags was tested and the obtained results are presented in the table below.

It is obvious from obtained results that the ARDL model for Russia has the smaller value of AIC and SBC statistics at lags 1, 9, and 10, and minimum values of AIC and SBC -1.996 and -1.818 respectively are fixed at lag 1. But, at the same time according to LM statistic, the ARDL model for Russia suffers from serial

correlation. The minimum lag of the ARDL model for Russia is fixed at 1 based on SBC and AIC respectively to test the null of a no long-run relationship between the nominal interest and inflation in Russia. As evident from Table 2, the null that $\alpha_1 = \alpha_2 = 0$ cannot be rejected for lags 1, 9 and 10 because the computed values of the F statistics are much lower than their asymptotic critical bound values of 3.62 and 4.16 as tabulated for I (0) and I (1), repressors at the 5% significance level, implying that in Russia the Fisher hypothesis does not hold in the long-run. The same conclusion can be done also for ARDL models for Kazakhstan and Kyrgyzstan. These models have minimum values of SBC and AIC at lag 1 and 2 respectively, but LM values showed the presence of serial correlation and F-statistic is too small. Therefore, it can be concluded that in Kazakhstan and Kyrgyzstan the Fisher hypothesis does not hold in the long-run.

$$\Delta i_t = \alpha_0 + \sum_{i=1}^n \beta_i \Delta i_{t-i} + \sum_{i=0}^n \gamma_i \Delta p_{t+1-i} + \phi EC_{t-1} + \nu_t \quad (3)$$

where,

n - the maximum lag length selected by *ARDL* model,

ϕ - the speed of adjustment and EC_{t-1} is the error correction term representing the speed of adjustment to disequilibrium.

The results that are obtained from the ARDL test for a long-run relationship between nominal interest and expected inflation rates are based on a dynamic conditional vector error correction model are strongly supported by the estimates of both autoregressive equation (2) and error-correction model (3), as shown in Tables 3 and 4. The estimates of equation (2) indicate that expected inflation does not play any role in determining the nominal interest rate on Treasury bills in all cases. The current nominal interest rate on Treasury bills is determined significantly by their past values in cases of Kazakhstan and Kyrgyzstan, but not for Russia. It is also important to note that the estimates of the autoregressive model in almost all cases pass all diagnostic tests. It must be noticed that F-statistics in all cases have got significantly enough values, which means that models have right functional form. The Breusch-Pagan-Godfrey test on homoscedasticity was employed. The models of all three countries do not reject the null hypothesis of homoskedasticity with large p-values.

Table 4: Estimates of the Error Correction Model Selected Based on SBC

	Russia	Kazakhstan	Kyrgyzstan
Constant	0.6538 (1.3041)	0.4681 (1.6570)	3.2457 (2.7221)
Δi_{t-1}	-0.0417 (-0.2031)	0.4235 (2.4194)	0.0724 (1.3523)
Δi_{t-2}		0.2624 (2.4420)	0.3962 (2.1531)
Δp_{t+1}	0.6868	4.9923	-1.8333

	(1.5014)	(1.8627)	(-0.7719)
Δp_t	0.8085 (2.5637)		
EC_{t-1}	-0.1548 (-1.3440)	-0.1230 (-2.012)*	-0.5251 (-2.6420)

Also, the estimates of the error-correction model, as presented in Table 4, show that in case of Kazakhstan and Kyrgyzstan a valid error-correction representation of the FH exist. The only exception in this case is Russia again in which the error correction term has turned out to be significant. However, the coefficient of error correction term for Kazakhstan is not large enough (-0.1230), implying that only 12.3% of the deviations from long run equilibrium relationship are corrected in each quarter. In other words, 49.2% of the deviations from the long run relationship are corrected every year, which means that it takes more than three years to restore the Fisher Hypothesis. On the other hand, the speed of adjustment or correction to the long run relationship is 53% in the case of Kyrgyzstan, implying that it takes two quarters to restore equilibrium between nominal interest rates and expected inflation.

CONCLUSION

The main object of this paper is to test the Fisher Hypothesis for three CIS countries to understand whether or not Treasury bill markets in these countries provide any hedge against inflation. Quarterly data was used on three month Treasury bills and consumer prices index covering the sample period from January 2002 till December 2011 (40 observations in total). Before testing the validity of these hypotheses, tests were conducted based on the Dickey-Fuller and Phillips-Perron test statistics to determine the order of integration of the underlying time series. Results obtained show that nominal interest rates on Treasury bills and inflation rates were not integrated of the same order. However, nominal interests turned out to be stationary in all cases when assessed are based on Phillips-Perron tests only under the first difference. Results based on the ARDL test for cointegration show that the FH do not holds in the long run for all countries. The results obtained based on autoregressive model distributed lag model as well as error correction model strongly confirm these results.

One implication that emerges from these results is that Treasury bill markets in the CIS countries under investigation do not provide investors any hedge against inflation. Another important implication is that monetary policy cannot be conducted effectively to contain inflation by reducing interest rates. And the third implication is the probability of poor quality of the source data and not a sufficient length of time series.

SMALL BUSINESS TAX CONCESSIONS DOWN UNDER

Paul Kenny
Flinders University, Australia

ABSTRACT

This paper examines Australia's 2009 Henry Review recommendations on small business taxation. In doing so this paper analyses these recommendations having regard to the issue of defining a small business and by examining the various rationales that are commonly extended for such concessions. Notwithstanding these rationales for these tax concessions, such concessions should be used sparingly. Defining a small business is problematic. Tax concessions generally contribute to complexity, inefficiency, inequity and damage fiscal adequacy. This paper submits direct targeted government grants are better alternative to support both small business and the wider economy.

INTRODUCTION

Small business tax concessions are advocated on the need to: offset regressivity of compliance costs; to provide simplicity; the importance of small business to the economy; to address market failures; the asymmetry of taxable profits and losses; and the need to ensure that small businesses can endure events which might threaten to break them up. Australian federal governments' increasingly broaden and tinker with a range of small business tax concessions as they seek electoral support from an estimated 2.7 million small businesses. Consequently, a plethora of costly tax concessions for small business has emerged. Their complexity produces considerable uncertainty as to their practical operation and for many the concession benefits do not appear to outweigh the additional compliance costs. The various concessions favour particular types of businesses with certain structures over other taxpayers and this creates distortions and inequities. Despite noting these concerns, the *Henry Review* (Henry 2009) generally supported the existing small business entities (SBE) tax concessions framework with recommendations that significantly broaden its scope. Consequently, the Government announced a further round of concessions (depreciation concessions) as another electoral cycle comes into play. This paper examines these *Henry Review* recommendations. In doing so, the paper first summarises the background to the current small business tax concessions including the former Simplified Tax System (STS) for small business as well as the SBE regime. The paper then examines the *Henry Review's* recommendations. Finally the paper analyses the *Henry Review's* SBE recommendations having regard to the issue of defining a small business and the examining the various rationales that are commonly provided for such concessions. Notwithstanding the above rationales for these tax concessions such concessions should be used sparingly. Defining a small business is problematic. Tax concessions generally contribute to complexity, inefficiency, inequity and damage fiscal adequacy. This paper submits direct targeted government grants are better alternative to support both small business and the wider economy.

BACKGROUND

Prior to the introduction of the goods and services tax (GST) small business tax concessions did not feature heavily in the taxation landscape. The advent of the GST and the greater regulatory burden on small business and its regressive impact appears to have inspired the 1999 *Ralph Review*' (Ralph Review 1999) Simplified Tax System (STS) to assist small business by way of a "simpler" tax system. The STS commenced on 1 July 2001 and was available to businesses that satisfied a \$1 million STS average turnover and a \$3 million depreciating assets test. The STS concessions consisted of an alternative cash accounting system, a prepayment regime, a simplified and accelerated depreciation regime and a simplified trading stock regime.

However, concerns were raised as to the practical operation of the STS and its inflexibility, complexity and marginal benefits. The STS became subject to extensive critical reviews by academics, practitioners, professional and Government bodies. Consequently, the federal Government implemented a series of amendments to the STS to make it more attractive to small business. The STS cash accounting basis created many problems for small business since they generally presented accounts on an accruals basis. Consequently, subdiv 328-C was repealed and cash accounting was abandoned from 1 July 2005. Further, roll over relief was introduced for STS depreciating assets to match the general depreciation rules. Additionally, new STS concessions were introduced. In 2005 the entrepreneurs tax offset (ETO) was introduced to provide a 25 per cent tax offset on the annual income tax liability attributable to business income of very small businesses. The ETO is gradually phased out when turnover exceeds \$50,000, and businesses with a turnover of \$75,000 are not eligible. An STS exemption also applied to the indirect value shifting rules. Outside of the STS, a range of other small business tax concessions were scattered throughout the various taxation laws. The *Ralph Review*'s recommendations for significant small business capital gains tax (CGT) concession were enacted. This consisted of four concessions: the CGT 15-year asset exemption; the CGT 50 per cent active asset reduction; the CGT retirement exemption and CGT roll-over relief. Additionally, under the withholding tax rules, small business could base PAYG installments on GDP-adjusted notional tax. Further, a PAYG installment reduction was available. In respect of the goods and services tax (GST) concessions were provided for small business to permit accounting for GST on a cash basis. Annual apportionment of input tax credits for acquisitions and importations that are partly creditable were allowed for small business. Small businesses could pay GST by quarterly installments. For fringe benefits tax (FBT) purposes small businesses obtained a FBT car parking exemption.

On 12 October 2005 the federal Government commissioned a taskforce chaired by Gary Banks to reduce the regulatory burden on small business. The *Banks Taskforce* found the need to harmonize taxation law definitions and recommended that the definition of a small business be aligned or rationalized (Banks 2006). As a result, on 1 July 2007, the federal Government renamed and modified the STS in Div 328 as part of the new 'Small Business Entities' (SBE) regime. The SBE test provides a new measure for determining what constitutes a small business. From 1 July 2007, SBEs have the choice to apply any of the SBE concessions since they are no longer compulsory, unlike most of the former STS concessions. Under the SBE rules, there is no need to lodge an election with the ATO to access the concessions. The former \$1 million STS turnover threshold was replaced with a \$2 million turnover threshold and the former STS \$3 million depreciating assets test was abolished. *Review*, did not provide any apparent over-arching vision for the ideal tax system, it aspired to raising tax revenue so as to do least harm to economic efficiency, provide equity (horizontal, vertical and inter-generational), and to minimise complexity for taxpayers and the community (Henry Report 2009). The *Henry Review* was conducted over a relatively short period of 19 months (May 2008 to December 2009) given its breadth and complexity. The *Henry Review* produced its first discussion paper, *Architecture of Australia's tax and transfer system* on 6 August 2008 (Henry Discussion Paper 2008). Unfortunately, the paper did not address small business tax concessions. The discussion paper outlined Australia's tax and transfer systems to inform public discussion. The paper was not intended to be exhaustive, nor was it intended to limit discussion to the issues raised, and called for public submissions. On 10 December 2008 the *Henry Review* published a consultation paper which outlined the key messages from the submissions received. The diverse views in the submissions for and against such tax concessions illustrate the competing arguments between vested interests.

THE HENRY REVIEW

The *Henry Review* had its origins in the federal Labor Government's 2008-09 Budget which announced a comprehensive 'root and branch' review of Australia's tax system. Commencing on 13 May 2008, the *Henry Review* panel was chaired by the Secretary to the Treasury, Dr Ken Henry. The *Henry Review* studied the Australian tax system and made recommendations to create a tax structure to help Australia deal with the social, economic and environmental challenges of the 21st century and enhance Australia's economic and social outcomes. Whilst the *Henry* and others. The consultation paper also referred to research (Johansson et al 2008) that indicates that small business incentives have no perceptible impact on economic growth. Further, the paper noted that the benefits of the concessions may not outweigh the costs, referring to the discussion of small business issues by Crawford and Freeman (Crawford & Freeman 2008) in the United Kingdom's *Mirrlees Review*. To obtain submission on the usefulness of small business tax concessions, the consultation paper raised the following key question about small business taxation (Henry Consultation Paper 2008 p 155): "Should the tax system be structured to cater for the specific circumstances of small business...". From December 2008 to 1 May 2009 further public submissions were received in response to the questions raised in the consultation paper. However, there were no small business specific organizations

involved in these discussions and consultation with small business was limited. The *Henry Review* provided its report to the Treasurer in December 2009. Whilst the report asserted that favorable treatment of self employed over employees can give rise to efficiency and equity concerns (Henry Report 2009) (and despite the earlier consultation paper noting the research findings that pointed to the ineffectiveness of small business tax concessions), overall the report found that special treatment was appropriate for small business. In doing so the *Henry Review* provided the following rationale: “Small businesses bear a disproportionately higher share of the tax compliance burden. To reduce this burden and to provide small business with greater tax certainty, the existing small business tax concessions should be streamlined and broadened” (Henry Report 2009 p 41).

Consequently, recommendation 30 greatly expanded the scope of the SBE regime by proposing an increase to the SBE turnover threshold from \$2 million to \$5 million, and that the \$6 million net asset value test should be considered for an adjustment (Henry Report 2009). Further, recommendation 17 allowed taxpayers who sell a share in a company or an interest in a trust that is a SBE to access the capital gains tax (CGT) concessions using the turnover test, rather than the current maximum net asset value test (Henry Report 2009). Such owners of SBE businesses will not need to determine eligibility under the maximum net asset value test, and instead rely on the same test used to access the other small business concessions. The *Henry Review* argued that this would rationalize and simplify these concessions (Henry Report 2009). Whilst this provides for some simplification with the removal of the maximum net asset value test, these recommendations would increase the number of eligible businesses and thus the extent of the compliance and administration costs. This also would open tax planning opportunities and lead to tax avoidance as taxpayers restructure their activities to become eligible. Larger businesses with low turnovers and significant CGT assets would be eligible. Such restructuring would distort efficiency and work to stymie small business growth.

Recommendation 29 allowed depreciating assets costing less than \$10,000 to be immediately written-off. The *Henry Review* reasoned that this ‘would allow small businesses to immediately write off most of their asset purchases, simplifying and providing more certain arrangements while also providing cash flow benefits’ (Henry Report 2009, p 41). Recommendation 29 also permitted other depreciating assets (except buildings) to be pooled together, with the value of the pool depreciated at a single declining balance rate. The *Henry Review* asserted this would further simplify the ‘simplified’ SBE depreciation regime (its two pools). The *Henry Review*, though, did propose to remove some of the SBE concessions. Recommendation 17 rationalized the small business CGT concessions to provide simplification given the high complexity and compliance costs by removing the active asset 50 per cent reduction and 15-year exemption concessions (Henry Report 2009). The *Henry Review* argued that these concessions may skew the allocation of resources in the economy to less productive uses and detract from equity goals. Also, the lifetime limit of the CGT retirement exemption would be increased to permanently align it with the capital gains tax cap for contributions to a superannuation fund (Henry Report 2009). The *Henry Review* argued that an increased retirement exemption is justified since many small businesses use the appreciation of value in their business as a lifetime savings vehicle for their retirement. Thus, this exemption should be increased to align it with the concessions available to others within the superannuation system. This would increase the current lifetime limit from \$500,000 to \$1.1 million (in 2009–10) contributions to a superannuation fund derived from the disposal of a small business, and ensure the limit is indexed annually. This recommendation appears equitable given the availability superannuation concessions available to non-business taxpayers. Recommendation 6 proposed to abolish the ETO given its complexity and the way it provides problematic incentives related to business structures (Henry Report 2009). The ETO only applies to very small businesses and about 73 per cent of recipients of the ETO receive less than \$600 (the maximum rebate is \$2,500). This will ensure government assistance is properly targeted and provide a more equitable and neutral treatment between self-employment and employment income.

ANALYSIS

In determining whether small business should be provided with tax concessions, there are two key questions. What is a small business? Should small business receive tax concessions? Defining a small business is extremely challenging. Should a small business be defined qualitatively or quantitatively? For practical reasons qualitative definitions are inappropriate since objective and measurable criteria are needed in legislation. Using quantitative measures brings the problem of ascertaining the parameters, whether it be by sales, profit, assets and / or number of employees. Different parameters will produce different ranges of small businesses. There does not appear to be any clear way of working out when a business ceases to be small. The Australian experience illustrates the dilemma. As noted above, prior to the SBE framework the

various small business tax concessions adopted different parameters and this created uncertainty and complexity. For example, the STS originally required a \$1 million STS average turnover and \$3 million depreciating assets test, whilst other small business concessions provide separate tests. The SBE regime then harmonized the definition of small business for many of the tax concessions. The STS depreciating asset test was abolished and a \$2 million aggregate turnover replaced the \$1m turnover test. This meant, though, that larger businesses with low values of depreciating assets would qualify as SBE (such as start up listed companies). The *Henry Review* further proposed that the aggregate turnover test be increased to \$5 million. The silence in the *Henry Review*'s publications detailing how this parameter was designed illustrates its arbitrariness. Setting parameters also poses the problem of manipulation as businesses restructure so as to access the small business concessions. This is evident with complex anti-avoidance measures in the former STS and in the SBE regime. Overall, there is no consensus on what a small business is, nor is there any consensus about the appropriate parameters. A number of parameters appear to be needed in order to appropriately identify the smaller businesses (to prevent manipulation) but the more parameters the greater the complexity. This seemingly impossible policy problem is illustrated in the many different ways governments' around the world define small business. If a "small business" is to be defined, then standard definitions of 'micro', 'small' and 'medium' businesses should be employed for data collection, analysis and policy development to assist the analysis of the health of the small business sector and promote more informed policy making (Parliamentary Joint Committee 2011).

As to the question whether small business should receive tax concessions, the *Henry Review*'s rationale focused on the need to offset regressivity of compliance costs and to provide simplicity. Other common arguments include: the importance of small business to the economy to address market failures; the asymmetry of taxable profits and losses; and the need to ensure that small businesses can endure break up events. Research in Australia and elsewhere has found that the costs for small business in complying with tax laws are regressive given their lack of resources and expertise (Evans 2003). On this basis, the *Henry Review* called for tax concessions (recommendations 29 and 30) to offset these costs. Although, it is counter argued that small business have a higher non-compliance with tax laws than employees which reduces the regressive impact of compliance. Slemrod provides evidence that non-compliance is similarly regressive to small business as are compliance costs (Slemrod 2004). The smaller the business, the less compliant. Pope also pointed to a number of studies from OECD countries that showed small businesses, especially micro businesses are responsible for a large proportion of tax evasion (Pope 2008). Since many small businesses will comply with tax laws there still exists an argument for tax concessions and exclusions where these provide an overall benefit in simplifying tax laws such that tax revenue and efficiency increase (Gentry 2004). For example, there is an apparent role for exclusions (such as the \$75,000 GST registration turnover threshold) to minimize the compliance and administration costs by reducing the number of affected taxpayers (OECD 1997). However, a high threshold may create inequity between who have to register and those who do not. This is inefficient since competition is impacted as more efficient larger small firms are at a disadvantage.

Tax concessions introduced to reduce compliance costs may also inadvertently increase these costs since the concessions can increase complexity. For example, the complexity of the STS resulted in a low take up by small business given the concession targeted 95 per cent of businesses. Only 14 per cent of eligible small businesses joined by 2002 (*Tax Laws Amendment (Small Business) Act 2007* (Cth)). In later years, the take up rate increased to only 27 per cent of small business and the STS was abandoned on 30 June 2007 (Senate Estimates Committee Hearing, 2009). There is also a trade-off between compliance costs and evasion. Tax concessions introduced to reduce compliance costs may increase opportunities for tax avoidance. For example, the turnover thresholds in the STS and SBE regimes provide avoidance opportunities by artificial means.

Under recommendation 30 the SBE turnover threshold would increase from \$2 million to \$5 million, and the \$6 million net asset value test would be considered for an adjustment. This proposal to broaden the taxpayer eligibility will increase compliance and administration costs associated with the SBE regime, and damage fiscal adequacy. This will also lead to inequity as larger and asset rich small businesses will gain the most from the SBE regime's generous depreciation and CGT concessions. This recommendation also shows how the SBE tax concessions lead to greater calls for concessions by non-SBE taxpayers. Recommendation 29 allows depreciating assets costing less than \$10,000 to be immediately written-off. Again this damages fiscal adequacy and leads to inequity. Further, both of these proposals do not target small business compliance costs, rather they generally benefit certain types of small business owning significant depreciating and CGT assets. Overall, these *Henry Review* proposals are not justifiable, these concessions provide a poorly targeted cash flow benefit. It is noted that the *Henry Review* did not

provide justification for its new determination of a small business, nor discuss research. The issue of small business non-compliance was also ignored. No qualitative or quantitative policy impacts were detailed by the *Henry Review* as to the affect of these recommendations.

The *Henry Review* asserted recommendations 17 and 29 would “simplify” the tax system. However, it is not clear that the \$10,000 depreciating asset immediate write-off and pooling of depreciating assets will provide any simplification given that most small businesses need to produce financial accounting statements based on accounting standards. Consequently, this appears to add to complexity with dual sets of accounts needed. Recommendation 17 proposed removing the CGT active asset 50 per cent reduction and 15-year exemption concessions. These concessions are complex and this proposal is well justified on simplicity grounds. As the *Henry Review* noted, these concessions are also inefficient and inequitable (Henry Report 2009). In summary, small business continually need to keep abreast of an extensive range of ever changing tax concessions and eligibility requirements in order to benefit. The complexity of the concessions means that small businesses rely extensively on professional help. For many these costs outweigh the benefits. The *Henry Review* should have recommended the abolition of small business tax concessions (except for limited threshold exclusions).

Further, it is argued that small business is important since it creates jobs, generates wealth, contributes to innovation and the economy (Birch 1979). In developed countries, there is a strong positive correlation between small business entrepreneurship and GDP growth as well as the level of gross domestic product (GDP) per capita (Pope 2008). In Australia the small business sectors provides about 30 per cent of GDP and from 1983 it has increased at an annual rate of 3.5 per cent per annum (Pope 2001). Whilst large business (with more than 200 employees) has only increased at 2.5 per cent per annum since 1983. In 2011 small business accounts for 96 per cent of all private sector businesses, employing 47 per cent of all private sector employment (ABS Cat No. 8104.0). An OECD report found that the contribution of small business to innovation is increasing as a result of new technologies which make it easier for small businesses to overcome barriers to entry and access larger markets (OECD 2010). In Australia, small businesses account for around one third of research and development of spending in high-tech industries (Connolly et al 2012). However, other studies suggest small business importance is overstated. Research has criticized studies purporting to show the importance of small businesses for job creation (Harrison 1997; Davis et al 1996; De Rugy 2005). In the United Kingdom research has found that only a minority of small firms generate jobs (Storey 1995; Curran et al 1993; Bannock 2005). This leads to the impossible problem of targeting tax concessions (if justified at all) to such firms. Australia’s former STS, the SBE regime and *Henry Review* small business tax concessions, for example applied to all small businesses. Under these concessions small businesses which do not intend to grow will benefit. Many small businesses do not wish to grow, with owners preferring a manageable scale and lifestyle (Small business roundtable, 2012). Also, hobby and lifestyle businesses will also access these tax concessions (if not subject to the non-commercial loss rules). As noted above, the concessions may result in the restructuring or manipulation of businesses to create a small business in order to qualify for the tax advantages, leading to tax avoidance. Tax concessions targeted at size are blunt instruments, they do not focus on jobs growth. Other parameters such as innovation appear more appropriate. Identifying such firms can be problematical, which firms should be targeted for success or failure? (Holtz-Eakin 2000). In 2009-10, only 42 per cent of small businesses were involved in innovative activity, versus 62 per cent of larger businesses (ABS Cat. No. 8166.0). Even if these firms could be identified, tax concessions are blunt instruments compared to a direct subsidy. If the targeting is not effective then resources will be misallocated and reduce productivity (Henry Report 2009). The US success with its Small Business Innovation Research program (of \$2 billion grants per annum over 26 years) shows though that innovative small business can be targeted and that such grants have a significant impact on catalyzing a broader economic transformation in innovation (Keller & Block 2012).

Small business may face market failure for example as a result of monopoly power of large firms making entry into the market difficult, or difficulties in raising finance due to size. Small business face many barriers to innovation, including access to funding, and there is potential for more firms to innovate with the removal of these barriers (DIISR 2011). Thus, it is argued that tax concessions are needed to promote investment in small firms. It is further contended that this will help the economy as a result of spillover effects from the innovative activity of the smaller firms (Gordon 1998; Aghion et al 2004). The *Henry Review* noted these issues were of a broader concern to all investments and developed a principle that tax concessions are warranted in order to correct market failure (Henry Report 2009). The *Henry Review*, though, made no specific recommendation on market failure in respect of small business. Crawford and Freedman established that tax concessions have a limited role in addressing market failure (Crawford & Freedman 2008). First, market inefficiencies may be the market arriving at the appropriate outcome (Adam

2008). A small business may be declined finance since it is unviable or has a high level of risk. The provision of tax concessions for small businesses are inefficient given they are such a blunt instrument. Such concessions may distort commercial decisions about expenditure, the selection of business organization and the transfer of businesses. This may result in the allocation of resources to small businesses which are less efficient than larger efficient firms. Further, tax concessions may restrict the growth of small business where the concessions are capped according to firm size. The concessions create complexity in the system. Even if problems faced by small business are sufficient to warrant government action, non-tax measures will often be better targeted (OECD 1994). A simple and neutral system of business taxation and targeted grants better assists small businesses and the economy.

The *Henry Review* observed that small business losses have a greater impact than on business than losses do on other businesses (Henry Report 2009). As Chennells et al found, there is discrimination against investment spending by new or small start up businesses (Chennells et al 2000). Small businesses obtain no reprieve from tax losses until taxable income is generated. Unlike larger firms, with existing profitable business who can claim these losses immediately. Thus, it is contended that tax rules should allow some level of pass-through treatment so that owners can set their business losses against other sources of income. In Australia, individuals operating businesses alone or in partnership, though, can offset business losses against other income (subject to the non-commercial loss rules). These arguments, though, do not apply to businesses operating through companies and trusts and the *Henry Review* found that in 2006-07, Australian small businesses accounted for almost one half of the carried forward losses (Henry Report 2009). The *Henry Review* thus recommended that all companies should be permitted to carry back revenue loss to offset against prior years taxable income with the amount of refund restricted to a company's franking account balance. Given that the recommendation applied to all companies (small and otherwise) this is not considered to be a small business tax concession. Additionally, it is contended that retirement or death might result in the cessation of a business and loss of employment and wealth generation (European Commission, 1994). Tax concessions are needed for small businesses upon the owner's death and where a business is disposed of whilst the owner is alive to keep the business intact by encouraging disposal and succession. There are benefits from inter-generational succession. Though, others found no evidence to support this (Bjuggren & Sund 2002). Research has found that where small family firms (as well as publicly traded firms) employ the eldest male child as CEOs, they become poorly managed (Bloom & Van Reenen 2006; Perez-Gonzalez 2005). Since the SBE CGT concessions are available where the business is not being maintained as a going concern by the person or persons acquiring it, they do not meet the objective of encouraging continuity. Providing reliefs from capital taxes to small businesses seems likely to lead to distortion and demands for further reliefs (Crawford & Freedman 2008).

CONCLUSION

First, having regard to the matter of defining a small business, the *Henry Review* (like the *Ralph Review*) provided little analysis to support its recommended definition of a small business. Whilst defining a small business is problematical, using uniform definitions of 'micro', 'small' and 'medium' businesses would help the examination of the impact of the small business sector and promote more informed policy making. Secondly, as to the question whether small business should receive tax concessions, overall the *Henry Review* proposed to substantially broaden the scope of the small business concessions. As seen by the recommendations to increase the turnover threshold, remove the CGT maximum net asset value test and increase concessions for depreciating assets. In contrast, the *Henry Review* also proposed to abolish two CGT concessions and the ETO concession. These recommendations are inconsistent. Having regard to the various rationales for the concessions, the available evidence suggests that as a general principle, concessions should be employed on a very limited basis (where an overall benefit in simplifying tax laws such that tax revenue and efficiency increase). Direct government grants are a better way of assisting small business as evident in the long standing success of the US Small Business Innovation Research program. The current small business tax concessions creates sets of winners and losers and imposing significant compliance and administration costs as evident in the former STS and current SBE regime. The *Henry Review* could have improved its recommendations by addressing small business tax issues in a separate chapter in its report. Specifically, the review could have explained the basis and provided evidence for its definition of a small business. Additionally, the *Henry Review* could have answered its question, as to whether small business tax concessions are justified, having regard to the available research. The alternative of direct grants should have been examined and detailed.

BANK FAILURES IN SOUTH AFRICA “WHERE HAVE WE GONE WRONG”? AN AREA OF CONCERN FOR SOUTH AFRICANS

O.M. Khan
Tshwane University of Technology, South Africa

ABSTRACT

In general bank failures can trigger off serious consequences in an economy that can lead to financial, economic, social and political ramifications. Banks act as intermediaries who receive money from those people who have surplus funds and make it available to prospective borrowers who might be in need of such funds at a price known as interest. Banks therefore play a very important role in an economy and hence are subjected to a rigid regulatory framework. Despite these regulations many banks still fail to meet their obligations and in the process become insolvent. In fact in South Africa since the 1990's many banks have failed and this in effect raises eyebrows of concern. This paper will therefore look at some of the reasons as to the cause of bank failures in South Africa and whether strategies could be put in place to address this situation.

INTRODUCTION

Banks pivotal role is to take in deposits from its customers and make such funds available for on lending. In this way the funds of net savers of a bank are channeled to borrowers who might be in need of such funds. As a result of this process the bank effectively becomes a debtor of those lending it money and the Banks borrowers in turn become debtors of the bank. The difference between the rates of interest a bank pays to its depositors and the rate at which it lends to its borrowers represent its margin of profits. Therefore in essence the banks functional role could be said to be that of an agent or an intermediary reallocating funds from those in surplus to those in need. Just as a business enterprise whose aim is to make a profit and further maximize its profitability, banks also have the same desire to maximize its profit. Consequently the banks desire to maximize profits could therefore seem to give banks the incentive to increase their capacity to lend money to its customers.

In South Africa the South African Reserve Bank acts as the Central Bank and is responsible for a number of authoritative functions and tasks which lie outside the confines of other banks and financial Institutions. Now despite the stringent regulatory framework which are in place it seems absurd and worrying that many banks in South Africa are still failing to meet their obligations and finally become insolvent. Within the South African Banking scenario since 1990 a number of banks failed in South Africa and hence it seems interesting to examine what could be the core factors that led to such failures and then suggest ways or strategies that could be adopted to avert such failures in the future.

An Overview of the South African banking Industry:

Control of money supply has become crucial in the functioning of any modern economy and this requires a clear defined policy to be in place for the regulations of banking business. This stems from the fact that the bank is entrusted with the care of handling other peoples money and in so doing any dishonourable motive on the part of the bank could seriously and adversely impact on banking business. In South Africa the South African Reserve Bank acts as the Central Bank whose main responsibility is the determination and implementation of monetary policy.

Legislation Protecting Depositors

Section 1 of the Banks act No.94 of 1990 as amended and hereinafter referred to as the 'Act' defines a bank as a public company or a person whose main business entails the acceptance of deposits from the general public for the purposes of carrying on the business of a banking Institutions.

The above definition of a bank clearly indicates that any person who accepts money from the general public in whatever form and lends such funds to the public falls within the sphere of the business of banking. In terms of Section (11) (1) of the Act it is required that the Institution register with the Registrar of Banks to operate as a Bank. Section (11) (2) provides that any organization conducting the business of a bank without registration would be guilty of an offence. Section 12(1) of the Act provides that any person who intends to carry on the business of a banking Institution may apply to the Registrar for permission to establish a bank.

Section 13(2) provides that the Registrar may grant such permission to an applicant if he satisfies him in respect to the following:

- That the business the applicant proposes to conduct is certainly that of a bank.
- That the applicant will conduct the proposed business of a bank as a public company in terms of the Act.
- And that the applicant will be able to establish itself successfully as a bank
- That the applicant will have the financial means to comply as a bank
- That the business of the proposed bank will be conducted in a prudent manner
- That the director or executive officer is a fit and proper person to hold office.
- That the executive officer of such a proposed bank has sufficient experience of the management of the kind of business that it is to conduct.
- That the composition of the Board of Directors of the proposed bank will be appropriate, having regard to the nature and scale of the business that it is intending to conduct.

Section 7 of the Act requires the Banks to provide the Registrar from time to time with any information as may be reasonably required to ascertain whether or not the bank is complying with all rules and its business in a proper manner.

The holding of liquid assets by banks is a safety measure in favour of banks in the event of abnormal withdrawal of cash by depositors and at the same time it serves to protect depositors. Hubbard (2005;35). Section 72(1) of the Act stipulates that a bank shall maintain in the Republic liquid assets amounting to not less than the aggregate of 20% of such different categories of its liabilities as specified by the legislator. Section 10A of the Act ensures that Banks always have adequate liquidity which serves as a second line of defence and hence they are required to maintain a certain amount of minimum reserve balance with the South African Reserve Bank which does not earn any interest. It is normally about 2,5% of the total liabilities of banks. Section 70 of the Act further requires banks to maintain a minimum amount of share capital and reserve funds so as to ensure that they are of an adequate size and solidity. South African Reserve Bank ultimately serves as Lender of Last Resort which Hubbard (2005;314) regards as an important source of credit to which banks could turn to during a panic safeguarding the interest of its depositors.

History of Banks Failure In South Africa

Since 1990 there has been a number of banks that have failed in South Africa and it was a common tendency on the part of The Reserve Bank to come to the rescue of struggling banks however it has now adopted a policy of encouraging other banks to come to the rescue of failing banks. Okeahalam (1998).

- **Alpha Bank** : the failure of this bank was as a result of high level of fraud.
- **Cape Investment Bank**: This bank was also a victim of fraud. In the case of this bank it failed to disclose the significant number of non performing assets in its balance sheet until this was exposed when Prima Bank (which subsequently failed itself) withdrew from a takeover deal . This led to a liquidity problem which caused the bank to fail in the second quarter of 1991.
- **Pretoria Bank** : Pretoria bank had been poorly managed for a period of time before failing in July 1991.Top management believed that merging Pretoria bank with Masterbond which was a participation mortgage bond Company to form a Company called Novabank would strengthen Pretoria Banks balance sheet by providing high yield returns from the mortgage market in which Masterbank operated. However when Masterbank was unable to service its commercial paper and debenture obligation which were the primary source of its funding it collapsed. This caused the proposed joint venture to fail and closed the strategic rescue line of Pretoria bank which then failed.
- **Sechold Bank**: Sechold Bank failed in December 1993 because of liquidity problems brought on after a wholly owned subsidiary Securities Limited lost R180 million in derivative trading positions. This

resulted in a loss of depositor and investor confidence that resulted in significant erosion of the of the Sechold Capital base.

- **Prima bank:** Prima bank failed and was placed into liquidation in the second quarter of 1994. It also had liquidity problems brought on by a large number of non performing loans.
- **African bank:** In the last quarter of 1995 African bank had liquidity problems and was placed under curatorship .During investigation it emerged that poor management and inadequate capital were considered to be the main problems.
- **Community bank:** This was a small bank with black management that also failed due to liquidity problems. Its liquidity problems stemmed from from a very high expense to income ratio which was the result of inefficient management and inadequate returns on investment at branch level.
- **Islamic Bank of South Africa (IBSA):** The Islamic Bank of South Africa also failed in November 1997 with debts of R50 million and R70 million and was under the Registrar of Bank curatorship. It emerged that bad management and improper management systems caused the bank to fail. According to Iqbal and Mirakhor (2011) it was the large amount of insider unsecured lending that had taken place that resulted in the Banks failure.
- **Saambou Bank:** Saambou Bank during September 2002 also came under curatorship when it became apparent that the bank was unable to meet depositors withdrawal demands and also unable to meet its obligations when it was legally bound. Fortunately First Rand bank came to its rescue and bought off the banking operations.

An overall analysis reveals that poor management ,liquidity and fraud seem to have been the prime reasons for banking failure in South Africa.

Way Forward

Many banks failed in South Africa and ofcourse some degree of concern is reasonably warranted so as to determine what should be the way forward so as to eliminate any future run in on banks. According to Abrams and Settle (1992) since banks work within a strict regulatory regime and the fact that such regulatory regime in effect is initiated by the Central bank it stands to reason then that the Central banks decisions need to be scrutinized. In this respect scrutiny by relevant stakeholders such as equity holders, management of banks and depositors play a vital role in determining to what extent Central bank is devising and implementing sufficiently aggressive strategies. Depositors also in scrutinizing the role of the Regulator are in fact making an assessment of the benefits of placing their deposits in different types of banks.

South Africa lacks a deposit insurance scheme which could play a pivotal role in safeguarding the funds of depositors, in the event of there being a run on a bank, for eg.when the Islamic bank of South Africa (IBSA) had failed the Reserve bank agreed to compensate investors to the tune of R50000 per depositor, this had covered 80% of the depositors since the primary depositor base of the Islamic bank was small. Muslim depositors also viewed the IBSA as a Community bank where the depositors had saved money to make the Haj pilgrimage to Mecca. The Reserve Bank solution did compensate most of the depositors fully but did not compensate all the depositors. Okeahalam (1998). South Africa does not have an explicit deposit –insurance scheme (DIS), however during 2000 at the request of the Minister of Finance the Bank Supervision Department was required to participate in a Joint Venture project with National Treasury to look into the requirements necessary to implement the South African Deposit Insurance Scheme (SADIS).Currently a work group has been established to research the issues and to come up with proposals on the establishment of SADIS. Therefore in the main, proposals on SADIS are currently on the map to serve the purposes and interests of South Africa. (Annual Report of the South African Reserve Bank Supervision Department: 2005).

The South African Reserve Bank acts as South Africas Central bank responsible for frmulating South Africas monetary policy and is largely responsible for its implementation. Its powers and functions are governed by the South African Reserve bank Act 90 of 1989. In terms of its Lender of last resort activities the Bank may in certain circumstances provide liquidity to those banks experiencing liquidity problems. It is therefore crucial to examine under what circumstances the Reserve Bank grants Lender of last Resort assistance to banks and examine the powers of those officials who exercise their influence in either granting or declining Lender of Last Resort lifelines. Okeahalam (1998) also stresses the point that there is a need for greater emphasis to be placed on revising the legislation so as to limit the discretionary power of officials on the part of the Reserve bank and the Registrar of Bank. In fact he advises that officials discretionary powers should be only retained as far as marginal decisions are concerned however their powers should be greatly

circumscribed with regard to major decisions such as the granting or not granting of Lender of last Resort assistance. There is therefore a need to revisit the statutes governing prudential regulations.

Well established Banks should render a more supportive and regulatory role to young banks which are in their infant stage of development and which might be experiencing liquidity problems. Vaish (1995;402) cites this strategy as moral suasion and publicity. As regards publicity Vaish submits that Central bank should frequently publish economic facts relating to both the states of the money market and the general state of the economy. This could lead to educational enrichment that could also benefit Reserve Bank officials who would in turn be able to keep abreast with new developments and render assistance to those banks who may be experiencing problems

CONCLUSION

Banks play a very important role in any modern economy acting as an agent or intermediary reallocating funds from those in surplus to those in need. Since they act typically as business enterprise they also aim at maximizing their profitability and hence are subject to rigid regulatory framework. The South African Reserve Bank acts as the Central Bank which exercises control over banking business. Many banks, in South Africa, since 1990 have failed despite the strict regulatory framework within which they have to operate hence the notion that the Reserve bank and Registrar of bank have failed in some aspects of bank supervision. This resultantly calls for a review of the banking legislation with a view to implementing strategies that would in future alleviate possible bank failures. One very relevant aspect is the idea of implementing a deposit Insurance scheme in South Africa

THE IMPACT OF PRE-PAID WATER METERS ON THE RIGHT OF ACCESS TO WATER IN SOUTH AFRICA, WITH REFERENCE TO LIMPOPO PROVINCE : A CONSTITUTIONAL PERSPECTIVE

Tshilidzi Knowles Khangala
Tshwane University of Technology, South Africa

ABSTRACT

Many people in South Africa still live without access to water at all, even though such has been guaranteed as a fundamental right in the South African Constitution. This paper demonstrates the challenges faced by the courts in the adjudication of cases relating to the right of access to water and the misunderstanding of the people at the ground, as well as the municipalities or services providers and the courts, in the interpretation of right of access to water and sufficient water. Although the issue in question is of nation interest, this paper uses the Limpopo Province, which is one of the nine provinces of South Africa, as a practical demonstration of the dire shortage of water in South Africa as a whole, and how such could be interpreted as the violation of International instruments that South Africa is a member state to.

INTRODUCTION

Water forms part of the second generation rights, together with other rights like the right to Food, Housing, Social Security, etc. The Interim Constitution of South Africa contained first generation rights and also second generation rights, but was not clear about the justiciability of the latter. Fortunately the final Constitution contains both first, second and third generation rights. Both this rights are constitutionally justiciable. Until recently, South African water law has developed inappropriately for the situation of water scarcity. Moreover, access to water rights has been skewed heavily to the detriment of the majority of the population. With the onset of democracy, the water law was reformed to address both the question of equitable access and to provide for the government to exercise management control over water resources.

THE LIMPOPO PROVINCE

Limpopo is a province of South Africa and it is situated in the North-Eastern part of the country. It shares borders with Botswana, Zimbabwe and Mozambique. The Limpopo province covers an area of 123 000sqkm, which accounts for 10.2% of the total land area in South Africa, and has an estimated population of 5.4 million people. Moreover, it is considered to be one of the poorest provinces in South Africa with a rural population of 89% and relatively high illiteracy and unemployment rates. The people rely heavily on agriculture for household food security. The province has a variable summer rainfall and is rich in bushveld. However, recently, the Limpopo province has been subjected to frequent droughts, which have had a bearing on agricultural production. At some stage the Giyani district was declared a disaster area, due to serious drought as a result of lack of rainfall and basic water supply.

A household may be enabled to gain a sustainable livelihood through ownership of land, livestock or trees; rights to grazing, fishing, hunting or gathering; and through stable employment with adequate remuneration or through varied repertoires of activities. It should include both social and economic dimensions of existence. However, several factors threaten sustainable livelihoods in Limpopo Province. Drought and unemployment have been noted as factors threatening the livelihoods in Limpopo province. Drought is a normal recurring event that affects the livelihood of communities. A serious drought or a series of consecutive droughts can be a disaster-triggering agent that exacerbates social and economic problems, and reduces the overall livelihood security of a society, as been the case in Limpopo province.

RESTRAINING DEVELOPMENT

The shortage and lack of water supply may lead to a halt and abrupt of various planned development, including physical, social and economic development. Buyelwa Sonjica stated that a shortage of water was fast becoming a restrain on development, as follows: “We have seen in many parts of the country where development had to be delayed because of the lack of water and associated infrastructure, and Limpopo has been no exception. Given the dire need for development and economic growth in our country, we cannot afford to let this happen.”

Many rural areas continue to lack basic infrastructure such as roads, water and electricity supply. This lack of infrastructure entrenches the problems of chronic poverty and limits the potential of communities to sustain economic growth, rural livelihoods and social development. Efforts to extend free basic services to all people are slowest to reach the rural areas and farm-dwellers, even while the majorities have access to free basic services in the urban areas. Moreover, access to government services such as education and health care are the weakest in rural areas.

THE HUMAN RIGHTS LAW PERSPECTIVE

Human rights are an inherent entitlement to every person as a consequence of being human, and are founded on respect for the dignity and worth of each person. The right to sufficient water, enshrined in South Africa’s Constitution, cannot be denied. The government is legally bound to comply with this constitutional mandate, and, to this end, has enacted policies, legislation, strategies and institutions to manage water resources and deliver water services.

Despite this, the implications and obligations of this relatively new constitutional right are not yet fully understood by the spectrum of stakeholders, ranging from institutions that have custody over water resources, to individuals entitled to water. This is clearly reflected in the many instances of deficient water security witnessed at grassroots level and the severe gaps that exist between the constitutional right to water and the current practice and understanding of this concept.

The human right to water is indispensable for leading a life in human dignity. It is a prerequisite for the realization of other human rights. The right to water clearly falls within the category of guarantees essential for securing an adequate standard of living, particularly since it is one of the most fundamental conditions for survival. The right should also be seen in conjunction with other rights enshrined in the International Bill of Human Rights, foremost amongst them the right to life and human dignity. For this reason the elements of the right to water must be adequate for human dignity, life and health.

The Supreme Court of India in the case of *Francis Coralie Mullin* held that: “life cannot be restricted to mere animal existence or physical survival. The right to life means the right to live with dignity and all that goes with it, including the basic necessities of life such as adequate nutrition, clothing, shelter and facilities for reading, writing and expressing oneself”.

THE SOUTH AFRICAN PERSPECTIVE THE CONSTITUTION

The rights to Health Care, Food, Water and Social Security

The Constitution provides that everyone has the right to have access to sufficient food and *water*. It further provides that the state must take reasonable legislative and other measures, with its available resources, to achieve the progressive realization of each of these rights.

The right to Equality

The Constitution provides that all people are equal, and the state may not unfairly discriminate directly or indirectly against anyone on one or more grounds, including race, ethnic or social origin, etc.

The Right to Just Administrative Action

The Constitution provides that everyone has the right to just administrative action that is lawful, reasonable and procedurally fair. It further states that national legislation must be enacted to give effect to these rights.

The Limitation Clause

It must be noted that a constitutional provisions always trump other legislation unless it can be shown to be a limitation of the right that is “reasonable and justifiable in an open and democratic society based on human dignity, equality and freedom”. The disconnection of an existing water supply has been held to be a limitation of the right of access to water. In *Residents of Bon Vista Mansions v Southern Metropolitan Local Council*, the council disconnected a water supply to the residents of Bon Vista Mansions. The disconnection was purportedly authorised by the Water Services Act. The Act permits disconnection for non-payment of services charges, but not in circumstances that will result in a person being denied access to basic water services, if that person shows that they are unable to pay for the services. In an application for interim interdict, the court held that the municipality had not discharged its constitutional and statutory obligations to justify the disconnection and ordered interim reinstatement of the service. The court went on to hold that the duty of the state to respect the rights in Bill of Rights meant that if a municipality disconnected a domestic water supply it was limiting the constitutional right of access to water and the limitation had to be justified.

NATIONAL LEGISLATIONS

The Promotion of Administration Justice Act

The PAJA is a national statute passed in accordance with section 33 of the Constitution. It provides in section 3(2) (b) that the requirements for procedural fairness, include adequate notice of proposed action, (ii) reasonable opportunity to make representations.

The Water Service Act

It is significant to note that this Act operate in tandem with the National Water Act. The objects this Act includes, inter alia:

- The right to access to basic water supply and the right to basic sanitation necessary to secure sufficient water and an environment not harmful to human health or well-being
- The setting of national standards for tariffs in respect of water services.

The “Basic water supply” refers to the prescribed minimum standard of water supply to households, including informal households, to support life and personal hygiene. One may argue that the amount of water to be sufficient in homesteads of Limpopo province may have to be different from other provinces which are not affected by drought. This Act further gives effect to section 27 of the Constitution by providing that everyone has the right of access to basic water supply and basic sanitation. It also provides that the Procedures for the limitation or discontinuation of water services must provide for reasonable notice of intention to limit or discontinue water services and for an opportunity to make representations.

The National Water Act

The purpose of this Act, which also applies in Limpopo province, is to ensure that the nation’s water resources are used, protected, developed, conserved and managed in such a manner that it takes into account various factors, inter alia:

- Meeting the basic human needs of present and future generations
- Promoting equitable access to water
- Redressing the results of past racial and gender discrimination
- Facilitating social and economic development
- Meeting international obligations

PRETORIA CITY COUNCIL V WALKER

The council had jurisdiction over the formerly exclusively white areas of Pretoria and over the townships of Attredgville and Mamelodi. The residents of old Pretoria were mostly white and those of the two town ships were mostly black. In old Pretoria ratepayers paid consumption-based tariffs for the water and electricity services supplied by the Council. Actual consumption was measured by meters placed in each property. In Attredgville and Mamelodi users paid a flat rate per household, no matter how much water or electricity they consumed. Walker, a resident of old Pretoria, complained that the flat rate in Mamelodi and Attredgville was lower than the metered rate and this therefore meant that the residents of old Pretoria subsidised those of the two townships for water and electricity.

The majority of the Constitutional Court considered the actions of the Council to be indirect discrimination on the listed grounds of race. However, the majority went on hold that the flat rate of water

and cross-subsidisation was not unfair discrimination. The court first took into account that Walker was white, and therefore belonged to a group that had not been disadvantaged by the racial policies and practices of the past. In an economic sense, his group was neither disadvantaged nor vulnerable, having been benefited by the discrimination in the past.

MAZIBUKO & NO v CITY OF JOHANNESBURG AND OTHERS

The applicants challenged, firstly, the City of Johannesburg's Free Basic Water policy in terms of which 6 kilolitres of water are provided monthly for free to all households in Johannesburg and, secondly, the lawfulness of the installation of pre-paid water meters in Phiri. The three respondents are the City of Johannesburg (the City); Johannesburg Water and the National Minister for Water Affairs and Forestry. The applicants succeeded in the South Gauteng High Court. The Court found that the installation of pre-paid water meters in Phiri was unlawful and unfair. It also held that the City's Free Basic Water policy was unreasonable and therefore unlawful. It ruled that the City should provide 50 litres of free basic water daily to the applicants and "similarly placed" residents of Phiri. On appeal, the Supreme Court of Appeal varied this order. The Supreme Court of Appeal held that 42 litres of water per day would be "sufficient water" within the meaning of the Constitution, and directed the City to reformulate its policy in the light of this conclusion.

The Constitutional Court held that the obligation placed on government by the Constitution is an obligation to take reasonable legislative and other measures to seek the progressive realisation of the right. The Court notes that it is implicit in the concept of progressive realisation that it will take time before everyone has access to sufficient water. The Court concluded, in contrast to the High Court and the Supreme Court of Appeal, that it is not appropriate for a court to give a quantified content to what constitutes "sufficient water" because this is a matter best addressed in the first place by the government, the 3 national government has adopted regulations which stipulate that a basic water supply constitute 25 litres per person daily; or 6 kilolitres per household monthly. The Court concluded that it cannot be said it is unreasonable for the city not to have supplied more, particularly given that, even on the applicants' case, 80% of the household in the City will receive adequate water under the present policy. The court noted that 100 000 household within Johannesburg still lack access to the most basic water supply, that is a tap within 200m of their households. The Court concluded that the installation of the meters was neither unfair nor discriminatory. The Court upheld the appeal by the City and Johannesburg Water and the Minister. The orders of the High Court and Supreme Court of Appeal were, therefore, set aside.

INTERNATIONAL LAW PERSPECTIVE

There are few but important international instrument that make reference to the right to water or of access to water. It is important to note that some of those instruments just have indirect reference to the right water. Some of those important instruments that impact on South Africa are the following:

THE UNIVERSAL DECLARATION OF HUMAN RIGHTS

The Universal Declaration of Human Rights guarantees to all individuals a standard of living adequate for the health and wellbeing, including food, clothing, housing, etc. Since the right to water is one of the most fundamental conditions for survival, it implies that, the right to water clearly falls within the category of guarantees essential for securing an adequate standard of living. The right to water is also inextricably related to the right to the highest attainable standard of health and the rights to adequate housing and adequate food.

THE INTERNATIONAL COVENANT ON ECONOMIC, SOCIAL & CULTURAL RIGHTS (ICESCR)

The International Covenant on Economic, Social and Cultural Rights guarantees and adequate standard of living, including adequate food, clothing and housing, and to the continuous improvement of living

conditions. It further guarantees the highest attainable standard of physical and mental health. One may argue that has the same as discussed above in UDHR , and as such covers the right to water.

THE AFRICAN CHARTER ON HUMAN & PEOPLE'S RIGHT

The African Charter on Human People 's Right is literally silent on the right to water ,but one may argue that the provision to free dispose of natural resources or generally satisfactory environment favorable to their development includes the right to water.

THE COVENANT ON ELIMINATION ON ALL FORMS OF DISCRIMINATION AGAINST WOMEN

The Covenant on Elimination on all forms Discrimination against Women enshrines the right to adequate living conditions, particularly in the relation to housing, sanitation, electricity and water supply.

THE UNITED NATIONS CHARTER ON THE RIGHTS OF CHILDREN

The United Nations Charter on the Children provides for the right to combat disease and malnutrition through the provision of adequate nutrition foods and clean drinking- water.

THE AFRICAN CHARTER ON THE RIGHTS AND WELFARE OF THE CHILD

The African Charter on the Rights and Welfare of the Child enshrines the “provision of adequate nutrition and safe drinking water.

ACCESS TO WATER

Access manner in which the right has been framed makes it clear that the state is not obliged to provide every inhabitant of South Africa with a free water supply. The state's duty towards those individuals who have the ability to pay for water services entails that the state must create the condition and opportunity to ensure that those individuals have ‘access’ to sufficient water. The right of “access” to water entails economic and physical access.

The committee on ESCR has with regard to economic access commented that water, and water facilities and services, must be affordable for all and state parties must adopt. The necessary means that may include, inter alia;

- Use of a range of appropriate low-cost techniques and technologies;
- Appropriate pricing policies such as free or low-cost water; and
- Income supplement any payment for water services has to be based on the principle of equality, ensuring that these services, whether privately or publicly provided, are affordable for all, including socially disadvantaged groups. Equality demands that poorer households should not be disproportionately burdened with water expenses as compared to richer households.

Regarding physical access, the committee stated that the water must be within the safe and physical reach of everyone, meaning within or in the immediate vicinity, of each household, educational institution and workplace. Special attention should also be paid to accessing water. The conditions for access can be created by, for example:

- Subsidizing existing water services or ensuring that the water service are affordable to poverty-stricken South African inhabitants
- Ensuring that water resources are not monopolized by powerful groups; and
- Ensuring an equitable allocation of water'

SUFFICIENCY OF WATER

In terms of the Water Services Act, everyone has a right of access to the prescribed minimum standard of water supply services necessary for the reliable supply of a sufficient quantity of water to households support life and personal hygiene. Regulation 3 of the June 2001 regulations under the Water Services Act provides in essence that the minimum standard for basic water supply is a minimum quantity of potable water of 25 litres per person per day or 6 kilolitres per household per month.

Concerning the above statement, Jaap de Visser argues that “For the urban poor who are used to relatively high levels of water usage, 6 kilolitres of free Water for each household per month will not be adequate. For a household of 8 people, 6 kilolitres of water amounts to two flushes of a toilet per person per day and will therefore be completely inadequate”. Peter Gleick argues that a minimum amount of water to ensure a basic standard of living is 50 litres per person per day (lpppd), broken down as follows:

- Minimum for drinking : 5lpppd
- Basic sanitation : 20lpppd
- Basic bathing : 15lpppd
- Basic food preparation : 10lpppd

CONCLUSION

It is logical to conclude that the installation of pre-paid water meters goes to limit the right of access to water, as was the argument in Mazibuko’s case. Although it limits the said right, it is allowed in terms of national legislation and it is justifiable in terms of section 36 of the Constitution. International law has incorporated the right to water in several instruments, and South Africa has in line with international instruments enshrined the water in its Constitution and national legislation. The above mentioned instruments have all enshrined either directly or indirectly, the right of to water. South Africa is a member state to all these instruments, as it has signed and ratified many of them. The consequences of being a member state to these instruments is that a country is obliged and bound to comply with them, and if they fail to do so, there are penalties or sanctions that be imposed on the said country.

Beside these international, Constitutional and national guarantee of the right of access water, residents of South Africa, particularly Limpopo residents, still experiences serious shortage of water, and consequently affect, inter alia, they right to dignity, life, adequate standard of living, improvement of living conditions, freely dispose of natural resources, sanitation, water supply and safe drinking water.

THE CONSTITUTIONAL ANALYSIS OF RICA ON THE RIGHT TO PRIVACY & SECURITY OF PERSONS

Tshilidzi Knowles Khangala
Tshwane University of Technology, South Africa

ABSTRACT

This study scrutinises the constitutionality of the interception of citizen's private calls and telecommunication- related activities by the government as provided for in the Regulation of Interception of Communication and Provision of Communication-Related Information Amendment Act (hereafter called RICA or the Act). The argument is based mainly on two constitutional and fundamental rights, namely, the right to privacy and security and safety of person. It argues that the said Act, violates and infringes upon the right to privacy and security and safety of person as enshrined in the South African Constitution of 1996, and such may not pass the test of the Constitution. A comparison with the United States of America is also undertaken, as it has similar legislation.

INTRODUCTION

It must be noted from the onset that South Africa is a democratic and constitutional country. The Constitution of South Africa is regarded to as one of the most liberal constitutions in the world. South Africa has recently passed a law called the RICA. The Act came as an amendment of the Regulation of Interception of Communication and Provision of Communications-Related Information Act (hereafter called the principal Act). RICA targets to amend the principal Act, by the insertion of certain new definitions and the amendment of certain definitions; to provide for registration of cellular phones and SIM-cards; to further regulate offences and penalties; and to provide for matters connected therewith. RICA gives the government a passport to tap or intercept private calls or violate the right to privacy. Interception connotes interference, obstruction, and stoppage of flow, seizure, and grabbing, among other negative processes. Communication involves the imparting or exchange of information, ideas, or feelings. This can be done via verbal, physical, electronic, written, telephonic, or any other available channels⁶.

This study proceeds from the premises that South Africa is a free and democratic society and the preamble of the Constitution states that the Constitution lays the foundations for a democratic and open society in which government is based on the will of people. The impetus behind the war of liberation was the quest for freedom, democracy and other rights contained in the Bill of Rights, for all South Africans. In the first place, the reigning government came to power in 1994, via a democratic process. The government is in power on claims that it was democratically elected into office, by free citizens, and there is less than four months after the people voted the new government in office. After all, is it not freedom and democracy the essence of the annual freedom day celebrations that all South Africans celebrate? Indeed, it has been proven in many countries that the governance of people in almost all societies is best optimized under a democratic configuration. It is also true for many that the potential of an individual or a society, best matures into reality, where freedom prevails.

Section 14 (d) entrenches the right of people "not to have the privacy of their communications infringed". The right to privacy is one of the fundamental rights enshrined in the Constitution and also defines the freedom and democracy of the citizens of South Africa. The Interception and Monitoring Prohibition Act also gave effect to this right. However, infringement of the right is regulated and safeguarded by way of prior judicial authorization. RICA has a negative impact on the societies' right to privacy for it allows authorities to intercept citizens' private calls. The government, colloquially, is encouraging its officials to obtain evidence unconstitutionally. Unconstitutionally obtained evidence is inadmissible.

The subject of this analysis, constitutionality, is one of those important factors that are fundamental to the sustenance of a democratic society. In a democratic society, decisions, actions, plans, operations and laws, all have to be constitutional. Section 35(5) of the Constitution provides that, “Evidence obtained in a manner that violates any right in the Bill of Rights must be excluded.”

Constitutionality refers to the extent or degree to which a particular statutory or administrative provision is consistent with the Constitution. This concept should be differentiated from constitutionalism, which means that, statutory, administrative and other forms of provisions must be crafted in compliance with the basic principles, spirit or system of governance in accord with widely accepted characteristics of a good constitution. Hence, legislation might be Constitutional but at the same time be contrary to the concept of constitutionalism. In the South African context, an instrument, provision or decree is constitutional only if it is consistent with the Constitution of South Africa of 1996. Section 2 of the Constitution establishes the supremacy of the Constitution and it also establishes the test for Constitutionality upon all South African laws. However, the purpose of the legislation on scrutiny must also be considered. RICA was enacted to regulate the interception and monitoring of communications by state officials for the purpose of gathering evidence during the investigation of a crime, or in the interest of maintaining justice, public health and safety, national security and the likes. The Act also improvises for the registration of cell phone SIM-cards and regulates offences and penalties available for breach of the provisions of the Act. RICA further provides that interception and provision of information may only take place once a direction has been issued by a judge or magistrate in terms of the Act.

THE SOUTH AFRICAN LAW PERSPECTIVE

The South African position is in these study tackled from the perspective of two conflicting rights, namely, the right to privacy and right to safety and security of person. The two rights are separately discussed below.

THE RIGHT TO SAFETY AND SECURITY

South Africa is now a Constitutional State where certain democratic principles determine the actions of the government and its citizens. South Africans have reached the point where they are fed up with the crime situation in the country. Everybody wants to live in a safe and secure society where peace and harmony prevail. This state of being will only be achieved if there is law and order in that specific society.

The Government must create the necessary structures which are responsible for the creation and maintaining of order in society. The Criminal Justice System refers to that components or governmental departments which are responsible for the execution and the enforcing of laws. The laws are promulgated by Parliament. The police must execute the law. This is done by means of proactive (preventative) measures to ensure that citizens obey the law. If citizens fail to obey the law and cause disorder, it is expected from the police to restore that order by investigating the case. Once the case has been investigated, it is the duty of the court to speak the law. In other words, the court must determine the guilt or innocence of the alleged offender. If the court convicts the offender, it is the responsibility of the correctional services to comply with the decision of the court (in other words to ensure that the prisoner will serve the sentence imposed by the court.

The parliament thus, by enacting RICA, enables the government to exercise the right to safety and security of the society by intercepting their private calls in a mission to curb telecommunication related crimes. RICA was enacted to regulate the interception and monitoring of communications by state officials for the purpose of gathering evidence during the investigation of a crime, or in the interest of maintaining justice, public health and safety, national security and the likes. The Act also improvises for the registration of cell phone SIM-cards and regulates offences and penalties available for breach of the provisions of the Act. RICA further provides that interception and provision of information may only take place once a direction has been issued by a judge or magistrate in terms of Act.

THE RIGHT TO PRIVACY

The Constitution of the Republic of South Africa of 1996 protects privacy in section 14 which states that, “everyone has the right to privacy, which includes the right not to have- (a) their person and home searched; (b) their property searched; (c) their possession seized; or (d) the privacy of their communications infringed.”

It is generally accepted that the concept of privacy is difficult to define because it is vague and evanescent, often meaning strikingly different things to different people. The law should nevertheless not shrink from conceptual clarity about this personal interest. It is at this point, where jurisprudence becomes relevant and important, since it is the task of jurisprudence precisely to describe those interests of personality that the law protects in order to render them dogmatically and practically manageable, and in this way to bring legal certainty. From this it is clear that the law should never ignore the individual nature of the different interest of personality.

In order to define the concept of privacy, it is necessary to understand that every personality interest has a pre-legal existence in factual reality. Since by nature a person has a fundamental interest in particular facets of his personality (such as his body, good name, privacy, dignity, etc), these interest exist autonomously de facto, independently of their recognition de iure. Thus the law does not create individual interests of personality, but recognizes and protects such interests in order to promote justice.

Neethling defined privacy as a condition of human life characterized by seclusion from the public and publicity. This embraces all those personal facts which the person concerned has himself determined to be excluded from the knowledge of outsiders and in respect of which he has the will that they be kept private. In *Bernstein v Bester*, Ackerman J viewed that, privacy relates only to the right to privacy does not relate solely to the individual within his intimate space, but is also retained in the social capacities in which people act.

THE CONCEPT OF REASONABLENESS

The reference to constitutionality of RICA makes it absolutely necessary to also deal with the concept of reasonableness. That is to say, relevant things must be 'reasonable' in a democratic society. Rautenbach and Malherbe points out that a balance must exist between the purpose of the limitation and limitation itself. This can be assured by identifying the reasonableness of the purpose of the limitation and the limitation itself. This issue will also lead to an inquiry of the effectiveness of the provisions of the Act. The Chief Executive Officer of Vodacom, Allan Knott-Graig questioned various issues upon the amendment of the principal Act and ones of the issues include the difficulty in registering "15 million to 20 million South Africans who simply do not have residential address". The question arises as to the reasonableness of this Act.

THE LIMITATION OF RIGHTS

The rights in the South African Constitution are not absolute, and can be limited in terms of the limitation clause, contained in section 36 thereof. If the court determines that a law or the conduct of the respondent impairs a fundamental right, it must then consider whether the infringement is a justifiable limitation of the right in question. Not all laws or conducts that infringe fundamental rights are unconstitutional. In *Christian Education South Africa v Minister of Education* the Constitutional court assumed in favour of the applicants that their religious rights were violated and then proceeded to hold that the violation was justified in terms of the criteria laid down in section 36 of the Constitution. These limitations have to be subjected to the reasonableness test.

Section 36 of the Constitution provides that, the rights in the Bill of Rights may be limited only in terms of law of general application to the extent that the limitation is reasonable and justified in an open and democratic society based on human dignity, equality and freedom, taking into consideration relevant factors including, the nature of the right, the importance of the purpose of the limitation, the nature and extent of the limitation, the relation between the limitation and its purpose and less restrictive means to achieve the purpose.

The application of the limitation clause involves a process, described in *S v Makwanyane and another* as "the weighing up of competing values and ultimately as assessment based on proportionality which calls for the balancing of different interests." In *National Coalition for Gay and Lesbian Equality and Another v Minister of Justice and Others* it was observed that relevant consideration in the balancing process are now expressly stated in section 36 (1) in the 1996 Constitution to include those itemised in paragraphs (a) to (e) thereof.

JUSTIFICATION OF THE RIGHT TO PRIVACY

The right to safety and security of the people as provided by RICA had failed its course, it had been averted by the failure of principal Act that more problems had been created and putting the security of the citizens' at stake. Since 2002, where the principal Act comes to being, security is still a nagging issue. The impact of RICA had stretched its wings and threatens the privacy of employee's in the workplace. The state had to employ other forms of remedies or other legislation to provide security to its citizens' which does not infringe their right to privacy.

Bogaert and Knapp submit that, privacy is not in itself not only good but it is related to ethics in that it concerns the casual relationship between one's concept of 'being in control of their own lives' or their autonomy. When aspects of an individual's life are open to public scrutiny, this may imply a disvaluing of one's autonomy."

COMPARISON WITH THE UNITED STATES OF AMERICA

In the thorough analysis of the of the legal position of the United States of America (hereafter USA) with regard to similar laws and rights, it will be realised that the U.S.A. has its own route in dealing with the right to privacy visa-vis right to state security in relation to the constitutionality of the citizen. The Analysis focuses on comparing the various features of the interception of Communications in South Africa and the U.S.A. The comparison is made with reference to the South Africa's RICA, which is under scrutiny in this study.

THE RIGHT TO PRIVACY

The concept of privacy in the USA has developed to such a degree that it now embraces not merely the right to seclusion but the right to individual autonomy or free choice- the right to make certain personal decisions relation to marriage, procreation, contraception, family relationships, child-rearing, education, communications and even death (the right to die with dignity). Unlike in South Africa, the right to privacy in USA is not specifically mentioned in the USA Constitution or its Amendments and the protection of privacy was, initially at least, a common law one.

However, more recently, as the right had been interpreted by courts to come not merely freedom to decide what information about oneself can be revealed to a wider public but also to include freedom to make certain intimate personal decisions, some constitutional backing has been sought. In USA, the same rules apply to privacy as to defamation that is; private individuals can recover for invasions of privacy when newspapers negligently print false statements about them, in the context of discussing an issue of general public interest. Burchell point out that, the right of privacy, which is recognised in the USA and South Africa, has not yet received recognition as a general right in English law.

THE INTERCEPTION OF COMMUNICATIONS

he interception of communications in the USA is mainly regulated by three statutes. Title III of the Omnibus Safe Streets and Crime Control Act of 1968 regulates interception of the contents of communications for law enforcement purposes. The Foreign Intelligence Surveillance Act of 1978 regulates interception of the contents of communications of foreign powers and their agents with the US. The Pen Registers and Trace Devices chapter of Title 18 regulate interception of non-content information of communications. Interception orders the three statutes are all issued by Judges.

Interception of call in USA is also governed by the Communications Assistance for Law Enforcement Act (hereafter CALEA) which was enacted to make clear a telecommunications carrier's duty to cooperate in the interception of communications for Law Enforcement purposes, and for other purposes. CALEA's purpose is to enhance the ability of law enforcement and intelligence agencies to conduct electronic surveillance by requiring that telecommunications carriers and manufacturers of telecommunications equipment modify and design their equipment, facilities, and services to ensure that they have built-in surveillance capabilities, allowing federal agencies to monitor all telephone, broadband internet and other communication avenues. This is similar to the provisions of RICA in South Africa but it differs in light of registration of SIM-Cards. The reason for adopting CALEA was the FBI's worry that increasing use of digital telephone exchange switches would make tapping phones at the phone company's central office harder and slower to execute, or in some cases impossible.

CONCLUSION

There can be no peace and order in any community when individual rights can be exercised without limitation at all times. In terms of a Bill of Rights it is possible to limit rights for the protection of some public interest or the rights of others. Not every right in the Bill of Rights is absolute. The limitation of the right to privacy by RICA it may be justified, because the Act serves some public interests by protecting a corresponding right to state security and it had to be understood that individuals' rights or interests need to be balanced with those of society at large.

There is a need for constitutional review of RICA. Section 172 of the Constitution provides for courts, within its powers, to decide constitutional matters. There is need for further amendment of the Act in question. The amendment will be required to nullify all the irregularities associated with the Act so that the spirit, purport and object of the Bill of Rights is achieved. Section 2 of the Constitution of the Republic of South Africa provides for the supremacy of the Constitution and it declares that, "law and conduct inconsistent with it (the Constitution) is invalid, and the obligations imposed by it must be fulfilled." Therefore, the RICA as passed by parliament and been applied as it is, should be seen as to some extent violating the right to privacy and security of person as guaranteed in the Constitution.

MARKETING PROPOSAL FOR MICRO-ENTERPRISES

Edmir Kuazaqui, UNIP-Universidade Paulista, Brazil
Teresinha Covas Lisboa, Universidade de Santo Amaro, Brazil

ABSTRACT

This article aims to present the main marketing concepts applied by micro-enterprises within a brief contextualization of a marketing plan. The development and theoretical evolution have stemmed from the bibliographical research as well as field research and observational studies by the authors of the article. The goal is not to exhaust the topic or to construct a Marketing Plan, but rather to contribute to the discussion, learning and use of a marketing mix in the segment of micro-enterprises in a more assertive manner. It was concluded that there is no doubt as to the importance of micro-enterprises for any country. Their contribution lies mainly in the economic and social insertion. It should be noted that micro-enterprises are greatly responsible for job generation in our country, denoting their prominent social and ecological perspective. More than a transient way of earning money, the reality of micro-enterprises should be considered as a social and economic phenomenon able of generate regional and, consequently, global growth.

INTRODUCTION

Companies offer important contributions to society. Under an economic point of view, they contribute to the generation of income and, consequently, to the development which it unfolds. Under a social point of view, they enable, from economic development, the democratization of opportunities and improvement of the population, which then may have access to schooling and education. Finally, under an entrepreneurial point of view, there is the possibility of undertaking, creating and innovating.

Kraus, Harms and Fink (2010) give evidence of a the great contribution of small businesses in the generation of new ideas, products, service and transactions, seeing that they generally stem from a more entrepreneurial vision with possibilities for being able to use creativity and innovation in a more rapid manner.

Micro-enterprises are inserted in this context, but with differentiated features and contributions, by virtue of their size and dynamics. One of the great difficulties of this type of company is to be inserted and develop in the market due to income limitations that influence the *budget* and the marketing intensity. In this way, communication dynamics and marketing strategies are differentiated in relation to medium and mainly large companies.

This article aims to present the main marketing concepts applied by micro-enterprises within a brief contextualization of a marketing plan. It has secondary objectives that seek to identify how Brazilian micro-businesses can apply the marketing mix strategies (product, price, market and distribution) as well as a knowledgeable level of management tools. The development and theoretical evolution stem from a bibliographical research, as well as a field and observational research by the author of this article. The goal is not to exhaust the topic, or construct a Marketing Plan, but rather to contribute to the discussion, learning and use of a *marketing mix* in the segment of micro-enterprises in a more assertive manner. And how can one make this plan work?

According to the Subcommittee Cabinet for Legal Affairs of the Presidency of the Republic (2013), micro-enterprises or small businesses are considered to be the business society, the simple society, the individual limited liability company. The performance of Brazilian economy has offered, in the last decade,

the emergence of micro and small enterprises (MPSs) to meet the growth in the production of goods and the provision of services. And, thus, it requires tools that can offer stability and market growth. In this case, marketing comes to meet those needs.

METHODOLOGY

The classification of the research conducted, according to Vergara (2010), is qualified in two aspects: as to purposes and as to means. As for research purposes, it was exploratory and descriptive. Exploratory, because they have not yet found the existence of any other studies on the subject and descriptive, because their aim was to describe the degree of knowledge of micro-entrepreneurs with regard to tools and marketing strategies. To analyze the knowledge level of the tools and marketing strategies, research was carried out at the Trianon Fair, that is held on Sundays on the sidewalks of the Avenida Paulista in the city of São Paulo, and has an average of 160 stalls. It is one of most traditional regions where its history goes back to the late 70's, and for this reason we chose to study it. A questionnaire applied there was duly registered and analyzed, with both open and closed questions, with the intent of raising administrative issues and other information related to the exhibitors.

Another research was carried out. Where the sample was composed of micro-businesses from various segments in the city of São Paulo, totaling 127 that were chosen for their accessibility, because "foremost of any statistical procedure, chose elements that you have easy access to" (VERGARA, 2010, p. 47). From the results, product characteristics were elaborated, such as pricing and distribution, that compose the application analyses of the marketing tools for micro-businesses.

THE MARKETING PLAN AND CONSUMER MARKET

No company can survive without a good marketing plan. This means that any entrepreneur who wants to get the best results must be clear as to what market needs it will attend to and how it will be done. The financial flow that will make it possible to meet the needs of the company and, at the same time will ensure sustained growth, will be thus obtained from the offer of a package of recognized benefits. Within this perspective, the starting point for the development of a strategic plan is the limitation of its powers through the creation of the mission, vision, objectives and corporate values. After which, it is necessary to have the identified construction of a *marketing mix* able to meet, in a prompt manner, the various market needs.

Micro-enterprises, in Brazil, are generally born from different situations. One of the most common, being the loss of employment which makes the professional look for a short and medium term solution to balance personal cash flow. Another situation is when there is the unfolding of activities that a professional already exerts through outsourcing; another, still, derives from the profile of the entrepreneur himself, being the normal succession process, from father to son, in small businesses. In addition to this, Carlson (1985) already stated that the great differentiator between small, medium and large businesses is their resources, where the small ones have limitations as to generating financial resources for projects and consequently a sustained manner for expansion. Thus, it is understandable that small businesses do not have a more elaborate clear strategic planning, but it is unacceptable that they accommodate themselves and work without a good business and marketing plan. Without a good marketing plan, the company will be able to get results, but without the certainty of measurable results; with one, the company will be able to obtain results more organized and manageable manner.

The consumer as the primary focus of the company

Every business starts from what the market can offer in terms of business opportunities. In this way, every organization must be created from the meeting of the needs and desires of the market. The term *consumer* can be defined as everyone who can buy, rent, use or take advantage of a product or service offered by a company or professional. According to Foxxall (apud BAKER, 2005, p. 87), "the consumer decision-making process is usually described as cognitive. The consumer is aware of a need or desire and a possible means to satisfy it, normally announced in the advertisement of a new brand".

In general, as consumers are spread out over the market, one of the major initial difficulties of the microenterprise is the limitation of its scope. Such companies usually grow from regional demands, promptly meeting determined consumer needs. And, as the offer of products and services is done by different sized companies, micro-enterprises come up against some difficulty in facing the marketing appeals

that the medium and large sized companies make. On the other hand, Hawkins, Mothersbaugh and Best (2007, p. 17) state that:

The most obvious result of the process for an individual consumer, whether the purchase is carried out or not, is some level of need satisfaction that initiated the process of [...] Two fundamental processes are involved – the real need satisfaction and the perceived need satisfaction.

Even with all the limitations, micro-enterprises should be attentive to consumer behavior, which can have great mobility and contact with different companies of different sizes. So, one of the ways of survival for these companies is the use of long-and short-term incentives which will be dealt with later.

One of the biggest challenges is that consumers make their first purchase and then repurchase, thus becoming a client. A client is anyone who has a link, sometimes with a company or a professional. In this context, marketing categorizes two levels of clients:

- Internal customer or internal public, which boils down to the company's employees. In this sense, marketing strategies as *internal marketing* serve as actions that target their involvement and commitment with the objectives and goals of the company.
- External client, which is characterized as one who will purchase the product or service. The enterprise should measure their quantitative and qualitative demand. The first will provide a consumer perspective and the second the profile, which will shape the company's marketing strategies.

Market segmentation as the main strategy for micro-enterprises

Due to its peculiarities, such as limitation of resources and geographic range it is recommended that micro-enterprises promptly use the market segmentation strategies. Under the context of marketing, market segmentation technique considers the characteristics of the market where the company wants to work of extreme value. The market segmentation advocates the idea that the market is heterogeneous with regard to its characteristics and consequent needs, desires and aspirations. In this way, the segmentation technique requires the identification and measurement of differences and groups them into consumption categories. There are three ways to categorize market segmentation strategies:

- Undifferentiated marketing strategy considers the market to be homogeneous with respect to its characteristics and needs. The company can offer a *marketing mix* without any differentiation. Considering Maslow's Theory, one can employ this strategy for products and services that meet basic needs such as water, for example, and the provision of general services;
- The concentrated marketing strategy considers that the market may have special features that the company can meet. In this way, it can focus its efforts on a single market segment. In this case, regionalism anticipates itself as one of the key variables, as well as special features and characteristics of where the company is located; and finally.
- Differentiated marketing strategy, in which the company identifies segments where they want to act and develops a *marketing mix* directed at each one of them. In this case, the company has a portfolio of strategies for each type of client group.

The selection of the best segmentation strategy involves:

- On the part of the company it allows for the optimization of economic, financial and human resources, involving any of the above strategies. There is no differentiation; there is the possibility of bargaining power due to the volumes transacted. If differentiated, it enables the purchase of lots that are compatible with demand.
 - On the part of demand there is the option for the product or service that best meets your needs, then loyalty may occur and consequently the periodic purchasing of lots.
- Market segmentation stems from the needs of the business and its good service towards the costumers, which makes it a form of sustained customer loyalty; on the other hand, if all companies think the same way, the same strategies become forms of competitive differentiation. Baker (2005, p. 44) states that segmentation: "[...] is not only dynamic and uncertain, but also diverse: enterprises are heterogeneous, as well as the nature of the demand".

One can categorically state, however, that one of the main marketing techniques that an enterprise can apply and from where there will be a more effective return is market segmentation, because:

- The company, with detailed knowledge of the market, can better understand their characteristics, needs and deficiencies. From the understanding of quantitative and qualitative characteristics, it is possible to make a referential analysis;
- From the *correct interpretation of data and information, the company should formulate the best marketing mix in a way that so promptly meets and sustains the segment you want to reach*. Through the

very essence of the marketing system, the *marketing mix* is a reflection of the characteristics of market potential;

- According to the supply and demand it enables the measurement, optimization and management of resources to better attend the segment, in view of needs of the enterprise itself;
- Allows for more flexible strategies according to the possible changes, even if they are quick and subtle, this and other complementary niches.

The application of information systems, essentially - Information Systems in Marketing and Market Research - is primordial for the identification of market niches and their characteristics and needs that should be met. Market research identifies quantitative and qualitative demand, referencing market potential. In turn, marketing information systems provide data and feedback information from secondary data. The updating of this data and information is important to give the company the basic elements for the adequacy of marketing strategies according to the product life cycle (PLC) or service to be analyzed. Although micro-enterprises have limited resources, it is understood that they can use the systems in a prompt manner, with the use of secondary data from trusted sources.

The customer base of a company can be categorized according to the consumption profile of their active clients:

- A portfolio with *light users*: customers that buy small volumes. They bring great operational costs and contribute little individually in relation to the working capital needs of the company. However, they can ensure the maintenance of the business, if grouped properly. A small cafeteria can have a daily volume of income from the clients of the famous coffee break;
- A portfolio with *medium users*: customers that buy periodically and in a certain volume. A restaurant per kilo can diversify its menu periodically to maintain its customers; and
- A portfolio with *heavy users*: customers that buy large volumes, but without any frequency. The company must be prepared to meet large batches and consequently cope with stock costs. A company can take advantage of small business opportunities, but should focus on specific events, such as graduations, graduate programs, which bring in high income every six months, enough to meet the needs of the working capital for the whole year.

If a company adopts a mixed strategy, it should make its services compatible in such a way as to attend to all classes of customers. A small business, for example, must have a diverse portfolio of clients with different contributions. In this case, it should make its resources compatible and have good management and control tools.

THE MARKETING MIX OF MICRO-ENTERPRISES

The survival of a company is directly related to the acceptance, on the part of the consumers, of what it offers to the market. McCarthy and Perreault (1999, p. 43) mention that the marketing compound is the set of “controllable variables that the company gathers to satisfy this target group” (consumers). These controllable variables, also known as *marketing mix*, can be categorized as the four P's: product, price, promotion and distribution points. The company should generally offer a *mix* to meet the needs of its consumers. On the other hand, the market should reciprocate the offer of solutions through payments that ensure the sustainability of the company.

Also, as controllable variables, aside from the internal environment, there are the raw material suppliers and services, competitors and distributors, which will be analyzed in conjunction with the analysis of the *marketing mix*. We decided to also avoid macro environmental analysis, which can be categorized as an uncontrollable variable, such as the economic, technological, and demographic environment, among others. In this way, we maintain the focus on the *marketing mix*. The first to be examined will be the product.

Product

In a *marketing mix* there is what is offered to the market in material form. Kotler and Armstrong (2008, p. 200), as the basis for all the marketing compound, define [...] a product as something that can be offered to a market for assessment, acquisition, use or consumption and that may satisfy a desire or need. Products include physical objects, services, events, people, places, organizations, ideas or a mixture of all of these entities.

Micro-enterprises have characteristics and particularities that influence the product offered, as in Table 1:

Table 1 – Product features.

Item reviewed	Particularity	Analysis and recommendation
Raw material suppliers and services	For having limited financial and economic resources, the company may find it difficult to acquire raw material or services at competitive prices.	You can choose the purchasing cooperatives, where the same raw materials can be purchased in volume and increasing bargaining power with suppliers.
Production	The company may have difficulty in producing or simply selling in large quantities.	Can try outsourcing processes and focusing on its customer base.
Distributors	The company usually sells its products in a regional fashion, within its reach capacity.	Can try negotiating, concentrating intensively on the distribution of what it sells.
Competitors	The company may have different types of competition, according to their specific characteristics, such as size and composition of what is sold.	Aggressive monitoring should be drawn up in relation to direct and indirect competitors.

Source: Authors

In this way, the micro-enterprises should look for alternatives in order to increase sales through the increase of its production capacity and, consequently, their productivity and scale economies. There are two crucial points to enable growth in a sustained manner:

- Obtaining productivity and scale economies means increasing one's financial return and decreasing costs and expenses; and
- Obtaining competitive differentiations through gradual innovations. Small businesses must provide products or services to the market, despite their research and development limitations. The innovations coming from small businesses can represent a way to decentralize power – which is naturally centered on large companies.

A good example is the strategy of an *Excel* spreadsheet, which is part of a *Windows* package. This spreadsheet was previously known as Lotus and the company that developed it did not have the resources to market it internationally. They decided then for patent registry and concession to Microsoft. In this way, the product could be marketed globally, regardless of the size and resources of the company concerned. A solution for the lack of resources to be adopted by micro-enterprise is building on provision of financial resources by entities such as the National Economic and Social Development Bank, BNDES, as well as the guidance of entities such as the Brazilian Service of Support for Micro and Small Enterprises, SEBRAE. In addition, higher education institutions, through their junior companies and incubators, can become paths for innovating products and services and for business management itself. Below, the distribution channels will be analyzed under a more organic viewpoint.

Relationship channels

From the perspective of a *marketing mix*, there are also distribution channels, which initially may be defined as entities that provide the exchange between manufacturers and consumers. However, in a more organic vision, these entities have different and important roles in the process of exchange. According to Kotler and Armstrong (2008, p. 304),

Generating a product or service and making them available to buyers requires building relationships not only with customers but also with suppliers and salesmen in the supply chain of the company. This consists of supply chain partners "at levels above " and " levels below ".

On the level above are the suppliers, and the distribution channel represented by wholesalers and retailers are on the level below. According to the number of participants, there are the following levels:

- Zero-level - characterized by direct marketing with the client. In this case, the company can get better financial returns for not having distribution and marketing expenses, but must absorb the transaction and operational costs,

- Level one - there is the presence of retailers, which can be defined as specialized agencies in trading and transactions that increase the reach of the company within the consumer market; and
- Level two – there is the presence of wholesalers that buy in bulk and resell to retailers and/or end customers. Generally, there is little possibility of operation by micro-enterprises at this level, due to production limitation, except for negotiations and specific contracts.

However, every company needs to have an integrated view of its business, as well as what each entity aggregates in relation to the value perceived by consumers.

Table 2 - Distribution characteristics.

Item reviewed	Particularity	Analysis and recommendation
Transacted volumes.	The company has no bargaining power with the distribution channel.	The company can choose for a negotiation that facilitates more effective frequency at the expense of increased cost, distribution and marketing expenses.
Logistics.	The company may have difficulty in receiving, stocking and marketing the product.	Must have a management that enables rational planning stemming from its limitations.

Source: Authors

Distribution strategies can be categorized in intensive, selective and exclusive:

- Intensive distribution strategies imply strong distribution capability throughout the market and with great geographical reach. For reason of their limitations, micro-enterprises are unable to achieve this level of intensity;
- The strategies of selective distribution indicate that the company may choose certain dealers, according to their production limitations, as well as their access to different categories of consumers; and
- Exclusive distribution strategies indicate that the micro businessman has chosen a company category for the marketing of their product, which gives them better control and focus on their sales.

Companies in the area of food products, such as, for example pizzerias, have bypassed geographical limitations by means of outsourcing their deliveries. Another important factor is the possibility of geographic dispersion. A good example is the Giraffe's, which has obtained considerable growth and is also present internationally. In recent times, logistics areas – internal and external – and physical distribution have become one of the greatest objects of analysis. It is of no value having a good product if it is not open to distribution or if there is any delay in delivery. The solution for micro-enterprises is sound management through the creation of indicators. If on one hand, the introduction of management indicators, such as the *Balanced Score Card* (BSC), can initially generate barriers, due to the standardization of procedures and processes, it will allow the company to have a more complete vision of the business, as well as the relationship channels.

Following below are the tangible products pricing strategies.

Initial pricing concepts

Every company must charge for what it offers to the market; all consumers must pay, and understand that they are getting something of a particular value. Thus, Kotler and Armstrong (2008, p. 258) note that In the strictest sense, price is the amount you will charge for a product or service. More widely, the price is the sum of all the values that consumers exchange for the benefits of getting or using a product or service. Historically, the price has been the main factor that affects the buyer's choice.

The formation of the price for the final consumer is one of the hardest decisions in the marketing compound, since it involves different variables that small business people are sometimes not aware of. It can and must involve aspects related to production and marketing costs, fixed and variable, and profit margin, i.e. should be contextualized with the chain of values and corporate objectives of the company. Supplementing with McCarthy and Perreault (1999, p. 275): "price objectives should flow and be adjusted to the company and their marketing goals. It should be explicitly declared because they have a direct effect on price policies, as well as the methods used for their determination."

According to the strategic planning of a company, the strategies of pricing can be:

- Elite or creaming method, in which the company offers to the market a product or service at a high price, being understood that this has a high added value, and that there is a consumer market interested and with sufficient income; and
- Floor or introduction, in which the company offers something at a low price, considering that the product or service does not have sufficient attributes that lead consumers to pay a higher price for it.

The selection of price strategies results from several situations involving: the categories of products and services offered, competition, suppliers, level of competition and expectation of returns on initial investment and working capital. In most cases, micro-enterprises offer a product or service at a competitive level, concerned mainly with short-term return. In sequence and terminating the analysis of the *mix*, the various forms of communication, information and promotion of their businesses, companies, products and services.

Promotion Tools for a micro-enterprise

To inform and market their products and services, all companies must use a composite of promotion. According to Kotler and Armstrong (2008, p. 357), Building good relationships with the client requires more than just the development of a good product, giving you a competitive price and making it available to the target customers. Companies also need to communicate their value propositions to customers.

The promotion compound is formed by long-and short-term incentives in order to motivate consumers into buying products and services at that time, but also aiming at managing the beginning and promoting the maintenance of the business relationships. Long-term incentives may be advertising and public relations; and short-term incentives can be categorized as sales promotion and personal selling.

Table 3 - Characteristics and applications of the compound of promotion.

Composite Item	Particularity	Analysis and recommendation
Advertising .	Long-term stimulus that aims to inform and generate relationships, especially with the target audience. Usually using printed, virtual and electronic media.	Because of the cost and breadth, in general, the micro-enterprise ceases to opt for this alternative of promotion or even the option for a more regionalized vehicle, such as neighborhood newspapers and similar means.
Public Relations.	Long-term stimulus that aims at generating relationships with different public, including the target market. With such tools as <i>news</i> and <i>press releases</i> .	Because of the diversity of ways to generate the stimuli, it can be an important tool of exposure with the public nearest to the company.
Sales promotion.	Short-term stimuli, aimed at transforming the action in selling, such as discounts, promotional packages, among others.	It is one of the most suitable stimuli for small firms, for facility reasons and for not having high developmental costs.
Personal selling.	Short-term stimulus that aims at contributing towards more forceful sales.	It is one of the most commonly used stimuli by small businesses, by the very nature of its operations.

Source: Authors

Micro-enterprises should combine the different actions in accordance with their goals and objectives, as well as in accordance with their expectations and budget. In general, the company must therefore generate long-term incentives, disclosing their name and promoting their respective products and services. In addition, short-term stimuli should be promoted in order to render sales and have the consequent return on their investment. In the specific case of micro-enterprises, it is natural that they make greater use of short-term incentives because of their need for financial return.

One option is the use of the internet to disseminate the company, as well as for marketing and sale of its products and services. Lodish, Morgan and Kallianpur (2002) recall the importance and relevance of the *web* in business enterprises and viral marketing.

Some companies can get free exposure by yielding part of their products and services. It is natural for restaurants to give amenities in exchange for exposure in newspapers and magazines. According to the methodology mentioned, some research was carried out by the author together with Teresinha Covas Lisboa and Fernando Brasil da Silva (2010), with the purpose of identifying the knowledge level of the management tools, as well as those related to marketing strategies.

Table 4: Administrative Skills.

INSTRUMENT	KNOW	%	UNAWARE	%	TOTAL	%
Cash flow	35	48.61	37	51.39	72	100.00

Such ignorance on the part of micro-entrepreneurs derives from various reasons, having as the main factor a lack of administration and marketing training, as well as in specific management areas. Adding to this reality, as was testified by Carlson (1985), the micro-businesses also have limited resources, which can hinder their growth in a sustainable way. Completing the analysis of the *marketing mix*, small businesses should look at their resources and possibilities for expansion and growth through the characteristics of the market in which they wish to act. Administration and management of resources with an integrated view of the market can provide the company with a clearer vision of the future, making for stronger strategic planning and ensuring its sustainability. Concluding the article, marketing trends will be briefly analyzed with focus on social responsibility and sustainability.

MARKETING TRENDS FOR MICRO-ENTERPRISES

Micro-enterprises contribute significantly to national economy, but they are influenced by external variables, such as the international, economic, social, technological, demographic, geographic environment, among others.

According to the Brazilian Service of Support for Micro and Small Businesses (SEBRAE) the number of micro-enterprises in the country has grown which also denotes a certain level of entrepreneurship. SEBRAE is a private non-profit organization established in 1972. It aims to promote competitiveness and sustainable development of micro and small enterprises. Maybe there would be a fewer number of new small businesses, if the opening decision involved only the financial aspects and equipment; but the entrepreneurial spirit drives the entrepreneur to think differently and adds more power to one's business. As direct consequences, there is the generation of new posts of employment that comprise direct social gain, aside from the possibility of the creation of new technologies and innovation. Oliveira (2008, p. 3) states that: The field of corporate social responsibility is not only for multinational companies that have global impact. Small companies have important economic activities at the local level in many parts of the world. In addition, many have a very close relationship with the company, investing in social projects, even if they are not recognized as social responsibility actions.

In counterpoint, Ghemawat (1999) develops an interesting theory about management from the use of resources (be they limited or not) for sustained growth. Finally, we highlight here, a text from "Guia Exame" (2011, p. 88), according to which, Around the world, the quest for a more sustainable economy became one of the great hopes for the resumption of growth. New technologies will need to be created, production methods will have to be reviewed and it is possible that the way we deal with natural resources will go through a radical change. Where will innovation blossom? It is hard to say. If the example of the technological revolution is repeated, many of the novelties will come from new companies, generated by

visionary entrepreneurs. It is this, in addition to other factors that are uniting small companies with sustainable appeal and large businesses interested in improving their own performance indicators, in social and environmental areas.

In this way, one can understand the current importance of micro-enterprises and their significance in a wider context, visionary and within the perspective of integrated social responsibility and environmental sustainability.

FINAL CONSIDERATIONS

There is no doubt of the importance of micro-enterprises for any country. Their contribution lies mainly in the economic and social insertion. It should be noted that micro-enterprises are the main ones responsible for the generation of employment in our country, denoting their prominent social and ecological perspective. As part of their nature, micro-businesses have limited resources, highlighting financial and personnel, impacted by the bargaining power together with their suppliers and distributors, as well as their capacity to offer their products or services in a more aggressive manner to the consumer market, once they do not have the necessary transaction volumes so as to obtain better business possibilities. Aside from this, the entrepreneurs are deficient as to management knowledge and the respective assertive use of their instruments and management tools. However, we can highlight the importance, aside from those referred to above, of the possibility of micro-businesses embarking on the use of creativity as a means of bringing about innovations that aim at developing necessary technology for society. The act of enterprising is extremely relevant, considering the possibility of creating new forms of regional businesses, as well as future possibilities of internationalization. In this way, it becomes necessary to have manager and collaborator professionalization in small businesses, whether by means of academic graduation or courses and specific training, that make management tools and marketing practices more competitive in relation to domestic and international markets. More than a transient way of earning money, the reality of micro-enterprises should be considered as a social and economic phenomenon able to generate regional growth and, consequently, global.

IMPROVING SERVICE QUALITY IN MALAYSIAN HOTELS: EXPLORING THE PEOPLE DIMENSION

Johanudin Bin Lahap
University Technology of MARA, Malaysia

G. Barry O'Mahony and John Dalrymple
Swinburne University of Technology, Australia

ABSTRACT

In Malaysia, tourism is a major catalyst for growth and development. While many Malaysian hotels are opulent, well-appointed hotels, service delivery standards are inconsistent. The aim of this study was to develop a customized, industry-wide service delivery model that could assist hotel operators to improve service quality. In-depth interviews were used to explore experts' perceptions of the importance of aspects of the people dimension in service delivery. The data obtained from this research process was then used to fashion a customised service improvement model by extracting the most appropriate service improvement dimensions from existing, empirically tested models within the literature.

INTRODUCTION

Tourism is an important industry that contributes at least 9 per cent of the world's Gross Domestic Product (GDP), employs over 255 million people worldwide and represents 8 per cent of the global workforce (World Travel & Tourism, 2012). The industry makes a significant contribution to the economic development of many countries with some countries reliant on tourism as a catalyst for growth and development. This is the case in Malaysia where the tourism industry has been hosting large numbers of tourists arriving for business or vacation purposes as well as transient passengers' en-route to other destinations. In 2011, the hospitality and tourism sector contributed MYR58.3 billion (USD 19.3 billion) towards Malaysia's GDP and it was ranked second, after the manufacturing sector, in terms of overall economic contribution (Annual Tourism Statistical Report 2009; Ministry of Finance 2010 Tourism Malaysia, 2012). The Malaysian hotel industry has experienced significant growth in the last 10 years and many hotels in Malaysia are now opulent, new hotels achieving the highest standards of presentation. However, service delivery often lags behind the physical environment and struggles to meet international standards and ergo the expectations of international guests.

There are diverse views among service quality researchers as to how to improve service delivery standards. Nevertheless, there is general agreement within the literature that there is a link between employee satisfaction and job performance and that employee satisfaction has a profound influence on service delivery (Arnett et al. 2002; Berry & Parasuraman, 1991; Parasuraman et al. 1985). Service sector researchers in particular have recognised that businesses that develop motivated, customer conscious employees achieve better service outcomes because employees who do not have confidence in the service that they are required to deliver are incapable of delivering services in a manner that meets or exceeds customer expectations (Berry, et al. 1976; Berry, 1981; Grönroos, 1983). However, by attracting, motivating, and retaining qualified personnel and by providing service tools designed to satisfy their wants and needs, organisations can develop a commitment to their mission and goals (Berry, 1981; Grönroos, 1983). In this way, internal employee relationships pave the way to building external customer relationships that, in turn, lead to long-term commitment by customers to the organization (Bowen and Shoemaker, 2003).

Past literature has revealed that service delivery personnel are considered to be among the most important factors in producing high quality service (Heskett, et al., 1994). Previously validated quality improvement models such as Total Quality Management (Breiter and Bloomquist, 1998; Kanji and Asher 1996; Sila and Ebrahimpour, 2002), Six Sigma (Pearlman and Chacko, 2012), SERVQUAL (Parasuraman, et al., 1988), Relationship Marketing (Bowen and Shoemaker, 2003), Internal Marketing (Berry and Parasuraman, 1991), and Internal Market Orientation (Gournaris, 2008) contain dimensions that are important but may not be appropriate for the Malaysian Hotel Sector. In light of this, and the literature that highlights the importance of the people dimension in service quality improvement, the following research question has been developed: Which characteristics (dimensions) of existing service quality models would be most appropriate to improve service delivery within the Malaysian Hotel Sector?

METHODOLOGY

While the ultimate aim of this research was to develop an appropriate service delivery model for the Malaysian hotel sector, it was critical to gain an understanding of the industry context to ascertain whether the human resource or “people dimension” is likely to play a key role in overall service improvement. In this way, a suitable model could be fashioned from the plethora of quality improvement models available within the literature based on input from local level stakeholders. Consequently, the views of local experts were seen as critical to explore whether a model that focused primarily on the people dimension was indeed appropriate for the Malaysian hotel sector. To this end, the researchers employed qualitative research techniques to gain insights from key experts. Semi-structured, in-depth interviews were employed and interviewees were selected on the basis of the industry perspective that they could provide (Minichiello et al., 1995).

As noted earlier, the tourism industry in Malaysia is a key economic contributor. As a result, the industry is supported by a number of government and non-government entities. For example, the Ministry for Tourism is responsible for increasing tourist numbers and tourism related revenue across the State, while the Ministry for Labour (Human Resources) is responsible for human resource development, remuneration and general working conditions within the State. Universities and colleges in the public and private sectors are responsible for preparing students for positions in the industry and hotel operators are responsible for hospitality operations and employees. Experts who could provide a view from each of these perspectives were included in the sample and each of these experts was recruited to take part in an in-depth interview. The sampling profile included a representative from the Ministry of Tourism, a representative from the Ministry of Human Resources, two hospitality and tourism educators, two hotel general managers (one from a four and one from a five star property) and two hotel human resource managers (one from a four and one from a five star property).

The semi-structured interviews were supported by an interview schedule based on themes and topics found within the literature. This level of structure was appropriate because, according to Marshall and Rossman (1995), structured interviews limit the potential for unexpected themes to emerge, while unstructured interviews tend to lose purpose. During the interviews, respondents were asked to provide their opinions on the current state of play in the Malaysian hotel sector with a specific emphasis on the importance of employee satisfaction in improving service delivery. They were also asked to discuss any other issues or inputs considered valuable to improve service delivery.

ANALYSIS AND RESULTS

The interviews were transcribed and coded, categorising topics and themes by using the headings in the interview schedule as a first step, and then allowing for emerging themes to develop systematically. The duration of the interviews ranged from 40 minutes to 1 hour and 45 minutes. Respondents were of the opinion that the key to improving service quality was indeed to focus on hotel employees’ needs and wants and the first step would be to examine the current system of remuneration. All respondents expressed strong views on this issue and believed that it had the most influence on service quality and, more importantly, service quality improvement. In general, these experts agreed that hotel employees in Malaysia are underpaid and poorly compensated for their work. As the interviews progressed, it became clear that the people dimensions or matters related to employees are critical to improving current service provision and to the future of the hospitality industry. This confirmed the importance of the human resource related dimensions of the proposed service improvement model.

Monetary compensation was seen as one of the most significant issues because the experts believed that one reason that hotel employees decided not to further their employment in the industry was because they found jobs in other industries that pay better salaries. In contrast, however, one expert felt that some hotel employees were overpaid compared to employees in other industries. This, however, was not the collective view. One of the experts also suggested that salary is one of the most important motivators for employees to perform better, but felt that the issue was not given sufficient attention by the Government or hotel operators. One of the experts explained that a fair compensation system is paramount to improving service delivery. Another expert explained that the ultimate way to improve service delivery within the hotel industry in Malaysia was to pay good salaries to hotel employees. He added that the majority of hotel operators in Malaysia fail to deploy proper Human Resource Management Practices with regard to compensation. He also asserted that many highly qualified graduates choose not to work in the industry due to poor remuneration.

Respondents also expressed the view that the majority of hotel operators assume that the function of hotel employees is to work and to execute tasks rather than to develop relationships with guests, or any of the other important tasks that are within the mandate of empowered workers. Respondents felt that they (hotel operators) were of the view that hotel employees are paid a salary and they should perform any tasks assigned to them. This is in keeping with the view of human resource management that views employees as an input to be exploited rather than a resource to be developed. The issue of remuneration, however, was extremely complex as the views and quotes expressed in the following sections show.

One consequence of low salary levels was that many hotel employees were reported to live below the poverty level. This claim was made on the basis that many rank and file employees are paid less than MYR 500 (basic salary) per month. As one respondent explained:

In Malaysia if the total household income is below MYR 500 you are considered under the poverty level. For an argument how rank and file hotel employees could survive with MYR 400 basic salaries in a month. In general MYR 500 ringgit minimum wages is practiced by hotels in Malaysia right now ... (Expert 2).

He went on to explain that "... at the moment, most hotel employees are being paid under the poverty level" and this expert strongly suggested it was crucial to review the hotel employee salary system not only to improve service but to assist in developing the skills needed to support the growing tourism industry.

The majority of experts proposed that a minimum wage for hotel employees should be introduced within the industry. They felt that to have a minimum wage in place would eliminate a number of current industry problems such as 'job hopping' and employee turnover. They also contended that this strategy would help the industry to improve service delivery. One issue that was raised as a demotivating influence for rank and file hotel employees was that management level employees enjoy a good base salary compared to lower level employees. Management also enjoyed longer vacations and a variety of other benefits that are not available to lower level employees. The experts felt that this was unfair, because lower ranking hotel employees are the back-bone of the industry and work extremely hard.

One of the experts also felt that the working environment, including the hours and job conditions, were not acceptable to hotel employees. Another respondent expressed the view that even if hotel employees were paid a good salary, they would certainly resign if they received a better offer from another hotel. This expert was of the view that there is no sense of loyalty among hotel employees; however, other respondents argued that hotel operators should have good employee retention strategies to overcome this problem. Another issue of compensation perceived to be important to the delivery of quality service was competition to employ the best talent to work in the hotel industry. One of the experts explained that hotels that have the capacity to pay a good salary are able to attract the best talent, but many highly talented hotel employees in Malaysia were also offered better salaries and benefits from other countries such as The United Arab Emirates, Taiwan, and Hong Kong. This was seen as a serious problem for hotel school graduates because of the state investment in education, which was then lost to Malaysia.

One of the experts also explained that uncontrolled hotel development has an adverse impact on the quality of service delivery as well as salary levels. That expert explained that when there are too many hotel rooms available in the Malaysian market, the need to employ more employees' increases. This creates a competitive employment market and salaries increase, pushing up overall costs. Employing untrained

employees was seen as a solution because they accept lower salaries. Thus, it was perceived that the quality of service delivery could be jeopardised by the addition of new hotels to the market.

One issue that emerged that had a direct impact on the compensation structure was that, under the *Malaysian National Wage Act 1960*, service charge (points system) payments made to hotel employees are not considered as salary. This is apparently because legislators are aware that the total amount of service charge varies from month to month. However, under the *Malaysian Employment Act 1995*, the remuneration from service charge is considered as salary. This issue has confused many hotel operators and they tend to opt to follow the *Malaysian National Wage Act 1960*. This is the lowest cost solution for hotel operators who rely on this Act to pay low contributions to the Employee Provident Fund (EPF) Agency (equivalent to superannuation). As one expert put it, there is both confusion and a lack of understanding about how best to tackle this problem:

... we have a problem agreeing to the mechanism under the Minimum Wage Act because other payments like service charge, are not counted as wages, but in the Employment Act, the definition of wages states that any payment other than salary, is also counted as wages, so you must treat service points as a wage. This means that service charge from your salary is counted as wages but under the Employment Act other payments must be excluded. So the Minimum Wage Act and the Employment Act are conflicting ... (Expert 5).

The expert went on to explain that "... the implementation would have a lot of complications for various entities in the business, however, the development is seen to be positive because we want the industry to be a prosperous industry for Malaysia as well as for hotel owners ..." (Expert 5).

Several respondents noted the Government's intention to introduce a minimum wage for hotel employees was a good strategy; however, there are stakeholders that are not happy with this decision. One reason for this was that the Employee Provident Fund (EPF), which is a pension scheme, requires a percentage of salary be paid in to the fund by employers for their employees. By using salary only, without service charge, to calculate this, the contribution for each employee is lower. This benefits the employer but leaves the employee with little to look forward to in retirement. This is a major issue, according to one expert who stated that "the Ministries are very concerned about this issue, because even though you take home MYR 2000 including points, your salary slip will only show MYR 400 and a low contribution to EPF ..." (Expert 8).

When commenting on the issue of a minimum wage, the majority of experts agreed that its introduction is inevitable and most felt that it should be implemented as soon as possible. This should be done, it was explained, to attract the best talent to work in the hotel sector. This would also reduce reliance on foreign workers currently imported to fill employee shortages. One of the experts also suggested that the service for front of house tasks should only be delivered by locals. Demands of the job, was another key theme associated with both compensation and the ability to provide high quality service. As one expert succinctly put it "... because they are on their feet twenty four seven, you can't be expecting them to give the service if there are not compensated ..." (Expert 1). Thus, it is this expert's opinion that excessive workloads are detrimental to improving service quality. Clearly then, the notion of happy staff making customers happy is not currently practiced in Malaysia, at least not in the view of this respondent. Several experts felt that because employee's basic needs were not being met, they could not deliver high quality service. Expert 1 explained this by contrasting the situation in Malaysia with service employees working on cruise ships stating that:

... comparatively when you look to the western service worker working on a cruise that employs 648 employees on board for example, when guests talk to one of them the service provider keeps on providing good service and is polite all the time. The main reason why they behave like that is because they are being put in a comfortable place. They don't have to worry about their well-being; they just concentrate on their job. This could happen in the Malaysian Hotel Industry Scenario ... (Expert 1).

Another expert held a similar view and highlighted the issue by referring to Malsow's Hierarchy of Needs advising that:

... even though you train the employee, if they are not compensated well, the training program does not make any sense, as when you look at the fundamentals of Abraham Maslow's

hierarchy of needs, I know it is an old theory, but I strongly believe that that theory can also be applied here in Malaysia. When someone's physiological needs are not fulfilled, how could you move to another level of your life? So, in relation to that, how can someone, I mean hotel employees, give more to their company (hotel operators) if their basic needs are not fulfilled? To fulfil their needs, someone is heavily relying on monetary resources to fulfill their needs and wants, for example, shelter, food and drink, sleep, or we can say as the basic needs to live in this world ... (Expert 7).

One of the proposed strategies to deal with the lack of interest among employees in the hotels sector is to listen to hotel employees' demands, one expert asserted. He explained that:

... the hotel industry in Malaysia is unregulated in terms of compensation. My deepest opinion is that hoteliers should listen to the demands of hotel employees. The main factor which leads hospitality and tourism graduates deciding not to work in hotels or to work in hotels, but abroad [i.e. in other countries] are heavily due to the issue of compensation, which is salary and other fringe benefits ... (Expert 2).

He added that other industries in Malaysia that have good compensation systems, when compared to the hotel industry, do not have issues of labour shortages or a shortage of skilled labour. He cited the following examples adding that:

... accounting, finance and information technology (IT) graduates enjoy good compensation, however, hospitality graduates are basically paid low salaries [This is odd because the hospitality and tourism industry is a booming sector contributing the second highest contribution to the Malaysian economy. How ironic the situation ... (Expert 2).

While reviewing the dimensions of the proposed model one of the experts contended that improving training and development programs as well as revising the direct and indirect compensation systems is important to improve service delivery. He commented that:

... I believe that all elements suggested by you are crucial to the improvement of the service, but for me I would like to stress that ... the pay system falls under the umbrella of direct and indirect compensation ... (Expert 2).

He reiterated that happy employees would certainly make customers happy and to support that contention he reported that:

... what is important right now, if the employee is happy, the customer will be happy too. If you are taking care of your staff, definitely you staff will take care of your business, that's for sure and they will provide better service to the customers and as a result the chances of the guest coming back for another stay will be high ... (Expert 2).

In addition, repeat customers could be created and "... if somebody is happy with their company and job, definitely they wouldn't mind to do extra work for the company ..." (Expert 2). The expert asserted that it was critical to come up with a solution to this as a means to maintain industry competitiveness. Compared to other countries Malaysia, in his opinion, is being left behind. The expert commented that:

... when we compare the scenario with Australia, Britain and most major cities in Europe, many hotel employees work in one hotel for 20 years or more because they are paid very good money and their welfare is being taken care of. But in the Malaysian scenario it is different. The hotels push the employees to give 100 per cent commitment but their remuneration and welfare are not been taken care of. So I think this is the root cause of the problem ... (Expert 7).

The expert further explained that:

... so if you look at this example, do you think our graduates will work in hotels? As a result, how are we going to improve the service in hotels if we keep on losing graduates that are fully trained by the hotel schools? The problem is rooted in the failure of Human Resource Practice by hotel operators. There are other instances of hospitality graduates taking jobs in the telecommunications industry. They have been offered MYR 1800 in salary, MYR 11 transport allowance every day, a shift allowance of MYR 20 a day, a mobile phone allowance of MYR 300 a

month and performance allowances of MYR 500 a month. So how can the hotel industry compete with this kind of package offered by other industries ... (Expert 7).

These other industries were perceived to have exceptionally competitive compensation packages and to have taken every effort to attract the best talent available in the country.

Expert eight further submitted that the majority of hotel employees are not happy with the salary they receive, adding that the room rates offered by the Malaysian Hotel Operators are considered to be among the cheapest in the region and this was why employees were not well paid. As he pointed out "... room rates are cheap, if the rates are cheap definitely the revenue will be not so high, so how are we going to attract good employees to work with us when we can't afford to pay them good money..." (Expert 8). The expert further explained that:

... when you look at the banking industry, you probably get MYR 1600 or MYR 1800, and here because of service charge and the salary, if the room rates are higher, the take home pay will be higher, because the starting salary is MYR 350 then you get 3 points, normally in a 5 star hotel 1 point can be MYR 350 times 3 is already MYR 1050, plus MYR 350 [basic salary] is already MYR 1400 ... (Expert 8).

In discussing the topic of training and development as well as hotel employees' career development, it was found that the majority of experts agreed that training is a critical factor in improving service delivery. Almost all of the experts asserted that, in order to have excellent service, hotel employees must be trained and they should be equipped with the right tools to execute service related tasks. It was claimed by one expert that "...most managers neglect the need for training as many of them do not have time to train their staff ..." (Expert 3). He further argued that, if there is no training or inadequate training, hotels could not improve service delivery.

Although this was one view, the issue of ongoing training featured heavily in the interviews and one of the experts captured the general view of respondents, arguing that training and continuous learning could assist in improving service delivery. One of the experts also asserted that training programs should be tailored to the needs and wants of customers. By this was meant that it is important for hotel operators to equip their employees with current knowledge and skills in order to serve international guests. One example presented was to train employees to handle the increasing number of disabled people and senior citizens that are currently accessing tourism in Malaysia.

Career development was another theme within the realm of training and development. The majority of experts agreed that hotel employees' career development should be well-planned as they asserted that career advancement was one of the most motivating factors for employees in Malaysia. Career path development was proposed by these respondents to have the capacity to reduce turnover rates among hotel employees in Malaysia because it was claimed that if employees were provided with a career development plan they would be able to work to the plan, develop their future careers and improve their job security.

In developing career pathways, two experts postulated that a management trainee program should be introduced. Such a program would provide hotel employees with adequate training in various departments within a hotel for a defined period of time. To further improve the program, hotel employees should have the opportunity to undergo international cross cultural exposure training. However it was recognised that this type of training could only be afforded by International Chain Hotels with a network of hotels in other countries.

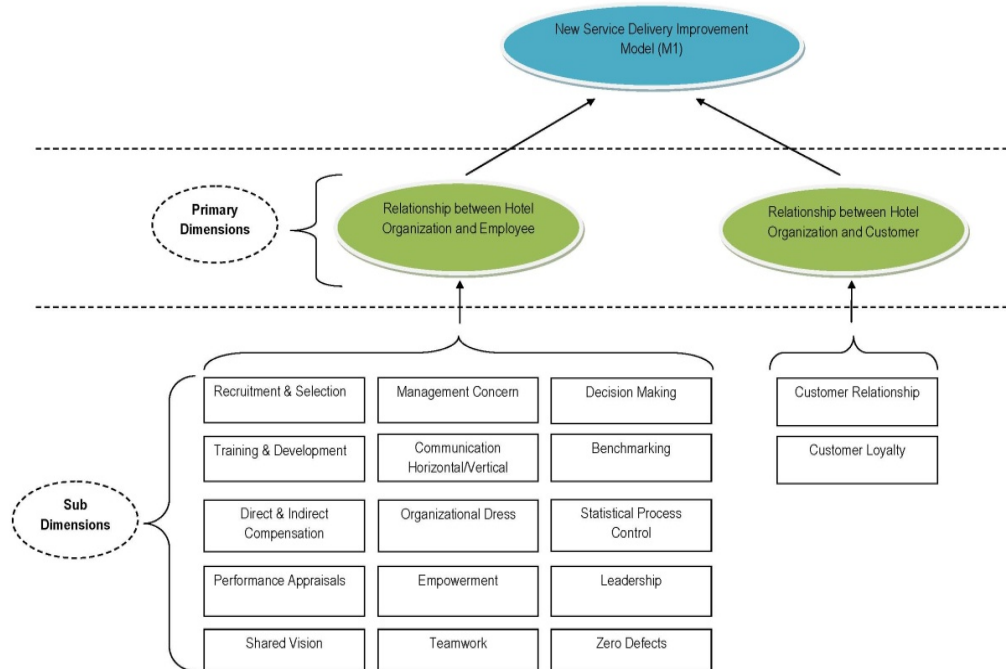

IMPLICATIONS FOR SERVICE IMPROVEMENT

Having established that the people dimension was critical to service quality improvement within the Malaysian hotel sector, the next step was to review the literature to identify appropriate quality improvement models that emphasised the importance of the "people dimension" and to develop a model that included those dimensions that focused on attracting, motivating, and retaining qualified personnel and created an environment where employees were supported by service systems and tools designed to satisfy their wants and needs. A review of literature uncovered a number of quality improvement models that included these dimensions; however, only those models that had been empirically tested were deemed appropriate to include in the proposed model. These were; Total Quality Management (TQM), Six Sigma, SERVQUAL, the Relationship Marketing paradigm, Internal Marketing and Internal Market Orientation (Gounaris 2008;

O'Mahony et al. 2013; Powell 1995; Ravichandran 2006; Shamji 2005; Sureshchandar et al. 2001; Thawani 2004).

Each of these was reviewed and it was found that there were a combined total of 240 dimensions that were seen to have an impact on service delivery. A process of elimination was introduced to develop a more manageable model and those dimensions that were more appropriate to non-service settings, such as manufacturing, were omitted and the most significant barriers to service improvement expressed by the experts were given precedence. These included recruitment, remuneration, training and development, the working environment (including the demands of the job), working hours and empowerment. This led to the development of a provisional service improvement model containing the 17 dimensions depicted in Figure 1.

Figure 1: Employee focused Service Delivery Improvement Model developed from interviews with experts and existing models.

CONCLUSIONS AND LIMITATIONS

The qualitative research uncovered the most significant barriers to service improvement that needed to be addressed in order to improve service delivery within Malaysian hotels. The majority view expressed by the experts was that recruitment, remuneration, training and development, the working environment, including the demands of the job and working hours were major issues of concern. Employee turnover was also seen to be a significant problem, which is consistent with the findings of Hemdi and Nasrudin (2005) study in Malaysia which found an unacceptably high number of hotel employees intended to leave their employment seeking better working conditions within other hotels or in other industries. Respondents' comments on training and development would also seem to suggest that workers are not being empowered within their current roles, which also has an influence on employee satisfaction and employee turnover intentions (Lashley 1996; Spreitzer, 2005). Most important, however, was the issue of employee remuneration which has a marked influence on recruitment, employee turnover and the delivery of quality service standards. The developed model addresses these key dimensions including elements that increase motivation such as management concern, communication and shared vision as well as dimensions that provide a sense of self (empowerment), and a sense of place (organizational dress). As such, the model has the potential to have a significant, positive impact on improving service quality within the Malaysian hotel sector.

This research has potentially significant policy implications, since the tourism and hospitality sectors are such important contributors to the Malaysian economy. The need to increase the occupancy rates of current and planned hotels is necessary to generate a reasonable return on investment for the operators,

while tax revenue is essential to provide government with adequate income to pursue their development agendas. The public and private sector education and training establishments require a successful industry to maintain their financial viability. All of this is dependent on service levels that contribute to the development of a substantial repeat customer base. All of the stakeholders have the potential to gain from such a customer base and they all have a contribution to make to its realisation.

Consequently, the ability of the tourism and hospitality sector to make a significant contribution to the economic development of Malaysia will depend on there being a vigorous, successful and profitable market. Part of this depends on there being an appropriate balance between supply and demand for tourism and hospitality services. For Malaysia, to attract high net worth individuals as visitors requires a combination of available four and five star accommodation coupled with service levels that match the expectations of international travellers who are high net worth individuals. This research indicates that one of the impediments to achieving these standards may lie in the potential mismatch between supply and demand. The over provision of high specification facilities undermines the realisation of the government goals on two grounds. Firstly, it increases the demand for staff who are sufficiently experienced and trained to deliver services to the required standard, while, at the same time, causing hotel owners to cut prices and lower costs in order to gain some return on their investment. In view of this, the authorities may wish to consider their approach to hotel development proposals to ensure that there is a reasonable and profitable balance between supply and demand for four and five star facilities and services.

The researchers recognise, however, that there are limitations to the study. For example, the model was developed with input from a small, albeit important, group of stakeholders. Consequently, further research is recommended to gain the perspectives of employees on the veracity of the proposed model.

THE EFFECT OF THE PERCEIVED RISK IN SOUTH KOREAN CONSUMERS' ACCEPTANCE OF THE CROWD-FUNDING

Han-suk Lee and Seongtae Hong, Sangmyung University, South Korea
Won-Jun Lee, Cheongju University, South Korea

ABSTRACT

Consumers' role in the markets has changed a lot over time with environmental change. From mere target for company's profit to co-creator of value, trends has shown an enrichment and empowerment of the role assigned to consumers. Consumers have recently begun to play a new role in some markets. The consumer's role has expanded to include investment support. This can be called crowd-funding. But crowd-funding is new phenomena and it is not fully understood. To explain this we employ structural equation modeling approach with crowd-funding initiatives. Results indicate that crowd-funding participants perceive some sources of risk in supporting. We hope this study become a basis for other related researches.

INTRODUCTION

While consumers have always had a special issue in the marketing study, the role in the markets has changed a lot over time with environmental change(Ordanini,Miceli,Pizzetti,Parasuraman, 2011). Basically Consumers make buying decisions every day. This means that consumers are mere target for company's sustainability. Then consumers became key information source in the "market orientation" literature which defines the business in terms of satisfying basic customer needs(Kohli and Jaworski, 1990). Consumers became smarter than old times and service industry also grew. Therefore some service marketing literature enlarged consumers' role as co-producers or co-creators of value(Vargo and Lusch, 2004). Over the years, this trends has shown an enrichment and empowerment of the role assigned to consumers. Last year there is an act that can affect consumers' role in the marketing. Jumpstart Our Business Startups Act, known as the JOBS Act enacted in April 2012. It is expected to revolutionize the crowd-funding industry.

Consumers have recently begun to play a new role in some markets. The consumer's role has expanded to include investment support. This, called crowd-funding, is a collective effort by people who network and pool their money together, usually via Internet, in order to invest in and support efforts initiated by other people or organization. This idea that consumers decide to pay for producing and promotion a product and bear the risk associated with that decision, represents a further step in the evolution of consumers' roles(Ordanini,Miceli,Pizzetti,Parasuraman, 2011).

But crowd-funding is new phenomena so it is not fully understood. Which antecedents affect the engagement of consumers as investor? What motivate consumers' investment? How the crowd-funding process work and its meaning of marketing strategy? Or how to implement crowd-funding as one of marketing strategies? Crowd-funding is usually happening by Internet. And nonetheless it is a rapidly growing field. But many surveys have reported that consumers concerned about Internet security. Also Internet fraud is another growing concern(Hassan,Kunz,Pearson,Mohamed, 2006). With the growth of crowd-funding we can think there are some obstacles which inhibit consumer's active participation.

To explain this issue, we employ a structural equation modeling approach associated with crowd-funding initiatives. First, we understand that perceived risk of crowd-funding is a multidimensional concept. We study the relationship between crowd-funding attitude and perceived risk such as economic risk, social risk, psychological risk, risk of time-loss, privacy risk, source risk. We also examine the relationship between the attitude and behavioral intention of crowd-funding. In order to carry out this research purposes, we conducted a survey of consumers from South Korea.

LITERATURE REVIEW

Crowd-funding

In South Korea, a recent movie named '26year' gathered more than 2million customers. It is interesting that more than hundreds of people participated in the investment of movie manufacturing. Also, a recent project at FundU raised 500,000 won for a group of over 70 year olds to teach them how to read and write. In return, a dozen anonymous supporters will get hand-written letters from the recipients. Another event aims to raise 50 million won to stage a concert for 20 to 30 year olds in an effort to inspire political interest among them. Sponsored by several celebrities including Korean rock band YB and comedian Kim Jae-dong, it brought in 11.58 million won from 70 donors within days(Koreatimes, 2012). Lots of projects were successfully launched by domestic crowdfuning sites. Crowd-funding refers to people choosing to raise money through the Internet to fund projects they want to succeed. Eventhough in Korea, the concept of crowd-funding is not widely accepted yet, currently about 12 local crowd- funding sites exist. Although the concept of getting a crowd to simply raise money for a cause or invest in local business is nothing new, the powerful Internet networking enable consumers to enlarge their role.

Some extant literature stream can help to understand crowd-funding. For example, literature related to donor behavior suggests that people who contribute to charitable causes are motivated by self-esteem, relief from feeling of guilt and obligation. Literature on brand community also suggests some aspects that relate to crowd-funding contexts(Hibbert and Horne, 1996; White and Peloza, 2009). In other viewpoint, brand community members are typically motivated by identification, status, and fun. But these literatures on these theories didn't capture the element of monetary support from users, which is a key characteristic of crowd-funding models. As initial study related to this area we consider perceived risk is one of major factors affect consumer's participation. Because crowd-funding is consumer's investment behavior, so spend money with considering its value.

Perceived risk

According to previous research if individuals perceive risk, they expect some kinds of loss. The development of theory of perceived risk in the context of consumer behavior began in 1960s. Since 1960, extensive consumer research showed that perceived risk affects consumers behavior across different cultures. The theory of consumers' perceived risk explains that consumers perceive risk because they face uncertainty and potentially undesirable consequences after purchasing. Therefore the more risk they perceive the less likely they will purchase. It can also be applied to crowd-funding. Perceived risk is powerful at explaining consumer's behavior because "Consumers are sometimes more motivated to avoid risk than maximize utility in purchasing". Perceived risks affect degree of consumer's business model adoption. For example, perceived risk was found to have a significant negative and direct effect on consumers' adoption of new internet service such as internet banking.

So for this research we adopted perceived risk terminology. This concept is highly related to financial consumer's behavior. A growing body of recent research has shown that consumer opinions, evaluations, and adoption intentions for new idea vary with the perceptions of risks. Moreover a solid stream of consumer behavior research acknowledges that, in order to reduce the effect of perceived risk, research must recognize and measure the effects of several types of risk. There are representative perceived risk types which are most popular in consumer behavior literature (Hassan,Kunz,Pearson,Mohamed, 2006; Lim, 2003) .

A general definition of perceived risk in marketing is "the nature and amount of risk perceived by a consumer in contemplating a particular purchase action". A review of past studies shows that researchers have identified the following dimensions(Lim, 2003).

1. Perceived financial risk is defined as concern over any financial loss that might be incurred because of decision behavior. Sometimes we can call this as economic risk. This explained the possibility of monetary loss arising from investing behavior. For example, even though they invest money and hope to have reward for that behavior, sometimes the product can be a failure or unsatisfactory products.

2. Perceived social risk associated with other people's opinions on the decision, resulting in possible disapproval by family or friends. This is concerned with individuals' perception of other people. It has ability that consumer's invest is not accepted by other society members.
3. Perceived psychological risk referring to the mental anxiety associated with a behavior. This is the possibility that individuals suffer mental stress because of their behavior. For example, consumers are likely to feel frustrated if their investment is unsuccessful.
4. Perceived time risk referring to the time loss associated with investment. In addition to searching time for appropriate Crow-funding idea, this dimension includes waiting time for Crow-funding idea actualization and commercialization.
5. Perceived source risk reflects concern over whether or not the consumer can trust the online Crow-funding project and feel comfortable in doing business with it. It is a general perception regarding the reliability of business model planner such as whether a company exists.
6. Perceived performance risk is the possibility that the business model does not work properly or can be obsolete only a short period of time.

Therefore summarizing at a macro level the theories examined above, it is logical to consider that in the initial stage of adoption of a new information business model, crowd-funding, when consumers have little knowledge of the crowd-funding, there may be opportunity factors that motivating users to adopt it, and barrier factors that making consumers dubious about the concept. As a basis research, this study will provide useful results to crowd-funding related marketers. It is important for researchers to identify influential factors to crowd-funding.

Although previous research show that perceived risk is an important factor for crowd-funding, there has been much concern about the relation between perceived risk and trust. Trust can be defined as a willingness to take risk and perceived risk is the likelihood of both positive and negative outcomes.

For this study we set basic approach in developing hypothesis. The hypothesis of this research is as follows:

H1: Dimensions of perceived risk have differential effects on Consumer's willingness to participation

METHOD

Theoretically, perceived risk must have strong relationship to consumer's behavior. Given the need for further empirical study on the crowd-funding, we conducted a survey. Despite its strategic importance, empirical study linking these two concepts has been lacking especially for its newness.

We recruited participants on the University through advertising on announcement board. Then we did scenario based survey. We developed and tested a model that investigates to find link about two construct with entertainment industry, film industry. Korean movies accounted for 58.8 percent of the market share here last year and the overall revenue of theaters, which included the sale of food and other non-ticket items, grew by 17.7 percent. Easy access to theaters is a major reason attributed to the increased audience numbers. In the past, people just visited theaters to see movies. Now they go there when they're shopping or dining. Theaters absorb people more easily as they draw closer to people's lives. With this era of Korean movie renaissance, a lot of film makers use crowd-funding as a promotional way or fund raising way.

At the survey, among other variables the survey measures (1) perceived risk (2) willingness to participate (3) former participation experience (4) involvement to film industry (5) some demographic information (6) how much invest for crowd-funding (7) expectation of reward

RESULT

In order to examine the proposed hypothesis, we used Partial Least Square(PLS) method to analyze data because it is more appropriate for complex models when the goal of the research is exploratory by

explaining variance. PLS is one of causal modeling approach. PLS analysis will be preferred when the emphasis is on prediction and theory development, as the statistical power of PLS is always larger than to that of other structural equation modeling methods(Reinartz, Haenlein, Henseler, 2009). It showed some interesting result about the relationship between constructs.

A DECISION-MAKING MODEL FOR SELECTING NEW PRODUCT DEVELOPMENT PROJECTS

Amy H. I. Lee, Chung Hua University, Taiwan
Hsing Hung Chen, Macau University of Science and Technology, China
He-Yau Kang, National Chin-Yi University of Technology, Taiwan

ABSTRACT

Firms today are usually under a dynamically changing and fierce competitive environment. To survive in such an intensive competitive market, firms need to be innovative and to produce new products that can lead to future profits. Successful new product development (NPD) thus is essential for the survival of firms. A conceptual model is proposed to select the most appropriate projects for NPD. First, constraint programming (CP) is used to select the NPD project candidates. Fuzzy analytic network process (FANP) with fuzzy multiple objective programming (FMOP) is developed next to help select the best NPD projects under specific environments and constraints. A case study in a photovoltaic (PV) firm is presented to examine the practicality of the model. The proposed model is recommended for implementing NPD projects to achieve sustainable competitive advantage.

INTRODUCTION

Under a globally competitive business environment, an important source of competitive advantage, survival and renewal for firms is technological innovation. Since new products can contribute to new sales and profits, the success of new product development (NPD) is important to survive in the market (Lee *et al.*, 2010). However, the failure rate of NPD is very high. A firm's ability to exploit its current competencies or explore new capabilities thus becomes critical, and a good NPD management is essential for developing products successfully.

Even though there are abundant works on NPD, comprehensive frameworks for selecting NPD projects are limited. This research is to propose a conceptual decision-making model for selecting the most appropriate NPD projects. A model that incorporates constraint programming (CP), fuzzy analytic network process (FANP) and fuzzy multiple objective programming (FMOP) is constructed to help decision-makers select the most appropriate NPD set under an environment with limited resources. The proposed model shall provide guidance and recommendations for managers on what factors should be stressed in selecting NPD projects and how to select the most appropriate set of projects for development.

In order to promote environmental protection and to confront natural resource scarcity, more and more countries and firms are paying attention to solar energy, which depends on an infinite resource, the sun, as one of the most promising renewable energy sources. Current PV products, however, still suffer a large difficulty in high production cost with low PV conversion efficiency (Lee *et al.*, 2012). Thus, PV firms need to focus on effective R&D to improve product quality and to achieve economic scale for cost effectiveness. The proposed NPD selection framework is applied to a case study of a PV firm in Taiwan to help the management evaluate NPD projects.

The remainder of this paper is organized as follows. Section 2 introduces some methodologies. The construction of the NPD evaluation framework is presented in section 3. A case study of a PV firm is carried out in section 4. Some conclusion remarks are made in the last section.

METHODOLOGIES

Constraint Programming (CP)

A constraint satisfaction problem (CSP) is a mathematical problem defined by a set of variables whose states must satisfy a set of constraints (Kang, 2011). CSP is to find one or all assignments to the variables so that the assignment(s) satisfies all the constraints (Kumar, 1992). Constraint programming (CP) refers to the techniques that deal with constraint representation and exploitation (Trojet *et al.*, 2011). CP is generally carried out by reducing the domains, and the objective of the constraints is to replace an initial CSP by an equivalent CSP which has a more restricted research space (Tchertchian *et al.*, 2013). Effective CP models have been developed widely in various fields such as product design, machine design and manufacturing, computer vision, robot or agent planning, resource allocation, scheduling, human resources management, agronomy, diagnosis, etc. (Kang, 2011; Trojet *et al.*, 2011).

Fuzzy Analytic Network Process (FANP)

Analytic network process (ANP) generalizes analytic hierarchy process (AHP) by replacing hierarchies with networks, and it is the extension and a more general form of AHP (Saaty, 1996). ANP can still represent the relationships hierarchically if necessary; however, it does not require as strict a hierarchical structure as AHP (Meade and Presley, 2002). Under AHP, each element in the hierarchy is assumed to be independent. In many real cases, interdependence among elements is often existed. Therefore, ANP should be used under such circumstances. Fuzziness and vagueness are common characteristics in decision-making problems, and fuzzy set theory can be adopted to ANP, so-called FANP. FANP has been applied in many academic works in recent years.

Fuzzy Multiple Objective Programming (FMOP)

Multiple objective programming (MOP) is a popular decision making tool in a complex environment. An MOP can be developed when decision makers want to optimize two or more objectives simultaneously under various constraints (Kang and Lee, 2010). Various factors need to be included in the objective functions and the constraints when formulating a MOP; however, they are often imprecisely or ambiguously known. Thus, fuzzy multiple objective programming (FMOP) has been introduced, and different kinds of FMOP models have been proposed to solve different decision-making problems, which can involve fuzzy values in objective function parameters, constraints parameters, or objectives (Kang and Lee, 2010).

THE PROPOSED FRAMEWORK

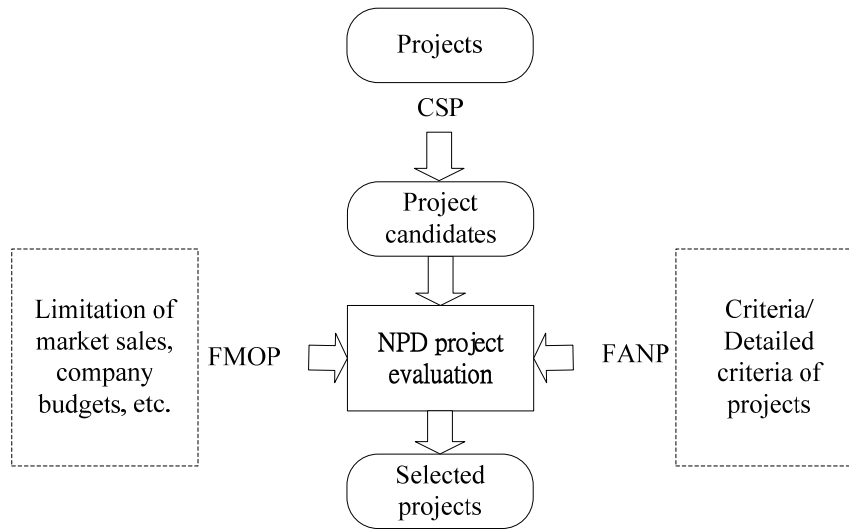

The steps of the proposed NPD project selection framework are as depicted in Figure 1 and are as follows:

1. Define the new product development project selection problem and collect NPD project candidates for the firm.
2. Apply constraint programming (CP) to select the NPD project candidates. Although there might be numerous potential projects, a firm cannot implement all the projects due to some constraints, such as technology capability and time. Therefore, CP is used to select the most probable projects for further analysis. Constraint satisfaction problems (CSP) are defined by a set of variables whose state must satisfy a set of constraints (Kang, 2011). The goal of CSP is to find one or more assignments to the variables so that the assignment(s) satisfy all the constraints (Kumar, 1992). A CSP is a triple (H'Mida and Vernadat, 2009; Kang, 2011):

$$(1) \quad (X, Y, \Phi)$$

where S is a finite set of variables ($x_1, x_2, \dots, x_n, \dots, x_N$); Y is a set of functions ($y_1, y_2, \dots, y_n, \dots, y_N$) which map every variable in X to a set of objects of arbitrary type. Each variable $x_n \in X$ has a nonempty domain $y_n \in Y$ which represent the set of all possible values for x_n ; Φ is a finite set of constraints ($\phi_1, \phi_2, \dots, \phi_j, \dots, \phi_J$) on an arbitrary subset of variables in X .

Figure 1: The proposed model for NPD project selection

3. Construct a NPD project evaluation network with criteria, detailed criteria and alternatives. Experts are invited to contribute their professional experiences to verify the criteria and the detailed criteria. The alternatives are the NPD projects selected from step 2.
4. Pairwise compare the criteria. Experts are asked to pairwise compare the criteria using triangular fuzzy numbers, as shown in Table 1. With respect to the overall objective, a matrix (\tilde{A}_{1k}) for expert k is as follows:

$$(2) \quad \tilde{A}_{1k} = \begin{matrix} & \begin{matrix} C_1 & C_2 & \dots & C_i & C_j & \dots & C_m \end{matrix} \\ \begin{matrix} C_1 \\ C_2 \\ \vdots \\ C_i \\ C_j \\ \vdots \\ C_m \end{matrix} & \begin{bmatrix} 1 & \tilde{a}_{12k} & \dots & \dots & \dots & \dots & \tilde{a}_{1mk} \\ 1/\tilde{a}_{12k} & 1 & \dots & \dots & \dots & \dots & \tilde{a}_{2mk} \\ \vdots & \vdots & \ddots & 1 & \dots & \dots & \dots \\ \vdots & \vdots & \vdots & \vdots & 1 & \tilde{a}_{ijk} & \dots \\ \vdots & \vdots & \vdots & 1/\tilde{a}_{ijk} & 1 & \dots & \dots \\ \vdots & \dots & \dots & \dots & \dots & 1 & \dots \\ 1/\tilde{a}_{1mk} & 1/\tilde{a}_{2mk} & \dots & \dots & \dots & \dots & 1 \end{bmatrix} \end{matrix}$$

where m is the number of Cs.

Table 1: Characteristic function of the fuzzy numbers (Lee *et al.*, 2006)

Fuzzy number	Characteristic (Membership) function
$\tilde{1}$	(1, 1, 3)
\tilde{x}	$(x-2, x, x+2)$ for $x=3,5,7$
$\tilde{9}$	(7, 9, 9)

5. Aggregate experts' opinions and build an aggregated pairwise comparison matrix. Geometric average approach is used to aggregate k experts' responses, and a synthetic triangular fuzzy number is obtained (Lee *et al.*, 2009):

$$(3) \quad \tilde{a}_{ij} = (\tilde{a}_{ij1} \otimes \tilde{a}_{ij2} \otimes \dots \otimes \tilde{a}_{ijk})^{1/k}$$

where $\tilde{a}_{ijk} = (l_{ijk}, t_{ijk}, u_{ijk})$

The fuzzy aggregated pairwise comparison matrix is:

$$(4) \quad \tilde{\mathbf{A}}_1 = \begin{bmatrix} 1 & \tilde{a}_{12} & \cdots & \cdots & \cdots & \cdots & \tilde{a}_{1j} \\ 1/\tilde{a}_{12} & 1 & \cdots & \cdots & \cdots & \cdots & \tilde{a}_{2j} \\ \vdots & \vdots & 1 & \cdots & \cdots & \cdots & \cdots \\ \vdots & \vdots & \vdots & 1 & \tilde{a}_{ij} & \cdots & \cdots \\ \vdots & \vdots & \vdots & 1/\tilde{a}_{ij} & 1 & \cdots & \cdots \\ \cdots & \cdots & \cdots & \cdots & \cdots & 1 & \cdots \\ 1/\tilde{a}_{1j} & 1/\tilde{a}_{2j} & \cdots & \cdots & \cdots & \cdots & 1 \end{bmatrix}$$

where $\tilde{a}_{ij} = (l_{ij}, t_{ij}, u_{ij})$

Then, the center of gravity (COG) method is adopted next to defuzzify the comparison between criteria i and j (Klir and Yuan, 1995):

$$(5) \quad a_{ij} = \frac{[(u_{ij} - l_{ij}) + (t_{ij} - l_{ij})]}{3} + l_{ij}$$

The defuzzified aggregated pairwise comparison matrix is:

$$(6) \quad \mathbf{A}_1 = \begin{bmatrix} 1 & a_{12} & \cdots & \cdots & \cdots & \cdots & a_{1j} \\ 1/a_{12} & 1 & \cdots & \cdots & \cdots & \cdots & a_{2j} \\ \vdots & \vdots & 1 & \cdots & \cdots & \cdots & \cdots \\ \vdots & \vdots & \vdots & 1 & a_{ij} & \cdots & \cdots \\ \vdots & \vdots & \vdots & 1/a_{ij} & 1 & \cdots & \cdots \\ \cdots & \cdots & \cdots & \cdots & \cdots & 1 & \cdots \\ 1/a_{1j} & 1/a_{2j} & \cdots & \cdots & \cdots & \cdots & 1 \end{bmatrix}$$

6. Calculate the priority vector of the defuzzified aggregated comparison matrix. A priority vector is derived for the defuzzified aggregated comparison matrix (Saaty, 1980, Saaty, 1996):

$$(7) \quad \mathbf{A}_1 \cdot \mathbf{w}_1 = \lambda_{\max} \cdot \mathbf{w}_1$$

where \mathbf{A}_1 is the defuzzified aggregated pairwise comparison matrix, \mathbf{w}_1 is the eigenvector, and λ_{\max} is the largest eigenvalue of \mathbf{A}_1 .

7. Check the consistency of the defuzzified aggregated pairwise comparison matrix. The consistency property is examined by the consistency index (CI) and consistency ratio (CR) (Saaty, 1980):

$$(8) \quad CI = \frac{\lambda_{\max} - n}{n - 1}$$

$$(9) \quad CR = \frac{CI}{RI}$$

where n is the number of items being compared in the matrix, and RI is random index (Saaty, 1980). The threshold CR value is set at 0.10, and a CR value that exceeds the threshold indicates an inconsistent judgment. In such a case, experts need to revise the original values in the specific part of the questionnaire.

8. Calculate the priorities of detailed criteria with respect to their same upper-level criterion, the priorities of alternatives with respect to each detailed criterion, and the interdependence among the detailed criteria by applying a similar procedure as in Step 3 to Step 7.
9. Form an unweighted supermatrix and a weighted supermatrix. Use the priorities calculated from step 5 and 7 to construct an unweighted supermatrix. Transform the unweighted supermatrix to a weighted supermatrix to ensure column stochastic.
10. Calculate the limit supermatrix by taking the weighted supermatrix to powers so that the supermatrix converges into a stable supermatrix. Obtain the priority weights of the alternatives from the limit supermatrix.
11. Obtain the priorities of multiple goals. FMOP can be incorporated to consider other factors such as cost budget and limited resources. Similar steps from 4 to 7 are applied to calculate the priority weights of goals w_g and of alternatives (e_{gv}) with respect to each additional goal.
12. Formulate and solve the FMOP. The overall objective is to maximize the satisfaction of the model. The degrees of satisfaction for the objectives are $\lambda_1, \lambda_2, \dots, \lambda_g$, and w_g from Step 11 are the weights for λ_g . The FMOP model can be formulated as follows (Kang and Lee, 2010):

$$(10) \quad \text{Maximize } \lambda = w_1 \times \lambda_1 + w_2 \times \lambda_2 + \dots + w_g \times \lambda_g$$

$$(11) \quad \text{subject to } \lambda_g \leq \mu_g(x), \text{ for all } g$$

$$(12) \quad \lambda_g \in [0, 1], \text{ for all } g$$

$$(13) \quad \text{Constraints}$$

where λ_g , $\mu_g(x)$ and w_g represent the degrees of satisfaction, membership functions and weights for objectives.

A CASE STUDY OF A PV FIRM IN TAIWAN

The depletion of fossil fuels and the gradually emerging consciousness about environmental protection have increased the use of renewable energy resources in the 21st century. Many environmental-friendly renewable energy resources such as hydraulic energy, wind energy, biomass energy, ocean energy and solar energy have received increasing attention, the rapid development in photovoltaic (PV) technology has made it the most promising alternative to conventional energy systems in recent years (Milliken *et al.*, 2007).

Taiwan has a strong background and foundation for developing the PV industry because of its successes in the semiconductor and TFT-LCD manufacturing industries. PV firms need to focus on effective R&D to improve product quality and to achieve economic scale for cost effectiveness in the global market (Lee *et al.*, 2012). Therefore, a well-designed NPD project evaluation and selection plan is necessary for a firm to improve its competitiveness.

In the case study, a PV firm, with limited resources, is considering to select a few NPD projects. In the first stage, CP is applied to select the NPD project candidates among numerous potential projects. A project can be a candidate only if a set of constraints is satisfied. The CP for NPD project selection is as follows:

$$(14) \quad \sum_i f_o(p_i) \times B_i \times O_i \geq Opp_i^{min}, \text{ for all } i$$

$$(15) \quad \sum_i f_c(p_i) \times B_i \times C_i \leq Cost_i^{max}, \text{ for all } i$$

$$(16) \quad \sum_i f_r(p_i) \times B_i \times R_i \leq Risk_i^{max}, \text{ for all } i$$

$$(17) \quad \sum_i f_t(p_i) \times B_i \times T_i \leq Time_i^{max}, \text{ for all } i$$

$$(18) \quad B_i \in \{0,1\}, \text{ for all } i$$

where $f_o(p_i)$ is the opportunity function (technology function), $f_c(p_i)$ is the cost function, $f_r(p_i)$ is the risk function and $f_t(p_i)$ is the time function.

The data of the 20 potential projects are listed in Table 2, and the result of the CP shows that project 2, 5, 7, 8 and 10 should be selected. The selected project candidates will be further analyzed using FANP and FMOP, and the most appropriate projects can be selected as a result.

Table 2: Data of the 20 potential projects

Project	O_i	Opp_i^{min}	C_i	$Cost_i^{max}$	R_i	$Risk_i^{max}$	T_i	$Time_i^{max}$
$i=1$	1.25	12	12.3	350	0.69	3.50	65	100
$i=2$	1.59		16.3		0.25		59	
$i=3$	1.01		25.1		0.76		79	
$i=4$	0.96		13.6		0.45		103	
$i=5$	2.36		18.7		0.91		69	
$i=6$	1.25		16.3		0.38		55	
$i=7$	1.95		15.9		0.76		78	
$i=8$	1.69		19.3		0.49		56	
$i=9$	0.68		20.5		0.19		91	
$i=10$	2.12		18.9		0.68		66	

CONCLUSIONS

How to select the most appropriate products to develop in order to acquire the highest expected benefits for the firm is an important task. In this research, a framework that incorporates constraint programming (CP), fuzzy analytic network process (FANP) and fuzzy multiple objective programming (FMOP) is proposed for evaluating NPD projects. Through CP, NPD projects that satisfy the constraints can be selected first. FANP is then applied to consider various interdependent factors, and by aggregating experts' opinions, the priorities of the NPD project candidates can be generated. FMOP is finally applied to select the NPD projects for development. The proposed framework is examined by a case study in a PV firm in Taiwan. In the future, a complete case study will be carried out.

CYBERNETIC ID-CRIME MANIFESTATION: VISUALIZING THE USE OF ILLEGITIMATE TECHNOLOGY – FUTURISTIC PERSPECTIVE

Nafta Mokate Lehobye
Tshwane University of Technology, South Africa

ABSTRACT

Although one-man businesses should also use bank facilities to withdraw money from their bank accounts like any other business, it still makes a lot of real sense when they use bank cards for their cash withdrawals. Despite all efforts taken when establishing these businesses to avoid legal risks, there is still much out there [financial risks] to look out for to protect their cash when effecting deposits and withdrawals using black stripped bank cards. This paper provides some guidelines as strategies tailor-made to help these small businesses minimising cybernetic ID crime to affect their cash flow. In order to achieve this, namely, to evade this kind of crime, this paper will then provide some guidelines as strategies befitting small businesses to rather circumvent the blow of the said crime. Looking into their future development, these small businesses should also take cognisance of what the South African law actually says to protect them from this particular crime. Questions now arising here are: what is this illegitimate technology spoken about and how is it being used to perpetrate cybernetic ID crime? How would this crime eventually be averted by small businesses avoiding an interruption the process of future business development in terms of cash flow?

INTRODUCTION

There exists a practice within small businesses where a messenger employee is sent to the bank with a load of money to deposit in the bank account of the business. These businesses are those amongst which are still in their infant stages of development and do not have safety facilities of depositing cash into their bank accounts. Besides, the cash to be deposited does not warrant any mobile cash transit facility like the macro businesses have. When small businesses send someone [employee] to do this, criminals can spot them at ease at any time when transacting in one way or the other (Neves, 2009). Criminals are able to copy information illegally from the magnetic strip [black strip] on the back of the bank card and use this information to steal money (Giles, 2010). The device used to copy the information is called a skimming device. Skimming devices can either be handheld or mounted onto an ATM. A later study by Carnegie Mellon University noted that "Most often than not, the causes of identity theft is not known," but reported that someone else concluded that "the probability of becoming a victim to identity theft as a result of a data breach is ... around only 2%" (Williams, 2009).

Identity theft is a form of stealing someone's identity in which someone pretends to be someone else by assuming that person's identity, typically in order to access resources or obtain credit and other benefits in that person's name (OEDO, 2007). The victim of identity theft (here meaning the person whose identity has been assumed by the identity thief) can suffer adverse consequences if they are held accountable for the perpetrator's actions (Campana, 2006). Identity theft occurs when someone uses your personally identifying information, like your name, social security number, or credit card number, without your permission, to commit fraud or other crimes (Giles, 2010). Questions to be addresses are: what is this technology and how is it being used to perpetrate cybernetic ID crime? How would this crime eventually be averted by small businesses avoiding an interruption on the process of future business development in terms of cash flow?

METHODOLOGY

This paper has identified two areas of immediate concern mostly falling victims of the said crime, namely private individuals and small businesses. Regarding small businesses, the aim will essentially be to provide preventative measures that will enhance their future development. Regarding private individuals, the guidelines will provide individual protection including their business interests (Armenakis and Harris, 2002). In answering the above questions, first, the paper will be descriptive and will adopt a qualitative paradigm (Corbin and Strauss, 2008). As mentioned earlier, it will essentially provide some guidelines as strategies befitting small businesses to circumvent the blow of the said crime. These guidelines will also be specifically aimed for protection by small businesses looking into regional legal responses internationally. These guidelines will thus be meaningful in benefiting identity protection of individuals out there. In achieving the objective of the study, the investigation will utilise the aid of organised print literature, but empirically, a survey will be conducted from the local banks where snap interviews will be conducted albeit with ethical considerations (Olivier, 2009). In this way, the results will most certainly clearly illuminate the problem (Foreman, 2009) brought about by the use of illicit technology through legislative protectionism (Barratt and Snyman, 2005) that will be interpreted and analysed. The paper will bring down findings from case study and provide some recommendations as will be evident from the conclusion.

THEORETICAL UNDERPINNINGS

Individual Identity Protection

The acquisition of personal identifiers is made possible through serious breaches of privacy. For consumers, this is usually a result of them naively providing their personal information or log-in credentials to the identity thieves as a result of being duped but identity-related documents such as credit cards, bank statements, utility bills, checkbooks etc. may also be physically stolen from vehicles, homes and offices, or directly from victims by pickpockets and bag snatchers (Crime Watch SA, 2012). Guardianship of personal identifiers by consumers is the most common intervention strategy recommended by the US Federal Trade Commission, Canadian Phone Busters and most sites that address identity theft (FTC, 2006). Such organizations offer recommendations on how individuals can prevent their information falling into the wrong hands. Identity theft can be partially mitigated by *not* identifying oneself unnecessarily (a form of information security control known as risk avoidance). This implies that organizations, IT systems and procedures should not demand excessive amounts of personal information or credentials for identification and authentication (Williams, 2009). Requiring, storing and processing personal identifiers (such as Social Security number, national identification number, drivers license number, credit card number, etc.) increases the risks of identity theft unless this valuable personal information is adequately secured at all times. To protect themselves against electronic identity theft by phishing, hacking or malware, individuals are well advised to maintain computer security, for example by keeping their operating systems and web browser security fully patched against known security vulnerabilities, running antivirus software and being cautious in their use of IT. Identity thieves sometimes impersonate dead people, using personal information obtained from death notices, gravestones and other sources to exploit delays between the death and the closure of the person's accounts, the inattentiveness of grieving families and weaknesses in the processes for credit-checking (Foreman, 2009). Such crimes may continue for some time until the deceased's families or the authorities notice and react to anomalies. In recent years, commercial identity theft protection/insurance services have become available in many countries. These services purport to help protect the individual from identity theft or help detect that identity theft has occurred in exchange for a monthly or annual membership fee or premium. The services typically work either by setting fraud alerts on the individual's credit files with the three major credit bureaus or by setting up credit report monitoring with the credit bureaus. While identity theft protection/insurance services have been heavily marketed, their value has been called into question.

Identity Protection by Organizations

In their May 1998 testimony before the United States Senate, the Federal Trade Commission (FTC) discussed the sale of Social Security numbers and other personal identifiers by credit-raters and data miners. The FTC agreed to the industry's self-regulating principles restricting access to information on credit reports. According to the industry, the restrictions vary according to the category of customer. Credit reporting agencies gather and disclose personal and credit information to a wide business client base (Wikipedia, 2009). Poor stewardship of personal data by organizations, resulting in unauthorized access to sensitive data, can expose individuals to the risk of identity theft (Campana, 2006). The Privacy Rights Clearinghouse has documented over 900 individual data breaches by US companies and government agencies since January

2005, which together have involved over 200 million total records containing sensitive personal information, many containing social security numbers. Poor corporate diligence standards which can result in data breaches include:

- failure to shred confidential information before throwing it into dumpsters;
- failure to ensure adequate network security;
- credit card numbers stolen by call centre agents and people with access to call recordings;
- the theft of laptop computers or portable media being carried off-site containing vast amounts of personal information. The use of strong encryption on these devices can reduce the chance of data being misused should a criminal obtain them;
- the brokerage of personal information to other businesses without ensuring that the purchaser maintains adequate security controls;
